Case Western Reserve University

Mission | Vision | Accreditation | Philosophy Statement | Cleveland | University Circle | Archives

The University
Case Western Reserve University (http://case.edu) is one of the nation's leading independent research universities, with programs that encompass the arts and sciences, engineering, the health sciences, law, management, and social work.

Brief History
Although its origins date to 1826, the university in its present form is the result of the 1967 federation of Case Institute of Technology and Western Reserve University. The two institutions had shared adjacent campuses since the late nineteenth century and were involved in cooperative efforts for many years. Western Reserve College was founded in 1826 in Hudson, Ohio, a town 26 miles southeast of Cleveland. The college took its name from that of the region, which at the time of the American Revolution, was known as the Western Reserve of Connecticut. In 1882, renamed Western Reserve University and boasting a medical school in addition to its undergraduate programs, the institution moved to the Cleveland site that later became known as University Circle. There it joined the Case School of Applied Science, founded in 1880 through the bequest of Leonard Case Jr., a leading benefactor and Cleveland civic leader. The name Case Institute of Technology was adopted in 1947 to reflect the institution's growing stature in the sciences and engineering.

University Mission
Case Western Reserve University improves people's lives through preeminent research, education and creative endeavor.

We realize this goal through:
• Scholarship that capitalizes on the power of collaboration.
• Learning that is active, creative and continuous.
• Promotion of an inclusive culture of global citizenship.

University Vision
We aspire to be recognized internationally as an institution that imagines and influences the future.

Toward that end, we will:
• Support advancement of select academic fields as well as new areas of interdisciplinary excellence.
• Provide students with the knowledge, skills and experiences necessary to become leaders in a world of rapid change and increasing interdependence.
• Nurture a community of scholars who are cooperative, collegial and committed to mentoring and inclusion.
• Build on our relationships with world-class health care, cultural, educational, and scientific institutions in University Circle and across greater Cleveland.

Accreditation
Case Western Reserve University is accredited at the institutional level by the Higher Learning Commission (http://www.ncahlc.org) and is a member of the North Central Association. In addition, many of Case's individual programs are accredited by nationally recognized professional associations, including:
• AASCB International - Association to Advance Collegiate Schools of Business (accountancy and business)
• Computing Accreditation Commission of ABET, www.abet.org (http://bulletin.case.edu/http://www.abet.org), (BS degree program in computer science)
• Engineering Accreditation Commission of ABET, www.abet.org (http://bulletin.case.edu/http://www.abet.org), (all BS degree programs in engineering, not including the engineering undesignated degree program)
• Accreditation Council for Cooperative Education (cooperative education programs)
• American Bar Association (law)
• American Board of Genetic Counseling (genetic counseling)
• American Chemical Society (chemistry)
• American College of Nurse-Midwives (nurse midwifery)
• American Dental Association (dentistry)
• American Medical Association and Association of American Medical Colleges, Liaison Committee on Medical Education (medicine)
• American Psychological Association (clinical psychology)
• American Speech-Language-Hearing Association (speech pathology)
• Commission on Accreditation for Dietetics Education, American Dietetic Association (didactic program in dietetics, dietetic internship)
• Commission on Accreditation of Allied Health Education Programs (anesthesiologist assistant)
• Commission on Collegiate Nursing Education (Doctor of Nursing Practice program)
• Council on Accreditation of Nurse Anesthesia Educational Programs
• Council on Education for Public Health (public health)
• Council on Social Work Education (applied social sciences)
• National Association of Schools of Music (music)
• National League for Nursing (nursing)
• Ohio Department of Education, Division of Teacher Education and Licensure (art education and music education)
• Teacher Education Accreditation Council (art education and music education)

The university is chartered as an educational institution under the laws of the State of Ohio and holds a Certificate of Authorization from the Ohio Board of Regents (http://regents.ohio.gov).

For further information, contact the university's Center for Institutional Research (http://www.cwru.edu/president/cir/cirhome.html).

Philosophy Statement on Educational Outcome Assessment
Case Western Reserve University commits to a comprehensive educational outcome assessment program, wherein we measure how our students have changed, what knowledge has been learned, and what competencies have been developed. Our educational outcome assessment programs will not only provide information on how well we are achieving our objectives, but also identify what types of programs and experiences have the most powerful impacts. The ultimate goal is to incorporate continuous evaluation into the educational culture for the improvement of programs and for enhancing the distinctiveness of our university.
Education outcome assessments will be based on the core vision and mission of each school and the university as a whole. The faculty, empowered by adequate resources and support to carry out assessment activities, accepts that educational outcome assessment is a part of academic duties. Outcome assessment is embraced as a means that can lead to improvements in teaching and learning, plus provide evidence of teaching effectiveness for institutional purposes.

Cleveland

From a settlement that began centuries ago on the banks of the Cuyahoga River, Cleveland has grown into a metropolis of close to 3 million people. The heritage of this Great Lakes port includes industrial achievement as well as cultural and scientific advances. The Cleveland area is headquarters for many of the nation's major corporations. The city is also a major banking center; the Fourth District Federal Reserve Bank, one of 12 in the nation, is located here.

Health care is another thriving Cleveland industry. Dozens of hospitals and medical centers are concentrated in the area. University Hospitals, the Cleveland Clinic, the MetroHealth Medical Center, and others have attained international recognition for outstanding patient care and contributions to medical research.

Greater Cleveland is dotted with shopping malls, theaters, and opportunities for sports and amusement. The latter include Lake Erie, the 17,000-acre Metropark system; professional baseball, football, and basketball teams; and facilities for softball, skiing, hiking, cycling, picnics, and other activities. More than 60 ethnic groups live in Cleveland; seasonal festivals continue traditions brought to the region from throughout the world.

University Circle

Case Western Reserve University is located in University Circle (http://www.universitycircle.org), a 550-acre concentration of more than 40 cultural, medical, educational, religious, and social service institutions located at the eastern edge of the city. In addition to Case Western Reserve University, which is the largest institution in University Circle, the community includes Severance Hall, home of the world-famous Cleveland Orchestra; the Cleveland Museum of Art, housing one of the nation's finest collections; the Cleveland Institute of Music; the Cleveland Institute of Art; University Hospitals; the Western Reserve Historical Society; the Cleveland Botanical Garden; the Cleveland Museum of Natural History; and many others. All are within walking distance of the university.

University Circle attracts visitors worldwide and from throughout the region to its concerts, theater performances, athletic events, art shows, public lectures, exhibits, and restaurants. Housing, shopping, and recreational facilities are all located in the area.

University Archives

University Archives (http://www.case.edu/its/archives) manages university records and publications to ensure the preservation of a reliable institutional memory. The office, which manages a collection of over 12,000 linear feet (approximately 25 million pages) and over 40 gigabytes that document the university’s life from 1826 to 2009, offers the following services:

- Research and reference services to help discover the who, what, where, when, how and why of Case Western Reserve University history and development
- Duplication services (digital, xerographic, and fax copies) of most documents
- Records services to assist in managing active records and guidance in transferring records to the University Archives
- Digitization of select, high-demand materials for ease of access and use

University Libraries and Resources

All Case Western Reserve University’s libraries support the university’s undergraduate, graduate and professional programs. Combined, their collections contain nearly 3 million volumes. The libraries maintain individual websites to facilitate communication of their unique services to the university community. Collections of electronic databases and electronic journals are shared and available for all university faculty, staff, and students through the campus network or authorized remote access. The libraries are an integrated system that comprises the Kelvin Smith Library and its branches, the Cleveland Health Sciences Library, the School of Law Library and the Harris Library at the Mandel School of Applied Social Sciences.

Kelvin Smith Library (KSL) serves as the knowledge and creativity commons on campus, and is open to all members of the university community, with collections and services that support the faculty, staff, undergraduate, and graduate students of the College of Arts and Sciences (http://www.case.edu/artsci), the Case School of Engineering (http://engineering.case.edu), the Weatherhead School of Management (http://weatherhead.case.edu), and the general administration of the university. Collections and research services begin with the main collection of nearly 2 million volumes on 30 miles of compact shelving that maximizes space in the building for researchers to work in a variety of styles, collaboratively or individually. Branches include collections, staff, and services:

- The Astronomy and Kulas Music Libraries are branches of KSL and are housed within their respective departments. KSL has access to more than 56,000 unique serials and periodicals and has a large retrospective collection housed in the Retrospective Research Collections Center (RRCC) located in Cedar Avenue Service building.
- The RRCC offers daily retrieval service to KSL for materials that can be borrowed, and also has a reading room and staff to assist with the collections housed at the Center.

Kelvin Smith Library and branch collections (http://library.case.edu/ksl/collections.html) are featured on the KSL homepage and in addition to books and journals expand learning and scholarship with other items such as audiovisual materials, government documents, special collections, datasets, digital collections, and Digital Case (http://library.case.edu/digitalcase) as a repository of campus intellectual output and special collections of the university. Personalized services help advance academics with The Center for Statistics and Geospatial Data (http://library.case.edu/ksl/collections/csgd), and the Freedman Digital Library, Language Learning and Multimedia Services Center (http://library.case.edu/ksl/freedmancenter), with new ways to locate and present research, and explore new technologies. KSL provides staff and services in support of teaching and research, including expert reference assistance in-person, online, and onsite in academic departments. ILLiad (http://library.case.edu/ksl/services/ill/libraryservices/ill) interlibrary loan services & electronic article delivery, Course Reserves & Electronic Reserves (http://library.case.edu/ksl/services/libraryservices/reserves) bring research to the desktop for researchers on or off campus. During fall and spring academic semesters, individuals with current Case ID cards can take advantage of KSL spaces and collections with its 24 hours - 7 days a week service. New initiatives in 2011 opened the Cramelot
The Mandel School of Applied Social Sciences (MSASS) has the distinction of being one of the few schools of social work that maintains a professional library for the use of its students, staff, faculty, and alumni as well as for the general university community. The Mandel School’s Lillian F. and Milford J. Harris Library contains over 40,000 volumes and subscriptions to 250 periodicals and about 900 video and audio items to support Mandel School academic programs, and is located on the 2nd and 3rd floors of the MSASS building. The library also has a variety of electronic media and other materials, which are available for classroom use by faculty. The Harris Library (http://msass.cwru.edu/harrislibrary) reference staff assist researchers in the library and via phone and email, and a computing lab (http://msass.cwru.edu/harrislibrary/General/Lab) and Help Desk also support MSASS students. The library’s website provides information resources (http://msass.cwru.edu/harrislibrary/Alumni/alumncrdclic.htm) information for social work students, faculty, practitioners, and other human service workers in Greater Cleveland.

The Cleveland Health Sciences Library has two facilities with collections that are open to all university students, faculty and staff. The Health Center Library (HCL) collections and services support the Schools of Dental Medicine (http://dental.case.edu), Medicine (http://casemed.case.edu), Nursing (http://fpb.case.edu), as well as the departments of Biology (http://www.case.edu/artsci/biol) and Nutrition (http://www.case.edu/med/nutrition), and celebrates its 40th anniversary in 2011. Allen Memorial Medical Library has a collection of clinical books and journals and a growing historical collection in the Dittrick Medical History Center and Museum, with a rare book collection, archives, medical artifacts, and a history of medical collection. News is featured on the Dittrick Museum Blog (http://dittrick.blogspot.com). Information, news, and highlights about collections, library spaces and services of HCL are featured on the CHSL (http://www.case.edu/chsl/library) homepage, with direct links to featured collections and resources like JAMA and Archives Journals, PubMed, MEDLINE, Springer Protocols, Reference assistance, and ILLiad interlibrary loan services.

The Judge Ben C. Green Law Library is located in the School of Law and has more than 300,000 volumes including complete collections of statutory and case law, law reviews, the National Reporter System, state reports, administrative reports and current law services. There is also an extensive British collection and special collections in taxation, labor law and foreign investments. The law library’s website provides core links to legal information resources, government agencies and legislative history resources. Posts on the facebook (http://www.facebook.com/caselawlibrary) page and Just In Case (http://blog.case.edu/law-library), the library blog, bring information about events, law library content, and new collection news to the campus community.

The Case Catalog is the university’s comprehensive online access portal with all the libraries’ collections and resources. The Case Catalog (http://bulletin.case.edu/http://catalog.case.edu) also includes collections of the Robinson Library (http://www.cim.library/about) at the Cleveland Institute of Music, (http://www.cim.library/about) the Gund Library (http://www.cia.library) at the Cleveland Institute of Art, and the Aaron Garber Library (http://www.siegelcollege.edu/aaron-garber-library/about-us.html) at the Siegal College of Judaic Studies. The Case Catalog (http://bulletin.case.edu/http://catalog.case.edu) is accessible through any web browser and also provides quick links to the individual library websites (http://library.case.edu/loc/libraries.html). For authenticated individuals, the Case Catalog (http://bulletin.case.edu/http://catalog.case.edu) offers quick links to the Research Database List (http://library.case.edu/databases/rdb), the electronic journal portal (http://lu4ld3lr5v.search.serialssolutions.com), and OhioLINK (http://www.ohiolink.edu) consortium materials. It also features research tools and access for Course Reserves and RefWorks citation management, and ILLiad (http://library.case.edu/loc/ill.html) services for each library. Computer workstations are located in each campus library to facilitate use of digital library information resources, and classrooms provide opportunities for learning and library instruction. Network access allows researchers to search the resources of the university’s libraries and the OhioLINK Central Catalog (http://oic1.ohiolink.edu/search) from any port on the campus network, from the Kelvin Smith Library wireless network, or remotely through university-authenticated VPN software.

Case Western Reserve University is a founding member of the OhioLINK consortium, which provides a shared, unified catalog for ninety colleges and universities, including the State Library of Ohio. The Center for Research Libraries also participates in resource sharing from the OhioLINK Central Catalog (http://oic1.ohiolink.edu/search), along with several Ohio public libraries. The OhioLINK Central Catalog (http://oic1.ohiolink.edu/search), at 48+ million items available for online requesting, also provides online access to a rich and robust variety of research materials such as 15,000,000 electronic journal articles in the EJC (http://journals.ohiolink.edu/ejc), 62,000 digital books in the EBC (http://ebooks.ohiolink.edu/ebc-home), 32,000 online theses and dissertations in the ETD Center (http://etd.ohiolink.edu), 3,000 digital media items in the Digital Media Center (http://dmc.ohiolink.edu), and hundreds of online databases in all disciplines. Authorized faculty, students, and staff enjoy automated online borrowing and renewals of book and media materials, as well as onsite borrowing privileges at OhioLINK member (http://www.ohiolink.edu/members-info) libraries. OhioLINK resources supplement local collections and augment online resources by maximizing resources for consortial licensing opportunities, bringing a vast array of online content to the members.

CPL@Case–KSL offers a site collection of Cleveland Public Library materials for all Case students, faculty, and staff with current Case IDs. Best sellers, audio books, foreign language magazines and other public library materials may be borrowed with a Cleveland Public Library (http://www.cpl.org) card. The site collection is designed for students who otherwise are not able to travel to public libraries in the area, with these items borrowed and returned directly to the Kelvin Smith Library (http://bulletin.case.edu/http://library.case.edu). Read more details about privileges for CPL@Case–KSL (http://bulletin.case.edu/CPL@Case–KSL), including how current faculty, staff, and students can get a CPL library card at KSL.

Other libraries in University Circle enrich the academic experience and include the Cleveland Institute of Art, the Cleveland Institute of Music, the Cleveland Museum of Art, the Western Reserve Historical Society, the Cleveland Museum of Natural History, and the Cleveland Botanical Garden Library.

The university is a member of the Association of Research Libraries (ARL), which comprises 126 North American research libraries.
Information Technology Services

The Information Technology Services (ITS) division provides solutions that support education, research and the day-to-day functions at Case Western Reserve University. We are committed to the stewardship of the university’s information technology resources and to fostering an environment in which integrity, communication, collaboration and support are paramount in everything we do.

New to CWRU: Welcome to Case Western Reserve University!

The Information Technology Services division provides solutions and support to the university which uphold and strengthen the interaction between challenge, discovery, scholarship, learning, teaching, working and technology. We proudly provide a wide range of products and services that you will surely utilize each day you are at Case Western Reserve.

We’ve constructed guides for technology immersion based upon your role at the university. These step-by-step books will help take you through how to get set up and where to seek the many resources available to you as a member of the CWRU community. We hope that this resource will help you maximize your technology-based experiences.

Service Desk

The Service Desk provides 24/7/365 free and unlimited technology service and support to all students, faculty and staff of the university community.

- Phone: 216.368.HELP (4357) : speak real time with a IT expert or schedule deskside or dormside assistance
- Email: help@case.edu
- In Person Walk-In locations: 11424 Bellflower & Sears Library
- Online Request or Chat: help.case.edu

eStore: Your key to great discounts on computers, mobile phones and more!

Case Western Reserve University maintains strategic partnerships with many premier technology manufacturers which allow the university to offer our students, faculty and staff cutting-edge technology products and services at highly advantageous discounts. Products available at the eStore include computers, backup services, high speed internet, cellular phones, and other accessories.

Software Center: Free software on popular titles and operating systems

Case Western Reserve faculty, staff and students are eligible to download over 40 software packages from the Software Center, generally at no charge, which the university has purchased and made available through site licenses with software manufacturer. Packages and tools include:

- Microsoft Office
- Symantec Endpoint Protection
- Adobe Creative Suite
- Adobe Acrobat Professional
- Operating System upgrades
- Mathematical and statistical packages and tools and programming languages

Learn how to use all of this great software through our partnership with Lynda.com. CWRU students, faculty and staff have unlimited free access to Lynda.com, a leading video-based IT training provider offers over 3275 training courses including Google Apps, Adobe CS5 Creative Suite, Microsoft Office, web development, audio/video production, computer programing, Apple Mobile Devices, and much more. Each training topic is delivered in hours of videos broken down into easy to manage 5 - 15 minute segments. These video based tutorials are taught by industry experts and available 24/7 for convenient, self-paced learning. Access Lynda.com using your CWRU Network ID and password through our special portal at help.case.edu/lynda

Vice Chair of the Board of Trustees
Case School of Engineering

Engineering seeks to create new processes, products, methods, materials, or systems that impact and are beneficial to our society. To enable its graduates to lead the advancement of technology, the Case School of Engineering (http://engineering.case.edu) offers thirteen degree programs at the undergraduate level (twelve engineering degrees, plus the BS in computer science). At the post-graduate level, the School of Engineering offers Master of Science programs and the Doctor of Philosophy for advanced, research-based study in engineering. Case School of Engineering offers two specialized degrees at the master’s level: a Master of Engineering specifically for practicing engineers, and an integrated Master of Engineering and Management jointly administered with the Weatherhead School of Management. The School of Engineering offers a Graduate Certificate program which provides an introductory graduate level understanding of the field of Wireless Health. The Case School of Engineering also offers two dual-degrees at the graduate level jointly administered with the School of Medicine: a Doctor of Medicine/Master of Science and a Doctor of Medicine/Doctor of Philosophy. The faculty and students participate in a variety of research activities offered through the departments and the interdisciplinary research centers of the University.

At the core of its vision, the Case School of Engineering seeks to set the standards for excellence, innovation, and distinction in engineering education and research prominence.

Statement of Educational Philosophy

The Case School of Engineering prepares and challenges its students to take positions of leadership in the professions of engineering and computer science. Recognizing the increasing role of technology in virtually every facet of our society, it is vital that engineering students have access to progressive and cutting-edge programs stressing five areas of excellence:

- Mastery of fundamentals
- Creativity
- Societal awareness
- Leadership skills
- Professionalism

Emphasizing these core values helps ensure that tomorrow’s graduates are valued and contributing members of our global society and that they will carry out the tradition of engineering leadership established by our alumni.

The undergraduate program aims to create life-long learners by emphasizing engineering fundamentals based on mathematics, physical, and natural sciences. Curricular programs are infused with engineering innovation, professionalism (including engineering ethics and the role of engineering in society), professional communications, and multidisciplinary experiences to encourage and develop leadership skills. To encourage societal awareness, students are exposed to and have the opportunity for in-depth study in the humanities, social sciences, and business aspects of engineering. Undergraduate students are encouraged to develop as professionals. Opportunities include the Cooperative Education Program, on-campus research activities, and participation in the student chapters of professional societies. Graduates are prepared to enter the workforce and be strong contributors as practicing engineers, or continue for advanced study in engineering.

At the graduate level, the Case School of Engineering combines advanced classroom study with a rigorous independent research experience leading to significant results appropriate for publication in archival journals and/or presentation at leading technical conferences. Scientific integrity, engineering ethics, and communication skills are emphasized throughout the program.

Brief History

The Case School of Engineering was established on July 1, 1992, by an action of the Board of Trustees of Case Western Reserve University as a professional school dedicated to serving society and meeting the needs of industry, government and academia through programs of teaching and research.

The Case School of Engineering continues the tradition of rigorous programs based on fundamental principles of mathematics, science and engineering that have been the hallmark of its two predecessors, the Case School of Applied Science (1880) and the Case Institute of Technology (1947). The formation of the Case School of Engineering is a re-commitment to the obligations of the gift of Leonard Case, Jr., to serve the citizens of Northern Ohio. The School of Engineering has been a leader in many educational programs, being the first engineering school to offer undergraduate programs in computer engineering, biomedical engineering, polymer engineering, and systems and control engineering.

Accreditation

The following Bachelor of Science programs are accredited by the Engineering Accreditation Commission of ABET, www.abet.org (http://bulletin.case.edu/schoolofengineering/http://www.abet.org):

- Aerospace Engineering
- Biomedical Engineering
- Chemical Engineering
- Civil Engineering
- Computer Engineering
- Electrical Engineering
- Engineering Physics
- Materials Science and Engineering
- Mechanical Engineering
- Polymer Science and Engineering
- Systems and Control Engineering

The following Bachelor of Science program is accredited by the Computing Accreditation Commission of ABET, www.abet.org (http://bulletin.case.edu/schoolofengineering/http://www.abet.org):

- Computer Science

Case School of Engineering’s Case Co-op Program is accredited by the Accreditation Council for Cooperative Education (http://www.co-opacccreditration.org) (ACCE).

Bachelor of Science | Master of Science | Master of Engineering | Doctorate

Engineering Degrees Granted

Bachelor of Science in Engineering with the following major field designations:

- Aerospace Engineering
- Biomedical Engineering
• Chemical Engineering
• Civil Engineering
• Computer Engineering
• Electrical Engineering
• Engineering Physics
• Materials Science and Engineering
• Mechanical Engineering
• Polymer Science and Engineering
• Systems and Control Engineering

Bachelor of Science in Engineering (Undesignated) (p. 21) (for programs that emphasize interdisciplinary areas or for programs that include some emphasis on non-technical fields)

Bachelor of Science in Computer Science (p. 60)

Bachelor of Science in Engineering/Master of Science
• Aerospace Engineering
• Biomedical Engineering
• Chemical Engineering
• Civil Engineering
• Computer Engineering
• Computing and Information Science
• Electrical Engineering
• Engineering Physics
• Materials Science and Engineering
• Mechanical Engineering
• Polymer Science and Engineering
• Systems and Control Engineering

Bachelor of Science in Engineering/Master of Engineering

Master of Science with the following major field designations:
• Aerospace Engineering
• Biomedical Engineering
• Chemical Engineering
• Civil Engineering
• Computer Engineering
• Computing and Information Science
• Electrical Engineering
• Macromolecular Science and Engineering
• Materials Science and Engineering
• Mechanical Engineering
• Systems and Control Engineering

Bachelor of Science in Engineering

In addition to the major department requirements, each engineering undergraduate degree program includes the Engineering Core, which provides a foundation in mathematics and sciences as well as aspects of engineering fundamentals for programs in engineering. The Engineering Core also is designed to develop communication skills and to provide a body of work in the humanities and social sciences. Requirements of the Engineering Core can be found in the Undergraduate Studies section of this bulletin.

Details of the specific curricular requirements for the undergraduate majors are described in the respective departmental descriptions. Details of the requirements of the undesignated engineering undergraduate degree are described under the Engineering Undesignated description.

Master of Science

Recognizing the different needs and objectives of resident and non-resident graduate students pursuing the master’s degree, two different plans are offered. In both plans, transfer of credit from another university is limited to six hours of graduate-level courses, taken in excess of the requirements for an undergraduate degree, approved by the student’s advisor, the department chair, and the dean of graduate studies.

All Master of Science degree programs require the submission of a Planned Program of Study via the Student Information System where it will be routed for appropriate approvals. Students must submit an approved program of study by the end of the second semester. A revised program of study must be submitted via the Student Information System when any change in the original plan occurs.

Master’s Thesis Plan (Plan A)

Minimum requirements for the degree of Master of Science in a major field under this plan are:

1. Completion of 18 hours of graduate course work. The courses must be approved by the department offering the degree.
2. Completion of nine hours of thesis work culminating in a thesis examination given by at least three professors, plus approval by the chair of the department offering the degree. A student with research
experience equivalent to a thesis may petition the Graduate Committee of the Case School of Engineering for substitution of nine hours of course work for the thesis requirement. In this case, the thesis examination above is replaced by a similar examination covering the submitted research work and publications.

At least 18 hours of total course work, in addition to 9 hours of thesis research, must be at the 400 level or higher.

**Master’s Comprehensive Plan (Plan B)**

Students may pursue either a project or non-project track under this option. Minimum requirements for the degree of Master of Science in a major field under this plan are one of the following:

**Project track**
Completion of 27 hours of graduate course work including three to six hours of Special Problems. Special Problems course work must consist of an engineering project approved by the chair of the department offering the degree, and may be carried out at the student’s place of employment with nominal supervision by a faculty advisor or in the school’s laboratories under direct supervision. The project must culminate in a written report and examination by at least three professors plus approval by the chair of the department offering the degree. The Special Problems course may be waived for students who have had industrial design or research experience and who submit sufficient evidence of this experience in the form of a publication or internal report. For these students, a minimum of 27 hours of course work and the final oral examination covering the submitted publications or reports as well as related course material will be required for the master’s degree. At least 18 hours of course work including up to 6 hours of Special Problems must be at the 400 level or higher.

**Non-project track**
Students who register for 27 hours, not including Special Problems course work, must pass satisfactorily a comprehensive examination to be administered by the department or curricular program committee. The examination may be written or oral, or both. A student must be registered during the semester in which any part of the comprehensive examination is taken. If not registered for other courses, the student will be required to register for one semester hour of EXAM 600 Master’s Comprehensive Exam, before taking the examination.

**Distance Education**
Through Distance Education, the Case School of Engineering offers graduate courses and degree programs for engineering professionals and students that cannot attend classes on campus. The program makes it convenient for students to overcome the logistical and financial barriers imposed by commuting to campus, and allows students working full time or located a distance from the Cleveland area to pursue a course only (comprehensive option) Master of Science degree (http://engineering.case.edu/current-students/academic-programs/ ms) or a practice oriented Master of Engineering degree (http://engineering.case.edu/meng/). The courses are delivered asynchronously so that distance learning students can view course lectures at their convenience, and can interact with the professor and students in the class through email, phone, video, and the course tools available in Blackboard. The distance learning courses and degree programs are identical to those given on-campus, and student performance assessments are the same regardless of the delivery mechanism. All distance courses are part of our standard curricula, and are offered on a regular time schedule to allow distance students to complete degree requirements over a predictable and reasonable time period.

For more details on the distance learning programs please visit http://engineering.case.edu/current-students/distance-learning and http://engineering.case.edu/meng/.

---

**Doctor of Medicine/Master of Science**

Medicine is undergoing a transformation based on the rapid advances in science and technology that are combining to produce more accurate diagnoses, more effective treatments with fewer side effects, and improved ability to prevent disease. The goal of the MD/MS in Engineering is to prepare medical graduates to be leaders in the development and clinical deployment of this technology and to partner with others in technology based translational research teams. For further information, see the MD/MS Program in the Biomedical Engineering graduate section of this bulletin (p. 27). Interested students should apply through the biomedical engineering department.

**Master of Engineering**

The Master of Engineering Program is a graduate degree program that targets currently employed engineers. The objective of this program is to provide engineers in industry with technical as well as business, management, and teamwork skills. The program differs from a traditional Master of Science degree in engineering by combining core courses that focus on the engineering-business environment and technical elective courses that concentrate on contemporary industrial practice rather than on research.

The Master of Engineering Program prepares students to enhance their role as corporate leaders and provides an environment in which practicing engineering professionals can address the increasingly wide range of technical, management, financial and interpersonal skills demanded by an ever-expanding and diverse global industry base.

The Master of Engineering Program requires 30 credit hours of course work that include 18 credit hours of core courses and 12 credit hours of technical electives that are chosen from focus areas (see below). It is possible to complete the Master of Engineering degree program within a two-year (six semester), part-time, program of study, although most students choose to complete the program over a seven-nine semester period. The core courses are aimed at equipping participants with knowledge on how engineering is practiced in contemporary industry, and the technical elective courses provide depth in a chosen specialty area. All courses are held in the late afternoon or evening hours and many are provided in a distance-learning format to minimize disruption at the workplace and home. Because the program makes extensive use of computers, participants need to have access to computer facilities.

**Curriculum**

The program consists of a set of six core courses and a four course technical elective sequence (a total of 30 credit hours are required). The core courses provide a common base of study and experience with problems, issues, and challenges in the engineering business environment. The technical course sequence provides an opportunity to update disciplinary engineering skills and to broaden interdisciplinary skills. Up to six transfer credits may be approved for graduate-level courses taken at Case Western Reserve or another accredited university.

### Technical Electives

Four courses are chosen from the technical concentration areas below. For detailed course offerings in these areas, please refer to the Master of Engineering (http://www.engineering.case.edu/meng) program information on the Case School of Engineering website.

- Biomedical Engineering
- Chemical Engineering
- Computer Engineering
- Infrastructure Engineering
- Macromolecular Science and Engineering
- Materials Processing and Synthesis
- Mechanical Engineering
- Robotics and Control
- Software Engineering
- Signal Processing and Communications

### Master of Engineering and Management

The Master of Engineering and Management program is designed to meet the needs of students seeking to excel in engineering careers in industry. The MEM degree requires only one calendar year of additional study and may be entered following a student’s Junior or Senior year. The program prepares engineers to work in different business environments. A rigorous curriculum prepares graduates to build synergy between the technical possibilities of engineering and the profit-loss responsibilities of management. This program evolved after years of research and interviews with over 110 professionals and twenty-eight corporations in the U.S.

#### The Program

The program includes 42 credit hours of graded course work. The ten-course core sequence makes up 30 of these hours. Students choose an area of concentration, either technology entrepreneurship or biomedical entrepreneurship, for the remaining 12 credits. The Program prepares participants to function as technical leaders with a unique blend of broadened engineering and management skills, which can have a strategic impact on the organization’s bottom line. Graduates are uniquely positioned for rapid advancement in technology-based organizations.

### Doctor of Philosophy

The student’s PhD program should be designed to prepare him or her for a lifetime of creative activity in research and in professional engineering practice. This may be coupled with a teaching career. The mastery of a significant field of knowledge required to accomplish this purpose is demonstrated by an original contribution to knowledge embodied in a thesis and by satisfactory completion of a comprehensive course program which is intensive in a specific area of study and includes work in other areas related to, but not identical with, the major field. The necessity for breadth as well as depth in the student’s education cannot be overemphasized. To this end, any engineering department may add additional requirements or constraints to ensure depth and breadth appropriate to its field.

No student may be admitted to candidacy for the PhD degree before approval of his or her Planned Program of Study via the Student Information System. After this approval has been obtained, it is the responsibility of the student’s department to notify the dean of graduate studies of his or her admission to candidacy after the student has fulfilled any additional department requirements. Minimal requirements in addition to the university requirements are:

1. The minimum course requirement beyond the BS level is 36 credit hours of courses taken for credit, at least 18 hours of which must be taken at Case Western Reserve University. The following courses taken for credit will be acceptable for a PhD program of study:
   i. All 400-, 500-, and 600-level courses
   ii. Those 300-level courses approved by the student’s department up to a maximum of three beyond the BS or a maximum of one beyond the MS
   iii. Approved graduate-level courses taken at other institutions

</tbody>
</table>
2. A minimum depth in basic science equivalent to six semester hours (for credit) is required. This requirement is to be satisfied by courses that have been previously approved by the faculty of the department in which the student is enrolled.

3. The requirement for breadth is normally satisfied by a minimum of 12 semester hours of courses (for credit) outside the student’s major area of concentration as defined by the student’s department and does not include courses taken to fulfill the basic science requirement.

4. A minimum of three teaching experiences as defined by the student’s department. All programs of study must include departmental 400T, 500T, and 600T courses to reflect this requirement. All students fulfilling teaching duties must complete UNIV 400A or UNIV 400B.

5. The minimum requirement for research is satisfied by at least eighteen hours of thesis (701) credits.

6. A cumulative quality-point average of 3.0 or above in all courses taken for credit as a graduate student at Case Western Reserve University (excluding grades in thesis research and grades of R) is required for the award of the doctoral degree.

Qualifying Examination
The student must pass a qualifying examination relevant to his or her area of study as designated by the curricular department with which he or she is affiliated. For students who obtain the MS degree from Case Western Reserve University, the qualifying examination should be taken preferably before the end of the student’s fourth semester of graduate study but no later than the end of the fifth semester at the university. For students entering with the master’s degree, the examination should be taken no later than the end of the third semester at the university.

Planned Program of Study
Each student is required to submit a Planned Program of Study, detailing his or her course work, thesis schedule, and qualifying examination schedule and indicating that all the minimum requirements of the university and the faculty of the Case School of Engineering are satisfied. This Planned Program of Study must be submitted via the Student Information System for approval before registering for the last 18 credits hours of the program.

If the student is pursuing the PhD degree without acquiring the MS degree, a petition to waive the requirement of the MS degree should be approved by the departmental advisor and the chair and submitted to the dean of graduate studies. All required courses taken at the university beyond the BS degree should be shown on the Planned Program of Study with the grade if completed. If the requirements are to be fulfilled in ways other than the standard described above, a memorandum requesting approval should be submitted to the dean of graduate studies.

The Planned Program of Study must be submitted within one semester after passing the qualifying examination.

Doctor of Medicine/Doctor of Philosophy
Students with outstanding qualifications may apply to the MD/PhD program. Students interested in obtaining a combined MD/PhD, with an emphasis on basic research in biomedical engineering or mechanical engineering, are strongly encouraged to explore the Medical Scientist Training Program (MSTP), administered by the School of Medicine. For further information, please see the Medical Scientist Training Program (MSTP) in the School of Medicine section of this bulletin. Interested students should apply through the MSTP office in the Medical School.

Graduate Cooperative Education (Co-op)
Graduate Cooperative Education (Co-op) is a formalized academic program that enables students to enhance their classroom studies with career-based experiences in industry. It is a learning experience designed to integrate classroom theory with practical experience and professional development.

Course
ENGR 400C. Graduate Cooperative Education. 0 Units.
An academic opportunity designed for graduate students to enhance their classroom, laboratory, and research learning through participation and experience in various organizational/industrial environments where theory is applied to practice. Graduate Cooperative Education experiences may be integrated with the student’s thesis or research project areas, or be solely for the purpose of gaining professional experience related to the student's major field of study. Registration in this course will serve to maintain full-time student status for the period of time that the student is on a co-op assignment.

Graduate Certificate
Wireless Health
Educational Objectives:
The Graduate Certificate in Wireless Health provides an integrated foundation for understanding the fundamentals and applications of converging wireless, sensor and medical technologies in health care. The program integrates fundamental material across the spectrum of disciplines underlying the field of wireless health through three coordinated 3-credit courses:

- Introduction to Wireless Health;
- The Human Body; and
- Biomedical Sensing Instrumentation

These courses prepare students to gain a systems-level overview (Introduction to Wireless Health), as well as introductory graduate level understanding of scientific (The Human Body) and engineering (Biomedical Sensing Instrumentation) disciplines underpinning the field of wireless health.

For more details, please refer to the Wireless Health (http://engineering.case.edu/wireless_health) information on the Case School of Engineering website.

Interdisciplinary Research Centers
Advanced Platform Technology | Case Metal Casting Laboratories | Center for Advanced Polymer Processing | Center for Biomaterials | Center for In Situ Cell and Tissue Imaging | CLIPS | Center for Mechanical Characterization of Materials | MIMS | Cleveland Functional Electrical Simulation Center | EDC | GLEI | Institute for Advanced Materials | MFL | NCSE | Neural Engineering Center | Nitinol Commercialization Accelerator | S-DLE | SCSAM | ThinkTank | WERC

Interdisciplinary research centers act as intensive incubators for students and faculty doing research and studying applications in specialized areas. Thirteen research centers and research programs at the Case School of Engineering have been organized to pursue cutting-edge research in collaboration with industrial and government partners. The transfer of technology to industry is emphasized in all the centers.
The educational programs of these centers encompass the training of graduate students in advanced methods and strategies, thus preparing them to become important contributors to industry after graduation; the involvement of undergraduates in research; the presentation of seminars that are open to interested members of the community; and outreach to public schools to keep teachers abreast of scientific advances and to kindle the interest of students in seeking careers in engineering.

Advanced Platform Technology (APT) Center (http://www.aptcenter.research.va.gov)

Louis Stokes Cleveland Department of Veterans Affairs Medical Center
10701 East Boulevard, Mail Stop 151 AW/APT
Cleveland, Ohio 44106
Phone: 216.707.6421 Fax: 216.707.6420
Ronald J. Triolo, Executive Director
ronald.triolo@case.edu

The Advanced Platform Technology (APT) Center brings together top faculty and researchers from Case Western Reserve University and the Department of Veterans Affairs to capture the most recent developments in the fields of microelectronics, material science, microsystems and mechanics, and focus them on the practical medical needs of individuals disabled by sensorimotor dysfunction, cognitive deficits or limb loss. The APT Center creates novel, cross-cutting technologies for the diagnosis, treatment or study of high priority clinical conditions within a structured framework that facilitates regulatory compliance, outsourcing by contract manufacturers, and dissemination within the rehabilitation community. Scientific technical development and clinical translation concentrates on prosthetics and orthotics, health monitoring and maintenance, neural interfaces and emerging enabling technologies. Center projects to date have concentrated primarily on developing new materials and microsystems for interfacing with the nervous system, repairing orthopaedic trauma and accelerating wound healing, replacing or restoring natural limb, sensory and organ system function, and both monitoring and promoting neurological, genito-urinary and vascular health. The APT Center was established as a VA Center of Excellence in 2005 in partnership with Case Western Reserve University and is based at the Louis Stokes Cleveland Department of Veterans Affairs Medical Center (LSCDVAMC). The Center is able to provide or facilitate access to the following resources:

1. Neural modeling and analysis of interface designs
2. Polymer and bioactive material development
3. Microelectromechanical (MEMS) systems design and fabrication
4. Rapid prototyping, mechanical testing and dynamic simulation
5. Pre-clinical in vitro and in vivo verification of device performance
6. Circuit and software design and fabrication
7. System validation and design control documentation
8. Professional engineering support and project management
9. Administrative support for intellectual property protection and regulatory affairs

Center for Advanced Polymer Processing (CAPP) (http://bulletin.case.edu/schoolofengineering/mailto:joao.maia@case.edu)

Kent Hale Smith Building, 3rd floor
Phone: 216.368.6372 Fax 216.543.4202
Joao Maia, Director
joao.maia@case.edu

CAPP is a state-of-the-art center for advanced polymer blending and compounding and reactive extrusion at CWRU able to perform basic research and applied research and development in support of the Ohio and US plastics industry. The main tools of CAPP are:

- State-of-the-art sensors that allow multiple rheological, physical, chemical and morphological quantities to be measured along the screw axis of twin-screw extruders;
- Advanced multi-scale computational simulation capabilities to build physical-chemical-structural models of polymer systems under flow in realistic polymer transformation processes;
- Integration of on-line sensors and multi-scale softwares to develop new advanced and functional multiphase complex materials or optimize the performance of existing ones.
Center for Biomaterials (http://www.case.edu/affil/CCB/ccbhome.htm?nw_view=1342450698&)

202 Wickenden Building (7207)
www.case.edu/affil/CCB/ccbhome.htm
Phone: 216.368.3005 Fax: 216.368.4969

roger.marchant@case.edu

Anirban Sen Gupta, Associate Director
Phone: 216.368.4564
anirban.sengupta@case.edu

The Center for Biomaterials carries out research and development projects to investigate new biomaterials, tissue engineered materials, and targeted drug delivery systems for use in cardiovascular applications and implants. The Center for Biomaterials also provides researchers access to shared use facilities, which includes high resolution microscopy such as AFM, molecular spectroscopies, surface analysis, and polymer and peptide synthesis capabilities. The chemical and mechanical interface between the biomaterial and the host tissue are the focus of major study, with the goal being to improve biologic function and biocompatibility in the response of the human body to implants. Current projects include investigation of thrombosis (blood clotting) and infection mechanisms due to cardiovascular prosthesis, biomimetic design of novel biomaterials for cardiovascular and neural implants; and cardiovascular and neural tissue engineering based on biomimetic designs. Studies at the cell and molecular level assist our understanding of the underlying mechanisms so that novel biomedical materials may be designed, prepared, and characterized.

Center for In Situ Cell and Tissue Imaging (http://mechbio.case.edu/contact.html)

307 Wickenden Building (7207)
Phone: 216.368.5884 Fax 216.368.4969
Melissa Knothe Tate, Director
melissa.tate@case.edu

The Center for In Situ Cell and Tissue Imaging (CISCTI) is designed to offer state of the art and cutting edge imaging capabilities to the biomedical community at Case Western Reserve University. The center showcases a custom-configured instrument based on the Leica TCS SP2 AOBS Spectral confocal microscope system (Leica Microsystems, Mannheim, Germany). The tunable acousto-optical beam splitter (AOBS) provides selection and examination of any portion of the visible and near-IR emission wavelengths set for a given dye or chosen for unique research applications; it allows for spectroscopy at length scales from tissue to cellular to subcellular. The microscope is configured with software for fluorescence recovery after photobleaching (FRAP), which provide diffusion rates of fluorescence-marked macromolecules. The upright design of the microscope allows not only examination of slides and cell cultures, but also thicker, opaque objects. The removable stage allows use of large objects, with the confocal scanning feature still functional, because it is built into the motorized nosepiece and not into a motorized stage as in other confocal microscopes. For example, the system allows for live animal and/or cell imaging concomitant fluorescent spectroscopy, patch clamping, fluorescence recovery after photobleaching (FRAP), tracking of molecular transport (e.g., drug delivery), and digital video documentation. In order to assist in preparation of specimens for imaging, a state of the art histology core lab (part of CISCTI) is set up to carry out fixation, embedding, and sectioning of soft and hard tissues. Through an Ohio Board of Regents BRTT grant (Clinical Tissue Engineering Center, CTEC), the CISCTI has recently acquired a stereolithography rapid prototyping system (3D Systems Viper si2).

Center for Layered Polymeric Systems (CLiPS) (http://www.stc-clips.org)

NSF Science and Technology Center
420 Kent Hale Smith Building (7202)
Phone: 216.368.4203 Fax: 216.368.6329 Eric Baer, Director
eric.baer@case.edu

Exploration of multilayered polymeric systems at the micro- and nanolayer levels reveals unique properties and capabilities that are different, and often not predicted, from systems involving the same materials on a larger scale. Technology refined within CLiPS allows the production of films and membranes composed of hundreds or thousands of layers. These extremely thin layers promote interactions approaching the molecular level between the materials used in the process.

CLiPS research activities are organized into four platforms to exploit the microlayer and nanolayer structures: (1) Rheology and New Processing focuses on integrating rheology into the multilayering process, and will explore combinations of rheologically dissimilar materials to create new polymer-based structures; (2) advanced Membranes and Transport Phenomena that exploit the layered hierarchy to achieve unique transport properties; (3) novel Optic and Electronic Systems based on the advanced layered materials, and (4) new Science and Technology Initiatives that probe a fundamental understanding and explore new opportunities for the layered structures.

CLiPS was established in 2006 with funding by the National Science Foundation as a Science and Technology Center. It is the first NSF STC ever to be established at Case Western Reserve University. CLiPS is a national center involving close partnership with the University of Texas, Fisk University, the University of Southern Mississippi, and the Naval Research Laboratory, and an important educational partnership with the Cleveland Metropolitan School District.

CLiPS researchers and educators work together to accomplish the Center’s mission of advancing the nation’s science and technology agenda through development of new materials and materials systems and for educating a diverse American workforce through interdisciplinary education programs.

Center for Mechanical Characterization of Materials (http://dmseg5.case.edu/Groups/Lewandowski/facilities.html)

White Building (7205)
Phone: 216.368.4234
John J. Lewandowski, Director
john.lewandowski@case.edu

The Center for Mechanical Characterization of Materials (CMCM) was established in 1987 to provide mechanical characterization (e.g., mechanical testing, deformation processing, etc.) expertise to the CWRU campus, medical, industrial, legal, outside university, and government laboratory communities. The Center, housed in the Charles M. White Metallurgy building, currently maintains equipment valued in excess of $4.5M and has been accessed by the local, national, and international communities. The CWRU campus community can access the facility via the use of a valid CWRU university account number that will be charged at an internal rate for machine time, including set up and any technician time involved. Long term testing can be provided at pro-rated charges in consultation with the Center Directors. Arrangements can be made...
to train users on the equipment and reserve time for equipment use by contacting the Center Co-director. Outside (i.e. non-CWRU) users can access the facility via a number of different mechanisms by contacting the Center Director.

In general, the Center is capable of mechanically evaluating and deformation processing materials that range in size scale from the micrometer range up through bulk quantities. This unique facility enables mechanical characterization at loading rates as low as one micrometer/hour (i.e. rate of fingernail growth!) up through impact (e.g. 3-4 meters/sec) at temperatures ranging from -196°C (i.e. liquid nitrogen) up to 1400°C. Hot microhardness testing up to 1000°C is available. Monotonic as well as cyclic fatigue testing is possible in addition to evaluations of mechanical behavior and processing with superimposed pressures up to 2 GPa. Novel high-rate and multiple-deformation sequence forging simulations are possible with the use of a multi-actuator forging simulator, in addition to sheet metal forming experimentation with independent control of forming rate and blank hold down force. Hot extrusion is also possible at temperatures up to 900°C on 0.5” diameter billets. Materials systems that have been investigated span the range of organic and inorganic materials, including metals, ceramics, polymers, composites, electronic materials, and biomedical materials systems. Descriptions of specific equipment and capabilities are provided with the website link.

Center for Modeling Integrated Metabolic Systems (MIMS) (http://casemed.case.edu/mims)

410 Wickenden (7207)

http://casemed.case.edu/mims Phone: 216.368.4066 Fax: 216.368.4969
Gerald M. Saidel, Director
gerald.saidel@case.edu

The primary aim of the MIMS Center is to develop mechanistic, mathematical models to simulate cellular metabolism in various tissues and organs (i.e., skeletal muscle, heart, brain, and adipose tissue) and to integrate these components in whole-body models. These biologically and physiologically based computational models incorporate cellular metabolic reactions and transport processes of a large number of chemical species. Model parameters quantitatively characterize metabolic pathways and regulatory mechanisms under normal and abnormal conditions including obesity and hypoxia as well as in disease states including type-2 diabetes, cystic fibrosis, and chronic kidney disease. The large-scale, complex mathematical models are solved numerically using sophisticated computational algorithms to simulate and analyze experimental responses to physiological and metabolic changes. Model parameters are optimally estimated by minimizing differences between model simulated outputs and experimental data using large-scale, nonlinear optimization algorithms. Experimentally validated models are used to predict the effects of altering metabolic processes with disease states, pharmacological agents, diet, and physical training.

Cleveland Functional Electrical Stimulation Center (http://fescenter.org)

11000 Cedar Avenue, Suite 230
www.FEScenter.org (http://bulletin.case.edu/schoolofengineering/http://www.FEScenter.org) Phone: 216.231.3257 Fax: 216.231.3258
Robert J. Kirsch, Director
info@FEScenter.org (http://bulletin.case.edu/schoolofengineering/emailto://info@FEScenter.org)

Functional electrical stimulation (FES) is the application of electrical currents to either generate or suppress activity in the nervous system. FES can produce and control the movement of otherwise paralyzed limbs, for standing and hand grasp; activate visceral bodily functions, such as micturition; create perceptions such as skin sensibility; arrest undesired activity, such as pain or spasm; and facilitate natural recovery and accelerate motor relearning. FES is particularly powerful and clinically relevant, since many people with neurological disabilities retain the capacity for neural conduction, and are thus amenable to this intervention.

The Center focuses its activities in four major areas:

- Fundamental studies to discover new knowledge
- Enabling technologies for clinical application or the discovery of knowledge
- Clinical research that applies this knowledge and technology to individuals with neurological dysfunction
- Transfer of knowledge and technology to the clinical community and to industry.

The FES Center was established as a VA RR&D Center of Excellence in 1991 and is based at the Louis Stokes Cleveland VAMC (CVAMC). The Center is a consortium with three institutional partners: CVAMC, Case Western Reserve University (CWRU), and the MetroHealth Medical Center (MHMC). The Center accomplishes its mission by integrating and facilitating the efforts of scientists, engineers, and clinicians through common goals and directions in the major clinical areas, and by providing mechanisms to accomplish these goals across the institutional partners.

Electronics Design Center (EDC) (http://engineering.case.edu/edc)

112 Bingham (7200)

Phone: 216.368.2935 Fax: 216.368.8738
Chung-Chiu Liu, Director
chung-chiu.liu@case.edu

The Electronics Design Center (EDC) is a multi-disciplinary educational and research center focusing on the applications of microfabrication processing to the advancement of chemical and biological micro-systems specializing in application-oriented electrochemical based biosensors. The Center has complete thick film and thin film processing facilities, including screen printing, ink jet printing and sputtering equipment. Other facilities supporting the microfabrication processing are also readily available. The EDC is a resource for industrial and academic researchers, offering access to equipment, laboratories and trained staff.

Great Lakes Energy Institute (GLEI) (http://energy.case.edu)

305 Olin Building (7074)
energy.case.edu
Phone: 216.368.0748
Dianne Anderson, Executive Director
dianne.anderson@case.edu

The Great Lakes Energy Institute at CWRU connects faculty across the university to transition breakthrough research into worldwide impact. Since 2008, GLEI has helped catalyze a four-fold increase in energy research, won awards from many major federal (NSF, DOE, ARPA-E) and state (Ohio Third Frontier) awarders, attracted nearly $10 million in gifts, worked with over 90 different industry partners, and encouraged multidisciplinary proposals from throughout the university. At the heart of these proposals and effort are over 75 engaged faculty, hailing from engineering, arts & sciences, business, and law. And while GLEI’s work supports all types of energy, focus lies in four priority areas:
Grid - CWRU’s energy program is underpinned by research and power systems. Strengths in controls, sensors, and electronics provide a core for smart grid connectivity of energy and storage.

Wind Energy - Wind energy emphasizes offshore deployment and is founded on controls, power management, and grid interface expertise. Much of this work is supported by DOE awards and the State of Ohio.

Solar - Research in next generation photovoltaics (PV) focuses on organics and lifetime and degradation science, stemming from a strong reputation in materials, research, and development.

Storage - Storage research builds on historical strengths in elecrochemistry. Recent research awards include ARPA-E and DOE.

The role of CWRU in energy also touches economic development and education. Through research and investment, university spin-outs are poised to contribute to a new energy economy while working toward a clean and sustainable future. Students undertake key roles in the research and commercialization of the energy technologies underpinning this transition.

Institute for Advanced Materials (http://case.edu/advancedmaterials)

519 Kent Hale Smith Building
Phone 216.368.4242
Stuart Rowan, Director
stuart.rowan@case.edu

The Institute for Advanced Materials is a clearinghouse for Case Western Reserve’s materials research and provides access to the university’s world-class expertise and state-of-the-art facilities. One of Ohio’s Centers of Excellence in Enabling Technologies: Advanced Materials and Sensors, the institute matches industry and governmental partners with campus-based collaborators to explore solutions to real world problems.

Advanced materials—polymers, metals, ceramics, composites, and biomaterials—are cornerstones to many emerging technologies like biocompatible medical implants, energy storage, and environmentally sustainable consumer products. Recognizing that, in Ohio, approximately ten percent of the state’s high tech workforce is engaged in advanced materials and related area industries, the Institute for Advanced Materials at Case Western Reserve aims to leverage and enhance Ohio’s industrial base and manufacturing capabilities, impact the global materials community, educate future materials leaders, and serve as a single, unified resource for advanced materials research.

Approximately 100 faculty, including several members of the National Academies, spanning four schools—Engineering, Arts & Sciences, Medicine and Dental Medicine—work with industrial partners and institutional collaborators to generate $38 million of annual materials research income with support from the National Institute of Health, the National Science Foundation, the US Department of Energy and the Department of Defense among others.

By harnessing the breadth of Case’s research base and creating new collaborative teams, the Institute for Advanced Materials drives the integration of new materials innovations from initial ideas to marketable technologies in energy, sustainability and human health.
Dominique Durand, Director
dominique.durand@case.edu

The research mission of the center is to bring to bear combined tools in physics, mathematics, chemistry, engineering and neuroscience to analyze the mechanisms underlying neuronal function and to solve the clinical problems associated with neuronal dysfunction. Research areas include: Neuromodulation, Neuroprostheses, Quantitative Neurophysiology, Neural Dynamics, Neuro-Mechanical Systems, Neural Regeneration, Neural Interfacing, Neural Imaging and Molecular Sensing, Neuro-Magnetism, and Systems Neuroscience. The education mission of the center is to provide engineers and scientists with an integrated knowledge of engineering and neuroscience capable of solving problems in neuroscience ranging from the molecules to the clinic. The center is also an outlet for technology transfer of new ideas to be commercialized by industrial partners. The center’s goals are accomplished by fostering interdisciplinary research between clinicians, scientists, students and local industry, educational experiences including didactic material, laboratory experience and clinical exposure, and close ties to industrial partners.

Nitinol Commercialization Accelerator (http://dmseg5.case.edu/groups/Lewandowski)
White Building (7205)
Phone: 216.368.4234
John J. Lewandowski, Director
john.lewandowski@case.edu
James D. McGuffin-Cawley, Co-Director
David Schwam, Co-Director

The Ohio Third Frontier Wright Projects Program has funded the Nitinol Commercialization Accelerator (NCA), a collaborative effort between the Cleveland Clinic, CWRU, University of Toledo, NASA Glenn Research Center, and Norman Noble, Inc. in order to develop a better understanding of the metallurgical processing and mechanical characterization of nitinol for use in biomedical and aerospace applications. Biomedical applications range from orthodontia to implantable devices while higher temperature shape memory alloys are of interest for aerospace. The collaboration is designed to create synergy amongst collaborators in the research and development of nitinol products.

The laboratory housed at CWRU’s Material Science and Engineering Department contains processing and characterization (thermal and mechanical) equipment that allows for the manufacture and analysis of nitinol products. Processing equipment includes a vacuum arc casting unit, vacuum heat treatment system, and hot extrusion capabilities. Thermal characterization equipment includes a high temperature Differential Scanning Calorimeter (DSC) while mechanical characterization equipment for testing wire/foil includes a number of flex bending fatigue machines, rotary bending fatigue machines, and tabletop tension testing machines.

The Cleveland Clinic and NASA Glenn Research Center also house equipment associated with the NCA program including: Radiance-Rofin Femtosecond Laser, Techne FB-08 Precision Calibration Bath, MTS Cryo-chamber and Grips, and an Aramis/Optotrak Certus 3D Strain Mapping system.

Solar-Durability and Lifetime Extension (S-DLE) Center (http://csegroups.case.edu/sdle/home)
Labs: White Building, 5th Floor / Sun Farm: CWRU West Quad

The research mission of the center is to bring to bear combined tools in physics, mathematics, chemistry, engineering and neuroscience to analyze the mechanisms underlying neuronal function and to solve the clinical problems associated with neuronal dysfunction. Roger H. French, Director
roger.french@case.edu
Paul Stinson, Program Manager
paul.stinson@case.edu
Daniel Dryden, Research Engineer
daniel.dryden@case.edu

The S-DLE Center was established in 2011 with funding from Ohio Third Frontier, and is dedicated to advancing the field of lifetime and degradation science. Activities in the Center focus on durability and degradation of environmentally exposed, long lived materials and technologies such as photovoltaics (PV), energy efficient lighting, and building envelope applications. The Center develops real-time and accelerated protocols for exposure to solar radiation and related environmental stressors to enable the evaluation of the environmental durability and lifetime of materials, components, and products. Researchers perform post-exposure optical and thermo-mechanical measurements to develop quantitative mechanistic models of degradation processes. The S-DLE Center’s capabilities and equipment include:

- Outdoor solar exposures: SunFarm with 14 dual-axis solar trackers with multi-sun concentrators, and power degradation monitoring
- Solar simulators for 1-1000X solar exposures
- Multi-factor environmental test chambers with temperature, humidity, freeze/thaw, and cycling
- A full suite of optical, interfacial, thermo-mechanical and electrical evaluation tools for materials, components and systems

Swagelok Center for Surface Analysis of Materials (SCSAM) (http://dmseg5.case.edu/groups/ernst/scsam.html)

110 Glennan Building
A. H. Heuer, Director
arthur.heuer@case.edu

The Swagelok Center for Surface Analysis of Materials (SCSAM) is a multi-user analytical facility providing instrumentation for microstructural characterization and surface and near-surface chemical analysis. The Center’s 16 major instruments encompass a wide range of characterization tools, which provide a comprehensive resource for academic researchers who can tailor the analyses to their specific needs.

Current capabilities include four (4) Scanning Electron Microscopes (SEMs) which are equipped for Focused Ion Beam (FIB) micromachining and XEDS, WDS, and EBSP detectors, two (2) Transmission Electron Microscopes (TEMs) equipped with XEDS and EELS detectors, an Atomic Force Microscope (AFM), a UHV Scanning Probe system, a Laser Scanning Confocal Optical Microscope dedicated for materials studies, including Raman microscopy, an automated Nanoindefter, an Ion Beam Accelerator for Rutherford Backscattering (RBS) and PIXE and PIGE, two (2) X-ray diffraction (XRD) systems, along with surface-specific tools for Time-of-Flight, Secondary Ion Mass Spectrometry (ToF-SIMS), Auger
Electron Spectrometry, and X-Ray Photoelectron Spectroscopy (XPS), also known as Electron Spectrometry for Chemical Analysis (ESCA).

SCSAM is administratively housed in the Case School of Engineering (CSE) and is central to much of the research carried out by the seven departments within CSE. However, the facility is extensively used by the Physics, Chemistry, Biology and Earth, Environmental, and Planetary Sciences departments within the College of Arts and Sciences, and by many departments within the Schools of Medicine and Dental Medicine. In addition to CWRU clients, many external institutions utilize SCSAM’s facilities, including NASA Glenn Research Center, the Cleveland Clinic, and numerous Ohio universities. More than 300 users utilize the facility in any given year.

SCSAM’s instruments are housed in a centralized area, allowing users convenient access to state-of-the-art solutions for their analytical needs.

**ThinkTank for Multiscale Computational Modeling of Bio-medical and Bio-inspired Systems** ([https://bme.case.edu/Welcome/SpecialPrograms/SpecialMECHBIO/MechBioThinkTank](https://bme.case.edu/Welcome/SpecialPrograms/SpecialMECHBIO/MechBioThinkTank))

Department of Mechanical & Aerospace Engineering

Phone: 216.368.5884 Fax: 216.368.4969
Melissa Knothe Tate, Director
melissa.tate@case.edu

Typically, computational modelers share common approaches to diverse research and development problems. By providing a common space and infrastructure (software licenses and hardware) for computational modelers to work, we hope to promote exchange of modeling experience and expertise and to promote cross-departmental as well as cross institutional collaborations. The ThinkTank provides a home for several international computational collaborations as well.

**Wind Energy Research and Commercialization (WERC) Center** ([http://energy.case.edu/Ohio-WERC](http://energy.case.edu/Ohio-WERC))

307 Olin Building
Great Lakes Energy Institute
Phone: 216.368.1366, Fax: 216.368.3209
David H. Matthiesen, Director
david.matthiesen@case.edu

The WERC Center is a multidisciplinary center for use by students, faculty, and industry providing instrumentation for wind resource characterization and research platforms in operating wind turbines. The WERC Center was established in 2010 with funding from the Ohio Department of Development Third Frontier Wright Project and the Department of Energy. Additional support was provided by the following inaugural industrial partners: Cleveland Electric Laboratories, The Lubrizol Corporation, Parker Hannifin Corporation, Azure Energy LLC., Rockwell Automation, Inc., Swiger Coil Systems LLC., and Wm. Sopko & Sons Co.

The instruments in the WERC Center include:

- A continuous scan ZephIR LiDAR, manufactured by Natural Power. This instrument measures horizontal and vertical wind velocity along with wind direction at 1 Hz frequency at five user set heights up to 200 m.
- Five meteorological measurement systems: 3 on campus; 1 with the off-campus wind turbines; and one at the City of Cleveland’s water intake crib located 3.5 miles offshore in Lake Erie.
- An ice thickness sensor that is deployed at the bottom of Lake Erie each fall and retrieved in the spring.
- A NorthWind 100 wind turbine manufactured by Northern Power Systems in Barre, Vermont, USA. This 100kW community scale wind turbine has a direct drive generator with full power inverters, stall control blades with a 21 m rotor diameter, and a 37 m hub height. This wind turbine is located on campus just east of Van Horn field and began operation in November, 2010.
- A Vestas V-27 wind turbine originally manufactured by Vestas in Denmark. This 225kW medium scale wind turbine has a gearbox drive generator, pitch controlled blades with a 27 m rotor diameter, and a 30 m hub height. In addition it has a 50kW generator for low wind generation. This wind turbine will be located at an industrial site in Euclid, OH about 15 minutes from campus and is scheduled to begin operation in August, 2011.
- A Nordex N-54 wind turbine originally manufactured by Nordex in Germany. This 1.0MW utility scale wind turbine has a gearbox drive generator, stall control blades with a 54 m rotor diameter, and a 70 m hub height. In addition it has a 200kW generator for low wind generation. This wind turbine will be located at an industrial site in Euclid, OH about 15 minutes from campus and is scheduled to begin operation in August, 2011.

**Administration**

Jeffrey L. Duerk, PhD
(Case Western Reserve University)
Dean of the Case School of Engineering and Nord Professor of Engineering

Marc R. Buchner, PhD
(Michigan State University)
Faculty Director of Program Evaluation and Assessment

Laura Bulgarelli, MS
(Georgia Institute of Technology)
Associate Dean of Finance and Administration

Lisa Camp
(Baldwin Wallace College)
Assistant Dean of Strategic Initiatives

Patrick E. Crago, PhD
(Case Western Reserve University)
Associate Dean of Engineering

Daniel Ducoff
(University of California, Berkeley)
Associate Dean of Development and External Affairs

Deborah J. Fatica, MA
(Bowling Green State University)
Assistant Dean of the Division of Education and Student Programs

Kenneth A. Loparo, PhD
(Case Western Reserve University)
Faculty Director of Continuing Education and Nord Professor of Engineering

Ica Manas-Zloczower, DSc
(Technion-Israel Institute of Technology)
Associate Dean of Faculty Development
Clare M. Rimnac, PhD
(Lehigh University)
Associate Dean of Research and Wilbert J. Austin Professor of Engineering
Degree Program in Engineering, Undesignated

Engineering (Undesignated)
The Case School of Engineering offers undesignated degrees at the Undergraduate and Graduate level.

Bachelor of Science in Engineering (Undesignated)
The Engineering (Undesignated) program prepares students who seek a technological background but do not wish to pursue pure engineering careers. For example, some needs in the public sector, such as pollution remediation, transportation, low-cost housing, elective medical care, and crime control could benefit from engineering expertise. To prepare for careers in fields that address such problems, the Engineering (Undesignated) program allows students to acquire some engineering background, and combine it with a minor in such programs as management, history of technology and science, or economics. This is not an ABET accredited program.

A student electing an undesignated degree must submit a clear statement of career goals supported by a proposed course schedule with written justification for the selections. These documents are to be submitted to the office of the associate dean in the Case School of Engineering. The program must be approved by the dean in the Case School of Engineering or designate in consultation with representatives of the major and minor departments. A total of at least 129 semester credits are required for graduation.

Since each student’s program is unique, no typical curriculum can be shown. Every program must fulfill the requirements described below.

1. Engineering Core
2. A minimum of two engineering electives courses selected from two of the following four groups:

**Thermodynamics or Physical Chemistry**
- EMAC 351 Physical Chemistry for Engineers (CHEM 111) 6
- & EMAC 370 and Polymer Chemistry and Industry
- CHEM 301 Introductory Physical Chemistry I 6
- & CHEM 302 and Introductory Physical Chemistry II
- ECHE 363 Thermodynamics of Chemical Systems 3

**Signals, systems or control**
- EECS 304 Control Engineering I with Laboratory 3
- ECHE 367 Process Control 4
- EECS 246 Signals and Systems 4
- or EBME 308 Biomedical Signals and Systems

**Materials science**
- EMSE 201 Introduction to Materials Science and Engineering 3
- EMAC 270 Introduction to Polymer Science and Engineering 3
- EMSE 314 Electrical, Magnetic, and Optical Properties of Materials 3
- EBME 306 Introduction to Biomedical Materials 3
- EECS 321 Semiconductor Electronic Devices 4

**Economics, production systems or decision theory**
- EECS 350 Operations and Systems Design 3
- EECS 352 Engineering Economics and Decision Analysis 3
- OPRE 345 Decision Theory 3

**Major**
The major must contain a minimum of 24 semester credit hours of work in one of the following engineering fields:
- Biomedical Engineering
- Chemical Engineering
- Civil Engineering
- Computer Engineering
- Electrical Engineering
- Engineering Physics
- Materials Science and Engineering
- Polymer Science and Engineering
- Systems and Control Engineering

This work includes a senior projects laboratory (3 credits) and usually a course with a physical measurements laboratory.

**Minor**
The minor program requires a minimum of 15 semester credit hours. Minors are available with approval of the Office of Undergraduate Studies. Minors should be developed with the help of the associate dean in the Case School of Engineering. Minors must be approved by the department offering the minor. Final approval of the minor resides with the Office of Undergraduate Studies.

**Total Units in Sequence:** 125-127

**Hours required for graduation:** 129

_a_ One of these courses must be a humanities/social science course.

**Master of Science in Engineering (Undesignated)**

A student working toward an undesignated Master of Science degree in engineering must select a department. The student is responsible for submitting a Planned Program of Study via the Student Information System where it will be routed for appropriate approvals. The Planned Program of Study must contain a minimum of 9 semester hours of course work in the department approving the program. A minimum of 18 semester hours of course work for the degree must be at the 400 level or higher. The student must meet all the requirements of the designated Master of Science degree in engineering.
Department of Biomedical Engineering

The Department of Biomedical Engineering was established in 1968 at Case Western Reserve University. As one of the pioneer programs in the world, it has become a strong and well-established program in research and education with many unique features. It was founded on the premise that engineering principles provide an important basis for innovative and unique solutions to biomedical problems. This philosophy has been the guide for the successful development of the program, which has been emulated by many other institutions. Quantitative engineering and analytic methods for biomedical applications remains the cornerstone of the program and distinguishes it from biomedical science programs. In addition to dealing with biomedical problems at the tissue and organ-system level, the department’s educational programs have a growing emphasis on cellular and subcellular mechanisms for understanding of fundamental processes, as well as for systems approaches to solving clinical problems.

Current degree programs include the BS, MS, ME, combined BS/MS, PhD, MD/MS, and MD/PhD in biomedical engineering. In all of the BME programs at Case, the goal is to educate engineers who can apply engineering methods to problems involving living systems. The Case School of Engineering and the School of Medicine are in close proximity on the same campus. The Biomedical Engineering faculty members carry joint appointments in the two schools and participate in the teaching, research, and decision-making committees of both. The department is close to several major medical centers (University Hospitals, Cleveland Clinic, VA Medical Center, and MetroHealth Medical Center). As a result, there is an unusually free flow of academic exchange and collaboration in research and education among the schools and institutions. All of Case Western Reserve’s BME programs take full advantage of faculty cooperation among university departments, which adds significant strength to the programs.

Mission

To educate leaders who will integrate both principles of engineering and medicine to create knowledge and discoveries that advance human health and well-being. Our faculty and students play leading roles ranging from basic science discovery to the creation, clinical evolution, and commercialization of new technologies, devices, and therapies. In short, we are “Engineering Better Health.”

Background

Graduates in biomedical engineering are employed in industry, hospitals, research centers, government, and universities. Biomedical engineers also use their undergraduate training as a basis for careers in business, medicine, law, and other professions.

Research

Several research thrusts are available to accommodate various student backgrounds and interests. Strong research collaborations with clinical and basic science departments of the university and collaborating medical centers bring a broad range of opportunities, expertise, and perspective to student research projects.

Biomaterials/Tissue Engineering/Drug and Gene Delivery

Fabrication and analysis of materials for implantation, including neural, orthopaedic, and cardiovascular tissue engineering, biomimetic materials, liposomal and other structures for controlled, targeted drug delivery, and biocompatible polymer surface modifications. Analysis of synthetic and biologic polymers by AFM, nanoscale structure-function relationships of biomaterials. Applications in the nervous system, the cardiovascular system, the musculoskeletal system, and cancer.

Biomedical Imaging

MRI, PET, SPECT, CT, ultrasound, acoustic elastography, optical coherence tomography, cardiac electrical potential mapping, human visual perception, image-guided intervention, contrast agents. In vivo microscopic and molecular imaging, and small animal imaging.

Biomedical Sensing

Optical sensing, electrochemical and chemical fiber-optic sensors, chemical measurements in cells and tissues, endoscopy.

Neural Engineering and Neural Prostheses

Neuronal mechanisms; neural interfacing for electric and magnetic stimulation and recording; neural dynamics, ion channels, second messengers; neural prostheses for control of limb movement, bladder, bowel, and respiratory function; computational modeling of neural structures.

Transport and Metabolic Systems Engineering

Modeling and analysis of tissue responses to heating (e.g., tumor ablation) and of cellular metabolism related to organ and whole-body function in health (exercise) and disease (cardiac).

Biomechanical Systems

Computational musculoskeletal modeling, bone biomechanics, soft tissue mechanics, control of neuroprostheses for motor function, neuromuscular control systems, human locomotion, cardiac mechanics.

Cardiovascular Systems

Normal cardiac physiology, pathogenesis of cardiac diseases, therapeutic technologies; electrophysiological techniques, imaging technologies, mathematical modeling, gene regulation, molecular biology techniques; cardiac bioelectricity and cardiac biomechanics.

Major I Specialty Electives I BS/MS I Minor

Undergraduate Programs

The Case Western Reserve undergraduate program leading to the Bachelor of Science degree with a major in biomedical engineering was established in 1972. The Bachelor of Science degree program in Biomedical Engineering is accredited by the Engineering Accreditation Commission of ABET, www.abet.org (http://www.abet.org).

Some BS graduates are employed in industry and medical centers. Others continue studies in biomedical engineering and other fields. Students with engineering ability and an interest in medicine may consider the undergraduate biomedical engineering program as an exciting alternative to conventional premedical programs. The undergraduate program has three major components: (1) Engineering Core, (2) BME Core, and (3) BME Track Courses. The Engineering Core provides a fundamental background in mathematics, sciences, and engineering. The BME Core integrates engineering with biomedical science to solve biomedical problems. Hands-on experience in BME is developed through undergraduate laboratory and project courses. In addition, by choosing BME Track Courses, the student can study a specific area in depth. This integrated program is designed to ensure
that BME graduates are competent engineers. Students may select open electives for educational breadth or depth or to meet entrance requirements of medical school or other professional career choices. BME faculty serve as student advisors to guide students in choosing the program of study most appropriate for individual needs and interests.

Educational Objectives
At the undergraduate level, we direct our efforts toward two educational objectives that describe the performance of alumni 3-6 years after graduation.

1. Our graduates will successfully enter and complete post-baccalaureate advanced degree programs, including those in biomedical engineering.
2. Our graduates will obtain jobs in the biomedical arena and advance to positions of greater responsibility.

Student Outcomes
As preparation for achieving the above educational objectives, the BS degree program in Biomedical Engineering is designed so that students attain:

- An ability to apply knowledge of mathematics, science, and engineering appropriate to the biomedical engineering
- An ability to design and conduct experiments, as well as to analyze and interpret data
- An ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability
- An ability to function on multi-disciplinary teams
- An ability to identify, formulate, and solve engineering problems
- An understanding of professional and ethical responsibility
- An ability to communicate effectively
- The ability to communicate the impact of engineering solutions in a global, economic, environmental, and societal context
- A recognition of the need for, and an ability to engage in life-long learning
- A knowledge of contemporary issues
- An ability to use the techniques, skills, and modern engineering tools necessary for engineering practice

Biomedical Engineering Specialty Electives
BME Courses for these tracks are presented in the tables below; more information can be obtained from the Department of Biomedical Engineering (http://bulletin.case.edu/schoolofengineering/biomedicalengineering) or directly from the Biomedical Engineering Laboratory. These tracks provide the student with a solid background in a well-defined area of biomedical engineering. To meet specific educational needs, students may choose alternatives from among the suggested electives or design unique specialties subject to departmental guidelines and faculty approval.

Biomechanics Track

EMAE 181  Dynamics  3
ECIV 310  Strength of Materials  3
EMAE 290  Computer-Aided Manufacturing  3

Biomaterials Track

EBME 327  Bioelectric Engineering  3
EBME 320  Medical Imaging Fundamentals  3
EBME 398  Senior Project Laboratory I  3

*To receive a minor in EECS, two (2) of the Tech Electives must be from EECS

Biomedical Computing and Analysis Track

EECS 302  Discrete Mathematics  3
EECS 233  Introduction to Data Structures  4
MATH 201  Introduction to Linear Algebra  3
EECS 324  Simulation Techniques in Engineering  3
EECS 105  Introduction to Biomedical Engineering (or Open Elective)  3

To receive a minor in Systems Engineering, students must choose EECS 304, EECS 346, and EECS 352 for tech. electives and either EECS 350 of EECS 391 for an open tech. elective.

EECS 304  Control Engineering I with Laboratory  3
EECS 346  Engineering Optimization  3
EECS 300  Dynamics of Biological Systems: A Quantitative Introduction to Biology  3
EECS 350  Operations and Systems Design  3
EECS 352  Engineering Economics and Decision Analysis  3
EECS 359  Bioinformatics in Practice  3
EECS 391  Introduction to Artificial Intelligence  3
EECS 398  Senior Project Laboratory I  3

To receive a minor in Computer Science, students must choose EECS 338 and EECS 340 for two of the tech. electives.

EECS 281  Logic Design and Computer Organization  3
EECS 293  Software Craftsmanship  3
EECS 313  Signal Processing  3
EECS 338  Introduction to Operating Systems  3
EECS 340  Algorithms and Data Structures  3
EECS 341  Introduction to Database Systems  3
EECS 343  Theoretical Computer Science  3

Case Western Reserve University  25
Co-op and Internship Programs

Opportunities are available for students to alternate studies and work in industry as a co-op student, which is integrated in a five-year program. Alternatively, students may obtain employment as summer interns.

Total Units in Sequence: 133

a  This is a typical program. Track courses are designed with courses in a desired order that might vary from the one here. Programs must be planned with a faculty advisor in the Department of Biomedical Engineering.
b  This optional course is limited to freshmen. This can be replaced by an open elective.
c  University Seminars (6 semester hours, minimum of 2 seminars selected from different thematic groups and different thematic group from that of FSCC 100 First Seminar).
d  Courses are chosen depending on the BME track courses as listed below.
e  Students take at least one math or science course approved by BME department.
f  SAGES BME Departmental Seminar, ENGL 398 Professional Communication for Engineers and ENGR 398 Professional Communication for Engineers must be taken together.
g  STAT 312 Basic Statistics for Engineering and Science, STAT 333 Uncertainty in Engineering and Science, or STAT 332 Statistics for Signal Processing fulfill the statistics requirement. Check with sequence advisor to determine the most appropriate class.
h  Students interested in Biomedical Computing and Analysis are required to take EECS 132.
i  Humanities/Social Science course
BS/MS Program

Undergraduates with a strong academic record may apply in their junior year for admission to the integrated BS/MS program. A senior research project that begins in the summer after the junior year is designed to expand into an MS thesis. Also, the student begins to take graduate courses in the senior year. With continuous progress in research during three summers and the academic years, this program can lead to both the BS and MS in five years.

Minor in Biomedical Engineering

A minor in biomedical engineering is offered to students who have taken the Engineering Core requirements. The minor consists of an approved set of five EBME courses.

Total Units 15

Graduate Programs

The objective of the graduate program in biomedical engineering is to educate biomedical engineers for careers in industry, academia, health care, and government and to advance research in biomedical engineering. The department provides a learning environment that encourages students to apply biomedical engineering methods to advance basic scientific discovery; integrate knowledge across the spectrum from basic cellular and molecular biology through tissue, organ, and whole-body physiology and pathophysiology; and to exploit this knowledge to design diagnostic and therapeutic technologies that improve human health. The unique and rich medical, science, and engineering environment at Case enables research projects ranging from basic science through engineering design and clinical application.

Numerous fellowships and research assistantships are available to support graduate students in their studies.

Graduate Certificate

A Graduate Certificate in Wireless Health is a new offering in the Department of Biomedical Engineering. For more details, please refer to the Wireless Health (http://engineering.case.edu/wireless_health) information on the Case School of Engineering website.

Master of Engineering

The MS program in biomedical engineering provides breadth in biomedical engineering and biomedical sciences with depth in an engineering specialty. In addition, students are expected to develop the ability to work independently on a biomedical research or design project. The MS requires a minimum of 27 credit hours. With an MS research thesis (Plan A), a minimum of 18 credits hours is needed in regular course work and 9 hours of thesis research (EBME 651 Thesis M.S.).

With an MS project (Plan B), a minimum of 24 credits hours is needed in regular course work, and three hours of project research (EBME 601 Research Projects); or this can be accomplished in 27 credit hours of coursework with a comprehensive final exam for the degree.

Master of Engineering and Management - Biomedical Entrepreneurship

Biomedical engineering students may apply for the Biomedical Entrepreneurship concentration in the Master of Engineering (MEM) program. The MEM is a degree offered by The Institute for Management and Engineering (TIME), a joint program between the Case School of Engineering and the Weatherhead School of Management. The objective of this program is to provide biomedical engineers with the business and management context required to enable them to drive innovation within biomedical companies while serving in a technical capacity.

Students can enter the program as undergraduates. The program does not interfere with undergraduate degree requirements. The curriculum includes courses integrating engineering and management, as well as industrial internships. By making use of summers for both course work and internships, the MEM degree is completed in one additional year beyond the BS, i.e., for a total of five years for the BS and MEM degrees. Students should apply through TIME.

MD/MS Program

Medicine is undergoing a transformation based on the rapid advances in science and technology that are combining to produce more accurate diagnoses, more effective treatments with fewer side effects, and improved ability to prevent disease. The goal of the MD/MS in Engineering is to prepare medical graduates to be leaders in the development and clinical deployment of this technology and to partner with others in technology based translational research teams. Current Case medical students in either the University Program (UP) or the Cleveland Clinic Lerner College of Medicine (CCLCM) may apply to the MD/MS in Engineering program.

Students must complete the normal requirements in their particular MD program. Portions of the medical school curriculum earn graded credit toward the MD/MS degree. Specifically, six credit hours of the medical school curriculum can be applied to the MS component of the joint degree.

The balance of 12 credit hours (4 courses) must be graduate level engineering concentration courses that provide rigor and depth in a field of engineering relevant to the area of research.

A required thesis (9 credit hours of EBME 651 Thesis M.S.) serves a key integration role for the joint degree, with both medical and engineering components. The thesis also fulfills the research requirement of the UP or CCLCM programs.

Students should apply through the BME department admissions office.

PhD Program in Biomedical Engineering

For those students with primary interest in research, the PhD in biomedical engineering provides additional depth and breadth in engineering and the biomedical sciences. Under faculty guidance, students are expected to undertake original research motivated by a biomedical problem. Research possibilities include the development of new theory, devices, or methods for diagnostic or therapeutic applications, as well as for measurement and evaluation of basic biological mechanisms.

The PhD program requires a minimum of 36 credit hours of courses beyond the BS degree. There are 12 credit hours of required core
the clinical needs of veterans and others with motor and sensory deficits and limb loss.

The Coulter-Case Translation and Innovation Partnership (CCTRP) is a department-based collaboration with the Wallace H. Coulter Foundation. The program fosters collaborations between clinicians and the Case Western Reserve University biomedical engineering faculty on translational research projects with the potential to impact patient care often through the creation of new biomedical products and new product concepts.

The department faculty and students have access to the facilities and major laboratories of the Case School of Engineering and School of Medicine. Faculty have numerous collaborations at University Hospitals, MetroHealth Medical Center, Louis Stokes Cleveland VA Medical Center, and the Cleveland Clinic. These provide extensive research resources in a clinical environment for both undergraduate and graduate students.

Primary Appointments

Robert F. Kirsch, PhD
(Northwestern University)
Professor and Interim Chair, Functional Electrical Stimulation Center

A. Bolu Ajiboye, PhD
(Northwestern University)
Assistant Professor
Development and control of brain-computer-interface (BCI) technologies for restoring function to individuals with nervous system injuries

Eben Alsberg, PhD
(University of Michigan)
Associate Professor
Biomimetic tissue engineering; innovative biomaterials and drug delivery vehicles for functional tissue regeneration and cancer therapy; control of stem cell fate decision; precise temporal and spatial presentation of signals to regulate cell behavior; mechanotransduction and the influence of mechanics on cell behavior and tissue formation; and cell-cell interactions

James P. Basilion, PhD
(The University of Texas)
Associate Professor (joint with Radiology)
High resolution imaging of endogenous gene expression; definition of "molecular signatures" for imaging and treatment of cancer and other diseases; generating and utilizing genomic data to define informative targets; strategies for applying non-invasive imaging to drug development; and novel molecular imaging probes and paradigms

Jeffrey Capadona, PhD
(Georgia Institute of Technology)
Assistant Professor
Advanced materials for neural interfacing; biomimetic and bio-inspired materials; host-implant integration; anti-inflammatory materials; and novel biomaterials for surface modification of cortical prostheses

Patrick E. Crago, PhD
(Case Western Reserve University)
Professor and Associate Dean of Engineering
Control of neuroprostheses for restoration of motor function; neuromechanics; and modeling of neuromusculoskeletal systems
Erin Lavik, ScD
(Massachusetts Institute of Technology)

Professor (joint with Mechanical and Aerospace Engineering)

healing, health, and disease states; novel materials and implants; multi-scale orthopaedic mechanobiology in cellular biomechanics, molecular transport and fluid flow through tissue; cellular, tissue, and organ levels; cellular and biofluid mechanics: study of development, growth, adaptation and repair of biological systems at the methods to uncover the biophysical mechanisms underlying processes of experimental mechanobiology: applying computational and experimental

Dominique M. Durand, PhD
(University of Toronto, Canada)

Efstathios (Stathis) Karathanasis, PhD
(Arizona State University)

Assistant Professor

manufacturing of multifunctional agents that facilitate diagnosing; treating and monitoring of therapies in a patient-specific manner

J. Lawrence Katz, PhD
(Polytechnic Institute of Brooklyn)

Professor Emeritus

Structure-property; relationships in bone; osteophilic biomaterials; ultrasonic studies of tissue anisotropy; and scanning acoustic microscopy

Melissa Knothe Tate, PhD
(Swiss Federal Institute of Technology ETH, Zurich, Switzerland)

Professor (Joint with Mechanical and Aerospace Engineering)

stem cell mechanisms and mechanobiology; multi-scale computational and experimental mechanobiology: applying computational and experimental methods to uncover the biophysical mechanisms underlying processes of development, growth, adaptation and repair of biological systems at the cellular, tissue, and organ levels; cellular and biofluid mechanics: study of cellular biomechanics, molecular transport and fluid flow through tissue; engineering and development of mechano-active, bio-inspired, and/or novel materials and implants; multi-scale orthopaedic mechanobiology in healing, health, and disease states

Erin Lavik, ScD
(Massachusetts Institute of Technology)

Elmer Lincoln Lindseth Associate Professor in Biomedical Engineering

Biomaterials; synthesis of new degradable polymers; tissue engineering; spinal cord repair; retinal regeneration; and drug delivery for optic nerve preservation and repair

Zheng-Rong Lu, PhD
(Lanzhou Institute of Chemical Physics, Chinese Academy of Sciences)

M. Frank and Margaret Domiter Rudy Professor of Biomedical Engineering

Drug delivery and molecular imaging; novel targeted imaging agents for molecular imaging; novel MRI contrast agents; image-guided therapy and drug delivery; polymeric drug delivery systems; multi-functional delivery systems for nucleic acids

Roger Marchant, PhD
(Case Western Reserve University)

Professor; Director, Center for Biomaterials

Self-assembling biomimetic materials; vascular tissue engineering; novel biomaterials for surface modification of cardiovascular devices and hydrogels for tissue engineering; targeted liposome drug delivery; bacterial adhesion; and cell and protein interactions with biomaterials using atomic force microscopy

J. Thomas Mortimer, PhD
(Case Western Reserve University)

Professor Emeritus

Neural control and prostheses; electrical activation of neural tissue; and membrane properties and electrodes

P. Hunter Peckham, PhD
(Case Western Reserve University)

Donnell Institute Professor; Distinguished University Professor; Rehabilitation engineering in spinal cord injury; neural prostheses; and functional electrical stimulation and technology transfer

Andrew M. Rollins, PhD
(Case Western Reserve University)

Associate Professor

Biomedical optics; real-time in-vivo microstructural, functional, and molecular imaging using optical coherence tomography; diagnosis and guided therapy for cancer, cardiovascular, and ophthalmic disease

Gerald M. Saidel, PhD
(The Johns Hopkins University)

Professor; Director, Center for Modeling Integrated Metabolic Systems

Mass and heat transport and metabolism in cells, tissues, and organ systems; mathematical modeling and simulation of dynamic and spatially distributed systems; optimal nonlinear parameter estimation and design of experiments

Nicole Seiberlich, PhD
(Lanzhou Institute of Chemical Physics, Chinese Academy of Sciences)

Drug delivery and molecular imaging; novel targeted imaging agents for drug delivery; polymeric drug delivery systems; multi-functional delivery systems for nucleic acids

M. Frank and Margaret Domiter Rudy Professor of Biomedical Engineering

Advanced signal processing and data acquisition techniques for rapid Magnetic Resonance Imaging (MRI).

Anirban Sen Gupta, PhD
(The University of Akron)

Assistant Professor

Targeted drug delivery; targeted molecular imaging; image-guided therapy; platelet substitutes; novel polymeric biomaterials for tissue engineering scaffolds

Nicole F. Steinmetz, PhD
(John Innes Centre in Norwich, UK)

Assistant Professor

Efstathios (Stathis) Karathanasis, PhD
(Arizona State University)

Assistant Professor

Fabricating multifunctional agents that facilitate diagnosing; treating and monitoring of therapies in a patient-specific manner

J. Lawrence Katz, PhD
(Polytechnic Institute of Brooklyn)

Professor Emeritus

Structure-property; relationships in bone; osteophilic biomaterials; ultrasonic studies of tissue anisotropy; and scanning acoustic microscopy

Melissa Knothe Tate, PhD
(Swiss Federal Institute of Technology ETH, Zurich, Switzerland)

Professor (Joint with Mechanical and Aerospace Engineering)

stem cell mechanisms and mechanobiology; multi-scale computational and experimental mechanobiology: applying computational and experimental methods to uncover the biophysical mechanisms underlying processes of development, growth, adaptation and repair of biological systems at the cellular, tissue, and organ levels; cellular and biofluid mechanics: study of cellular biomechanics, molecular transport and fluid flow through tissue; engineering and development of mechano-active, bio-inspired, and/or novel materials and implants; multi-scale orthopaedic mechanobiology in healing, health, and disease states

Erin Lavik, ScD
(Massachusetts Institute of Technology)
Engineering of viral nanoparticles as smart devices for applications in medicine: tissue-specific imaging, drug-delivery, and tissue engineering

Dustin J. Tyler, PhD
(Case Western Reserve University)
Associate Professor

Neuromimetic neuroprostheses; laryngeal neuroprostheses; clinical implementation of nerve electrodes; cortical neuroprostheses; minimally invasive implantation techniques; and modeling of neural stimulation and neuroprostheses

Horst A. von Recum, PhD
(University of Utah)
Associate Professor

Affinity-based delivery of small molecule drugs and biomolecules for applications in device infection, HIV, orthopedics, cardiovascular, ophthalmology and cancer; directed differentiation of stem cells for tissue engineering applications, such as endothelial cells, cardiomyocytes, motor neurons and T-cells

David L. Wilson, PhD
(Rice University)
Robert J. Herbold Professor

Biomedical image processing; digital processing and quantitative image quality of X-ray fluoroscopy images; interventional MRI

Xin Yu, ScD
(Harvard-MIT)
Associate Professor

Magnetic resonance imaging and spectroscopy; applications of MRI and MRS to cardiovascular research

Research Appointments

Musa L. Audu, PhD
(Case Western Reserve University)
Research Associate Professor

Human musculoskeletal modeling and development of control systems for rehabilitation of individuals with balance disorders

Niloy Bhadra, MD, PhD
(Case Western Reserve University)
Research Assistant Professor

Experimental and computational studies of high frequency waveforms for reversible conduction block of peripheral nerves; design, testing and implementation of neuroprosthetic systems for the upper limb

Michael Jenkins, PhD
(Case Western Reserve University)
Research Assistant Professor

Biomedical optics; development of optical pacing and optical imaging technologies for investigating cardiac development and diseases

Nicola Lai, PhD
(University of Pisa, Pisa/Cagliari, Italy)
Research Assistant Professor

Systems biology investigation of muscle exercise metabolism in diabetes; systems integrated physiology; mass transport and metabolism in cell, tissue and organ systems; mathematical modeling and analysis of dynamic and distributed systems

Junmin Zhu, PhD
(Peking University)
Research Assistant Professor

Biomimetic engineering of nanomaterials; design and synthesis of extracellular matrix (ECM)-mimetic scaffolds for bioengineering vascular grafts and networks; engineering of multifunctional nanosystems for targeting tumor angiogenesis

Secondary Appointments

Ozan Akkus, PhD
(Case Western Reserve)  
Associate Professor

Development of novel biomaterials that sill substitute bone and soft tissues, bioinspired from the synthesis of bone such that ductile biocompatible polymer matrices are subjected to mineralization. Tendon replacement strategy involve alignment of collagen monomers by a novel electrochemical method to obtain strong bundles.

Jay Alberts, PhD
(Arizona State University)

Assistant Professor of Biomedical Engineering (Cleveland Clinic)

Neural basis of upper extremity motor function and deep brain stimulation in Parkinson’s disease

James M. Anderson, MD (Case Western Reserve University), PhD
(Oregon State University)

Professor, Pathology, University Hospitals-Case Medical Center

Blood and tissue/material interactions as they relate to implantable devices and biomaterials

Harinara Baskaran, PhD
(Pennsylvania State University)

Assistant Professor, Chemical Engineering

Design and build microvascular flow analogs that can be used to overcome nutrient limitations in tissue-engineered products

Jonathan Baskin, MD
(New York University)

Assistant Professor, Chief, Otolaryngology-Head & Neck Surgery, University Hospitals-Case Medical Center, VA Medical Center

Bioengineering of bone substitutes using nanotechnology

Arnold Caplan, PhD
(Johns Hopkins University)

Professor, Biology

Develop and refine the technology necessary to isolate one of these rare stem cells, the mesenchymal stem cell (MSC)

Ronald L. Cechner, Clinical PhD (Anesthesiology)
(Case Western Reserve University)

Assistant Professor, Anesthesiology and Associate Professor, Biomedical Engineering and Pathology, Technical Director, Anesthesia Simulation Laboratory, University Hospitals-Case Medical Center

Simulator in medical education

John Chae, MD
(New Jersey Medical School)

Professor, Physical Medicine and Rehabilitation, MetroHealth Medical Center

Stroke rehabilitation, neuromuscular electrical stimulation to restore upper and lower extremity function after stroke

Hillel J. Chiel, PhD
(Massachusetts Institute of Technology)

Professor, Biology

Biomechanical and neural basis of feeding behavior in the marine mollusk Aplysia californica; neuromechanical system modeling; analysis of neural network dynamics

Guy Chisolm, PhD
(University of Virginia)
Professor, Cell Biology, Cleveland Clinic
Vascular biology; lipoprotein-cell interactions
Margot Damaser, PhD
(University of California)

Associate Professor, Biomedical Engineering, Cleveland Clinic
Biomechanics and neural control of the female pelvic floor and lower urinary tract in normal and dysfunctional cases
David Dean, PhD
(City University of New York)

Associate Professor, Neurological Surgery, Anatomy, Orthodontics,
University Hospitals-Case Medical Center
Computer-Assisted Surgery, skull (bone) tissue engineering, photodynamic therapy of glioma, and automated radiosurgery treatment planning
James Dennis, PhD
(Case Western Reserve University)

Assistant Professor, Orthopaedics, University Hospitals-Case Medical Center
Engineering cartilage for orthopaedic and trachea reconstruction applications; developing reagents, termed “cell paints;” that can be used to direct repair cells to specific organs and tissues
Kathleen Derwin, PhD
(University of Michigan)

Assistant Professor, Molecular Medicine (Biomedical Engineering, Cleveland Clinic)
Tendon mechanobiology and tissue engineering
Isabelle Deschenes, PhD
(Laval University)

Assistant Professor, Cardiology, MetroHealth Medical Center
Molecular mechanisms of cardiac arrhythmias, ion channels structure-function
J. Kevin Donahue, MD
(Washington University)

Associate Professor, Cardiology, MetroHealth Medical Center
Arrhythmia ablation; atrial fibrillation; cardiac arrhythmia; gene therapy; implantable cardioverter defibrillator; myocardial infarction; ventricular tachycardia
Agata Exner, PhD
(Case Western Reserve University)

Associate Professor, Radiology, University Hospitals-Case Medical Center
Development and imaging characterization of drug delivery for cancer chemotherapy; interventional radiology
Elizabeth Fisher, PhD
(Rutgers University)

Associate Professor, Molecular Medicine (Biomedical Engineering, Cleveland Clinic)
Quantitative image analysis for application to multiple sclerosis and neurodegenerative diseases
Christopher Flask, PhD
(Case Western Reserve University)

Assistant Professor, Radiology, University Hospitals-Case Medical Center
Development of Quantitative and Molecular MRI Imaging Methods, MRI Physics
Kiyotaka Fukamachi, MD, PhD
(Kyushu University)

Professor

Research activities entail promoting human health through the development of various surgical treatments for heart failure, encompassing a broad range of options
Linda M. Graham, MD
(University of Michigan)

Professor, Surgery (Vascular Surgery and Biomedical Engineering), Cleveland Clinic
Cell movement and vascular healing, vascular tissue engineering
Roy Greenberg, MD
(University of Cincinnati)

Associate Professor, Surgery (Thoracic and Cardiovascular and Biomedical Engineering, Cleveland Clinic)
Development and assessment of endovascular devices for treating vascular diseases
Mark Griswold, PhD
(University of Wuerzburg, Germany)

Associate Professor, Radiology, University Hospitals-Case Medical Center
Rapid magnetic resonance imaging, image reconstruction and processing and MRI hardware/instrumentation
Vikas Gulani, MD, PhD
(University of Illinois)

Assistant Professor, Radiology, University Hospitals-Case Medical Center
Diffusion tensor imaging and diffusion anisotropy, MRI microscopy, body MRI, and functional MRI
Alex Y. Huang, MD, PhD
(Johns Hopkins University)

Assistant Professor, Pediatrics, Pathology, University Hospitals-Case Medical Center/Rainbow Babies and Children’s Hospital
Study various aspects of anti-tumor immune responses, immune – host – pathogen interaction, T cell-mediated memory immunity, and chemokine - receptor biology
Michael W. Keith, MD
(Ohio State University)

Professor, Orthopaedic Surgery, MetroHealth Medical Center
Restoration of motor function in hands
Kandice Kottke-Marchant, MD, PhD
(Case Western Reserve University)

Professor, Molecular Medicine (Pathology and Laboratory Medicine, Cleveland Clinic)
Thrombosis, hemostasis and vascular disease, hypercoagulable states, bleeding disorders, endothelial cell function, atherosclerosis
Vinod Labhasetwar, PhD
(Nagpur University, India)

Associate Professor, Molecular Medicine (Biomedical Engineering, Cleveland Clinic)
Cancer treatment and detection, delivery of anti-oxidant enzymes in stroke and development of a non-stent approach to inhibition of restenosis
Kenneth R. Laurita, PhD
(Case Western Reserve University)

Associate Professor, Heart and Vascular Research Center, MetroHealth Medical Center
Cellular mechanisms of cardiac arrhythmias using fluorescent imaging of transmembrane potential and intracellular calcium in the intact heart
Zhenghong Lee, PhD
(Case Western Reserve University)
Associate Professor, Radiology, Nuclear Medicine, University Hospitals-
Case Medical Center
Quantitative PET and SPECT imaging, multimodal image registration, 3D
visualization, molecular imaging and small animal imaging systems

R. John Leigh, MD
(University of Newcastle-Upon-Tyne, U.K.)
Professor, Neurology, VA Medical Center
Normal and abnormal motor control of the eye

Kenneth Loparo, PhD
(Case Western Reserve University)
Nord Professor of Engineering, Electrical Engineering & Computer
Science
Stability and control of nonlinear and stochastic systems; systems biology

Cameron McIntyre, PhD
(Case Western Reserve University)
Assistant Professor, Molecular Medicine (Biomedical Engineering,
Cleveland Clinic)
Theoretical modeling of the interaction between electric fields and the
nervous system; deep brain stimulation

Mehran Mehregany, PhD
(Massachusetts Institute of Technology)
Professor, Electrical Engineering & Computer Science
Micro/Nano-Electro-Mechanical Systems; silicon carbide semiconductor
technology and microsystems; wireless health

Pedram Mohseni, PhD
(University of Michigan)
Assistant Professor, Electrical Engineering & Computer Science
Biomicrosystems; biomedical microtelemetry; biological-electronic
interfaces; microelectronics for neurotechnology; and wireless integrated
sensing/actuating systems

George F. Muschler, MD
(Northwestern University)
Professor, Molecular Medicine (Orthopaedic Surgery and Biomedical
Engineering, Cleveland Clinic)
Bone biology, skeletal reconstruction, aging and osteoporosis

Raymond F. Muzic Jr., PhD
(Case Western Reserve University)
Associate Professor, Radiology, Biomedical Engineering, Oncology,
Division of General Medical Sciences, University Hospitals-Case Medical
Center
Quantitative analysis of biomedical imaging data, physiologic modeling,
optimal experiment design, assessment of new radiopharmaceuticals,
imaging response to therapy, and in vivo quantification of receptor
concentration

Marc Penn, MD, PhD
(Case Western Reserve University)
Assistant Professor, Molecular Medicine (Cardiology and Cell Biology,
Cleveland Clinic)
Myocardial ischemia, vascular biology, cardiac critical care

Clare Rimnac, PhD
(Lehigh University)
Professor, Mechanical and Aerospace Engineering
Orthopaedic implant performance and design, mechanical behavior of
hard tissues

Stuart Rowan, PhD
(University of Glasgow, UK)
Kent Hale Smith Professor, Macromolecular Science & Engineering

Investigation and utilization of Supramolecular Chemistry (the chemistry
of the non-covalent bond) in polymer chemistry

Mark S. Rzeszotarski, PhD
(Case Western Reserve University)
Professor, Radiology, MetroHealth Medical Center
Radiological imaging; computed tomography, medical education

Dawn Taylor, PhD
(Arizona State University)
Assistant Professor, Molecular Medicine (Neurosciences, Cleveland
Clinic)
Restoration of movement and function to paralysis victims through the
application of electrical current to the peripheral nerves

Ronald J. Triolo, PhD
(Drexel University)
Associate Professor, Orthopaedics, University Hospitals-Case Medical
Center, VA Medical Center, MetroHealth Medical Center
Neural prostheses, rehabilitation engineering and restoration of lower
extremity function, biomechanics of human movement quantitative
analysis and control of gait, standing balance and seated posture

Albert L. Waldo, MD
(State University of New York, Downstate)
Professor, Medicine/Cardiology, University Hospitals-Case Medical
Center
Cardiac electrophysiology and cardiac excitation mapping

Michael Weiss, MD, PhD, MBA
(Harvard Medical School, Case Western Reserve University)
Professor
Protein engineering: design of more stable proteins for use in novel
devices and design of less stable proteins for use in artificial operons in
 genetic model organisms. The use of multi-dimensional MR spectroscopy
to interrogate the outcomes of such protein engineering efforts.

Barry Wessels, PhD
(University of Notre Dame)
Professor, Biomedical Engineering and Radiation Oncology; Director,
Division of Medical Physics and Dosimetry, University Hospitals-Case Medical
Center
Radiolabeled antibody therapy (Dosimetry and clinical trials), image-
guided radiotherapy, intensity modulated radiation therapy, image fusion
of CT, MR, SPECT and PET for adaptive radiation therapy treatment
planning

Xiong Yu, PhD, P.E.
(Purdue University School of Civil Engineering)
Associate Professor
Materials and sensors innovations with emphasis on interdisciplinary
innovation to improve intelligent and durability

Guang Hui Yue, PhD
(University of Iowa)
Associate Professor, Molecular Medicine, (Biomedical Engineering,
Cleveland Clinic)
Neural control of movement

Maciej Zborowski, PhD
(Polish Academy of Science)
Associate Professor, Molecular Medicine (Biomedical Engineering,
Cleveland Clinic)
Membrane separation of blood proteins

Assem G. Ziady, PhD
(Case Western Reserve University)
Assistant Professor, Pediatrics, University Hospitals-Case Medical Center
Proteomics, DNA nanoparticles, mass spectrometry, cystic fibrosis, inflammation, and redox signaling
Nicholas P. Ziats, PhD
(Case Western Reserve University)

Associate Professor, Pathology, University Hospitals-Case Medical Center
Vascular grafts; vascular cells; blood vessels
Christian Zorman, PhD
(Case Western Reserve University)

Associate Professor, Electrical Engineering & Computer Science
Development of enabling materials for micro- and nanosystems
Nicholas P. Ziats, PhD
(Case Western Reserve University)

Adjunct Appointments

Kath Bogie, D. Phil
(University of Oxford)
Adjunct Assistant Professor, Biomedical Engineering (VA Medical Center)
Wound prevention and treatment in individuals with paralysis and in the biomechanics of wheelchairs and seating for people with limited mobility

Scott Bruder, MD, PhD
(Case Western Reserve University)
Adjunct Professor
Advises MD/PhD students regarding careers in industry.

Richard C. Burgess, MD, PhD
(Case Western Reserve University)
Adjunct Professor of Biomedical Engineering (Neurological Computing, Cleveland Clinic)
Magnetoencephalography; Electrophysiological monitoring; EEG processing; medical informatics

Alan F. Dowling, PhD
(Massachusetts Institute of Technology)
Adjunct Professor (Global Health Associates LLC)
Models of health care systems

Colin Drummond, PhD (Syracuse University), MBA (Case Western Reserve University)
Adjunct Professor
Sensor and information technology systems

William J. Dupps, MD, PhD
(The Ohio State University)
Adjunct Professor (Cleveland Clinic)
Application of engineering tools to the diagnosis and management of biomechanical disorders such as keratoconus and glaucoma

Luis Gonzalez-Reyes, MD (University of Los Andes), PhD (London University)
Adjunct Instructor, Biomedical Engineering
Physiology; biophysics; molecular and cellular physiology

Elizabeth C. Hardin, PhD
(University of Massachusetts)
Adjunct Associate Professor of Biomedical Engineering, (VA Medical Center)
Neural prostheses and gait mechanics; improving gait performance with neural prostheses using strategies developed in conjunction with forward dynamics musculoskeletal models

Thomas Hering, PhD
(Case Western Reserve University)
Adjunct Associate Professor (Orthopaedic Surgery, Washington University)
Cartilage; extracellular matrix biochemistry and molecular biology; transciptional regulation of chondrogenesis

Vincent J. Hetherington, DPM
(Pennsylvania College of Podiatric Medicine)
Adjunct Assistant Professor of Biomedical Engineering (Surgery, Ohio College of Podiatric Medicine)
Biomaterials and biomechanics of foot prostheses

Jill S. Kawalec-Carroll, PhD
(Case Western Reserve University)
Adjunct Assistant Professor, Biomedical Engineering, Research Director, Ohio College of Podiatric Medicine
Biomaterials and biomechanics of foot prostheses

Kevin L. Kilgore, PhD
(Case Western Reserve University)
Adjunct Assistant Professor, Biomedical Engineering, Orthopaedics, (MetroHealth Medical Center)
Functional electrical stimulation; neuroprostheses

William Landis, PhD
(Massachusetts Institute of Technology)
Adjunct Professor of Biomedical Engineering (Microbiology, Immunology and Biochemistry, Northeastern Ohio Universities College of Medicine)
Mineralization of vertebrates, effect of mechanical force on mineralization, calcium transport in mineralization, tissue engineering

Paul Marasco, PhD
(Vanderbilt University)
Adjunct Assistant Professor
Neural Plasticity, Sensory Neurophysiology, Brain Organization, Senory Integration with Prosthetic devices

Aaron S. Nelson, MD
(Medical College of Ohio)
Adjunct Assistant Professor, Medical Director, MIMvista Corporation (Cleveland, OH)
Multimodality and quantitative imaging for neurologic and cardiac disorders, oncology, and radiation oncology

Anand Ramamurthi, PhD
(Oklahoma State University)
Adjunct Associate Professor (Biomedical Engineering, Cleveland Clinic)
Artificial heart valves, tissue engineering, biomaterials, thrombosis

Michael Southworth
(Webster University)
Adjunct Instructor (Southworth and Associates LLC)
Regulatory affairs for biosciences

James Thomas, MD
(University of Otago)
Adjunct Professor (Cardiovascular Medicine, Cleveland Clinic)
Ultrasound, ultrasonography, and digital echocardiography

Antonie Van den Bogert, PhD
(University of Utrecht)
Adjunct Associate Professor (Orchard Kinetics, LLC)
Biomechanics, motion capture, computational modeling

Franciscus Van der Helm, PhD
(Delft University)
Adjunct Professor (Mechanical and Biomechanical Engineering, Delft University)
Courses

EBME 105. Introduction to Biomedical Engineering. 3 Units.
This course is intended to introduce Freshmen to a wide variety of biomedical engineering fields including: biomaterials, tissue engineering, drug delivery systems, biomedical imaging and processing, cardiac measurement and analysis, neural engineering, neuromuscular control, and systems biology. Topics span research, development, and design for diagnostic and therapeutic applications. Prereq: Freshman standing.

EBME 201. Physiology-Biophysics I. 3 Units.
This course (1) teaches cell physiology from an engineering perspective - basics covered include cell structures and functions, genes and protein synthesis, diffusion fundamentals, electrical properties of neural and muscle cells, sensory transduction, and integration of function on the micro and macro scale; (2) teaches how to use engineering tools to model different cell functions and predict, measure, and control cell behavior; (3) introduces mathematical and graphical analysis of specific physiological systems emphasizing applied modeling and simulation. Prereq: Must have declared major or minor in Biomedical Engineering, or requisites not met permission.

EBME 202. Physiology-Biophysics II. 3 Units.
This course is an extension of EBME 201 that will extend the application of system modeling and simulation to complex physiological systems in a clinical environment. The course will cover models of biochemical systems with pathology, muscle, the cardiovascular system, respiratory system, renal and hepatic systems with pathology and clinical applications. Prereq: EBME 201 or consent of instructor.

EBME 300. Dynamics of Biological Systems: A Quantitative Introduction to Biology. 3 Units.
This course will introduce students to dynamic biological phenomena, from the molecular to the population level, and models of these dynamical phenomena. It will describe a biological system, discuss how to model its dynamics, and experimentally evaluate the resulting models. Topics will include molecular dynamics of biological molecules, kinetics of cell metabolism and the cell cycle, biophysics of excitability, scaling laws for biological systems, biomechanics, and population dynamics. Mathematical tools for the analysis of dynamic biological processes will also be presented. Students will manipulate and analyze simulations of biological processes, and learn to formulate and analyze their own models. This course satisfies a laboratory requirement for the biology major. Offered as BIOL 300 and EBME 300.

EBME 303. Structure of Biological Materials. 3 Units.
Structure of proteins, nucleic acids, connective tissue and bone, from molecular to microscopic levels. An introduction to bioengineering biological materials and biomimetic materials, and an understanding of how different instruments may be used for imaging, identification and characterization of biological materials. Offered as: EBME 303 and EMAC 303. Recommended preparation: EBME 201, EMBE 202, and EMAC 270.

EBME 305. Materials for Prosthetics and Orthotics. 3 Units.
A synthesis of skeletal tissue structure and biology, materials engineering, and strength of materials concepts. This course is centered on deepening the concept of biocompatibility and using it to pose and solve biomaterials problems. We cover: fundamental concepts of materials used for load bearing medical applications, wear, corrosion, and failure of implants. Structure and properties of hard tissues and joints are presented using a size hierarchy motif. Tools and analysis paradigms useful in the characterization of biomaterials are covered in the context of orthopedic and dental applications. Prereq: EBME 306.

EBME 306. Introduction to Biomedical Materials. 3 Units.
Biomaterials design and application in different tissue and organ systems. The relationship between the physical and chemical structure of biomaterials, functional properties, and biological response. Recommended preparation: EBME 201 and EBME 202.

EBME 307. Biomechanical Prosthetic Systems. 3 Units.
Introduction to the basic biomechanics of human movement and applications to the design and evaluation of artificial devices intended to restore or improve movement lost due to injury or disease. Measurement techniques in movement biomechanics, including motion analysis, electromyography, and gait analysis. Design and use of upper and lower limb prostheses. Principles of neuroprostheses with applications to paralyzed upper and lower extremities. Recommended preparation: Consent of instructor and senior standing.

EBME 308. Biomedical Signals and Systems. 4 Units.

EBME 309. Modeling of Biomedical Systems. 3 Units.

EBME 310. Principles of Biomedical Instrumentation. 3 Units.

EBME 315. Applied Tissue Engineering. 3 Units.
This course is designed to provide students with understanding and expertise of the basic tools in tissue engineering research. Through lectures the students will be introduced to the array of methods and materials available to tissue engineering researchers, learn how to rationally determine suitable choices for their applications, and receive instruction on how to implement those designs. Much of the course will be spent in the BME Tissue Engineering Laboratory getting hands-on experience (1) on the materials end with materials selection, characterization, and scaffold fabrication; (2) on the cell end with cell culture, tissue characterization and bioreactor design. The class will be assessed by a weekly grading of the students’ lab notebooks, as well as a final exam based on the content learned throughout the semester.
EBME 316. Biomaterials for Drug Delivery. 3 Units.
The teaching objective is to provide students with a basic understanding of the principles of design and engineering of well-defined molecular structures and architectures intended for applications in controlled release and organ-targeted drug delivery. The course will discuss the therapeutic basic of drug delivery based on drug pharmacodynamics and clinical pharmacokinetics. Biomaterials with specialized structural and interfacial properties will be introduced to achieve drug targeting and controlled release. Offered as EBME 316 and EBME 416. Prereq: EBME 306 and PHRM 309.

EBME 317. Excitable Cells: Molecular Mechanisms. 3 Units.
Ion channels are the molecular basis of membrane excitability in all cell types, including neural, heart, and muscle cells. This course presents the structure and the mechanism of function of ion channels at the molecular level. It introduces the basic principles and methods in the ion channel study including the ionic basis of membrane excitability, thermodynamic and kinetic analysis of channel function, voltage clamp and patch clamp techniques, and molecular and structural biology approaches. The course will cover structure of various potassium, calcium, sodium, and chloride channels and their physiological function in neural, cardiac, and muscle cells. Exemplary channels that have been best studied will be discussed to illustrate the current understanding of the molecular mechanisms of channel gating and permeation. Graduate students will present exemplary papers in the journal club style. Recommended preparation: EBME 201 or equivalent. Offered as EBME 317 and EBME 417.

EBME 318. Biomedical Engineering Laboratory I. 1 Unit.
Experiments for measurement, assisting, replacement, or control of various biomedical systems. Students choose a few lab experiences from a large number of offerings relevant to all BME sequences. Experiments are conducted primarily in faculty labs with 3-8 students participating. Recommended preparation: ENGR 210. Prereq: BME Major, EBME 201, EBME 202 and Prereq or Coreq: EBME 308.

EBME 319. Biomedical Engineering Laboratory II. 1 Unit.
Experiments for measurement, assisting, replacement, or control of various biomedical systems. Students choose a few lab experiences from a large number of offerings relevant to all BME sequences. Experiments are conducted primarily in faculty labs with 3-8 students participating. Recommended preparation: EBME 201, EBME 202, and ENGR 210. Prereq or Coreq: EBME 318.

EBME 320. Medical Imaging Fundamentals. 3 Units.
General principles, instrumentation, and biomedical applications of medical imaging. Topics include: x-ray, ultrasound, MRI, nuclear imaging, image reconstruction, and image quality. Recommended preparation: EBME 308, ENGR 210, and EBME 202 or equivalent.

EBME 322. Applications of Biomedical Imaging. 3 Units.
This course will provide an introduction to biomedical imaging and its applications in measurements of physiological function, stem cell biology, and drug delivery. Students will learn about imaging technologies including basic principles of imaging (resolution and contrast), optical microscopy and in vivo imaging, and magnetic resonance imaging. Emerging techniques in cellular and molecular imaging, including targeted imaging agents and reporter gene imaging will be discussed. Biomedical applications will include such topics as tumor characterization in drug assessment, functional brain mapping, targeted drug delivery, functional cardiovascular measurements, and stem cell research will be demonstrated. Prereq: EBME 201, EBME 202, EBME 308, PHYS 121, PHYS 122.

EBME 325. Introduction to Tissue Engineering. 3 Units.
The goal of this course is to present students with a firm understanding of the primary components, design principles, and engineering concepts central to the field of tissue engineering. First, the biological principles of tissue formation during morphogenesis and wound repair will be examined. The cellular processes underlying these events will be presented with an emphasis on microenvironment regulation of cell behavior. Biomimetic approaches to controlling cell function and tissue formation via the development of biomaterial systems will then be investigated. Case studies of regeneration strategies for specific tissues will be presented in order to examine the different tissue-specific engineering strategies that may be employed. Special current topics in tissue engineering will also be covered. Recommended preparation: EBME 306, BIOL 362, and CHEM 223.

EBME 327. Bioelectric Engineering. 3 Units.

EBME 328. Biomedical Engineering R&D Training I. 1 Unit.
This course will provide research and development in the laboratory of a mentoring faculty member. Varied R&D experiences will include activities in biomedical instrumentation, tissue engineering, imaging, drug delivery, and neural engineering. Each student must identify a faculty mentor, and together they will create description of the training experience prior to the first class. Prereq: EBME 201 and EBME 202.

EBME 329. Biomedical Engineering R&D Training II. 1 Unit.
This course will provide research and development training in the laboratory of a mentoring faculty member. Varied R&D experiences will include activities in biomedical instrumentation, tissue engineering, imaging, drug delivery, and neural engineering. Each student must identify a faculty mentor, and together will create a description of the training experience prior to the first class. Recommended preparation EBME 328. Prereq: EBME 201 and EBME 202.

EBME 350. Quantitative Molecular Bioengineering. 3 Units.
The objective of this course is to equip the students with a “molecular toolbox”--a set of quantitative skills that permit rational designs for engineering tissues starting at the molecular level. The course will build on the physical and chemical principles in equilibrium, kinetics, and mass transport. Specific examples in bioengineering systems will be used throughout the course to illustrate the importance of understanding and application of these principles to tissue engineering. Recommended preparation: ENGR 225. Offered as EBME 350 and ECHE 355.

EBME 359. Biomedical Computer Simulation Laboratory. 1 Unit.

EBME 360. Biomedical Instrumentation Laboratory. 1 Unit.
A laboratory which focuses on the basic components of biomedical instrumentation and provides hands-on experience for students in EBME 310, Biomedical Instrumentation. The purpose of the course is to develop design skills and laboratory skills in analysis and circuit development. Coreq: EBME 310.
EBME 370. Principles of Biomedical Engineering Design. 2 Units.
Students learn and implement the design process to produce working prototypes of medical devices with potential commercial value to meet significant clinical needs. Critical examination of contemporary medical problems is used to develop a specific problem statement. The class is divided into teams of 3 to 4 students. Each team integrates their knowledge and skills to design a device to meet their clinical need. Project planning and management, including resource allocation, milestones, and documentation, are required to ensure successful completion of projects within the allotted time and budget. Formal design reviews by a panel of advisors and outside medical device experts are required every four weeks. Every student is required to give oral presentations at each formal review and is responsible for formal documentation of the design process, resulting in an executive summary and complete design history file of the project. The course culminates with a public presentation of the team's device to a panel of experts. This course is expected to provide the student with a real-world, capstone design experience. Recommended preparation: EBME 310

EBME 380. Biomedical Engineering Design Experience. 3 Units.
This course is the culmination of the BME educational experience in which the student will apply acquired skills and knowledge to create a working device or product to meet a medical need. Students will learn how to apply engineering skills to solve problems and physically realize a project design. The course structure includes regular meetings with a faculty project advisor, regular reports of accomplished activity, hands on fabrication of devices, and several lectures from leading engineers from industry and academia that have first-hand experience in applying the principles of design to Biomedical Engineering. Students will also provide periodic oral progress reports and a final oral presentation with a written design report. Prereq: EBME 370.

EBME 396. Special Topics in Undergraduate Biomedical Engineering I. 1 - 18 Unit.
(Credit as arranged.)

EBME 398. Senior Project Laboratory I. 3 Units.
The design process required to produce biomedical devices, research equipment, and clinical tools is developed. Topics include identification of need; requirements specification; project management; working in teams; solutions conceptualization, refinement, and selection; hazard and risk analysis and mitigation; verification; validation; regulatory requirements; and medical device pathways to the market. Through critical examination of contemporary medical research and clinical problems, students, working in teams, will identify a need to develop a specific problem statement, project plan, input requirements, solution concept and risk analysis. Students will provide periodic oral progress reports and a final oral presentation with a written design report. Recommended preparation: EBME 310.

EBME 399. Senior Project Laboratory II. 3 Units.
Continuation of EBME 398. Recommended preparation: EBME 398 and consent of department.

EBME 400T. Graduate Teaching I. 0 Units.
This will provide the Ph.D. candidate with experience in teaching undergraduate or graduate students. The experience is expected to consist of direct student contact, but will be based upon the specific departmental needs and teaching obligations. This teaching experience will be conducted under the supervision of the faculty member who is responsible for the course, but the academic advisor will assess the educational plan to ensure that it provides an educational opportunity for the student. Recommended preparation: UNIV 400, BME Ph.D. student.

EBME 401. Biomedical Instrumentation and Signal Analysis. 4 Units.
Graduate students with various undergraduate backgrounds will learn the fundamental principles of biomedical measurements that integrate instrumentation and signal processing with problem-based hands-on experience. Prereq or Coreq: May not have taken EBME 401 prior to Fall 2011 or EBME 421 after Summer 2011.

EBME 402. Organ/Tissue Physiology and Systems Modeling. 4 Units.
Graduate students with various undergraduate backgrounds will learn the fundamental principles of organ and tissue physiology as well as systems modeling. Prereq or Coreq: May not have taken EBME 402 prior to Fall 2011 or EBME 422 after Summer 2011.

EBME 403. Biomedical Instrumentation. 3 Units.
Analysis and design of biomedical instruments with special emphasis on transducers. Body, system, organ, tissue, cellular, molecular, and nano-level measurements. Applications to clinical problems and biomedical research. Prereq: Graduate standing.

EBME 406. Polymers in Medicine. 3 Units.
This course covers the important fundamentals and applications of polymers in medicine, and consists of three major components: (i) the blood and soft-tissue reactions to polymer implants; (ii) the structure, characterization and modification of biomedical polymers; and (iii) the application of polymers in a broad range of cardiovascular and extravascular devices. The chemical and physical characteristics of biomedical polymers and the properties required to meet the needs of the intended biological function will be presented. Clinical evaluation, including recent advances and current problems associated with different polymer implants. Recommended preparation: EBME 306 or equivalent. Offered as EBME 406 or EMAC 471. Prereq: Graduate standing or Undergraduate with Junior or Senior standing and a cumulative GPA of 3.2 or above.

EBME 407. Neural Interfacing. 3 Units.
Neural interfacing refers to the principles, methods, and devices that bridge the boundary between engineered devices and the nervous system. It includes the methods and mechanisms to get information efficiently and effectively into and out of the nervous system to analyze and control its function. This course examines advanced engineering, neurobiology, neurophysiology, and the interaction between all of them to develop methods of connecting to the nervous system. The course builds on a sound background in Bioelectric Phenomenon to explore fundamental principles of recording and simulation, electrochemistry of electrodes in biological tissue, tissue damage generated by electrical stimulation, materials and material properties, and molecular functionalization of devices for interfacing with the nervous system. Several examples of the state-of-art neural interfaces will be analyzed and discussed. Recommended preparation: EBME 401. Prereq: Graduate standing or Undergraduate with Junior or Senior standing and a cumulative GPA of 3.2 or above.
EBME 408. Engineering Tissues/Materials - Learning from Nature’s Paradigms. 3 Units.
This course aims to provide students with a foundation based on "nature's" design and optimization criteria for engineering tissues and biomaterials. This will be achieved through focused review of the principles of development, wound healing, regeneration, and repair through remodeling, using nature as a paradigm. Principles of transport will be explored quantitatively and in relation to multi-organismal evolution. Cellular engineering principles will be explored, including current state of the art in stem cell physiology and therapeutic applications. Endogenous engineering approaches to surgical tissue reconstruction will be analyzed. An overview of contemporary approaches to tissue and cell engineering will be given, including tissue scaffold design, use of bioreactors in tissue engineering, and molecular surface modifications for integration of engineered tissues in situ. Fundamental engineering principles will be augmented through case studies involving specific applications. Ethical considerations related to clinical non-clinical application of tissue and cell engineering technology will be integrated into each lecture. Prereq: Graduate standing or Undergraduate with Junior or Senior standing and a cumulative GPA of 3.2 or above.

EBME 409. Systems and Signals in Biomedical Engineering. 3 Units.

EBME 410. Medical Imaging Fundamentals. 3 Units.
Physical principles of medical imaging. Imaging devices for x-ray, ultrasound, magnetic resonance, etc. Image quality descriptions. Patient risk. Recommended preparation: EBME 308 and EBME 310 or equivalent. Prereq: Graduate standing or Undergraduate with Junior or Senior standing and a cumulative GPA of 3.2 or above.

EBME 411. Biomaterials for Drug Delivery. 3 Units.
The teaching objective is to provide students with a basic understanding of the principles of design and engineering of well-defined molecular structures and architectures intended for applications in controlled release and organ-targeted drug delivery. The course will discuss the therapeutic basic of drug delivery based on drug pharmacodynamics and clinical pharmacokinetics. Biomaterials with specialized structural and interfacial properties will be introduced to achieve drug targeting and controlled release. Offered as EBME 316 and EBME 416. Prereq: EBME 306 and PHRM 309 or graduate standing.

EBME 417. Excitable Cells: Molecular Mechanisms. 3 Units.
Ion channels are the molecular basis of membrane excitability in all cell types, including neural, heart, and muscle cells. This course presents the structure and the mechanism of function of ion channels at the molecular level. It introduces the basic principles and methods in the ion channel study including the ionic basis of membrane excitability, thermodynamic and kinetic analysis of channel function, voltage clamp and patch clamp techniques, and molecular and structural biology approaches. The course will cover structure of various potassium, calcium, sodium, and chloride channels and their physiological function in neural, cardiac, and muscle cells. Exemplary channels that have been best studied will be discussed to illustrate the current understanding of the molecular mechanisms of channel gating and permeation. Graduate students will present exemplary papers in the journal club style. Recommended preparation: EBME 201 or equivalent. Offered as EBME 317 and EBME 417. Prereq: Graduate standing or Undergraduate with Junior or Senior standing and a cumulative GPA of 3.2 or above.

EBME 418. Electronics for Biomedical Engineering. 3 Units.
Fundamental concepts of analog design with special emphasis on circuits for biomedical applications. Analysis and design of discrete and integrated circuit amplifiers; application circuits of operational amplifiers; noise measurement; communication circuits; specialized biomedical applications such as circuits for low noise amplification, high CMRR biomedical amplifiers, implantable circuits, circuits for electrochemistry and circuits for optical recordings, circuits for recording neural activity, electrical safety and telemetry. A team project will be required for all students. Recommended preparation: EECS 344 or consent of instructor. Prereq: Graduate standing or Undergraduate with Junior or Senior standing and a cumulative GPA of 3.2 or above.

EBME 419. Applied Probability and Stochastic Processes for Biology. 3 Units.
Applications of probability and stochastic processes to biological systems. Mathematical topics will include: introduction to discrete and continuous probability spaces (including numerical generation of pseudo random samples from specified probability distributions), Markov processes in discrete and continuous time with discrete and continuous sample spaces, point processes including homogeneous and inhomogeneous Poisson processes and Markov chains on graphs, and diffusion processes including Brownian motion and the Ornstein-Uhlenbeck process. Biological topics will be determined by the interests of the students and the instructor. Likely topics include: stochastic ion channels, molecular motors and stochastic ratchets, actin and tubulin polymerization, random walk models for neural spike trains, bacterial chemotaxis, signaling and genetic regulatory networks, and stochastic predator-prey dynamics. The emphasis will be on practical simulation and analysis of stochastic phenomena in biological systems. Numerical methods will be developed using both MATLAB and the R statistical package. Student projects will comprise a major part of the course. Offered as BIOL 319, EECS 319, MATH 319, BIOL 419, EBME 419, and PHOL 419.

EBME 420. Biomedical Ultrasound Technologies. 3 Units.
EBME 421. Bioelectric Phenomena. 3 Units.
The goal of this course is to provide working knowledge of the theoretical methods that are used in the fields of electrophysiology and bioelectricity for both neural and cardiac systems. These methods will be applied to describe, from a theoretical and quantitative perspective, the electrical behavior of excitable cells, the methods for recording their activity and the effect of applied electrical and magnetic fields on excitable issues. A team modeling project will be required. Recommended preparation: differential equations, circuits. Prereq: Graduate standing or Undergraduate with Junior or Senior standing and a cumulative GPA of 3.2 or above.

EBME 422. Muscles, Biomechanics, and Control of Movement. 4 Units.
Quantitative and qualitative descriptions of the action of muscles in relation to human movement. Introduction to rigid body dynamics and dynamics of multi-link systems using Newtonian and Lagrangian approaches. Muscle models with application to control of multi-joint movement. Forward and inverse dynamics of multi-joint, muscle driven systems. Dissection, observation and recitation in the anatomy laboratory with supplemental lectures concentrating on kinesiology and muscle function. Recommended preparation: EMAE 181 or equivalent. Offered as EBME 422 and EMAE 402. Prereq: Graduate standing or Undergraduate with Junior or Senior standing and a cumulative GPA of 3.2 or above.

EBME 425. Tissue Engineering and Regenerative Medicine. 3 Units.
This course will provide advanced coverage of tissue engineering with a focus on stem cell-based research and therapies. Course topics of note include stem cell biology and its role in development, modeling of stem cell function, controlling stem cell behavior by engineering materials and their microenvironment, stem cells' trophic character, and state-of-the-art stem cell implementation in tissue engineering and other therapeutic strategies. Offered as EBME 425 and PATH 435. Prereq: EBME 325 or equivalent or graduate standing.

EBME 426. Nanomedicine. 3 Units.

EBME 427. Movement Biomechanics and Rehabilitation. 3 Units.
Introduction to the basic biomechanics of human movement and applications to the design and evaluation of artificial devices intended to restore or improve movement lost due to injury or disease. Measurement techniques in movement biomechanics, including motion analysis, electromyography, and gait analysis. Design and use of upper and lower limb prostheses. Principles of neuroprostheses with applications to paralyzed upper and lower extremities. Term paper required. Recommended preparation: Consent of instructor and graduate standing. Prereq: Graduate standing or Undergraduate with Junior or Senior standing and a cumulative GPA of 3.2 or above.

EBME 431. Physics of Imaging. 3 Units.
Description of physical principles underlying the spin behavior in MR and Fourier imaging in multi-dimensions. Introduction of conventional, fast, and chemical-shift imaging techniques. Spin echo, gradient echo, and variable flip-angle methods. Projection reconstruction and sampling theorems. Bloch equations, T1 and T2 relaxation times, rf penetration, diffusion and perfusion. Flow imaging, MR angiography, and functional brain imaging. Sequence and coil design. Prerequisite may be waived with consent of instructor. Recommended preparation: PHYS 122 or PHYS 124 or EBME 410. Offered as EBME 431 and PHYS 431.

EBME 440. Translational Research for Biomedical Engineers. 3 Units.
Translation of laboratory developments to improve biomedical and clinical research and patient care. Interdisciplinary and team communication. Evaluation of technology and research planning with clinical and engineering perspectives. Discussing clinical situations, shadowing clinicians, attending Grand Rounds and Morbidity-Mortality conferences. Validation study design. Regulatory/oversight organization. Protocol design and informed consent for Institutional Review Board (IRB) approval. NIH requirements for human subject research. Special project reports to produce IRB protocol or NIH-style proposal. Prereq: Graduate standing or Undergraduate with Junior or Senior standing and a cumulative GPA of 3.2 or above.

EBME 447A. Rehabilitation for Scientists and Engineers. 0 Units.
Medical, psychological, and social issues influencing the rehabilitation of people with spinal cord injury, stroke, traumatic brain injury, and limb amputation. Epidemiology, anatomy, pathophysiology and natural history of these disorders, and the consequences of these conditions with respect to impairment, disability, handicap, and quality of life. Students will directly observe the care of patients in each of these diagnostic groups throughout the full continuum of care starting from the acute medical and surgical interventions to acute and subacute rehabilitation, outpatient medical and rehabilitation management and finally to community re-entry.

EBME 447B. Rehabilitation for Scientists and Engineers. 3 Units.
Medical, psychological, and social issues influencing the rehabilitation of people with spinal cord injury, stroke, traumatic brain injury, and limb amputation. Epidemiology, anatomy, pathophysiology and natural history of these disorders, and the consequences of these conditions with respect to impairment, disability, handicap, and quality of life. Students will directly observe the care of patients in each of these diagnostic groups throughout the full continuum of care starting from the acute medical and surgical interventions to chronic and subacute rehabilitation, outpatient medical and rehabilitation management and finally to community re-entry. Coreq: EBME 447A.

EBME 451. Molecular and Cellular Physiology. 3 Units.
This course covers cellular and molecular basics for graduate students with little or no prior biology background. The emphasis of EBME 451 is on the molecular and cellular mechanisms underlying physiological processes. Structure-function relationship will be addressed throughout the course. The primary goal of the course is to develop understanding of the principles of the physiological processes at molecular and cellular level and to promote independent thinking and ability to solve unfamiliar problems. This course is no longer a core course of the Biomedical Engineering graduate curriculum but serves as a fundamentals course to prepare students for the graduate cellular and molecular physiology core. Prereq: Graduate standing.
EBME 452. Tissue and Organ Systems Physiology. 3 Units.
Mechanisms of membrane and capillary-tissue transport, tissue mechanics, electrical propagation, signaling, control and regulation processes. Cardiac vascular, renal, respiratory, gastro-intestinal, neural, sensory, motor, musculoskeletal, and skeletal systems. Basic engineering analysis for quantitative understanding of physiological concepts. Prereq: Graduate standing or Undergraduate with Junior or Senior standing and a cumulative GPA of 3.2 or above.

EBME 460. Advanced Topics in NMR Imaging. 3 Units.
Frontier issues in understanding the practical aspects of NMR imaging. Theoretical descriptions are accompanied by specific examples of pulse sequences, and basic engineering considerations in MRI system design. Emphasis is placed on implications and trade-offs in MRI pulse sequence design from real-world versus theoretical perspectives. Recommended preparation: EBME 431 or PHYS 431. Offered as EBME 460 and PHYS 460. Prereq: Graduate standing or Undergraduate with Junior or Senior standing and a cumulative GPA of 3.2 or above.

EBME 461. Biomedical Image Processing and Analysis. 3 Units.
Principles of image processing and analysis with applications to biomedical images from the nano-scale to 3D whole organ imaging. Topics include image filtering, enhancement, restoration, registration, morphological processing, and segmentation. Recommended preparation: EBME 409 or equivalent. Prereq: Graduate standing or Undergraduate with Junior or Senior standing and a cumulative GPA of 3.2 or above.

EBME 462. Cellular and Molecular Imaging. 3 Units.
Frontier issues in biomedical imaging that address problems at the cellular and molecular levels. Topics include endogenous methods to assess molecular compositions, imaging agents, reporter genes and proteins, and drug delivery, which will be discussed in the context of applications in cancer, cardiology, central nervous system, ophthalmology, musculoskeletal diseases, pulmonary diseases, and metabolic diseases. Emphasis is placed on an interdisciplinary problem-based approach to investigate the application of biomedical imaging to biological and disease areas. Recommended preparation: EBME 410 and EBME 451 or consent of instructor. Prereq: Graduate standing or Undergraduate with Junior or Senior standing and a cumulative GPA of 3.2 or above.

EBME 474. Biotransport Processes. 3 Units.
Biomedical mass transport and chemical reaction processes. Basic mechanisms and mathematical models based on thermodynamics, mass and momentum conservation. Analytical and numerical methods to simulate in vivo processes as well as to develop diagnostic and therapeutic methods. Applications include transport across membranes, transport in blood, tumor processes, bioreactors, cell differentiation, chemotaxis, drug delivery systems, tissue engineering processes. Recommended preparation: EBME 350 and EBME 409 or equivalent. Offered as EBME 474 and ECHE 474. Prereq: EBME 409 and graduate standing or EBME 309 and senior standing.

EBME 478. Computational Neuroscience. 3 Units.
Computer simulations and mathematical analysis of neurons and neural circuits, and the computational properties of nervous systems. Students are taught a range of models for neurons and neural circuits, and are asked to implement and explore the computational and dynamic properties of these models. The course introduces students to dynamical systems theory for the analysis of neurons and neural learning, models of brain systems, and their relationship to artificial and neural networks. Term project required. Students enrolled in MATH 478 will make arrangements with the instructor to attend additional lectures and complete additional assignments addressing mathematical topics related to the course. Recommended preparation: MATH 223 and MATH 224 or BIOL 300 and BIOL 306. Offered as BIOL 378, COGS 378, MATH 378, BIOL 478, EBME 478, EECS 478, MATH 478 and NEUR 478.

EBME 500T. Graduate Teaching II. 0 Units.
This course will provide the Ph.D. candidate with experience in teaching undergraduate or graduate students. The experience is expected to consist of direct student contact, but will be based upon the specific departmental needs and teaching obligations. This teaching experience will be conducted under the supervision of the faculty member who is responsible for the course, but the academic advisor will assess the educational plan to ensure that it provides an educational opportunity for the students. Recommended preparation: EBME 400T, BME Ph.D. student.

EBME 507. Motor System Neuroprostheses. 3 Units.
Fundamentals of neural stimulation and sensing, neurophysiology and pathophysiology of common neurological disorders, general implantation and clinical deployment issues. Specialist discussions in many application areas such as motor prostheses for spinal cord injury and stroke, cochlear implants, bladder control, stimulation for pain management, deep brain stimulation, and brain computer interfacing. Prereq: Graduate standing.

EBME 513. Biomedical Optical Diagnostics. 3 Units.
Engineering design principles of optical instrumentation for medical diagnostics. Elastic and inelastic light scattering theory and biomedical applications. Confocal and multiphoton microscopy. Light propagation and optical tomographic imaging in biological tissues. Design of minimally invasive spectroscopic diagnostics. Recommended preparation: EBME 403 or PHYS 326 or consent. Prereq: Graduate standing.

EBME 519. Parameter Estimation for Biomedical Systems. 3 Units.

EBME 570. Graduate Professional Development for Biomedical Engineers. 1 Unit.
Students will be trained in topics including public speaking, grant writing, notebook management, professionalism, etc. Prereq: Graduate standing.
EBME 600T. Graduate Teaching III. 0 Units.
This course will provide the Ph.D. candidate with experience in teaching undergraduate or graduate students. The experience is expected to consist of direct student contact, but will be based upon the specific departmental needs and teaching obligations. This teaching experience will be conducted under the supervision of the faculty member who is responsible for the course, but the academic advisor will the assess the educational plan to ensure that it provides an educational opportunity for the students. Recommended preparation: EBME 500T, BME Ph.D. student.

EBME 601. Research Projects. 1 - 18 Unit.

EBME 602. Special Topics. 1 - 18 Unit.

EBME 607. Neural Engineering Topics. 1 Unit.
The goal of this class is to explore topics in Neural Engineering not covered in the curriculum. A single topic will be chosen per semester. Four speakers with expertise in the chosen area will be invited to the campus. Each speaker will give a seminar and participate in a 2-hour workshop/journal club on the specific topic. The students will be assigned one or two seminal papers written by the speaker prior to the visit. Students will take turns presenting these papers to the rest of the class. The paper and the topic will then be open for discussion. At the end of the semester, the students will collaborate to write a single review article in a publishable format on the topic of the semester.

EBME 611. BME Departmental Seminar I. 0.5 Units.
Lectures by invited speakers on subjects of current interest in biomedical engineering. Students will be evaluated on reading and preparation of questions for select speakers, as well as weekly participation. Between this course and EBME 612 students must earn a minimum of 1 credit (two semesters) and can take up to 4 credits over eight different semesters.

EBME 612. BME Departmental Seminar II. 0.5 Units.
Lectures by invited speakers on subjects of current interest in biomedical engineering. Students will be evaluated on reading and preparation of questions for select speakers, as well as weekly participation. Between this course and EBME 611 students must earn a minimum of 1 credit (two semesters) and can take up to 4 credits over eight different semesters.

EBME 613. Topic Seminars for NeuroEngineering Students. 0.5 Units.
Lectures by students in the seminar series on subjects of current interest to biomedical engineering students in NeuroEngineering. Students will be evaluated on presentation preparation and performance, as well as weekly participation. Between this course and EBME 614 students must earn a minimum of 1 credit (two semesters) and can take up to 4 credits over eight different semesters. Prereq: Graduate standing.

EBME 614. Topic Seminars for NeuroEngineering Students. 0.5 Units.
Lectures by students in the seminar series on subjects of current interest to biomedical engineering students in NeuroEngineering. Students will be evaluated on presentation preparation and performance, as well as weekly participation. Between this course and EBME 613 students must earn a minimum of 1 credit (two semesters) and can take up to 4 credits over eight different semesters. Prereq: Graduate standing.

EBME 615. Topic Seminars for Imaging Students. 0.5 Units.
Lectures by students in the seminar series on subjects of current interest to biomedical engineering students in Imaging. Students will be evaluated on presentation preparation and performance, as well as weekly participation. Between this course and EBME 616 students must earn a minimum of 1 credit (two semesters) and can take up to 4 credits over eight different semesters. Prereq: Graduate standing.

EBME 616. Topic Seminars for Imaging Students. 0.5 Units.
Lectures by students in the seminar series on subjects of current interest to biomedical engineering students in Imaging. Students will be evaluated on presentation preparation and performance, as well as weekly participation. Between this course and EBME 615 students must earn a minimum of 1 credit (two semesters) and can take up to 4 credits over eight different semesters. Prereq: Graduate standing.

EBME 617. Topic Seminars for Biomaterials Students. 0.5 Units.
Lectures by students in the seminar series on subjects of current interest to biomedical engineering students in Biomaterials. Students will be evaluated on presentation preparation and performance, as well as weekly participation. Between this course and EBME 618 students must earn a minimum of 1 credit (two semesters) and can take up to 4 credits over eight different semesters. Prereq: Graduate standing.

EBME 618. Topic Seminars for Biomaterials Students. 0.5 Units.
Lectures by students in the seminar series on subjects of current interest to biomedical engineering students in Biomaterials. Students will be evaluated on presentation preparation and performance, as well as weekly participation. Between this course and EBME 617 students must earn a minimum of 1 credit (two semesters) and can take up to 4 credits over eight different semesters. Prereq: Graduate standing.

EBME 619. Topic Seminars for Miscellaneous Biomedical Engineering Students. 0.5 Units.
Lectures by students in the seminar series on subjects of current interest to biomedical engineering students in outside of NeuroEngineering, Imaging, and Biomaterials. Students will be evaluated on presentation preparation and performance, as well as weekly participation. Between this course and EBME 620 students must earn a minimum of 1 credit (two semesters) and can take up to 4 credits over eight different semesters. Prereq: Graduate standing.

EBME 620. Topic Seminars for Miscellaneous Biomedical Engineering Students. 0.5 Units.
Lectures by students in the seminar series on subjects of current interest to biomedical engineering students in topics outside of NeuroEngineering, Imaging, and Biomaterials. Students will be evaluated on presentation preparation and performance, as well as weekly participation. Between this course and EBME 619 students must earn a minimum of 1 credit (2 semesters) and can take up to 4 credits over eight different semesters. Prereq: Graduate standing.

EBME 621. BME Research Rotation I. 0 Units.
Opportunity for trainees to participate in BME research under supervision of faculty.

EBME 651. Thesis M.S.. 1 - 18 Unit.
Ph.D. candidates only. Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
Department of Chemical Engineering

The Department of Chemical Engineering offers Bachelor of Science in Engineering, Master of Science, and Doctor of Philosophy degree programs that provide preparation for work in all areas of chemical engineering. Breadth elective sequences in biochemical engineering, biomedical engineering, computing, electrochemical engineering, electronic materials, environmental engineering, management/entrepreneurship, polymer science, systems and control, or advanced studies provide depth and specialization for undergraduates majoring in chemical engineering. A special biochemical engineering track is available, where students integrate biochemistry, biology, and bioengineering courses into the standard chemical engineering curriculum. Chemical engineering undergraduates are members of the student chapter of the American Institute of Chemical Engineers (AIChE). The AIChE chapter sponsors social events, field trips to local industry, technical presentations by outside speakers, and employment counseling. Information about the AIChE can be obtained through the department, the chapter president or the chapter advisor. There are eleven full-time faculty members, all of whom are pursuing active research programs. The research of the faculty is aimed at advanced and emerging areas of chemical engineering.

Mission

The chemical engineering department seeks to provide the expertise, environment, facilities, and administrative structure that inspire learning and the pursuit of scholarly activities in chemical engineering and related science and engineering disciplines. The Department will provide an educational program and research environment that will permit our graduates to compete in the evolving workplace, to permit students and faculty to advance knowledge at the highest levels of the profession, and to address the technological and personnel needs of industry, governments, and society.

Background

The profession of chemical engineering involves the analysis, design, operation and control of processes that convert matter and energy to more useful forms, encompassing processes at all scales from the molecular to the megascale. Traditionally, chemical engineers are responsible for the production of basic chemicals, plastics, and fibers. However, today’s chemical engineers are also involved in food and fertilizer production, synthesis of electronic materials, waste recycling, and power generation. Chemical engineers also develop new materials (ceramic composites and electronic chips, for example) as well as biochemicals and pharmaceuticals. The breadth of training in engineering and the sciences gives chemical engineers a particularly wide spectrum of career opportunities. Chemical engineers work in the chemical and materials related industries, in government, and are readily accepted by graduate schools in engineering, chemistry, medicine, or law (mainly for patent law).

Research

Research in the department is sponsored by a variety of state and federal agencies, by private industry, and by foundations. Current active research topics include:

Energy Conversion and Storage
- Fuel cells
- Batteries
- Supercapacitors
- Transport/structure properties of polymer electrolytes for fuel cell applications
- Electrocatalysis
- Photovoltaics

Electrochemical Devices
- Electrochemical sensors
- Implantable electrochemical devices
- Electrochemical reactor design
- Electrode processes
- Metallization of semiconductor devices by plating

Biomedical Applications of Chemical Engineering
- Cell/cellular transport processes in inflammation
- Tissue engineering
- Wound healing
- Neurosensing and neural stimulation
- Engineering of surfaces for sensing applications
- Implantable electrochemical devices
- BioMEMS and biosensors
- Dental implants
- Drug delivery

Diamond and Diamond-like Materials
- Chemical vapor deposition of diamond
- Electrochemistry on diamond
- Conductive diamond films

Design and Synthesis of Advanced Materials
- Growth of single-crystal Group III nitrides
- Plasma and plasma processing
- Nanoparticles, nanotubes, nanowires
- Molecular electronics: Electrochemical synthesis of alloys and compounds
- Microvascular constructs
- Functional polymers and composites

Processing and Characterization of Novel Materials
- Nanomaterials and polymer nanocomposites
- Development of responsive additives for particle clusters
- Electronic materials
- Surface and colloidal phenomena
- Surfactant and polymer solutions
- NMR spectroscopy and imaging
- Light scattering/spectroscopy

Advanced Separation Methods
- Enhanced oil recovery
- Ultrasonically assisted sorting and collection of small particles
- Haemodialysis
- Electrochemical and membrane separations
- Nanoporous materials
Simulation and Modeling
- Mathematical modeling of engineering processes
- Molecular simulation, statistical mechanics
- Triboelectric charging
- Light scattering and laser anemometry
- Data acquisition, statistical analyses
- Current distributions/electrochemical systems
- Redox equilibria
- Biomimetics
- Monolayer dynamics
- Stochastic processes
- Electrode structures

Student Outcomes
As preparation for achieving the above educational objectives, the BS degree program in Chemical Engineering is designed so that students attain:
- an ability to apply knowledge of mathematics, science, and engineering
- an ability to design and conduct experiments, as well as to analyze and interpret data
- an ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability
- an ability to function on multidisciplinary teams
- an ability to identify, formulate, and solve engineering problems
- an understanding of professional and ethical responsibility
- an ability to communicate effectively
- the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context
- a recognition of the need for, and an ability to engage in life-long learning
- a knowledge of contemporary issues
- an ability to use the techniques, skills, and modern engineering tools necessary for engineering practice

Materials Elective: one of the following courses:
- EMAC 270 Introduction to Polymer Science and Engineering
- EMAC 276 Polymer Properties and Design
- EMSE 201 Introduction to Materials Science and Engineering
- EMSE 314 Electrical, Magnetic, and Optical Properties of Materials

Approved Breadth Elective Sequence 9-11
Total Units 57-59

Concentrations and Breadth Elective Sequences
A distinctive feature of the chemical engineering program is the three-course breadth elective sequence taken during the junior and senior years that permits a student to major in chemical engineering and, at the same time, pursue an interest in a related field. Eleven elective sequences have standing departmental approval: biochemical engineering, biomedical engineering, computing, electrochemical engineering, electronic materials, energy, environmental engineering, management/entrepreneurship, polymer science, undergraduate research and systems and control. There is also an advanced study sequence for students in the combined BS/MS program. Subject to departmental approval, students may alternatively choose to design their own breadth elective sequence.

In addition, two concentrations, one in biochemical engineering and the second in pre-medical studies, are available for students interested in these paths.

Biochemical Engineering Concentration
Biochemical engineering can be defined as the field of application of chemical engineering principles to systems that utilize biomolecules or bio-organisms to bring forth biotransformation. Biochemical engineering applications are versatile, ranging from waste-water treatment to production of therapeutic proteins. For the biochemical engineering concentration, students should take the following six courses and two electives selected from the subsequent lists:
- BIOL 300 Dynamics of Biological Systems: A Quantitative Introduction to Biology
- BIOL 301 Biotechnology Laboratory: Genes and Genetic Engineering
- BIOC 307 General Biochemistry
The Pre-Medical Concentration provides a focused approach to medical school preparation for chemical engineering majors. By using the flexibility provided by science and technical electives in the curriculum, students are able to pursue courses that provide the background needed for medical school. Students take the following courses to meet the course requirements of most medical schools.

**A student enrolled in this concentration satisfies the material and science electives requirements as well as the breadth elective sequence requirements of the program. Further, the student does not have to take CHEM 290 Chemical Laboratory Methods for Engineers.**

BS/MS Advanced Study Sequence (Advisor: Dr. Qutubuddin)

Three courses selected from the following:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>ECHE 460</td>
<td>Thermodynamics of Chemical Systems (Fall)</td>
<td>3</td>
</tr>
<tr>
<td>ECHE 461</td>
<td>Transport Phenomena (Spring)</td>
<td></td>
</tr>
<tr>
<td>ECHE 462</td>
<td>Chemical Reaction Engineering (Spring)</td>
<td></td>
</tr>
<tr>
<td>ECHE 475</td>
<td>Chemical Engineering Analysis (Fall)</td>
<td></td>
</tr>
</tbody>
</table>

Total Units: 9

Courses in these sequences may satisfy the materials elective requirement but do not reduce the total credit hours requirement for the degree.

Students should take a 300-level undergraduate or introductory graduate course that would be relevant to their research project and is approved by the department.

Bachelor of Science in Engineering

</tbody>
</table>

Year Total: 16 15

Total Units in Sequence: 129

Hours required for graduation: 129-131 (depending on breadth elective sequence)

Higher number (advanced or honors) courses are available to students by invitation only.

Must take one course from each thematic group: FSSY or USY—Thinking about the symbolic world, FSNA or USNA—Thinking about the natural world and FSSO or USSO—Thinking about the social world. Specific seminar topics will change periodically.

A three-course (9 credit hours minimum) breadth sequence (approved by the Chemical Engineering faculty). Pre-approved sequences include: biochemistry engineering, biomedical engineering, computing, electrochemical engineering, electronic materials processing, energy, environmental engineering, management, polymer science, systems and control, and advanced study (BS/MS).

SAGES Departmental Seminar.

Science elective, chosen from:

- PHYS 221 Introduction to Modern Physics
- CHEM 224 Introductory Organic Chemistry II/CHEM 324 Organic Chemistry II
- CHEM 311 Inorganic Chemistry I
- BIOL 300 Dynamics of Biological Systems: A Quantitative Introduction to Biology
One Materials elective is required. Suggested courses include:
- EMSE 201 Introduction to Materials Science and Engineering
- EMAC 270 Introduction to Polymer Science and Engineering
- EMAC 276 Polymer Properties and Design
- EMSE 314 Electrical, Magnetic, and Optical Properties of Materials

SAGES Capstone Course

Five-Year Combined BS/MS Program
This program offers outstanding undergraduate students the opportunity to obtain an MS degree, with a thesis, in one additional year of study beyond the BS degree. (Normally, it takes two years beyond the BS to earn an MS degree.) In this program, an undergraduate student can take up to nine hours of graduate credit that simultaneously satisfies undergraduate degree requirements. Typically, students in this program start their research leading to the MS thesis in the fall semester of the senior year. The BS degree is awarded at the completion of the senior year. Application for admission to the five-year BS/MS program is made after completion of five semesters of coursework. Minimum requirements are a 3.2 grade point average and the recommendation of the department.

Five-and-a-Half Year Cooperative BS/MS Program
The cooperative bachelor's/master's program enables outstanding students who are enrolled in the cooperative education program to earn an MS in one semester beyond the BS degree. Students complete six credits of a graduate project (ECHE 660) during the second co-op period and follow an Advanced Study elective sequence. The courses ECHE 460, ECHE 461, and an agreed-upon mathematics course are used to satisfy both graduate and undergraduate requirements. Typically, students in this program start their research leading to the MS thesis in the fall semester of the senior year. The BS degree is awarded at the completion of the senior year. Application for admission to the five-year BS/MS program is made after completion of five semesters of coursework. Minimum requirements are a 3.2 grade point average and the recommendation of the department.

Minor in Chemical Engineering
The minor in chemical engineering is for students majoring in other disciplines. A minimum of 17 hours in chemical engineering courses are required for the minor. The required courses are:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENGR 225</td>
<td>Thermodynamics, Fluid Dynamics, Heat and Mass Transfer</td>

<tr>
<td>ECHE 367</td>
<td>Process Control</td>
<td></td>
</tr>
</tbody>
</table>

Total Units 17-18

Graduate Programs
Master of Science Program
Each MS candidate must complete a minimum of 27 hours of graduate-level credits. These credits can be distributed in one of two ways.

Plan A

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>ECHE 401</td>
<td>Chemical Engineering Communications</td>
<td>1</td>
</tr>
<tr>
<td>Six graduate-level courses</td>
<td>18</td>
<td></td>
</tr>
<tr>
<td>MS thesis research</td>
<td>9</td>
<td></td>
</tr>
<tr>
<td>Total Units</td>
<td>28</td>
<td></td>
</tr>
</tbody>
</table>

Plan B
Part-time students, and those in the 5-1/2-year BS/MS cooperative program, may opt for Plan B, which requires completion of 24 credit hours (eight courses) of approved graduate course work and a 3 credit hour project replacing the MS thesis. In special cases, a student may be permitted to complete a 6 credit project. In this case only seven courses will be required.

All MS students are required to include the following courses in their program:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>ECHE 460</td>
<td>Thermodynamics of Chemical Systems</td>
<td>3</td>
</tr>
<tr>
<td>ECHE 461</td>
<td>Transport Phenomena</td>
<td>3</td>
</tr>
<tr>
<td>ECHE 462</td>
<td>Chemical Reaction Engineering</td>
<td>3</td>
</tr>
<tr>
<td>ECHE 475</td>
<td>Chemical Engineering Analysis</td>
<td>3</td>
</tr>
<tr>
<td>*</td>
<td>or an equivalent graduate-level math course</td>
<td></td>
</tr>
</tbody>
</table>

The other courses should be technical graduate-level courses selected after consultation with the advisor. In special circumstances, e.g., students have taken a similar or complementary course at another university, one of the required courses may be waived from the program of study. Full-time MS students are expected to do some teaching or mentoring as part of their education. Also, at various points during their thesis research, students will be required to present seminars and reports on their progress.

Master of Engineering Program
The Department of Chemical Engineering also participates in the practice-oriented Master of Engineering program offered by the Case School of Engineering. The Department of Chemical Engineering participates in the Chemical and Materials Processing and Synthesis sequence.

Doctor of Philosophy Program
The degree of Doctor of Philosophy is awarded in recognition of deep and detailed knowledge of chemical engineering and a comprehensive understanding of related subjects together with a demonstration of the ability to perform independent research, to suggest new areas for research, and to communicate results in an acceptable manner. For students entering the PhD program with a BS degree, a total of 12 courses (36 credit hours) is required. Course requirements for students entering with MS degrees are adjusted to account for work done at other universities, but a minimum of 6 courses (18 credit hours) must be taken at CWRU. The course requirements for students entering with a BS degree are as follows:
Core Courses
All programs of study must include:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>ECHE 460</td>
<td>Thermodynamics of Chemical Systems</td>
<td>3</td>
</tr>
<tr>
<td>ECHE 461</td>
<td>Transport Phenomena</td>
<td>3</td>
</tr>
<tr>
<td>ECHE 462</td>
<td>Chemical Reaction Engineering</td>
<td>3</td>
</tr>
<tr>
<td>ECHE 475</td>
<td>Chemical Engineering Analysis</td>
<td>3</td>
</tr>
<tr>
<td>Total Units</td>
<td></td>
<td>12</td>
</tr>
</tbody>
</table>

A minimum of six additional graduate courses (in chemical engineering or other departments) must be taken. At least one of these electives must be in a Basic Science (i.e., Chemistry, Physics, Biology, Biochemistry, Mathematics, or Statistics). All PhD programs of study must include two mathematics or statistics courses, one of which must be ECHE 475 (listed above as a "core" course). With department approval, a 300-level lecture course can be used to replace an elective course.

Professional Development Courses
The balance of the PhD course work (two courses in addition to the TA assignment) is met through the professional development courses. All PhD students are required to assist in three teaching experiences as part of their degree requirements. Students enroll in the following courses for these teaching experiences.

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>ECHE 401</td>
<td>Chemical Engineering Communications</td>

</tr>
<tr>
<td>Total Units</td>
<td></td>
<td>6</td>
</tr>
</tbody>
</table>

* Six semesters of ECHE 470 Graduate Research Colloquium are required.

Comments on PhD Guidelines
The department anticipates that from time to time, special cases will arise which are exceptions to the above guidelines, e.g., a student may have taken a graduate-level course at another school. In these cases, the student must submit a statement with the Planned Program of Study justifying the departure from the guidelines. It should be noted that the above guidelines are a minimum requirement. All programs are chosen with the approval of the student’s faculty advisor.

Other Requirements for the PhD Degree
Students who wish to enter the PhD program must pass a First Proposition oral examination (with an accompanying written report) that tests a student’s ability to think creatively, grasp new research concepts, and discuss such concepts critically and comprehensively. The First Proposition serves as the qualifying examination for the PhD degree. A Second Proposition focusing on the students own research topic is required by the end of the second year in the program. All PhD students must satisfy the residency requirements of the university and the Case School of Engineering. In addition, at various points in the course of the dissertation research, students will be required to prepare reports and seminars on their work, and defend their dissertation. The Chemical Engineering Graduate Student Handbook contains a more detailed description of the department’s PhD requirements and a time schedule for their completion.

Facilities
The department is housed in the Albert W. Smith Building and portions of the Bingham Building on the Case Quadrangle. Professor Smith was chair of industrial chemistry at Case from 1911 to 1927. Under his leadership a separate course of study in chemical engineering was introduced at Case in 1913. Professor Smith was also a close associate of Herbert Dow, the Case alumnus who founded Dow Chemical in 1890 with the help and support of Professor Smith. The Albert W. Smith Chemical Engineering Building contains one technology enhanced classroom; the undergraduate Unit Operations Laboratory; an undergraduate reading room, named after Prof. Robert V. Edwards; and the normal complement of offices and research laboratories. The lobby of the A.W. Smith Building, renovated by contributions from the James family, often serves as a formal and informal gathering place for students and faculty. The department has exceptionally strong facilities for electrochemical and energy research, for microfabrication, and for chemical vapor deposition and thin film synthesis. In addition, a full range of biochemical, analytical and materials characterization instrumentation is available in the Case School of Engineering. Analytical instrumentation is available within the Department of Chemical Engineering, the Department of Chemistry, and the Materials Research Laboratory.

Faculty
Uziel Landau, PhD  
(University of California, Berkeley)  
Professor and Chair  
Electrochemical engineering, modeling of electrochemical systems, electrodeposition, batteries, fuel cells, electrolyzers, corrosion  
John C. Angus, PhD  
(University of Michigan)  
Professor Emeritus  
Chemical vapor deposition of diamond, electrochemistry of diamond, gallium nitride synthesis  
Harihara Baskaran, PhD  
(The Pennsylvania State University)  
Associate Professor  
Transport phenomena in biology and medicine  
Donald L. Feke, PhD  
(Princeton University)  
Professor and Vice Provost for Undergraduate Education  
Transport phenomena, dispersive mixing, particle science and processing  
Daniel Lacks, PhD  
(Harvard University)  
C. Benson Branch Professor of Chemical Engineering  
Molecular simulation, statistical mechanics  
Chung-Chiu Liu, PhD  
(Case Institute of Technology)  
Wallace R. Persons Professor of Sensor Technology and Control  
Electrochemical sensors, electrochemical synthesis, electrochemistry related to electronic materials  
J. Adin Mann Jr., PhD  
(Iowa State University)  
Professor  
Surface phenomena, interfacial dynamics, colloid science, light scattering, biomemetics, molecular electronics, Casimir force (effects)  
Heidi B. Martin, PhD  
(Case Western Reserve University)
Developing skills in quantitative formulation and solution of word problems. Prereq: CHEM 111, ENGR 145 and MATH 122. Material and energy balances. Conservation principles and the elementary laws of physical chemistry applied to chemical processes.

**ECHE 250. Honors Research I. 1 - 3 Unit.**
A special program which affords a limited number of students the opportunity to conduct research under the guidance of one of the faculty. At the end of the first semester of the sophomore year, students who have a strong interest in research are encouraged to discuss research possibilities with the faculty. Assignments are made based on mutual interest. Subject to the availability of funds, the faculty employs students through the summers of their sophomore and junior years, as members of their research teams.

**ECHE 251. Honors Research II. 1 - 3 Unit.**
(See ECHE 250.) Recommended preparation: ECHE 250.

**ECHE 252. Introduction to Chemical Systems. 3 Units.**
Material and energy balances. Conservation principles and the elementary laws of physical chemistry applied to chemical processes. Developing skills in quantitative formulation and solution of word problems. Prereq: CHEM 111, ENGR 145 and MATH 122.

**ECHE 360. Transport Phenomena for Chemical Systems. 4 Units.**
Fundamentals of fluid flow, heat and mass transport from the microscopic and macroscopic perspectives. Applications to chemical systems, including steady and transient operations, convective and molecular (conduction and diffusion) effects, and interfacial transport. Design of unit operations (e.g., heat exchangers). Heat and mass transfer analogies. Vector/tensor analysis and dimensional analysis used throughout. Prereq: ENGR 225 and MATH 223.

**ECHE 361. Separation Processes. 3 Units.**
Analysis and design of separation processes involving distillation, extraction, absorption, adsorption, and membrane processes. Design problems and the physical and chemical processes involved in separation. Equilibrium stage, degrees of freedom in design, graphical and analytical design techniques, efficiency and capacity of separation processes. Prereq: ECHE 260 and ECHE 363.

**ECHE 362. Chemical Engineering Laboratory. 4 Units.**
Experiments in the operation of separation and reaction equipment, including design of experiments, technical analysis, and economic analysis. Experiments cover distillation, liquid-liquid extraction, heat transfer, fluidized beds, control, membrane separations, and chemical and electrochemical reactors. Prereq: ECHE 260, ECHE 360, ECHE 361, ECHE 363 and ECHE 364.

**ECHE 362D. Chemical Engineering Laboratory in Denmark. 4 Units.**
Chemical Engineering Laboratory in Denmark. A version of ECHE 362 taught during the summer at DTU in Lyngby. Prereq: ECHE 260 and ECHE 360 and ECHE 361 and ECHE 363 and ECHE 364.
ECHE 363. Thermodynamics of Chemical Systems. 3 Units.
First law, second law, phase equilibria, phase rule, chemical reaction equilibria, and applications to engineering problems.
Thermodynamic properties of real substances, with emphasis on solutions. Thermodynamic analysis of processes including chemical reactions. Prereq: ECHE 260 and Prereq or Coreq: ENGR 225.

ECHE 364. Chemical Reaction Processes. 3 Units.

ECHE 365. Measurements Laboratory. 3 Units.
Laboratory introduction to the measurement process in engineering. Matching measurements to approximate and exact physical models is stressed. Extraction of physical parameters and estimation of the errors in the parameter estimates is an important part of the course. Example projects cover steady and unsteady state heat transfer, momentum transfer, and the first law of thermodynamics. Recommended preparation: ECHE 360. Prereq: ECHE 260, ECHE 363 and ENGR 225.

ECHE 366. Process Control. 4 Units.
Theoretical and practical aspects of feedback control of chemical processes. The course involves extensive use of computer software with some exams taken using the computer. Short laboratories and Labview training are integrated into the course. Topics include: analysis of linear dynamical systems using Laplace transforms, derivation of unsteady state mathematical models of simple chemical processes, dynamic simulation of linear and nonlinear models, design of PID controllers by model inverse methods, tuning of controller to accommodate process model uncertainty, two degrees of freedom controllers, feed-forward and cascade control. The Labview training covers programming basics, interfacing to a data acquisition system, and incorporating control algorithms. Prereq: ECHE 260 and MATH 224.

ECHE 367. Fluid Mechanics for Chemical Systems. 3 Units.
This course introduces the physical and mathematical concepts associated with the motion of material and the transfer of momentum. These concepts will be applied to the analysis of engineering systems to obtain both exact solutions and practical estimates. Both analytical and numerical solutions will be utilized.

ECHE 368. Heat and Mass Transfer for Chemical Systems. 3 Units.
This course introduces the physical and mathematical concepts associated with the transfer of heat and mass. These will be applied to the analysis of engineering situations to obtain both exact solutions and practical estimates. Analytical and numerical solutions will be utilized.

ECHE 369. Chemical Engineering Design Project. 3 Units.
This is a course that uses the small teams approach to solve chemical process design problems. Numerous exercises involving process design are used to integrate material taught in previous and concurrent courses. This includes application of computer based design tools, economics, scheduling, decision making with uncertainty, and proposal and report preparation. This work leads to one comprehensive process design project done by the class, which includes a written and oral report. Prereq: ECHE 365, ECHE 367, ECHE 398.

ECHE 370. Process Analysis and Design. 3 Units.

ECHE 371. Special Topics in Chemical Engineering. 3 Units.
Special topics within an area of chemical engineering.

ECHE 372. Chemical Engineering Applied to Microfabrication and Devices. 3 Units.
Silicon based microfabrication and micromachining require many chemical engineering technologies. Microfabricated devices such as sensors are also directly related to chemical engineering. The applications of chemical engineering principles to microfabrication and micromachining are introduced. Oxidation processing, chemical vapor deposition, etching and patterning techniques, electroplating and other technologies are discussed. Graduate students will submit an additional final project on some technical aspect of microfabrication technology or devices. Recommended preparation: ECHE 363 and ECHE 371. Offered as ECHE 383 and ECHE 483.

ECHE 373. Research and Innovation. 3 Units.
This course is an opportunity for undergraduate students to experience research--how to approach a research problem, design experiments and analyze data. This will be accomplished through (a) hands-on laboratory experiences with important research techniques, (b) assignment of open-ended projects on research topics, and (c) discussion of specific interdisciplinary research being pursued at Case. It is meant to be a mechanism for students to become involved in a research project; the final assignment is to submit a proposal for this project. Example interdisciplinary research areas to be included are Fuel Cells and Batteries, Sensors, Biomaterials, and Micro and Nano-fabricated Devices.

ECHE 374. Process Analysis and Design. 3 Units.

ECHE 375. Chemical Engineering Design Project. 3 Units.
This is a course that uses the small teams approach to solve chemical process design problems. Numerous exercises involving process design are used to integrate material taught in previous and concurrent courses. This includes application of computer based design tools, economics, scheduling, decision making with uncertainty, and proposal and report preparation. This work leads to one comprehensive process design project done by the class, which includes a written and oral report. Prereq: ECHE 365, ECHE 367, ECHE 398.

ECHE 376. Graduate Teaching 1. 0 Units.
All Ph.D. students are required to take this course. The experience includes elements from the following tasks: development of teaching or lecture materials, teaching recitation groups, providing laboratory assistance, tutoring, exam/quiz/homework preparation and grading, mentoring students. Recommended preparation: Entering Ph.D. student in Chemical Engineering.
ECHE 401. Chemical Engineering Communications. 1 Unit.
Introductory course in communication for Chemical Engineering graduate students: preparation of first proposal for thesis, preparation of technical reports and scientific papers, literature sources, reviewing proposals, and manuscripts for professional journals, and making effective technical presentations.

ECHE 402. Chemical Engineering Communications II. 2 Units.
This course is a continuation of ECHE 401 and is designed to develop skills in writing proposals for funding research projects. The federal requirements are reviewed for submitting proposals to the major granting agents including NSF, NIH and DoD. We will study strategies for developing fundable projects. Each student will submit a research proposal for a thesis project and do an oral presentation of the project.

ECHE 460. Thermodynamics of Chemical Systems. 3 Units.
Phase equilibria, phase rule, chemical reaction equilibria in homogeneous and heterogeneous systems, ideal and non-ideal behavior of fluids and solutions, thermodynamic analysis of closed and open chemical systems with applications. Recommended preparation: ECHE 363.

ECHE 461. Transport Phenomena. 3 Units.

ECHE 462. Chemical Reaction Engineering. 3 Units.

ECHE 464. Surfaces and Adsorption. 3 Units.
Thermodynamics of interfaces, nature of interactions across phase boundaries, capillary wetting properties of adsorbed films, friction and lubrication, flotation, detergency, the surface of solids, relation of bulk to surface properties of materials, non-catalytic surface reactions. Recommended preparation: CHEM 335 or equivalent.

ECHE 466. Colloid Science. 3 Units.

ECHE 469. Chemical Engineering Seminar. 0 Units.
Distinguished outside speakers present current research in various topics of chemical engineering science. Graduate students also present technical papers based on thesis research.

ECHE 470. Graduate Research Colloquium. 0.5 Units.
Outside speakers present lectures on their current research. Various topics in the areas of chemical engineering science, basic and applied chemistry, bioengineering, material science, and applied mathematics are covered in the lectures. Graduate students also present technical papers based on their own research. Students are graded on the submission of one-page summary reports on any two lectures.

ECHE 474. Biotransport Processes. 3 Units.
Biomedical mass transport and chemical reaction processes. Basic mechanisms and mathematical models based on thermodynamics, mass and momentum conservation. Analytical and numerical methods to simulate in vivo processes as well as to develop diagnostic and therapeutic methods. Applications include transport across membranes, transport in blood, tumor processes, bioreactors, cell differentiation, chemotaxis, drug delivery systems, tissue engineering processes. Recommended preparation: EBME 350 and EBME 409 or equivalent. Offered as EBME 474 and ECHE 474.

ECHE 475. Chemical Engineering Analysis. 3 Units.

ECHE 477. Data Acquisition and LabVIEW Bootcamp. 1 Unit.
This course will introduce and implement basic data acquisition concepts and LabVIEW virtual instrumentation programming, providing hands-on experience with hardware and software. It is intended to help those with little or no data acquisition experience to get started on setting up data acquisition for their application. No prior experience with LabVIEW is required. Consult with the instructor for additional details.

ECHE 480. Electrochemical Engineering. 3 Units.
Engineering aspects of electrochemical processes including current and potential distribution, mass transport and fluid mechanical effects. Examples from industrial processes including electroplating, industrial electrolysis, corrosion, and batteries. Recommended preparation: ECHE 260 or permission of instructor. Offered as ECHE 381 and ECHE 480.

ECHE 483. Chemical Engineering Applied to Microfabrication and Devices. 3 Units.
Silicon based microfabrication and micromachining require many chemical engineering technologies. Microfabricated devices such as sensors are also directly related to chemical engineering. The applications of chemical engineering principles to microfabrication and micromachining are introduced. Oxidation processing, chemical vapor deposition, etching and patterning techniques, electroplating and other technologies are discussed. Graduate students will submit an additional final project on some technical aspect of microfabrication technology or devices. Recommended preparation: ECHE 363 and ECHE 371. Offered as ECHE 383 and ECHE 483.

ECHE 500T. Graduate Teaching II. 0 Units.
All Ph.D. students are required to take this course. The experience will include elements from the following tasks: development of teaching or lecture materials, teaching recitation groups, providing laboratory assistance, tutoring, exam/quiz/homework preparation and grading, mentoring students. Recommended preparation: Ph.D. student in Chemical Engineering.
ECHE 580. Special Topics. 3 Units.
Special topics in chemical engineering. Prereq: Consent of instructor.

ECHE 590. Topics in Materials Engineering. 3 Units.
Seminar course focusing on topics related to materials engineering. Typical subjects include processing and properties of electronic and nanomaterials, composites and dispersions; mixing of particles and agglomerates; electrodeposition of alloys; molecular level simulations. Students will be assigned readings from book chapters, classical articles and state of the art publications. A discussion leader (pre-assigned) will be responsible for introducing the papers and leading a critical discussion. Active student participation in the discussions is expected.

ECHE 591. Carbon Nanoscience and Nanotechnology. 3 Units.
This course presents the fundamental aspects of nanoscience and nanotechnology with an emphasis on carbon nanomaterials and nanodevices. This proposed course intends to provide students with the fundamental aspects of nanoscience and nanotechnology. Nanotechnology draws on the strengths of all the basic sciences and is the engineering at the molecular level, which has the potential to lead to novel scientific discoveries as well as new industrial technologies. This course will give students insight into a new, exciting and rapidly developing field. The course has a good balance between basic knowledge and depth with a focus on some key application areas, which will enable students to work in a variety of scientific professions. Offered as ECHE 591 and EMAC 492.

ECHE 600T. Graduate Teaching III. 0 Units.
All Ph.D. students are required to take this course. The experience will include elements from the following tasks: development of teaching or lecture materials, teaching recitation groups, providing laboratory assistance, tutoring, exam/quiz/homework preparation and grading, mentoring students. Recommended preparation: Ph.D. student in Chemical Engineering.

ECHE 601. Independent Study. 1 - 18 Unit.

ECHE 651. Thesis M.S.. 1 - 18 Unit.

ECHE 660. Special Problems. 1 - 18 Unit.
Research course taken by Plan B M.S. students.

ECHE 701. Dissertation Ph.D.. 1 - 18 Unit.
Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
Department of Civil Engineering

The Department of Civil Engineering offers programs of study in environmental, geotechnical, and structural engineering, construction engineering and management, and engineering mechanics.

Civil engineers plan, design, and construct facilities for meeting the needs of modern society. Civil engineers also help to reduce the environmental impact of these designs to help make modern society more sustainable. Examples of such facilities are transportation systems, schools and office buildings, bridges, dams, land reclamation projects, water treatment and distribution systems, commercial buildings, and industrial plants. Civil engineers can choose from a broad spectrum of opportunities in industry and consulting practice as well as research and development in firms in which civil engineers often participate as owners or partners. Employment can be found among a wide variety of industrial, governmental, construction, and private consulting organizations. There is a large demand for civil engineers nationally. The program at Case Western Reserve University is built around small classes, good faculty-student relationships and advising, and a program flexible enough to meet students’ personal career aims.

The Department of Civil Engineering of the Case School of Engineering offers an accredited Bachelor of Science degree in Civil Engineering with courses in almost all the traditional civil engineering subjects. The graduate program offers the Master of Science and Doctor of Philosophy degrees in structures, engineering mechanics, geotechnical and environmental engineering. A cooperative education program involving participating engineering firms is available for both undergraduate and graduate students.

An active research program gives the students opportunities to participate in projects related to design, analysis, and testing. Projects are in areas such as computational mechanics, probabilistic design, bridges, dynamics and wind engineering, response of concrete and steel structures, fracture mechanics, static and dynamic behavior of soils, earthquake engineering, subsurface and ex situ remediation, contaminated sediments, infrastructure materials and infrastructure systems optimization.

Mission Statement and Objectives

The Department of Civil Engineering developed its own mission statement and educational objectives that are consistent with those of the Engineering School. This process involved the entire Civil Engineering faculty and the Civil Engineering Development Committee. It was conducted during regular faculty meetings and special meetings called for this purpose. It is an ongoing process.

Mission Statement:

Our mission is to prepare students for leadership roles in civil and environmental engineering. The department will provide facilities and research expertise to advance the state of the civil engineering profession within the mission of the Case School of Engineering. Students will be taught to address problems building on solid technical foundations while taking advantage of advanced technologies. Our graduates will adhere to high technical and ethical standards, in service to the public. Graduates will be prepared for the pursuit of advanced learning in civil engineering and related fields, as well as for the practice of civil and environmental engineering at the highest professional levels.

Research

Research under way in Civil Engineering includes work in analytical, design and experimental areas and is sponsored by industry, state, and federal government sources. Major areas of research interest are:

- Random vibration
- Engineering materials
- Behavior of reinforced and prestressed concrete
- Wind engineering
- Earthquake analysis and design of structures
- Finite element methods
- Nondestructive Testing of Structures
- Passive and active control of the vibration of structures
- Transient response of nonlinear structures
- Blast loading of structures
- Modeling of micro electromechanical systems
- Fracture mechanics
- Modeling of concrete, of geomaterials and of asphalt concrete
- High and low-cycle fatigue
- Geotechnical/Pavement Materials
- Static behavior of anisotropic clays and sands
- Soil liquefaction
- Bifurcation and shear banding in soils
- Centrifuge modeling of static and dynamic soil behavior
- Dynamic soil structure interaction
- Non-destructive testing evaluation of soils and pavement materials
- Measurement of dynamic soil properties
- Design of Structures for High-Speed Vehicles
- Stability of tailings dams
- Environmental Engineering
- Environmentally conscious manufacturing
- Remediation of “old” metal-contaminated soils
- Brownfields/structural remediation
- Environmental modeling/software development
- Environmental decision analysis
- Geoenvironmental engineering
- Environmental fluid mechanics
- Sediment remediation
- In-situ remediation of non-aqueous phase liquids
- Environmental chemistry
- Bioremediation
- Sustainable engineering
- Structural health monitoring
- Transportation safety
- Infrastructure engineering
- Non-destructive Testing
- Sensor technology
- Smart materials
- Energy structures and geotechnology
- Urban hydraulics
- Soil contamination standards
Undergraduate Programs

The faculty of the Civil Engineering Department believe very strongly that undergraduate education should prepare students to be productive engineers upon receiving the degree. For this reason, particular emphasis in undergraduate teaching is placed on the application of engineering principles to the solution of problems. After completing a broad civil engineering core program undergraduate students must choose an elective sequence in one of the areas of civil engineering of particular interest, such as structural, geotechnical or environmental engineering; construction management or engineering mechanics.

In order to provide undergraduates with experience in industry, the department attempts to arrange summer jobs for the three summers between their semesters at Case Western Reserve University. By working for organizations in all areas of design and construction, students can gain an invaluable knowledge of the way the industry functions. This experience lets them gain more from their education and makes them more attractive to prospective employers upon graduation.

A cooperative education program is also available, which allows the student to spend time working full-time in an engineering capacity with a contractor, consulting engineer, architect, or materials supplier during the course of his or her education. This learning experience is designed to intergrate classroom theory with practical experience and professional development.

The Bachelor of Science degree program in Civil Engineering is accredited by the Engineering Accreditation Commission of ABET, www.abet.org (http://bulletin.case.edu/schoolofengineering/civilengineering/http://www.abet.org).

The curriculum has been designed so that the student chooses a sequence of four (4) or more approved elective courses. The sequence is intended to give students the chance to pursue in some depth a particular area related to their careers as civil engineers. Samples of courses from which elective sequences could be chosen follow the civil engineering curriculum in this bulletin. In addition, the students are required to do a senior project in their area of interest.

Students enrolled in other majors may elect to pursue a minor in civil engineering or in environmental engineering. Department approval and a minimum of 15 credit hours are required.

Most classes in the Civil Engineering Department have enrollment of less than 25 so the students have opportunities to develop close relationships with the faculty. Students also have opportunities to gain practical experience as well as earn a supplemental income by assisting faculty members on consulting work during vacation periods.

Educational Objectives

1. Graduates of the ECIV Program will enter the profession of Civil Engineering and advance to positions of greater responsibility and leadership, in line with ASCE Professional Grade Descriptions.
2. Graduates of the ECIV Program will enter and successfully progress in, or complete, advanced degree programs within their fields of choice.
3. Graduates of the ECIV Program will progress toward or complete professional registration and licensure.

Student Outcomes

As preparation for achieving the above educational objectives, the BS degree program in Civil Engineering is designed so that students attain:

- an ability to apply knowledge of mathematics (including differential equations) and science (including calculus-based physics and general chemistry) and one additional area of science.
- an ability to design and conduct experiments, as well as to analyze and interpret data in more than one area of civil engineering.
- an ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability.
- an ability to function on multi-disciplinary teams.
- an ability to identify, formulate, and solve engineering problems.
- an understanding of professional and ethical responsibility and the role of civil engineers in providing for the safety and well-being of the general public.
- an ability to communicate effectively in written and oral form.
- the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context.
- a recognition of the need for, and an ability to engage in life-long learning.
- a knowledge of contemporary issues.
- an ability to use the techniques, skills, and modern engineering tools necessary for engineering practice and the design of functional civil engineering facilities.
- proficiency in probability and statistics, as applied to civil engineering design and planning issues.
- an understanding of professional practice issues, including the role of civil engineering design and management professionals in the construction process, public policy and leadership.
- an ability to develop an understanding of the importance of professional licensure and the ethical use of a professional license.

Structural Engineering
Computer use is an integral part of the Civil Engineering curriculum. From required courses in computer programming and numerical analysis to subsequent use and development of civil engineering programs, the student fully utilizes the computer as a planning, analysis, design, and managerial tool.

All sequences are constructed to provide a balance of marketable skills and theoretical bases for further growth. With departmental approval other sequences can be developed to meet students’ needs.

ECIV 411  Elasticity, Theory and Applications
ECIV 420  Finite Element Analysis

**Structural & Geotechnical Engineering**

ECIV 211  Civil Engineering Materials
ECIV 320  Structural Analysis I
ECIV 321  Structural Analysis II
ECIV 322  Structural Design I
ECIV 323  Structural Design II
ECIV 330  Soil Mechanics
ECIV 430  Foundation Engineering
ECIV 433  Soil Dynamics

**Construction Engineering and Management**

ECIV 340  Construction Management
ECIV 341  Construction Scheduling and Estimating
ACCT 203  Survey of Accounting
BIFI 355  Corporate Finance
COGS 303  SAGES Departmental Seminar: Current Controversies in Cognitive Science (acct 203)

* Approval of the department is required.

**Minor in Environmental Engineering**

Select a minimum of 15 credit hours from the following list of courses (approval of the department is required):

ENGR 225  Thermodynamics, Fluid Dynamics, Heat and Mass Transfer  4
EEPS 321  Hydrogeology  3
ECIV 351  Engineering Hydraulics and Hydrology  3
ECIV 361  Water Resources Engineering  3
ECIV 362  Solid and Hazardous Waste Management  3
ECIV 368  Environmental Engineering  3
ECIV 460  Environmental Remediation  3

**Graduate Programs**

The graduate programs in structural engineering, geotechnical engineering, engineering mechanics and environmental engineering prepare students for careers in industry, professional practice, research and teaching. Experience has shown that job opportunities are excellent for students who receive advanced degrees in civil engineering from Case Western Reserve University. Recent advanced degree recipients have found positions in universities, consulting firms, state and federal agencies, aerospace firms, and the energy industry.

Each student’s program of course work and research is tailored to his or her interests, in close consultation with the faculty advisor. For students working toward the Master of Science degree plans may include a research oriented thesis, a practice oriented project or only courses plus a comprehensive exam. For students working toward the Doctor of Philosophy degree a research dissertation is required.

The department also encourages undergraduate students to make use of the university’s BS/MS program to pursue advanced studies in Civil Engineering. Undergraduates should apply for the BS/MS program in their junior year so they are able to select senior electives that will also satisfy MS degree requirements. Up to 9 hours of senior electives may be counted in both the BS and MS program thus allowing the student to complete the MS degree in the fifth year of study. Fifth year tuition scholarships may also be available. For more information students should discuss the BS/MS program with their Academic Advisor and/or the department BS/MS program coordinator.

**Facilities**

**Vanderhoof-Schuette Structural Laboratory**

The Vanderhoof-Schuette Structural Laboratory and Educational facility features a 2400 ft² cellular strong floor and a 28 ft. high, L-shaped cellular strong wall. The strong wall includes a vertical cell for testing tall specimens with loads up to 1000kips. A 15-ton crane, a scissors lift, and a forklift truck are available for positioning specimens. A 95 gpm hydraulic pump powers servo-hydraulic actuators for applying static or dynamic forces. The laboratory has a variety of instrumentation and data acquisition equipment. A 6 ft x 6 ft uni-axial shaking table is available for seismic testing of small physical models.

**Strength of Materials Laboratory**

This laboratory is equipped with two MTS servo-hydraulic test systems. One of the MTS systems is capable of applying simultaneous axial and torsional loads. Capabilities include fracture toughness evaluation of various materials, crack growth kinetics under different loading histories and other micromechanics studies. An environmental chamber is available.

**Bingham Concrete Laboratory**

A concrete laboratory is available for undergraduate instruction. It includes screening equipment, a concrete mixer, air-entrainment equipment, a humidity-controlled room for curing concrete, and facilities for prestressing concrete. A 300k MTS servo-hydraulic machine is available for testing concrete and masonry specimens.

**Environmental Engineering Laboratory**

This laboratory is one in a suite of laboratories that support environmental engineering teaching and research. The facilities include a teaching laboratory, an advanced instrumentation laboratory, a remediation research laboratory and an electronic classroom/software laboratory. The Environmental Engineering laboratory is equipped for conventional Standard Methods analysis of water, wastewater, soil, solid waste and air samples (pH meters, furnaces, ovens, incubators, hoods, etc.) and for aerobic microbiology work. The lab also offers generous bench top space for student teams to explore laboratory procedures and provides direct access to research, instrumentation, and computational facilities.

**Environmental Instrumentation Laboratory**

This laboratory is equipped for state-of-the-art analysis of environmental contaminants. The room supports a computer controlled Dionex DX-500 IC/HPLC system, a computer controlled Varian SPECTRAA 200/SIPS 10 (flame & furnace) AA system, and a computer controlled Hewlett Packard 6890 GC/MS analysis system for organic and inorganic pollutant analysis. Where appropriate, machines have been equipped with autosamplers to improve productivity.

**Remediation Research Laboratory**

This laboratory is designed to support physical research on the applied science and design of remediation engineering. The laboratory provides a modeling floor for the assembly of laboratory-scale remediation schemes, and provides immediate access to instrumentation and computational facilities for data analysis.

**Soil Mechanics Laboratory**

This laboratory has a full array of both instructional and research units; notable are automated triaxial units for generalized extension and compression tests, units permitting simultaneous application of hydrostatic, axial, and torsional static and dynamic stresses, a cubical
device for true triaxial testing, units by means of which one-dimensional consolidation in the triaxial cell can be automatically achieved, and various pore pressure force and deformation measuring devices. Tests are monitored and evaluated by data acquisition-computer systems. Also available is a longitudinal and torsional resonant column device and a large size oedometer equipped with bender elements. The laboratory has a SP2000 high speed camera to study dynamic phenomena. A 20 g-tons fully automated centrifuge with a servo-hydraulic earthquake shaker is in operation. The laboratory has a full set of equipment for TDR tests.

**Haptic Research Laboratory**
The haptic interface laboratory hosts two state-of-the-art driving simulators. It provides holistic driving simulations for advanced research, education and training in the area of transportation safety, human perception and human-machine interface.

**Neff Civil Engineering Undergraduate Computer Laboratory**
This laboratory provides Civil Engineering students with access to all the computer resources needed for both course work and research. The laboratory is supplemented by other facilities provided by the university. All of the computers in the Neff lab can act as independent workstations or provide access via a fiber optic link to other campus computers.

**Civil Engineering Study Lounge**
This study area is designed to supplement the computer laboratories with a more quiet workplace for individual or group study.

**ASCE Lounge**
Provides a student controlled venue for hosting American Society of Civil Engineers (ASCE) student chapter activities.

**Miller Library**
The Miller Library named in honor of Graig J. Miller, a former Civil Engineering Faculty member, acts as both a library and as the Department’s premier meeting space.

**Vose Room**
The department also shares use of the Vose Room equipment for meetings and video conferencing.

**Faculty**
Xiangwu (David) Zeng, PhD, PE

*Professor*
Structures; wind and earthquake engineering; applied random processes; history of engineering
Arthur A. Huckelbridge, DEng, PE
(University of California Berkeley)
*Professor*
Structures, design and dynamics: earthquake engineering, bridge engineering
Aaron A. Jennings, PhD, PE
(University of Massachusetts)
*Professor*
Environmental and geoenvironmental engineering; groundwater contamination; hazardous waste management; uncertainty analysis for environmental models
Brian Metrovich, PhD
(Lehigh University)
*Associate Professor*
Structural engineering, fatigue and fracture mechanics, steel structures, atomistic modeling of failure phenomena, structural health monitoring, and nondestructive evaluation
Michael Pollino, PhD, PE
(University at Buffalo)
*Assistant Professor*
Structural engineering; seismic analysis and design, rehabilitation of structures and civil infrastructure, large scale experimental testing of structural systems and sub-assemblages, structural dynamics, steel structures
Adel S. Saada, PhD, PE
(Princeton University)
*Professor*
Mechanics of materials; static and dynamic mechanical behavior of soils; foundation engineering
Xiong (Bill) Yu, PhD, PE
(Purdue University)
*Associate Professor*
Geotechnical engineering; infrastructure; construction material testing; information technology
Banu Sizirici Yildiz, PhD
(Florida International University)
*Assistant Professor*
Sustainable engineering systems, waste management and concentrate management

**Emeritus Faculty**
J. Ludwig Figueroa, PhD
(University of Illinois)
*Professor Emeritus*

**Adjunct Faculty**
Terrance Cybulski, Adjunct Lecturer
Philip DeSantis, Adjunct Professor
Dan Ghiocel, Adjunct Professor
Kenneth L. Klika, Adjunct Professor
Mark D. Rokoff, Adjunct Assistant Professor
John Stevenson, Adjunct Professor
Lance Wanamaker, Adjunct Lecturer
Katie Wheaton, Adjunct Lecturer
Bart Zalewski, Adjunct Lecturer
Erwin V. Zaretsky, Adjunct Professor

**Staff**
Nancy A. Longo, Department Assistant
Courses

ECIV 160. Surveying and Computer Graphics. 3 Units.
Principles and practice of surveying; error analysis, topographic mapping, introduction to photogrammetry and GIS; principles of graphics; computer-aided-drafting. Laboratory.

ECIV 211. Civil Engineering Materials. 3 Units.

ECIV 300. Undergraduate Research. 3 Units.
Research conducted under the supervision of a sponsoring Civil Engineering faculty member. Research can be done on an independent topic or as part of an established ongoing research activity. The student will prepare a written report on the results of the research. Course may fulfill one technical elective requirement.

ECIV 310. Strength of Materials. 3 Units.

ECIV 320. Structural Analysis I. 3 Units.

ECIV 321. Structural Analysis II. 3 Units.

ECIV 322. Structural Design I. 3 Units.

ECIV 323. Structural Design II. 3 Units.
Continuation of ECIV 322. Collapse limit state analysis/design, torsion of concrete members, reinforcing steel details, compression reinforced flexural members, two-way slabs, slender columns, torsion of steel members, lateral and local buckling of steel members, plate girders, intro to prestressed concrete design and timber design. Recommended preparation: ECIV 320 and ECIV 322.

ECIV 330. Soil Mechanics. 4 Units.
The physical, chemical, and mechanical properties of soils. Soil classification, capillarity, permeability, and flow nets. One dimensional consolidation, stress and settlement analysis. Shear strength, stability of cuts, and design of embankments, retaining walls and footings. Standard laboratory tests performed for the determination of the physical and mechanical properties of soils. Laboratory. Recommended preparation: ECIV 310.

ECIV 340. Construction Management. 3 Units.
Selected topics in construction management including specifications writing, contract documents, estimating, materials and labor, bidding procedures and scheduling techniques. The course is augmented by guest lecturers from local industries.

ECIV 341. Construction Scheduling and Estimating. 3 Units.
The focus is on scheduling, and estimating and bidding for public and private projects. This includes highways as well as industrial and building construction. The use of computers with the latest software in estimating materials, labor, equipment, overhead and profit is emphasized. Recommended preparation: ECIV 340 and consent of instructor.

ECIV 351. Engineering Hydraulics and Hydrology. 3 Units.
Application of fluid statics and dynamics to Civil Engineering Design. Hydraulic machinery, pipe network analysis, thrust, hammer, open channel flow, sewer system design, culverts, flow gauging, retention detention basin design. Applied hydrology, hydrograph analysis and hydraulic routing will also be introduced. Recommended preparation: Concurrent enrollment in ENGR 225.

ECIV 360. Civil Engineering Systems. 3 Units.
Introduction to probability, random variables, and non-deterministic modeling. Decision-making in civil engineering. Engineering economics. Introduction to optimization and linear programming. Reliability analysis.

ECIV 361. Water Resources Engineering. 3 Units.
Water doctrine, probabilistic analysis of hydrologic data, common and rare event analysis, flood forecasting and control, reservoir design, hydrologic routing, synthetic streamflow generation, hydroelectric power, water resource quality, water resources planning. Recommended preparation: ECIV 351.

ECIV 362. Solid and Hazardous Waste Management. 3 Units.

ECIV 368. Environmental Engineering. 3 Units.
Principle and practice of environmental engineering. Water and waste water engineering unit operations and processes including related topics from industrial waste disposal, air pollution and environmental health.

ECIV 396. Civil Engineering Special Topics I. 1 - 3 Unit.
Special topics in civil engineering in which a regular course is not available. Conferences and report.

ECIV 397. Civil Engineering Topics II. 3 Units.
Special topics in civil engineering in which a regular course is not available. Conferences and report.
ECIV 398. Civil Engineering Senior Project. 3 Units.
A project emphasizing research and/or design must be completed by all civil engineers. Requirements include periodic reporting of progress, plus a final oral presentation and written report.

ECIV 400T. Graduate Teaching I. 0 Units.
This series of three courses will provide Ph.D. students with practical experience in teaching at the University level and will expose them to effective teaching methods. Each course assignment will be organized in coordination with the student's dissertation advisor and the department chairperson. Assignments will successively require more contact with students, with duties approaching the teaching requirements of a faculty member in the Ph.D. student's area of study. Prereq: Ph.D. students in Civil Engineering.

ECIV 411. Elasticity, Theory and Applications. 3 Units.

ECIV 420. Finite Element Analysis. 3 Units.
Development and application of finite element methods with emphasis on solid mechanics. Development of truss, beam, shell, and solid elements will be considered. Formulation of isoparametric elements. Meshing and modeling techniques discussed using commercial finite element software. Recommended preparation: ECIV 310 or permission of instructor.

ECIV 421. Advanced Reinforced Concrete Design. 3 Units.
Properties of plain and reinforced concrete, ultimate strength of reinforced concrete structural elements, flexural and shear design of beams, bond and cracking, torsion, moment redistribution, limit analysis, yield line analysis of slabs, direct design and equivalent frame method, columns, fracture mechanics concepts. Recommended preparation: ECIV 322 and consent of instructor.

ECIV 422. Advanced Structural Steel Design. 3 Units.
Selected topics in structural steel design including plastic design, torsion, lateral buckling, torsional-flexural buckling, frame stability, plate girders, and connections, including critical review of current design specifications relating to these topics. Recommended preparation: ECIV 322.

ECIV 423. Prestressed Concrete Design. 3 Units.
Design of prestressed concrete structures, mechanical behavior of concrete suitable for prestressing and prestressing steels, load balancing, partial prestressing, prestressing losses, continuous beams, prestressed slab design, columns. Recommended preparation: ECIV 323 or ECIV 421 and consent of instructor.

ECIV 424. Structural Dynamics. 3 Units.
Modeling of structures as single and multidegree of freedom dynamic systems. The eigenvalue problem, damping, and the behavior of dynamic systems. Deterministic models of dynamic loads such as wind and earthquakes. Analytical methods, including modal, response spectrum, time history, and frequency domain analyses. Recommended preparation: ECIV 321 and consent of instructor.

ECIV 425. Structural Design for Dynamic Loads. 3 Units.
Structural design problems in which dynamic excitations are of importance. Earthquake, wind, blast, traffic, and machinery excitations. Human sensitivity to vibration, mechanical behavior of structural elements under dynamic excitation, earthquake response and earthquake-resistant design, wind loading, damping in structures, hysteretic energy dissipation, and ductility requirements. Recommended preparation: ECIV 424.

ECIV 426. Structural Reliability. 3 Units.

ECIV 430. Foundation Engineering. 3 Units.

ECIV 431. Special Topics in Geotechnical Engineering. 3 Units.

ECIV 432. Mechanical Behavior of Soils. 3 Units.
Soil statics and stresses in a half-space-tridimensional consolidation and sand drain theory; stress-strain relations and representations with rheological models. Critical state and various failure theories and their experimental justification for cohesive and noncohesive soils. Laboratory measurement of rheological properties, pore water pressures, and strength under combined stresses. Laboratory. Recommended preparation: ECIV 330.

ECIV 433. Soil Dynamics. 3 Units.

ECIV 437. Pavement Analysis and Design. 3 Units.
ECIV 450. Environmental Engineering Chemistry. 3 Units.
Fundamentals of inorganic, organic, and physical chemistry with emphasis on the types of problems encountered in the environmental engineering field. Equilibria among liquid, gaseous, and solid phases; kinetics to the extent that time permits. A strong mathematical approach is taken in solving the equilibrium and kinetic problems presented. Equilibrium speciation software for solution of more complex problems. Topics that will be covered in the course include chemical equilibrium, acid/base reactions, mathematical problem solving approach, graphical approaches, titration curves, solubility of gases and solids, buffering systems, numerical solution of equilibrium problems, thermodynamics, oxidation-reduction reactions, principles of quantitative chemistry and analytical techniques, introduction to the use of analytical instrumentation, and chemical kinetics. Prereq: ECIV 368 or requisites not met permission.

ECIV 451. Infrastructure Engineering Practice. 3 Units.
Case studies presenting significant accomplishments in infrastructure engineering presented by distinguished practicing engineers. Case studies will examine the historical development of our infrastructure, assessing cultural value of our built environment, alternate infrastructure models, public empowerment, sustainability, stewardship, financing, legal issues, and concepts for future development of infrastructure systems. Students will write environmental and cultural assessments of specific infrastructure projects.

ECIV 452. Infrastructure Aging and Assessment Technologies. 4 Units.
Mechanical, thermal, and electrochemical processes that cause degradation of our built infrastructure. Reinforced concrete carbonation and freezing and thawing; fatigue, brittle fracture, and corrosion of steel; weathering of masonry; degradation of asphalt pavements; deterioration of underground systems; aging of polymer-based construction products such as sealants and coatings. Assessment technologies, including non-destructive testing and mathematical modeling. Laboratory and field experiences.

ECIV 453. Infrastructure Rehabilitation Design. 4 Units.
Rehabilitation materials and systems; mechanical, electrochemical, thermal, environmental, and aesthetic criteria for decision-making; design principles; specifications and control of construction processes; rehabilitation case studies. Application to structures, pipelines, pavements, and drainage systems.

ECIV 454. Modeling Infrastructure Systems. 4 Units.
Examination of the properties that distinguish infrastructure performance models from more traditional engineering analysis models. Infrastructure software implementation strategies. Application of existing models to problems such as water distribution systems, mass transport, pavement management, and brownfield redevelopment. Development of new models to address infrastructure performance and sustainability.

ECIV 455. Infrastructure Engineering Decision Making. 3 Units.
Aspects of decision theory applied to infrastructure systems. Review of probability and statistics, engineering economics, cost-benefit analysis, impact of social, historical, environmental and government policies on decisions. Emergency management and security considerations. Methods of project financing; asset management and asset optimization.

ECIV 456. Intelligent Infrastructure Systems. 3 Units.
Topics on smart infrastructure systems; smart materials fabrication, embedded sensing technology for infrastructure condition monitoring, the system models for infrastructural condition diagnosing and adaptive controlling, and spatial-temporal integrated infrastructure management system.

ECIV 460. Environmental Remediation. 3 Units.
Evolution of proactive environmental engineering to recover contaminated air, water, and soil environments. Lake and river remediation, contaminated sediments, indoor air quality, chemical spills, underground storage tanks, contaminated soils, solid and hazardous waste sites, superfund remediation. Recommended preparation: ECIV 368 or consent of instructor.

ECIV 500T. Graduate Teaching II. 0 Units.
This series of three courses will provide Ph.D. students with practical experience in teaching at the University level and will expose them to effective teaching methods. Each course assignment will be organized in coordination with the student’s dissertation advisor and the department chairperson. Assignments will successively require more contact with students, with duties approaching the teaching requirements of a faculty member in the Ph.D. student’s area of study. Prereq: Ph.D. student in Civil Engineering.

ECIV 560. Environmental Engineering Modeling. 3 Units.

ECIV 561. Groundwater Analysis. 3 Units.
Principles of mass transport through porous media, formulation of saturated and unsaturated flow equations in alternative coordinate systems, analytical and numerical solutions of flow equations, application of existing groundwater software, analysis of solute transport problems.

ECIV 585. Fracture Mechanics. 3 Units.
Crack tip fields, stress intensity factors, singular solutions, energy changes with crack growth, cohesive zone models, fracture toughness, small scale yielding, experimental techniques, fracture criteria, J-integral, R-curve, fatigue cracks, fracture of composites, dynamic fracture. Recommended preparation: ECIV 405, ECIV 411 and consent of instructor.

ECIV 587. Advanced Mechanics Seminar. 3 Units.
Advanced topics in mechanics of solids. Thermodynamics with internal variables; thermoelasticity; plasticity; gradient theories; finite theories of plasticity; damage mechanics; endochronic plasticity; non-linear fracture mechanics; probabilistic mechanics. Recommended preparation: ECIV 406, ECIV 420, ECIV 505 or consent of instructor.
ECIV 600T. Graduate Teaching III. 0 Units.
This series of three courses will provide Ph.D. students with practical experience in teaching at the University level and will expose them to effective teaching methods. Each course assignment will be organized in coordination with student’s dissertation advisor and the department chairperson. Assignments will successively require more contact with students, with duties approaching the teaching requirements of a faculty member in the Ph.D. student’s area of study. Prereq: Ph.D. students in Civil Engineering.

ECIV 601. Independent Study. 1 - 18 Unit.
Plan B.

ECIV 611. Civil Engineering Graduate Seminar. 0 Units.
Distinguished outside speakers present current research in various topics of Civil Engineering. Graduate students also present technical papers based on thesis research.

ECIV 650. Infrastructure Project. 1 - 6 Unit.
Project based experience in the application of infrastructure engineering principles to a complex infrastructure system.

ECIV 651. Thesis M.S.. 1 - 18 Unit.
Plan A.

ECIV 660. Special Topics. 1 - 18 Unit.
Topics of special interest to students and faculty. Topics can be those covered in a regular course when the student cannot wait for the course to be offered.

Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
Department of Electrical Engineering and Computer Science

Electrical Engineering and Computer Science (EECS) spans a spectrum of topics from (i) materials, devices, circuits, and processors through (ii) control, signal processing, and systems analysis to (iii) software, computation, computer systems, and networking. The EECS Department at Case Western Reserve supports four synergistic degree programs: Electrical Engineering, Computer Science, Computer Engineering, and Systems & Control Engineering. Each degree program leads to the Bachelor of Science degree at the undergraduate level. The department also offers a Bachelor of Arts in Computer Science for those students who wish to combine a technical degree with a broad education in the liberal arts. At the graduate level, the department offers the Master of Science and Doctor of Philosophy degrees in Electrical Engineering, Computer Engineering, Systems & Control Engineering, and Computing & Information Sciences (i.e., computer science). We offer minors in Electrical Engineering, Computer Science (BS and BA), Computer Engineering, Systems & Control Engineering, and also in Computer Gaming, Artificial Intelligence (AI), and Electronics. For supplemental information to this bulletin as well as the latest updates, please visit the EECS Department web site at http://eecs.case.edu.

EECS is at the heart of modern technology. EECS disciplines are responsible for the devices and microprocessors powering our computers and embedded into everyday devices, from cell phones and tablets to automobiles and airplanes. Healthcare is increasingly building on EECS technologies: micro/nano systems, electronics/instrumentation, implantable systems, wireless medical devices, surgical robots, imaging, medical informatics, bioinformatics, system biology, and data mining and visualization. The future of energy will be profoundly impacted by EECS technologies, from smart appliances connected to the Internet, smart buildings that incorporate distributed sensing and control, to the envisioned smart grid that must be controlled, stabilized, and kept secure over an immense network. EECS drives job creation and starting salaries in our fields are consistently ranked in the top of all college majors. Our graduates work in cutting-edge companies—from giants to start-ups, in a variety of technology sectors, including computer and internet, healthcare and medical devices, manufacturing and automation, automotive and aerospace, defense, finance, energy, and consulting.

Department Structure

EECS at Case Western Reserve is organized internally into two informal divisions: (i) Computer Science (CS); and (ii) Electrical, Computer, and Systems Engineering (ECSE). The chair of EECS is Professor Michael Branicky.

Educational Philosophy

The EECS department is dedicated to developing high-quality graduates who will take positions of leadership as their careers advance. We recognize that the increasing role of technology in virtually every facet of our society, life, and culture makes it vital that our students have access to progressive and cutting-edge higher education programs. The program values for all of the degree programs in the department are:

- mastery of fundamentals
- creativity
- social awareness

- leadership skills
- professionalism

Stressing excellence in these core values helps to ensure that our graduates are valued and contributing members of our global society and that they will carry on the tradition of engineering leadership established by our alumni.

Our goal is to graduate students who have fundamental technical knowledge of their profession and the requisite technical breadth and communications skills to become leaders in creating the new techniques and technologies which will advance their fields. To achieve this goal, the department offers a wide range of technical specialties consistent with the breadth of electrical engineering and computer science, including recent developments in the field. Because of the rapid pace of advancement in these fields, our degree programs emphasize a broad and foundational science and technology background that equips students for future developments. Our programs include a wide range of electives and our students are encouraged to develop individualized programs which can combine many aspects of electrical engineering and computer science.

Research

The research thrusts of the Electrical Engineering and Computer Science department include:

1. Micro/Nano Systems
2. Electronics and Instrumentation
3. Robotics and Haptics
4. Embedded Systems, including VLSI, FPGA
6. Bioinformatics and Systems Biology
7. Machine Learning and Data Mining
8. Computer Networks and Distributed Systems
9. Secure and Reliable Software
10. Energy Systems, including Wind and Power Grid Management/Control
11. Gaming, Simulation, Optimization
12. Medical Informatics and Wireless Health

EECS participates in a number of groundbreaking collaborative research and educational programs, including the Microelectromechanical Systems Research Program, the Center for Computational Genomics, graduate program in Systems Biology and Bioinformatics, the Clinical & Translational Science Collaborative, the Great Lakes Energy Institute, and the VA Center for Advanced Platform Technology.

Electrical Engineering | Systems and Control Engineering | Computer Engineering | Computer Science | Suggested Programs of Study

Undergraduate Programs

The EECS department engineering offers accredited programs leading to BS degrees in:

1. Electrical Engineering
2. Systems and Control Engineering
3. Computer Engineering
4. Computer Science

These programs provide students with a strong background in the fundamentals of mathematics, science, and engineering. Students
can use their technical and open electives to pursue concentrations in
bioelectrical engineering, complex systems, automation and control,
digital systems design, embedded systems, micro/nano systems, robotics
and intelligent systems, signal processing and communications, and
software engineering. In addition to an excellent technical education,
all students in the department are exposed to societal issues, ethics,
professionalism, and have the opportunity to develop leadership and
creativity skills.

The Bachelor of Science degree programs in Computer Engineering,
Electrical Engineering, and Systems and Control Engineering are
accredited by the Engineering Accreditation Commission of ABET,

The Bachelor of Science degree program in Computer Science is
accredited by the Computing Accreditation Commission of ABET,

**Electrical Engineering**

The Bachelor of Science program in electrical engineering provides
our students with a broad foundation in electrical engineering through
combined classroom and laboratory work, and prepares our students for
entering the profession of electrical engineering, as well as for further
study at the graduate level.

The educational mission of the electrical engineering program is to
graduate students who have fundamental technical knowledge of their
profession and the requisite technical breadth and communications skills
to become leaders in creating the new techniques and technologies that
will advance the general field of electrical engineering.

**Educational Objectives**

1. Graduates will be successful professionals obtaining positions
   appropriate to their background, interests, and education.
2. Graduates will engage in life-long learning.
3. Graduates employed within engineering fields will demonstrate
techical competence such as identifying, formulating, analyzing,
and creating engineering solutions using appropriate current
engineering techniques, skills, and tools.
4. Graduates will be able to (i) effectively communicate technical
   information, (ii) function effectively on teams, and (iii) develop and
   apply electrical engineering solutions within a global, societal, and
   environmental context.

**Student Outcomes**

As preparation for achieving the above educational objectives, the BS
degree program in Electrical Engineering is designed so that students attain:

- an ability to apply knowledge of mathematics, science, and
  engineering
- an ability to design and conduct experiments, as well as to analyze
  and interpret data
- an ability to design a system, component, or process to meet desired
  needs within realistic constraints such as economic, environmental,
  social, political, ethical, health and safety, manufacturability, and
  sustainability
- an ability to function on multi-disciplinary teams
- an ability to identify, formulate, and solve engineering problems
- an understanding of professional and ethical responsibility
- an ability to communicate effectively
- the broad education necessary to understand the impact of
  engineering solutions in a global, economic, environmental, and
  societal context
- a recognition of the need for, and an ability to engage in life-long
  learning
- a knowledge of contemporary issues
- an ability to use the techniques, skills, and modern engineering tools
  necessary for engineering practice.

Core courses provide our students with a strong background in signals
and systems, computers, electronics (both analog and digital), and
semiconductor devices. Students are required to develop depth in at
least one of the following technical areas: electromagnetics, signals and
systems, solid state, computer hardware, computer software, control, and
circuits. Each electrical engineering student must complete the following
requirements.

**Major in Electrical Engineering**

**Depth Requirement**

Each student must show a depth of competence in one technical area by
taking at least three courses from one of the following seven areas. This
depth requirement may be met using a combination of the above core
courses and a selection of open and technical electives.

**Area I: Signals & Systems**

Cooperative Education Program in Electrical Engineering
There are many excellent Cooperative Education (CO-OP) opportunities for electrical engineering majors. A CO-OP student does two CO-OP assignments in industry or government. The length of each assignment is a semester plus a summer which is enough time for a student to complete a significant engineering project. The CO-OP program takes five years to complete because the student is typically gone from campus for two semesters.

BS/MS Program in Electrical Engineering
The department encourages highly motivated and qualified students to apply for admission to the five-year BS/MS Program in the junior year. This integrated program, which permits substitution of MS thesis work for the senior design project, provides a high level of fundamental training and in-depth advanced training in the student's selected specialty. It also offers the opportunity to complete both the Bachelor of Science in Engineering and Master of Science degrees within five years.

Minor in Electrical Engineering
Students enrolled in degree programs in other engineering departments can have a minor specialization by completing the following courses:
EECS 245 Electronic Circuits 4
EECS 246 Signals and Systems 4
EECS 281 Logic Design and Computer Organization 4
EECS 309 Electromagnetic Fields I 3
Approved technical elective 3
Total Units 18

Minor in Electronics
The department also offers a minor in electronics for students in the College of Arts and Sciences. This program requires the completion of 31 credit hours, of which 10 credit hours may be used to satisfy portions of the students’ skills and distribution requirements. The following courses are required for the electronics minor:
MATH 125 Math and Calculus Applications for Life, Managerial, and Social Sci I 4
MATH 126 Math and Calculus Applications for Life, Managerial, and Social Sci II 4
PHYS 115 Introductory Physics I 4
PHYS 116 Introductory Physics II 4
ENGR 131 Elementary Computer Programming 3
ENGR 210 Introduction to Circuits and Instrumentation 4
EECS 246 Signals and Systems 4
EECS 281 Logic Design and Computer Organization 4
Total Units 31

Systems and Control Engineering
The Bachelor of Science program in systems and control engineering provides our students with the basic concepts, analytical tools, and engineering methods which are needed in analyzing and designing complex technological and non-technological systems. Problems relating to modeling, decision-making, control, and optimization are studied. Some examples of systems problems which are studied include: modeling and analysis of complex energy, environmental, and biological systems; computer control of industrial plants; developing world models for studying environmental policies; and optimal planning and management in large-scale systems. In each case, the relationship and interaction among the various components of a given system must
be modeled. This information is used to determine the best way of coordinating and regulating these individual contributions to achieve the overall goal of the system.

Major in Systems and Control Engineering

The mission of the Systems and Control Engineering program is to provide internationally recognized excellence for graduate and undergraduate education and research in systems analysis, design, and control. These theoretical and applied areas require cross-disciplinary tools and methods for their solution.

Educational Objectives

1. Graduates will understand multidisciplinary phenomena using systems methodology as demonstrated by their ability to deal with technical, social, political and economic issues.
2. Graduates will use systems understanding, critical thinking and problem solving skills to analyze and design engineering systems or processes that respond to technical and societal needs as demonstrated by their measured professional accomplishments in industry, government and research.
3. Graduates will facilitate multidisciplinary projects that bring together practitioners of various engineering fields in an effective, professional, and ethical manner as demonstrated by their teamwork, leadership, communication, and management skills.

Student Outcomes

As preparation for achieving the above educational objectives, the BS degree program in Systems and Control Engineering is designed so that students attain:

- an ability to apply knowledge of mathematics, science, and engineering
- an ability to design and conduct experiments, as well as to analyze and interpret data
- an ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability
- an ability to function on multi-disciplinary teams
- an ability to identify, formulate, and solve engineering problems
- an understanding of professional and ethical responsibility
- an ability to communicate effectively
- the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context
- a recognition of the need for, and an ability to engage in life-long learning
- a knowledge of contemporary issues
- an ability to use the techniques, skills, and modern engineering tools necessary for engineering practice.

There are four elective sequences available within the BS program in systems and control engineering curriculum that represent the breadth of the discipline:

Area: 1 Dynamic Systems, Control and Signal Processing

Cooperative Education Program in Systems and Control Engineering

There are many excellent Cooperative Education (CO-OP) opportunities for systems and control engineering majors. A CO-OP student does two CO-OP assignments in industry or government. The length of each assignment is a semester plus a summer which is enough time for the student to complete a significant engineering project. The CO-OP program takes five years to complete because the student is typically gone from campus for two semesters.

BS/MS Program in Systems and Control Engineering

The department encourages highly motivated and qualified students to apply for admission to the five-year BS/MS Program in the junior year. This integrated program, which permits substitution of MS thesis work for the senior design project, provides a high level of fundamental training and in-depth advanced training in the student’s selected specialty. It also offers the opportunity to complete both the Bachelor of Science in Engineering and Master of Science degrees within five years.

Minor in Systems and Control Engineering

A total of five courses (15 credit hours) are required to obtain a minor in systems and control engineering. At least 9 credit hours must be selected from:

- EECS 401 Digital Signal Processing
- EECS 408 Introduction to Linear Systems
- EECS 416 Convex Optimization for Engineering
- EECS 452 Random Signals
- EECS 483 Data Acquisition and Control
- EECS 489 Robotics I
Educational Objectives

1. Graduates will be successful professionals obtaining positions appropriate to their background, interests, and education.
2. Graduates will engage in life-long learning.
3. Graduates employed within engineering fields will demonstrate technical competence such as identifying, formulating, analyzing, and creating engineering solutions using appropriate current engineering techniques, skills, and tools.
4. Graduates will be able to (i) effectively communicate technical information, (ii) function effectively on teams, and (iii) develop and apply computer engineering solutions within a global, societal, and environmental context.

Student Outcomes

As preparation for achieving the above educational objectives, the BS degree program in Computer Engineering is designed so that students attain:

- an ability to apply knowledge of mathematics, science, and engineering
- an ability to design and conduct experiments, as well as to analyze and interpret data
- an ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability
- an ability to function on multi-disciplinary teams
- an ability to identify, formulate, and solve engineering problems
- an understanding of professional and ethical responsibility
- an ability to communicate effectively
- the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context
- a recognition of the need for, and an ability to engage in life-long learning
- a knowledge of contemporary issues
- an ability to use the techniques, skills, and modern engineering tools necessary for engineering practice.

Computer Engineering

The Bachelor of Science program in Computer Engineering is designed to give a student a strong background in the fundamentals of computer engineering through combined classroom and laboratory work. A graduate of this program will be able to use these fundamentals to analyze and evaluate computer systems, both hardware and software. A computer engineering graduate would also be able to design and implement a computer system for general purpose or embedded computing incorporating state-of-the-art solutions to a variety of computing problems. This includes systems which have both hardware and software component, whose design requires a well-defined interface between the two, and the evaluation of the associated trade-offs.

The educational mission of the computer engineering program is to graduate students who have fundamental technical knowledge of their profession along with requisite technical breadth and communications skills to become leaders in creating the new techniques and technologies which will advance the general field of computer engineering. Core courses provide our students with a strong background in digital systems design, computer organization, hardware architecture, and digital electronics.

Educational Objectives

1. Graduates will be successful professionals obtaining positions appropriate to their background, interests, and education.
2. Graduates will engage in life-long learning.
3. Graduates employed within engineering fields will demonstrate technical competence such as identifying, formulating, analyzing, and creating engineering solutions using appropriate current engineering techniques, skills, and tools.
4. Graduates will be able to (i) effectively communicate technical information, (ii) function effectively on teams, and (iii) develop and apply computer engineering solutions within a global, societal, and environmental context.

Student Outcomes

As preparation for achieving the above educational objectives, the BS degree program in Computer Engineering is designed so that students attain:

- an ability to apply knowledge of mathematics, science, and engineering
- an ability to design and conduct experiments, as well as to analyze and interpret data
- an ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability
- an ability to function on multi-disciplinary teams
- an ability to identify, formulate, and solve engineering problems
- an understanding of professional and ethical responsibility
- an ability to communicate effectively
- the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context
- a recognition of the need for, and an ability to engage in life-long learning
- a knowledge of contemporary issues
- an ability to use the techniques, skills, and modern engineering tools necessary for engineering practice.

Major in Computer Engineering

Major Requirements

<td>Basic Statistics for Engineering and Science</td>
<td>3</td>
</tr>
<tr>
<td>STAT 313</td>
<td>Statistics for Experimenters</td>
<td>3</td>
</tr>
<tr>
<td>STAT 332</td>
<td>Statistics for Signal Processing</td>
<td>3</td>
</tr>
<tr>
<td>STAT 333</td>
<td>Uncertainty in Engineering and Science</td>
<td>3</td>
</tr>
</tbody>
</table>

Design Requirement

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>EECS 398</td>
<td>Engineering Projects I</td>
<td>4</td>
</tr>
</tbody>
</table>

In consultation with a faculty advisor, a student completes the program by selecting technical and open elective courses that provide in-depth training in principles and practice of computer engineering. With the approval of the advisor a student may emphasize a specialty of his/her choice by selecting elective courses from other programs or departments.

Many courses have integral or associated laboratories in which students gain “hands-on” experience with computer engineering principles and instrumentation. Students have ready access to the teaching laboratory facilities and are encouraged to use them during nonscheduled hours in addition to the regularly scheduled laboratory sessions. Opportunities also exist for undergraduate student participation in the wide spectrum of research projects being conducted in the department.
Cooperative Education Program in Computer Engineering

There are many excellent Cooperative Education (CO-OP) opportunities for computer engineering majors. A CO-OP student does two CO-OP assignments in industry or government. The length of each assignment is a semester plus a summer which is enough time for the student to complete a significant computing project. The CO-OP program takes five years to complete because the student is typically gone from campus for two semesters.

BS/MS Program in Computer Engineering

Highly motivated and qualified students are encouraged to apply to the BS/MS Program which will allow them to get both degrees in five years. The BS can be in Computer Engineering or a related discipline, such as mathematics or electrical engineering. Integrating graduate study in computer engineering with the undergraduate program allows a student to satisfy all requirements for both degrees in five years.

Minor in Computer Engineering

The department also offers a minor in computer engineering. The minor has a required two course sequence followed by a two course sequence in either hardware or software aspects of computer engineering. The following two courses are required for any minor in computer engineering:

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>EECS 281</td>
<td>Logic Design and Computer Organization</td>
<td>4</td>
</tr>
<tr>
<td>EECS 233</td>
<td>Introduction to Data Structures</td>
<td>4</td>
</tr>
</tbody>
</table>

Students should note that EECS 132 Introduction to Programming in Java is a prerequisite for EECS 233 Introduction to Data Structures.

The two-course hardware sequence is:

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>EECS 314</td>
<td>Computer Architecture</td>
<td>3</td>
</tr>
<tr>
<td>EECS 315</td>
<td>Digital Systems Design</td>
<td>4</td>
</tr>
</tbody>
</table>

The corresponding two-course software sequence is:

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>EECS 337</td>
<td>Compiler Design</td>
<td>4</td>
</tr>
<tr>
<td>EECS 338</td>
<td>Introduction to Operating Systems</td>
<td>4</td>
</tr>
</tbody>
</table>

In addition to these two standard sequences, a student may design his/her own depth area with the approval of the minor advisor. A student cannot have a major and a minor, or two minors, in both Computer Engineering and Computer Science because of the significant overlap between these subjects.

Computer Science

Bachelor of Science in Computer Science

The Bachelor of Science program in Computer Science is designed to give a student a strong background in the fundamentals of mathematics and computer science. A graduate of this program should be able to use these fundamentals to analyze and evaluate software systems and the underlying abstractions upon which they are based. A graduate should also be able to design and implement software systems which are state-of-the-art solutions to a variety of computing problems; this includes problems which are sufficiently complex to require the evaluation of design alternatives and engineering trade-offs. In addition to these program specific objectives, all students in the Case School of Engineering are exposed to societal issues, professionalism, and are provided opportunities to develop leadership skills.

Our mission is to graduate students who have fundamental technical knowledge of their profession and the requisite technical breadth and communications skills to become leaders in creating the new techniques and technologies which will advance the field of computer science.

Educational Objectives

1. To educate and train students in the fundamentals of computer science and mathematics, in order to analyze and solve computing problems, as demonstrated by their professional accomplishments in industry, government and graduate programs and measured within three to five years after graduation.
2. To educate students with an understanding of real-world computing needs, as demonstrated by their ability to address technical issues involving computing problems encountered in industry, government and graduate programs and measured within three to five years after graduation.
3. To train students to work effectively, professionally and ethically in computing-related professions, as demonstrated by their communications, teamwork and leadership skills in industry, government and graduate programs and measured within three to five years after graduation.

Student Outcomes

As preparation for achieving the above educational objectives, the BS degree program in Computer Science is designed so that students attain:

- An ability to apply knowledge of computing and mathematics appropriate to the discipline
- An ability to analyze a problem, and identify and define the computing requirements appropriate to its solution
- An ability to design, implement, and evaluate a computer-based system, process, component, or program to meet desired needs
- An ability to function effectively on teams to accomplish a common goal
- An understanding of professional, ethical, and social responsibilities
- An ability to communicate effectively
- An ability to analyze the impact of computing on individuals, organizations, and society, including ethical, legal, security, and global policy issues
- Recognition of the need for and an ability to engage in continuing professional development
- An ability to use current techniques, skills, and tools necessary for computing practice
- An ability to apply mathematical foundations, algorithmic principles, and computer science theory in the modeling and design of computer-based systems in a way that demonstrates comprehension of the tradeoffs involved in design choices
- An ability to apply design and development principles in the construction of software systems of varying complexity

Bachelor of Arts in Computer Science

The Bachelor of Arts program in Computer Science is a combination of a liberal arts program and a computing major. It is a professional program in the sense that graduates can be employed as computer professionals, but it is less technical than the Bachelor of Science program in Computer Science. This degree is particularly suitable for students with a wide range of interests. For example, students can major in another discipline in addition to computer science and routinely complete all of the requirements for the double major in a 4 year period. This is possible because over a third of the courses in the program are open electives. Furthermore, if a student is majoring in computer science and a second technical field such as mathematics or physics many of
the technical electives will be accepted for both majors. Another example of the utility of this program is that it routinely allows students to major in computer science and take all of the pre-med courses in a four-year period.

Cooperative Education Program in Computer Science

There are many excellent Cooperative Education (CO-OP) opportunities for computer science majors. A CO-OP student does two CO-OP assignments in industry or government. The length of each assignment is a semester plus a summer which is enough time for the student to complete a significant computing project. The CO-OP program takes five years to complete because the student is typically gone from campus for two semesters.

BS/MS Program in Computer Science

Students with a grade point average of 3.2 or higher are encouraged to apply to the BS/MS Program which will allow them to get both degrees in five years. The BS can be in Computer Science or a related discipline, such as mathematics or electrical engineering. Integrating graduate study in computer science with the undergraduate program allows a student to satisfy all requirements for both degrees in five years.

Minor in Computer Science (BS or BSE)

For students pursuing a BS or BSE degree, the following three courses are required for a minor in computer science:

- EECS 233  Introduction to Data Structures  4
- EECS 338  Introduction to Operating Systems  4
- EECS 340  Algorithms and Data Structures  3

A student must take an additional 4 credit hours of computing courses with the exclusion of EECS 132 Introduction to Programming in Java and ENGR 131 Elementary Computer Programming. EECS 302 Discrete Mathematics may be used in place of three of these credit hours since it is a prerequisite for EECS 340 Algorithms and Data Structures. Students should note that EECS 132 Introduction to Programming in Java is a prerequisite for EECS 233 Introduction to Data Structures.

Minor in Computer Science (BA)

For students pursuing BA degrees, the following courses are required for a minor in computer science:

- EECS 132  Introduction to Programming in Java  3
- EECS 233  Introduction to Data Structures  4
- MATH 125  Math and Calculus Applications for Life, Managerial, and Social Sci  4

Two additional computing courses are also required for this minor.

#### Hours Required for Graduation: 128

b. Selected students may be invited to take PHYS 123 Physics and Frontiers I - Mechanics and PHYS 124 Physics and Frontiers II - Electricity and Magnetism in place of PHYS 121 General Physics I - Mechanics and PHYS 122 General Physics II - Electricity and Magnetism.

d. CO-OP students may obtain design credit for one semester of Engineering Projects if their co-op assignment included significant design responsibility; however, the student is still responsible for such course obligations as reports, presentations, and ethics assignments. Design credit and fulfillment of remaining course responsibilities are arranged through the course instructor.
Signal Processing or Communication Systems technical elective to be taken in any semester after EECS 246 Signals and Systems. This elective should be chosen from EECS 313 Signal Processing, EECS 351 Communications and Signal Analysis, or EECS 354 Digital Communications.

Technical electives from an approved list.

Total Units in Sequence: 129

Hours Required for Graduation: 129

Technical electives are more generally defined as any course related to the principles and practice of computer engineering. This includes all EECS courses at the 200 level and above, and can include courses from other programs. All non-EECS technical electives must be approved by the student’s advisor.

The student must take either EECS 318 VLSI/CAD (Fall Semester) or EECS 338 Introduction to Operating Systems (Spring Semester), and a three credit hour technical elective.

Chosen from: MATH 380 Introduction to Probability, STAT 312 Basic Statistics for Engineering and Science, STAT 313 Statistics for Experimenters, STAT 332 Statistics for Signal Processing, STAT 333 Uncertainty in Engineering and Science

May be taken in the Fall semester if the student would like to take EECS 399 Engineering Projects II in the Spring semester.

**Total Units in Sequence:** 129

**Hours Required for Graduation:** 129

a. Chosen from the list of approved CS technical electives. All other technical electives must be approved by the student’s advisor.

b. ENGR 210 Introduction to Circuits and Instrumentation is recommended because it provides flexibility in choice of major and advanced EECS courses.

Graduate Programs

The EECS department offers graduate study leading to the Master of Science and Doctor of Philosophy degrees in (a) Electrical Engineering; (b) Computer Engineering; (c) Systems & Control Engineering; (d) Computing & Information Sciences (i.e., computer science). These graduate programs provide a balance of breadth and depth appropriate for each degree and support the department’s research thrust areas by emphasizing:

Electrical Engineering
Research in microelectromechanical systems (MEMS), micro/nano sensors, solid-state and photonic devices, wireless implantable biosensors, CMOS and mixed-signal integrated circuit design, robotics, surgical robotics and simulation, and haptics.

Systems and Control Engineering
Research in non-linear control, optimization, simulation, signal processing, systems biology, smart grid, and wind energy.

Computer Engineering
Research in VLSI design, programmable logic, computer architectures, embedded systems, design for testability, reconfigurable processors, and hardware security.

Computer Science
Research in bioinformatics, databases, software engineering, data mining, machine learning, pervasive networks, distributed systems, computational biology, and medical Informatics.

Incoming students are encouraged to apply for departmental teaching assistantships. In addition, training and research funds are used to provide assistantships that support the academic preparation and thesis research of graduate students. A limited number of fellowships providing partial support may also be available for students enrolled in the BS/MS program.

The department believes that the success of its graduates at all levels is due to emphasis on project and problem-oriented course material coupled with the broad-based curricular requirements.

MS students may select either Plan A which requires a research thesis or Plan B which does not require a thesis. Doctoral dissertations in all programs must be original contributions to the existing body of knowledge in engineering and science.

Academic requirements for graduate degrees in engineering are as specified by the Case School of Engineering in this bulletin (p. 9). A more detailed set of rules and regulations for each degree program contained here is available from the department, and may also be found on the department Web page (http://engineering.case.edu/eecs).

Graduate Certificate
A Graduate Certificate in Wireless Health is a new offering in the Department of Electrical Engineering and Computer Science. For more details, please refer to the Wireless Health (http://engineering.case.edu/wireless_health) information on the Case School of Engineering website.

Facilities

Computer Facilities

The department computer facilities incorporate both Unix (primarily Solaris) and Microsoft Windows-based operating systems on high end computing workstations for education and research. A number of file, printing, database, and authentication servers support these workstations, as well as the administrative functions of the department. Labs are primarily located in the Olin and Glennan buildings, but include Nord Hall, and are networked via the Case network.

The Case network is a state-of-the-art, high-speed fiber optic campus-wide computer network that interconnects laboratories, faculty and student offices, classrooms, and student residence halls. It is one of the largest fiber-to-desktop networks anywhere in the world. Every desktop has a 1 Gbps (gigabit per second) connection to a fault-tolerant 10 Gbps backbone. To complement the wired network, over 1,200 wireless access points (WAPs) are also deployed allowing anyone with a laptop or wireless enabled PDA to access resources from practically anywhere on campus.

Off campus users, through the use of virtual private network (VPN) servers, can use their broadband connections to access many on campus resources, as well as software, as if they were physically connected to the Case network. The department and the university participate in the Internet2 and National Lambda Rail projects, which provides high-speed, inter-university network infrastructure allowing for enhanced collaboration between institutions. The Internet2 infrastructure allows students, faculty and staff alike the ability to enjoy extremely high performance connections to other Internet2 member institutions.

Aside from services provided through a commodity Internet connection, Case network users can take advantage of numerous online databases such as EUCLIDplus, the University Libraries’ circulation and public access catalog, as well as Lexus-Nexis™ and various CD-ROM based dictionaries, thesauri, encyclopedias, and research databases. Many regional and national institutional library catalogs are accessible over the network, as well.

EECS faculty are active users of the Microfabrication Laboratory and participants in the Advanced Platform Technology Center described under Interdisciplinary Research Centers.

Additional Department Facilities

Sally & Larry Sears Undergraduate Design Laboratory

This laboratory supports all departmental courses in circuits and includes a state-of-the-art lecture hall, a modernistic glass-walled lab, an electronics “store”, and a student lounge and meeting area. Specialized lab space is available for senior projects and sponsored undergraduate programs. The lab is open to all undergraduates, and components are provided free of charge, so students can “play and tinker” with electronics and foster innovation and creativity. The laboratory provides access to PCs, oscilloscopes, signal generators, logic analyzers, and specialized equipment such as RF analyzers and generators. In addition, the lab includes full-time staff dedicated to the education, guidance and mentoring of undergraduates in the “art and practice” of hands-on engineering.

This is the central educational resource for students taking analog, digital, and mixed-signal courses in electronics, and has been supported by various corporations in addition to alumnus Larry Sears, a successful
engineer and entrepreneur. Basic workstations consist of Windows-based computers equipped with LabView software, as well as Agilent 546xx oscilloscopes, 33120A Waveform Generators, 34401A Digital Multimeters, and E3631A power supplies. Advanced workstations are similarly configured, but with a wider variety of high-performance test equipment.

**Jennings Computer Center Lab**

Supported by an endowment from the Jennings Foundation, this lab provides our students with the educational resources necessary for their classwork and exploration of the art of computing. This lab has both PCs and Sun Unix workstations, and includes two high-speed laser printers.

**EECS Undergraduate Computer Lab**

This laboratory (recently renovated with major funding provided by Rockwell Automation) on the 8th floor of the Olin building is accompanied by a suite of instructor/TA offices, and supports the freshman computing classes: ENGR 131 Elementary Computer Programming and EECS 132 Introduction to Programming in Java. Thirty student Macintosh workstations with underlying UNIX operating systems are available for hands-on instruction, and support the study of introductory programming at the university.

**Nord Computer Laboratory**

This is a general-purpose computer facility that is open 24 hours a day, to all students. The lab contains 50 PCs running Windows and four Apple Macintosh computers. Facilities for color printing, faxing, copying and scanning are provided. Special software includes PRO/Engineer, ChemCAD and Visual Studio. Blank CDs, floppy disks, transparencies and other supplies are available for purchase. Visit the website (http://www.scl.cwru.edu) for more information.

**Virtual Worlds (Gaming and Simulation) Laboratory**

The Virtual Worlds Gaming and Simulation Lab forms the basis for experiential work in existing game related courses such as Artificial Intelligence, Graphics, and Simulation and for new gaming/simulation courses. Multi-disciplinary senior projects also use the lab facilities. In addition, a large number of significant cross-disciplinary immersive learning opportunities are available with the Cleveland Institute of Art, the CWRU Music department, and the CWRU School of Medicine.

The Virtual Worlds laboratory includes a PC room, a Console room, an Immersion room, an Audio room, a Medical Simulation room, and a Virtual Reality room containing:

- 24 networked high-performance Alienware gaming quality PCs
- Virtual reality components including three head mounted displays, three data gloves, a four sensor magnetic tracker, two inertial trackers, and three haptic interfaces
- Game consoles, e.g. PS2, Xbox, Gamecube, Nintendo DS, PSP
- Large screen 2-D and 3-D projection displays
- Audio and music synthesis and production equipment

**Database and Bioinformatics Research Laboratory**

Primarily funded by equipment grants from the National Science Foundation and Microsoft Research, this laboratory provides PCs running Windows and Linux supporting research in database systems and bioinformatics.

**Networks Laboratory**

Supported through donations from both Cisco Systems and Microsoft Research, the networks lab has 15 stations complete with a PC, a Cisco switch and router, IP telephony equipment, as well as network patches back to a central rack where devices at one workstation may be routed to other equipment in the lab. A “library” of related equipment is also available.

**Intelligent Networks & Systems Architecting (INSA) Research Laboratory**

The Intelligent Networks & Systems Architecting (INSA) Research Laboratory is a state-of-the-art research facility dedicated to intelligent computer networks, systems engineering, design, and architectural. It includes optimization, simulation, artificial intelligent, visualization, and emulation. This lab has been partially supported by NASA’s Space Exploration programs for Human and Robotic Technology (H&RT). The INSA Lab is equipped with 10 high-performance workstations and 2 servers in a mixed Windows and Linux environment, with over 40 installed network interface cards providing connectivity to its wired and wireless research networks. It includes software packages such as GINO and LINDO, Arena simulation, ns2 and OPNET, as well as the STK satellite toolkit, artificial neural network, systems architecting and modeling, and statistical analysis and data management packages such as SPSS. The INSA Lab is also used for research in heterogeneous, sensor web, and mobile ad-hoc networks with space and battlefield applications.

**VLSI Design Laboratory**

This lab has been supported by the Semiconductor Research Corporation, NSF, NASA, Synopsys and Sun Microsystems. This laboratory has a number of advanced UNIX workstations that run commercial CAD software tools for VLSI design and is currently used to develop design and testing techniques for embedded system-on-chip.

**Embedded Systems Laboratory**

The Embedded Systems Laboratory is equipped with several Sun Blade Workstations running Solaris and Intel PCs running Linux. This lab has been recently equipped with advanced FPGA Virtex II prototype boards from Xilinx, including about 100 Xilinx Virtex II FPGAs and Xilinx CAD tools for development work. A grant-in-aid from Synopsys has provided the Synopsys commercial CAD tools for software development and simulation. This Lab is also equipped with NIOS FPGA boards from Altera, including software tools.

**Mixed-Signal Integrated Circuit Laboratory**

This research laboratory includes a cluster of Windows workstations and a UNIX server with integrated circuit design software (Cadence Custom IC Bundle), as well as a variety of equipment used in the characterization of mixed-signal (analog and digital) integrated circuits, which are typically fabricated using the MOSIS foundry service. Test equipment includes an IC probe station, surface-mount soldering equipment, logic and network/spectrum analyzers, an assortment of digital oscilloscopes with sample rates up to 1 GHz, and a variety of function generators, multi-meters, and power supplies.

**Microelectromechanical Systems (MEMS) Research Laboratory**

The MEMS Research Laboratory is equipped for microfabrication processes that do not require a clean room environment. These include chemical-mechanical polishing (two systems), bulk silicon etching, aqueous chemical release of free standing micromechanical components,
and supercritical point drying. In addition to the fabrication capabilities, the lab is also well equipped for testing and evaluation of MEMS components as it houses wafer-scale probe stations, a vacuum probe station, a multipurpose vacuum chamber, and an interferometric load-deflection station. Two large (8 x 2 ft2) vibration isolated air tables are available for custom testing setups. The laboratory has a wide variety of electronic testing instruments, including a complete IV-CV testing setup.

BioMicroSystems Laboratory

This research laboratory focuses on developing wireless integrated circuits and microsystems for a variety of applications in biomedical and neural engineering. The laboratory contains several PC computers, software packages for design, simulation, and layout of high-performance, low-noise, analog/mixed-signal/RF circuits and systems, and testing/measurement equipment such as dc power supply, arbitrary function generator, multichannel mixed-signal oscilloscope, data acquisition hardware, spectrum analyzer, potentiotstat, and current source meter. Visit the website (http://www.mohsenilab-cwru.org) for more information.

Emerging Materials Development and Evaluation Laboratory

The EMDE Laboratory is equipped with tooling useful in characterizing materials for MEMS applications. The laboratory contains a PC-based apparatus for load-deflection and burst testing of micromachined membranes, a custom-built test chamber for evaluation and reliability testing of MEMS-based pressure transducers and other membrane-based devices, a probe station for electrical characterization of micro-devices, a fume hood configured for wet chemical etching of Si, polymers, and a wide variety of metals, tools for electroplating, an optical reflectometer, and a supercritical-point dryer for release of surface micromachined devices. The lab also has a PC with layout and finite element modeling software for device design, fabrication process design and analysis of testing data.

Laboratory for Nanoscale Devices and Integrated Systems

This research lab explores new engineering and physics at the nanoscale, and by applying such knowledge, develops new devices and tools for emerging technological applications in the new frontiers of information, biomedical, and life sciences. A primary current theme of the research is on developing nanoscale electromechanical systems (NEMS), based on exploration and understandings of mesoscopic devices fundamentals and new characteristics of various nanoscale structures and functional systems. The lab has been developing NEMS with new functions and high performance, in combination with some of the latest advances in advanced materials, integrated circuits, and others, through crossdisciplinary explorations and collaboration. The lab is dedicated to the development of various NEMS transducers, biosensors, high-frequency nanodevices, and high-precision instruments. For more information, contact Dr. Philip Feng (http://bulletin.case.edu/schoolofengineering/elecengcompsci/malitto/philip.feng@case.edu).

Some of the recent research highlights include: the first very-high-frequency silicon nanowire resonators and sensors, the first ultra-high-frequency self-sustaining oscillators (aka NEMS clocks), the first low-voltage (~1V), high-speed nanowire NEMS switches, and the first NEMS mass sensors for weighing single-biomolecules and for probing the noise arising from adsorbed atoms walking on the surface of a vibrating NEMS.

Control and Energy Systems Center (CESC)

The Control and Energy Systems Center (CESC) looks for new transformational research and engineering breakthroughs to build a better world, improving our industry, economy, energy, environment, water resources and society, all with sustainability and within an international collaboration framework. With an interdisciplinary and concurrent engineering approach, the CESC focuses on bridging the gap between fundamental and applied research in advanced control and systems engineering, with special emphasis in energy innovation, wind energy, power systems, water treatment plants, sustainability, spacecraft, environmental and industrial applications. Fundamental research foci are to gain knowledge and understanding on multi-input-multi-output physical worlds, nonlinear plants, distributed parameter systems, plants with non-minimum phase, time delay and/or uncertainty, etc., and to develop new methodologies to design quantitative robust controllers to improve the efficiency and reliability of such systems. Applied research aims to develop advanced solutions with industrial partners, for practical control engineering problems in energy systems, multi-megawatt wind turbines, renewable energy plants, power system dynamics and control, grid integration, energy storage, power electronics, wastewater treatment plants, desalination systems, formation flying spacecraft, satellites with flexible appendages, heating systems, robotics, parallel kinematics, telescope control, etc. The Center was established in 2009 with the support of the Milton and Tamar Maltz Family Foundation and the Cleveland Foundation.

Process Control Laboratory

This laboratory contains process control pilot plants and computerized hardware for data acquisition and process control that is used for demonstrations, teaching, and research. This laboratory also has access to steam and compressed air for use in the pilot processes that include systems for flow and temperature control, level and temperature control, pH control, and pressure control plants.

Dynamics and Control Laboratory

This laboratory contains data acquisition and control devices, PLCs, electromechanical systems, and mechanical, pneumatic, and electrical laboratory experiments for demonstrations, teaching, and research. Particular systems include: AC/DC servo systems, multi-degree-of-freedom robotic systems, rectilinear and torsional multi-degree-of-freedom vibration systems, inverted pendulum, magnetic levitation system, and a PLC-controlled low-voltage AC smart grid demonstration system that includes conventional and renewable (wind and solar) generation, battery and compressed air energy storage, residential, commercial and industry loads, a capacitor bank for real-time power factor correction, and advanced sensing and controls implemented through an interconnected system of intelligent software agents.

Electrical, Computer, and Systems Engineering Division

Michael S. Branicky, ScD, PE
(Massachusetts Institute of Technology)
Professor and Chair of EECS

Systems and control, hybrid systems, cyber-physical systems, distributed control over networks, learning; applications to robotics, manufacturing, and biology

Swarup Bhunia, PhD
(Purdue University)
Associate Professor
Low power and robust nanoelectronics, adaptive nanocomputing, hardware security and protection, implantable electronics

Marc Buchner, PhD
(Michigan State University)
Associate Professor
Computer gaming and simulation, virtual reality, software-defined radio, wavelets, joint time-frequency analysis

M. Cenk Cavusoglu, PhD
(University of California, Berkeley)
Associate Professor
Robotics, systems and control theory, and human-machine interfaces; with emphasis on medical robotics, haptics, virtual environments, surgical simulation, and bio-system modeling and simulation

Vira Chankong, PhD
(Case Western Reserve University)
Associate Professor
Large-scale optimization; logic-based optimization; multi-objective optimization; optimization applications in radiation therapy treatment planning, medical imaging, manufacturing and production systems, and engineering design problems

Philip Feng, PhD
(California Institute of Technology)
Assistant Professor
Nanoelectromechanical systems (NEMS), energy-efficient devices, advanced materials & devices engineering, bio/chemical sensors & biomedical Microsystems, RF/microwave devices & circuits, low-noise measurement & precision instruments

Mario Garcia-Sanz, DrEng
(University of Navarra, Spain)
Milton and Tamar Maltz Professor in Energy Innovation
Robust and nonlinear control, quantitative feedback theory, multivariable control, dynamic systems, systems modeling and identification; energy innovation, wind energy, spacecraft, electrical, mechanical, environmental and industrial applications

Steven L. Garverick, PhD
(Massachusetts Institute of Technology)
Professor
Mixed-signal integrated circuit design, microelectromechanical system integration, sensor/actuator interfacing, data conversion, wireless communication, analog neural network circuits, medical instrumentation

Wei Lin, PhD
(Washington University)
Professor
Nonlinear control, dynamic systems and homogeneous systems theory, H-infinity and robust control, adaptive control, system parameter estimation and fault detection, nonlinear control applications to under-actuated mechanical systems, biologically-inspired systems and systems biology

Kenneth A. Loparo, PhD
(Case Western Reserve University)
Nord Professor of Engineering
Stability and control of nonlinear and stochastic systems; fault detection, diagnosis, and prognosis; recent applications work in advanced control and failure detection of rotating machines, signal processing for the monitoring and diagnostics of physiological systems, and modeling, analysis, and control of power and energy storage systems including the smart grid and micro-grids

Behnam Malakooti, PhD, PE
(Purdue University)
Professor
Design and multi-objective optimization, manufacturing/production/operations systems, intelligent systems and networks, artificial neural networks, biological systems, intelligent decision making

Mehran Mehregany, PhD
(Massachusetts Institute of Technology)
Goodrich Professor of Engineering Innovation
Research and development at the intersections of micro/nano-electro-mechanical systems, semiconductor silicon carbide and integrated circuits

Francis "Frank" L. Merat, PhD, PE
(Case Western Reserve University)
Associate Professor
Computer and robot vision, digital image processing, sensors, titanium capacitors and power electronics; RF and wireless systems; optical sensors; engineering education

Pedram Mohseni, PhD
(University of Michigan)
Associate Professor
Biomedical microsystems, bioelectronics, wireless neural interfaces, CMOS interface circuits for MEMS, low-power wireless sensing/actuating microsystems

Wyatt S. Newman, PhD, PE
(Massachusetts Institute of Technology)
Professor
Mechatronics, high-speed robot design, force- and vision-based machine control, artificial reflexes for autonomous machines, rapid prototyping, agile manufacturing, mobile robotic platforms

C. A. Papachristou, PhD
(Johns Hopkins University)
Professor
VLSI design and CAD, computer architecture and parallel processing, design automation, embedded system design

Daniel Saab, PhD
(University of Illinois at Urbana-Champaign)
Associate Professor
Computer architecture, VLSI system design and test, CAD design automation

Sree N. Sreenath, PhD
(University of Maryland)
Professor
Systems biology complexity research (modeling, structural issues, and simulation); cell signaling, population behavior, and large-scale behavior; global issues and sustainable development

Xinmiao Zhang, PhD
(University of Minnesota)
Timothy E. and Allison L. Schroeder Associate Professor
VLSI architecture design for communications, digital signal processing, cryptosystems and medical instruments

Hongping Zhao, PhD
(Lehigh University)
Assistant Professor
Applied physics of semiconductor optoelectronics materials and devices, physics of semiconductor nanostructures, and semiconductors for light emitting diodes, lasers, and energy applications; emphasis on III-Nitride semiconductors
Christian A. Zorman, PhD  
(Case Western Reserve University)  
Associate Professor  
Materials and processing techniques for MEMS and NEMS, wide bandgap semiconductors, development of materials and fabrication techniques for polymer-based MEMS and bioMEMS

Case School of Engineering

Christian A. Zorman, PhD  
(Case Western Reserve University)  
Associate Professor  
Materials and processing techniques for MEMS and NEMS, wide bandgap semiconductors, development of materials and fabrication techniques for polymer-based MEMS and bioMEMS

Computer Science Division

Michael S. Branicky, ScD, PE  
(Massachusetts Institute of Technology)  
Professor and Chair of EECS  
Systems and control, hybrid systems, cyber-physical systems, distributed control over networks, learning; applications to robotics, manufacturing, and biology

Harold S. Connamacher, PhD  
(University of Toronto)  
Assistant Professor  
Constraint satisfaction problems, graph theory, random structures, and algorithms

Chris Fietkiewicz, PhD  
(Case Western Reserve University)  
Assistant Professor  
Applied and theoretical neuroscience, neuronal modeling, signal processing and signal analysis, electrophysiology, applications to epilepsy and respiratory control

Mehmet Koyuturk, PhD  
(Purdue University)  
T. & D. Schroeder Associate Professor of Computer Science and Engineering  
Bioinformatics and computational biology, computational modeling and algorithm development for systems biology, integration, mining and analysis of biological data, algorithms for distributed systems

Michael Lewicki, PhD  
(California Institute of Technology)  
Associate Professor  
Computational perception and scene analysis, visual representation and processing, auditory representation and analysis

Jing Li, PhD  
(University of California, Riverside)  
Associate Professor  
Computational biology and bioinformatics, statistical genomics and functional genomics, systems biology, algorithms

Vincenzo Liberatore, PhD  
(Rutgers University)  
Associate Professor  
Distributed systems, Internet computing, randomized algorithms

Gultekin Ozsoyoglu, PhD  
(University of Alberta, Canada)  
Professor  
Graph databases and data mining problems in metabolic networks, metabolomics, and systems biology, bioinformatics, web data mining

Z. Meral Ozsoyoglu, PhD  
(University of Alberta, Canada)  
Andrew R. Jennings Professor of Computing  
Database systems, database query languages and optimization, data models, index structures, bioinformatics, medical informatics

H. Andy Podgurski, PhD  
(University of Massachusetts, Amherst)  
Professor  
Software engineering methodology and tools, especially use of data mining, machine learning, and program analysis techniques in software testing, fault detection and localization, reliable engineering and software security, electronic medical records, privacy

Michael Rabinovich, PhD  
(University of Washington)  
Professor  
Computer networks, Internet performance evaluation, databases, utility computing

Soumya Ray, PhD  
(University of Wisconsin, Madison)  
Assistant Professor  
Artificial intelligence, machine learning, reinforcement learning, automated planning, applications to interdisciplinary problems including medicine and bioinformatics

GQ (Guo-Qiang) Zhang, PhD  
(Cambridge University, England)  
Professor  
Programming languages, theory of computation, logic and topology in computer science, knowledge representation, information technology, clinical and medical informatics, semantic web

Xiang Zhang, PhD  
(University of North Carolina at Chapel Hill)  
Assistant Professor  
Computational genetics, bioinformatics, data mining, machine learning, databases

Research Faculty

Mehdi Bageri-Hamaneh, PhD  
(Case Western Reserve University)  
Research Assistant Professor  
Simulation and modeling of biological systems, biomedical signal processing, electroencephalogram (EEG) source imaging

Evren Gurkan-Cavusoglu, PhD  
(Middle East Technical University)  
Research Assistant Professor  
Systems and control theory, systems biology, computational biology, biological system modeling, signal processing applied to biological systems, signal processing

Farhad Kaffashi, PhD  
(Case Western Reserve University)  
Research Assistant Professor  
Haptic devices, including low-power design and effects on perception; applications to robotic surgery and telesurgery; secure teleoperation

Joseph A. Potkay, PhD  
(University of Michigan)  
Research Assistant Professor  
Medical microsystems, MEMS, microfluidics; microfabricated artificial organs, biocompatible sensor/actuator systems; energy harvesting and implantable power generators
Active Emeritus Faculty

George W. Ernst, PhD
(Carnegie Institute of Technology)
Emeritus Professor
Learning problem solving strategies, artificial intelligence, expert systems, program verification

Dov Hazony, PhD
(University of California, Los Angeles)
Emeritus Professor
Network synthesis, ultrasonics, communications

Wen H. Ko, PhD
(Case Institute of Technology)
Emeritus Professor
Solid state electronics, micro and nano sensors, biomedical instrumentation, implant telemetry

Mihajlo D. Mesarovic, PhD
(University of Belgrade)
Emeritus Professor
Complex systems theory, global issues and sustainable development, systems biology

Lee J. White, PhD
(University of Michigan)
Emeritus Professor
Software testing: regression testing, GUI testing, specification-based testing, testing of object-oriented software

Adjunct Faculty Appointments

Michael Adams, PhD
(Case Western Reserve University)
Adjunct Assistant Professor

Mark A. Allman
(Case Western Reserve University)
Adjunct Instructor

Aaron Fleischman, PhD
(Case Western Reserve University)
Adjunct Assistant Professor

Reza Jamesebi, PhD
(Case Western Reserve University)
Adjunct Assistant Professor

Suparerk Janjarasjitt, PhD
(Case Western Reserve University)
Adjunct Assistant Professor

Stephen M. Phillips, PhD, PE
(Arizona State University)
Adjunct Professor

Srinivas Raghavan, PhD
(Ohio State University)
Adjunct Professor

Gideon Samid, PhD
(Israel Institute of Technology)
Adjunct Assistant Professor

Shivakumar Sastry
(Case Western Reserve University)
Adjunct Associate Professor

William L. Schultz, PhD, PE
(Case Western Reserve University)
Adjunct Associate Professor

Marvin S. Schwartz, PhD
(Case Western Reserve University)
Adjunct Professor

Larry Sears
(Case Western Reserve University)
Adjunct Instructor

Amit Sinha, PhD
(Case Western Reserve University)
Adjunct Assistant Professor

Norman Tien, PhD
(University of California, San Diego)
Adjunct Professor

Peter J. Tsivitse, PhD
(Case Western Reserve University)
Adjunct Professor

Stephen D. Umans, PhD
(Massachusetts Institute of Technology)
Adjunct Professor

Olaf Wolkenhauer, PhD
(UMIST, Manchester)
Adjunct Professor

Qing-rong Jackie Wu, PhD
(Mayo Graduate School)
Adjunct Associate Professor

Secondary Faculty Appointments

Alexis R. Abramson, PhD
(University of California, Berkeley)
Associate Professor, Mechanical and Aerospace Engineering

Mark Griswold, PhD
(University of Würzburg, Germany)
Associate Professor, Radiology

Joseph F. Koonce, PhD
(University of Wisconsin, Madison)
Professor, Biology

Thomas LaFramboise, PhD
(University of Illinois)
Associate Professor, Genetics

Roger D. Quinn, PhD
(Virginia Polytechnic Institute and State University)
Professor, Mechanical and Aerospace Engineering

Satya S. Sahoo, PhD
(Wright State University)
Assistant Professor, Center for Clinical Investigations

Nicole Sieberlich, PhD
(University of Wurzburg, Germany)
Assistant Professor, Biomedical Engineering

Matthew J. Sobel, PhD
(Stanford University)
Professor, Operations
Courses

EECS 132. Introduction to Programming in Java. 3 Units.
Introduction to computer programming and problem solving with the Java language. Computers, operating systems, and Java applications; software development; conditional statements; loops; methods; arrays; classes and objects; object-oriented design; unit testing; strings and text I/O; inheritance and polymorphism; GUI components; application testing; abstract classes and interfaces; exception handling; files and streams; GUI event handling; generics; collections; threads; comparison of Java to C, C++, and C#.

EECS 233. Introduction to Data Structures. 4 Units.
The programming language Java; pointers, files, and recursion. Representation and manipulation of data: one way and circular linked lists, doubly linked lists; the available space list. Different representations of stacks and queues. Representation of binary trees, trees and graphs. Hashing; searching and sorting. Prereq: EECS 132.

EECS 245. Electronic Circuits. 4 Units.

EECS 246. Signals and Systems. 4 Units.

EECS 251. Numerical Methods. 3 Units.
Introduction to basic concepts and algorithms used in the numerical solution of common problems including solving non-linear equations, solving systems of linear equations, interpolation, fitting curves to data, integration and solving ordinary differential equations. Computational error and the efficiency of various numerical methods are discussed in some detail. Most homework requires the implementation of numerical methods on a computer. Prereq: MATH 122 and either ENGR 131 or EECS 132.

EECS 281. Logic Design and Computer Organization. 4 Units.
Fundamentals of digital systems in terms of both computer organization and logic level design. Organization of digital computers; information representation; boolean algebra; analysis and synthesis of combinational and sequential circuits; datapaths and register transfers; instruction sets and assembly language; input/output and communication; memory. Prereq: ENGR 131 or EECS 132.

EECS 290. Introduction to Computer Game Design and Implementation. 3 Units.
This class begins with an examination of the history of video games and of game design. Games will be examined in a systems context to understand gaming and game design fundamentals. Various topics relating directly to the implementation of computer games will be introduced including graphics, animation, artificial intelligence, user interfaces, the simulation of motion, sound generation, and networking. Extensive study of past and current computer games will be used to illustrate course concepts. Individual and group projects will be used throughout the semester to motivate, illustrate and demonstrate the course concepts and ideas. Group game development and implementation projects will culminate in classroom presentation and evaluation. Prereq: EECS 132.

EECS 293. Software Craftsmanship. 4 Units.
A course to improve programming skills, software quality, and the software development process. Software design; Version control; Control issues and routines; Pseudo-code programming process and developer testing; Defensive programming; Classes; Debugging; Self-documenting code; Refactoring. Prereq: EECS 233.

EECS 296. Independent Projects. 1 - 3 Unit.

EECS 297. Special Topics. 1 - 3 Unit.
Special topics in Computer Engineering, Computer Science, Electrical Engineering, and Systems and Control Engineering. Prereq: Limited to freshmen and sophomores.

EECS 301. Digital Logic Laboratory. 2 Units.
This course is an introductory experimental laboratory for digital networks. The course introduces students to the process of design, analysis, synthesis and implementation of digital networks. The course covers the design of combinational circuits, sequential networks, registers, counters, synchronous/asynchronous Finite State Machines, register based design, and arithmetic computational blocks. Recommended preparation: EECS 281.

EECS 302. Discrete Mathematics. 3 Units.
A general introduction to basic mathematical terminology and the techniques of abstract mathematics in the context of discrete mathematics. Topics introduced are mathematical reasoning, Boolean connectives, deduction, mathematical induction, sets, functions and relations, algorithms, graphs, combinatorial reasoning. Offered as EECS 302 and MATH 304. Prereq: MATH 122 or MATH 124 or MATH 126.

EECS 304. Control Engineering I with Laboratory. 3 Units.
Analysis and design techniques for control applications. Linearization of nonlinear systems. Design specifications. Classical design methods: root locus, bode, nyquist, PID, lead, lag, lead-lag controller design. State space modeling, solution, controllability, observability and stability. Modeling and control demonstrations and experiments single-input/ single-output and multivariable systems. Control system analysis/design/ implementation software. Prereq: EECS 246 or equivalent.
EECS 305. Control Engineering I Laboratory. 1 Unit.
A laboratory course based on the material in EECS 304. Modeling, simulation, and analysis using MATLAB. Physical experiments involving control of mechanical systems, process control systems, and design of PID controllers. Coreq: EECS 304.

EECS 309. Electromagnetic Fields I. 3 Units.
Maxwell’s integral and differential equations, boundary conditions, constitutive relations, energy conservation and Pointing vector, wave equation, plane waves, propagating waves and transmission lines, characteristic impedance, reflection coefficient and standing wave ratio, in-depth analysis of coaxial and strip lines, electro- and magnetooptics, simple boundary value problems, correspondence between fields and circuit concepts, energy and forces. Prereq: PHYS 122. Prereq or Coreq: MATH 224.

EECS 312. Introduction to Electric Power Systems. 3 Units.
This course is intended to be an introduction to three-phase electric power systems. Modeling of system components including generators, transformers, loads, transmission lines. The per-unit system. One-line diagrams and equivalent circuits. Real and reactive power. Phasor diagrams. Voltage and frequency regulation. Load-flow analysis. Short-circuit calculations. Fault analysis using the techniques of symmetrical component analysis.

EECS 313. Signal Processing. 3 Units.

EECS 314. Computer Architecture. 3 Units.
This course provides students the opportunity to study and evaluate a modern computer architecture design. The course covers topics in fundamentals of computer design, performance, cost, instruction set design, processor implementation, control unit, pipelining, communication and network, memory hierarchy, computer arithmetic, input-output, and an introduction to RISC and super-scalar processors. Recommended preparation: EECS 281.

EECS 315. Digital Systems Design. 4 Units.
This course gives students the ability to design modern digital circuits. The course covers topics in logic level analysis and synthesis, digital electronics: transistors, CMOS logic gates, CMOS lay-out, design metrics space, power, delay, Programmable logic (partitioning, routing), state machine analysis and synthesis, register transfer level block design, datapath, controllers, ASM charts, microsequencers, emulation and rapid prototyping, and switch/logic-level simulation. Recommended preparation: EECS 281.

EECS 316. Computer Design. 3 Units.
Methodologies for systematic design of digital systems with emphasis on programmable logic implementations and prototyping. Laboratory which uses modern design techniques based on hardware description languages such as VHDL, CAD tools, and Field Programmable Gate Arrays (FPGAs). Recommended preparation: EECS 281; EECS 315 or consent of instructor.

EECS 318. VLSI/CAD. 4 Units.
With Very Large Scale Integration (VLSI) technology there is an increased need for Computer-Aided Design (CAD) techniques and tools to help in the design of large digital systems that deliver both performance and functionality. Such high performance tools are of great importance in the VLSI design process, both to perform functional, logical, and behavioral modeling and verification to aid the testing process. This course discusses the fundamentals in behavioral languages, both VHDL and Verilog, with hands-on experience. Recommended preparation: EECS 281, EECS 315.

EECS 319. Applied Probability and Stochastic Processes for Biology. 3 Units.
Applications of probability and stochastic processes to biological systems. Mathematical topics will include: introduction to discrete and continuous probability spaces (including numerical generation of pseudo random samples from specified probability distributions), Markov processes in discrete and continuous time with discrete and continuous space examples, point processes including homogeneous and inhomogeneous Poisson processes and Markov chains on graphs, and diffusion processes including Brownian motion and the Ornstein-Uhlenbeck process. Biological topics will be determined by the interests of the students and the instructor. Likely topics include: stochastic ion channels, molecular motors and stochastic ratchets, actin and tubulin polymerization, random walk models for neural spike trains, bacterial chemotaxis, signaling and genetic regulatory networks, and stochastic predator-prey dynamics. The emphasis will be on practical simulation and analysis of stochastic phenomena in biological systems. Numerical methods will be developed using both MATLAB and the R statistical package. Student projects will comprise a major part of the course. Offered as BIOL 319, EECS 319, MATH 319, BIOL 419, EBME 419, and PHOL 419. Prereq: MATH 224 or MATH 223 and BIOL 300 or BIOL 306 and MATH 201 or MATH 307 or consent of instructor.

EECS 321. Semiconductor Electronic Devices. 4 Units.
Energy bands and charge carriers in semiconductors and their experimental verifications. Excess carriers in semiconductors. Principles of operation of semiconductor devices that rely on the electrical properties of semiconductor surfaces and junctions. Development of equivalent circuit models and performance limitations of these devices. Devices covered include: junctions, bipolar transistors, Schottky junctions, MOS capacitors, junction gate and MOS field effect transistors, optical devices such as photodetectors, light-emitting diodes, solar cells and lasers. Prereq: PHYS 122. Prereq or Coreq: MATH 224.

EECS 322. Integrated Circuits and Electronic Devices. 3 Units.
Technology of monolithic integrated circuits and devices, including crystal growth and doping, photolithography, vacuum technology, metalization, wet etching, thin film basics, oxidation, diffusion, ion implantation, epitaxy, chemical vapor deposition, plasma processing, and micromachining. Basics of semiconductor devices including junction diodes, bipolar junction transistors, and field effect transistors. Prereq: PHYS 122. Prereq or Coreq: MATH 224.
EECS 324. Simulation Techniques in Engineering. 3 Units.
Principles and techniques of continuous-time and discrete-event simulation which are powerful tools for analyzing a wide variety of complex engineering, systems biology and business problems. EXCEL, MATLAB/SIMULINK, and ARENA are used as the main computational and programming instruments to demonstrate the basic steps in dynamic systems modeling, discrete-event systems modeling as well as typical results of stochastic/Monte Carlo simulations, continuous/discrete-time simulations, and discrete-event simulations respectively. Design and evaluation of simulation experiments will also be covered. Recommended preparation: STAT 312, STAT 332, or STAT 333. Prereq: MATH 224.

EECS 325. Computer Networks I. 3 Units.

EECS 326. Instrumentation Electronics. 3 Units.
A second course in instrumentation with emphasis on sensor interface electronics. General concepts in measurement systems, including accuracy, precision, sensitivity, linearity, and resolution. The physics and modeling of resistive, reactive, self-generating, and direct-digital sensors. Signal conditioning for same, including bridge circuits, coherent detectors, and a variety of amplifier topologies: differential, instrumentation, charge, and transimpedance. Noise and drift in amplifiers and resistors. Practical issues of interference, including grounding, shielding, supply/return, and isolation amplifiers. Prereq: ENGR 210 and (EECS 246, EBME 308 or EMAE 350).

EECS 337. Compiler Design. 4 Units.
Design and implementation of compilers and other language processors. Scanners and lexical analysis; regular expressions and finite automatata; scanner generators; parsers and syntax analysis; context free grammars; parser generators; semantic analysis; intermediate code generation; runtime environments; code generation; machine independent optimizations; data flow and dependence analysis. There will be a significant programming project involving the use of compiler tools and software development tools and techniques. Recommended preparation: EECS 233 and EECS 281.

EECS 338. Introduction to Operating Systems. 4 Units.
CPU scheduling, memory management, concurrent processes, semaphores, monitors, deadlocks, secondary storage management, file systems, protection, UNIX operating system, fork, exec, wait, UNIX System V IPCs, sockets, remote procedure calls, threads. Must be proficient in "C" programming language. Recommended preparation: EECS 337.

EECS 339. Web Data Mining. 3 Units.

EECS 340. Algorithms and Data Structures. 3 Units.
Efficient sorting algorithms, external sorting methods, internal and external searching, efficient string processing algorithms, geometric and graph algorithms. Recommended preparation: EECS 233 and MATH 304.

EECS 341. Introduction to Database Systems. 3 Units.
Relational model, ER model, relational algebra and calculus, SQL, OBE, security, views, files and physical database structures, query processing and query optimization, normalization theory, concurrency control, object relational systems, multimedia databases, Oracle SQL server, Microsoft SQL server. Recommended preparation: EECS 233. Prereq: EECS 302.

EECS 342. Introduction to Global Issues. 3 Units.
This systems course is based on the paradigm of the world as a complex system. Global issues such as population, world trade and financial markets, resources (energy, water, land), global climate change, and others are considered with particular emphasis put on their mutual interdependence. A reasoning support computer system which contains extensive data and a family of models is used for future assessment. Students are engaged in individual, custom-tailored, projects of creating conditions for a desirable or sustainable future based on data and scientific knowledge available. Students at CWRU will interact with students from fifteen universities that have been strategically selected in order to give global coverage to UNESCO'S Global-problematique Education Network Initiative (GENie) in joint, participatory scenario analysis via the internet.

EECS 343. Theoretical Computer Science. 3 Units.
Introduction to mathematical logic, different classes of automata and their correspondence to different classes of formal languages, recursive functions and computability, assertions and program verification, denotational semantics. MATH/EECS 343 and MATH 410 cannot both be taken for credit. Offered as EECS 343 and MATH 343.

EECS 344. Electronic Analysis and Design. 3 Units.
The design and analysis of real-world circuits. Topics include: junction diodes, non-ideal op-amp models, characteristics and models for large and small signal operation of bipolar junction transistors (BJTs) and field effect transistors (FETs), selection of operating point and biasing for BJT and FET amplifiers. Hybrid-pi model and other advanced circuit models, cascaded amplifiers, negative feedback, differential amplifiers, oscillators, tuned circuits, and phase-locked loops. Computers will be extensively used to model circuits. Selected experiments and/or laboratory projects. Prereq: EECS 245.

EECS 345. Programming Language Concepts. 3 Units.
This course studies important concepts underlying the design, definition, implementation and use of modern programming languages including syntax, semantics, names/scopes, types, expression, assignment, subprograms, data abstraction, and inheritance. Imperative, object-oriented, concurrent, functional, and logic programming paradigms are discussed. Illustrative examples are drawn from a variety of popular languages, such as C++, Java, Ada, Lisp, and Prolog. Recommended preparation: EECS 233, EECS 337.
EECS 346. Engineering Optimization. 3 Units.
Optimization techniques including linear programming and extensions; transportation and assignment problems; network flow optimization; quadratic, integer, and separable programming; geometric programming; and dynamic programming. Nonlinear optimization topics: optimality criteria, gradient and other practical unconstrained and constrained methods. Computer applications using engineering and business case studies. Recommended preparation: MATH 201.

EECS 350. Operations and Systems Design. 3 Units.
Introduction to design, modeling, and optimization of operations and scheduling systems with applications to computer science and engineering problems. Topics include, forecasting and time series, strategic, tactical, and operational planning, life cycle analysis, learning curves, resources allocation, materials requirement and capacity planning, sequencing, scheduling, inventory control, project management and planning. Tools for analysis include: multi-objective optimization, queuing models, simulation, and artificial intelligence.

EECS 351. Communications and Signal Analysis. 3 Units.
Fourier transform analysis and sampling of signals. AM, FM and SSB modulation and other modulation methods such as pulse code, delta, pulse position, PSK and FSK. Detection, multiplexing, performance evaluation in terms of signal-to-noise ratio and bandwidth requirements. Prereq: EECS 246 or requisites not met permission.

EECS 352. Engineering Economics and Decision Analysis. 3 Units.

EECS 354. Digital Communications. 3 Units.

EECS 359. Bioinformatics in Practice. 3 Units.
This course covers basic computational methods of organizing and analyzing biological data, targeting senior and junior level students from both mathematical/computational sciences and life sciences. The aim of the course is to provide the students with basic skills to be able to understand molecular biology data and associated abstractions (sequences, structure, gene expression, molecular network data), access to available resources (public databases, computational tools on the web). Implement basic computational methods for biological data analysis, and use understanding of these methods to solve other problems that arise in biological data analysis. Topics covered include DNA and protein sequence databases, pairwise sequence alignment and sequence search (dynamic programming, BLAST), multiple sequence alignment (HMMs, CLUSTAL-W), sequence clustering, motif finding, pattern matching, phylogenetic analysis (tree reconstruction, neighbor joining, maximum parsimony, maximum likelihood), gene finding, functional annotation, biological ontologies, analysis of gene expression data, and network biology (protein protein interactions, topology, modularity).

EECS 360. Manufacturing and Automated Systems. 3 Units.
Formulation, modeling, planning, and control of manufacturing and automated systems with applications to computer science and engineering problems. Topics include, design of products and processes, location/spatial problems, transportation and assignment, product and process layout, group technology and clustering, cellular and network flow layouts, computer control systems, reliability and maintenance, and statistical quality control. Tools and analysis include: multi-objective optimization, artificial intelligence, and heuristics for combinatorial problems. Offered as EECS 360 and EECS 460.

EECS 365. Complex Systems Biology. 3 Units.
Complex Systems Biology is an interdisciplinary course based on systems science, engineering, biology, and medicine. The objective is to provide students with an understanding of the current state of systems biology and major challenges ahead. The biological phenomena across the level of complexity will be considered from molecular to organisms and ecology to provide universality of the systems concepts for understanding the functions and behavior of biological systems. Case studies are used and a course project is required to be completed. Prereq: Junior Standing.

EECS 366. Computer Graphics. 3 Units.

EECS 371. Applied Circuit Design. 4 Units.
This course will consist of lectures and lab projects designed to provide students with an opportunity to consolidate their theoretical knowledge of electronics and to acquaint them with the art and practice of circuit and product design. The lectures will cover electrical and electronic circuits and many electronic and electrical devices and applications. Examples include mixed-signal circuits, power electronics, magnetic and piezo components, gas discharge devices, sensors, motors and generators, and power systems. In addition, there will be discussion of professional topics such as regulatory agencies, manufacturing, testing, reliability, and product cost. Weekly labs will be true "design" opportunities representing real-world applications. A specification or functional description will be provided, and the students will design the circuit, select all components, construct a breadboard, and test. The objective will be functional, pragmatic, cost-effective designs. Prereq: EECS 245.

EECS 374. Advanced Control and Energy Systems. 3 Units.
This course introduces applied quantitative robust and nonlinear control engineering techniques to regulate automatically renewable energy systems in general and wind turbines in particular. The course also studies the fundamentals for dynamic multidisciplinary modeling and analysis of large multi-megawatt wind turbines (mechanics, aerodynamics, electrical systems, control concepts, etc.). The course combines lecture sessions and lab hours. The 400-level includes an experimental lab competition, where the object is to design, implement, and experimentally validate a control strategy to regulate a real system in the laboratory (helicopter control competition or similar); it will also include additional project design reports. Offered as EECS 374 and EECS 474. Prereq: EECS 304.
EECS 376. Mobile Robotics. 4 Units.
Design of software systems for mobile robot control, including: motion control; sensory processing; localization and mapping; mobile-robot planning and navigation; and implementation of goal-directed behaviors. The course has a heavy lab component involving a sequence of design challenges and competitions performed in teams. Prereq: ENGR 131 or EECS 233.

EECS 381. Hybrid Systems. 3 Units.
Today, the most interesting computer code and microprocessor designs are "embedded" and hence interact with the physical world, producing a mixture of digital and analog domains. The class studies an array of tools for understanding and designing these "hybrid systems." Topics include: basics of language and finite state automata theory, discrete-event dynamic systems, Petri nets, timed and hybrid automata, and hybrid dynamical systems. Simulation, verification, and control concepts and languages for these models. Prereq: MATH 224 and (EECS 246 or EECS 302 or MATH 304).

EECS 390. Advanced Game Development Project. 3 Units.
This game development project course will bring together an interdisciplinary group of advanced undergraduate students in the fields of Electrical Engineering and Computer Science, Art, Music, and English to focus on the design and development of a complete, fully-functioning computer game (as an interdisciplinary team). The student teams are given complete liberty to design their own fully functional games from their original concept to a playable finished product, i.e., from the initial idea through to the wrapped box. The student teams will experience the entire game development cycle as they execute their projects. Responsibilities include creating a game idea, writing a story, developing the artwork, designing characters, implementing music and sound effects, programming and testing the game, and documenting the entire project. Recommended preparation: Junior or Senior standing and consent of instructor.

EECS 391. Introduction to Artificial Intelligence. 3 Units.
This course is an introduction to artificial intelligence. We will study the concepts that underlie intelligent systems. Topics covered include problem solving with search, constraint satisfaction, adversarial games, knowledge representation and reasoning using propositional and first order logic, reasoning under uncertainty, introduction to machine learning, automated planning, reinforcement learning and natural language processing. Recommended: basic knowledge of probability and statistics. Prereq: ENGR 131 or EECS 132.

EECS 393. Software Engineering. 3 Units.
Topics: Introduction to software engineering; software lifecycle models; development team organization and project management; requirements analysis and specification techniques; software design techniques; programming practices; software validation techniques; software maintenance practices; software engineering ethics. Undergraduates work in teams to complete a significant software development project. Graduate students are required to complete a research project. Recommended preparation for EECS 493: EECS 337. Offered as EECS 393 and EECS 493. Prereq: EECS 337.

EECS 394. Introduction to Information Theory. 3 Units.
This course is intended as an introduction to information and coding theory with emphasis on the mathematical aspects. It is suitable for advanced undergraduate and graduate students in mathematics, applied mathematics, statistics, physics, computer science and electrical engineering. Course content: Information measures-entropy, relative entropy, mutual information, and their properties. Typical sets and sequences, asymptotic equipartition property, data compression. Channel coding and capacity: channel coding theorem. Differential entropy, Gaussian channel, Shannon-Nyquist theorem. Information theory inequalities (400 level). Additional topics, which may include compressed sensing and elements of quantum information theory. Recommended Preparation: MATH 201 or MATH 307. Offered as MATH 394, EECS 394, MATH 494 and EECS 494. Prereq: MATH 223 and MATH 380 or requisites not met permission.

EECS 395. Senior Project in Computer Science. 4 Units.
Capstone course for computer science seniors. Material from previous and concurrent courses used to solve computer programming problems and to develop software systems. Professional engineering topics such as project management, engineering design, communications, and professional ethics. Requirements include periodic reporting of progress, plus a final oral presentation and written report. Scheduled formal project presentations during last week of classes. Prereq: Senior standing.

EECS 396. Independent Projects. 1 - 6 Unit.

EECS 397. Special Topics. 1 - 6 Unit.
Special topics in Computer Engineering, Computer Science, Electrical Engineering, and Systems and Control Engineering. Prereq: Limited to juniors and seniors.

EECS 398. Engineering Projects I. 4 Units.
Capstone course for electrical, computer and systems and control engineering seniors. Material from previous and concurrent courses used to solve engineering design problems. Professional engineering topics such as project management, engineering design, communications, and professional ethics. Requirements include periodic reporting of progress, plus a final oral presentation and written report. Scheduled formal project presentations during last week of classes. Prereq: Senior Standing. Prereq or Coreq: ENGR 398 and ENGL 398.

EECS 399. Engineering Projects II. 3 Units.
Continuation of EECS 398. Material from previous and concurrent courses applied to engineering design and research. Requirements include periodic reporting of progress, plus a final oral presentation and written report. Prereq: Senior Standing.
EECS 400T. Graduate Teaching I. 0 Units.
This course will provide the Ph.D. candidate with experience in teaching undergraduate or graduate students. The experience is expected to involve direct student contact but will be based upon the specific departmental needs and teaching obligations. This teaching experience will be conducted under the supervision of the faculty member who is responsible for the course, but the academic advisor will assess the educational plan to ensure that it provides an educational experience for the student. Students in this course may be expected to perform one or more of the following teaching related activities: grading homeworks, quizzes, and exams, having office hours for students, tutoring students. Recommended preparation: Ph.D. student in EECS department.

EECS 401. Digital Signal Processing. 3 Units.

EECS 405. Data Structures and File Management. 3 Units.
Fundamental concepts: sequential allocation, linked allocation, lists, trees, graphs, internal sorting, external sorting, sequential, binary, interpolation search, hashing file, indexed files, multiple level index structures, btrees, hashed files. Multiple attribute retrieval; inverted files, multi lists, multiple-key hashing, hd trees. Introduction to data bases. Data models. Recommended preparation: EECS 233 and MATH 304.

EECS 408. Introduction to Linear Systems. 3 Units.

EECS 409. Discrete Event Systems. 3 Units.
A broad range of system behavior can be described using a discrete event framework. These systems are playing an increasingly important role in modeling, analyzing, and designing manufacturing systems. Simulation, automata, and queuing theory have been the primary tools for studying the behavior of these logically complex systems; however, new methods and techniques as well as new modeling frameworks have been developed to represent and to explore discrete event system behavior. The class will begin by studying simulation, the theory of languages, and finite state automata, and queuing theory approaches and then progress to examining selected additional frameworks for modeling and analyzing these systems including Petrinets, perturbation analysis, and Min-Max algebras.

EECS 412. Electromagnetic Fields III. 3 Units.

EECS 413. Nonlinear Systems I. 3 Units.
This course will provide an introduction to techniques used for the analysis of nonlinear dynamic systems. Topics will include existence and uniqueness of solutions, phase plane analysis of two dimensional systems including Poincare-Bendixson, describing functions for single-input single-output systems, averaging methods, bifurcation theory, stability, and an introduction to the study of complicated dynamics and chaos. Recommended preparation: Concurrent enrollment in EECS 408.

EECS 415. Integrated Circuit Technology I. 3 Units.

EECS 416. Convex Optimization for Engineering. 3 Units.
This course will focus on the development of a working knowledge and skills to recognize, formulate, and solve convex optimization problems that are so prevalent in engineering. Applications in control systems; parameter and state estimation; signal processing; communications and networks; circuit design; data modeling and analysis; data mining including clustering and classification; and combinatorial and global optimization will be highlighted. New reliable and efficient methods, particular those based on interior-point methods and other special methods to solve convex optimization problems will be emphasized. Implementation issues will also be underscored. Recommended preparation: MATH 201 or equivalent.

EECS 417. Introduction to Stochastic Control. 3 Units.
Analysis and design of controllers for discrete-time stochastic systems. Review of probability theory and stochastic properties, input-output analysis of linear stochastic systems, spectral factorization and Weiner filtering, minimum variance control, state-space models of stochastic systems, optimal control and dynamic programming, statistical estimation and filtering, the Kalman-Bucy theory, the linear quadratic Gaussian problem, and the separation theorem. Recommended preparation: EECS 408.

EECS 419. Computer System Architecture. 3 Units.
Interaction between computer systems hardware and software. Pipeline techniques - instruction pipelines - arithmetic pipelines. Instruction level parallelism. Cache mechanism. I/O structures. Examples taken from existing computer systems.

EECS 421. Optimization of Dynamic Systems. 3 Units.
EECS 422. Solid State Electronics II. 3 Units.

EECS 423. Distributed Systems. 3 Units.
Introduction to distributed systems; system models; network architecture and protocols; interprocess communication; client-server model; group communication; TCP sockets; remote procedure calls; distributed objects and remote invocation; distributed file systems; file service architecture; name services; directory and discovery services; distributed synchronization and coordination; transactions and concurrency control; security; cryptography; replication; distributed multimedia systems. Recommended preparation: EECS 338.

EECS 424. Introduction to Nanotechnology. 3 Units.
An exploration of emerging nanotechnology research. Lectures and class discussion on 1) nanostructures: superlattices, nanowires, nanotubes, quantum dots, nanoparticles, nanocomposites, proteins, bacteria, DNA; 2) nanoscale physical phenomena: mechanical, electrical, chemical, thermal, biological, optical, magnetic; 3) nanofabrication: bottom up and top down methods; 4) characterization: microscopy, property measurement techniques; 5) devices/applications: electronics, sensors, actuators, biomedical, energy conversion. Topics will cover interdisciplinary aspects of the field. Offered as EECS 424 and EMAE 424.

EECS 425. Computer Networks I. 3 Units.

EECS 426. MOS Integrated Circuit Design. 3 Units.

EECS 428. Computer Communications Networks II. 3 Units.
Introduction to topics and methodology in computer networks and middleware research. Traffic characterization, stochastic models, and self-similarity. Congestion control (Tahoe, Reno, Sack). Active Queue Management (RED, FQ) and explicit QoS. The Web: overview and components, HTTP, its interaction with TCP, caching. Overlay networks and CDN. Expected work includes a course-long project on network simulation, a final project, a paper presentation, midterm, and final test. Recommended preparation: EECS 425 or permission of instructor.

EECS 433. Database Systems. 3 Units.

EECS 434. Microfabricated Silicon Electromechanical Systems. 3 Units.

EECS 435. Data Mining. 3 Units.
Data Mining is the process of discovering interesting knowledge from large amounts of data stored either in databases, data warehouses, or other information repositories. Topics to be covered include: Data Warehouse and OLAP technology for data mining, Data Preprocessing, Data Mining Primitives, Languages, and System Architectures, Mining Association Rules from Large Databases, Classification and Prediction, Cluster Analysis, Mining Complex Types of Data, and Applications and Trends in Data Mining. Recommended preparation: EECS 341 or equivalent.

EECS 437. Advanced Topics in Data Mining and Bioinformatics. 3 Units.
This course will cover a large number of active data mining and bioinformatics research areas, which include but not limited to: text mining, sequence analysis, network/graph mining, microarray analysis, and mining mobile objects. Students are expected to understand various methods and approaches employed in these research areas and have critical thinking on the advantages and disadvantages of these approaches. In addition, students need to complete a course-long project which exhibits the independent research capability in these data mining and bioinformatics areas. Recommended preparation: EECS 340, EECS 435.

EECS 438. Biomedical Microdevices. 3 Units.
Recent advances in large scale molecular biology have created the technological need for miniaturized instrumentation that can interact with macromolecules, cells, and tissue with high throughput and in many cases massively parallel formats. This course covers several applications of microfabricated devices to current problems in biology and medicine. The course material includes applications of miniaturization technologies for medical diagnostics and macromolecule assays, drug discovery, cellular activity monitoring and growth, and tissue engineering.

EECS 439. Web Data Mining. 3 Units.
Web crawling technology, web search and information extraction, unsupervised and semi-supervised learning techniques and their application to web data extraction, social network analysis, various pagerank algorithms, link analysis, web resource discovery, web, resource description framework (RDF), XML. Web Ontology Language (OWL). Recommended preparation: EECS 338, EECS 341.
EECS 440. Machine Learning. 3 Units.
Machine learning is a subfield of Artificial Intelligence that is concerned with the design and analysis of algorithms that "learn" and improve with experience. While the broad aim behind research in this area is to build systems that can simulate or even improve on certain aspects of human intelligence, algorithms developed in this area have become very useful in analyzing and predicting the behavior of complex systems. Machine learning algorithms have been used to guide diagnostic systems in medicine, recommend interesting products to customers in e-commerce, play games at human championship levels, and solve many other very complex problems. This course is focused on algorithms for machine learning: their design, analysis and implementation. We will study different learning settings, including supervised, semi-supervised and unsupervised learning. We will study different ways of representing the learning problem, using propositional, multiple-instance and relational representations. We will study the different algorithms that have been developed for these settings, such as decision trees, neural networks, support vector machines, k-means, harmonic functions and Bayesian methods. We will learn about the theoretical tradeoffs in the design of these algorithms, and how to evaluate their behavior in practice. At the end of the course, you should be able to: --Recognize situations where machine learning algorithms are applicable; --Understand, represent and formulate the learning problem; --Apply the appropriate algorithm(s), or if necessary, design your own, with an understanding of the tradeoffs involved; --Correctly evaluate the behavior of the algorithm when solving the problem. Prereq: EECS 391 or EECS 491 or consent of instructor.

EECS 441. Internet Applications. 3 Units.
This course exposes students to research in building and scaling internet applications. Covered topics include Web services, scalable content delivery, applications of peer-to-peer networks, and performance analysis and measurements of internet application platforms. The course is based on a collection of research papers and protocol specifications. Students are required to read the materials, present a paper in class, prepare short summaries of discussed papers, and do a course project (team projects are encouraged). Prereq: EECS 325 or EECS 425.

EECS 444. Computer Security. 3 Units.
General types of security attacks; approaches to prevention; secret key and public key cryptography; message authentication and hash functions; digital signatures and authentication protocols; information gathering; password cracking; spoofing; session hijacking; denial of service attacks; buffer overruns; viruses, worms, etc., principles of secure software design, threat modeling; access control; least privilege; storing secrets; socket security; RPC security; security testing; secure software installation; operating system security; database security; web security; email security; firewalls; intrusions. Recommended preparation: EECS 337.

EECS 450. Operations and Systems Design. 3 Units.
Introduction to design, modeling, and optimization of operations and scheduling systems with applications to computer science and engineering problems. Topics include, forecasting and times series, strategic, tactical, and operational planning, life cycle analysis, learning curves, resources allocation, materials requirement and capacity planning, sequencing, scheduling, inventory control, project management and planning. Tools for analysis include: multi-objective optimization, queuing models, simulation, and artificial intelligence.

EECS 451. Introduction to Digital Communications. 3 Units.
Analysis and design of modern digital communications systems: introduction to digital communication systems, review of basic analog and digital signal processing for both deterministic and stochastic signals, signal space representation, basis functions, projections and matched filters, pulse shaping, pulse amplitude modulation, quadrature amplitude modulation, deterministic performance and performance in noise, carrier frequency and phase tracking, symbol timing synchronization, source coding and channel coding. Extensive computer-based design exercises using Matlab and Simulink to design and test digital modems and communication systems. Prereq: STAT 332 or equivalent.

EECS 452. Random Signals. 3 Units.

EECS 454. Analysis of Algorithms. 3 Units.
This course presents and analyzes a number of efficient algorithms. Problems are selected from such problem domains as sorting, searching, set manipulation, graph algorithms, matrix operations, polynomial manipulation, and fast Fourier transforms. Through specific examples and general techniques, the course covers the design of efficient algorithms as well as the analysis of the efficiency of particular algorithms. Certain important problems for which no efficient algorithms are known (NP-complete problems) are discussed in order to illustrate the intrinsic difficulty which can sometimes preclude efficient algorithmic solutions. Recommended preparation: EECS 454: MATH 304 and (EECS 340 or EECS 405). Offered as EECS 454 and OPRE 454.

EECS 458. Introduction to Bioinformatics. 3 Units.

EECS 459. Bioinformatics for Systems Biology. 3 Units.
EECS 460. Manufacturing and Automated Systems. 3 Units.
Formulation, modeling, planning, and control of manufacturing and automated systems with applications to computer science and engineering problems. Topics include, design of products and processes, location/spatial problems, transportation and assignment, product and process layout, group technology and clustering, cellular and network flow layouts, computer control systems, reliability and maintenance, and statistical quality control. Tools and analysis include: multi-objective optimization, artificial intelligence, and heuristics for combinatorial problems. Offered as EECS 360 and EECS 460.

EECS 466. Computer Graphics. 3 Units.
Theory and practice of computer graphics: object and environment representation including coordinate transformations image extraction including perspective, hidden surface, and shading algorithms; and interaction. Covers a wide range of graphic display devices and systems with emphasis in interactive shaded graphics. Laboratory. Recommended preparation: EECS 233.

EECS 474. Advanced Control and Energy Systems. 3 Units.
This course introduces applied quantitative robust and nonlinear control engineering techniques to regulate automatically renewable energy systems in general and wind turbines in particular. The course also studies the fundamentals for dynamic multidisciplinary modeling and analysis of large multi-megawatt wind turbines (mechanics, aerodynamics, electrical systems, control concepts, etc.). The course combines lecture sessions and lab hours. The 400-level includes an experimental lab competition, where the object is to design, implement, and experimentally validate a control strategy to regulate a real system in the laboratory (helicopter control competition or similar); it will also include additional project design reports. Offered as EECS 374 and EECS 474. Prereq: EECS 374 and EECS 474. Prereq: EECS 374.

EECS 476. Mobile Robotics. 3 Units.
Design of software systems for mobile robot control, including: motion control; sensory processing; localization and mapping; mobile-robot planning and navigation; and implementation of goal-directed behaviors. The course has a heavy lab component involving a sequence of design challenges and competitions performed in teams.

EECS 478. Computational Neuroscience. 3 Units.
Computer simulations and mathematical analysis of neurons and neural circuits, and the computational properties of nervous systems. Students are taught a range of models for neurons and neural circuits, and are asked to implement and explore the computational and dynamic properties of these models. The course introduces students to dynamical systems theory for the analysis of neurons and neural learning, models of brain systems, and their relationship to artificial and neural networks. Term project required. Students enrolled in MATH 478 will make arrangements with the instructor to attend additional lectures and complete additional assignments addressing mathematical topics related to the course. Recommended preparation: MATH 223 and MATH 224 or BIOL 300 and BIOL 306. Offered as BIOL 378, COGS 378, MATH 378, BIOL 478, EBME 478, EECS 478, MATH 478 and NEUR 478.

EECS 483. Data Acquisition and Control. 3 Units.
Data acquisition (theory and practice), digital control of sampled data systems, stability tests, system simulation digital filter structure, finite word length effects, limit cycles, state-variable feedback and state estimation. Laboratory includes control algorithm programming done in assembly language.

EECS 484. Computational Intelligence I: Basic Principles. 3 Units.
This course is concerned with learning the fundamentals of a number of computational methodologies which are used in adaptive parallel distributed information processing. Such methodologies include neural net computing, evolutionary programming, genetic algorithms, fuzzy set theory, and "artificial life." These computational paradigms complement and supplement the traditional practices of pattern recognition and artificial intelligence. Functionalities covered include self-organization, learning a model or supervised learning, optimization, and memorization.

EECS 485. VLSI Systems. 3 Units.
Basic MOSFET models, inverters, steering logic, the silicon gate, nMOS process, design rules, basic design structures (e.g., NAND and NOR gates, PLA, ROM, RAM), design methodology and tools (spice, N.mpc, Caesar, mkpla), VLSI technology and system architecture. Requires project and student presentation, laboratory.

EECS 486. Research in VLSI Design Automation. 3 Units.
Research topics related to VLSI design automation such as hardware description languages, computer-aided design tools, algorithms and methodologies for VLSI design for a wide range of levels of design abstraction, design validation and test. Requires term project and class presentation.

EECS 488. Embedded Systems Design. 3 Units.
Objective: to introduce and expose the student to methodologies for systematic design of embedded system. The topics include, but are not limited to, system specification, architecture modeling, component partitioning, estimation metrics, hardware software codesign, diagnostics.

EECS 489. Robotics I. 3 Units.

EECS 490. Digital Image Processing. 3 Units.
Digital images are introduced as two-dimensional sampled arrays of data. The course begins with one-to-one operations such as image addition and subtraction and image descriptors such as the histogram. Basic filters such as the gradient and Laplacian in the spatial domain are used to enhance images. The 2-D Fourier transform is introduced and frequency domain operations such as high and low-pass filtering are developed. It is shown how filtering techniques can be used to remove noise and other image degradation. The different methods of representing color images are described and fundamental concepts of color image transformations and color image processing are developed. One or more advanced topics such as wavelets, image compression, and pattern recognition will be covered as time permits. Programming assignments using software such as MATLAB will illustrate the application and implementation of digital image processing.

EECS 491. Artificial Intelligence. 3 Units.
This course covers advanced topics in Artificial Intelligence. Topics include representing knowledge using directed and undirected probabilistic graphical models, associated exact and approximate inference algorithms, statistical relational learning, advanced topics in reinforcement learning and automated planning. Prereq: EECS 391 or consent.
EECS 492. VLSI Digital Signal Processing Systems. 3 Units.
Digital signal processing (DSP) can be found in numerous applications, such as wireless communications, audio/video compression, cable modems, multimedia, global positioning systems and biomedical signal processing. This course fills the gap between DSP algorithms and their efficient VLSI implementations. The design of a digital system is restricted by the requirements of applications, such as speed, area and power consumption. This course introduces methodologies and tools which can be used to design VLSI architectures with different speed-area tradeoffs for DSP algorithms. In addition, the design of efficient VLSI architectures for commonly used DSP blocks is presented in this class. Recommended preparation: EECS 485.

EECS 493. Software Engineering. 3 Units.
Topics: Introduction to software engineering; software lifecycle models; development team organization and project management; requirements analysis and specification techniques; software design techniques; programming practices; software validation techniques; software maintenance practices; software engineering ethics. Undergraduates work in teams to complete a significant software development project. Graduate students are required to complete a research project. Recommended preparation for EECS 493: EECS 337. Offered as EECS 393 and EECS 493.

EECS 494. Introduction to Information Theory. 3 Units.
This course is intended as an introduction to information and coding theory with emphasis on the mathematical aspects. It is suitable for advanced undergraduate and graduate students in mathematics, applied mathematics, statistics, physics, computer science and electrical engineering. Course content: Information measures-entropy, relative entropy, mutual information, and their properties. Typical sets and sequences, asymptotic equipartition property, data compression. Channel coding and capacity: channel coding theorem. Differential entropy, Gaussian channel, Shannon-Nyquist theorem. Information theory inequalities (400 level). Additional topics, which may include compressed sensing and elements of quantum information theory. Recommended Preparation: MATH 201 or MATH 307. Offered as MATH 394, EECS 394, MATH 494 and EECS 494.

EECS 495. Nanometer VLSI Design. 3 Units.
Semiconductor industry has evolved rapidly over the past four decades to meet the increasing demand on computing power by continuous miniaturization of devices. Now we are in the nanometer technology regime with the device dimensions scaled below 100nm. VLSI design using nanometer technologies involves some major challenges. This course will explain all the major challenges associated with nanoscale VLSI design such as dynamic and leakage power, parameter variations, reliability and robustness. The course will present modeling and analysis techniques for timing, power and noise in nanometer era. Finally, the course will cover the circuit/architecture level design solutions for low power, high-performance, testable and robust VLSI system. The techniques will be applicable to design of microprocessor, digital signal processor (DSP) as well as application specific integrated circuits (ASIC). The course includes a project which requires the student to work on a nanometer design issue. Recommended preparation: EECS 426 or EECS 485.

EECS 500. EECS Colloquium. 0 Units.
Seminars on current topics in Electrical Engineering and Computer Science.

EECS 500T. Graduate Teaching II. 0 Units.
This course will provide the Ph.D. candidate with experience in teaching undergraduate or graduate students. The experience is expected to involve direct student contact but will be based upon the specific departmental needs and teaching obligations. This teaching experience will be conducted under the supervision of the faculty member who is responsible for the course, but the academic advisor will assess the educational plan to ensure that it provides an educational experience for the student. Students in this course may be expected to perform one or more of the following teaching related activities: grading homeworks, quizzes, and exams, having office hours for students, running recitation sessions, providing laboratory assistance. Recommended preparation: Ph.D. student in EECS department.

EECS 516. Large Scale Optimization. 3 Units.
Concepts and techniques for dealing with large optimization problems encountered in designing large engineering structure, control of interconnected systems, pattern recognition, and planning and operations of complex systems; partitioning, relaxation, restriction, decomposition, approximation, and other problem simplification devices; specific algorithms; potential use of parallel and symbolic computation; student seminars and projects. Recommended preparation: EECS 416.

EECS 518. Nonlinear Systems: Analysis and Control. 3 Units.

EECS 520. Robust Control. 3 Units.
One of the most important problems in modern control theory is that of controlling the output of a system so as to achieve asymptotic tracking of prescribed signals and/or asymptotic rejection of undesired disturbances. The problem can be solved by the so-called regulator theory and H-infinity control theory. This course presents a self-contained introduction to these two important design methods. The intention of this course is to present ideas and methods on such a level that the beginning graduate student will be able to follow current research. Both linear and nonlinear results will be covered. Recommended preparation: EECS 408.

EECS 523. Advanced Neural Microsystems. 3 Units.
This course will cover the latest advances in neuroengineering with specific attention to integrated Microsystems targeting wired/wireless multichannel interfacing with the nervous system at the cellular level in biological hosts. The aim is to provide students familiar with microfabrication and integrated circuit design with an application-driven, system-level overview of sensors and microelectronics in Microsystems format for neural engineering. Recommended preparation: EECS 426.

EECS 526. Integrated Mixed-Signal Systems. 3 Units.
Mixed-signal (analogue/digital) integrated circuit design. D-to-A and A-to-D conversion, applications in mixed-signal VLSI, low-noise and low-power techniques, and communication sub-circuits. System simulation at the transistor and behavioral levels using SPICE. Class will design a mixed-signal CMOS IC for fabrication by MOSIS. Recommended preparation: EECS 426.
EECS 527. Advanced Sensors: Theory and Techniques. 3 Units.
Sensor technology with a primary focus on semiconductor-based devices. Physical principles of energy conversion devices (sensors) with a review of relevant fundamentals: elasticity theory, fluid mechanics, silicon fabrication and micromachining technology, semiconductor device physics. Classification and terminology of sensors, defining and measuring sensor characteristics and performance, effect of the environment on sensors, predicting and controlling sensor error. Mechanical, acoustic, magnetic, thermal, radiation, chemical and biological sensors will be examined. Sensor packaging and sensor interface circuitry.

EECS 531. Computer Vision. 3 Units.
The goal of computer vision is to create visual systems that recognize objects and recover structures in complex 3D scenes. This course emphasizes both the science behind our understanding of the fundamental problems in vision and the engineering that develops mathematical models and inference algorithms to solve these problems. Specific topics include feature detection, matching, and classification; visual representations and dimensionality reduction; motion detection and optical flow; image segmentation; depth perception, multi-view geometry, and 3D reconstruction; shape and surface perception; visual scene analysis and object recognition.

EECS 589. Robotics II. 3 Units.
Survey of research issues in robotics. Force control, visual servoing, robot autonomy, on-line planning, high-speed control, man/machine interfaces, robot learning, sensory processing for real-time control. Primarily a project-based lab course in which students design real-time software executing on multi-processors to control an industrial robot. Recommended preparation: EECS 489.

EECS 600. Special Topics. 1 - 18 Unit.
Offered as EECS 600 and SYBB 600.

EECS 600T. Graduate Teaching III. 0 Units.
This course will provide Ph.D. candidate with experience in teaching undergraduate or graduate students. The experience is expected to involve direct student contact but will be based upon the specific departmental needs and teaching obligations. This teaching experience will be conducted under the supervision of the faculty member who is responsible for the course, but the academic advisor will assess the educational plan to ensure that it provides an educational experience for the student. Students in this course may be expected to perform one or more of the following teaching related activities running recitation sessions, providing laboratory assistance, developing teaching or lecture materials presenting lectures. Recommended preparation: Ph.D. student in EECS department.

EECS 601. Independent Study. 1 - 18 Unit.

EECS 602. Advanced Projects Laboratory. 1 - 18 Unit.

EECS 620. Special Topics. 1 - 18 Unit.

EECS 621. Special Projects. 1 - 18 Unit.

EECS 649. Project M.S.. 1 - 9 Unit.

EECS 651. Thesis M.S.. 1 - 18 Unit.
Department of Macromolecular Science and Engineering

Macromolecular science and engineering is the study of the synthesis, structure, processing, and properties of polymers. These giant molecules are the basis of synthetic materials including plastics, fibers, rubber, films, paints, membranes, and adhesives. Research is constantly expanding these applications through the development of new high performance polymers, e.g., for engineering composites, electronic, optical, and biomedical uses. In addition, most biological systems are composed of macromolecules—proteins (e.g., silk, wool, tendon), carbohydrates (e.g., cellulose) and nucleic acids (RNA and DNA) are polymers and are studied by the same methods that are applied to synthetic polymers.

Production of polymers and their components is central to the chemical industry, and statistics show that over 75 percent of all chemists and chemical engineers in industry are involved with some aspect of polymers. Despite this, formal education in this area is offered by only a few universities in this country, resulting in a continued strong demand for our graduates upon completion of their BS, MS, or PhD degrees.

Research
The research activities of the department span the entire scope of macromolecular science and polymer technology.

Synthesis
New types of macromolecules are being made in the department’s synthesis laboratories. The emphasis is on creating polymers with novel functional properties such as photoconductivity, selective permeation, and biocompatibility, and in producing new materials which behave like classical polymers without being linked together by covalent bonds.

Physical Characterization
This is the broad area of polymer analysis, which seeks to relate the structure of the polymer at the molecular level to the bulk properties that determine its actual or potential applications. This includes characterization of polymers by infrared, Raman, and NMR and mass spectroscopy, thermal and rheological analysis, determination of structure and morphology by x-ray diffraction, electron microscopy, and atomic force microscopy, permeability and free volume, and investigation of molecular weights and conformation by light scattering.

Mechanical Behavior and Analysis
Polymeric materials are known for their unusual mechanical capabilities, usually exploited as components of structural systems. Analysis includes the study of viscoelastic behavior, yielding and fracture phenomena and a variety of novel irreversible deformation processes.

Processing
A major concern of industry is the efficient and large scale production of polymer materials for commercial applications. Research in this area is focusing on reactive processing, multi-layer processing and polymer mixing, i.e., compounding and blends. The integration of sensors and processing equipment, and methods for examining changes in structure and composition during processing steps are growing areas of inquiry. Both laboratory and simulation research are brought to bear on these critical issues.

Materials Development and Design
Often, newly conceived products require the development of polymeric materials with certain specific properties or design characteristics. Materials can be tailor-made by designing synthesis and processing conditions to yield the best performance under specified conditions. Examples might be the design of photoluminescent and semi-conducting polymers for use in optoelectronic devices, polymers that are stable at high temperatures for fire-retardant construction materials, high temperature polymer electrolytes for use in advanced fuel cells, low density thermal insulating polymer composite materials, advanced polymeric optical devices, and biocompatible polymers for use in prosthetic implants, reconstructive medicine and drug-delivery vehicles.

Biopolymers
Living systems are composed primarily of macromolecules, and research is in progress on several projects of medical relevance. The department has a long-standing interest in the hierarchical structure and properties of the components of connective tissues (e.g., skin, cartilage, and bone). The department is also engaged in the development of new biocompatible polymers for applications in human health.

Undergraduate Programs
In 1970, the department introduced a program leading to the Bachelor of Science in Engineering degree with a major in polymer science, which is designed to prepare the student both for employment in polymer-based industry and for graduate education in polymer science. The Bachelor of Science degree program in Polymer Science and Engineering is accredited by the Engineering Accreditation Commission of ABET, www.abet.org (http://www.abet.org).

The Case School of Engineering is proud that the polymer science and engineering program was the first such undergraduate program in the country to receive accreditation from the Engineering Council for Professional Development. The curriculum combines courses dealing with all aspects of polymer science and engineering with basic courses in chemistry, physics, mathematics, and biology, depending on the needs and interests of the student. The student chooses a sequence of technical electives, in consultation with a faculty advisor, allowing a degree of specialization in one particular area of interest, e.g., biomaterials, chemical engineering, biochemistry, or physics. In addition to required formal laboratory courses, students are encouraged to participate in the research activities of the department, both through part-time employment as student laboratory technicians and through the senior project requirement: a one or two semester project that involves the planning and performance of a research project.

Polymer science undergraduates are also strongly encouraged to seek summer employment in industrial laboratories during at least one of their three years with the department. In addition to the general undergraduate curriculum in macromolecular science, the department offers three specialized programs which lead to the BS with a macromolecular science major. The cooperative program contains all the course work required for full-time resident students plus one or two six-month cooperative sessions in polymer-based industry. The company is selected by the student in consultation with his or her advisor, depending on the available opportunities. The dual-degree program allows students to work simultaneously on two baccalaureate level degrees within the university. It generally takes five years to complete the course requirements for each department for the degree. The BS/MS program leads to the simultaneous completion of requirements for both the master’s and bachelor’s degrees. Students with a minimum GPA of 3.0 may apply for admission to this program in their junior year.
Mission Statement
To educate students who will excel and lead in the development of polymeric materials and the application of structure-property relationships. The department seeks to prepare students for either professional employment or advanced education, primarily in this or related science or engineering disciplines, but also in professional schools of business, law or medicine. Undergraduate students are offered opportunities for significant research experience, capitalizing on the strength of our graduate program.

Educational Objectives
Our program will produce graduates who:

1. Are competent, creative, and highly valued professionals in industry, academia, or government.
2. Are flexible and adaptable in the workplace, possess the capacity to embrace new opportunities of emerging technologies, and embrace leadership and teamwork opportunities, all affording sustainable engineering careers.
3. Continue their professional development by obtaining advanced degrees in Polymer Science and Engineering or other professional fields, as well as medicine, law, management, finance or public policy.
4. Act with global, ethical, societal, ecological, and commercial awareness expected of practicing engineering professionals.

Student Outcomes
As preparation for achieving the above educational objectives, the BS degree in Polymer Science and Engineering is designed so that students attain:

- an ability to apply knowledge of mathematics, science, and engineering
- an ability to design and conduct experiments, as well as to analyze and interpret data
- an ability to design a system, component, or process to meet desired needs
- an ability to function in multi-disciplinary teams
- an ability to identify, formulate, and solve engineering problems
- an understanding of professional and ethical responsibility
- an ability to communicate effectively
- the broad education necessary to understand the impact of engineering solutions in a global and societal context
- a recognition of the need for, and an ability to engage in life-long learning
- a knowledge of contemporary issues
- an ability to use the techniques, skills, and modern engineering tools necessary for engineering practice

**Year Total:** 16 15

**Total Units in Sequence:** 129

**Hours required for graduation:** 129

- Engineering Core Courses
- Choice of USNA, USSO, or USSY course focused on thinking about the natural, social, or symbolic “world.”
- Approved Natural Science electives:
  - BIOL 214 Genes, Evolution and Ecology (d);
  - BIOL 215 Cells and Proteins (d);
  - BIOL 307 General Biochemistry (d);
  - BIOL 362 Principles of Developmental Biology
- Suggested for pre-med students
- EMAC 355 Polymer Analysis Laboratory is strongly recommended.
At least 3 of the 4 Technical Electives have to be taken from:
- EBME 315 Applied Tissue Engineering;
- EBME 316 Biomaterials for Drug Delivery;
- EBME 325 Introduction to Tissue Engineering;
- EBME 350 Quantitative Molecular Bioengineering;
- EBME 408 Engineering Tissues/Materials - Learning from Nature's Paradigms;
- EBME 426 Nanomedicine;
- EMAC 471 Polymers in Medicine / EBME 406 Polymers in Medicine;
- a three-credit research sequence of EMAC 125 Freshman Research on Polymers and EMAC 325 Undergraduate Research in Polymer Science
- EMAC 372 Polymer Processing and Testing Laboratory (offered in the spring semester of the fourth year)

Preparation for the polymer science project should commence in the previous semester.

**Minor in Polymer Science and Engineering**

The minor in Polymer Science and Engineering consists of five courses from the list below (special arrangements can be made to include appropriate EMAC graduate courses as well).

Choose any five of the following: 15

Total Units: 15

**Graduate Programs**

Courses leading to the Master of Science (MS) and Doctor of Philosophy (PhD) degrees in macromolecular science are offered within the Case School of Engineering. They are designed to increase the student’s knowledge of macromolecular science and of his or her own basic area of scientific interest, with application to specific polymer research problems. Research programs derive particular benefit from close cooperation with graduate programs in chemistry, physics, materials science, chemical engineering, biological sciences, and other engineering areas. The interdisciplinary academic structure allows the faculty to fit the individual program to the student’s background and career plans. Basic and advanced courses are offered in polymer synthesis, physical chemistry, physics, biopolymers, and applied polymer science and engineering. A laboratory course in polymer characterization instructs students in the use of modern experimental techniques and equipment. Graduate students are also encouraged to take advanced course work in polymer solid state physics, physical chemistry, synthesis, rheology, and polymer processing. The department also offers, in conjunction with the School of Medicine, a six- to seven-year MD/PhD program for students interested in the application of polymers and plastics to medicine, as well as for students interested in a molecular structural basis of medicine, particularly related to connective tissues, biomechanics, aging, pharmaceuticals, and blood behavior. Initiated in 1977, it is the only program of its kind in the nation.

**Master of Science**

**Master’s Thesis (Plan A)**

The minimum requirement to complete a master’s degree under Plan A is 27 hours. Of the 27 hours, at least 18 hours must be coursework, and 9 hours must be EMAC 651 Thesis M.S. (thesis research). At least 18 semester hours of coursework, including thesis, must be at the 400 level or higher.

All Plan A MS students must take 6 credits of departmental fundamentals courses including the lab component. Please note: Once a student begins registration of EMAC 651 Thesis M.S., the student must register for at least one credit hour of this course every semester until graduation. The normal residency period for an MS degree is 2 years.

For completion of master’s degree Plan A, an oral examination (defense) of the master’s thesis is required. The examination is conducted by a committee of three university faculty members. The candidate’s thesis advisor usually serves as the chair of the examining committee. The chair of the department or the curricular program faculty appoints members of the committee. The examining committee must agree unanimously that the candidate has passed the thesis examination.

**Master’s Comprehensive (Plan B)**

The master’s Plan B program is available for individuals who live out-of-state or are working full-time. A research report and oral examination is required before graduation. This option requires 27 total credit hours; categorized by the following:

1. 3-6 cr. hrs. need to be project credit (independent study) which needs to be approved by advisor
2. 21-24 course credits (of which 9 must be based in Macromolecular Science); and
3. 6 core course credits.

Each candidate for the master’s degree under Plan B must satisfactorily pass a comprehensive examination, which is administered by the department or curricular program committee. The examination may be written or oral or both. A student must be registered during the semester in which any part of the comprehensive examination is taken. If not registered for other courses, the student will be required to register for one semester hour of EXAM 600 Master’s Comprehensive Exam, before taking the examination.

Elective and core courses can be taken via Distance Learning (ITN) or by transfer (transfers need to be approved by chair of department and dean of graduate studies; core courses also needs instructors’ approval).

**PhD Programs**

The PhD program consists of 36 hours of coursework, including the departmental core courses and 18 credit hours of PhD thesis (EMAC 701 Dissertation Ph.D.) are required for the PhD degree, in addition to passing the research qualifying exam (oral proposal) and the written qualifying exam.

Of the coursework credit requirements, the core courses are designated as “depth” courses (12 credits). In addition, all students will take a minimum of two breadth courses in basic science and/or other departments in the School of Engineering (for a total of six credits). The remaining breadth requirements (up to 18 credits) are satisfied by course modules taken in Macromolecular Science and Engineering.
Each doctoral student is responsible for becoming sufficiently familiar with the research interests of the department or program faculty to choose in a timely manner a faculty member who will serve as the student’s research advisor. The research advisor is expected to provide mentorship in research conception, methods, performance and ethics, as well as focus on development of the student’s professional communication skills, building professional contacts in the field, and fostering the professional behavior standard of the field and research in general.

The research advisor also assists with the selection of three other faculty to serve as the required additional members of the dissertation advisory committee. This committee must be formed within the second semester following admission. Throughout the development and completion of the dissertation, these members are expected to provide constructive criticism and helpful ideas generated by the research problem from the viewpoint of their particular expertise. Each member will make an assessment of the originality of the dissertation, its value, the contribution it makes and the clarity with which concepts are communicated, especially to a person outside the field.

The doctoral student is expected to arrange meetings and maintain periodic contact with each committee member. A meeting of the full committee for the purpose of assessing the student’s progress should occur at least once a year until the completion of the dissertation.

For students entering the PhD program with a MS degree, 18, instead of 36 credit hours, of coursework is required. Other requirements for a PhD remain the same as described above. Normally students should orient their training around their main area of interest/expertise and in relation to their research program. For those enrolled in the MD/PhD degree program, all 18 course credits for breadth and depth courses must be taken within the Medical School Program.

The core courses designated as depth courses are:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>EMAC 401</td>
<td>Polymer Foundation Course I: Organic Chemistry</td>
<td>3</td>
</tr>
<tr>
<td>EMAC 402</td>
<td>Polymer Foundation Course II: Physical Chemistry</td>
<td>3</td>
</tr>
<tr>
<td>EMAC 403</td>
<td>Polymer Foundation Course III: Physics</td>
<td>3</td>
</tr>
<tr>
<td>EMAC 404</td>
<td>Polymer Foundation Course IV: Engineering</td>
<td>3</td>
</tr>
</tbody>
</table>

Students are required to take all four depth courses (12 credits), but on the approval of the instructor, can be excused from one or more of the courses if the relevant course content is not satisfied by a course taken in prior undergraduate or graduate degrees. However, the excused credits must be fulfilled by taking additional breadth courses. NOTE: While EMAC 401 Polymer Foundation Course I: Organic Chemistry and EMAC 402 Polymer Foundation Course II: Physical Chemistry, and EMAC 403 Polymer Foundation Course III: Physics and EMAC 404 Polymer Foundation Course IV: Engineering are offered at the same time in the Fall and Spring semesters, respectively, students can still sign up for both courses, since one is offered in the first half and the other in the second half of the semester.

Two courses in basic science and/or engineering are required. These courses can be taken in other departments of the School of Engineering, or in the departments of Mathematics, Biology, Biochemistry, Chemistry, or Physics as approved by the advisor.

As part of the course requirements, all students are required to register for EMAC 677 Colloquium in Macromolecular Science and Engineering (the Friday departmental seminars) which will be graded with either “Pass” or “No Pass.”

Students who have taken EMAC 370 Polymer Chemistry and Industry and EMAC 376 Polymer Engineering as undergraduates can use these courses to fulfill one or more of the depth requirements in the Department of Macromolecular Science and Engineering for the MS and PhD degree. However, the credits for this course cannot be applied towards the course credit requirements for the graduate degree. Exceptions are possible for the combined BS/MS program.

**Engineering School Requirements**

**Depths:** The foundation courses are deemed to satisfy the depth requirements (12 credits).

**Breadth:** Two courses in basic science and/or other departments in the School of Engineering (for a total of six credits). The remaining breadth requirements (18 credits) are satisfied by course modules taken in Macromolecular Science and Engineering.

**Graduate Rules**

Graduates entering the Department of Macromolecular Science and Engineering are subject to the academic rules of the University, of the School of Engineering, and of the Department. Consult the Graduate Student Handbook (http://gradstudies.case.edu).

A short abstract of important points include:

1. GPA requirements are described below in the Departmental Rules.
2. A student receiving a “U” in a course is automatically placed on probation and must remove him/herself from probation within one year (usually by repeating the course). If a course is repeated, both original and revised grades will count in the grade point average.
3. Some students are admitted on a probationary basis and must achieve a 3.0 GPA after two semesters to remain in good standing (this is a rule of the Engineering School).
4. Students entering the graduate program for a PhD need to fill out the “Planned Program of Study” by the end of their second semester.
5. All students are required to serve as teaching assistants. Responsibilities as a TA include serving as an instructor, lab assistant, recitation leader, grader, or tutor in an undergraduate course. After fulfilling the required teaching assistant program, UNIV 400, students will make sure that three teaching courses (400T, 500T, and 600T) are listed on their Planned Program of Study. Completion of this teaching requirement will be monitored by Graduate Studies and is required in order to graduate.

**Engineering School Rules**

Most of these rules are incorporated in the number and type of courses required by the Department. However, Case School of Engineering PhD students are required to 1) maintain full-time status as a PhD bound student; 2) maintain a grade point average of 3.2 or above; and 3) continue making satisfactory academic progress as certified by their advisor.

**Departmental Rules**

1. Students in the PhD program receiving a GPA below 2.50 in any two consecutive semesters will be asked to terminate their graduate study program.
2. The GPA requirement established by the university at various stages of the graduate program shall exclude MS or PhD thesis credits which will be graded "S" or "U" until a final grade is given at the end of the program. Hence a student must maintain a minimum GPA of 2.75 (for an MS) OR a 3.0 (for a PhD) in coursework. (As mentioned above, Case School of Engineering PhD students must maintain a GPA of 3.2 or above.)
4. Plan A MS students must give a departmental seminar (as part of the student lecture series).

5. Plan B MS degrees are limited to non-fellowship students.

6. Coursework may be transferred from another university, subject to Graduate Committee approval if:
   - the courses duplicate requirements of the department;
   - the courses were in excess of the undergraduate degree requirements; or
   - the courses were taken in a graduate program elsewhere;
   - a grade of B or better was achieved in those courses;
   - a petition is made to and approved by the Graduate Committee of the Department
   - the transferred grades will not count in the GPA at CWRU.

7. Plan B MS degrees are limited to non-fellowship students.

8. The Department reserves the right to withhold financial support to a student if that student takes an undue amount of time in completing his/her MS or PhD requirements (normally no longer than 3 years for MS and 5 years after initial registration of EMAC 701 Dissertation Ph.D.).

9. A PhD student must pass the written Qualifying Exam within 24 months after enrollment with a MS degree into the PhD program. A PhD student must pass the written Qualifying Exam within 24 months after enrollment with a BS degree into the PhD program. A student only has two chances to pass the Qualifying Exam. Students will be asked to answer 4 mandatory questions – one from each of the following five areas:
   - Polymer Synthesis
   - Polymer Physical Chemistry
   - Polymer Physics
   - Applied Polymer Science
   - Seminars (from the previous year)

   Two elective questions will be chosen from a number of questions from all elective courses offered in the Department. NOTE: The Qualifying Exam is given twice per year respectively on the first Friday in the beginning and the first Friday after the end of the Spring semester. For PhD students enrolled in a Spring semester, those with MS must pass the Qualifying Exam at the end of his/her second Spring semester, and those with BS must pass it at the beginning of his/her third Spring semester.

10. It is expected that all students will present the results of their research at the student lecture series.

11. At least three (3) weeks prior to the RQE oral defense, the student will submit to the graduate chairperson a research proposal title with a one-paragraph synopsis of the research problem and approach, along with suggestions for two members (i) and (ii), below) of the three member examining committee. The examining committee will consist of three faculty members: (i) a member (or intended member) of the student’s Thesis Advisory Committee, (ii) an expert in the research proposal area and (iii) a faculty member selected systematically and in a neutral manner by the Graduate Committee. The student’s primary thesis advisor or co-advisors is/are excluded from the examining committee. Upon establishing the examining committee, the student will arrange with the committee for the date, time, and location of the RQE. The student will then distribute the written research proposal to the examining committee five full business days before the defense. It should be no less than 15 and no more than 20 pages of double-spaced text with 1” margins on all sides. No more than 5 pages can be devoted to the proposal introduction or background. Figures, tables, and schemes should not exceed five pages in total. Literature citations are in addition to this page count. The oral presentation will be chaired by a designated chairperson from the examining committee. It should contain only limited background material, focusing primarily on execution of the proposed research. The oral presentation should last 20-30 minutes, with questions from faculty being for clarification only. Following the presentation, the examining committee will ask questions for the student to answer concerning the proposal. On the basis of the written proposal and oral defense (presentation and question responses) the faculty will then confer and tender a decision of pass, conditional pass with major revision, or fail, immediately. The decision will be communicated to the student and graduate chairperson in writing within one business day.

12. All PhD students are required to fulfill their teaching requirement by registering for the three teaching courses, 400T, 500T, and 600T that will be posted to the departmental roster each semester. Completion of the teaching requirement will be monitored by Graduate Studies, and these three teaching courses must appear both on the Program of Study form and the student’s transcript.

13. The Research Qualifying Exam (RQE) is designed to test the student’s knowledge of the chosen field as well as his/her originality and ability to perform high quality, independent research. It consists of a written research proposal and an oral defense. All PhD students who hold an MS degree must pass the RQE within 2 years of enrolling in the PhD program, while students with a BS degree must do so within 2.5 years. Successful passing of the Written Qualifying Exam (not to be confused with the written portion of this RQE) is prerequisite to taking the RQE. Students have two chances to pass the RQE and no student will be allowed to continue on to a PhD degree if he/she has not successfully taken it. A conditional pass with major revision (see below) requires modification to the written or oral portion, at the examination committee discretion, within ten business days and following guidelines by the examination committee. A second exam, if required due to failure of the first exam, must be taken within six months of the first exam with at least one examination committee member remaining the same. Passing the exam constitutes advancement to candidacy and is required for enrolling in EMAC 701 Dissertation Ph.D.

14. The department requires the equivalent of six credit hours of departmental assistance. This requirement takes the form of grading, laboratory assistance and/or general departmental duties and is designed to utilize no more than three hours/week of a student’s time. The departmental service requirement must be completed within the first two semesters of study. However, the departmental service requirement form must be turned in at the end of the each semester until the obligation is met.
19. Vacation Policy. Graduate students in the department who receive fellowship support for 12 months are normally entitled to two weeks vacation plus national holidays. Alternative arrangements may be made with the student’s advisor, giving ample advance notice. In certain situations it is possible to take a leave of absence without financial support.

20. Prior to graduation a student is required to clean out his/her laboratory space including a removal of waste solvents and hazardous material.

21. Failure to comply with all of the above course requirements may result in termination or delay graduation.

Facilities

The Kent Hale Smith Science and Engineering Building houses the Department of Macromolecular Science. The building was built in 1993, and specifically designed to meet the specific needs of polymer research. The facility consists of five floors, plus a basement. The laboratories for chemical synthesis are located principally on the top floor, the molecular and materials characterization laboratories on the middle floors, and the major engineering equipment on the ground floor, while the NMR, MALDI-TOF, and TA-InstrumentsThermal Characterization instrumentation are located in the basement. Modern, computer-interfaced classrooms are installed on the ground floor. Additional instrumentation available includes Small and Wide-Angle X-ray diffractometers; scanning electron microscopy; a complete range of molecular spectroscopic equipment including FTIR, laser Raman, and high resolution solution and solid-state NMR (including imaging), as well as Raman and FTIR microscopes; and dynamic light scattering spectroscopy. There are also facilities for polymer characterization (molecular weight distribution), optical microscopy, solution and bulk rheology, scanning calorimetry, and for testing and evaluating the mechanical properties of materials. A newly built-out processing lab provides the complete suite of Thermo-Fisher batch, single- and twin-screw mixing and extrusion equipment, as well as that manufacturer’s state of the art rheometers. The C. Richard Newpher polymer processing laboratory includes a high temperature Rheometrics RMS-800 dynamic mechanical spectrometer, a Bomem DA-3 FTIR with FT-Raman capabilities, a compression molding machine, a Brabender plasticorder, a high speed Instron testing machine, and a vibrating sample magnetometer. The Charles E. Reed ’34 Laboratory is concerned with the mechanical analysis of polymeric materials. The major testing is done by Instron Universal testing instruments including an Instron model 1123 with numerous accessories such as an environmental chamber for high or low temperature experiments. Additional mechanical testing of fibers, films and injection-molded (Boy model 22-S) are provided by MTS universal testers which are used for both research and undergraduate teaching laboratory classes. The NSF Center for Layered Polymeric Systems (CLiPS) has its central facility within the department, with three cutting-edge multilayer extrusion systems as its centerpiece. CLiPS also operates a Bruckner KARO IV biaxial stretching unit, which allows controlled biaxial stretching of polymer films, and an Atomic Force Microscope which probes the morphological and mechanical properties of materials at the nanoscale. The Molecular Modeling Center provides access to various software packages for the rheological and molecular modeling of polymers.

Faculty

David Schiraldi, PhD
(University of Oregon)

Professor and Chair
Advanced composites based on aerogels and nanofillers, monomer and polymer synthesis, structure-property relationships, polymer degradation, polymerization catalysis, synthetic fibers, barrier packaging materials.

Rigoberto C. Advincula, PhD
(University of Florida)
Professor
Design and synthesis of nanostructured materials, dendrimers, polymer brushes, thin films, and the use of innovative surface characterization techniques. Applications in electro-optical devices, sensors, biomaterials, and smart coatings.

John Blackwell, PhD
(University of Leeds, England)
Leonard Case Jr. Professor
Determination of the solid state structure and morphology of polymers. X-ray analysis of the structure of thermotropic copolyesters, copolyimides, polyurethanes, polysaccharides; supramolecular assemblies, fluoropolymers; molecular modeling of semi-crystalline and liquid crystalline polymers; rheological properties of polysaccharides and glycoproteins.

Liming Dai, PhD
(Australian National University)
Kent Hale Smith Professor
Multifunctional nanomaterials; optoelectronic macromolecules; and biomaterials and bioinspiration.

Hatsuo Ishida, PhD
(Case Western Reserve University)
Professor
Processing of polymers and composite materials; structural analysis of surfaces and interfaces; molecular spectroscopy of synthetic polymers

Alexander M. Jamieson, DPhil
(Oxford University, England)
Professor
Quasielastic laser light scattering; relaxation and transport of macromolecules in solution and bulk; structure-function relationships of biological macromolecules.

LaShanda T. Korley, PhD
(Massachusetts Institute of Technology)
Assistant Professor
Structure-function relationships; toughening mechanisms in segmented copolymers; spatial confinement of self-assembled materials, including biomaterials; hierarchical microstructures.

João Maia, PhD
(University of Wales Aberystwyth, U.K.)
Associate Professor
Emeriti Faculty

Jack L. Koenig, PhD  
(University of Nebraska, Lincoln)  
The Donnell Institute Professor Emeritus  
Polymer structure-property relationships using infrared, Raman, NMR spectroscopy and spectroscopic imaging techniques

Jerome B. Lando, PhD  
(Polytechnic Institute of Brooklyn)  
Professor Emeritus  
Solid state polymerization; X-ray crystallography of polymers; electrical properties of polymers; ultra-thin polymer films

Morton H. Litt, PhD  
(Polytechnic Institute of Brooklyn)  
Professor Emeritus

Kinetics and mechanisms of free radical and ionic polymerization; mechanical properties of polymers; fluorocarbon chemistry; synthesis of novel monomers and polymers; polymer electrical properties; cross-linked liquid crystal polymers

Charles E. Rogers, PhD  
(Syracuse University and State University of New York)  
Professor Emeritus  
Transport and mechanical properties of polymers; synthesis and properties of multicomponent systems; environmental effect on polymers; adhesion, adhesives, and coatings

Secondary Faculty

James M. Anderson, PhD  
(Orange State University, M.D.)  
Professor of Macromolecular Science, Pathology, and Biomedical Engineering  
Biomaterials for delivery of therapeutic proteins; protein-polymer conjugates; drug-delivery; biopolymer catalysts; self-assembling peptides; affinity-based delivery of therapeutics; layered polymeric delivery systems

Gary Wnek, PhD  
(Massachusetts Institute of Technology)  
F. Alex Nason Professor of Materials Science  
Optical materials and elements, optical properties and electronic structure of materials, and electrodynamic van der Waals-London dispersion interactions

Erin Lavik, PhD  
(Massachusetts Institute of Technology)  
Elmer Lincoln Lindseth Associate Professor in Biomedical Engineering  
Development of new approaches to understand and treat injuries and to diseases of the spinal cord, optic nerve, and retina

J. Adin Mann Jr., PhD  
(Iowa State University)  
Professor of Chemical Engineering  
Surface phenomena, interfacial dynamics, light scattering, and stochastic processes of adsorption and molecular rearrangement at interfaces

Roger Marchant, PhD  
(Case Western Reserve University)  
Professor of Biomedical Engineering  
Biopolymers, polymer surface coatings, and properties and characterization of polymer surfaces on implants and sensors

Primary Faculty

Polymer rheology: extensional rheology and rheometry; micro- and nano-rheology; bio-rheology: food rheology and processing; rheology for macromolecular technology: development and optimization of polymer blends and composites; viscoelasticity of micro- and nano-layered polymer films; on- and in-line monitoring of extrusion-based processes; micro-processing; environmental rheology and processing

Ica Manas-Zloczower, DSc  
(Israel Institute of Technology)  
Professor and Associate Dean of Faculty Development  
Structure and micromechanics of fine particle clusters; interfacial engineering strategies for advanced materials processing; dispersive mixing mechanisms and modeling; design and mixing optimization studies for polymer processing equipment through flow simulations

John Pokorski, PhD  
(Northwestern University)  
Assistant Professor  
Biomaterials for delivery of therapeutic proteins; protein-polymer conjugates; drug-delivery; biopolymer catalysts; self-assembling peptides; affinity-based delivery of therapeutics; layered polymeric delivery systems

Stuart Rowan, PhD  
(University of Glasgow, UK)  
Kent Hale Smith Professor  
Organic chemistry, synthesis, supramolecular chemistry, conducting polymers, interlocked macromolecules (polyrotaxanes and polycatenanes), peptide nucleic acids, supramolecular polymerization, reversible ‘dynamic’ chemistry and combinatorial libraries

Gary Wnek, PhD  
(University of Massachusetts, Amherst)  
The Joseph F. Toot, Jr., Professor of Engineering and Faculty Director, The Institute for Management and Engineering (TIME)  
Polymers with unusual electrical or optical properties; biomaterials for tissue engineering and regenerative medicine; electric field-mediated processing (electrospinning of nano- and micro fibers and morphology modulation in polymer blends); polymer-based microfluidic platforms; polymer product design

Lei Zhu, PhD  
(University of Akron)  
Associate Professor  
Nanoscale structure and morphology of crystalline/liquid crystalline polymers and block copolymers; ferroelectric and dielectric polymers for electric energy storage; polymer/inorganic hybrid nanocomposites; biodegradable polymers for diagnostic and drug delivery
Experimental condensed matter physics and liquid crystal physics

Kenneth Singer, PhD
(University of Pennsylvania)
Professor of Physics

Modern optics and condensed matter experiment and nonlinear optics

Philip Taylor, PhD
(Cambridge University, England)
Perkins Professor of Physics

Phase transitions and equations of state for crystalline polymers; piezoelectricity and pyroelectricity

Horst von Recum, PhD
(University of Utah, Salt Lake City)
Assistant Professor of Biomedical Engineering

Novel platforms for the delivery of molecules and cells and the use of novel stimuli-responsive polymers for use in gene and drug delivery

Adjunct Faculty

Scott E. Rickert, PhD
(Case Western Reserve University)
Adjunct Professor

Conducting polymers; microdevices; polymer electrodes; polymer adorption

Alan Riga, PhD
(Case Western Reserve University)
Adjunct Full Professor

Extensive industrial and forensic science experience in laboratory testing and characterization of materials, pharmaceuticals, excipients, proteins, metals, alloys, polymers, biopolymers, elastomers, organic chemicals, monomers, resins, thermostets, and thermoplastics

Christoph Weder, DrScNat
(ETH Zurich Switzerland)
Adjunct Full Professor

Design, synthesis and investigation of structure-property relationships of novel functional polymers: polymers with unusual optic and/or electronic properties; (semi)conducting conjugated polymers; stimuli-responsive polymers; biomimetic materials, polymer nanocomposites, supramolecular chemistry.

Courses

EMAC 125. Freshman Research on Polymers. 1 Unit.
Freshman research in polymer chemistry, engineering, and physics. Students will be placed in active research groups and will participate in real research projects under the supervision of graduate students and faculty mentors.

EMAC 270. Introduction to Polymer Science and Engineering. 3 Units.

EMAC 276. Polymer Properties and Design. 3 Units.
The course reviews chemical and physical structures of a wide range of applications for synthetic and natural polymers, and addresses “Which polymer do we choose for a specific application and why?” We examine the polymer properties, the way that these depend on the chemical and physical structures, and reviews how they are processed. We aim to understand the advantages and disadvantages of the different chemical options and why the actual polymers that are used commercially are the best available in terms of properties, processibility and cost. The requirements include two written assignments and one oral presentation. Recommended preparation: ENGR 145.

EMAC 303. Structure of Biological Materials. 3 Units.
Structure of proteins, nucleic acids, connective tissue and bone, from molecular to microscopic levels. An introduction to bioengineering biological materials and biomimetic materials, and an understanding of how different instruments may be used for imaging, identification and characterization of biological materials. Offered as: EBME 303 and EMAC 303. Recommended preparation: EBME 201, EMBE 202, and EMAC 270.

EMAC 325. Undergraduate Research in Polymer Science. 1 - 3 Unit.
Undergraduate laboratory research in polymer chemistry/physics/engineering. Students will undertake an independent research project, working under the mentoring of both a graduate student and a faculty member. A mid-term written progress report is required. A written report and oral presentation will be made at the end of the semester. Can be taken for 1-3 credits per semester, up to a total of 6 credit hours. Students are expected to spend approximately 5 hours/week in the laboratory per credit registered each semester. Recommended preparation: Sophomore/Junior standing and consent of instructor.

EMAC 351. Physical Chemistry for Engineering. 3 Units.
Principles of physical chemistry and their application to systems involving physical and chemical transformations. The nature of physical chemistry, properties of gases, overview of the laws of thermodynamics, thermochemistry, solutions, phases and chemical equilibrium, kinetics of chemical reaction, solutions of electrolytes and introduction to quantum mechanics, atomic structure and molecular statistics. Recommended preparation: ENGR 225, PHYS 122.

EMAC 355. Polymer Analysis Laboratory. 3 Units.
Experimental techniques in polymer synthesis and characterization. Synthesis by a variety of polymerization mechanisms. Quantitative investigation of polymer structure by spectroscopy, diffraction and microscopy. Molecular weight determination. Physical properties. Recommended preparation: EMAC 270 or MATH 224 or MATH 234.

EMAC 370. Polymer Chemistry and Industry. 3 Units.
The nature of polymer chemistry ranging from the fundamentals of organic chemistry of polymer synthesis to the industrial chemistry of polymer production. Physical chemistry as it pertains to the characterization of polymers will also be discussed. Recommended preparation: EMAC 270, CHEM 223, CHEM 224.

EMAC 372. Polymer Processing and Testing Laboratory. 3 Units.
Basic techniques for the rheological characterization of thermoplastic and thermoset resins; "hands-on" experience with the equipment used in polymer processing methods such as extrusion, injection molding, compression molding; techniques for mechanical characterization and basic principles of statistical quality control. Recommended preparation: EMAC 377.
EMAC 375. Fundamentals of Non-Newtonian Fluid Mechanics and Polymer Rheology. 3 Units.
This course will involve the study of Rheology from the perspectives of rheological property measurement, phenomenological and molecular models, and applicability to polymer processing. In particular, students will be introduced to: 1) General concepts of Rheology and Newtonian Fluid Mechanics, 2) Standard flows and material functions; 3) The role of Rheology as a structural characterization tool, with an emphasis on polymeric systems; 4) Experimental methods in Rheology with quantitative descriptions of associated flows and data analyses; 5) Viscoelasticity and Non-Newtonian Fluid Mechanics, including the application of models, both phenomenological and molecular, to the prediction of rheological behavior and extraction of model parameters from real data sets; and 6) The relevance of rheological behavior of different systems to practical processing schemes, particularly with respect to plastics manufacturing. Offered as EMAC 375 and EMAC 475. Prereq: ENGR 225 or EMAC 404.

EMAC 376. Polymer Engineering. 3 Units.
Mechanical properties of polymer materials as related to polymer structure and composition. Visco-elastic behavior, yielding and fracture behavior including irreversible deformation processes. Recommended preparation: EMAC 276 and ENGR 200. Offered as EMAC 376 and EMAC 476.

EMAC 377. Polymer Processing. 3 Units.
Application of the principles of fluid mechanics, heat transfer and mass transfer to problems in polymer processing; elementary steps in polymer processing (handling of particulate solids, melting, pressurization and pumping, mixing); principles and procedures for extrusion, injection molding, reaction injection molding, secondary shaping. Recommended preparation: ENGR 225.

EMAC 378. Polymer Engineer Design Product. 3 Units.
Uses material taught in previous and concurrent courses in an integrated fashion to solve polymer product design problems. Practicality, external requirements, economics, thermal/mechanical properties, processing and fabrication issues, decision making with uncertainty, and proposal and report preparation are all stressed. Several small exercises and one comprehensive process design project will be carried out by class members. Offered as EMAC 378 and EMAC 478.

EMAC 396. Special Topics. 1 - 18 Unit.
(Credit as arranged.)

EMAC 398. Polymer Science and Engineering Project I. 1 - 3 Units.
(Senior project). Research under the guidance of faculty. Requirements include periodic reporting of progress, plus a final oral presentation and written report. Repeatable up to 3 credit hours. When taken for 3 credits it may be spread over two successive semesters. Recommended preparation: Senior standing.

EMAC 399. Polymer Science and Engineering Project II. 1 - 9 Unit.
(Senior project.) Research under the guidance of staff, culminating in thesis. Recommended preparation: Majors only and senior standing.

EMAC 400T. Graduate Teaching I. 0 Units.
This course will engage the Ph.D. students in teaching experiences that will include non-contact (such as preparation and grading of homeworks and tests) and direct contact (leading recitations and monitoring laboratory works, lectures and office hours) activities. The teaching experience will be conducted under the supervision of the faculty. All Ph.D. students will be expected to perform direct contact teaching during the course sequence. The proposed teaching experiences for EMAC Ph.D. students are outlined below in association with undergraduate classes. The individual assignments will depend on the specialization of the students. The activities include grading, recitation, lab supervision and guest lecturing. Recommended preparation: Ph.D. student in Macromolecular Science.

EMAC 401. Polymer Foundation Course I: Organic Chemistry. 3 Units.
The class is an introduction to the synthesis and organic chemistry of macromolecules. The course introduces the most important polymerization reactions, focusing on their reaction mechanisms and kinetic aspects. Topics include free radical and ionic chain polymerization, condensation (step-growth) polymerization, ring-opening, insertion and controlled addition polymerization. The lecture portion of this course (2 credit hours) is integrated with a laboratory or term paper component (1 credit hour). There is no limit on the number of students for the class as a whole. However, there is a limit of 12 students on the laboratory component (other students will do term papers).

EMAC 402. Polymer Foundation Course II: Physical Chemistry. 3 Units.
This course is an introduction to the physical chemistry of polymers in solution. Topics include: polymer statistics (microstructure, configuration, and chain dimensions), thermodynamics and transport properties of polymers in solution, methods for molecular weight determination, physical chemistry of water-soluble polymers, and characterization of polymer microstructure (IR and NMR). The lecture portion of this course (2 credit hours) is integrated with a laboratory or term paper component (1 credit hour). There is no limit on the number of students for the class as a whole. However, there is a limit of 12 students on the laboratory component (other students will do term papers).

EMAC 403. Polymer Foundation Course III: Physics. 3 Units.
This course is an introduction to the physics of polymers in the bulk amorphous and crystalline states. Topics include: structural and morphological analysis using X-ray diffraction, electron microscopy and atomic force microscopy, characterization of thermal transitions, viscoelastic behavior and rubber elasticity, and dynamic mechanical analysis. The lecture portion of this course (2 credit hours) is integrated with a laboratory or term paper component (1 credit hour). There is no limit on the number of students for the class as a whole. However, there is a limit of 12 students on the laboratory component (other students will do term papers).
EMAC 404. Polymer Foundation Course IV: Engineering. 3 Units.
This class is an introduction to the engineering and technology of polymeric materials. Topics include: additives, blends and composites, natural polymers and fibers, thermoplastics, elastomers, and thermosets, polymer degradation and stability, polymers in the environment, polymer rheology and polymer processing, and polymers for advanced technologies (membrane science, biomedical engineering, applications in electronics, photonic polymers). The lecture portion of this course (2 credit hours) is integrated with a laboratory or term paper component (1 credit hour). There is no limit on the number of students for the class as a whole. However, there is a limit of 12 students on the laboratory component (other students will do term papers).

EMAC 410. Polymers Plus Self - Assembly and Nanomaterials. 2 Units.
The course focuses on the concepts of supramolecular chemistry and self-assembly specifically as it applies to nano-polymeric systems. After dealing with many of the fundamental aspects of supramolecular chemistry the focus of the class deals with how to access/ utilize nanoscale features using such processes, namely the 'bottom-up' approach to nanomaterials/systems. Areas which will be addressed include block copolymers, DNA assemblies, nanotubes and dendrimers. Prereq: EMAC 401 or EMAC 370.

EMAC 412. Polymers Plus Inorganic/Coordination Chemistry. 2 Units.
The course focuses on the concepts of inorganic and coordination chemistry specifically as they apply to polymeric systems. The fundamental aspects of coordination chemistry, including coordinative saturation, kinetics and mechanism will be presented and used as a vehicle to describe coordination polymerizations and supramolecular coordination phenomena. The chemistry and physics of nanoscale inorganic modification of polymers by clays, silsesquioxanes, metal oxides and metal particles will also be discussed. Prereq: EMAC 401 or EMAC 370.

EMAC 413. Polymers Plus Green Chemistry and Engineering. 2 Units.
This course focuses on green chemistry and engineering, particularly as it relates to polymers. Specific topics to be covered in this course will include green chemistry, catalysis, alternative solvents, green processing, renewable materials, and life cycle analysis. Case studies will be utilized to connect lecture topics to real-world examples. Prereq: EMAC 401 and EMAC 404.

EMAC 414. Polymers Plus Advanced Composite and Nanocomposite Materials and Interfaces. 2 Units.
"Advanced Composite and Nanocomposite Materials and Interfaces" will aim at providing advanced concept in composite material structures, importance of interface on the property development, rheological background to be able to manufacture optimized materials, and appropriate processing techniques to choose for a specific product to be manufactured. Specifically, this course will discuss the following items: 1. Basic concept of heterogeneous materials including advantages and problems associated with making multiphase materials. 2. It will review broadly the materials used to make composites and nanocomposites. 3. Unique properties of composites/nanocomposites in rheological, mechanical, and physical properties will be discussed. 4. Various composite processing techniques will be discussed in detail. 5. Surface treatment of the reinforcing materials and interface/interphase structures of composites/nanocomposites will be discussed.

EMAC 415. Polymers Plus Structure and Morphology. 2 Units.
This special topic focuses on polymer structure and morphology and their applications. Topics include solid-state physics of various polymeric materials, ranging from crystalline polymers to liquid crystalline polymers, and block copolymers. First, symmetry operation, space groups, reciprocal spaces are introduced. Examples of the crystalline structures of industrially important polymers and typical polymer crystalline morphology such as lamellar and spherulitic crystals are discussed. Defects in crystalline polymer is also an important issue that determines their physical properties. Second, typical phase structure and transitions of liquid crystals and liquid crystalline polymers are introduced, including both thermotropic and lyotropic liquid crystals. Finally, nanostructure and morphology of block copolymers are discussed. Prereq: EMAC 402 and EMAC 403.

EMAC 416. Polymers Plus Applied Rheology and Processing. 2 Units.
This course focuses on the applications of Rheology to Polymer Engineering in general and processing technologies in particular. It starts with a general review of rheological concepts, including viscoelasticity and continues with the influence of shear rate, temperature, and pressure on the rheological properties. Next, the role of Rheology in support of polymer processing, including effects and defects of rheological origin will be analyzed; here the focus will be on the most common processing techniques - extrusion, injection molding, blow-molding, and thermoforming. Finally, there will be a brief introduction of the role of Rheology in the structural characterization of polymeric materials. Prereq: EMAC 376 or graduate standing.

EMAC 420. Polymers Plus Advanced Physical Chemistry. 2 Units.
The course focuses on the principles of physical chemistry that are most relevant to macromolecular science. Prereq: EMAC 402, EMAC 403.

EMAC 421. Polymer Plus Hierarchical Structures and Properties. 2 Units.
Discuss the hierarchical solid state structure of synthetic and naturally occurring polymeric systems and relate these structures to their properties. Particular emphasis will be on natural systems containing collagen(s) and carbohydrate(s), and on synthetic crystalline, liquid crystalline, and reinforced composite polymeric materials. In order to prepare students for application of these concepts we will determine how mechanical, transport and optical (photonic) behavior can be controlled by structure manipulation. Prereq: EMAC 403 and EMAC 404 or EMAC 474 or EMAC 476.

EMAC 422. Polymers Plus Microscopy. 2 Units.
This course focuses on application of microscopy techniques to the analysis of the microstructure of polymeric materials. Specifically, atomic force microscopy, transmission and scanning electron microscopy, and optical microscopy will be discussed. Practical aspects of these techniques will be applied to a variety of systems, including block copolymers, nanocomposites, LC polymers, and multi-layered films. Prereq: EMAC 403 or EMAC 474.

EMAC 423. Polymers Plus Adhesives, Sealants and Coatings. 2 Units.
EMAC 425. Polymer Plus Energy. 2 Units.

Energy research has become the focus of the twenty-first century. This course is a special topic on polymers in the energy field and related applications. We primarily focus on polymers for solar cells, fuel cells, batteries, double layer electrochemical capacitors, dielectric capacitors, and wind energy. For solar cells, we will introduce conducting polymers and basic types of polymer solar cells. For fuel cells, we will introduce both proton- and hydroxide-exchange fuel cells. Fundamental issues of ion transport, water management, and fuel cell longevity will be introduced. For supercapacitors, we will introduce porous carbon structures and charge storage mechanism. For dielectric capacitors, we will introduce fundamental concepts in electrostatics, different types of polarization, and loss mechanism. For wind energy, we will introduce polymer composites for wind blades and polymer coatings. This course will combine lectures and contemporary literature reviews/essays.

EMAC 444. Polymers Plus Optoelectronics. 2 Units.

The course focuses on the design, synthesis and structure-property relationship of polymers with unusual optic and electronic properties and the application of these advanced materials in emerging technologies. Topics include (1) introduction to the interaction of polymers with electromagnetic radiation, (2) Conjugated Polymers: Chemistry & Physics, (3) Intrinsically Conducting Polymers, (4) Ionically Conducting Polymers, (5) Light Emitting Polymers, (6) Polymer Field Effect Transistors and other Semiconductor Devices, (7) Optoelectronic Polymers in Sensors, (8) Nonlinear Optical Polymers, and (9) Latest Developments. Prereq: EMAC 401 or EMAC 370.

EMAC 450. The Business of Polymers. 2 Units.

This course will link polymer technology to business and management issues that need to be considered for successful technology commercialization. Topics include project management, finance, opportunity assessment, the voice of the customer, and protection of intellectual property. Case studies from both large and small companies will be used to illustrate key concepts. Recommended preparation: EMAC 270, EMAC 276.

EMAC 451. Polymer Product Design. 2 Units.

This course introduces the fundamentals of successful product design and development with specific attention to products based on polymeric materials. Topics covered include the voice of the customer, idea generation and screening, concept selection, prototyping, manufacturing, and launch. The importance of good design beyond simple form and function will be stressed. Each student will complete a product design portfolio that considers all of these issues. Recommended preparation: EMAC 270, EMAC 276, EMAC 450.

EMAC 475. Fundamentals of Non-Newtonian Fluid Mechanics and Polymer Rheology. 3 Units.

This course will involve the study of Rheology from the perspectives of rheological property measurement, phenomenological and molecular models, and applicability to polymer processing. In particular, students will be introduced to: (1) General concepts of Rheology and Newtonian Fluid Mechanics, (2) Standard flows and material functions; (3) The role of Rheology as a structural characterization tool, with an emphasis on polymeric systems; (4) Experimental methods in Rheology with quantitative descriptions of associated flows and data analyses; (5) Viscoelasticity and Non-Newtonian Fluid Mechanics, including the application of models, both phenomenological and molecular, to the prediction of rheological behavior and extraction of model parameters from real data sets; and (6) The relevance of rheological behavior of different systems to practical processing schemes, particularly with respect to plastics manufacturing. Offered as EMAC 375 and EMAC 475. Prereq: ENGR 225 or EMAC 404.

EMAC 477. Elementary Steps in Polymer Processing. 3 Units.

This course is an application of principles of fluid mechanics and heat transfer to problems in polymer processing. In the first part of the course, basic principles of transport phenomena will be reviewed. In the second part, the elementary steps in polymer processing will be described and analyzed with application to a single screw extruder.

EMAC 478. Polymer Engineer Design Product. 3 Units.

Uses material taught in previous and concurrent courses in an integrated fashion to solve polymer product design problems. Practicability, external requirements, economics, thermal/mechanical properties, processing and fabrication issues, decision making with uncertainty, and proposal and report preparation are all stressed. Several small exercises and one comprehensive process design project will be carried out by class members. Offered as EMAC 378 and EMAC 478.

EMAC 490. Polymers Plus Professional Development. 1 Unit.

This course focuses on graduate student professional development. The course involves weekly meetings and oral presentations with attention on the content and style of the presentation materials (PowerPoint, posters, etc.), oral presentation style and project management skills. This course can be taken for the total of 3 credits over three different semesters.

EMAC 491. Polymers Plus Literature Review. 1 Unit.

This course involves weekly presentations of the current polymer literature. It involves at least one presentation by the enrolled student and participation in all literature reviews (at least 10/semester). The course will focus on presentation skills (both oral and written), scientific interpretation, and development of peer-review skills. This course can be taken for a total of 3 credits over three different semesters.

EMAC 492. Carbon Nanoscience and Nanotechnology. 3 Units.

This course presents the fundamental aspects of nanoscience and nanotechnology with an emphasis on carbon nanomaterials and nanodevices. This proposed course intends to provide students with the fundamental aspects of nanoscience and nanotechnology. Nanotechnology draws on the strengths of all the basic sciences and is the engineering at the molecular level, which has the potential to lead to novel scientific discoveries as well as new industrial technologies. This course will give students insight into a new, exciting and rapidly developing field. The course has a good balance between basic knowledge and depth with a focus on some key application areas, which will enable students to work in a variety of scientific professions. Offered as ECHE 591 and EMAC 492.
EMAC 500T. Graduate Teaching II. 0 Units.
This course will engage the Ph.D. students in teaching experiences that will include non-contact (such as preparation and grading of homework and tests) and direct contact (leading recitations and monitoring laboratory works, lectures and office hours) activities. The teaching experience will be conducted under the supervision of the faculty. All Ph.D. students will be expected to perform direct contact teaching during the course sequence. The proposed teaching experiences for EMAC Ph.D. students are outlined below in association with graduate classes. The individual assignments will depend on the specialization of the students. The activities include grading, recitation, lab supervision and guest lecturing. Recommended preparation: Ph.D. student in Macromolecular Science.

EMAC 600T. Graduate Teaching III. 0 Units.
This course will engage the Ph.D. students in teaching experiences that will include non-contact and direct contact activities. The teaching experience will be conducted under the supervision of the faculty. The proposed teaching experiences for EMAC Ph.D. student in this course involve instruction in the operation of major instrumentation and equipment used in the daily research activities. The individual assignments will depend on the specialization of the students. Recommended preparation: Ph.D. student in Macromolecular Science.

EMAC 601. Independent Study. 1 - 18 Unit.
(Credit as arranged.)

EMAC 651. Thesis M.S.. 1 - 18 Unit.
(Credit as arranged.)

EMAC 673. Selected Topics in Polymer Engineering. 2 - 3 Units.
Timely issues in polymer engineering are presented at the advanced graduate level. Content varies, but may include: mechanisms of irreversible deformation: failure, fatigue and fracture of polymers and their composites; processing structure-property relationships; and hierarchical design of polymeric systems. Recommended preparation: EMAC 376 or EMAC 476.

EMAC 677. Colloquium in Macromolecular Science and Engineering. 0 - 1 Units.
Lectures by invited speakers on subjects of current interest in polymer science and engineering. This course can be taken for 3 credits over three different semesters.

EMAC 690. Special Topics in Macromolecular Science. 1 - 18 Unit.

(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

EMAC C200. Co-op Seminar II for Macromolecular Science and Engineering. 2 Units.
Professional development activities for students returning from cooperative education assignments. Recommended preparation: COOP 002 and EMAC C100.
Department of Materials Science and Engineering

Materials science and engineering is a discipline that extends from the basic science of materials structure and properties to the design and evaluation of materials in engineering systems. Most engineers—mechanical, civil, chemical, and electrical—work with materials on the job, and many become well acquainted with the properties of the materials they use most often. The role of a materials engineer is to understand why materials behave as they do under various conditions; to recognize the limits of performance that particular materials can attain; and to know what can be done during the manufacture of materials to meet the demands of a given application.

The Department of Materials Science and Engineering at Case Western Reserve University offers programs leading to the Bachelor of Science in Engineering, Master of Science, and Doctor of Philosophy degrees. The department conducts academic and research activities with metals, ceramics, composites, and electronic materials. Increasingly, the demands for new materials, and for improved materials in existing applications, transcend the traditional categories. The technological challenges that materials engineers face will continue to demand a breadth of knowledge across the spectrum of engineering materials.

While an engineering discipline, the field brings basic science tools to bear on the technological challenges related to materials products and their manufacture. Materials science draws on chemistry in its concern for bonding, synthesis, and composition of engineering materials and their chemical interactions with the environment. Physics provides a basis for understanding the mechanical, thermal, optical, magnetic and electrical properties of materials, as well as the tools needed to ascertain the structure and properties of materials. Mathematics is used throughout materials manufacture and analysis.

Undergraduate Programs

The undergraduate curriculum leading to the degree of Bachelor of Science in materials science and engineering consists of the “Engineering Core”—basic courses in mathematics, physics, chemistry, and engineering, with electives in social sciences and humanities—plus materials courses, technical electives, and open electives. A total of 129 credit hours is required. Please see the table for the recommended semester-by-semester listing of courses.

The Bachelor of Science degree program in Materials Science and Engineering is accredited by the Engineering Accreditation Commission of ABET, www.abet.org (http://www.abet.org).

The broad objectives of the undergraduate program at the Department of Materials Science and Engineering are to provide the students a strong background in mathematics, physics and chemistry, a link between the sciences and the practice of materials engineering through the departmental courses during the sophomore, junior, and senior years, and a comprehensive design experience in materials engineering through a combination of graded course work distributed throughout the curriculum in addition to the Senior Project.

The primary means of accomplishing this mission is our undergraduate curriculum and associated activities, through their emphasis on:

• The interrelationships among the processing, structure, properties, and performance of engineering materials

• The mutual reinforcement of education and professional development throughout one’s career.

The undergraduate experience in Materials Science and Engineering at Case Western Reserve is marked by a high degree of hands-on experience and many opportunities for professional development before graduation. Lab courses, senior projects, and plant tours ensure that every student sees the field first-hand in current research and industrial settings.

Educational Objectives

1. Graduates will successfully enter and complete graduate and professional degree programs.
2. Graduates will assume leadership positions in materials science related industries.
3. Graduates will work in an environment that requires problem solving skills.
4. Graduates will be proficient in written, graphical, and oral communications.
5. Graduates will take an active part in professional organizations.

Student Outcomes

As preparation for achieving the above educational objectives, the BS degree program in Materials Science and Engineering is designed so that students attain:

• an ability to apply knowledge of mathematics, science, and engineering
• an ability to design and conduct experiments, as well as to analyze and interpret data
• an ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability
• an ability to function on multi-disciplinary teams
• an ability to identify, formulate, and solve engineering problems
• an understanding of professional and ethical responsibility
• an ability to communicate effectively
• the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context
• a recognition of the need for, and an ability to engage in life-long learning
• a knowledge of contemporary issues
• an ability to use the techniques, skills, and modern engineering tools necessary for engineering practice.

Program Outcomes

• Graduates will understand the interrelationships among processing, structure, and properties of a wide range of engineering materials, and how these factors together control the materials performance.
• Graduates will be able to carry out laboratory experiments, analyze data, and interpret the significance of their results, especially with respect to the processing of engineering materials and characterization of their engineering properties.
• Graduates will be proficient in the oral, written, and electronic communication of their ideas.
• Graduates will be proficient in the use of computer technology and computer-based information systems.
• Graduates will be able to function effectively in groups of peers and independently.
• Graduates will be informed of the impact of engineering on society and of the professional, ethical, safety, and environmental responsibilities that that entails.
• Graduates will regard professional development and education as processes that should continue hand-in-hand throughout their academic and professional careers.

Approved Technical Electives

The following courses are approved technical electives in Materials Science and Engineering. A student is encouraged to discuss with their class advisor a sequence of technical elective courses, which takes into account the biannual nature of some offerings. Students may request approval of other elective courses by submitting a written petition justifying their choices to the department’s Undergraduate Studies Committee.

Total Units in Sequence: 129

Hours required for graduation: 129

1. Selected students may be invited to take PHYS 123 Physics and Frontiers I - Mechanics & PHYS 124 Physics and Frontiers II - Electricity and Magnetism (General Physics I-II Honors) in place of PHYS 121 General Physics I - Mechanics & PHYS 122 General Physics II - Electricity and Magnetism.
2. The two SAGES University Seminars must be chosen from a different thematic group of USNA (Natural World), USSO (Social World) or USSY (Symbolic World).
3. One of these must be in the humanities or social sciences.
4. Or CHEM 335 Physical Chemistry I. Satisfies the Math, Natural Sciences, or Statistics requirement of the Engineering Core.
5. Or PHYS 250 Computational Methods in Physics.
6. Designed as SAGES Departmental Seminar; ENGR 398 & ENGL 398 must be taken concurrently.

Cooperative Education

The Cooperative Education program at Case Western Reserve began in the Materials Science and Engineering Department and the department’s faculty continues to strongly support student participation. Over the past ten years approximately three-quarters of the department’s undergraduates have participated in and completed at least one cooperative education experience. A wide range of opportunities exist for materials majors including heavy industry, mid-size and small firms, and government and corporate research centers. Many opportunities are local to Northern Ohio, but a wide range of possibilities around the country, and, occasionally, international opportunities arise.

The cooperative education experience is monitored to ensure that students progress in job responsibilities during the course of an assignment. It is common for students to assume positions of responsibility, including employee supervision or decision-making on behalf of the company.

Five-Year Combined BS/MS Program

This program offers outstanding undergraduate students the opportunity to obtain an MS degree, with a thesis, in one additional year of study beyond the BS degree. (Normally, it takes 2 years beyond the BS to earn an MS degree.) In this program, an undergraduate student can take up to 9 credit hours that simultaneously satisfy undergraduate and graduate requirements. Typically, students in this program start their research leading to the MS thesis in the fall semester of the senior year. The department endeavors to support such students through the following summer and academic year at the normal stipend for entering graduate students. The BS degree is awarded at the completion of the senior year.

Application for admission to the five year BS/MS program is made after completion of five semesters of course work. Minimum requirements are a 3.2 grade point average and the recommendation of a faculty member of the department. Interested students should contact Professor Peter Lagerlof.

Minor in Materials Science and Engineering

In addition to the Bachelor of Science degree program in materials science and engineering, the department also offers a minor in materials science and engineering. This sequence is intended primarily for a student majoring in science or engineering, but it is open to any student with a sound background in introductory calculus, chemistry, and physics. This program requires the completion of 5 courses with a minimum of 15 credit hours, of which a maximum of 6 hours can be counted toward the student’s major. All students will be required to take:

</tbody>
</table>

Total Units: 15

Substitutions of other 3-credit EMSE courses, or sequences including 1- and 2-credit EMSE courses totaling at least 15 credit hours, will be considered on a case-by-case basis. Prof. De Guire (http://bulletin.case.edu/schoolofengineering/materialsscienceengineering/mailto:mark.degure@case.edu) (510 White, 368.4221) will assist MSE minors with course selection.

Graduate Programs

The department offers programs leading to the Master of Science and Doctor of Philosophy degrees. The theory, properties, and engineering behavior of metals, ceramics, electronic materials, and composite materials is encompassed in the academic courses and research within the department. The primary areas of specialization are in
materials processing, mechanical properties, surface and microstructural characterization, environmental effects, and electronic materials.

**MS Degree Requirements**

The MS degree in materials science and engineering is awarded through either Plan A (master’s thesis) or Plan B (master’s comprehensive). Plan A involves a thesis based on individual research and a final oral thesis defense; this plan is appropriate for full-time graduate students. Plan B involves a major project and a comprehensive oral exam; it is typically pursued by part-time graduate students.

Plan A requires successful completion of 6 courses (18 credit hours) and at least 9 credit hours of EMSE 651 Thesis M.S.. Plan B requires the successful completion of eight courses (24 credit hours) as well as 3 credit hours of EMSE 649 Special Projects. The six courses for Plan A and the 8 courses for Plan B may include a maximum of 2 courses from an engineering or science curriculum outside the department. No more than 2 courses at the 300 level can be included; all other courses must be at a higher level. Transfer of credit from another university is limited to 6 credit hours of graduate level courses (with grade B or better) taken in excess of BS degree requirements at the other university. A Planned Program of Study must be submitted by the end of the first semester for Plan A students, and by the end of 2 courses for Plan B students. A cumulative GPA of 2.75 or higher is required.

Plan A students must prepare a written thesis and successfully defend the thesis in a final oral exam. Plan B students must prepare a written report on his/her special project and satisfactorily pass a comprehensive oral exam. The thesis exam for Plan A and the oral exam for Plan B must be conducted by an examining committee consisting of three faculty members of the department.

**PhD Degree Requirements**

Students entering the graduate program for a PhD will need to submit the Planned Program of Study within the first semester.

Candidates for a PhD degree in materials science and engineering must meet the following requirements to prove their competency for doctoral study and to be accepted into the doctoral program:

1. Submit an approved Planned Program of Study form and a Supplementary Information form specifying the Breadth and Basic Science requirements.
2. Pass a comprehensive written General Exam within 6 months following their being awarded an MS degree (12 months for students with an MS degree from a different science or engineering discipline).
3. Pass a Thesis Proposal Exam (written and oral) during the semester immediately following the successful completion of the written General Exam. These requirements are explained in detail below. At the completion of these requirements, the student must fill out the second part of the PhD Student Permanent Record form.

Upon successful completion of all requirements and research, the PhD candidate must submit a written dissertation as evidence for his/her ability to conduct independent research at an advanced level. The PhD candidate must pass a final oral exam in defense of the dissertation. The Dissertation Committee must consist of at least three faculty members of the department and one non-departmental member. The candidate must provide each committee member with a copy of the completed dissertation at least 10 days before the exam, so that the committee members may have an opportunity to read and discuss it in advance.

The student must provide two (2) unbound copies of the final approved version of the thesis for the university, and two (2) bound copies of the thesis, one for the department and one for the student’s faculty advisor.

**PhD Program of Study (Course Requirements)**

A PhD student must take a minimum of 18 credit hours of EMSE 701 and must continue registration each succeeding regular semester (fall and spring) until the dissertation is complete, unless granted a leave of absence. The time limit for the PhD program is 5 years, starting with the first semester of EMSE 701 Dissertation Ph.D. registration.

The minimum course requirement for a PhD degree is 12 courses (36 credit hours) beyond the BS level, out of which at least six courses (18 credit hours) must be taken at Case Western Reserve University. Of these 12 courses, six courses must satisfy the Breadth Requirement and two courses must satisfy the Basic Science Requirement for the department as outlined below. In the case of a student entering with an MS degree from another discipline, additional courses may be required as decided by the Graduate Studies Committee of the department. A GPA of 3.0 is required for graduate assistants.

**Breadth Requirements**

A broad knowledge of the field of materials science and engineering includes a minimum level of understanding of the following six areas:

- Mechanical Behavior (a)
- Structure (b)
- Physical Properties (c)
- Processing (d)
- Thermodynamics and Kinetics (e)
- Phase Transformations (f)

The Breadth Requirement for the PhD can be fulfilled by taking a total of 6 courses (18 credit hours); these 6 courses must include at least one course from each area a, b, c, and d and 2 courses from areas e and f combined. The department maintains a list of approved courses for each of these areas.

**Basic Science Requirements**

A minimum depth in basic science of two courses (6 credit hours) is required for a PhD degree. This requirement can be fulfilled by taking 2 courses selected from physics, chemistry, mathematics and/or statistics, and/or certain engineering curricula. The department maintains a current list of approved courses for the Basic Science Requirements.

The Planned Program of Study, a list of the courses the student will take to fulfill the PhD requirements, will be discussed and approved at the time of the Thesis Proposal Exam. This form and the associated Supplementary Information form must be approved by the student’s Dissertation Committee (excluding the non-departmental member) and the chair of the department and submitted to the dean of graduate studies within one semester of passing the General Exam.

**PhD General Exam**

The written General Exam is offered twice a year, typically in January and June, provided at least three students are registered to take the exam. The Exam is comprehensive and consists of two parts:

1. Thermodynamics and Kinetics; Materials Processing: covering such topics as phase equilibria, phase transformations, diffusion, defect chemistry, synthesis, fabrication, microstructural development, and thermomechanical processing.
2. Structure; Properties, Performance, and Reliability: covering crystallography and symmetry, analytical techniques (diffraction, imaging, and spectroscopy), line defects, surfaces and interfaces, microstructural analysis, mechanical, thermal, chemical (environmental), and electrical, optical, and magnetic properties, individually and in combination.

The emphasis in both parts of this General Exam will be on inorganic materials: metals, ceramics, semiconductors, and composites.

Each part of the exam will last for three hours; the morning session is devoted to part 1 and the afternoon session covers part 2. Each part of the Exam is divided into two sections:

- Part 1 (morning): Section 1 (Thermodynamics & Kinetics) and Section 2 (Processing)
- Part 2 (afternoon): Section 3 (Structure) and Section 4 (Properties, Performance, & Reliability)

The exam is closed book. Each section of the exam will contain a minimum of 4 questions. Students must answer 5 questions from part 1 and 5 questions from part 2, with at least 2 questions being answered from each section.

In order to pass the written General Exam, the criteria are as follows—six out of ten questions in the exam require a 70% passing grade as well as a 75% average for the whole exam. Students who fail the exam (or the Thesis Proposal Exam described below) may elect to take the exam a second time.

**Thesis Proposal Exam**

The Thesis Proposal Exam tests the more specific knowledge of the PhD candidate concerning the science underlying the proposed research and to his or her intellectual maturity. It is composed of a written and an oral part, both dealing with the candidate’s proposed research project. The written document should be given to each member of the student’s Dissertation Advisory Committee (excluding the non-departmental member) during the semester immediately following the successful completion of the General Exam. It should include a literature search, analysis of the research problem, suggested research procedures, and the general results to be expected. The document should be written by the student and not his/her thesis advisor, and will be examined by the student’s Dissertation Advisory Committee for this purpose.

The oral part of the Thesis Proposal Exam should last approximately two hours and must be given before the student’s Dissertation Advisory Committee within one week of submitting the above written document to the Committee. Both parts of the Thesis Proposal Exam will be graded Pass/Fail.

At the time of this exam, the student will also have his/her Planned Program of Study examined and approved by the Dissertation Advisory Committee.

**Research Areas**

**Deformation and Fracture**

Determination of the relationships between structure and mechanical behavior of traditional and advanced materials: metals, ceramics, intermetallics, composites, and biological materials. State-of-the-art facilities are available for testing over a range of strain rates, test temperatures, stress states, and size scales for both monotonic and cyclic conditions.
simulates modern manufacturing processing. The press can deliver up to five consecutive impacts to a material in less than five seconds with a punch velocity as high as 110 inch/sec. The maximum punch force is 110,000 pounds.

**Mechanical Testing Facility**

The Center for Mechanical Characterization of Materials (CMC) Mechanical Testing Facility permits the determination of mechanical behavior of materials over loading rates ranging from static to impact, with the capability of testing under a variety of stress states under either monotonic or cyclic conditions. A variety of furnaces and environmental chambers are available to enable testing at temperatures ranging from -196 C to 1800 C. The facility is operated under the direction of a faculty member and under the guidance of a full-time engineer. The facility contains one of the few laboratories in the world for high-pressure deformation and processing, enabling experimentation under a variety of stress states and temperatures. The equipment in this state-of-the-art facility includes:

- **High Pressure Deformation Apparatus**: These units enable tension or compression testing to be conducted under conditions of high hydrostatic pressure. Each apparatus consists of a pressure vessel and diagnostics for measurement of load and strain on deforming specimens, as well as instantaneous pressure in the vessel. Pressures up to 1.0 GPa loads up to 10kN, and displacements of up to 25 mm are possible. The oil based apparatus is operated at temperatures up to 300°C room temperature while a gas (i.e. Ar) based apparatus is used at room temperature.
- **Hydrostatic Extrusion Apparatus**: Hydrostatic extrusion (e.g. pressure-to-air, pressure-to-pressure) can be conducted at temperatures up to 300 °C on manually operated equipment interfaced with a computer data acquisition package. Pressures up to 2.0 GPa are possible, with reduction ratios up to 6 to 1, while various diagnostics provide real time monitoring of extrusion pressure and ram displacement.
- **Advanced Forging Simulation Rig**: A multi-actuator: MTS machine based on a 330 kip, four post frame, enables sub-scale forging simulations over industrially relevant strain rates. A 110 kip forging actuator is powered by five nitrogen accumulators enabling loading rates up to 120 inches/sec on large specimens. A 220 kip indexing actuator provides precise deformation sequences for either single, or multiple, deformation sequences. Date acquisition at rates sufficient for analysis is available. Testing with heated dies is possible.
- **Advanced Metal Forming Rig**: A four post frame with separate control of punch actuator speed and blank hold down pressure enables determination of forming limit diagrams. Dynamic control of blank hold down pressure is possible, with maximum punch actuator speeds of 11.8 inches/sec. A variety of die sets are available.

The remainder of the equipment in the Mechanical Testing Facility is summarized below:

- **Servo-hydraulic Machines**: Four MTS Model 810 computer-controlled machines with load capacities of 3 kip, 20 kip, 50 kip, and 50 kip, permit tension, compression, and fatigue studies to be conducted under load-, strain-, or stroke control. Fatigue crack growth may be monitored via a dc potential drop technique as well as via KRAK gages applied to the specimen surfaces. Fatigue studies may be conducted at frequencies up to 30 Hz. In addition, an Instron Model 1331 20 kip Servo-hydraulic machine are available for both quasi-state and cyclic testing.

- **Universal Testing Machines**: Three INSTRON screw-driven machines, including two INSTRON Model 1125 units permit tension, compression and torsion testing.

**Electromechanical Testing Machine**: A computer-controlled INSTRON Model 1361 can be operated under load-, strain-, or stroke control. Stroke rates as slow as 1 micrometer/hour are possible.

- **Fatigue Testing Machines**: Three Sonntag fatigue machines and two R. R. Moore rotating-bending fatigue machines are available for producing fatigue-life (S-N) data. The Sonntag machines may be operated at frequencies up to 60 Hz.

- **Creep Testing Machines**: Three constant load frames with temperature capabilities up to 800 C permit creep testing, while recently modified creep frames permit thermal cycling experiments as well as slow cyclic creep experiments.

- **Impact Testing Machines**: Two Charpy impact machines with capacities ranging from 20 ft-lbs to 240 ft-lbs are available. Accessories include a Dynatup instrumentation package interfaced with an IBM PC, which enables recording of load vs. time traces on bend specimens as well as on tension specimens tested under impact conditions.

- **Instrumented Microhardness Tester**: A Nikon Model QM High-Temperature Microhardness Tester permits indentation studies on specimens tested at temperatures ranging from -196 C to 1600 C under vacuum and inert gas atmospheres. This unit is complemented by a Zwick Model 3212 Microhardness Tester as well as a variety of Rockwell Hardness and Brinell Hardness Testing Machines.

**Environmental Stress Laboratories**

These facilities include equipment for corrosion, oxidation, and adhesion and wear studies. A wide range of environments can be simulated and controlled: a) aqueous corrosion: atmospheric, immersion and high pressure/high temperature in autoclaves and b) oxidation: single and mixed gases over a range of temperatures and pressures. Special items include: electrochemical test equipment, environmental cracking test equipment, vacuum equipment for permeation studies, high sensitivity Cahn electro balances for thermogravitmetric studies and polymer/metal adhesion test fixtures.

**The Swagelok Center for Surface Analysis of Materials (SCSAM)**

The Swagelok Center for Surface Analysis of Materials (SCSAM) is a multi-user analytical facility providing instrumentation for microstructural characterization and surface and near-surface chemical analysis. The center's 16 major instruments encompass a wide range of characterization tools, which provide a comprehensive resource for academic researchers who can tailor the analyses to their specific needs.

Current capabilities include four (4) Scanning Electron Microscopes (SEMs) which are equipped for Focused Ion Beam (FIB) micromachining and XEDS, WDS, and EBSP detectors, two (2) Transmission Electron Microscopes (TEMs) equipped with XEDS and EELS detectors, an Atomic Force Microscope (AFM), a UHV Scanning Probe system, a Laser Scanning Confocal Optical Microscope dedicated for materials studies, including Raman microscopy, an automated Nanodentener, an Ion Beam Accelerator for Rutherford Backscattering (RBS) and PIXE and PIGE, two (2) X-ray diffraction (XRD) systems, along with surface-specific tools for Time-of-Flight, Secondary Ion Mass Spectrometry (ToF-SIMS), Auger Electron Spectrometry, and X-Ray Photoelectron Spectroscopy (XPS), also known as Electron Spectrometry for Chemical Analysis (ESCA).

SCSAM is administratively housed in the Case School of Engineering (CSE) and is central to much of the research carried out by the seven departments within CSE. However, the facility is extensively used by the Physics, Chemistry, Biology and Earth, Environmental, and Planetary Sciences departments within the College of Arts and Sciences, and by
many departments within the Schools of Medicine and Dental Medicine. In addition to CWRU clients, many external institutions utilize SCSAM’s facilities, including NASA Glenn Research Center, the Cleveland Clinic, and numerous Ohio universities. More than 300 users utilize the facility in any given year.

SCSAM’s instruments are housed in a centralized area, allowing users convenient access to state-of-the-art solutions for their analytical needs.

Transmission Electron Microscope Laboratory

Two transmission electron microscopes are available that provide virtually all conventional and advanced microscopy techniques required for state-of-the-art materials research and involve an installed capacity worth $3,000,000. The microscopes available are (i) an FEI Tecnai F30 300kV field-emission gun energy-filtering high-resolution analytical transmission scanning transmission electron microscope with an information resolution limit better than 0.14nm, equipped with an EDAX system with a high-energy resolution Si-Li detector for X-ray energy-dispersive spectroscopy (XEDS), a Gatan GIF2002 imaging energy filter including a 2k by 2k slow-scan CCD camera, and a high-angle annular dark-field detector for scanning transmission electron microscopy (STEM), and (ii) a Philips CM20 200kV analytical transmission electron microscope equipped with a Tracer Northern high-purity Ge X-ray energy-dispersive spectroscopy detector, a Gatan parallel electron energy-loss spectrometer (PEELS), and a STEM unit.

Conventional TEM techniques, such as bright-field and dark-field imaging, electron diffraction, or weak-beam dark-field imaging (WBDF) are used routinely to analyze line defects (dislocations) and planar defects (interfaces, grain boundaries, stacking faults) in crystalline materials. Advanced TEM techniques include (i) high-resolution TEM, which enables assessing the atomic structure of crystal defects such as heterophase interfaces, grain boundaries, or dislocations, (ii) convergent-beam electron diffraction, which can be used, for example, to obtain crystallographic information (space group) and to determine orientation relationships between small (even nanoscopic) crystallites, and (iii) energy-filtering TEM, which includes zero-loss filtering for improved image contrast and resolution in conventional imaging and diffraction as well as electron spectroscopic imaging (ESI), a technique that enables rapid elemental mapping with high spatial resolution based on element-characteristic energy losses of the primary electrons in the specimen. Specimen preparation facilities for transmission electron microscopy consist of two dimple-grinders, two electropolishing units, three ultramicrotomes, and two conventional ion-beam mills, and two state-of-the-art precision ion polishing systems (PIPS, by Gatan).

Scanning Electron Microscopy Laboratory

Scanning electron microscopy (SEM) and spectrochemical analysis provide valuable specimen investigation with great depth of field and realistic three-dimensional imaging at resolutions up to 500,000X. Determination of the topography of nearly any solid surface is possible. Spectrochemical studies are possible with the use of energy dispersive systems capable of detecting elements from boron to uranium. The laboratory houses two instruments. The first is an Hitachi S-4500, a field emission electron microscope with two secondary electron detectors, a backscattered electron detector, and an infrared chamber scope. In addition, it has a Noran energy dispersive x-ray detection system. The microscope is capable of operating at a spatial resolution of less than 1.5 nm at 15 kV. It also performs well at reduced beam energies (1 kV), facilitating the observation of highly insulating materials. The second instrument is a Philips XL-30 ESEM with a large chamber that can be used as a conventional SEM, or in the environmental mode, can be used to examine wet, oily, gassy or non-conducting samples. It has a camera for crystallographic orientation imaging, a deformation stage capable of 1000 lbs force, hot stages capable of temperatures up to 1500 C, and a cooling stage that goes down to -20 C. An attached Noran X-ray system permits qualitative and quantitative EDX spectroscopy, X-ray mapping and line scans.

Surface Science Laboratories

The Center for Surface Analysis of Materials (CSAM) enjoys state-of-the-art characterization of metal, alloy, ceramic, and polymer surfaces. These tools include a PHI 680 Scanning Auger Microprobe (SAM) for elemental analysis of surfaces and mapping, and PHI 3600 Secondary Ion Mass Spectrometry (SIMS), which provides surface sensitivities for species in the part per billion range. A PHI model 5600 instrument provides X-ray Photoelectron Spectroscopy (XPS or ESCA) capability, which produces information concerning chemical states. The latter two instruments are particularly useful for ceramic and polymer surfaces. With specimen heating, cooling, and depth profiling capabilities directly incorporated in these devices, subsurface regions and interfaces in composite structures, as well as at thin film substrate interfaces, can be examined and fully characterized. The ion beam facility for the analysis of materials consists of a NEC SSDH 1.7 MV tandem pelletron accelerator for the production of 3.4 MeV protons, 5.1 MeV alpha particles, and N ions with energies in excess of 7.0 MeV. Sample analysis takes place in a turbo-molecular pumped high vacuum chamber. The chamber is equipped with a computer-controlled 5 axis manipulator and has provisions for maintaining sample temperatures from 77 K to 1000 K. A Si surface barrier detector, NaI(Tl) scintillator, and a liquid nitrogen-cooled Si(Li) detector are used to detect scattered ions, characteristic gamma rays and characteristic X-rays, respectively. This instrumentation can non-destructively provide composition and structure information in the near-surface region of materials using techniques such as Rutherford backscattering spectrometry (RBS), ion channeling, particle-induced X-ray analysis (PIXE), and nuclear reaction analysis (NRA). As with other analytic techniques, sensitivity, sampling depth, and depth resolution are sample dependent. However, sensitivities of 1 atomic percent, accuracies of 5%, and a depth resolution of 20 nm are usually easily achieved.

The typical specimen is a solid, vacuum-compatible material with lateral dimensions between 0.5 cm x 0.5 cm and 5 cm x 5 cm. However, PIXE and NRA can also be performed on non-vacuum compatible specimens such as liquids and irreplaceable artifacts of interest to museum curators and archeologists.

A recently acquired FEI Nova Focused Ion Beam (FIB) system used to machine thin foils suitable for TEM directly out of the surface of a specimen is available. The Nova FIB includes an SEM, a computer interface enabling entirely automated milling and an internal “lift out” system for transferring thin films onto support grids. To investigate the character of surfaces at the nanometer scale the laboratory has a Digital Instruments Dimension 3000 Scanning Probe Microscope which operates as an AFM and contains a Hysitron Nanoindenter.

Electronic Properties Laboratory

Crystal Growth and Analysis Laboratory

The Crystal Growth and Analysis Laboratory is equipped for research studies and characterization of bulk semiconductor and photonic materials. The growth facilities include a high pressure Czochralski system, low pressure Czochralski system, and a Vertical Bridgman system with magnetic field stabilization. The characterization facilities include capabilities for sample preparation, a Hall effect system, Infra-
red microscope, and an Inductively Coupled Plasma-Mass Spectrometer (ICP-MS).

**X-Ray Laboratory**

The X-ray laboratory contains diffraction equipment for study of the structures of ceramics, metals, polymers, minerals, and single crystals of organic and inorganic compounds. A new Scintag diffractometer system includes a theta-theta wide angle goniometer, a 4.0 kW x-ray generator with copper tube, a third axis stress attachment, a thermolectrically cooled Peltier germanium detector, a thin film analysis system, a dedicated PC for data acquisition, and a turbomolecular-pumped furnace attachment permitting sample temperatures up to 2000 degrees C.

**Fuel Cell Testing Laboratory**

The department houses a lab for testing of solid oxide fuel cells (SOFC). Facilities include:

- 2 test stands for 4” cells and small stacks (Fuel Cell Technologies); test temperatures to 1000°C; professional turnkey LabView interface for system control and data acquisition
- 2 test stands for 1” cells; test temperatures to 1000°C; LabView interface for complete system control and data acquisition; Omega mass flow controllers; Keithley and Amrel electronics; AutoLab Electrochemical Analyzer for I-V, galvanostatic or amperometric testing and AC impedance spectroscopy
- All test stands contained in dedicated 20’ x 8’ enclosure rated for use with hydrogen, hydrogen sulfide, and carbon monoxide with ventilation system, leak detection, tank pressure monitors, alarm system
- Dedicated furnaces and ovens for preparing cells for testing

**The Solar-Durability and Lifetime Extension (S-DLE) Center**

The Solar-Durability and Lifetime Extension (S-DLE) Center located in CWRU’s White Hall, along with its S-DLE (Sun Farm) on CWRU’s West Quad is focused on long lifetime, environmentally exposed materials technologies such as photovoltaics, energy efficient lighting and building envelope applications. It is a Wright Projects center, funded by the Ohio Third Frontier commission. The center was founded to develop real-time and accelerated protocols for exposure to solar radiation and related environmental stressors to enable evaluation of the environmental durability and lifetime of materials, components, and products. Post-exposure optical and thermo-mechanical measurements are used to develop quantitative mechanistic models of degradation processes in the bulk of the device materials and at the inherent interfaces between dissimilar materials. The S-DLE Center’s capabilities include:

- Solar exposures: 2-axis solar trackers with multi-sun concentrators, and power degradation monitoring
- Solar simulators for 1 to 1000X exposures
- Multi-factor environmental test chambers with temperature, humidity, freeze/thaw and cycling
- A full suite of optical, interfacial, thermo-mechanical and electrical evaluations of materials, components and systems

**The Wind Energy Research and Commercialization (WERC) Center**

The WERC Center is a multidisciplinary center for use by students, faculty, and industry providing instrumentation for wind resource characterization and research platforms in operating wind turbines. The WERC Center was established in 2010 with funding from the Ohio Department of Development Third Frontier Wright Project and the Department of Energy. Additional support was provided by the following inaugural industrial partners: Cleveland Electric Laboratories, The Lubrizol Corporation, Parker Hannifin Corporation, Azure Energy LLC, Rockwell Automation, Inc., Swiger Coil Systems LLC, and Wm. Sopko & Sons Co.

The instruments in the WERC Center include:

- A continuous scan ZephIR LiDAR, manufactured by Natural Power. This instrument measures horizontal and vertical wind velocity along with wind direction at 1 Hz frequency at five user set heights up to 200 m.
- Five meteorological measurement systems: 3 on campus; 1 with the off campus wind turbines; and one at the City of Cleveland’s water intake crib located 3.5 miles offshore in Lake Erie.
- An ice thickness sensor that is deployed at the bottom of Lake Erie each fall and retrieved in the spring.
- A Nordex N-54 wind turbine manufactured by Northern Power Systems in Barre, VT USA. This 100kW community scale wind turbine has a direct drive generator with full power inverters, stall control blades with a 21 m rotor diameter, and a 37 m hub height. This wind turbine is located on campus just east of Van Horn field and began operation in November, 2010.
- A Vestas V-27 wind turbine originally manufactured by Vestas in Denmark. This 225kW medium scale wind turbine has a gearbox drive generator, pitch controlled blades with a 27 m rotor diameter, and a 30 m hub height. In addition it has a 50kW generator for low wind generation. This wind turbine is located at an industrial site in Euclid, OH about 15 minutes from campus and began operation in March, 2012.
- A Nordex N-54 wind turbine originally manufactured by Nordex in Germany. This 1.0MW utility scale wind turbine has a gearbox drive generator, stall control blades with a 54 m rotor diameter, and a 70 m hub height. In addition it has a 200kW generator for low wind generation. This wind turbine is located at an industrial site in Euclid, OH about 15 minutes from campus and is scheduled to begin operation in July, 2012.

**Faculty**

James D. McGuffin-Cawley, PhD
(Rensselaer Polytechnic Institute)

Chair; Arthur S. Holden Professor of Engineering; Great Lakes Professor of Ceramic Processing

Powder processing of ceramics; aggregation phenomena; oxidation, diffusion, and solid state reactions; silicate and active metal brazing of ceramics; joining of materials; ceramic matrix composites

William A. “Bud” Baeslack III, PhD
(Case Western Reserve University)

Provost and Executive Vice President

Welding, joining of materials, and titanium and aluminum metallurgy

Mark R. DeGuire, PhD
(Massachusetts Institute of Technology)

Associate Professor

Synthesis and properties of ceramics in bulk and thin-film form, including fuel cell materials, gas sensors, coatings for biomedical applications, photovoltaics, and ferrites. Testing and microstructural characterization of materials for alternative energy applications. High-temperature phase equilibria. Defect chemistry

Frank Ernst, PhD
(University of Göttingen)
Leonard Case Jr. Professor of Engineering
Microstructure and microcharacterization of materials; defects in crystalline materials; interface and stress-related phenomena; semiconductor heterostructures, plated metallization layers; photovoltaic materials; surface hardening of alloys, quantitative methods of transmission electron microscopy

Roger H. French, PhD
(Massachusetts Institute of Technology)
F. Alex Nason Professor of Materials Science
Optical materials science, including optical properties, electronic structure, and radiation durability of optical materials, polymers, ceramics and liquids using vacuum ultraviolet and optical spectroscopies and spectroscopic ellipsometry. Lifetime and degradation science of photovoltaic materials, components and systems including solar radiation durability and degradation mechanisms and rates. Quantum electrodynamics and van der Waals – London dispersion interactions applied to wetting, and long range interactions for manipulation of nanoscale objects such as carbon nanotubes and biomolecular materials.

Arthur H. Heuer, PhD, DSc
(University of Leeds, England)
Distinguished University Professor; Kyocera Professor of Materials; Director, Swagelok Center for Surface Analysis of Materials
Interstitial hardening and improved corrosion resistance of stainless steels and nickel-base alloys; oxidation and hot corrosion of nickel-base and iron-base alloys; improved corrosion resistance of aluminum base alloys; solid oxide fuel cells; high resolution and analytical electron microscopy; 3D reconstruction of soft tissue for life science applications; oxygen and aluminum lattice and grain boundary diffusion in aluminum oxide; dislocations and plastic deformation of aluminum oxide; quantum mechanics of point defects, dislocations, and grain boundaries of aluminum oxide; and electronic structure of aluminum oxide.

Harold Kahn, PhD
(Massachusetts Institute of Technology)
Research Associate Professor
Materials reliability in microsystems technology and microelectromechanical systems; surface engineering of steels and alloys; mechanical testing of biological nanofibrils; microfluidic and microoptical devices.

Peter Lagerlof, PhD
(Case Western Reserve University)
Associate Professor
Mechanical properties of ceramics and metals. Of particular interest is to understand how low temperature deformation twinning is related to plastic deformation by dislocation slip at elevated temperatures. Deformation twinning models for both basal and rhombohedral twinning in sapphire, which are properly related to dislocation slip at elevated temperatures, have been established. The basal twinning model has been confirmed experimentally using TEM techniques. Current research involves studies on how to generalize this twinning model to other materials systems; i.e., metals, intermetallic compounds and other ceramics.

John J. Lewandowski, PhD
(Carnegie-Mellon University)
Leonard Case Jr. Professor of Engineering and Director - Center for Mechanical Characterization of Materials
Mechanical behavior of materials; fracture and fatigue; micromechanisms of deformation and fracture; composite materials; bulk metallic glasses and composites; refractory metals; toughening of brittle materials; high-pressure deformation and fracture studies; hydrostatic extrusion; deformation processing

David H. Matthiesen, PhD
(Massachusetts Institute of Technology)
Associate Professor; Director, Wind Energy Research and Commercialization (WERC) Center
Materials for use in wind turbines; wind resource measurements onshore and offshore; materials interactions with ice; bulk crystal growth processing; process engineering in manufacturing; heat, mass, and momentum transport.

P. Pirouz, PhD
(Imperial College of Science and Technology, England)
Professor
Defects in semiconductors; heteroepitaxial growth of electronic materials; diffraction theory; transmission electron microscopy and its applications in materials science; fiber-reinforced composites; synthetic growth of diamond

Alp Sehirliogou, PhD
(University of Illinois at Urbana Champaign)
Research Assistant Professor
High-temperature piezoelectrics for actuators and ultrasonic applications; electro-thermal imaging; multifunctional electro-ceramics.

Ali Sayir, PhD
(Case Western Reserve University)
Research Associate Professor
Structure/property relationships in ferroelectric and piezoelectric ceramics, in actuators and sensors for engine and energy harvesting applications, thermoelectric energy conversion, high temperature ceramics for hydrogen separation.

David Schwam, PhD
(The Technion University)
Research Associate Professor
Gating of advanced aluminum and magnesium alloys, development of die and permanent mold materials, thermal fatigue testing, recycling.

Gerhard E. Welsch, PhD
(Case Western Reserve University)
Professor
Metals and oxides; high temperature properties, mechanical and electrical properties. Materials for capacitive energy storage; metal sponges; high temperature materials, metal-cell composites. Synthesis of materials

Secondary Faculty
Clemens Burda, PhD
Associate Professor of Chemistry
Walter Lambrecht, PhD
Professor of Physics
Nicole F. Steinmetz, PhD
Assistant Professor of Biomedical Engineering
Russell Wang, DDS
Associate Professor of Dentistry
Xiong (Bill) Yu, PhD, PE
Assistant Professor of Civil Engineering

Adjunct Faculty
Aron Chait
Adjunct Professor
Courses

EMSE 102. Materials Seminar. 1 Unit.
Topical lectures by faculty on current areas of materials research serving to complement the concepts introduced in EMSE 201. General discussion of overall curriculum and educational objectives. Recommended preparation: EMSE 201 or concurrent enrollment.

EMSE 103. Materials in Sports. 3 Units.
The relationships between optimizing sports activities and the performance requirements of sports equipment are developed. The inherent properties of materials are shown to be the controlling factors in the design of almost all types of sports equipment. Properties of the major classes of materials used to manufacture sports equipment are examined. Materials discussed include advanced composites, foams, metals, ceramics, and natural composites, e.g., wood and leather. The absorption, storage, and release of energy by equipment during sports activities are shown to relate to the basic structure of the materials from which it is made. Demonstration experiments are conducted periodically throughout the course.

EMSE 110. Transitioning Ideas to Reality I - Materials in Service of Industry and Society. 1 Unit.
In order for ideas to impact the lives of individuals and society they must be moved from "blue sky" to that which is manufacturable. Therein lies true creativity - design under constraint. Greater Cleveland is fortunate to have a diverse set of industries that serve medical, aerospace, electric, and advanced-materials technologies. This course involves trips to an array of work sites of leading companies to witness first-hand the processes and products, and to interact directly with practitioners. Occasional in-class speakers with demonstrations will be used when it is not logistically reasonable to visit off-site.

EMSE 120. Transitioning Ideas to Reality II - Manufacturing Laboratory. 2 Units.
This course complements EMSE 110. In that class students witness a diverse array of processing on-site in industry. In this class students work in teams and as individuals within processing laboratories working with an array of "real materials" to explore the potential of casting, machining, and deformation processes to produce real parts and/or components. An introduction to CAD as a means of communication is provided. The bulk of the term is spent in labs doing hands-on work. Planned work is carried out to demonstrate techniques and potential. Students have the opportunity to work independently or in teams to produce articles as varied as jewelry, electronics, transportation vehicles, or novel components or devices of the students choosing.

EMSE 125. Freshman Research in Materials Science and Engineering. 1 Unit.
Freshman students conduct independent research in the area of material science and engineering, working closely with graduate student(s) and/or postdoctoral fellow(s), and supervised by an EMSE faculty member. An average of 5-6 hr/wk in the laboratory, periodic updates, and an end of semester report is required. Prereq: Limited to freshman, with permission of instructor.

EMSE 201. Introduction to Materials Science and Engineering. 3 Units.
Introductory treatment of crystallography, phase equilibria, and materials kinetics. Application of these principles to examples in metals, ceramics, semiconductors, and polymers, illustrating the control of structure through processing to obtain desired mechanical and physical properties. Design content includes examples and problems in materials selection and of design of materials for particular performance requirements. Recommended preparation: ENGR 145 and PHYS 121 and MATH 121.

EMSE 202. Phase Diagrams and Transformations. 3 Units.

EMSE 203. Applied Thermodynamics. 3 Units.
Basic thermodynamics principles as applied to materials. Application of thermodynamics to material processing and performance including condensed phase and gaseous equilibria, stability diagrams, corrosion and oxidation, electrochemical and vapor phase reactions. Recommended preparation: CHEM 301.

EMSE 270. Materials Laboratory I. 2 Units.
Introduction to processing, microstructure and property relationships of metal alloys, ceramics and glass. Solidification of a binary alloy and metallography by optical and scanning electron microscopy. Synthesis of ceramics powders, thermal analysis using TGA and DTA, powder consolidation, sintering and grain growth kinetics. Processing and coloring of glass and glass-ceramics.

EMSE 280. Materials Laboratory II. 2 Units.
Synthesis and processing. Experiments designed to demonstrate and evaluate different ways to process different types of materials. Solidification of melts. Crystalization kinetics, processing using oxidation and oxidized microstructures. Laboratory teams are selected for all experiments.
EMSE 290. Materials Laboratory III. 2 Units.
Experiments designed to characterize and evaluate different microstructural designs produced by variations in processing. Fracture of brittle materials, fractography, thermal shock resistance, hardenability of steels, TTT and CT diagrams, composites, solidification of metals, solution annealing of alloys. Recommended preparation: EMSE 201.

EMSE 301. Fundamentals of Materials Processing. 3 Units.
Introduction to materials processing technology with an emphasis on the relation of basic concepts to the processes by which materials are made into engineering components. Includes casting, welding, forging, cold-forming, powder processing of metals and ceramics, and polymer and composite processing. Recommended preparation: EMSE 201 and EMSE 202 and EMSE 203.

EMSE 302. Fundamentals of Materials Processing Laboratory. 1 Unit.
Demonstration of basic processes of materials fabrication. Includes visits to commercial materials processing plants for tours and demonstrations. Graded pass/fail.

EMSE 303. Mechanical Behavior of Materials. 3 Units.
Review of elasticity and plasticity, Basic stress strain relationships of single crystal and polycrystalline materials, Yield criteria, Microstructural factors controlling deformation and fracture of polycrystalline materials, Strengthening mechanisms, Fracture toughness and fatigue behavior of engineering materials. Recommended preparation: EMSE 201 and ENGR 200.

EMSE 307. Foundry Metallurgy. 3 Units.
Introduction to solid-liquid phase transformations and their application to foundry and metal casting processes, Includes application of nucleation and growth to microstructural development, application of thermodynamics to molten metal reactions, application of the principles of fluid flow and heat transfer to gating and risering techniques, and introduction to basic foundry and metal casting technology. Recommended preparation: EMSE 202 and EMSE 203 and ENGR 225.

EMSE 310. Applications of Diffraction Principles. 1 Unit.
A lab sequence in conjunction with EMSE 312, Diffraction Principles, involving experiments on crystallography, optical diffraction, Laue backscattering on single crystals, powder diffraction of unknown compounds, electron diffraction and imaging, and chemical analysis using energy dispersive x-ray spectroscopy. Recommended preparation: EMSE 312 or consent of instructor.

EMSE 312. Diffraction Principles. 3 Units.

EMSE 313. Engineering Applications of Materials. 3 Units.
Optimum use of materials taking into account not only the basic engineering characteristics and properties of the materials, but also necessary constraints of component design, manufacture (including machining), abuse allowance (safety factors), and cost. Interrelations among parameters based on total system design concepts. Case history studies. Systems of failure analysis. Recommended preparation: EMSE 202 and ENGR 200.

EMSE 314. Electrical, Magnetic, and Optical Properties of Materials. 3 Units.

EMSE 325. Undergraduate Research in Materials Science and Engineering. 1 - 3 Unit.
Undergraduate laboratory research in materials science and engineering. Students will undertake an independent research project along side graduate student(s) and/or postdoctoral fellow(s), and will be supervised by an EMSE faculty member. Written and oral reports will be given on a regular basis, and an end of semester report is required. The course can be repeated up to four (4) times for a total of six (6) credit hours. Prereq: Sophomore or Junior standing and consent of instructor.

EMSE 335. Strategic Metals and Materials for the 21st Century. 3 Units.
This course seeks to create an understanding of the role of mineral-based materials in the modern economy focusing on how such knowledge can and should be used in making strategic choices in an engineering context. The history of the role of materials in emerging technologies from a historical perspective will be briefly explored. The current literature will be used to demonstrate the connectedness of materials availability and the development and sustainability of engineering advances with examples of applications exploiting structural, electronic, optical, magnetic, and energy conversion properties. Processing will be comprehensively reviewed from source through refinement through processing including property development through application of: titanium, beryllium, molybdenum, cobalt, vanadium, manganese, tantalum, rhenium, and rare earth group metals. The concept of strategic recycling, including design for recycling and waste stream management will be considered. Offered as EMSE 335 and EMSE 435. Prereq: Senior standing or graduate student.

EMSE 360. Transport Phenomena in Materials Science. 3 Units.
Review of momentum, mass, and heat transport from a unified point of view. Application of these principles to various phenomena in materials science and engineering with an emphasis on materials processing. Both analytical and numerical methodologies applied in the solution of problems. Recommended preparation: ENGR 225 and MATH 224 or equivalent.
EMSE 372. Relation of Materials to Design. 4 Units.
The design of mechanical and structural elements considering static failure, elastic stability, residual stresses, stress concentration, impact, fatigue, creep and environmental conditions on the mechanical behavior of engineering materials. Rational approaches to materials selection for new and existing designs of structures. Laboratory experiments coordinated with the classroom lectures. Offered as EMAE 372 and EMSE 372. Prereq: ECIV 310.

EMSE 396. Special Project or Thesis. 1 - 18 Unit.
Special research projects or undergraduate thesis in selected material areas.

EMSE 398. Senior Project in Materials I. 1 Unit.
Independent Research project. Projects selected from those suggested by faculty; usually entail original research. The EMSE 398 and 399 sequence form an approved SAGES capstone.

EMSE 399. Senior Project in Materials II. 2 Units.
Independent Research project. Projects selected from those suggested by faculty; usually entail original research. Requirements include periodic reporting of progress, plus a final oral presentation and written report. Recommended preparation: EMSE 398 or concurrent enrollment.

EMSE 400T. Graduate Teaching I. 0 Units.
To provide teaching experience for all Ph.D.-bound graduate students. This will include preparing exams/quizzes, homework, leading recitation sessions, tutoring, providing laboratory assistance, and developing teaching aids that include both web-based and classroom materials. Graduate students will meet with supervising faculty member throughout the semester. Grading is pass/fail. Students must receive three passing grades and up to two assignments may be taken concurrently. Recommended preparation: Ph.D. student in Materials Science and Engineering.

EMSE 401. Transformations in Materials. 3 Units.

EMSE 403. Modern Ceramic Processing. 3 Units.
Fundamental science and technology of modern ceramic powder processing and fabrication techniques. Powder synthesis techniques. Physical chemistry of aqueous and nonaqueous colloidal suspensions of solids. Shape forming techniques: extrusion; injection molding; slip and tape casting; dry, isostatic, and hot isostatic pressing. Recommended preparation: EMSE 316 or concurrent enrollment.

EMSE 404. Diffusion Processes in Solids and Melts. 3 Units.

EMSE 405. Dielectric, Optical and Magnetic Properties of Materials. 3 Units.
Electrical properties of nonmetals: ionic conductors, dielectrics, ferroelectrics, and piezo-electrics. Magnetic phenomena and properties of metals and oxides, including superconductors. Mechanisms of optical absorption in dielectrics. Optoelectronics. Applications in devices such as oxygen sensors, multilayer capacitors, soft and hard magnets, optical fibers, and lasers.

EMSE 406. Optical Materials, Elements and Technologies. 3 Units.
Optical materials, elements and technologies are the focus of this course. Inorganic or organic optical materials are defined by their optical properties, radiation durability under ultraviolet and solar irradiation, and ancillary properties required for robust application. Optical elements of, for example, photolithography (as used in the semiconductor industry) include photomasks, pellicles, and imaging fluids. Photovoltaics (PV) have reflective, refractive, anti-reflective, or encapsulating elements. To produce the desired optical function, both photolithography and photovoltaics rely on the structure-property relationships of materials and precise manufacturing methods. Ancillary properties of interest are latent image formation and development for photoreists and adhesion and environmental isolation for PV encapsulants. We will see how photolithography has been the dominant contributor to the continuous shrinkage of semiconductors, and, with photovoltaics, we will examine how PVs compete with current energy sources by potentially reducing the cost per kWh through technological advancement. Optimization of the optical, physical and economic performance of these materials and elements, including sufficient durability over their required lifetime, is a critical challenge for technological success. Higher performance materials and novel optical elements and system designs, coupled with increased PV module lifetimes and lower degradation rates, are important paths to cost-competitive PV electricity. We will also study the manner in which the evolution of technology has defined and driven the roadmaps of these optical technologies (Moore’s Law). The course will include two computational optics labs to design state-of-the-art optical technologies for photolithographic imaging of sub-wavelength semiconductor device feature sizes, and of non-imaging concentrating photovoltaic systems with high optical efficiencies.

EMSE 409. Deformation Processing. 3 Units.
Flow stress as a function of material and processing parameters; yielding criteria; stress states in elastic-plastic deformation; forming methods: forging, rolling, extrusion, drawing, stretch forming, composite forming. Recommended preparation: EMSE 303.

EMSE 411. Environmental Effects on Materials. 3 Units.
Oxidation, corrosion and modification of structure of properties of metallic, ceramic and carbonaceous materials in environments of air, gases and aqueous electrolytes at low and high temperatures; Coatings and other protection methods; Material selection for self-passivation. Conversion-reactions and anodizing for beneficial applications.

EMSE 412. Materials Science and Engineering Seminar. 0 Units.

EMSE 413. Fundamentals of Materials Engineering and Science. 3 Units.
Provides a background in materials for graduate students with undergraduate majors in other branches of engineering and science: reviews basic bonding relations, structure, and defects in crystals. Lattice dynamics; thermodynamic relations in multi-component systems; microstructural control in metals and ceramics; mechanical and chemical properties of materials as affected by structure; control of properties by techniques involving structure property relations; basic electrical, magnetic and optical properties.
EMSE 417. Properties of Materials at High Temperatures. 3 Units.

EMSE 419. Phase Equilibria and Microstructures of Materials. 3 Units.
The multi-component nature of most material systems require understanding of phase equilibria and descriptions of microstructure. Attention will be given to phase equilibria in multi-component (ternary and higher) systems, and the stereological description of the microstructure of multiphase systems.

EMSE 421. Fracture of Materials. 3 Units.

EMSE 426. Semiconductor Thin Film Science and Technology. 3 Units.

EMSE 427. Dislocations in Solids. 3 Units.
Elasticity and dislocation theory; dislocation slip systems; kinks and dislocation motion; jogs and dislocation interactions, dislocation dissociation and stacking faults; dislocation multiplication, applications to yield phenomena, work hardening and other mechanical properties.

EMSE 429. Crystallography and Crystal Chemistry. 3 Units.
Crystal symmetries, point groups, translation symmetries, space lattices, crystal classes, space groups, crystal chemistry, crystal structures and physical properties.

EMSE 435. Strategic Metals and Materials for the 21st Century. 3 Units.
This course seeks to create an understanding of the role of mineral-based materials in the modern economy focusing on how such knowledge can and should be used in making strategic choices in an engineering context. The history of the role of materials in emerging technologies from a historical perspective will be briefly explored. The current literature will be used to demonstrate the connectedness of materials availability and the development and sustainability of engineering advances with examples of applications exploiting structural, electronic, optical, magnetic, and energy conversion properties. Processing will be comprehensively reviewed from source through refinement through processing including property development through application of: titanium, beryllium, molybdenum, cobalt, vanadium, manganese, tantalum, rhenium, and rare earth group metals. The concept of strategic recycling, including design for recycling and waste stream management will be considered. Offered as EMSE 335 and EMSE 435. Prereq: Senior standing or graduate student.

EMSE 500T. Graduate Teaching II. 0 Units.
To provide teaching experience for all Ph.D.-bound graduate students. This will include preparing exams/quizzes/homework, leading recitation sessions, tutoring, providing laboratory assistance, and developing teaching aids that include both web-based and classroom materials. Graduate students will meet with supervising faculty member throughout the semester. Grading is pass/fail. Students must receive three passing grades and up to two assignments may be taken concurrently. Recommended preparation: Ph.D. student in Materials Science and Engineering.

EMSE 502. Mechanical Properties of Metals and Composites. 3 Units.
Microstructural effects on strength and toughness of advanced metals and composites. Review of dispersion hardening and composite strengthening mechanisms. Toughening of brittle materials via composite approaches such as fiber reinforcement, ductile phases, and combinations of approaches. Recommended preparation: ENGR 200 and EMSE 303 or EMSE 421; or consent.

EMSE 504. Thermodynamics of Solids. 3 Units.

EMSE 509. Conventional Transmission Electron Microscopy. 3 Units.
Introduction to transmission electron microscopy-theoretical background and practical work. Lectures and laboratory experiments cover the technical construction and operation of transmission electron microscopes, specimen preparation, electron diffraction by crystals, electron diffraction techniques of TEM, conventional TEM imaging, and scanning TEM. Examples from various fields of materials research illustrate the application and significance of these techniques. Recommended preparation: Consent of instructor.

EMSE 511. Failure Analysis. 3 Units.
Methods and procedures for determining the basic causes of failures in structures and components. Recognition of fractures and excessive deformations in terms of their nature and origin. Development and full characterization of fractures. Legal, ethical, and professional aspects of failures from service. Recommended preparation: EMSE 201 and EMSE 303 and ENGR 200; or consent.

EMSE 512. Advanced Techniques of Transmission Electron Microscopy. 3 Units.
Theory and laboratory experiments to learn advanced techniques of transmission electron microscopy, including high-resolution transmission electron microscopy (HRTEM), convergent-beam electron diffraction (CBED), microanalysis using X-ray energy-dispersive spectroscopy (XEDS) and electron energy-loss spectroscopy (EELS), and electron-spectroscopic imaging (ESI) for elemental mapping. Recommended preparation: EMSE 509.
**EMSE 514. Defects in Semiconductors. 3 Units.**
Presentation of the main crystallographic defects in semiconductors; point defects (e.g., vacancies, interstitials, substitutional and interstitial impurities), line defects (e.g., dislocations), planar defects (e.g., grain boundaries). Structural, electrical and optical properties of various defects. Interpretation of the properties from the perspective of semiconductor physics and materials science and correlation of these defects to physical properties of the material. Experimental techniques including TEM, EBIC, CL, DLTS, etc. Recommended preparation: EMSE 426.

**EMSE 515. Analytical Methods in Materials Science. 3 Units.**
Microcharacterization techniques of materials science and engineering: SPM (scanning probe microscopy), SEM (scanning electron microscopy), FIB (focused ion beam) techniques, SIMS (secondary ion mass spectrometry), EPMA (electron probe microanalysis), XPS (X-ray photoelectron spectrometry), and AES (Auger electron spectrometry), ESCA (electron spectrometry for chemical analysis). The course includes theory, application examples, and laboratory demonstrations.

**EMSE 600T. Graduate Teaching III. 0 Units.**
To provide teaching experience for all Ph.D.-bound graduate students. This will include preparing exam/quizzes/homework, leading recitation sessions, tutoring, providing laboratory assistance, and developing teaching aids that include both web-based and classroom materials. Graduate students will meet with supervising faculty member throughout the semester. Grading is pass/fail. Students must receive three passing grades and up to two assignments may be taken concurrently. Recommended preparation: Ph.D. student in Materials Science and Engineering.

**EMSE 601. Independent Study. 1 - 18 Unit.**

**EMSE 633. Special Topics. 1 - 18 Unit.**

**EMSE 649. Special Projects. 1 - 18 Unit.**

**EMSE 651. Thesis M.S.. 1 - 18 Unit.**
Required for Master’s degree. A research problem in metallurgy, ceramics, electronic materials, biomaterials or archeological and art historical materials, culminating in the writing of a thesis.

**EMSE 701. Dissertation Ph.D.. 1 - 18 Unit.**
Required for Ph.D. degree. A research problem in metallurgy, ceramics, electronic materials, biomaterials or archeological and art historical materials, culminating in the writing of a thesis. Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
Department of Mechanical and Aerospace Engineering

The Department of Mechanical and Aerospace Engineering of the Case School of Engineering offers programs leading to bachelors, masters, and doctoral degrees. It administers the programs leading to the degrees of Bachelor of Science in Engineering with a major in aerospace engineering and Bachelor of Science in Engineering with a major in mechanical engineering. Both curricula are based on four-year programs of preparation for productive engineering careers or further academic training. The Bachelor of Science degree program in Mechanical Engineering and the Bachelor of Science degree program in Aerospace Engineering are accredited by the Engineering Accreditation Commission of ABET, www.abet.org (http://www.abet.org).

Departmental Mission

The mission of the Mechanical and Aerospace Engineering Department is to educate and prepare students at both the undergraduate and graduate levels for leadership roles in the fields of Mechanical Engineering and Aerospace Engineering and to conduct research for the benefit of society.

The undergraduate program emphasizes fundamental engineering science, analysis and experiments to insure that graduates will be strong contributors in their work environment, be prepared for advanced study at top graduate schools and be proficient lifelong learners. The graduate programs emphasize advanced methods of analysis, mathematical modeling, computational and experimental techniques applied to a variety of mechanical and aerospace engineering specialties including, applied mechanics, dynamic systems, robotics, biomechanics, fluid mechanics, heat transfer, propulsion and combustion. Leadership skills are developed by infusing the program with current engineering practice, design, and professionalism (including engineering ethics and the role of engineering in society) led by concerned educators and researchers.

The academic and research activities of the department center on the roles of mechanics, thermodynamics, heat and mass transfer, and engineering design in a wide variety of applications such as aeronautics, astronautics, biomechanics and orthopedic engineering, biomimetics and biological inspired robotics, energy, environment, machinery dynamics, mechanics of advanced materials, nanotechnology and tribology. Many of these activities involve strong collaborations with the Departments of Biology, Electrical Engineering and Computer Science, Materials Science and Engineering and Orthopaedics of the School of Medicine.

The significant constituencies of the Mechanical and Aerospace Engineering Department are the faculty, the students, the alumni and the external advisory boards. The educational program objectives are established and reviewed on an ongoing basis based on the feedback from the various constituencies as well as archival information about the program graduates. The faculty engages in continuing discussions of the academic programs in the regularly scheduled faculty meetings throughout the academic year. Periodic surveys of alumni provide data regarding the preparedness and success of the graduates as well as guidance in program development. Archival data include the placement information for graduating seniors, which provides direct information regarding the success of the graduates in finding employment or being admitted to graduate programs.

Mastery of Fundamentals

• A strong background in the fundamentals of chemistry, physics and mathematics.

• Methods of mechanical engineering analysis, both numerical and mathematical, applied to mechanics, dynamic systems and control, thermodynamics, fluid mechanics and heat transfer.

• Methods of modern experimental engineering analysis and data acquisition.

Creativity

• Ability to identify, model, and solve mechanical and aerospace engineering design problems.

• Ability to design experiments to resolve mechanical and aerospace engineering issues.

• Ability to perform an individual senior project that demonstrates original research and/or design content.

Societal Awareness

• Issues of environmental impact, efficient use of energy and resources, benefits of recycling.

• An awareness of the multi-disciplinary nature of mechanical and aerospace engineering.

• Impact of economic, product liability and other legal issues on mechanical and aerospace engineering manufacturing and design.

Leadership Skills

• An ability to work in teams.

• Ethical considerations in engineering decisions.

• Proficiency in oral and written communication.

• Professionalism

• Students are encouraged to develop as professionals through participation in the student chapters of the American Society of Mechanical Engineers (ASME) and the American Institute of Aeronautics and Astronautics (AIAA).

• Students are encouraged to augment their classroom experiences with the cooperative education program and the strong graduate research program of the department.

• Students are encouraged to take the Fundamentals of Engineering Examination as the first step in the process of becoming a registered professional engineer.

• The bachelor's candidate must complete an independent design project with an oral and written final report.

• The master's candidate must demonstrate independent research resulting in a thesis or project suitable for publication and/or presentation in peer reviewed journals and/or conferences.

• The doctoral candidate must complete a rigorous independent thesis containing original research results appropriate for publication in archival journals and presentation at leading technical conferences.

Aerospace Engineering

Aerospace engineering has grown dramatically with the rapid development of the computer in experiments, design and numerical analysis. The wealth of scientific information developed as a result of aerospace activity forms the foundation for the aerospace engineering major.

Scientific knowledge is being developed each day for programs to develop reusable launch vehicles (RLV), the International Space Station (ISS), High Speed Transport (HST), Human Exploration and Development of Space (HEDS) and micro-electro-mechanical sensors and control systems for advanced flight. New methods of analysis and
design for structural, fluid, and thermodynamic applications are required to meet these challenges.

The aerospace engineering major has been developed to address the needs of those students seeking career opportunities in the highly specialized and advancing aerospace industries.

**Mechanical Engineering**

Civilization, as we know it today, depends on the intelligent and humane use of our energy resources and machines. The mechanical engineer’s function is to apply science and technology to the design, analysis, development, manufacture, and use of machines that convert and transmit energy, and to apply energy to the completion of useful operations. The top ten choices of the millennium committee of the National Academy of Engineering, asked to select the 20 top engineering accomplishments of the 20th century, was abundant with mechanical engineering accomplishments, electrification (large scale power generation and distribution), automobiles, air travel (development of aircraft and propulsion), mechanized agriculture, and refrigeration and air conditioning.

**Research**

**Aerospace Technology and Space Exploration**

Flow in turbomachinery, molecular dynamics simulation of rarefied gas flow, two phase flow, supersonic combustion and propulsion, thermoacoustic refrigeration, in-situ resource utilization from space. Gravitational effects on transport phenomena, fluids and thermal processes in advance life support systems for long duration space travel, interfacial processes, g-jitter effects on microgravity flows, two phase flow in zero and reduced gravity.

**Combustion and Energy**

Hydrogen ignition and safety, catalytic combustion, flame spread, fire research and protection, combustion in micro- and partial gravity.

**Dynamics of Rotating Machinery**

Forced and instability vibration of rotor/bearing/seal systems, nonlinear rotor dynamics, torsional rotor vibration, rotor dynamic characteristics of bearings and seals (computational and experimental approach), control of rotor system dynamics, rub-impact studies on bearings and compressor/ turbine blading systems. Advanced rotating machinery monitoring and diagnostics.

**Heat Transfer**

Analysis of heat transfer in complex systems such as biological organisms, multi-functional materials and building enclosures.

**Engineering Design**

Optimization and computer-aided design, feasibility studies of kinematic mechanisms, kinematics of rolling element-bearing geometries, mechanical control systems, experimental stress analysis, failure analysis, development of biologically inspired methodologies.

**Manufacturing**

Agile manufacturing work cells developed to facilitate quick change over from assembly of one object to assembly of other objects contains multiple robots, a conveyor system and flexible parts feeders.

**Materials**

Development of novel experimental techniques to investigate material response at elevated temperatures and high rates of deformation. Constitutive modeling of damage evolution, shear localization and failure of advanced engineering materials. Fabrication of mechanical properties of composite materials; creep, rupture, and fatigue properties of engineering materials at elevated temperatures.

**Multiphase Flow Research**

Application of non-intrusive laser based diagnostic techniques and ultrasound techniques including pulsed ultrasound Doppler velocimetry to study solid-liquid, solid-gas, liquid-gas and solid-liquid-gas, multiphase flows encountered in slurry transport and bio-fluid mechanics.

**Nanotechnology**

Research related to various nanotechnology applications with particular emphasis on energy conversion, generation and storage in nanostructured materials including the synthesis of polymer-based nanocomposites. Current research projects include investigation of nanocomposites for thermoelectric devices, molecular simulation of thermal transport across interfacial regions, and biomimetic research on protein-based shark gel.

**Musculoskeletal Mechanics and Materials Research**

Design, modeling, and failure analysis of orthopaedic prostheses and material selection; mechanical properties of, and transport processes in, bone and soft tissue; tribology of native and tissue engineered cartilage; nondestructive mechanical evaluation of tissue engineered cartilage.

**Robotics**

Biologically inspired and biologically based design and control of legged robots. Dynamics, control and simulation of animals and robots.

**Tribology and Seals**

Time-resolved friction on nano- and microsecond time scale with applications to high speed machining and mechanics of armor penetration. Study of gas lubricated foil bearing systems with application to oil-free turbomachinery. Evaluation of advanced seal concepts and configurations for high temperature applications in gas turbine engines.

**Turbomachinery**

Vibration characteristics of seals and bearings and measurement of chaotic motion. Rub impact studies of blade tip/casing interactions, particle-blade/casing interactions in centrifugal pumps.

**Bachelor of Science in Engineering**

**Educational Objectives**

1. Graduates will enter and successfully engage in careers in Aerospace Engineering, Mechanical Engineering and other professions appropriate to their background, interests, and skills.
2. Graduates will engage in continued learning through post-baccalaureate education and/or professional development in engineering or other professional fields.
3. Graduates employed in engineering fields will (i) demonstrate technical ability by identifying, formulating, analyzing, and creating engineering solutions using appropriate contemporary engineering techniques, skills, and tools; (ii) communicate effectively; and (iii) positively and effectively work with and impact teams.
4. Graduates will develop as leaders in their chosen professions.

**Student Outcomes**

As preparation for achieving the above educational objectives, the B.S. degree programs in Aerospace Engineering and Mechanical Engineering are designed so that students attain:
• an ability to apply knowledge of mathematics, science, and engineering
• an ability to design and conduct experiments, as well as to analyze and interpret data
• an ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability
• an ability to function on multi-disciplinary teams
• an ability to identify, formulate, and solve engineering problems
• an understanding of professional and ethical responsibility
• an ability to communicate effectively
• the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context
• a recognition of the need for, and an ability to engage in life-long learning
• a knowledge of contemporary issues
• an ability to use the techniques, skills, and modern engineering tools necessary for engineering practice.

The Bachelor of Science in Mechanical Engineering and the Bachelor of Science in Aerospace Engineering degree programs are accredited by the Engineering Accreditation Commission of ABET, www.abet.org

Technical Electives By Program

Aerospace Engineering: For students following the Design and Manufacturing Track
(see requirements for Design and Manufacturing below)
- All 200-, 300-, and 400-level courses from the following areas: EMAE all, EMAE cross-listed, EBME all, EBME cross-listed, ECIV all, EECS all, EECS cross-listed, & EMAC all
- All 300- and 400-level course in ECHE and EMSE areas
- All 300-level MATH and STAT courses with the concurrence of the advisor
- NOTE: We are not accepting EMSE 201 as a technical elective

Mechanical Engineering: For students following the Design and Manufacturing Track
See requirements for Design and Manufacturing below
- All 200-, 300-, and 400-level courses from the following areas: EMAE all, EMAE cross-listed, EBME all, EBME cross-listed, ECIV all, EECS all, EECS cross-listed, & EMAC all
- All 300- and 400-level course in ECHE and EMSE areas
- All 300-level MATH and STAT courses with the concurrence of the advisor
- NOTE: We are not accepting EMSE 201 as a technical elective
Science Electives for Mechanical Engineering Majors

The Student Information System is currently set up to accept PHYS 221 Introduction to Modern Physics or STAT 312 Basic Statistics for Engineering and Science as a science elective. Other courses for individual students can be selected with the approval of the student’s advisor and the chair using an Academic Advisement Requirement Form (http://www.case.edu/provost/ugstudies/ARcorrection.pdf).

Humanities and Social Science Requirements

Consult the Office of Undergraduate Studies section (p. 537) in this bulletin.

Double Major Mechanical and Aerospace Engineering

The department also offers a double major in Mechanical and Aerospace Engineering. The course selection details are provided in the course listing section. The number of additional courses required can vary from six or two courses depending upon the student’s program of study.

Five Year Program of Study

The department curriculum offers a five-year cooperative (co-op) education program and a combined bachelors-masters programs which may be completed in five years. Co-op weaves two 7-month industrial internships into the normal four-year program by combining a summer with either a fall or spring semester to form the 7-month industrial experiences. Students apply in the middle of the sophomore year and normally begin the internship in the spring semester of the junior year. After completing the second internship, students return to campus in the spring or fall to complete their final year of study.

The combined bachelors/masters program allows a student to double count 9 credit hours of graduate course work towards the Bachelor of Science degree in any one of the department’s two degree programs. By completing the remaining graduate credit hours and a thesis, a student may earn a Master of Science degree in mechanical or aerospace engineering. This may take 5 years or a little longer. Application to this program is initiated in the spring of the junior year with the department’s graduate student programs office. A minimum grade point of 3.2 is required for consideration for this accelerated program.

Another option is the 5 year TiME Program taught in conjunction with the Weatherhead School of Management in which a student completes a BS in Aerospace or Mechanical Engineering and earns a Master of Engineering Management.

GRADUATE PROGRAMS

Master of Science Program

(Research or Project oriented)

For a research-oriented MS, each candidate must complete a minimum of 27 hours of graduate-level credits, including at least 18 hours of graduate-level courses and 9 credit hours of MS thesis research.

For the project-oriented option, students must complete 27 credit hours distributed in either of three ways: 21, 24, or 27 credit hours (7, 8 or 9 courses) of approved graduate course work and 6, or 3 credit hours of project replacing the MS thesis.

(Course Oriented)

Each MS candidate must complete 27 hours of graduate-level credits. The candidate has to pass a comprehensive examination upon completion of the course work.

In addition, a BS/ MS program and a 5-year TiME program (BS/ Master of Engineering Management) are also offered for our undergraduate students as indicated in the preceding section.

Master of Engineering Program

The Department of Mechanical and Aerospace Engineering participates in the practice-oriented Master of Engineering Program offered by the Case School of Engineering. In this program, students complete a core program consisting of five courses, and select a four-course sequence in an area of interest.

Doctor of Philosophy Program

Students wishing to pursue the doctoral degree in mechanical and aerospace engineering must successfully pass the doctoral qualifying examination consisting of both written and oral components. Qualifying exams are offered on applied mechanics, dynamics and design or fluid and thermal engineering sciences. Students can choose to take it in the fall or spring semesters. The minimum course requirements for the Ph.D. degree are as follows:

Depth Courses

All programs of study must include 6 graduate level mechanical courses in mechanical engineering or aerospace engineering. Usually these courses follow a logical development of a branch of mechanics, dynamics and design or fluid and thermal engineering science determined in conjunction with the student’s dissertation advisor to meet the objectives of the dissertation research topic.

Breadth and Basic Science Courses

A minimum of six graduate courses are required to fulfill the breadth and basic science courses. The basic science requirement is satisfied by taking two courses in the area of science and mathematics. Four additional courses are needed to provide the breadth outside the student’s area of research.

Dissertation Research

All doctoral programs must include a minimum of 18 credit hours of thesis research, EMAE 701.
Residence and Teaching Requirements

All doctoral programs must meet the residency requirements of the School of Graduate Studies and the teaching requirements of the Case School of Engineering.

Facilities

The education and research philosophy of the Department of Mechanical and Aerospace Engineering for both the undergraduate and graduate programs is based on a balanced operation of analytical, experimental, and computational activities. All three of these tools are used in a fundamental approach to the professional activities of research, development, and design. Among the major assets of the department are the experimental facilities maintained and available for the faculty, students, and staff.

The introductory undergraduate courses are taught through the Robert M. Ward ’41 Laboratory, the Bingham Student Workshop, the Reinberger Product and Process Development Laboratory, and the Reinberger Design Studio. The Ward Laboratory is modular in concept and available to the student at regularly scheduled class periods to conduct a variety of prepared experimental assignments. The lab is equipped with a variety of instruments ranging from classic analog devices to modern digital computer devices for the collection of data and the control of processes. Advanced facilities are available for more specialized experimental tasks in the various laboratories dedicated to each specific discipline. Most of these laboratories also house the research activities of the department, so students are exposed to the latest technology in their prospective professional practice. Finally, every undergraduate and graduate degree program involves a requirement, i.e., Project, Thesis or Dissertation, in which the student is exposed to a variety of facilities of the department.

The following is a listing of the major laboratory facilities used for the advanced courses and research of the department.

Biorobotics Laboratory Facilities

The Biorobotics Laboratory (http://birobots.cwru.edu/) consists of approximately 1080 square feet of laboratory and 460 square feet of office space. The lab includes two CNC machines for fabrication of smaller robot components. The lab’s relationship with CAISR (Center for Automation and Intelligent Systems Research) provides access to a fully equipped machine shop where larger components are fabricated. The laboratory hardware features several biologically inspired hexapod robots including two cockroach-like robots, Robot III and Robot IV. Both are based on the Blaberus cockroach and have 24 actuated revolute joints. They are 17 times larger than the insect (30 inches long). Robot IV is actuated with pneumatic artificial muscles. A compressed air facility has been installed to operate the robots. In addition, the lab contains structural dynamic testing equipment (sensors, DAQ boards, shakers) and an automated treadmill (5 feet by 6 feet) for developing walking robots. The Biorobotics Laboratory contains 20 PCs, and a dedicated LAN connected to the campus. Algor Finite Element Analysis software, Mechanical Desktop, and Pro/Engineer are installed for mechanical design and structural analysis. Also, the lab has developed dynamic simulation software for analyzing walking animals and designing walking robots.

Case Low Speed Research Wind Tunnel

The Case Low Speed Research Wind Tunnel provides very low free stream turbulence levels. The tunnel is completely modular, allowing a variety of different experimental configurations to be realized, greatly extending the tunnel’s functionality. The tunnel, originally constructed in the late 1940’s, has undergone a rebuilding effort with the construction of a new test section, the replacement of the entire upstream half of the wind tunnel, the rebuild of the drive section, and installation of a new drive motor and motor controller. The new upstream portion provides the incoming flow treatment necessary to produce a low free stream turbulence level. The improved drive section and motor increase the tunnel’s maximum speed while reducing noise and vibration levels. With these improvements, the tunnel now supports research of the highest quality as well as graduate and undergraduate student experiments.

Distributed Intelligence and Robotics Laboratory

The Distributed Intelligence and Robotics Laboratory (DIoRL) is a new laboratory in the Department of Mechanical and Aerospace Engineering that facilitates research activities on robotics and mechatronics. The primary research focuses on distributed intelligence, multi-agent systems, biologically-inspired robotics and medical applications. The laboratory is currently being constructed to house self-sufficient facilities and equipment for designing, testing and preliminary manufacturing. The DIoRL also conduct theoretical research related to design methodology and control algorithms based on information theory, complexity analysis and group theory.

Laser Flow Diagnostics Laboratory

A laser diagnostics laboratory is directed toward investigation of complex two-phase flow fields involved in energy-related areas, bio-fluid mechanics of cardiovascular systems, slurry flow in pumps and thermoacoustic power and refrigeration systems. The laboratory is equipped with state-of-the-art Particle Image Velocimetry (PIV) equipment, Pulsed Ultrasound Doppler Velocimeter, Ultrasound concentration measurement instrumentation and modern data acquisition and analysis equipment including PCs. The laboratory houses a clear centrifugal slurry flow pump loop and heart pump loop. Current research projects include investigation of flow through micro-chip devices, CSF flow in ventricles, investigation of solid-slurry flow in centrifugal pumps using ultrasound technique and PIV, thermo-acoustic refrigeration for space application.

Mechanics of Materials Experimental Facility

The major instructional as well as research facility for experimental methods in mechanics of materials is the Daniel K. Wright Jr. Laboratory. Presently, the facility houses a single-stage gas-gun along with tension/compression split Hopkinson bar and torsional Kolsky bar apparatus for carrying out fundamental studies in dynamic deformation and failure of advanced material systems. Hewlett Packard and Tektronix high speed, wide bandwidth digitizing oscilloscopes along with strain-gage conditioners and amplifiers are available for data recording and processing. The facility houses state-of-the-art laser interferometry equipment for making spatial and temporal measurements of deformation. High speed Hg-Cd-Te detector arrays are available for making time resolved multi-point non-contact temperature measurements.

A Schenck Pegasus digital servo-controlled hydraulic testing system with a 20Kip Universal testing load frame equipped with hydraulic grips and instrumentation is available for quasi-static mechanical testing under load or displacement control. A newly developed moiré microscope is available for studying large-scale inelastic deformation processes on micron size scales. CCD camera along with the appropriate hardware/
software for image-acquisition, processing and analyzing of full field experimental data from optical interferometers such as moiré microscope, photo-elasticity, and other laser based spatial interferometers are available.

**Rotating Machinery Dynamics and Tribology Laboratory**

This laboratory focuses on rotating machinery monitoring and diagnostic methods relating chaos content of dynamic non-linearity and model-based observers’ statistical measures to wear and impending failure modes. A double-spool-shaft rotor dynamics test rig provides independent control over spin speed and frequency of an adjustable magnitude circular rotor vibration orbit for bearing and seal rotor-dynamic characterizations.

Simultaneous radial and axial time-varying loads on any type of bearing can be applied on a second test rig. Real time control of rotor-mass unbalance at two locations on the rotor while it is spinning up to 10,000 rpm, simultaneous with rotor rubbing and shaft crack propagation, can be tested on a third rig. Self-excited instability rotor vibrations can be investigated on a fourth test rig.

**Musculoskeletal Mechanics and Materials Laboratories**

These laboratories are a collaborative effort between the Mechanical and Aerospace Engineering Department of the Case School of Engineering and the Department of Orthopaedics of the School of Medicine that has been ongoing for more than 40 years. Research activities have ranged from basic studies of mechanics of skeletal tissues and skeletal structures, experimental investigation of prosthetic joints and implants, measurement of musculoskeletal motion and forces, and theoretical modeling of mechanics of musculoskeletal systems. Many studies are collaborative, combining the forces of engineering, biology, biochemistry, and surgery. The Biomechanics Test labs include Instron mechanical test machines with simultaneous axial and torsional loading capabilities, a non-contacting video extensometer for evaluation of biological materials and engineering polymers used in joint replacements, acoustic emission hardware and software, and specialized test apparatus for analysis of joint kinematics. The Bio-imaging Laboratory includes microscopes and three-dimensional imaging equipment for evaluating tissue microstructure and workstations for three-dimensional visualization, measurement and finite element modeling. An Orthopaedic Implant Retrieval Analysis lab has resources for characterization and analysis of hard tissues and engineering polymers, as well as resources to maintain a growing collection of retrieved total hip and total knee replacements that are available for the study of implant design. The Soft Tissue Biomechanics lab includes several standard and special test machines. Instrumentation and a Histology facilities support the activities within the Musculoskeletal Mechanics and Materials Laboratories.

**National Center for Space Exploration Research**

The National Center for Space Exploration Research (NCSER) is a collaborative effort between the Universities Space Research Association (USRA), Case Western Reserve University (CWRU), and NASA Glenn Research Center (GRC) that provides GRC with specialized research and technology development capabilities essential to sustaining its leadership role in NASA missions. Expertise resident at NCSER includes reduced gravity fluid mechanics, reduced gravity combustion processes; heat transfer, two-phase flow, micro-fluidics, and phase change processes; computational multiphase fluid dynamics, heat and mass transfer, computational simulation of physico-chemical fluid processes and human physiological systems. This expertise has been applied to:

- Cryogenic fluid management
- Spacecraft fire safety
- Energy storage
- Thermal management and control
- ISS experiment development
- Astronaut health
- In situ resource utilization
- Materials synthesis
- On orbit repair of electronics
- Exploration life support
- Environmental monitoring/control
- Integrated system health monitoring
- Planetary Surface Mobility
- Bio-fluid mechanics
- Biosystems modeling

**nanoEngineering Laboratory**

The nanoEngineering Laboratory focuses on research related to various nanotechnology applications with particular emphasis on energy conversion, generation and storage in nanostructured and bio-inspired materials. Synthesis of polymer-based nanocomposites, nanofluids and individual nanostructures is accomplished with tools available in the laboratory. Furthermore, the laboratory houses various pieces of equipment for thermal and electrical characterization of these materials. Research projects include investigation of nanocomposites for thermoelectric devices, molecular simulation of thermal transport across interfacial regions, characterization of nanomaterials for thermal management (of electronics and buildings) as well as thermal insulation applications, and biomimetic research on a protein-based shark gel.

**Other Experimental Facilities**

The department facilities also include several specialized laboratories.

**The GM Engines Laboratory** is a modern facility for measuring the dynamic performance of internal combustion engines while monitoring behavioral parameters such as pressures, temperatures and exhaust emissions. The test cells can be operated completely by remote control with all data collected by digital computers.

**Engineering Services Fabrication Center** offers complete support to assist projects from design inception to completion of fabrication. Knowledgeable staff is available to assist Faculty, Staff, Students, Researchers, and personnel associated with Case Western Reserve University.

**The Harry A. Metcalf Computational Laboratory** offers 28 Dell Pentium IV computers ranging from 2.5 to 3.4GHz, running Windows XP Professional attached to 3 Dell dual processor servers, running Windows NT 4.0 Server or Windows Server 2003, via local area network running at 1Gb/s. The computer lab also offers 29 UTP connections for Laptops running at 10/100 Mb/s.

**The Harry A. Metcalf Computational Laboratory** provides access to a number of software packages. Some of these include SolidWorks 2008 SP4.0; Abaqus CAE 6.8 for FEA; Microsoft Visual C++; MatLab 2008A; Microsoft Office 2007 Professional; Mathematica 6.0.1; MathType 6.0; and LabView 8.5. All of the laboratory’s computers are directly linked to the campus network giving students access to a large variety of software on different libraries across campus. The lab is open for student use 24 hours a day 7 days a week via card access.

**The Bingham Student Workshop** is a 2380 sq.ft. facility complete with machining, welding, metal fabrication, and woodworking equipment. This facility is available for the Case undergrads in Mechanical Engineering. Before gaining access to the shop all ME students are required to take the EMAE 172, Mechanical Manufacturing course. This course gives the student a foundation in basic machining, welding, sheet metal fabrication,
and safety. Manual drafting, design, and computer-aided drafting is also included in the course. After completion the student can use the shop for other Mechanical Engineering courses requiring prototypes. The BSW, is also, used for senior projects and student organizations, such as, the SAE Baja and Formula and the Design Build and Fly.

The Reinerberger Design Studio includes a total of 33 computers consisting of 18 Dell 1GHz Pentium III, 10 Dell 3.4 GHz Pentium IV, and 5 Dell 2.6GHz Pentium IV workstations for Undergraduate Student design use. These machines are connected via a Gigabit local area network to a Dell Dual 500MHz Pentium III server running Windows NT 4.0 and a Dell Dual 800MHz Pentium III server running Windows NT 4.0. The Studio is tied directly to the campus network allowing information to be shared with the HAMCL and other network resources. The Studio is used for the instruction of the SolidWorks 2005 CAD software, MasterCam 9.0 CAM software, Solidworks CAD/CAM/FEA software, and Algor 16.1 FEA software. The RDS also offers a 3D Systems SLA 250 and a Dimension machine for generating SLA models from CAD models.

The Reinerberger Product and Process Development Laboratory is 1600 square feet of laboratory and office space dedicated to computer-aided engineering activities. The computer numerical control (CNC) laboratory includes both two industrial sized machine tools with additional space for lecture and group project activities. The CNC machine tools located in the laboratory are; a HAAS VF3 4 axis-machining center, a HAAS 2 axis lathe. A Mitutoyo coordinate measuring machine (CMM) located in its own laboratory space completes the facilities. The CMM enables students to inspect their manufactured components to a very degree of precision. The laboratory is used to support both undergraduate and graduate manufacturing courses (EMAE 390, EMAE 490).

High Performance Computing

For high performance computing the department uses the CWRU high performance computing cluster (HPCC). The HPCC consists of 112 compute nodes with Intel Pentium 4 Xeon EM64T processors. All nodes are interconnected with Gigabit Ethernet for MPI message passing and all nodes are interconnected by a separate Ethernet for the purpose of out-of-band cluster management. The MAE Department also has a direct access to all the Ohio Supercomputing Center and all NSF supercomputing centers, primarily to the Pittsburgh Supercomputing Center. Computing-intensive research projects can obtain an account on those supercomputers through their advisers. Research projects carried on in cooperation with the NASA Glenn Research Center can have access to NASA computing facilities. Sophisticated, extensive, and updated general and graphics software are available for applications in research and classroom assignments.

Faculty

J. Iwan D. Alexander, PhD
(Washington State University)
Chair; Cady Staley Professor of Engineering; Faculty Director, Great Lakes Energy Institute
Fluid dynamics; heat and mass transfer, low gravity fluid dynamics, interfacial transport capillary surface equilibria and dynamics, two-phase flow in porous media, vibrational convection
Jaikrishnan R. Kadambi, PhD
(University of Pittsburgh)
Professor and Associate Chair
Experimental fluid mechanics; multiphase flows; laser diagnostics; bio-fluid mechanics; turbomachinery
Alexis R. Abramson, PhD
(Case Western Reserve University)

Malcolm N. Cooke, PhD
(University of Pittsburgh)  
Professor  
Aerospace engineering, aerospace design

Roger D. Quinn, PhD
(Virginia Polytechnic Institute & State University)
Arthur P. Armington Professor of Engineering  
Biologically inspired robotics; agile manufacturing systems; structural dynamics, vibration and control

Joseph M. Mansour, PhD
(Rensselaer Polytechnic Institute)
Professor  
Mechanics of materials and structures  
Fluid mechanics; heat and mass transfer; tribology; turbomachinery

Maurice L. Adams, PhD
(UC Berkeley)  
Associate Professor  
Macro/micro/nanoscale heat transfer and energy transport

Paul Barnhart, PhD
(Case Western Reserve University)  
Associate Professor  
Robotics; distributed system design and control; modular robotics; multi-body dynamical systems

Kevin Lee, PhD
(John Hopkins University)  
Assistant Professor  
Computer graphics; virtual reality; computer animation

Vikas Prakash, PhD
(Brown University)  
Professor  
Experimental solid mechanics; distributed systems; structural dynamics, vibration and control

Ozan Akkus, PhD
(Case Western Reserve University)  
Associate Professor  
Biomechanics; applied mechanics

Melissa L. Knothe Tate, PhD
(Swiss Federal Institute of Technology, Zurich, CH)  
Professor  
Bio-Biomechanics; fracture mechanics; biomedical devices; biomaterials

Arthur P. Armington Professor of Engineering  
Biologically inspired robotics; agile manufacturing systems; structural dynamics, vibration and control

Melissa L. Knothe Tate, PhD
(Swiss Federal Institute of Technology, Zurich, CH)  
Professor  
Bio-Biomechanics; fracture mechanics; biomedical devices; biomaterials

Joseph M. Mansour, PhD
(Rensselaer Polytechnic Institute)
Professor  
Mechanics of materials and structures  
Fluid mechanics; heat and mass transfer; tribology; turbomachinery

Maurice L. Adams, PhD
(UC Berkeley)  
Associate Professor  
Macro/micro/nanoscale heat transfer and energy transport

Paul Barnhart, PhD
(Case Western Reserve University)  
Associate Professor  
Robotics; distributed system design and control; modular robotics; multi-body dynamical systems

Kevin Lee, PhD
(John Hopkins University)  
Assistant Professor  
Computer graphics; virtual reality; computer animation

Vikas Prakash, PhD
(Brown University)  
Professor  
Experimental solid mechanics; distributed systems; structural dynamics, vibration and control

Ozan Akkus, PhD
(Case Western Reserve University)  
Associate Professor  
Biomechanics; applied mechanics

Melissa L. Knothe Tate, PhD
(Swiss Federal Institute of Technology, Zurich, CH)  
Professor  
Bio-Biomechanics; fracture mechanics; biomedical devices; biomaterials

Joseph M. Mansour, PhD
(Rensselaer Polytechnic Institute)
Professor  
Mechanics of materials and structures  
Fluid mechanics; heat and mass transfer; tribology; turbomachinery

Maurice L. Adams, PhD
(UC Berkeley)  
Associate Professor  
Macro/micro/nanoscale heat transfer and energy transport

Paul Barnhart, PhD
(Case Western Reserve University)  
Associate Professor  
Robotics; distributed system design and control; modular robotics; multi-body dynamical systems

Kevin Lee, PhD
(John Hopkins University)  
Assistant Professor  
Computer graphics; virtual reality; computer animation

Vikas Prakash, PhD
(Brown University)  
Professor  
Experimental solid mechanics; distributed systems; structural dynamics, vibration and control

Ozan Akkus, PhD
(Case Western Reserve University)  
Associate Professor  
Biomechanics; applied mechanics

Melissa L. Knothe Tate, PhD
(Swiss Federal Institute of Technology, Zurich, CH)  
Professor  
Bio-Biomechanics; fracture mechanics; biomedical devices; biomaterials
Associate Professor
Etiology and innovative treatment modalities for osteoporosis, fracture healing, osteolysis and osteonecrosis
James S. Tien, PhD
(Princeton University)
Leonard Case Jr. Professor of Engineering
Combustion; propulsion, and fire research

Emeritus Faculty
Dwight T. Davy, PhD, PE (University of Iowa)
Professor Emeritus
Musculo-skeletal biomechanics; applied mechanics

Isaac Greber, PhD (Massachusetts Institute of Technology)
Professor Emeritus
Fluid dynamics; molecular dynamics and kinetic theory; biological fluid mechanics; acoustics

Thomas P. Kicher, PhD (Case Institute of Technology)
Arthur P. Armington Professor Emeritus of Engineering
Elastic stability; plates and shells; composite materials; dynamics; design; failure analysis

Simon Ostrach, PhD, PE (Brown University)
Wilbert J. Austin Distinguished Professor Emeritus of Engineering
Fluid mechanics; heat transfer; micro-gravity phenomena; materials processing; physicochemical hydrodynamics

Eli Reshotko, PhD (California Institute of Technology)
Kent H. Smith Emeritus Professor of Engineering
Fluid Dynamics; heat transfer, propulsion; power generation

S. Stanford Manson, MS (University of Michigan)
Emeritus Professor
Metal fatigue, creep rupture, thermal stress, plasticity, fracture mechanics

Research Faculty
Richard J. Bachmann, PhD (Case Western Reserve University)
Assistant Research Professor
Biologically inspired robotics

R. Balasubramaniam, PhD (Case Western Reserve University)
Research Associate Professor, National Center for Space Exploration Research
Microgravity fluid mechanics

Uday Hegde, PhD (Georgia Institute of Technology)
Research Associate Professor, National Center for Space Exploration Research
Combustion, turbulence and acoustics

Mohammad Kassemi, PhD (University of Akron)
Research Associate Professor, National Center for Space Exploration Research
Computational fluid mechanics

Meng-Seng Liou, PhD (University of Michigan)
Research Associate Professor, National Center for Space Exploration Research
Computational fluid mechanics; aerodynamics; multi-objective optimization

Kenneth Loparo, PhD (Case Western Reserve University)
Professor of Electrical Engineering and Computer Science
Control; robotics; stability of dynamical systems; vibrations

David Matthiesen, PhD (Massachusetts Institute of Technology)
Associate Professor of Materials Science Engineering
Microgravity crystal growth

Wyatt S. Newman, PhD (Massachusetts Institute of Technology)
Professor of Electrical Engineering and Computer Science
Courses

EMAE 160. Mechanical Manufacturing. 3 Units.
The course is taught in two sections: Graphics and Manufacturing. To introduce manufacturing processes and materials and their relationships to mechanical design engineering. Course includes hands-on machining and metal fabrication lab. Also, each lab creates a virtual field trip of a manufacturing facility to be shared with the class. Graphics Development of mechanical engineering drawings in orthogonal, sectional, and pictorial views using manual drafting and computer-aided drafting (CAD software), dimensioning, tolerancing geometric dimensioning and tolerancing and assembly drawings will also be covered. All students are paired up to give a Manufacturing Design Presentation demonstrating the course material. The course has two (75) minute lectures and one (110) minute Machining Lab per week.

EMAE 181. Dynamics. 3 Units.
Elements of classical dynamics: particle kinematics and dynamics, including concepts of force, mass, acceleration, work, energy, impulse, momentum. Kinetics of systems of particles and of rigid bodies, including concepts of mass center, momentum, mass moment of inertia, dynamic equilibrium. Elementary vibrations. Recommended preparation: MATH 122 and PHYS 121 and ENGR. 200

EMAE 250. Computers in Mechanical Engineering. 3 Units.

EMAE 260. Design and Manufacturing I. 3 Units.
This is the second course of a 4-course sequence focusing on "Engineering Design and Manufacturing." This course develops students’ competence and self-confidence as design engineers by exposing the students to design as a creative process and its relationship with modern manufacturing practices. The outcomes of the course focus on the student's ability to apply their knowledge of mathematics, science and engineering to design a system, component, or process that meets desired needs within realistic, multi-dimensional constraints, such as: economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability. Additionally, students will be given the opportunity to identify, formulate, and solve engineering problems, while applying professional and ethical practices. Professional communication skills are emphasized and expected during all stages of the design process. The course has five main areas of emphasis: design as a creative process, decision-based design methodologies, project management, engineering economics, and design for manufacture (CAD/CAM/CAE) using industrial software tools. The course exposes the student to the integration of engineering design, manufacturing, and management disciplines and includes activities to consider and understand the complex processes associated with controlling and managing product data through all stages of the product life-cycle (PLM). Topics include: engineering ethics, design as a creative process, design methodologies, project management, engineering economics, product life-cycle management (PLM), CAD/CAE/CAM, and the role of digital manufacturing within the design process. Design/Rapid Prototyping Studio activities are an integral part of the course, and enable the students to be part of a design and build team working on various project-based tasks. Prereq: EMAE 160 or EMAE 172.

EMAE 282. Mechanical Engineering Laboratory I. 2 Units.
Techniques and devices used for experimental work in mechanical and aerospace engineering. Lecture topics include elementary statistics, linear regression, propagation of uncertainty, digital data acquisition, characteristics of common measurement systems, background for measurement laboratories, and elements of report writing. Hands-on laboratory experiences may include measurements in solid mechanics, dynamics, and fluid and thermal sciences, which are summarized in group reports. At least one report will focus on design of a measurement. Specific lecture and measurement topics will be chosen for each student on a case-by-case basis. Only students who have taken EMAE 283 but not EMAE 282 may take EMAE 282.

EMAE 283. Mechanical Engineering Laboratory II. 2 Units.
Techniques and devices used for experimental work in mechanical and aerospace engineering. Lecture topics include elementary statistics, linear regression, propagation of uncertainty, digital data acquisition, characteristics of common measurement systems, background for measurement laboratories, and elements of report writing. Hands-on laboratory experiences may include measurements in solid mechanics, dynamics, and fluid and thermal sciences, which are summarized in group reports. At least one report will focus on design of a measurement. Specific lecture and measurement topics will be chosen for each student on a case-by-case basis. Only students who have taken EMAE 282 but not EMAE 283 may take EMAE 283.
EMAE 285. Mechanical Engineering Measurements Laboratory. 4 Units.
Techniques and devices used for experimental work in mechanical and aerospace engineering. Lecture topics include elementary statistics, linear regression, propagation of uncertainty, digital data acquisition, characteristics of common measurement systems, background for measurement laboratories, and elements of report writing. Hands-on laboratory experiences may include measurements in solid mechanics, dynamics, and fluid and thermal sciences, which are summarized in group reports. At least one report will focus on design of a measurement. Recommended preparation: EMAE 181, ENGR 225 and ECIV 310.

EMAE 290. Computer-Aided Manufacturing. 3 Units.
An advanced design and manufacturing engineering course covering a wide range of topics associated with the 'design for manufacturability' concept. Students will be introduced to a number of advanced solid modeling assignments (CAD), rapid prototyping (RP), and computer-aided manufacturing (CAM). In addition students will be introduced to computer numerical control (CNC) manual part-programming for CNC milling and turning machine tools. All students will be given a design project requiring all detail and assembly drawings for a fully engineered design. The course has two (50) minute lectures and one (110) minute CAD/CAM Lab per week. Prereq: EMAE 172.

EMAE 325. Fluid and Thermal Engineering II. 4 Units.
The continuation of the development of the fundamental fluid and thermal engineering principles introduced in ENGR 225, Introduction to Fluid and Thermal Engineering. Applications to heat engines and refrigeration, chemical equilibrium, mass transport across semi-permeable membranes, mixtures and air conditioning, developing external and internal flows, boundary layer theory, hydrodynamic lubrication, the role of diffusion and convection in heat and mass transfer, radiative heat transfer and heat exchangers. Recommended preparation: ENGR 225.

EMAE 350. Mechanical Engineering Analysis. 3 Units.

EMAE 352. Thermodynamics in Energy Processes. 3 Units.
Thermodynamic properties of liquids, vapors and real gases, thermodynamic relations, non-reactive mixtures, psychometrics, combustion, thermodynamic cycles, compressible flow. Prereq: ENGR 225.

EMAE 355. Design of Fluid and Thermal Elements. 3 Units.

EMAE 356. Aerospace Design. 3 Units.
Interactive and interdisciplinary activities in areas of fluid mechanics, heat transfer, solid mechanics, thermodynamics, and systems analysis approach in design of aerospace vehicles. Projects involve developing (or improving) design of aerospace vehicles of current interest (e.g., hypersonic aircraft) starting from mission requirements to researching developments in relevant areas and using them to obtain conceptual design. Senior standing required.

EMAE 359. Aero/Gas Dynamics. 3 Units.

EMAE 360. Design and Manufacturing II. 3 Units.
This is the third course of a 4-course sequence focusing on “Engineering Design and Manufacturing,” and is the senior capstone design course focused on a semester-long design/build/evaluate project. The course draws on a student’s past and present academic and industrial experiences and exposes them to the design and manufacture of a product or device that solves an open-ended ”real world” problem with multidimensional constraints. The course is structured and time-tabled within the Case School of Engineering (CSE) to give the EMAE 360 students the opportunity to team with students from other CSE departments to form multidisciplinary design teams to work on the solution to a common problem. The outcomes of the course continue to focus on the student’s ability to function on multidisciplinary teams while applying their knowledge of mathematics, science and engineering to design a system, component, or process that meets desired needs within realistic, multidimensional constraints, such as: economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability. Professional communication skills are emphasized and expected during all stages of the design process and will include formal and informal oral presentations, periodic peer-focused design reviews, and a development through its various evolutionary stages to completion. Prereq: EMAE 160 or EMAE 172, and EMAE 260.

EMAE 363. Mechanical Engineering Modern Analysis Methods. 4 Units.
This is a required mechanical engineering course to develop an in-depth fundamental understanding of current analysis software tools, as well as to develop an ability to perform practical analyses using current software tools to analyze assigned industrial case studies for the following topical areas: (1) mechanism synthesis, (2) finite element analyses for stress and deflection, (3) machinery vibration, and (4) computational fluid dynamics. It is comprised of three lectures and one software application laboratory period per week. Prereq: ENGR 225, EMAE 181, EMAE 250, and ECIV 310.

EMAE 370. Design of Mechanical Elements. 3 Units.

EMAE 372. Relation of Materials to Design. 4 Units.
The design of mechanical and structural elements considering static failure, elastic stability, residual stresses, stress concentration, impact, fatigue, creep and environmental conditions on the mechanical behavior of engineering materials. Rational approaches to materials selection for new and existing designs of structures. Laboratory experiments coordinated with the classroom lectures. Offered as EMAE 372 and EMSE 372. Prereq: ECIV 310.
EMAE 376. Aerostructures. 3 Units.

EMAE 377. Birobotics Team Research. 3 Units.
Many exciting research opportunities cross disciplinary lines. To participate in such projects, researchers must operate in multi-disciplinary teams. The Birobotics Team Research course offers a unique capstone opportunity for undergraduate students to utilize skills they developed during their undergraduate experience while acquiring new teaming skills. A group of eight students form a research team under the direction of two faculty leaders. Team members are chosen from appropriate majors through interviews with the faculty. They will research a biological mechanism or principle and develop a robotic device that captures the actions of that mechanism. Although each student will cooperate on the team, they each have a specific role, and must develop a final paper that describes the research generated on their aspect of the project. Students meet for one class period per week and two 2-hour lab periods. Initially students brainstorm ideas and identify the project to be pursued. They then acquire biological data and generate robotic designs. Both are further developed during team meetings and reports. Final oral reports and a demonstration of the robotic device occur in week 15. Offered as BIOL 377, EMAE 377, BIOL 477, and EMAE 477.

EMAE 378. Mechanics of Machinery I. 3 Units.
Comprehensive treatment of design analysis methods and computational tools for machine components. Emphasis is on bearings, seals, gears, hydraulic drives and actuators, with applications to machine tools. Recommended preparation: EMAE 370. Offered as EMAE 378 and EMAE 478.

EMAE 379. Mechanics of Machinery II. 3 Units.
The focus of this course is Rotating Machinery Vibration, and it is comprised of four major components: 1) modeling, 2) analyses, 3) measurement techniques, and 4) physical insights into rotor vibration phenomena. Recommended preparation: EMAE 181. Offered as EMAE 379 and EMAE 479.

EMAE 381. Flight and Orbital Mechanics. 3 Units.
Aircraft performance: take-off and landing, unaccelerated flight, range and endurance, flight trajectories, static stability and control, simple maneuvers. Orbital mechanics: the solar system, elements of celestial mechanics, orbit transfer under impulsive thrust, continuous thrust, orbit transfer, decay of orbits due to drag, elements of lift-off and re-entry. Recommended preparation: ENGR 225. EMAE 359

EMAE 382. Propulsion. 3 Units.

EMAE 387. Vibration Problems in Engineering. 4 Units.

EMAE 390. Advanced Manufacturing Technology. 3 Units.
This course will focus on advanced design and manufacturing technologies and systems, with an emphasis on the total product life cycle and the challenges of secure and efficient product data management. Topics will include: traditional and rapid subtractive and additive prototyping and manufacturing technologies, design for manufacture (DFM), control and quality assurance of the design and manufacturing process, manufacturing system integration, "Globalization," and sustainable engineering. The course will be project-based and laboratory sessions will take place in the Reinberger and think[box] studios. Prereq: EMAE 290.

EMAE 396. Special Topics in Mechanical and Aerospace Engineering. 1 - 18 Unit.
(Credit as arranged.)

EMAE 397. Independent Laboratory Research. 1 - 3 Unit.
Independent research in a laboratory.

EMAE 398. Senior Project. 3 Units.
Individual or team design or experimental project under faculty supervision. Requirements include periodic reporting of progress, plus a final oral presentation and written report. Recommended preparation: Senior standing, EMAE 360, and consent of instructor.

EMAE 399. Advanced Independent Laboratory Research/Design. 1 - 3 Unit.
Students perform advanced independent research or an extended design project under the direct mentorship of the instructor. Typically performed as an extension to EMAE 397 or EMAE 398. Prereq: EMAE 397.

EMAE 400T. Graduate Teaching I. 0 Units.
This course will engage the Ph.D. candidate in a variety of teaching experiences that will include direct contact (for example, teaching recitations and laboratories, guest lectures, office hours) as well non-contact preparation (exams, quizzes, demonstrations) and grading activities. The teaching experiences will be conducted under the supervision of the faculty member(s) responsible for coordinating student teaching activities. All Ph.D. candidates enrolled in this course sequence will be expected to perform direct contact teaching at some point in the sequence. Recommended preparation: Ph.D. student in Mechanical Engineering.

EMAE 401. Mechanics of Continuous Media. 3 Units.
Vector and tensor calculus. Stress and traction, finite strain and deformation tensors. Kinematics of continuous media, general conservation and balance laws. Material symmetry groups and observer transformation. Constitutive relations with applications to solid and fluid mechanics problems.
EMAE 402. Muscles, Biomechanics, and Control of Movement. 4 Units.

EMAE 403. Aerophysics. 3 Units.
The course introduces the physical and chemical topics of basic importance in modern fluid mechanics, plasma dynamics, and combustion sciences: statistical calculations of thermodynamic properties of gases; quantum mechanical analysis of atomic and molecular structure; transport phenomena; propagation, emission, and absorption of radiation; chemical and physical equilibria; adiabatic flame temperatures of complex reacting systems; and reaction kinetics.

EMAE 415. Introduction to Musculo-skeletal Biomechanics. 3 Units.

EMAE 424. Introduction to Nanotechnology. 3 Units.
An exploration of emerging nanotechnology research. Lectures and class discussion on 1) nanostructures: superlattices, nanowires, nanotubes, quantum dots, nanoparticles, nanocomposites, proteins, bacteria, DNA; 2) nanoscale physical phenomena: mechanical, electrical, chemical, thermal, biological, optical, magnetic; 3) nanofabrication: bottom up and top down methods; 4) characterization: microscopy, property measurement techniques; 5) devices/applications: electronics, sensors, actuators, biomedical, energy conversion. Topics will cover interdisciplinary aspects of the field. Offered as EECS 424 and EMAE 424.

EMAE 453. Advanced Fluid Dynamics I. 3 Units.
Derivation and discussion of the general equations for conservation of mass, momentum, and energy using tensors. Several exact solutions of the incompressible Newtonian viscous equations. Kinematics and dynamics of inviscid, incompressible flow including free streamline theory developed using vector, complex variable, and numerical techniques.

EMAE 454. Advanced Fluid Dynamics II. 3 Units.

EMAE 455. Advanced Thermodynamics. 3 Units.
Basic ideas of thermodynamics and dominant methods of their development: operational, postulational, and statistical. Entropy and information theory. Irreversible thermodynamics. Applications.

EMAE 457. Combustion. 3 Units.
Chemical kinetics and thermodynamics; governing conservation equations for chemically reacting flows; laminar premixed and diffusion flames; turbulent flames; ignition; extinction and flame stabilization; detonation; liquid droplet and solid particle combustion; flame spread, combustion-generated air pollution; applications of combustion processes to engines, rockets, and fire research.

EMAE 459. Advanced Heat Transfer. 3 Units.
Analysis of engineering heat transfer from first principles including conduction, convection, radiation, and combined heat and mass transfer. Examples of significance and role of analytic solutions, approximate methods (including integral methods) and numerical methods in the solution of heat transfer problems. Recommended preparation: EMAE 453.

EMAE 460. Theory and Design of Fluid Power Machinery. 3 Units.
Fluid mechanic and thermodynamic aspects of the design of fluid power machinery such as axial and radial flow turbomachinery, positive displacement devices and their component characterizations. Recommended preparation: Consent of instructor.

EMAE 477. Biorobotics Team Research. 3 Units.
Many exciting research opportunities cross disciplinary lines. To participate in such projects, researchers must operate in multi-disciplinary teams. The Biorobotics Team Research course offers a unique capstone opportunity for undergraduate students to utilize skills they developed during their undergraduate experience while acquiring new teaming skills. A group of eight students form a research team under the direction of two faculty leaders. Team members are chosen from appropriate majors through interviews with the faculty. They will research a biological mechanism or principle and develop a robotic device that captures the actions of that mechanism. Although each student will cooperate on the team, they each have a specific role, and must develop a final paper that describes the research generated on their aspect of the project. Students meet for one class period per week and two 2-hour lab periods. Initially students brainstorm ideas and identify the project to be pursued. They then acquire biological data and generate robotic designs. Both are further developed during team meetings and reports. Final oral reports and a demonstration of the robotic device occur in week 15. Offered as BIOL 377, EMAE 377, BIOL 477, and EMAE 477.

EMAE 478. Mechanics of Machinery I. 3 Units.
Comprehensive treatment of design analysis methods and computational tools for machine components. Emphasis is on bearings, seals, gears, hydraulic drives and actuators, with applications to machine tools. Recommended preparation: EMAE 370. Offered as EMAE 378 and EMAE 478.

EMAE 479. Mechanics of Machinery II. 3 Units.
The focus of this course is Rotating Machinery Vibration, and it is comprised of four major components: 1) modeling, 2) analyses, 3) measurement techniques, and 4) physical insights into rotor vibration phenomena. Recommended preparation: EMAE 181. Offered as EMAE 379 and EMAE 479.
EMAE 480. Fatigue of Materials. 3 Units.

EMAE 481. Advanced Dynamics I. 3 Units.

EMAE 487. Vibration Problems in Engineering. 3 Units.

EMAE 488. Advanced Robotics. 3 Units.
This course will focus on up-to-date knowledge and theories related to robotics and multi-agent systems. Related mathematics and theories including group theory (Lie groups), rigid-body motions (SO(3) and SE(3)), kinematics, dynamics, and control will be studied. In addition, the class will also discuss structural, computational and task complexity in robotic systems based on combinatorial analysis, information theory, and graph theory. Lecture and discussion topics: Kinematics; Introduction to Group Theory and Lie Groups; Rigid-body Motions (SO(3), SE(3)); Multi-body Dynamical Systems: Order-N computational methods; Complexity Analysis for Robotic Systems; Structural complexity, information-theoretic complexity, and task complexity; Special Discussion Topics; Special discussion topics may vary each year. Students enrolled in this class will be required to conduct a final project. Two or three students will work as a team. The topics for student teams may include: computer simulation of multi-body dynamical systems, art robot design, and complexity analysis for coupled complex systems. The detailed information will be provided in the first week of the class. The final presentations and demonstrations will be held during the last week of class and will be open to the public audience. Students are also required to submit a final report following a IEEE conference paper template. Prereq: EMAE 181, EECS 246.

EMAE 489. Robotics I. 3 Units.

EMAE 490T. Graduate Teaching II. 0 Units.
This course will engage the Ph.D. candidate in a variety of teaching experiences that will include direct contact (for example, teaching, recitations and laboratories, guest lectures, office hours) as well non-contact preparation (exams, quizzes, demonstration) and grading activities. The teaching experience will be conducted under the supervision of the faculty member(s) responsible for coordinating student teaching activities. All Ph.D. candidates enrolled in this course sequence will be expected to perform direct contact teaching at some point in the sequence. Recommended preparation: Ph.D. student in Mechanical Engineering.

EMAE 500. Advanced Dynamics II. 3 Units.

EMAE 540. Advanced Dynamics II. 3 Units.
Nonlinear oscillations; including equations of Duffings, van der Pol, Hill, and Mathieu; and perturbation solution approaches. Bifurcation and jump phenomena, strange attractors, chaos. Poincare maps and related engineering applications.

EMAE 541. Dynamics of Nonlinear Systems. 3 Units.
Nonlinear oscillations; including equations of Duffings, van der Pol, Hill, and Mathieu; and perturbation solution approaches. Bifurcation and jump phenomena, strange attractors, chaos. Poincare maps and related engineering applications.

EMAE 545. Computational Fluid Dynamics. 3 Units.

EMAE 554. Turbulent Fluid Motion. 3 Units.
Fundamental law, initial and boundary conditions, basic equations for isotropic and anisotropic media, related physical problems, steady and transient temperature distributions in solid structures. Analytical, graphical, numerical, and experimental methods for constant and variable material properties. Recommended preparation: Consent of instructor.

EMAE 555. Conduction and Radiation. 3 Units.

EMAE 600T. Graduate Teaching III. 0 Units.
This course will engage the Ph.D. candidate in a variety of teaching experiences that will include direct contact (for example, teaching recitations and laboratories, guest lectures, office hours) as well non-contact preparation (exams, quizzes, demonstrations) and grading activities. The teaching experience will be conducted under the supervision of the faculty member(s) responsible for coordinating student teaching activities. All Ph.D. candidates enrolled in this course sequence will be expected to perform direct contact teaching at some point in the sequence. Recommended preparation: Ph.D. student in Mechanical Engineering.

EMAE 601. Independent Study. 1 - 18 Unit.

EMAE 651. Thesis M.S.. 1 - 18 Unit.
EMAE 657. Experimental Techniques in Fluid and Thermal Engineering Sciences. 3 Units.
Exposure to experimental problems and techniques provided by the planning, design, execution, and evaluation of an original project. Lectures: review of the measuring techniques for flow, pressure, temperature, etc.; statistical analysis of data; information theory concepts of instrumentation; electrical measurements and sensing devices; and the use of digital computer for data acquisition and reduction. Graduate standing or consent of instructor required.

EMAE 689. Special Topics. 1 - 18 Unit.

Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

EMAE C100. Co-Op Seminar I for Mechanical Engineering. 1 Unit.
Professional development activities for students returning from cooperative education assignments. Recommended preparation: COOP 001.

EMAE C200. Co-Op Seminar II for Mechanical Engineering. 2 Units.
Professional development activities for students returning from cooperative education assignments. Recommended preparation: COOP 002 and EMAE C100.
Division of Education and Student Programs

The Division of Education and Student Programs (http://engineering.case.edu/desp) (DESP) designs, develops and administers programs and opportunities which complement and enhance the curricular offerings in the Case School of Engineering.

The DESP staff is committed to serving all engineering undergraduate and graduate students. We work closely with students, faculty, staff, and off-campus organizational representatives to deliver experiences designed to promote excellence in engineering education.

Mission Statement

The mission of the Division of Education and Student Programs is to support, through teaching and educational research, the Case School of Engineering’s educational programs, student programs, and outreach activities at all academic levels: K-12, undergraduate, graduate, and continuing education.

The activities supported by DESP include optional academic programs that enhance the engineering curriculum, such as Cooperative Education and the Dual Degree undergraduate programs, as well as global exchange programs and support of engineering student organizations.

Co-operative Education

Cooperative Education (Co-op) (http://engineering.case.edu/coop) is an academic program that enables students to alternate classroom studies with career based experiences in industry. It is a learning experience designed to integrate classroom theory with practical experience and professional development. Co-op is a paid full time work experience designed to maximize the student’s education. Case co-op assignments are typically for two seven-month periods, each period consisting of a summer and a contiguous spring or fall semester. This program is available to students pursuing degrees in engineering, accounting, management and all science majors except astronomy.

For additional information, please contact Ms. Mary Rose Tichar (http://bulletin.case.edu/schoolofengineering/educationandstudentprograms/mailto:mary.tichar@case.edu) at 216.368.4447.

Dual Degree (3-2) Engineering Program

The Dual Degree (3-2) (http://engineering.case.edu/desp/dualdegree) Engineering Program enables superior students, enrolled at approximately forty participating liberal arts colleges in the continental United States and Puerto Rico, to combine a strong liberal arts foundation with the study of engineering. While enrolled at a cooperating liberal arts college, students complete courses in mathematics, chemistry, physics, and computer science in addition to studies in the humanities and social sciences. Students complete these courses during their first three years and must obtain the approval of the designated faculty liaison at the liberal arts college prior to admission to the Case School of Engineering.

Qualified candidates continue at the Case School of Engineering for an additional two years of concentrated coursework in an engineering field. At the conclusion of five years, two baccalaureate degrees are awarded: one from the liberal arts college and the other a Bachelor of Science degree from Case Western Reserve University. For additional information, please contact Ms. Deborah Fatica (http://bulletin.case.edu/schoolofengineering/educationandstudentprograms/mailto:debora.fatica@case.edu) at 216.368.4449.

Engineering Student Organizations

The Case School of Engineering is known for having many dynamic student organizations. There are many clubs and organizations that enable you to meet more students while working towards a meaningful cause. To check out a complete list of Student Organizations, click here (http://engineering.case.edu/desp/studentorgs). If you’re unsure of which one would best match your interests, stop in the DESP office to get started! For additional information, please contact Ms. Maria Campbell (http://bulletin.case.edu/schoolofengineering/educationandstudentprograms/mailto:maria.campbell@case.edu) at 216.368.5024.

Global Programs

Global Programs (http://engineering.case.edu/desp/global-exchange) offer international opportunities for engineering students ranging from study abroad to short-term exchange programs, internships and cooperative education experiences, and research opportunities. Participation in global activities optimizes the student’s educational experience as well as contributes to their societal awareness. Exposure to global activities is a very valuable asset for leadership positions within multinational corporations.

The Division of Education and Student Programs designs and implements programs tailored to students’ interests. Currently, short term cultural and language immersion programs are offered in the summer at Waseda University in Tokyo, Japan; Tianjin University in Tianjin, China; and University of Stuttgart in Stuttgart, Germany, with more being established. At the University of Botswana, a three-week engineering core course is taught, which intertwines engineering content with regional issues specific to sub-Saharan Africa. New programs and opportunities continue to develop for students.

In addition, the Case School of Engineering hosts many students from various countries which enables students to learn about and interact with various cultures.

Students may also be interested in the student chapter of Engineers Without Borders, a national non-profit organization devoted to delivering engineering assistance to developing areas around the world.

Approximately 80% of the Case School of Engineering faculty collaborate with over one hundred universities and organizations in over thirty countries spanning six continents.

For additional information, please contact Ms. Deborah Fatica (http://bulletin.case.edu/schoolofengineering/educationandstudentprograms/mailto:debora.fatica@case.edu) at 216.368.4449.

K-12 Outreach

K-12 Outreach is an emerging arm of the DESP. The goals of the outreach work are to: 1) increase the understanding of engineering as a career among K-12 students, and 2) increase the Case Western Reserve University School of Engineering enrollment of underrepresented minorities and women. These goals are fulfilled through an array of activities in partnership with CWRU faculty, staff, students, area K-12 schools and youth-serving organizations. For additional information, please contact Ms. Me’lani Joseph (http://bulletin.case.edu/schoolofengineering/educationandstudentprograms/mailto:melani@case.edu) at 216.368.1651.
Engineering Physics

The Engineering Physics major allows students with strong interests in both physics and engineering to concentrate their studies in the common areas of these disciplines. The Engineering Physics major prepares students to pursue careers in industry, either directly after undergraduate studies, or following graduate study in engineering or physics. Many employers value the unique problem solving approach of physics, especially in industrial research and development. Its engineering science and design components prepare students to work as professional engineers.

Students majoring in engineering physics complete the Engineering Core as well as a rigorous course of study in physics. Students select a concentration area from an engineering discipline, and must complete a sequence of at least four courses in this discipline. In addition, a senior research project under the guidance of a faculty member is required. The project includes a written report and participation in the senior seminar and symposium.

Mission and Program Objectives

The mission of the Engineering Physics program is to prepare students for careers in engineering where physics principles can be applied to the advancement of technology. This education at the intersection of engineering and physics will enable students to seek employment in engineering upon graduation while providing a firm foundation for the pursuit of graduate studies in either engineering or physics. The Engineering Physics program will develop sufficient depth in both engineering and physics skills to produce engineers who can relate fundamental physics to practical engineering problems, and will possess the versatility to address new problems in our rapidly changing technological base. The program will provide a curriculum and environment to develop interdisciplinary collaboration, ethical and professional outlooks, communication skills, and the tools and desire for life-long learning.

Educational Objectives

1. Graduates of the Engineering Physics program will apply their strong problem solving skills as physicists along with an understanding of the approach, methods, and requirements of engineering and engineering design for a successful career in advancing technology.

2. Graduates of the Engineering Physics program will use their strong skills in problem solving, research experience and knowledge in physics and engineering as successful graduate students and researchers in highly ranked graduate programs.

Program Outcomes

As preparation for achieving the above program educational objectives, the BS degree program in Engineering Physics is designed so that students attain:

- an ability to apply knowledge of mathematics, science, and engineering
- an ability to design and conduct experiments, as well as to analyze and interpret data
- an ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability
- an ability to function on multi-disciplinary teams
- an ability to identify, formulate, and solve engineering problems
- an understanding of professional and ethical responsibility
- an ability to communicate effectively
- the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context
- a recognition of the need for, and an ability to engage in life-long learning
- a knowledge of contemporary issues
- an ability to use the techniques, skills, and modern engineering tools necessary for engineering practice.

### Year Total: 15

### Total Units in Sequence: 129

### Hours required for graduation: 129

**a**
Selected students may be invited to take MATH 124 Calculus II, MATH 227 Calculus III or MATH 228 Differential Equations in place of MATH 121 Calculus for Science and Engineering I, MATH 122 Calculus for Science and Engineering II, MATH 223 Calculus for Science and Engineering III or MATH 224 Elementary Differential Equations.

**b**
Selected students may be invited to take PHYS 123 Physics and Frontiers I - Mechanics or PHYS 124 Physics and Frontiers II - Electricity and Magnetism in place of PHYS 121 General Physics I - Mechanics or PHYS 122 General Physics II - Electricity and Magnetism.

**c**
Engineering Physics Concentration courses are flexible, but must be in a specific engineering discipline or study area and be approved by an advisor. Possible concentration areas include: Biomedical Engineering (Biomedical Systems and Analysis, Devices and Instrumentation, Biomaterials); Chemical Engineering; Civil Engineering (Solid Mechanics, Structural Engineering, Geotechnical Engineering, Environmental Engineering); Electrical Engineering and Computer Science (Solid State, Computer Science, Computer Engineering-Software, Computer Engineering-Hardware, Systems and Control); Macromolecular Science and Engineering; Materials Science and Engineering; Mechanical and Aerospace Engineering (Aerospace, Mechanics).

Students may choose to fulfill this requirement in their third year:
- PHYS 332 Introduction to Quantum Mechanics II
- PHYS 327 Quantum Electronics/PHYS 427 Quantum Electronics
- EECS 321 Semiconductor Electronic Devices
- EMSE 314 Electrical, Magnetic, and Optical Properties of Materials
- EMSE 405 Dielectric, Optical and Magnetic Properties of Materials
College of Arts and Sciences

The Case Western Reserve University College of Arts and Sciences (http://artsci.case.edu) combines a history of educational excellence with a commitment to innovation and discovery. Building on a 185-year-old tradition, the college traces its origins to several predecessor institutions, including Adelbert College, Flora Stone Mather College, Cleveland College, Western Reserve College, and the Case Institute of Technology. Today, the college offers educational and research programs in the arts and humanities, mathematics and natural sciences, and social sciences. It comprises 22 academic departments and 34 interdisciplinary programs and centers.

Brief History

Western Reserve College, the earliest of our predecessor institutions, was founded in 1826 in Hudson, Ohio, about 26 miles southwest of Cleveland. In 1882 the college moved to Cleveland, where it formed the basis for Western Reserve University. The institution expanded to include several professional and graduate schools in addition to its liberal arts programs. It also served as a magnet for other artistic, cultural, educational, medical, and scientific organizations, now its neighbors in the extraordinary setting known as University Circle.

Central to the heritage of the college are the traditions of the programs that preceded it: Adelbert College, as the men’s undergraduate unit of Western Reserve University was known after the move to Cleveland; Flora Stone Mather College, initially founded in 1888 as the Cleveland College for Women; and Cleveland College, founded in 1925 in downtown Cleveland to serve part-time and adult students. These three units, each with a distinguished history of scholarship and achievement, were brought together in 1972 under the revived name of Western Reserve College. The college took its present form in 1992, when undergraduate and graduate programs and research in the arts, humanities, and social sciences were united with those in the physical sciences to form the College of Arts and Sciences.

Since the early 19th century, the college and its predecessors have participated in important developments in higher education. Examples include:

- Engagement in issues of social justice. Western Reserve College’s early years in Hudson saw debates between two groups, each opposing slavery. Colonizationists believed that liberated slaves should be resettled in Africa; abolitionists did not favor such a policy. After long and bitter conflict, supporters of the abolitionist movement carried the day.

- Emergence of science. The college in Hudson was home to early and distinguished programs in astronomy and mathematics. Later, in 1887, Professor Edward Morley collaborated with Professor Albert Michelson of the Case School of Applied Science in a series of experiments that remain among the most significant in the history of physics.

- Education of women. In the 1850s, the college’s Cleveland-based Department of Medicine awarded six of the first seven medical degrees granted to women in this country. The founding of the College for Women in 1888 was only the second instance of a separate “coordinate” college for women at a major university.

- Demographic and technological change. Following World War II, enrollment in Cleveland College swelled with returning veterans. During this period, the introduction of new technologies and fields of study drove increasing demand for advanced education and research in a wide range of disciplines.

Undergraduate Programs

Undergraduates in the college can choose a major or minor from almost 60 programs, design their own courses of study, or enroll in integrated bachelor’s/master’s degree programs. The university offers great flexibility to students wishing to pursue double majors in disparate fields, such as physics and studio art. In addition, students from all fields are eligible to participate in the college’s vibrant performing arts programs, including music and dance ensembles.

Beyond their course work, students are encouraged to conduct independent research within the college, in other units of the university, or in the scientific and cultural institutions of University Circle. They also have opportunities to engage in service learning projects and internships in research institutions, businesses, cultural institutions, and governmental agencies. With funding from the college’s Experiential Learning Fellowship programs, undergraduates may design and carry out ambitious research projects in Cleveland or across the globe.

Graduate Programs

The college’s graduate offerings include doctoral programs in 19 fields and several distinctive master’s programs. Through a partnership with the Cleveland Play House, the Department of Theater has created one of the nation’s preeminent Master of Fine Arts programs in acting (http://theater.case.edu/grad.php). The Science and Technology Entrepreneurship Program (STEP) (http://step.case.edu) offers a three- or four-semester sequence of courses leading to a Master of Science degree in biotechnology, chemistry, or physics.

Centers in the College of Arts and Sciences

Baker-Nord Center for the Humanities

Established in 1996 with a generous endowment gift from Eric and Jane Nord, the Baker-Nord Center (http://artsci.case.edu/bakernord) is dedicated to: 1) highlighting and celebrating the arts and humanities at Case Western Reserve University (art history and art, classics, English, history, modern languages and literatures, music, philosophy, religious studies, theater, and dance) through public lectures, panels, performances, and special programs; 2) supporting research and creative work in the humanities and arts through fellowships, grants, and symposia, as well as encouraging new and innovative directions in research and creativity, including the digital humanities, through public forums and open discussion; and 3) facilitating cross-disciplinary and inter-disciplinary collaborations among Case Western Reserve University faculty and members of other University Circle institutions that address questions and problems of broad human interest, within and outside of the academy.

Center for Education and Research in Cosmology and Astrophysics

The Center for Education and Research in Cosmology and Astrophysics (http://www.case.edu/origins/sciences/cosmology.html) (CERCA) is a center for the advancement and promotion of the scientific understanding of the origin and evolution of the universe and its contents, and their connection to fundamental physics. CERCA connects scientists and educators in the Departments of Physics and Astronomy and at the Shafraian Planetarium of the Cleveland Museum of Natural History (CMNH). It draws together theoretical and experimental physicists and
Ernest B. Yeager Center for Electrochemical Sciences

The mission of the Ernest B. Yeager Center for Electrochemical Sciences (http://yces.case.edu) (YCES) is: 1) to enhance the education and training of students in fundamental and applied aspects of electrochemistry; 2) to provide a national and international resource for the dissemination of electrochemical knowledge within industrial, laboratory, and academic communities and to the general public and to support the continuing education of professional electrochemists; (3) to promote interactions between electrochemists and their research colleagues through seminars and symposia; and 4) to foster the improvement of the environment and human welfare through research in the design of materials and the development of processes and devices that will positively influence fields from medicine and microelectronics to energy conversion and energy storage.

Schubert Center for Child Studies

The Schubert Center for Child Studies (http://schubertcenter.case.edu/home.aspx) aims to strengthen links between child-related academic study, public policy formation, and professional practice. The Schubert Center convenes experts from across campus and throughout the Cleveland community to provide an innovative forum for multidisciplinary education, research, and communications focused on child policy.

Skeletal Research Center

The mission of the Skeletal Research Center (http://www.case.edu/artscli/biol/skeletal) (SRC) is to facilitate the advancement of basic research and to accelerate the translation of this new information into innovative clinical strategies for the regeneration and maintenance of skeletal tissues. Based in the Department of Biology, the center provides an organizational umbrella for the creative and innovative interactions of faculty. Although members of our faculty have long been recognized as leaders in skeletal research, the center was established in 1986 to draw these individuals together into a multidisciplinary group which could jointly approach current basic research and clinical problems. SRC is an administrative entity under the dean of the College of Arts and Sciences and the dean of the School of Medicine.

Center for Research on Tibet

The Center for Research on Tibet (http://www.case.edu/affil/tibet) at Case Western Reserve University was founded in 1987 and is administered within the Department of Anthropology. The center’s goal is to conceptualize and conduct research on Tibetan history, society, language, ecology/physiology, and culture so as to understand traditional Tibet and the manner in which it has changed.

Center for Science and Mathematics Education

The Center for Science and Mathematics Education (http://www.case.edu/artscli/csm) links the resources of the College of Arts and Sciences - including faculty, staff, and students - with needs in the K-12 STEM community. Its collaborations with external partners, including schools and public libraries, park systems, and science museums, enhance instruction and generate student interest in the STEM fields of science, technology, engineering, and mathematics. The center hosts the annual Northeast Ohio Regional Science Olympiad, conducts a summer Shipwreck Camp that includes lessons in meteorology and marine geology, and engages middle school students in biological fieldwork in its Environmental Heroes Program. Through the Gelfand Science and Engineering Fair Program, it provides support for science fairs in Northeast Ohio schools, and it recruits and trains undergraduates to assist younger students with their science fair projects. In addition, the center participates in the university’s Robert Noyce Teacher Scholarship Program, which provides mentoring and other support for future math and science teachers.

Center for the Study of Writing

The Center for the Study of Writing (http://www.case.edu/writing/csw) (CSW) is a flexible, cross-disciplinary center that fosters connections between innovative writing research and sound pedagogical practices, and between specialized faculty expertise and the needs and interests of aspiring undergraduate and graduate students.

Dittrick Medical History Center

The Dittrick Medical History Center (http://www.case.edu/artscli/dittrick/museum) is comprised of the Dittrick museum, archives, and collections of rare books, artifacts, and images. The center originated as part of the Cleveland Medical Library Association (est. 1894) and today functions as an interdisciplinary study center within the College of Arts and Sciences.

Center for Policy Studies

The Center for Policy Studies (http://policy.case.edu) has four objectives: 1) to make Case Western Reserve University a more attractive and rewarding institution for students and faculty who wish to learn about and engage in the creation of public policy; 2) to raise the public profile of the university by sponsoring programs and other activities that publicize and increase the reach of the work of CWRU’s policy analysts and their guests; 3) to contribute to the wider community by disseminating information and analysis of policy issues as generated both by faculty and by guests we bring to campus; and 4) to encourage creation of a community of policy studies on campus that may serve in the future as the basis for further development of policy-oriented curriculum at both the undergraduate and graduate levels.

Center for Research on Tibet

The Center for Research on Tibet (http://www.case.edu/affil/tibet) at Case Western Reserve University was founded in 1987 and is administered within the Department of Anthropology. The center’s goal is to conceptualize and conduct research on Tibetan history, society, language, ecology/physiology, and culture so as to understand traditional Tibet and the manner in which it has changed.

Center for Science and Mathematics Education

The Center for Science and Mathematics Education (http://www.case.edu/artscli/csm) links the resources of the College of Arts and Sciences - including faculty, staff, and students - with needs in the K-12 STEM community. Its collaborations with external partners, including schools and public libraries, park systems, and science museums, enhance instruction and generate student interest in the STEM fields of science, technology, engineering, and mathematics. The center hosts the annual Northeast Ohio Regional Science Olympiad, conducts a summer Shipwreck Camp that includes lessons in meteorology and marine geology, and engages middle school students in biological fieldwork in its Environmental Heroes Program. Through the Gelfand Science and Engineering Fair Program, it provides support for science fairs in Northeast Ohio schools, and it recruits and trains undergraduates to assist younger students with their science fair projects. In addition, the center participates in the university’s Robert Noyce Teacher Scholarship Program, which provides mentoring and other support for future math and science teachers.

Center for the Study of Writing

The Center for the Study of Writing (http://www.case.edu/writing/csw) (CSW) is a flexible, cross-disciplinary center that fosters connections between innovative writing research and sound pedagogical practices, and between specialized faculty expertise and the needs and interests of aspiring undergraduate and graduate students.

Dittrick Medical History Center

The Dittrick Medical History Center (http://www.case.edu/artscli/dittrick/museum) is comprised of the Dittrick museum, archives, and collections of rare books, artifacts, and images. (Marquette University)
Assistant Dean, Development and External Relations
American Studies Program

The American Studies Program is designed to give students the flexibility to cross traditional intellectual boundaries in order to develop perspectives on American life that are more expansive and critical than those normally found within the limits of a single discipline. The interdisciplinary approach makes available a wide variety of materials, methods, theories, and themes to use as tools to investigate the complexities of the American past and present. The process of investigation is as important as the outcome, for it teaches students to analyze with breadth as well as depth, to think creatively as well as critically.

Elective Courses: (18 credit hours):

Students are to choose six electives, in two areas of concentration. An area of concentration consists of either 1) courses in a single department, or 2) courses from more than one department focusing on a theme or issue such as technology and culture, urban studies, literature and society, etc.

Minor

A minor consists of five courses: the introductory class and four electives that focus on a significant period, problem area, or aspect of American civilization. The rationale for selecting such a minor program, and its relation to the student’s career or intellectual interests, must be discussed with and approved by the minor advisor.

Renée M. Sentilles, PhD
Associate Professor, Department of History; Director, American Studies Program

Courses

AMST 117. Exploring American History Through Biography. 3 Units.
This discussion and lecture class uses various forms of biography to explore issues of American Identity throughout the course of American history. The class will discuss how certain biographies have created archetypal American identities, and how issues such as race, class, gender, sexuality, religion, and historical context have shaped the writing, reading and purpose of biography. The last third of the class will consider the process of "national memory," the way the United States has decide to remember its past. Here the “biography” is collective, and created by myriad strands of mass culture woven together to create a national mythology. We will explore the works of those striving to pull apart these different strands, and explore what these memories tell us about established national identity. Students will explore biographical process through their assignments, and consider such questions as: How do American biographies influence our understanding of what it means to be American? How does biographical medium affect the message? Can we accept biography as history? This course investigates biography as a constructed genre that comes in a variety of forms, including autobiography, biographical novels, oral histories, and film. Offered as AMST 117 and HSTY 117.

AMST 270. American Art and Culture Before 1900. 3 Units.
Survey of the development of American art from colonial times to the present which explores how art has expressed both American values and American anxieties. Painting is emphasized, but the course also considers architecture, the decorative arts, film, literature, and music. Offered as AMST 270 and ARTH 270.

AMST 271. American Art and Culture: The Twentieth Century. 3 Units.
Survey of the development of American art from 1900 to the present (and the future) which will explore how art has expressed both American values and American anxieties. Painting will be emphasized, but the course will also consider architecture, the decorative arts, film, literature, and music. Offered as AMST 271 and ARTH 271.

AMST 327. American Theater and Playwrights. 3 Units.
Designed to provide students an overview of the development of theater in the United States and to familiarize them with the work and themes of selected American playwrights. Offered as AMST 327 and THTR 327.

AMST 390. Independent Study. 1 - 3 Unit.
Asian Studies Program

Asian studies has become an increasingly important area of study in North American colleges and universities. This is due in part to a growing acknowledgment that Asian cultures are of significance both regionally and globally. The Asian Studies Program offers students the opportunity to explore these cultures from a multidisciplinary perspective so that they are able to understand the social, cultural, political, and other forces that shape and have shaped Asian nations.

The Asian Studies Program draws on faculty and courses from such departments as anthropology, art history and art, economics, modern languages and literatures, history, philosophy, political science, and religious studies. A current list of approved courses is available from the program advisor. Departmental seminars and senior capstone courses in the Asian Studies Program may count toward the completion of the SAGES General Education Requirements.

The undergraduate program in Asian studies offers a major and a minor. Students are encouraged to take courses in different disciplines in order to obtain broad exposure to the languages, literature, art, culture, religious traditions, and political, economic, and social institutions of Asian countries. The Asian Studies Program also offers an honors program to qualified majors.

In addition to course offerings, the Asian Studies Program sponsors extracurricular activities that enhance the formal study of Asia and give students additional opportunities to explore and understand Asia’s importance in the global community. The program sponsors lectures and films and administers a Web site devoted to Asia. It also encourages students to participate in study abroad programs in Asian countries and to utilize Asian resources at the Cleveland Museum of Art and other local institutions.

Undergraduate Program

Major

The Asian studies major, which leads to a Bachelor of Arts degree, consists of 31 credit hours, including:

- At least 16 credit hours (two years) of Chinese or Japanese language
- 15 credit hours of Asia-related courses, selected in consultation with the program advisor

The 15 hours in Asia-related courses must be at the 200 or 300 level and come from at least three different departments.

Minor

The minor in Asian studies consists of 18 credit hours of Asia-related courses, selected in consultation with the program advisor. Only one year (8 credits) of language study (Japanese or Chinese) counts toward the minor.

The 18 hours in Asia-related courses must be at the 200 or 300 level and come from at least three different departments.

Honors Program

Asian Studies Honors is a semester-long program for Asian studies majors, normally taken during the senior year, which involves researching and writing an honors thesis. Honors program requirements include the completion of 12 semester hours of approved Asia-related courses, at least two semesters of study of an Asian language, and maintenance of a GPA of at least 3.0 overall and 3.2 in Asian studies courses.

A participating student enrolls in ASIA 398 Honors Thesis and writes a thesis under the direction of an Asian studies faculty member. The student also receives guidance from a second reader, who must be a member of the Asian Studies Program. A third reader, who need not be a member of the Asian Studies Program, is optional. Each student must maintain regular contact with the supervising faculty member in the various stages of researching and writing the thesis. Detailed guidelines and deadlines for the course are available from the program advisor.

Case Western Reserve University
HSTY 385  
Offered as ASIA 133 and HSTY 133.

ASIA 133. Introduction to Chinese History and Civilization. 3 Units.
This course explains the continuities and discontinuities in the history of China by stressing the development and distinctive adaptations of cultural, religious, and political patterns from the origins of the Chinese civilization to the present. By focusing on major cultural, socioeconomic, and political issues such as Confucianism, Buddhism, trade relations, imperialism, and intellectual discourse in the overall Asian context (with particular reference to Korea and Japan), we discuss the historical development of China and its situation on entering the 21st century. Taking into account the key historical events in the last century, we examine the emergence of China as a modern nation-state and the fundamental transformation of Chinese society in the postwar period. Offered as ASIA 133 and HSTY 133.

ASIA 134. Introduction to Japanese History and Civilization. 3 Units.
This course provides an introduction to various aspects of Japanese civilization, from its origins to the present. By focusing on major cultural, socio-economic, and political issues such as the adaptation and transformation of Confucianism, Buddhism, Shintoism, social structures, material culture, foreign relations, militarism, nationalism, and intellectual discourse in the overall Asian context (with particular reference to Korea and China), we discuss the historical development of Japan and the country's position on entering the 21st century. We examine the emergence of Japan as a modern nation-state and the fundamental transformation of its society in the post-war period. Offered as ASIA 134 and HSTY 134.

ASIA 235. Asian Cinema and Drama. 3 Units.
Introduction to major Asian film directors and major traditional theatrical schools of India, Java/Bali, China, and Japan. Focus on the influence of traditional dramatic forms on contemporary film directors. Development of skills in cross-cultural analysis and comparative aesthetics. Offered as ASIA 235 and WLIT 235.

ASIA 288. Imperial China: The Great Qing. 3 Units.
This course is an introduction to the history of Imperial China, from the fall of the Ming Dynasty in 1644 to the creation of the Chinese republic in 1912. We will explore the major historical transformations (political, economic, social, and cultural) of the last imperial dynasty, the Qing (1644-1911), and develop an understanding of the major social, political, economic, and intellectual cultural forces shaping the formation of modern China. Contrary to commonly-held ideas in both West and in China that traditional Chinese society was timeless or stagnant, historians now see dramatic and significant changes during this period--to the economy, to gender relations, to religion, and to many other aspects of life. This course surveys the social, political, economic, and cultural history of this era, with emphasis on recent research. The main goals of the course will be to acquaint students with the key changes and to show the interplay between economic, social, and cultural changes on the one hand and political developments on the other. By the end of the semester you should have a good sense of how Chinese society was transformed over the course of the 17th through early 20th centuries. The topics we will discuss include urbanization and commerce; gender, family and kinship; education and the examination system; opium and free trade; and ethnicity and nationalism. Offered as ASIA 288 and HSTY 288.

ASIA 289. History of Twentieth Century China. 3 Units.
Completes a two-term sequence of the Chinese history survey, although HSTY 288 is not a prerequisite for this course. Beginning with the First Sino-Japanese War (1895), we review the historical development of intellectual discourse, public reaction, and political protest in later Imperial China through the creation of the People’s Republic in 1949 forward to contemporary times. In contrast to the conventional description of China from a Western point of view, this course tries to explain the emergence of modern China in the context of its intellectual, political, and socio-economic transformation as experienced by Chinese in the late 19th and into the 20th century. By discussing the influence of the West, domestic rebellions, and political radicalism, we examine how the Chinese state and society interacted in search for modernization and reforms, how these reforms were continued during the Republican period, and to what extent historical patterns can be identified in China’s present-day development. Offered as ASIA 289 and HSTY 289.
ASIA 398. Honors Thesis. 1 - 4 Unit.
Intensive study of a topic or problem under the direction of a faculty member, resulting in the preparation of an honors thesis.

ASIA 399. Independent Study. 1 - 3 Unit.
Tutorial in Asian Studies.
Biochemistry

The College of Arts and Sciences awards the Bachelor of Arts and Bachelor of Science degrees in biochemistry. The required courses for the majors and minor are offered by the Department of Biochemistry in the School of Medicine. For details about the department's undergraduate programs, please consult the Department of Biochemistry (p. 724) section of this bulletin.
Childhood Studies Program

The Childhood Studies Program is an educational opportunity for undergraduate students interested in a wide array of issues concerning children and the experience of childhood. This interdisciplinary minor focuses on the life stages of infancy through adolescence and enables students to pursue interests in parenting, child development, gender, the life course, and the place of children in society and culture.

While the Childhood Studies Program is situated in the College of Arts and Sciences, children and childhood are a focus of research and teaching in units throughout the university, including the School of Medicine, the Mandel School of Applied Social Sciences, the School of Law, the School of Dental Medicine, and the Frances Payne Bolton School of Nursing. In addition, the Schubert Center for Child Studies sponsors research, lectures, and programs on children and childhood and provides opportunities for student involvement in research, education, and policy, including externships with local nonprofits.

Undergraduate Program

Minor

The undergraduate minor in childhood studies is built on a foundation in the social sciences. It is also suited, however, to students interested in exploring childhood from the perspectives of the natural sciences, the humanities, or the arts. The minor requires a minimum of 15 hours of course work; the courses must be taken in at least two different departments.

The courses listed below are accepted toward the minor. Other courses may be accepted with approval from one of the program co-directors.

**Courses**

**CHST 301. Child Policy. 3 Units.**

This course introduces students to issues in public policy that impacts children and families. Local, state and federal child policy will be considered, and topics will include, for example, policies related to child poverty, education, child welfare, juvenile justice, and children's physical and mental health. Students will learn how policy is developed, how research informs policy and vice versa, and a framework for analyzing social policy. Recommended preparation: One social sciences course or consent. Offered as ANTH 305 and CHST 301.

**CHST 302. Experiential Learning in Child Policy. 3 - 6 Units.**

Focus on state and federal legislative policy impacting children, youth, and families. Course includes an experiential learning component at the state or federal level and a travel experience to either Columbus, OH or Washington, DC to learn firsthand how policy is formed. Students may take this course twice for credit. Offered as ANTH 307 and CHST 302. Prereq: CHST 301.

**CHST 398. Child Policy Externship. 3 Units.**

Externships offered through CHST 398/ANTH 308 give students an opportunity to work directly with professionals who design and implement policies that impact the lives of children and their families. Agencies involved are active in areas such as public health, including behavioral health, education, juvenile justice, childcare and/or child welfare. Students apply for the externships, and selected students are placed in local public or nonprofit agencies with a policy focus. Each student develops an individualized learning plan in consultation with the Childhood Studies Program faculty and the supervisor in the agency. CHST 398/ANTH 308 is a 3 credit-hour course and may be taken twice for a total of 6 credit hours. Offered as CHST 398 and ANTH 308. Prereq: CHST 301.
CHST 398C. Child Policy Externship and Capstone. 3 Units.
Externships offered through CHST/ANTH/PSCL 398C give students an opportunity to work directly with professionals who design and implement policies that impact the lives of children and their families. Agencies involved are active in areas such as public health, including behavioral health, education, juvenile justice, childcare and/or child welfare. Students apply for the externships, and selected students are placed in local public or nonprofit agencies with a policy focus. Each student develops an individualized learning plan in consultation with the Childhood Studies Program faculty and the supervisor in the agency. Offered as CHST 398C, ANTH 398C, and PSCL 398C. Prereq: CHST 301.

CHST 399. Independent Study. 1 - 6 Unit.
Students propose topics for independent reading and research.
Computer Science

The College of Arts and Sciences awards the Bachelor of Arts degree in computer science. The required courses for the major and minor are offered by the Department of Electrical Engineering and Computer Science in the Case School of Engineering.

For details about the department’s undergraduate programs, please consult the Department of Electrical Engineering and Computer Science (p. 60) section of this bulletin.
Department of Anthropology

Anthropology, with its broad comparative approach, is in a strategic position to contribute to the identification and resolution of many of the problems, both local and global, that challenge society today. The Department of Anthropology offers programs leading to both undergraduate (Bachelor of Arts) and graduate (Master of Arts, Doctor of Philosophy) degrees. In addition, the department offers joint graduate degree programs with Case Western Reserve University School of Medicine (MA or PhD/MPH and MD/MA or PhD) and with the Frances Payne Bolton School of Nursing (MSN/MA). Students graduating with a BA in anthropology normally must continue for the MA or PhD degree if they are interested in working as anthropologists.

General Anthropology | Medical Anthropology | Physical Anthropology | Archaeology | Minors

Undergraduate Programs

Majors

The undergraduate major requires a minimum of 30 semester hours in anthropology. The undergraduate program provides a cross-cultural perspective on human behavior, culture, and biology. Students may choose from four major concentrations.

1. The General Anthropology Concentration provides training in three subdisciplines of anthropology. The first, sociocultural anthropology, emphasizes relationships among socioeconomic institutions, cultural ecology, health and medicine, religion and symbolism, individual psychological variables, and language. The second, physical anthropology, emphasizes human ecology and adaptability, human growth and development, nutritional adaptation, epidemiology, and human and nonhuman primate evolution. The third, archaeology, deals with the long sequences of independent sociocultural, technological, and ecological evolution that have taken place under diverse conditions.

2. The Medical Anthropology Concentration provides training in the three subdisciplines discussed above, but with a focus on their relationship to physical and mental health, illness, disease, and medicine.

3. The Physical Anthropology Concentration deals with the biological nature of humans past and present. Physical anthropologists look beyond purely biological phenomena to understand how biology, behavior, and environment interact. Most course work is in the subdiscipline of human biology, which seeks to understand those interactions by studying physiology, genetics, nutrition, and epidemiology in modern human populations throughout the world. But the concentration also provides training in paleoanthropology, which documents the biological history of humans and, in conjunction with archaeology, analyzes those interactions for past humans.

4. The Archaeology Concentration focuses on the customs and daily life of people who lived in the past. Anthropologists excavate and analyze the material remains of the sites of human occupation. At the same time, archaeological research seeks to understand the evolution of culture and society by determining how and why changes in human society have occurred.

**Departmental Honors**

This program is open to qualified majors in anthropology who have completed 15 hours of anthropology with a 3.25 GPA and who have an overall 3.0 GPA. Students should apply for the program in the fall semester of their junior year and, if approved, register for ANTH 391 Honors Tutorial and ANTH 392 Honors Tutorial in the spring of their junior year and the fall of their senior year.

Honors students are required to undertake a research project under the supervision of one or more faculty members and to present an acceptable research paper in the fall semester of their senior year. Students interested in the program should contact one of the department’s undergraduate advisors.

**Integrated Graduate Studies**

The Department of Anthropology participates in the Integrated Graduate Studies Program (p. 549). Interested students can find the general requirements and the admission procedures for the program in the Undergraduate Studies section of this bulletin and may consult the department for further information.

**Minors**

The department offers four minor emphases in anthropology: general anthropology, medical anthropology, archaeology, and physical anthropology. All require a minimum of 15 semester hours in anthropology.
Degree examinations can receive one of three grades: High Pass, Pass, or Fail. “High Pass” signifies performance sufficient for both the Master of Arts degree and advancement to the Doctor of Philosophy program, provided other requirements have also been satisfied. “Pass” signifies performance adequate for the master’s degree but insufficient to enter the doctoral program. “Fail” means a performance inadequate for the master’s degree. In the case of grades of Pass and Fail, the written examination may be retaken once.

### Doctor of Philosophy

The Doctor of Philosophy degree program includes specializations in medical anthropology and global health, cross-cultural aging, human biology/physical anthropology, and sociocultural anthropology. It requires a minimum of 36 credit hours.

PhD students will work with their doctoral advisor and faculty committee to determine prior to completing candidacy exams what foreign language, if any, is needed to successfully complete the PhD. If language competency is required, the language requirement can be met by a demonstration of competency either in a relevant written language or in an oral field language. The advisor, in consultation with the committee, will determine the level of competency needed and by what means language proficiency will be certified. Certification of competency must occur prior to the dissertation defense.

### Medical Anthropology and Global Health Program

The objective of the Medical Anthropology and Global Health Program is to train medical anthropologists, physicians, nurses, and other health professionals (1) to recognize and deal with, on both theoretical and practical levels, the complex relations between the biological, social, cultural, psychological, economic, and techno-environmental determinants and concomitants of sickness and health in both local and global settings; and (2) to analyze and evaluate how health services are organized and delivered.

Within the Medical Anthropology and Global Health Program, students may choose to specialize in medical anthropology, cross-cultural aging, human adaptation and disease, nutrition, social demography, and so on. All Master of Arts degree students in medical anthropology must complete 27 hours:

### MA Requirements

The main purpose of the Master of Arts degree program is to prepare students to begin teaching, research, or service careers with a solid background in anthropology. Undergraduate course work in anthropology, while helpful, is not a prerequisite for admission.

Requirements for the master’s degree include credit hour requirements, core course requirements, and a six-hour comprehensive written Master of Arts examination. A candidate for the master’s degree is required to complete 27 hours of class work, including an approved statistics course (3 hours) in which the student has earned a grade of C or better. No more than 6 credit hours of electives may be taken in 300-level courses (advanced undergraduate courses). All master’s degree candidates are required to attain a minimum cumulative grade point average of 3.0 in the core courses (described below) in order to qualify for the degree. Any student may retake an examination in a required course the next time it is given. The second grade will be the one considered for the student’s overall average.

All master’s degree candidates are required to take a six-hour comprehensive written examination in their field set by the department’s examination committee. This examination must be taken before the completion of 27 semester hours of graduate work. Written master’s degree examinations can receive one of three grades: High Pass, Pass, or Fail.

**Medical Anthropology and Global Health | Cross-Cultural Aging | Joint-Degree Programs**

**Graduate Programs**

The Department of Anthropology offers graduate programs leading to the Master of Arts and Doctor of Philosophy degrees in anthropology with specializations in medical anthropology and global health, cross-cultural aging, and other areas.

The department also offers three combined degrees:

- MA or PhD/MPH (with the School of Medicine)
- MD/MA or PhD (with the School of Medicine)
- MSN/MA (with the Frances Payne Bolton School of Nursing)

**Master of Arts**

The main purpose of the Master of Arts degree program is to prepare students to begin teaching, research, or service careers with a solid background in anthropology. Undergraduate course work in anthropology, while helpful, is not a prerequisite for admission.

Requirements for the master’s degree include credit hour requirements, core course requirements, and a six-hour comprehensive written Master of Arts examination. A candidate for the master’s degree is required to complete 27 hours of class work, including an approved statistics course (3 hours) in which the student has earned a grade of C or better. No more than 6 credit hours of electives may be taken in 300-level courses (advanced undergraduate courses). All master’s degree candidates are required to attain a minimum cumulative grade point average of 3.0 in the core courses (described below) in order to qualify for the degree. Any student may retake an examination in a required course the next time it is given. The second grade will be the one considered for the student’s overall average.

All master’s degree candidates are required to take a six-hour comprehensive written examination in their field set by the department’s examination committee. This examination must be taken before the completion of 27 semester hours of graduate work. Written master’s degree examinations can receive one of three grades: High Pass, Pass, or Fail. “High Pass” signifies performance sufficient for both the Master of Arts degree and advancement to the Doctor of Philosophy program, provided other requirements have also been satisfied. “Pass” signifies performance adequate for the master’s degree but insufficient to enter the doctoral program. “Fail” means a performance inadequate for the master’s degree. In the case of grades of Pass and Fail, the written examination may be retaken once.

### PhD Requirements

All PhD students in medical anthropology are required to complete the PhD requirements. Students develop a specific plan of study, requiring a minimum of 36 credit hours, in consultation with their advisor.
Students must take an approved statistics course (3 credits) and earn a grade of C or better if this requirement has not been fulfilled at the MA level.

Students must take ANTH 504 Anthropological Research Design.

Students must complete two approved seminars (500 level).

Students must take 6-15 credit hours in electives (depending on whether they need to take the statistics course or the 500-level seminars). Students may not take more than six total credit hours of ANTH 599 Tutorial: Advanced Studies in Anthropology.

Students must take 18 credit hours in dissertation (ANTH 701 Dissertation Ph.D.).

After completing course requirements, a student must take the written Doctor of Philosophy candidacy examination. Within one semester of successfully completing this examination, the student is required to defend a dissertation prospectus with the cooperation of his or her advisor and committee.

**Specializations in Medical Anthropology and Global Health**

**International Health**
The international health specialization offers students training in international health research as well as in evaluation of international health projects. The curriculum includes course work in medical anthropology, epidemiology, and special topics in international health, such as maternal and child health. Students are qualified to work in international health research, in academic positions, or in administrative positions in governmental or private agencies.

**Urban Health**
The urban health specialization prepares students for careers in anthropology, public health, or allied fields, with a special focus on racial and ethnic disparities in health and on underserved populations in urban areas around the world. Under the guidance of faculty with research experience both domestically and internationally, students will learn anthropological theory and methods focusing on health and illness among urban populations.

**Psychological Anthropology**
The psychological anthropology specialization prepares students for positions in teaching and research institutions. It is also relevant for mental health professionals concerned with research and theoretical issues related to multiethnic patient populations.

**Cross-Cultural Aging**
The cross-cultural aging specialization focuses on the processes of aging and the circumstances of older people throughout the world. Particular attention is given to the impact of social, cultural, economic, political, and demographic variables on the experience of aging.

All MA students in the cross-cultural aging specialization must complete 27 credit hours, including the medical anthropology core courses, an approved statistics course, and 12 credit hours of electives approved by the advisor. At the PhD level, students specializing in cross-cultural aging must develop a program with their advisor to meet all PhD requirements.

**Cross-Cultural Aging Program**
In addition to the cross-cultural aging specialization in the Medical Anthropology Program, the department offers a distinct Cross-Cultural Aging Program. Degree candidates are required to demonstrate mastery of the literature, theories, and methods appropriate to Western and non-Western gerontology, and are encouraged to gain research experience in both Western and non-Western settings. The program emphasizes the integration of qualitative and quantitative methodologies.

**MA Requirements**
Graduates of the master's program are qualified to work in research or administrative positions in governmental and private agencies, and to teach at the college and university levels. All MA students in cross-cultural aging must complete 27 credit hours including the following core courses:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>

</tbody>
</table>

Approved statistics course

Electives 12

Total Units 27

**PhD Requirements**
All PhD students in cross-cultural aging are required to develop a specific plan of study, with a minimum of 36 credit hours, in consultation with their advisor.

Students must take 18 credit hours in electives as approved by their advisory committee. (For those students who have not completed the MA statistics requirement, an approved 3-credit course in statistics is required.) Students must take 18 credit hours in dissertation (ANTH 701 Dissertation Ph.D.).

After completing course requirements, a student must take the written Doctor of Philosophy candidacy examination. Within one semester of successfully completing this examination, the student is required to defend a dissertation prospectus with the cooperation of his or her advisor and committee. Before a candidate is permitted to defend the dissertation, he or she must demonstrate a reading knowledge in a foreign language in which there is a scholarly literature relevant to his or her program of studies. A foreign-born student may substitute his or her native language (if it is not English) if it meets the above conditions.

**Other Specializations**
Students interested in graduate degrees in social-cultural or physical anthropology should contact the department about requirements.

**Joint-Degree Programs**

**MA or PhD/MPH Program with the School of Medicine**
The joint MA or PhD/MPH program provides students with the opportunity to receive an anthropology graduate degree and a public health degree simultaneously. A combined public health/anthropology degree will be especially valuable to students interested in working in urban health or international health, or within health policy programs. The joint MA/MPH requires 54 credit hours (21 in anthropology and 33 in public health). The joint PhD/MPH requires an additional 18 credit hours in anthropology beyond the MA level and 18 hours of ANTH 701 Dissertation Ph.D., for a total of 90 credit hours. All joint-degree students will develop a program of study with their advisors in both anthropology and public health.

**MD/MA or PhD Program with the School of Medicine**
The objectives of the joint MD/MA or PhD program are to train unusually qualified students to conduct research on a broad range of bio-cultural problems, with emphasis on the relationship between medicine,
ecology, subsistence variables, population dynamics, and disease epidemiology; and to identify and analyze sociocultural impediments to the successful introduction of effective functioning and evaluation of health care programs in diverse contexts. Applicants should make separate application for admission to the School of Medicine and the Department of Anthropology (through the School of Graduate Studies). Applications to the Department of Anthropology may include MCAT scores rather than GRE scores, in addition to other information indicated on the graduate school forms.

**MSN/MA Program with the Frances Payne Bolton School of Nursing**

The joint MSN/MA program affords students a unique opportunity to combine the cross-cultural expertise of medical anthropology with clinical expertise in nursing. This combination of skills and knowledge will be of particular value in preparing students for careers in international health and in our multicultural society. Students must complete a minimum of 19 credits in nursing core courses, 12 to 22 credits in clinical major courses, and a minimum of 18 credits in anthropology courses. The actual number of credits depends upon the nursing major selected. The total MSN/MA degree requirement is a minimum of 55 hours.

**Department Faculty**

Lawrence P. Greksa, PhD  
(Pennsylvania State University)  
*Professor and Chair*

Physical anthropology; human biology; growth and development; nutrition; modernization; Polynesia; Andes; Old Order Amish

Eileen Anderson-Fye, EdD  
(Harvard University)  
*Assistant Professor*

Psychological and medical anthropology; culture, gender, and human development; anthropology of adolescence; globalization; immigration; mental health; eating and body image disorders; child abuse and trauma; adolescent psychiatric medication usage; person-centered ethnography; mixed methods; Belize; Belizean immigrants in the United States

Cynthia Beall, PhD  
(Pennsylvania State University)  
*Distinguished University Professor and Sarah Idell Pyle Professor; Co-Director, Center for Research on Tibet*

Physical anthropology; adaptation to high-altitude hypoxia on the Andean, Tibetan, and East African plateaus

Atwood D. Gaines, PhD, MPH  
(University of California, Berkeley; University of California, Berkeley, School of Public Health)  
*Professor; Professor of Psychiatry and Professor of Bioethics, Case School of Medicine; Professor of Nursing, Frances Payne Bolton School of Nursing*

Medical and psychiatric anthropology; cultural studies of science and medicine; cultural bioethics; religion; aging and dementia; social identity and health; United States; France and the Mediterranean

Melvyn C. Goldstein, PhD  
(University of Washington)  
*John Reynolds Harkness Professor; Co-Director, Center for Research on Tibet; Professor of International Health, School of Medicine*

Social and cultural anthropology; development/population anthropology; cross-cultural and global aging; cultural ecology, ethnicity, and nationalism; anthropology and history; Tibet, China, Mongolia, Himalayas

Vanessa M. Hildebrand, PhD  
(Washington University)  
*Assistant Professor*

Sociocultural anthropology; maternal and reproductive health; science and technology studies; global health and global health policy; Southeast Asia, Indonesia, United States

Lee D. Hoffer, PhD, MPE  
(University of Colorado, Denver; Washington University School of Medicine)  
*Assistant Professor*

Cultural and medical anthropology; drug addiction; psychiatric epidemiology; ethnographic research methods; complex systems; computational modeling; economic anthropology; United States

Jill E. Korbin, PhD  
(University of California, Los Angeles)  
*Professor; Associate Dean, College of Arts and Sciences; Director, Schubert Center for Child Studies; Co-Director, Childhood Studies Program*

Cultural, medical, and psychological anthropology; culture and human development; child maltreatment; neighborhood; United States; Old Order Amish

Janet McGrath, PhD  
(Northwestern University)  
*Associate Professor; Director of Graduate Programs; Associate Professor of International Health, School of Medicine*

Biomedical anthropology; anthropology of infectious disease; international and global health; AIDS; urban health; United States, Africa

Jim Shaffer, PhD  
(University of Wisconsin, Madison)  
*Associate Professor*

Archaeology; Middle East, Central Asia, Indus Valley, India

**Adjunct Faculty**

Katia Almeida, PhD  
(Federal University of Rio Janeiro)  
*Adjunct Assistant Professor*

Cultural and social anthropology; art and aesthetics in cross-cultural perspective; Amazonian ethnology; Latin American studies

Jennifer Furin, MD  
(Harvard University; University of California), PhD  
(Los Angeles)  
*Adjunct Assistant Professor; Assistant Professor, Department of Medicine, Division of Infectious Diseases, TB Research Unit*

Medical anthropology; infectious diseases; HIV; TB; community health; health policy and programming; Haiti, Peru, former Soviet Union, Resothe, Rwanda

Nomi Greber, PhD  
(Case Western Reserve University)  
*Adjunct Associate Professor; Curator of Archaeology, Cleveland Museum of Natural History*

Archaeology; Early/Middle Woodland of Eastern North America; Adena/Hopewell; geophysical remote sensing; archaeoastronomy

Yohannes Haile-Selassie, PhD  
(University of California, Berkeley)  
*Adjunct Professor; Curator and Head of Physical Anthropology, Cleveland Museum of Natural History*

Human evolution

Bruce Latimer, PhD  
(Kent State University)
ANTH 102. Being Human: An Introduction to Social and Cultural Anthropology. 3 Units.
The nature of culture and humans as culture-bearing animals. The range of cultural phenomena including language, social organization, religion, and culture change, and the relevance of anthropology for contemporary social, economic, and ecological problems.

ANTH 103. Introduction to Human Evolution. 3 Units.
Physical, cultural, and technological evolution of humans. The systematic interrelationships between humans, culture, and environment.

ANTH 202. Archaeology of Eastern North America. 3 Units.
This course is an introduction to the archaeology and prehistory of the eastern woodlands of North America. Course material will focus on the archaeological record of native societies living east of the Mississippi River from the first arrivals at the end of the Pleistocene up to the coming of Europeans. Specific topics for discussion include late Pleistocene settlement, hunter-gatherer environmental adaptations, the origin of food production, and the development of ranked societies.

ANTH 215. Health, Culture, and Disease: An Introduction to Medical Anthropology. 3 Units.
This course is an introduction to the field of Medical Anthropology. Medical Anthropology is concerned with the cross-cultural study of culture, health, and illness. During the course of the semester, our survey will include (1) theoretical orientations and key concepts; (2) the cross-cultural diversity of health beliefs and practices (abroad and at home); and (3) contemporary issues and special populations (e.g., AIDS, homelessness, refugees, women’s health, and children at risk).

ANTH 225. Evolution. 3 Units.
Multidisciplinary study of the course and processes of organic evolution provides a broad understanding of the evolution of structural and functional diversity, the relationships among organisms and their environments, and the phylogenetic relationships among major groups of organisms. Topics include the genetic basis of micro- and macro-evolutionary change, the concept of adaptation, natural selection, population dynamics, theories of species formation, principles of phylogenetic inference, biogeography, evolutionary rates, evolutionary convergence, homology, Darwinian medicine, and conceptual and philosophic issues in evolutionary theory. Offered as ANTH 225, BIOL 225, EEPS 225, HSTY 225, and PHIL 225.

ANTH 233. Introduction to Jewish Folklore. 3 Units.
Exploration of a variety of genres, research methods and interpretations of Jewish folklore, from antiquity to the present. Emphasis on how Jewish folk traditions and culture give us access to the spirit and mentality of the many different generations of the Jewish ethnic group, illuminating its past and informing the direction of its future development. Offered as ANTH 233, RLGN 233, and JDST 233.

ANTH 295. Comparative Primate Behavior. 3 Units.
The behavior of non-human primates (prosimians, monkeys, and apes) and the relevance of these studies for understanding the evolution of human behavior. Biological and ecological influences on behavior. The social aspects of primate life, both human and nonhuman. Recommended preparation: ANTH 102 or ANTH 103 or consent of department.

ANTH 301. Biological Aging in Humans. 3 Units.
Biological aging phenomena, evidence that various sociocultural and environmental influences may slow or accelerate the aging process, and theories explaining the evolution of the aging process. Recommended preparation: ANTH 103. Offered as ANTH 301 and ANTH 401.
ANTH 302. Darwinian Medicine. 3 Units.
Darwinian medicine deals with evolutionary aspects of modern human disease. It applies the concepts and methods of evolutionary biology to the question of why we are vulnerable to disease. Darwinian (or evolutionary) medicine proposes several general hypotheses about disease causation including disease as evolutionary legacy and design compromise, the result of a novel environment, a consequence of genetic adaptation, the result of infectious organisms’ evolutionary adaptations, and disease symptoms as manifestation of defense mechanisms. It proposes that evolutionary ideas can explain, help to prevent and perhaps help to treat some diseases. This course presents the basic logic of Darwinian medicine and evaluates hypotheses about specific diseases that illustrate each of the hypotheses about disease causation. Recommended preparation: ANTH 103. Offered as ANTH 302 and ANTH 402.

ANTH 304. Introduction to the Anthropology of Aging. 3 Units.
Reviews historical and methodological approaches to the study of aging. Examines theoretical assumptions about aging by comparing studies from Western and non-Western societies that illustrate the differential importance of culture in the experience of aging. Recommended preparation: ANTH 102. Offered as ANTH 304 and ANTH 404.

ANTH 305. Child Policy. 3 Units.
This course introduces students to issues in public policy that impacts children and families. Local, state and federal child policy will be considered, and topics will include, for example, policies related to child poverty, education, child welfare, juvenile justice, and children’s physical and mental health. Students will learn how policy is developed, how research informs policy and vice versa, and a framework for analyzing social policy. Recommended preparation: One social sciences course or consent. Offered as ANTH 305 and CHST 301.

ANTH 306. The Anthropology of Childhood and the Family. 3 Units.
Child-rearing patterns and the family as an institution, using evidence from Western and non-Western cultures. Human universals and cultural variation, the experience of childhood and recent changes in the American family. Recommended preparation: ANTH 102. Offered as ANTH 306 and ANTH 406.

ANTH 307. Experiential Learning in Child Policy. 3 - 6 Units.
Focus on state and federal legislative policy impacting children, youth, and families. Course includes an experiential learning component at the state or federal level and a travel experience to either Columbus, OH or Washington, DC to learn firsthand how policy is formed. Students may take this course twice for credit. Offered as ANTH 307 and CHST 302. Prereq: CHST 301.

ANTH 308. Child Policy Externship. 3 Units.
Externships offered through CHST 398/ANTH 308 give students an opportunity to work directly with professionals who design and implement policies that impact the lives of children and their families. Agencies involved are active in areas such as public health, including behavioral health, education, juvenile justice, childcare and/or child welfare. Students apply for the externships, and selected students are placed in local public or nonprofit agencies with a policy focus. Each student develops an individualized learning plan in consultation with the Childhood Studies Program faculty and the supervisor in the agency. CHST 398/ANTH 308 is a 3 credit-hour course and may be taken twice for a total of 6 credit hours. Offered as CHST 398 and ANTH 308. Prereq: CHST 301.

ANTH 310. Introduction to Linguistic Anthropology. 3 Units.
This is an introduction to the core concepts, theories and methodologies that form the study of language from an anthropological point of view. The course provides exposure to current issues in linguistic anthropological research and reviews some of the foundational topics of research past, highlighting the contributions of linguistics to anthropology and social science. Topics to be explored include: 1) an overview of the study of language (language structure and patterns, the effects of linguistic categories on thought and behavior, meaning and linguistic relativity, cross-language comparison, and non-verbal communication); 2) doing linguistic anthropology "on the ground" (an intro to the laboratory and field techniques of linguistic anthropology); 3) the study of language as function and social action (language and social structure speech acts and events, verbal art, language and emotion); and 4) the study of language/discourse and power (language in politics, medicine, and law). Offered as ANTH 310 and ANTH 410.

ANTH 313. The Anthropology of Adolescence. 3 Units.
This course investigates the anthropology of adolescence. What are the conditions under which adolescence has appeared around the world as a life stage? What are the roles of adolescence cross-culturally? What are the varieties of adolescent experience? Through classic and contemporary texts, the course will address these questions as well as special topics particularly important to adolescence such as globalization, mental health, and sexuality. Offered as ANTH 313 and ANTH 413.

ANTH 314. Cultures of the United States. 3 Units.
This course considers the rich ethnic diversity of the U.S. from the perspective of social/cultural anthropology. Conquest, immigration, problems of conflicts and accommodation, and the character of the diverse regional and ethnic cultures are considered as are forms of racism, discrimination, and their consequences. Groups of interest include various Latina/o and Native peoples, African-American groups, and specific ethnic groups of Pacific, Mediterranean, European, Asian, and Caribbean origin. Offered as ANTH 314, ETHS 314, and ANTH 414.

ANTH 317. Asian Medical Systems. 3 Units.
Examines the philosophical assumptions and therapies of the traditional and contemporary medical systems of India, Tibet, China, and Japan. Particular attention will be given to the folk, popular, and institutional sectors of medical practice as well as to the contemporary relationship between traditional medicine and Western medicine in each of these societies. Recommended preparation: ANTH 102. Offered as ANTH 317 and ANTH 417.

ANTH 318. Death and Dying. 3 Units.
Examines cultural context of death and dying. Topics include social and psychological consequences of changing patterns of mortality, attitudes towards the taking of life, preparation for death, mortuary rituals, grief and mourning, and nature of relationship between living and dead. Recommended preparation: ANTH 102. Offered as ANTH 318 or ANTH 418.
ANTH 319. Introduction to Statistical Analysis in the Social Sciences. 3 Units.
Statistical description (central tendency, variation, correlation, etc.) and statistical evaluation (two sample comparisons, regression, analysis of variance, non-parametric statistics). Developing an understanding of statistical inference, particularly on proper usage of statistical methods. Examples from the social sciences. Cannot be used to meet the A&S Humanities and Social Sciences requirement. Not available for credit to students who have completed STAT 201 or PSCL 282. Prereq: Major in Anthropology.

ANTH 321. Methods in Archaeology. 3 Units.
This course reviews the basic methods and techniques used in modern anthropological archaeology. Topics to be discussed include the nature of the archaeological record, research design, techniques of field archaeology, methods of laboratory analysis, museum archaeology, ethnoarchaeology, and cultural interpretation. Prereq: ANTH 107.

ANTH 323. AIDS: Epidemiology, Biology, and Culture. 3 Units.
This course will examine the biological and cultural impact of AIDS in different societies around the world. Topics include: the origin and evolution of the virus, the evolutionary implications of the epidemic, routes of transmission, a historical comparison of AIDS to other epidemics in human history, current worldwide prevalences of AIDS, and cultural responses to the epidemic. Special emphasis will be placed on the long-term biological and social consequences of the epidemic. Recommended preparation: ANTH 102 or ANTH 103 or ANTH 105. Offered as ANTH 323 and ANTH 423.

ANTH 324. Field Methods in Archaeology. 3 - 6 Units.
This field course is designed to give the student a comprehensive introduction to archaeological field work. All participants will be introduced to the methods of archaeological survey, techniques of hand excavation, artifact identification, and the preparation of field notes and documentation. In large measure this is a "learning through doing" course which is supplemented by formal and informal lectures and discussions about archaeological methods and regional prehistory. The Fields School is held as two, three-week sessions of instruction in the field. All participants are required to attend an orientation meeting that is held at the Museum on the first day of each session. The remainder of each session will take place from Monday through Friday at an archaeological site in northeast Ohio. Students are responsible for their own transportation to and from the field site and must bring a sack lunch. All participants will receive a field manual which will provide detailed information on the course and techniques of field work.

ANTH 326. Power, Illness, and Inequality: The Political Economy of Health. 3 Units.
This course explores the relationship between social inequality and the distribution of health and illness across class, race, gender, sexual orientation, and national boundaries. Class readings drawn from critical anthropological approaches to the study of health emphasize the fundamental importance of power relations and economic constraints in explaining patterns of disease. The course critically examines the nature of Western biomedicine and inequality in the delivery of health services. Special consideration is given to political economic analysis of health issues in the developing world such as AIDS, hunger, reproductive health, and primary health care provision. Recommended preparation: ANTH 102 or ANTH 215. Offered as ANTH 326 and ANTH 426.

ANTH 327. Ancient Cultures of the Ohio Region. 3 Units.
This course surveys the archaeology of Native American cultures in the Great Lakes region from ca. 10,000 B.C. to A.D. 1700. The geographic scope of this course is the upper Midwest, southern Ontario, and the St. Lawrence Valley with a focus on the Ohio region. Recommended preparation: ANTH 107. Offered as ANTH 327 and ANTH 427.

ANTH 330. Special Topics in Prehistory. 3 Units.
Special topics or geographical areas of archaeological significance (e.g., the origins of food production, the archaeology of the Mediterranean, the archaeology of North America). Recommended preparation: ANTH 102 or ANTH 107.

ANTH 331. The Most Ancient Near East. 3 Units.
The Near East, archaeologically, is the most intensely researched area in the world. The research, spanning 150 years, reveals a continuous record of human adaptation spanning two million years, five human species, multiple major environmental changes, and shifts in human adaptive strategies from nomadic hunting and gathering to sedentary village agriculture and the emergence of urban centers "civilization." The archaeological record of this extraordinary period beginning two million years ago until about 4000 BC is reviewed. Emphasis is placed on the human response to social and ecological changes. The course examines how the emergence of sedentary settlements, surplus food production, population growth, interregional trade, and socially-economically stratified societies fundamentally changed the human condition. Recommended preparation: ANTH 102 or ANTH 107.

ANTH 333. Roots of Ancient India: Archaeology of South Asia. 3 Units.
Archaeological discoveries in South Asia (modern India, Pakistan, Sri Lanka, Bangladesh, and Nepal) reveal a continuous record of human habitation from almost two million years ago until the present. Early human populations in the region encountered dramatically changing ecological conditions resulting in various cultural adaptations over this long period. Beginning with the earliest hunter-gatherer populations, archaeological data reveal a diversity of cultural changes/adaptations in South Asia resulting in the indigenous development of sedentary agricultural societies coexisting with hunters and gatherers, and with pastoral nomadic groups interacting over diverse ecospheres. These cultural developments resulted in the formation of the Harappan (Indus Valley) culture - a unique, ancient (2600-1300 BC) Old World civilization. Archaeological data indicate this Harappan culture provided basic fundamental cultural traits that evolved into the culturally Early Historic Indian Tradition. Special attention is given to theoretical controversies surrounding the cultural continuity issue in South Asian culture history and its significance for understanding Old World archaeology. Recommended preparation: ANTH 102 or ANTH 107.

ANTH 335. Illegal Drugs and Society. 3 Units.
This course provides perspectives on illegal drug use informed by the social, political and economic dimensions of the issues. Framed by the history, epidemiology, and medical consequences of drug use, students will confront the complex challenges posed by addiction. Anthropological research conducted in the U.S. and cross-culturally will demonstrate, elaborate and juxtapose various clinical, public health, and law enforcement policies and perspectives. Topics examined will include: why exclusively using a bio-medical model of addiction is inadequate; how effective is the war on drugs; what prevention, intervention and treatment efforts work; and various ideological/moral perspectives on illegal drug use. Offered as ANTH 335 and ANTH 435.
ANTH 337. Comparative Medical Systems. 3 Units.
This course considers the world’s major medical systems. Foci include professional and folk medical systems of Asia and South Asia, North and South America, Europe and the Mediterranean, including the Christian and Islamic medical traditions. Attention is paid to medical origins and the relationship of popular to professional medicines. The examination of each medical tradition includes consideration of its psychological medicine and system of medical ethics. Recommended preparation: ANTH 215. Offered as ANTH 337 and ANTH 437.

ANTH 338. Maternal Health: Anthropological Perspectives on Reproductive Practices and Health Policy. 3 Units.
The reproductive process is shared by humans as biological beings. However, the experience of pregnancy and childbirth is also dependent on the cultural, social, political, historical, and political-economic setting. This course frames issues in reproductive health by looking at the complex issues associated with maternal health and mortality worldwide. After reviewing biomedical perspectives on reproductive processes this course will focus on childbirth and pregnancy as the process and ritual by which societies welcome new members. This course will review ethnomedical concepts; discuss the interaction between local, national, and global agendas shaping reproductive practices; and conclude with anthropological critiques of reproductive health initiatives. Offered as ANTH 338 and ANTH 438.

ANTH 339. Ethnographic and Qualitative Research Methods. 3 Units.
This is a course on applying ethnographic research methods in the social sciences. Ethnographic research seeks to understand and describe the experiences of research participants (i.e. subjects) through becoming involved in their daily lives. Findings from ethnography are generated through systematic observation within the natural context in which behavior occurs (i.e. fieldwork). Unlike methods that emphasize detachment, distance, and objectivity, ethnography involves developing knowledge by becoming an ad hoc member of the group(s) one is studying. The principal techniques of ethnography, "participant-observation" and "In-depth open ended interviewing," require actively engaging the research process. This class will explore ethnographic research techniques, as well as other qualitative research methods. In addition to addressing how such methods make claims about social phenomena, this class will also explore more practical topics such as: developing questions, entering the field, establishing rapport, taking and managing field notes, coding data, and data analysis. Lectures, readings, and class discussion will be complimented by assignments using techniques. Offered as ANTH 339 and ANTH 439. Prereq: ANTH 102.

ANTH 341. Cultural Area Studies in Anthropology. 3 Units.
Recommended preparation: ANTH 102. Offered as ANTH 341 and ANTH 441.

ANTH 347. Cultural Ecology: An Epistemological Approach to Environmental Sustainability. 3 Units.
This course provides the understanding that the realm of human culture is where both the cause and cure of nearly all contemporary environmental sustainability challenges are found. This is because culture is the medium through which humans as living systems perceive, interpret, and act upon their environment. Through understanding principles that guide living systems and applying them to human/nature interaction in diverse cultures throughout the world, students develop an ecological epistemology, or way of knowing nature. This leads to more effective advocacy for environmental sustainability and an increasing depth in interaction with nature, particularly in the domains of aesthetics and the sacred. This course is an approved SAGES Departmental seminar. Offered as ANTH 347 and ANTH 447. Prereq: ANTH 102.

ANTH 349. Cultures of Latin America. 3 Units.
The aim of this course is to consider cultural diversity and social inequality in contemporary Latin America from an anthropological perspective. A variety of aspects related to ethnicity, religion, music, gender, social movements, cuisine, urban spaces, violence, and ecology are considered in addition to current economic and political issues. These topics will be analyzed in relation to Latin America’s complex historical and social formation and its identity representations. The course takes under consideration various case studies in which not just local communities but also perceptions of national institutions and practices will be analyzed from pluralistic approaches (provided by either Latin American and non-Latin American researchers) that combine fieldwork, interviews and life experiences with textual and media sources. Special attention will be paid to contemporary global issues affecting Latin America. Offered as ANTH 349 and ANTH 449. Prereq: ANTH 102.

ANTH 351. Topics in International Health. 3 Units.
Special topics of interest in International Health. Recommended preparation: ANTH 102 or ANTH 215. Offered as ANTH 351 and ANTH 451.

ANTH 352. Japanese Culture and Society. 3 Units.
Focuses on contemporary Japanese cultural and social institutions. Topics include child-rearing, personality, values, education, gender roles, the dual economy, and popular culture. Recommended preparation: ANTH 102. Offered as ANTH 352 and ANTH 452.

ANTH 353. Chinese Culture and Society. 3 Units.
Focuses on Chinese cultural and social institutions during the Maoist and post-Maoist eras. Topics include ideology, economics, politics, religion, family life, and popular culture. Recommended preparation: ANTH 102. Offered as ANTH 353 and ANTH 453.

ANTH 357. Native American Cultures. 3 Units.
Intensive examination of the cultures of selected Native American peoples, including historical, political, religious, social organizational, linguistic, and medical/psychiatric aspects of American Indian life. Not available for credit to students who have completed USSO 219. Recommended preparation: ANTH 102. Offered as ANTH 357 and ANTH 457.

ANTH 359. Introduction to International Health. 3 Units.
Critical health problems and needs in developing countries. Prevalence of infectious disease, malnutrition, chronic disease, injury control. Examines strategies for improvement of health in less developed countries. Recommended preparation: ANTH 102. Offered as ANTH 359 and ANTH 459.
ANTH 361. Urban Health. 3 Units.
This course provides an anthropological perspective on the most important health problems facing urban population around the world. Special attention will be given to an examination of disparities in health among urban residents based on poverty, race/ethnicity, gender, and nationality. Offered as ANTH 361 and ANTH 461.

ANTH 362. Contemporary Theory in Anthropology. 3 Units.
A critical examination of anthropological thought in England, France and the United States during the second half of the twentieth century. Emphasis will be on the way authors formulate questions that motivate anthropological discourse, on the way central concepts are formulated and applied and on the controversies and debates that result. Readings are drawn from influential texts by prominent contemporary anthropologists. Recommended preparation: ANTH 102. Offered as ANTH 362 and ANTH 462.

ANTH 365. Gender and Sex Differences: Cross-cultural Perspective. 3 Units.
Gender roles and sex differences throughout the life cycle considered from a cross-cultural perspective. Major approaches to explaining sex roles discussed in light of information from both Western and non-Western cultures. Offered as ANTH 365 and ANTH 465 and WGST 365. Prereq: ANTH 102 or consent of department.

ANTH 367. Topics in Evolutionary Biology. 3 Units.
The focus for this course on a special topic of interest in evolutionary biology will vary from one offering to the next. Examples of possible topics include theories of speciation, the evolution of language, the evolution of sex, evolution and biodiversity, molecular evolution. ANAT/ANTH/EEPS/PHIL/PHOL 467 BIOL 468 will require a longer, more sophisticated term paper, and additional class presentation. Offered as ANTH 367, BIOL 368, EEPS 367, PHIL 367, ANAT 467, ANTH 467, BIOL 468, EEPS 467, PHIL 467 and PHOL 467. Prereq: ANTH 225 or equivalent.

ANTH 368. Evolutionary Biology Capstone. 3 Units.
This course focuses on a special topic of interest in evolutionary biology that will vary from one offering to the next. Examples of possible topics include theories of speciation, the evolution of language, the evolution of sex, evolution and biodiversity, molecular evolution. Students will participate in discussions and lead class seminars on evolutionary topics and in collaboration with an advisor or advisors, select a topic for a research paper or project. Each student will write a major research report or complete a major project and will make a public presentation of her/his findings. Offered as ANTH 368, BIOL 369, PHIL 368. Prereq: ANTH 225, BIOL 225, GEOL 225, HSTY 225, PHIL 225 or its equivalent or permission of instructor.

ANTH 369. The Anthropology of Nutrition. 3 Units.
Examines human nutrition and physical performance within the framework of human adaptability theory. The emphasis is on the measurement of energetic intake and expenditure in human populations; the assessment, health consequences, and bio-cultural correlates of malnutrition and obesity; and the uses of energetic data in assessing human population adaptation. Recommended preparation: ANTH 103. Offered as ANTH 369 and ANTH 469.

ANTH 369D. The Anthropology of Nutrition. 3 Units.
Human nutrition is examined from an anthropological perspective. We will briefly cover methods for assessing and evaluating dietary intake and dietary patterns. The remainder of the course will focus on various social, ecological, and genetic factors which influence human nutritional patterns and the causes and consequences of protein-energy malnutrition. The course will be taught in a seminar format and is designed to enhance your skills in critically reading the anthropological literature and in improving your written and oral communication skills. A student may not receive credit for both ANTH 369 and ANTH 369D. Recommended preparation: ANTH 102, ANTH 103.

ANTH 370. Field Seminar in Paleoanthropology. 12 Units.
Paleoanthropology is the study of human physical and cultural evolution based on fossils and cultural remains from ancient geological times. These fossils and cultural remains are collected by conducting fieldwork in various parts of the world where geological phenomena have exposed fossiliferous sedimentary windows from the deep past. Hence, fieldwork is one of the major backbones of paleoanthropology. This course is designed for advanced undergraduate students who are interested in pursuing higher degrees in paleoanthropology, human paleobiology, evolutionary biology, or other related disciplines. This course introduces students to the principles and methods of paleontological fieldwork in real time. It introduces students to paleoanthropological fieldwork from locating fossiliferous areas based on aerial photo interpretations to survey methodology; from methods of systematic excavation, fossil collection and documentation in the field, to curation and preparation of fossil specimens in laboratories; from conducting scientific analyses in laboratory environments to subsequently publishing the results in peer-reviewed journals. Recommended preparation: ANTH 377. Prereq: ANTH 103 and ANTH 375.

ANTH 371. Culture, Behavior, and Person: Psychological Anthropology. 3 Units.
Cross-cultural perspectives on personality, human development, individual variability, cognition, deviant behavior, and the role of the individual in his/her society. Classic and contemporary anthropological writings on Western and non-Western societies. Recommended preparation: ANTH 102. Offered as ANTH 371 and ANTH 471.

ANTH 375. Human Evolution: The Fossil Evidence. 3 Units.
This course will survey the biological and behavioral changes that occurred in the hominid lineage during the past five million years. In addition to a thorough review of the fossil evidence for human evolution, students will develop the theoretical framework in evolutionary biology. Recommended preparation: ANTH 377, BIOL 225. Offered as ANAT 375, ANTH 375, ANTH 475 and ANTH 475. Prereq: ANTH 103.

ANTH 376. Topics in the Anthropology of Health and Medicine. 3 Units.
Special topics of interest, such as the biology of human adaptability; the ecology of the human life cycle health delivery systems; transcultural psychiatry; nutrition, health, and disease; paleoepidemiology; and population anthropology. Recommended preparation: ANTH 102 or ANTH 103. Offered as ANTH 376 and ANTH 476.

ANTH 377. Human Osteology. 4 Units.
This course for upper division undergraduates and graduate students will review the following topics: human skeletal development and identification; and forensic identification (skeletal aging, sex identification and population affiliation). Offered as ANAT 377, ANTH 377, ANAT 477 and ANTH 477.
ANTH 378. Reproductive Health: An Evolutionary Perspective. 3 Units.
This course provides students with an evolutionary perspective on the factors influencing human reproductive health, including reproductive biology, ecology, and various aspects of natural human fertility. Our focus will be on variation in human reproduction in mostly non-western populations. Recommended preparation for ANTH 378: ANTH 103. Offered as ANTH 378 and ANTH 478.

ANTH 379. Topics in Cultural and Social Anthropology. 3 Units.
Special topics of interest across the range of social and cultural anthropology. Recommended preparation: ANTH 102. Offered as ANTH 379 and ANTH 479.

ANTH 380. Independent Study in Laboratory Archaeology I. 1 - 3 Unit.
This course provides an introduction to the basic methods and techniques of artifact curation and laboratory analysis in archaeology. Under the supervision of the instructor, each student will develop and carry out a focused project of material analysis and interpretation using the archaeology collections of the Cleveland Museum of Natural History. Each student is required to spend a minimum of two hours per week in the Archaeology laboratory for each credit hour taken. By the end of the course, the student will prepare a short report describing the results of their particular project. Recommended preparation: ANTH 107 and permission of department, and prior permission of Department of Archaeology at the Cleveland Museum of Natural History.

ANTH 381. Independent Study in Laboratory Archaeology II. 1 - 3 Unit.
This course provides an introduction to the basic methods and techniques of artifact curation and laboratory analysis in archaeology. Under the supervision of the instructor, each student will develop and carry out a focused project of material analysis and interpretation using the archaeology collections of the Cleveland Museum of Natural History. Each student is required to spend a minimum of two hours per week in the Archaeology laboratory for each credit hour taken. By the end of the course, the student will prepare a short report describing the results of their particular project. Recommended preparation: ANTH 107 and permission of department, and prior permission of Department of Archaeology at the Cleveland Museum of Natural History.

ANTH 382. Anthropological and Ecological Perspectives on Preserving and Restoring the Natural World. 3 Units.
Now that the environmentally deleterious effects of modern Western culture on the natural world have reached major proportions it has become crucial to explore innovative solutions to this dilemma. In this course novel perspectives derived from the intersection of anthropology and ecology are discussed. The primary perspective focused upon is the understanding that human culture and the natural world in which it is embedded are essentially communicative, or semiotic processes, which thrive upon diverse interaction and feedback. Preserving and restoring the Natural World thus shifts from protecting individual species and particular cultural practices to enhancing the communicative matrix of life and multiple cultural views of the environment. Through this understanding, students will learn to apply a more elegant, effective, and aesthetically pleasing perspective to the challenging environmental issues facing our contemporary world. An in-depth examination of the North American Prairie, along with a comparison of influences on the landscape by indigenous and modern Western Culture will serve as the particular region of focus. This course is an approved SAGES departmental seminar. Offered as ANTH 382 and ANTH 482.

ANTH 385. Applied Anthropology. 3 Units.
This class will provide students with an overview of how anthropologists put theories, methods, and findings to use in addressing social issues and problems. Applied projects presented will span a diverse range of topics and fields, including: healthcare and medicine, nutrition, international development, displacement of populations, education, as well projects from business and industry. Class discussion will address orientations of and advantages in applied approaches, as well the ethical questions such projects often encounter. Offered as ANTH 385 and ANTH 485.

ANTH 388. Globalization, Development and Underdevelopment: Anthropological Persp. 3 Units.
This course examines both theoretical and practical perspectives on globalization and economic development in the "Third World." From "Dependency," "Modernization," and "World System" theory to post-structuralist critiques of development discourse, the class seeks to provide a framework for understanding current debates on development and globalization. The "neoliberal monologue" that dominates the contemporary development enterprise is critically examined in the context of growing global inequality. Special consideration is given to the roles of international agencies such as the World Bank, International Monetary Fund, United Nations, and non-governmental organizations (NGOs) in the "development industry." The course also focuses on the contribution of anthropologists to development theory and practice with emphasis on the impact of development on the health of the poor and survival of indigenous cultures. Opportunities for professional anthropologists in the development field are reviewed. Offered as ANTH 388 and ANTH 488. Prereq: ANTH 102.

ANTH 391. Honors Tutorial. 3 Units.
Prereq: Acceptance into Honors Program.

ANTH 392. Honors Tutorial. 3 Units.
Prereq: Acceptance into Honors Program.

ANTH 393. Human Ecology: The Biology of Human Adaptability. 3 Units.
The place of human populations in the ecosystem. The importance of biological and behavioral responses of populations ranging from hunters and gatherers to contemporary and industrial societies. The effect of various natural and manmade stresses on man’s adaptation to the environment. Recommended preparation: ANTH 103. Offered as ANTH 393 and ANTH 493.

ANTH 394. Seminar in Evolutionary Biology. 3 Units.
This seminar investigates 20th-century evolutionary theory, especially the Modern Evolutionary synthesis and subsequent expansions of and challenges to that synthesis. The course encompasses the multidisciplinary nature of the science of evolution, demonstrating how disciplinary background influences practitioners’ conceptualizations of pattern and process. This course emphasizes practical writing and research skills, including formulation of testable theses, grant proposal techniques, and the implementation of original research using the facilities on campus and at the Cleveland Museum of Natural History. Offered as ANTH 394, BIOL 394, EEPS 394, HSTY 394, PHIL 394, ANTH 494, BIOL 494, EEPS 494, HSTY 494, and PHIL 494.
ANTH 396. Undergraduate Research in Evolutionary Biology. 3 Units.
Students propose and conduct guided research on an aspect of evolutionary biology. The research will be sponsored and supervised by a member of the CASE faculty or other qualified professional. A written report must be submitted to the Evolutionary Biology Steering Committee before credit is granted. Offered as ANTH 396, BIOL 396, EEPS 396, and PHIL 396. Prereq: ANTH 225 or equivalent.

ANTH 398. Anthropology SAGES Capstone. 3 Units.
Supervised original research on a topic in anthropology, culminating in a written report and a public presentation. The research project may be in the form of an independent research project, a literature review, or some other original project with anthropological significance. The project must be approved and supervised by faculty. Group research projects are acceptable, but a plan which clearly identifies the distinct and substantial role of each participant must be approved by the supervising faculty. Prereq: Major in Anthropology.

ANTH 398C. Child Policy Externship and Capstone. 3 Units.
Externships offered through CHST/ANTH/PSCL 398C give students an opportunity to work directly with professionals who design and implement policies that impact the lives of children and their families. Agencies involved are active in areas such as public health, including behavioral health, education, juvenile justice, childcare and/or child welfare. Students apply for the externships, and selected students are placed in local public or nonprofit agencies with a policy focus. Each student develops an individualized learning plan in consultation with the Childhood Studies Program faculty and the supervisor in the agency. Offered as CHST 398C, ANTH 398C, and PSCL 398C. Prereq: CHST 301.

ANTH 399. Independent Study. 1 - 6 Unit.
Students may propose topics for independent reading and research.

ANTH 401. Biological Aging in Humans. 3 Units.
Biological aging phenomena, evidence that various sociocultural and environmental influences may slow or accelerate the aging process, and theories explaining the evolution of the aging process. Recommended preparation: ANTH 103. Offered as ANTH 301 and ANTH 401.

ANTH 402. Darwinian Medicine. 3 Units.
Darwinian medicine deals with evolutionary aspects of modern human disease. It applies the concepts and methods of evolutionary biology to the question of why we are vulnerable to disease. Darwinian (or evolutionary) medicine proposes several general hypotheses about disease causation including disease as evolutionary legacy and design compromise, the result of a novel environment, a consequence of genetic adaptation, the result of infectious organisms’ evolutionary adaptations, and disease symptoms as manifestation of defense mechanisms. It proposes that evolutionary ideas can explain, help to prevent and perhaps help to treat some diseases. This course presents the basic logic of Darwinian medicine and evaluates hypotheses about specific diseases that illustrate each of the hypotheses about disease causation. Recommended preparation: ANTH 103. Offered as ANTH 302 and ANTH 402.

ANTH 404. Introduction to the Anthropology of Aging. 3 Units.
Reviews historical and methodological approaches to the study of aging. Examines theoretical assumptions about aging by comparing studies from Western and non-Western societies that illustrate the differential importance of culture in the experience of aging. Recommended preparation: ANTH 102. Offered as ANTH 304 and ANTH 404.

ANTH 406. The Anthropology of Childhood and the Family. 3 Units.
Child-rearing patterns and the family as an institution, using evidence from Western and non-Western cultures. Human universals and cultural variation, the experience of childhood and recent changes in the American family. Recommended preparation: ANTH 102. Offered as ANTH 306 and ANTH 406.

ANTH 410. Introduction to Linguistic Anthropology. 3 Units.
This is an introduction to the core concepts, theories and methodologies that form the study of language from an anthropological point of view. The course provides exposure to current issues in linguistic anthropological research and reviews some of the foundational topics of research past, highlighting the contributions of linguistics to anthropology and social science. Topics to be explored include: 1) an overview of the study of language (language structure and patterns, the effects of linguistic categories on thought and behavior, meaning and linguistic relativity, cross-language comparison, and non-verbal communication); 2) doing linguistic anthropology "on the ground" (an intro to the laboratory and field techniques of linguistic anthropology); 3) the study of language as function and social action (language and social structure speech acts and events, verbal art, language and emotion); and 4) the study of language/discourse and power (language in politics, medicine, and law). Offered as ANTH 310 and ANTH 410.

ANTH 413. The Anthropology of Adolescence. 3 Units.
This course investigates the anthropology of adolescence. What are the conditions under which adolescence has appeared around the world as a life stage? What are the roles of adolescence cross-culturally? What are the varieties of adolescent experience? Through classic and contemporary texts, the course will address these questions as well as special topics particularly important to adolescence such as globalization, mental health, and sexuality. Offered as ANTH 313 and ANTH 413.

ANTH 414. Cultures of the United States. 3 Units.
This course considers the rich ethnic diversity of the U.S. from the perspective of social/cultural anthropology. Conquest, immigration, problems of conflicts and accommodation, and the character of the diverse regional and ethnic cultures are considered as are forms of racism, discrimination, and their consequences. Groups of interest include various Latina/o and Native peoples, African-American groups, and specific ethnic groups of Pacific, Mediterranean, European, Asian, and Caribbean origin. Offered as ANTH 314, ETHS 314, and ANTH 414.

ANTH 417. Asian Medical Systems. 3 Units.
Examines the philosophical assumptions and therapies of the traditional and contemporary medical systems of India, Tibet, China, and Japan. Particular attention will be given to the folk, popular, and institutional sectors of medical practice as well as to the contemporary relationship between traditional medicine and Western medicine in each of these societies. Recommended preparation: ANTH 102. Offered as ANTH 317 and ANTH 417.
ANTH 418. Death and Dying. 3 Units.
Examines cultural context of death and dying. Topics include social and psychological consequences of changing patterns of mortality, attitudes towards the taking of life, preparation for death, mortuary rituals, grief and mourning, and nature of relationship between living and dead. Recommended preparation: ANTH 102. Offered as ANTH 318 or ANTH 418.

ANTH 423. AIDS: Epidemiology, Biology, and Culture. 3 Units.
This course will examine the biological and cultural impact of AIDS in different societies around the world. Topics include: the origin and evolution of the virus, the evolutionary implications of the epidemic, routes of transmission, a historical comparison of AIDS to other epidemics in human history, current worldwide prevalences of AIDS, and cultural responses to the epidemic. Special emphasis will be placed on the long-term biological and social consequences of the epidemic. Recommended preparation: ANTH 102 or ANTH 103 or ANTH 105. Offered as ANTH 323 and ANTH 423.

ANTH 426. Power, Illness, and Inequality: The Political Economy of Health. 3 Units.
This course explores the relationship between social inequality and the distribution of health and illness across class, race, gender, sexual orientation, and national boundaries. Class readings drawn from critical anthropological approaches to the study of health emphasize the fundamental importance of power relations and economic constraints in explaining patterns of disease. The course critically examines the nature of Western biomedicine and inequality in the delivery of health services. Special consideration is given to political economic analysis of health issues in the developing world such as AIDS, hunger, reproductive health, and primary health care provision. Recommended preparation: ANTH 102 or ANTH 215. Offered as ANTH 326 and ANTH 426.

ANTH 427. Ancient Cultures of the Ohio Region. 3 Units.
This course surveys the archaeology of Native American cultures in the Great Lakes region from ca. 10,000 B.C. to A.D. 1700. The geographic scope of this course is the upper Midwest, southern Ontario, and the St. Lawrence Valley with a focus on the Ohio region. Recommended preparation: ANTH 107. Offered as ANTH 327 and ANTH 427.

ANTH 435. Illegal Drugs and Society. 3 Units.
This course provides perspectives on illegal drug use informed by the social, political and economic dimensions of the issues. Framed by the history, epidemiology, and medical consequences of drug use, students will confront the complex challenges posed by addiction. Anthropological research conducted in the U.S. and cross-culturally will demonstrate, elaborate and juxtapose various clinical, public health, and law enforcement policies and perspectives. Topics examined will include: why exclusively using a bio-medical model of addiction is inadequate; how effective is the war on drugs; what prevention, intervention and treatment efforts work; and various ideological/moral perspectives on illegal drug use. Offered as ANTH 335 and ANTH 435.

ANTH 437. Comparative Medical Systems. 3 Units.
This course considers the world’s major medical systems. Foci include professional and folk medical systems of Asia and South Asia, North and South America, Europe and the Mediterranean, including the Christian and Islamic medical traditions. Attention is paid to medical origins and the relationship of popular to professional medicines. The examination of each medical tradition includes consideration of its psychological medicine and system of medical ethics. Recommended preparation: ANTH 215. Offered as ANTH 337 and ANTH 437.

ANTH 438. Maternal Health: Anthropological Perspectives on Reproductive Practices and Health Policy. 3 Units.
The reproductive process is shared by humans as biological beings. However, the experience of pregnancy and childbirth is also dependent on the cultural, social, political, historical, and political-economic setting. This course frames issues in reproductive health by looking at the complex issues associated with maternal health and mortality worldwide. After reviewing biomedical perspectives on reproductive processes this course will focus on childbirth and pregnancy as the process and ritual by which societies welcome new members. This course will review ethnomedical concepts; discuss the interaction between local, national, and global agendas shaping reproductive practices; and conclude with anthropological critiques of reproductive health initiatives. Offered as ANTH 338 and ANTH 438.

ANTH 439. Ethnographic and Qualitative Research Methods. 3 Units.
This is a course on applying ethnographic research methods in the social sciences. Ethnographic research seeks to understand and describe the experiences of research participants (i.e. subjects) through becoming involved in their daily lives. Findings from ethnography are generated through systematic observation within the natural context in which behavior occurs (i.e. fieldwork). Unlike methods that emphasize detachment, distance, and objectivity, ethnography involves developing knowledge by becoming an ad hoc member of the group(s) one is studying. The principal techniques of ethnography, "participant-observation" and "in-depth open ended interviewing," require actively engaging the research process. This class will explore ethnographic research techniques, as well as other qualitative research methods. In addition to addressing how such methods make claims about social phenomena, this class will also explore more practical topics such as: developing questions, entering the field, establishing rapport, taking and managing field notes, coding data, and data analysis. Lectures, readings, and class discussion will be complimented by assignments using techniques. Offered as ANTH 339 and ANTH 439.

ANTH 441. Cultural Area Studies in Anthropology. 3 Units.
Recommended preparation: ANTH 102. Offered as ANTH 341 and ANTH 441.

ANTH 442. The Challenge of Suffering: Meaning, Responses, and Potential for Growth. 3 Units.
The interdisciplinary course will address the multiple facets of suffering, including the meaning of suffering, potential for growth and transformation, policies and practices that influence suffering, and those factors that affect quality of life and quality of death. Concepts and theories will be drawn from the social sciences and humanities, as well as from the health disciplines. The influence of socio-political, cultural, and economic forces of suffering will be addressed. Graduate standing or permission of instructor is required. Offered as: ANTH 442 and MEDS 9440 and NURS 440.
ANTH 447. Cultural Ecology: An Epistemological Approach to Environmental Sustainability. 3 Units.
This course provides the understanding that the realm of human culture is where both the cause and cure of nearly all contemporary environmental sustainability challenges are found. This is because culture is the medium through which humans as living systems perceive, interpret, and act upon their environment. Through understanding principles that guide living systems and applying them to human/nature interaction in diverse cultures throughout the world, students develop an ecological epistemology, or way of knowing nature. This leads to more effective advocacy for environmental sustainability and an increasing depth in interaction with nature, particularly in the domains of aesthetics and the sacred. This course is an approved SAGES Departmental seminar. Offered as ANTH 347 and ANTH 447.

ANTH 449. Cultures of Latin America. 3 Units.
The aim of this course is to consider cultural diversity and social inequality in contemporary Latin America from an anthropological perspective. A variety of aspects related to ethnicity, religion, music, gender, social movements, cuisine, urban spaces, violence, and ecology are considered in addition to current economic and political issues. These topics will be analyzed in relation to Latin America’s complex historical and social formation and its identity representations. The course takes under consideration various case studies in which not just local communities but also perceptions of national institutions and practices will be analyzed from pluralistic approaches (provided by either Latin American and non-Latin American researchers) that combine fieldwork, interviews and life experiences with textual and media sources. Special attention will be paid to contemporary global issues affecting Latin America. Offered as ANTH 349 and ANTH 449.

ANTH 451. Topics in International Health. 3 Units.
Special topics of interest in International Health. Recommended preparation: ANTH 102 or ANTH 215. Offered as ANTH 351 and ANTH 451.

ANTH 452. Japanese Culture and Society. 3 Units.
Focuses on contemporary Japanese cultural and social institutions. Topics include child-rearing, personality, values, education, gender roles, the dual economy, and popular culture. Recommended preparation: ANTH 102. Offered as ANTH 352 and ANTH 452.

ANTH 453. Chinese Culture and Society. 3 Units.
Focuses on Chinese cultural and social institutions during the Maoist and post-Maoist eras. Topics include ideology, economics, politics, religion, family life, and popular culture. Recommended preparation: ANTH 102. Offered as ANTH 353 and ANTH 453.

ANTH 457. Native American Cultures. 3 Units.
Intensive examination of the cultures of selected Native American peoples, including historical, political, religious, social organizational, linguistic, and medical/psychiatric aspects of American Indian life. Not available for credit to students who have completed USSO 219. Recommended preparation: ANTH 102. Offered as ANTH 357 and ANTH 457.

ANTH 459. Introduction to International Health. 3 Units.
Critical health problems and needs in developing countries. Prevalence of infectious disease, malnutrition, chronic disease, injury control. Examines strategies for improvement of health in less developed countries. Recommended preparation: ANTH 102. Offered as ANTH 359 and ANTH 459.

ANTH 461. Urban Health. 3 Units.
This course provides an anthropological perspective on the most important health problems facing urban population around the world. Special attention will be given to an examination of disparities in health among urban residents based on poverty, race/ethnicity, gender, and nationality. Offered as ANTH 361 and ANTH 461.

ANTH 462. Contemporary Theory in Anthropology. 3 Units.
A critical examination of anthropological thought in England, France and the United States during the second half of the twentieth century. Emphasis will be on the way authors formulate questions that motivate anthropological discourse, on the way central concepts are formulated and applied and on the controversies and debates that result. Readings are drawn from influential texts by prominent contemporary anthropologists. Recommended preparation: ANTH 102. Offered as ANTH 362 and ANTH 462.

ANTH 465. Gender and Sex Differences: Cross-cultural Perspective. 3 Units.
Gender roles and sex differences throughout the life cycle considered from a cross-cultural perspective. Major approaches to explaining sex roles discussed in light of information from both Western and non-Western cultures. Offered as ANTH 365 and ANTH 465 and WGST 365.

ANTH 467. Topics in Evolutionary Biology. 3 Units.
The focus for this course on a special topic of interest in evolutionary biology will vary from one offering to the next. Examples of possible topics include theories of speciation, the evolution of language, the evolution of sex, evolution and biodiversity, molecular evolution. ANAT/ANTH/EEPS/PHIL/PHOL 467/BIOL 468 will require a longer, more sophisticated term paper, and additional class presentation. Offered as ANTH 367, BIOL 368, EEPS 367, PHIL 367, ANAT 467, ANTH 467, BIOL 468, EEPS 467, PHIL 467 and PHOL 467.

ANTH 469. The Anthropology of Nutrition. 3 Units.
Examines human nutrition and physical performance within the framework of human adaptability theory. The emphasis is on the measurement of energetic intake and expenditure in human populations; the assessment, health consequences, and bio-cultural correlates of malnutrition and obesity; and the uses of energetic data in assessing human population adaptation. Recommended preparation: ANTH 103. Offered as ANTH 369 and ANTH 469.

ANTH 470. Tutorial in Physical Anthropology. 3 Units.
Guided readings in physical anthropology. Recommended preparation: Graduate standing and consent of department.

ANTH 471. Culture, Behavior, and Person: Psychological Anthropology. 3 Units.
Cross-cultural perspectives on personality, human development, individual variability, cognition, deviant behavior, and the role of the individual in his/her society. Classic and contemporary anthropological writings on Western and non-Western societies. Recommended preparation: ANTH 102. Offered as ANTH 371 and ANTH 471.

ANTH 475. Human Evolution: The Fossil Evidence. 3 Units.
This course will survey the biological and behavioral changes that occurred in the hominid lineage during the past five million years. In addition to a thorough review of the fossil evidence for human evolution, students will develop the theoretical framework in evolutionary biology. Recommended preparation: ANTH 377, BIOL 225. Offered as ANTH 375, ANTH 375, ANAT 475 and ANTH 475. Prereq: ANTH 103.
ANTH 476. Topics in the Anthropology of Health and Medicine. 3 Units.
Special topics of interest, such as the biology of human adaptability; the ecology of the human life cycle health delivery systems; transcultural psychiatry; nutrition, health, and disease; paleoepidemiology; and population anthropology. Recommended preparation: ANTH 102 or ANTH 103. Offered as ANTH 376 and ANTH 476.

ANTH 477. Human Osteology. 4 Units.
This course for upper division undergraduates and graduate students will review the following topics: human skeletal development and identification; and forensic identification (skeletal aging, sex identification and population affiliation). Offered as ANAT 377, ANTH 377, ANAT 477 and ANTH 477.

ANTH 478. Reproductive Health: An Evolutionary Perspective. 3 Units.
This course provides students with an evolutionary perspective on the factors influencing human reproductive health, including reproductive biology, ecology, and various aspects of natural human fertility. Our focus will be on variation in human reproduction in mostly non-western populations. Recommended preparation for ANTH 378: ANTH 103. Offered as ANTH 378 and ANTH 478.

ANTH 479. Topics in Cultural and Social Anthropology. 3 Units.
Special topics of interest across the range of social and cultural anthropology. Recommended preparation: ANTH 102. Offered as ANTH 379 and ANTH 479.

ANTH 480. Medical Anthropology and Global Health I. 3 Units.
The first in a sequence of two graduate core courses in medical anthropology and global health. This course focuses on foundational concepts and theories in medical anthropology, as well as topical areas which have been central to the development of the field. Prereq: Graduate Standing in Anthropology.

ANTH 481. Medical Anthropology and Global Health II. 3 Units.
The second in a sequence of two graduate core courses in medical anthropology and global health. This course focuses on the application of medical anthropology theory and methods to the study of global health. Recommended preparation: ANTH 480. Prereq: Graduate Standing in Anthropology.

ANTH 482. Anthropological and Ecological Perspectives on Preserving and Restoring the Natural World. 3 Units.
Now that the environmentally deleterious effects of modern Western culture on the natural world have reached major proportions it has become crucial to explore innovative solutions to this dilemma. In this course novel perspectives derived from the intersection of anthropology and ecology are discussed. The primary perspective focused upon is the understanding that human culture and the natural world in which it is embedded are essentially communicative, or semiotic processes, which thrive upon diverse interaction and feedback. Preserving and restoring the Natural World thus shifts from protecting individual species and particular cultural practices to enhancing the communicative matrix of life and multiple cultural views of the environment. Through this understanding, students will learn to apply a more elegant, effective, and aesthetically pleasing perspective to the challenging environmental issues facing our contemporary world. An in-depth examination of the North American Prairie, along with a comparison of influences on the landscape by indigenous and modern Western Culture will serve as the particular region of focus. This course is an approved SAGES departmental seminar. Offered as ANTH 382 and ANTH 482.

ANTH 485. Applied Anthropology. 3 Units.
This class will provide students with an overview of how anthropologists put theories, methods, and findings to use in addressing social issues and problems. Applied projects presented will span a diverse range of topics and fields, including: healthcare and medicine, nutrition, international development, displacement of populations, education, as well projects from business and industry. Class discussion will address orientations of and advantages in applied approaches, as well the ethical questions such projects often encounter. Offered as ANTH 385 and ANTH 485.

ANTH 488. Globalization, Development and Underdevelopment: Anthropological Persp. 3 Units.
This course examines both theoretical and practical perspectives on globalization and economic development in the "Third World." From "Dependency," "Modernization," and "World System" theory to post-structuralist critiques of development discourse, the class seeks to provide a framework for understanding current debates on development and globalization. The "neoliberal monologue" that dominates the contemporary development enterprise is critically examined in the context of growing global inequality. Special consideration is given to the roles of international agencies such as the World Bank, International Monetary Fund, United Nations, and non-governmental organizations (NGOs) in the "development industry." The course also focuses on the contribution of anthropologists to development theory and practice with emphasis on the impact of development on the health of the poor and survival of indigenous cultures. Opportunities for professional anthropologists in the development field are reviewed. Offered as ANTH 388 and ANTH 488.

ANTH 493. Human Ecology: The Biology of Human Adaptability. 3 Units.
The place of human populations in the ecosystem. The importance of biological and behavioral responses of populations ranging from hunters and gatherers to contemporary and industrial societies. The effect of various natural and manmade stresses on man's adaptation to the environment. Recommended preparation: ANTH 103. Offered as ANTH 393 and ANTH 493.
ANTH 494. Seminar in Evolutionary Biology. 3 Units.
This seminar investigates 20th-century evolutionary theory, especially the Modern Evolutionary synthesis and subsequent expansions of and challenges to that synthesis. The course encompasses the multidisciplinary nature of the science of evolution, demonstrating how disciplinary background influences practitioners' conceptualizations of pattern and process. This course emphasizes practical writing and research skills, including formulation of testable theses, grant proposal techniques, and the implementation of original research using the facilities on campus and at the Cleveland Museum of Natural History. Offered as ANTH 394, BIOL 394, EEPS 394, HSTY 394, PHIL 394, ANTH 494, BIOL 494, EEPS 494, HSTY 494, and PHIL 494.

ANTH 495. Research Practicum in Medical Anthropology and Global Health. 3 Units.
This course prepares selected Anthropology graduate students for research in medical anthropology and global health in both local and global settings, with the goal of enhancing the research skills of students early in their graduate careers. Prereq: Graduate standing in Anthropology.

ANTH 496. Public Policy and Aging. 3 Units.
Overview of aging and the aged. Concepts in the study of public policy. Policies on aging and conditions that they address. The politics of policies on aging. Emergent trends and issues. Offered as ANTH 498, BETH 496, EPBI 408, GERO 496, HSTY 480, MPH 408, NURS 479, NURS 579, POSC 480, and SOCI 496.

ANTH 502. Research Practicum in Med Anthropology and Cross-cultural Gerontology. 3 Units.
Provides M.A. students with firsthand experience in applying anthropology to health and aging problems. Prereq: Graduate standing.

ANTH 503. Seminar in Social Cultural Anthropology. 3 Units.

ANTH 504. Anthropological Research Design. 3 Units.
Practical and theoretical issues in the selection of questions for health and aging research in societal settings. Illustration of frameworks and designs for research. Discussion of the problems of collection, analysis, and interpretation of data along with the nonscientific influences on the research process and the use of results. Prereq: Graduate standing in anthropology.

ANTH 506. Seminar in Comparative Health Systems. 3 Units.
Prereq: ANTH 480.

ANTH 507. Seminar in Controversial Issues in Anthropology. 3 Units.
The goals of this course are to provide students with opportunities to: (1) Familiarize themselves with the (alleged) facts of various controversial issues that have characterized the field of anthropology over the past 50 years; (2) enhance their skills in analyzing and assessing the nature and quality of the arguments and empirical data employed by parties to the controversies; (3) develop an appreciation of the role of historical and political contexts in shaping the emergence and evolution of the controversies; and (4) consider the ethics involved in the practice and public representation of anthropology. Prereq: ANTH 480 and ANTH 481.

ANTH 508. Seminar in Policy and Program Planning and Evaluation. 3 Units.
Prereq: ANTH 504.

(Credit as arranged.) Advanced studies in anthropology.

(Credit as arranged.) Advanced studies in anthropology.

ANTH 601. Independent Research. 1 - 18 Unit.
(Credit as arranged.)

ANTH 651. Thesis M.A.. 1 - 18 Unit.
(Assigned.)

ANTH 701. Dissertation Ph.D.. 1 - 18 Unit.
(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
Department of Art History and Art

The Department of Art History and Art (http://www.case.edu/artsci/arth/arth.html) offers opportunities to study art history, to participate in a broad range of studio offerings, to pursue state teacher licensure in art education, and to engage in pre-professional museum training. The Bachelor of Arts degree is granted in art history and in pre-architecture (second major only), and the Bachelor of Science degree in art education. The department offers graduate programs leading to the degrees of Master of Arts in art history, Master of Arts in art history and museum studies, and Master of Arts in art education, Doctor of Philosophy in art history, and Doctor of Philosophy in art history and museum studies. Qualified undergraduates majoring in art history or art education may participate in the Integrated Graduate Studies Program.

All art programs are considerably enhanced by close cooperation with cultural institutions located in University Circle, in particular the Cleveland Museum of Art, the Cleveland Institute of Art, and the Museum of Contemporary Art (MOCA).

Art History Program

Students majoring in art history have a wide variety of career opportunities. Graduates with a strong background in art history are employed as college and university professors; as museum professionals (in curatorial, educational, and administrative positions); as art librarians and archivists; as journalists; as art gallery or auction house staff members; as art conservators and restorers; as art specialists in the diplomatic service and at all levels of government; and in other careers in industry, film, and television. Some of these specialties require additional study and professional preparation beyond the bachelor’s degree. Other art history majors who have fulfilled the required prerequisites go on to attend law, medical, or business school.

The graduate programs in art history are offered as part of the joint program in art history of Case Western Reserve University and the Cleveland Museum of Art. Many classes, undergraduate and graduate level, are taught at the museum, and some courses are offered or co-taught by museum curators who hold adjunct appointments in the department. Students taking advanced-level courses use the museum’s extensive research library, and all students have an opportunity to study original works of art in the museum’s superb collections.

Art Education Program

The Art Education Program’s mission is “to prepare proactive, scholar-practitioner art educators who will develop into leaders, teachers, and talented artists in the field of art education.”

The undergraduate and graduate degree programs in art education are offered in conjunction with the Cleveland Institute of Art. Art education majors have the advantage of pursuing their academic studies in a university environment and their studio studies at a professional art school that educates artists and designers. Students participate in educational field experiences conducted in many of Greater Cleveland’s urban and suburban school systems, museums, and cultural institutions. Graduates of the Art Education Program have pursued careers as teachers, supervisors, and consultants in public and private schools, colleges, art schools, and museums; as administrators of galleries and art organizations; as designers of educational programs for industry; and as practicing artists. The program is especially proud of its record in recruiting and graduating students from diverse backgrounds.

The program offers pre-architecture as a second major and as a minor for students who expect to continue architectural studies at the graduate level or who simply wish to pursue an area of interest. For students seeking to develop and nurture their artistic and creative talents, the program offers a variety of introductory and intermediate art studio courses, taught by experienced artists/teachers.

Art Studio Program

The Art Studio Program offers a variety of art courses that can be taken for personal enjoyment to gain experience in a variety of art media. Courses in drawing, painting, design, ceramics, enameling and jewelry, textiles, photography, digital media, and architecture are taught at various skill levels by experienced, professional artists. These courses can be taken as university electives to fulfill minors in art studio, photography, or architecture, or to complete a second major in pre-architecture. At the end of each semester there is a comprehensive exhibition of student work in the Art Gallery.

BA Art History | BS Art Education | BA Pre-Architecture | Minors

Undergraduate Programs

The art history curriculum is designed to give students a broad grounding in painting, sculpture, architecture, and the decorative arts, with a strong emphasis on understanding the cultural context in which they were produced. Students develop a technical and critical vocabulary as well as sound writing skills to analyze works of art.

Integrated Graduate Studies Program. Qualified undergraduates majoring in art history or art education may also participate in the Integrated Graduate Studies Program (p. 549). Interested students should note the general requirements and the admission procedures in this bulletin and may consult the department for further information.

Majors

Bachelor of Arts in Art History

This major requires 36 hours of course work in art history, including:

- ARTH 101 Art History I: Pyramids to Pagodas 3
- ARTH 102 Art History II: Michelangelo to Maya Lin 3
- Art History 200-level courses 3-6
- ARTH 396 Majors Seminar 3
- Art History electives at the 300 level 15-18
- Art Studio courses 3-6

Foreign language study (French, German, or Italian) is highly recommended.

Departmental Honors. Majors who wish to earn the Bachelor of Arts degree with honors in art history must make written application to the department chair no later than the fall semester of their senior year. Departmental honors are awarded upon fulfillment of the following requirements: a grade point average of at least 3.5 in the major and an A in ARTH 399 Honors Thesis.

Bachelor of Science in Art Education

The Bachelor of Science in art education requires a total of 124 credits and is designed to educate professional teachers of art for the public and private schools who are also competent, creative artists. The program meets the requirements of the Ohio Board of Education to qualify its university-recommended students for Pre-K-12 Visual Art Specialist Licensure to teach art in the public schools of Ohio and more than 40 reciprocating states.

This program is conducted jointly by Case Western Reserve University and the Cleveland Institute of Art. Admission requires application to Case
Western Reserve and submission of an art portfolio to the Cleveland Institute of Art. Credentials must be acceptable to both institutions. Academic work is taken at Case Western Reserve, and the majority of art studio courses at the Cleveland Institute of Art, as follows:

**Retention and Advanced Standing (Undergraduate Level)**

The Bachelor of Science program in art education is designed to educate professional teachers of art. There are four decision points in the program, and for each of these decision points, there are three possible outcomes: unconditional admission; conditional admission with a prescribed remedial plan which when successfully completed will result in unconditional admission; or denial of admission. Denial of admission at any decision point means the student is no longer able to pursue an art education degree at Case Western Reserve.

**Decision Point 1: Application for Admission to the Program**

Official admission to the Art Education Program generally occurs at the end of the fall semester of the sophomore year after a student completes ARTS 295 Introduction to Art Education. Admission to the program requires:

1. being accepted to the university
2. being accepted as an art major through a portfolio review before matriculation
3. successful completion of ARTS 295 Introduction to Art Education, including evaluation of an initial Teaching ePortfolio
4. cumulative Case GPA of 2.5 or better
5. submission of a signed Statement of Assurance of Good Moral Character
6. a satisfactory interview with art education faculty, documented on the Teacher Licensure Admission Assessment Form

**Decision Point 2: Application for Advanced Standing**

The Application for Advanced Standing should be submitted by the junior year and the fall semester after Decision Point 1. The application requires:

1. a successful review of the updated Teaching ePortfolio
2. submission of a current DPR form documenting the following: a cumulative GPA of 2.5 or better, an art course GPA of 2.5 or better, and an education GPA of 3.0 or better
3. a passing score on the Candidate Disposition Assessment Inventory, completed by the art education faculty

**Decision Point 3: Application for Student Teaching**

The Application for Student Teaching should be completed by week 8 of the semester prior to student teaching. The application requires:

1. a successful review of the updated Teaching ePortfolio
2. submission of a current DPR form documenting the following: a cumulative GPA of 2.5 or better, an art course GPA of 2.5 or better, and an education GPA of 3.0 or better
3. a passing score on the Candidate Disposition Assessment Inventory, completed by the art education faculty
4. passing a TB test
5. presenting documentation of Hepatitis B vaccination
6. passing official Federal and State criminal background checks

**Decision Point 4: Application for Initial Licensure**

Application for Initial Licensure occurs after successful completion of all degree requirements. The application requires:

1. a successful review of the completed Teaching ePortfolio
2. submission of a current DPR form documenting the following: a cumulative GPA of 2.5 or better, an art course GPA of 2.5 or better, and an education GPA of 3.0 or better
3. a passing score on the Candidate Disposition Assessment Inventory, completed by the art education faculty
4. achievement of state-mandated scores on the two Praxis II national teacher exams
5. completion of the Case Student Teaching Final Assessment by the cooperating teacher and university supervisor with a grade of B or better
6. completion of the Case Teacher Licensure Exit Interview and Survey

After successfully completing all requirements at the four decision points, the student is recommended by the university’s director of teacher education for the Ohio Visual Art (Pre-K-12) License. Completion of the Bachelor of Science in art education does not ensure that the State of
Ohio’s Visual Art Teacher License will be awarded. Teacher licensure is also obtainable through the Art Education Graduate Program of Study. Additional information on this program is available in the office of the director of art education.

**Bachelor of Arts in Pre-Architecture**

The Pre-Architecture Program introduces the student to the forms, history, and functions of architecture as well as to the studio skills relevant to its practice. The program is designed to provide a background for undergraduate students who plan to continue architectural studies at the graduate level, as well as for those interested in the study of architecture as part of a liberal or technical education.

Pre-architecture may be chosen only as a second major. The double major is required so that the perspectives provided by this interdisciplinary program may be complemented by a concentrated disciplinary experience. For a student who completes a Bachelor of Science degree (BS, BSE, or BSN), pre-architecture may serve as the sole major for a BA degree.

To declare a pre-architecture major, students should have declared a first major and have sophomore or junior standing. Up to 6 credits in general education requirements and elective courses taken by students for their first major may be applied to their pre-architecture major.

The major consists of a minimum of 30 credit hours, 15 of which are in required courses and the remainder of which are approved elective courses. Detailed information about approved electives is available in the departmental office.

The required courses are:

- ARTH 101 Art History I: Pyramids to Pagodas 3
- ARTH 102 Art History II: Michelangelo to Maya Lin 3
- ARTS 106 Creative Drawing I 3
- ARTS 302 Architecture and City Design I 3
- ARTS 303 Architecture and City Design II 3
- Art history courses 6
- Two of the following: 6
  - ARTS 101 Design and Color I
  - ARTS 201 Design and Color II
  - ARTS 206 Creative Drawing II
  - ARTS 220 Photography Studio I
  - THTR 223 Introduction to Scenic Design
  - THTR 224 Introduction to Lighting Design
- One of the following: 3
  - MATH 125 Math and Calculus Applications for Life, Managerial, and Social Sci
  - MATH 126 Math and Calculus Applications for Life, Managerial, and Social Sci II
  - PHYS 115 Introductory Physics I
  - PHYS 116 Introductory Physics II
  - PHYS 121 General Physics I - Mechanics
  - PHYS 122 General Physics II - Electricity and Magnetism

*For students whose interests lie in aesthetics and the history of architecture, the required 3 hours may be in sociology, American studies, anthropology, history (specifically courses on the history of science and technology), civil engineering, or earth, environmental, and planetary sciences.

**Minors**

Four minors, each requiring 18 credit hours, are available: one in art history, and three through the Art Studio Program.

**Graduate Programs**

**Master of Arts in Art History**

The MA program in art history is designed to provide the student with a broad knowledge of the major art historical periods, the scholarly and bibliographical resources, and the methodologies of art history. It also offers an opportunity to investigate art historical problems in some depth. In addition to the regular graduate school application form, applicants to the graduate program in art history are required to submit GRE scores and copies of two research papers that they consider to represent their best work. The minimum GRE score for acceptance is equivalent to 500 on the former scoring system. Applicants for the MA should have a BA major or minor concentration in art history or a related humanities field and a minimum GPA of 3.5.

The master’s degree in art history is conducted exclusively under Plan B as described under the School of Graduate Studies (p. 662) in this bulletin. All other requirements of the MA program must be fulfilled:

- ARTH 495 Methodologies of Art History (3)
• Eight graduate courses on the 400 level or above, three of which must be seminars on the 500 level. These eight courses must include one course each from four of the following five areas: world art; ancient; medieval; Renaissance/Baroque; modern and American (24).
• ARTH 489 M.A. Qualifying Paper (3)
• A reading knowledge of one foreign language (normally French, German, or Italian)
• Successful performance on the MA comprehensive examination

Total: 30 hours

Master of Arts in Art History and Museum Studies

The MA program in art history and museum studies includes the same broad requirements and objectives of the MA program in art history, along with a year-long museum studies course and two supervised museum internships. In addition to the regular graduate school application form, applicants to the graduate program in art history are required to submit GRE scores and copies of two research papers that they consider to represent their best work. The minimum GRE score for acceptance is equivalent to 500 on the former scoring system. Applicants for the MA should have a BA major or minor concentration in art history or a related humanities field and a minimum GPA of 3.5.

The requirements include:

• Six graduate courses on the 400 level or above (18), three of which must be seminars on the 500 level (9). These six courses must include one course each from four of the following five areas: world art; ancient; medieval; Renaissance/Baroque; modern and American.
• A reading knowledge of one foreign language (normally French, German or Italian)
• Successful performance on the MA comprehensive examination

Total: 31 hours

Master of Arts in Art Education

The Master of Arts in Art Education is offered in two plans: Plan I for those who already hold teacher licenses and who desire advanced studio- and art-related studies; Plan II for those holding the Bachelor of Fine Arts or equivalent degree who desire multi-age teacher licensure as visual art specialists. Both programs are offered jointly by Case Western Reserve University and the Cleveland Institute of Art, and both require 36 semester hours.

The admission procedure includes an online application, three letters of recommendation, a college transcript, which are to be submitted to the Art Education office, and an interview with the program director in which students show a portfolio of artwork and discuss their program of study. For students pursuing Plan I, The Cleveland Institute of Art admission procedure requires a portfolio. Approval by both the University and the Cleveland Institute of Art is required for admission into Plan I. Information and application forms are available online through the Office of Graduate Admission at Case Western Reserve University.

Plan I

• 18 hours in studio to be taken at the Cleveland Institute of Art or Case Western Reserve University at the 300 level or above; and 18 hours in academic courses to be taken at Case Western Reserve University at the 400 level or above, to be selected in consultation with the director of art education; or
• 30 semester hours of course credit: 18 hours in studio to be taken at the Cleveland Institute of Art at the 300 level or above; and 12 hours in academic courses to be taken at Case Western Reserve University at the 400 level or above, to be selected in consultation with the director of art education; AND a thesis exhibition based on individual research (not less than 6 semester hours of registration).

Total Units: 36

The Master’s Plan II Program in Art Education is designed to educate professional teachers of art. There are four decision points in the Art Education Program. For each of the decision points, there are three possible outcomes: unconditional admission; conditional admission with a prescribed remedial plan which when successfully completed will result in unconditional admission; or denial of admission. Denial of admission at any decision point means the student is no longer able to pursue an art education degree at Case Western Reserve University.

Decision Point 1: Application for Admission to the Program

Application for admission to the program requires:
1. being accepted to the university
2. being accepted as an art major through an art portfolio review
3. submission of a signed Statement of Assurance of Good Moral Character
4. a satisfactory interview with art education faculty, documented on the Teacher Licensure Admission Assessment Form

Decision Point 2: Application for Advanced Standing

Application for advanced standing requires:
1. a successful review of the updated Teaching ePortfolio
2. submission of a current transcript documenting the following: a cumulative GPA of 3.0 or better, an art course GPA of 3.0 or better, and an education GPA of 3.0 or better
3. a passing score on the Candidate Disposition Assessment Inventory, completed by the art education faculty at the end of the first semester

Decision Point 3: Application for Student Teaching

Application for student teaching requires:
1. a successful review of the updated Teaching ePortfolio
2. submission of a current transcript documenting the following: a cumulative GPA of 3.0 or better, an art course GPA of 3.0 or better, and an education GPA of 3.0 or better
3. a passing score on the Candidate Disposition Assessment Inventory, completed by the art education faculty
4. passing a TB test
5. presenting documentation of Hepatitis B vaccination
6. passing official Federal and state criminal background checks

**Decision Point 4: Application for Initial Licensure**

Application for initial licensure occurs after successful completion of all degree requirements. The application requires:

1. a successful review of the updated Teaching ePortfolio
2. submission of a current final transcript documenting the following: a cumulative GPA of 3.0 or better, an art course GPA of 3.0 or better, and an education GPA of 3.0 or better
3. a passing score on the Candidate Disposition Assessment Inventory, completed by the art education faculty
4. achievement of state-mandated scores on the two Praxis II national teacher exams
5. completion of the Case Student Teaching Final Assessment by the cooperating teacher and university supervisor with a grade of B or better
6. completion of the Case Teacher Licensure Exit Interview and Survey

After successfully completing all requirements at the four decision points, the student is recommended by the university’s director of teacher education for the Ohio Provisional Art (Pre-K-12) License. Completion of the Master’s Plan II Program in Art Education degree does not ensure that the State of Ohio’s Provisional Visual Art Teacher License will be awarded.

**Doctor of Philosophy in Art History**

The doctoral program in art history is designed to allow advanced graduate students the opportunity to specialize in designated areas. Admission to the program requires an MA in art history or its equivalent, including a reading knowledge of one approved foreign language (normally French, German, or Italian). Admission to the program is made on the basis of academic record, experience, recommendations, and personal interviews. Applicants are required to submit GRE scores and two research papers written during their matriculation for a master's degree, or a thesis if completed by the time of application. Reading knowledge of one approved foreign language (normally French, German, or Italian) is also required for admission.

Students in the museum studies program are required to take a minimum of 48 hours of graduate study as follows:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARTH 490A</td>
<td>Visual Arts and Museums I</td>

<td></td>
</tr>
<tr>
<td>ARTH 610A</td>
<td>Advanced Visual Arts and Museums: Internship I</td>
<td>3</td>
</tr>
<tr>
<td>ARTH 610B</td>
<td>Advanced Visual Arts and Museums Internship II</td>
<td>3</td>
</tr>
<tr>
<td>ARTH 701</td>
<td>Dissertation Ph.D.</td>
<td>18</td>
</tr>
</tbody>
</table>

**Total Units**: 48

The requirement to take ARTH 490A and B will be waived for students who received the Master of Arts in art history and museum studies from Case Western Reserve University from 2011 onward. Students who have not taken ARTH 495 Methodologies of Art History or its equivalent should take this course as part of their preparation. During the two-semester internship, the student will be assigned to one or more departments in the Cleveland Museum of Art for supervised study and practice that will be evaluated by a member of the faculty in art history. The dissertation subject should be related to some aspect of art museum research; it may take the form of a special collection or exhibition catalogue, but it must satisfy the scholarly standards of the department and the university.

Doctoral students must demonstrate an ability to read two approved languages (other than English) useful in art historical research. German is normally required as one of the two languages for students concentrating in Western art. Both languages must be approved by the department at the time of admission or during the first semester of doctoral study. The general examination cannot be taken until the language requirement is fulfilled.

Doctoral students are required to pass a written and oral general examination before being advanced to candidacy. Within two weeks after the written examination, the faculty examining committee will administer the oral examination. A final evaluation will be based on the student’s performance in both the written and oral sections of the general examination.
student’s performance in both the written and oral sections of the general examination.

**Department Faculty**

Catherine B. Scallen, PhD  
(Princeton University)  
*Associate Professor and Chair*  
Northern Renaissance and Baroque art and historiography

ARTH Courses

ARTH 101. Art History I: Pyramids to Pagodas. 3 Units.
The first half of a two-semester survey of world art highlighting the major monuments of the ancient Mediterranean, medieval Europe, Mesoamerica, Africa, and Asia. Special emphasis on visual analysis, and socio-cultural contexts, and objects in the Cleveland Museum of Art.

ARTH 102. Art History II: Michelangelo to Maya Lin. 3 Units.
The second half of a two-semester survey of world art highlighting the major monuments of art made in Africa, the Americas, Asia, and Europe from 1400 to the present. Special emphasis on visual analysis, historical and sociocultural contexts, and objects in the Cleveland Museum of Art.

ARTH 203. The Arts of Asia. 3 Units.
A survey of Japanese and Chinese art from the Bronze Age to the 18th century, with particular emphasis on objects in the Cleveland Museum of Art. The relationship of art works to Buddhism and Hinduism is explored along with cultural rituals, ceremonies, and traditions.

ARTH 204. Arts of East Asia. 3 Units.
A survey of the major developments in the arts of East Asia from the bronze age to the present in a wide range of media, including sculpture, painting, ceramics, architecture, calligraphy, prints, and installations. The course explores factors behind the making of works of art, including social, political and religious meanings, while examining the historical contexts for the arts of China, Japan, and Korea. Attention will be paid to the relationship between art and the ideas and practices of Buddhism, Shinto, Daoism, and Confucianism. Our topics include: secular and sacred narrative scroll painting, ceramics and tea culture, landscape painting, Buddhist cave temples, ancient bronzes, mortuary art, expressions of resistance and reclusion in visual arts, cross-cultural exchanges within the region and with the West, and the role of East Asian artists in the contemporary international art market.

ARTH 220. Jewish Traditional Art and Architecture. 3 Units.
Tradition and transformation in Jewish artistic expression over time and across space. Course will begin with biblical period and continue down to the present day in Israel and America. Examination of how concepts such as “Jewish” and “art” undergo change within the Jewish community over this period. Offered as ARTH 220 and JDST 220.

ARTH 221. Building on Antiquity. 3 Units.
Beginning with Ancient Greece and Rome and ending in Cleveland, the course will provide orientation in the architectural orders and in most periods of European and Euro-American architectural history, as well as, to an extent, architectural criticism. The issue of how architecture has meaning will be central, not least in connection with the formalized “language” of classicism and the emergence of development of building types (temple, museum, civic hall, transportation buildings, etc.). We will also review more subtle ways in which architecture conveys meaning or mood, and the assignment of gendered associations to certain architectural elements. The course will consider more or less blatant political uses of architecture and architectural imagery, but also more elusive and/or ambiguous cases, as well as the phenomenon of the shifting meanings of architecture through changes of era, owner, audience, etc. Offered as ARTH 221 and CLSC 221.

ARTH 227. Ancient Cities and Sanctuaries. 3 Units.
A selection of cities and sanctuaries from the ancient Near East, Egypt, the Aegean, Greece, Etruria, and Rome; their political and religious institutions and the relationship to contemporary art forms. Offered as ARTH 227 and CLSC 227.

ARTH 228. Ancient Greek Athletics. 3 Units.
Exploration of the role of athletics in the ancient, primarily Greek world, and their reflection in the art of the period. Offered as ARTH 228 and CLSC 228.
ARTH 240. Architecture: Ancient to 1850. 3 Units.
Western traditions of architecture and urban design from antiquity to the early nineteenth century, with emphasis on pre-industrial cities and landscapes. Interactions between western theory and practice and certain non-western cultures, especially the Arab/Turkish world and China.

ARTH 241. Medieval Art. 3 Units.
This course will introduce students to the pivotal works of art created between approximately 250 and 1500. We will discuss painting, sculpture, architecture, manuscript illumination, and graphic arts. Medieval visual and material culture will be considered within the framework of socio-political developments, rapid urban growth, the flowering of monastic culture, the rise of universities, and changes in devotional practices. While the course will primarily focus on western part of the medieval Christendom, we will also discuss Jewish, Byzantine, and Islamic art. Visits to the CMA will form an integral part of the course.

ARTH 250. Art in the Age of Discovery. 3 Units.
A survey of developments in Renaissance art and architecture in northern Europe and Italy during a new age of science, discovery and exploration, 1400-1600.

ARTH 260. Art in Early Modern Europe. 3 Units.
A survey of European art in the seventeenth and eighteenth centuries, an era of rising nationalism, political aggrandizement, religious expansion and extravagant art patronage. The tensions between naturalism and idealization, court and city, public and private, church and secular patronage, grand commissions and an open air market, will provide themes of the course as we explore what characterized the arts of Austria, Belgium, England, France, Germany, Italy, The Netherlands, and Spain.

ARTH 270. American Art and Culture Before 1900. 3 Units.
Survey of the development of American art from colonial times to the present which explores how art has expressed both American values and American anxieties. Painting is emphasized, but the course also considers architecture, the decorative arts, film, literature, and music. Offered as AMST 270 and ARTH 270.

ARTH 271. American Art and Culture: The Twentieth Century. 3 Units.
Survey of the development of American art from 1900 to the present (and the future) which will explore how art has expressed both American values and American anxieties. Painting will be emphasized, but the course will also consider architecture, the decorative arts, film, literature, and music. Offered as AMST 271 and ARTH 271.

ARTH 280. Modern Art and Modern Science. 3 Units.
An examination of the development of painting, sculpture, and architecture from the 19th to the mid 20th century. Special attention is given to the emergence of "modernism" and the influence of science on such movements as Impressionism and Cubism.

ARTH 284. History of Photography. 3 Units.
A survey of the history of photography from its inception in 1839 to the present. Emphasis is on the complex relationship between technological innovations and picture-making; the artistic, documentary, and personal uses of photography; and the relationship of photography to other art forms.

ARTH 301. Museums and Globalization. 3 Units.
Museums are everywhere contested spaces today. Historically designed as symbols of power, centers for research, agents of public education and community formation in Western industrial societies, they have become sites of development and cultural controversy on a global scale. From Cleveland and Paris to Nairobi and Dubai museums figure in urban redevelopment, national identity formation, conflicts between religion and science, and global tourism. Questions we will consider in this course: what are the fundamental features of museums as institutions? what ties have linked them to wider national and international communities of academics, NGO’s and business? to political, economic and social concerns? how do museums in Asia, Africa the Middle East and Latin America figure in the current international contention over heritage rights? This is an innovative course allowing students to collaborate on projects, engage with guest lecturers and access museums across the globe. The course is organized in three parts: Part I: National Identity Building and Museums; Part II: Museums and Identity Politics; Part III: Museums and Global Development. Offered as HSTY 329, ARTH 301, HSTY 429, and ARTH 401.

ARTH 302. Buddhist Art in Asia. 3 Units.
This course explores the visual culture of Buddhism in Asia from its origins in India to its transmission and transformation in China, Korea, Japan, Tibet, Nepal, and Southeast Asia. Our historically and culturally structured examination will trace major developments in Buddhist art and their relationship with belief, practice, and ritual. We will consider the ways that artistic traditions have adapted and evolved both within individual cultures and cross-culturally. The study of sculpture, architecture, and painting in their religious contexts will be our primary focus, but we will also consider the movement of Buddhist art from temples to sites of secular display in museums around the world and the religious and cultural issues that arise from these moves. Topics include: representations of the life of the historical Buddha; visual programs of temples; artistic representations of paradies and hells; sacred sites and architecture; Imperial patronage of Buddhist art; the role of art in pilgrimage and ritual; and visual imagery associated with schools of Buddhism such as Pure Land, Chan, and Zen. Offered as ARTH 302 and ARTH 402.

ARTH 307. Arts of China. 3 Units.
A survey of the major developments in Chinese art from the Neolithic period to the present, including archaeological discoveries, bronzes, calligraphy, painting, sculpture, ceramics, architecture, performance art, and installations. Among topics covered are: ancient funerary art and tombs; painting and sculpture of early Buddhist grottoes; landscape painting; art commissioned and collected by the imperial court; literati painting and calligraphy; public and private art associated with Daoist; Buddhist, and Confucian religious practices and sites; art produced during periods of non-Chinese rule under the Tanguts, Mongols, and Manchus; foreign influences on Chinese artists; and the role of Chinese artists in the contemporary international art market. The course explores factors behind the creation and reception of works of art, including social, political and religious meanings, while examining the historical contexts for and artistic traditions of the visual culture of China. Recommended preparation: Students with some Asian studies, Chinese language, Chinese history, or other appropriate background. Offered as ARTH 307 and ARTH 407. Prereq: One 100- or 200-level ARTH course or requisites not met permission from instructor.
ARTH 308. Arts of Japan. 3 Units.
A survey of the major developments in Japanese art from prehistoric times to the present in a wide range of media, including sculpture, ceramics, architecture, calligraphy, painting, garden design, woodblock prints, film, and installations. Among topics covered are: Buddhist art, narrative handscrolls, ink painting and portraiture associated with Zen, ceramics for tea ceremony, Edo and Meiji period woodblock prints, and Western and Chinese influences on Japanese artists. Modern and contemporary artists and filmmakers such as Isamu Noguchi, Akira Kurosawa, Yayoi Kusama, Yasumasa Morimura, and Takashi Murakami are also investigated. The course explores factors behind the making of works of art, including social and religious meanings, while examining the historical contexts for and aesthetic principles of the arts of Japan. Prerequisites include one previous art history course at the 100- or 200-level or permission of instructor. Students with some Asian studies, Japanese language, Japanese history, or other appropriate background by be permitted to enroll at the discretion of the instructor. Offered as: ARTH 308 and ARTH 408. Prereq: One 100- or 200-level ARTH course or by permission of instructor.

ARTH 311. Rome: City and Image. 3 Units.
This course studies the architectural and urban history of Rome from the republican era of the ancient city up to the eighteenth century using the city itself as the major "text." The emphasis will be placed on the extraordinary transformations wrought in the city, or at least in key districts, by powerful rulers and/or elites, especially in the ancient empire and in the Renaissance and baroque eras. In a larger perspective, the great construction projects exerted a far-reaching effect within and beyond Europe, but we will study them in relation to their topographical situation, their functions, and their place in a long history of variations on prestigious themes since many of the artworks and the urban settings featured in the course carry the mark of the Long history of the city itself. Recommended preparation: At least one 200-level course in ANTH, ARTH, CLSC, ENGL, HSTY, or RLGN. Offered as ARTH311/411 and CLSC 311.

ARTH 332. Art and Archaeology of Ancient Italy. 3 Units.
The arts of the Italian peninsula from the 8th century B.C. to the 4th century A.D., with emphasis on recent archaeological discoveries. Lectures deal with architecture, sculpture, painting, and the decorative arts, supplemented by gallery tours at the Cleveland Museum of Art. Offered as ARTH 332, CLSC 332, and ARTH 432.

ARTH 333. Greek and Roman Painting. 3 Units.
Greek vase painting. Etruscan tomb painting and Roman wall painting. The development of monumental painting in antiquity. Offered as ARTH 333, CLSC 333, and ARTH 433.

ARTH 334. Art and Archaeology of Greece. 3 Units.
A survey of the art and architecture of Greece from the beginning of the Bronze Age (3000 B.C.) to the Roman conquest (100 B.C.) with emphasis on recent archaeological discoveries. Lectures deal with architecture, sculpture, painting, and the decorative arts, supplemented by gallery tours at the Cleveland Museum of Art. Offered as ARTH 334, CLSC 334, and ARTH 434.

ARTH 335. Issues in Ancient Art. 3 Units.
Various topics in Ancient art. Lectures, discussions and reports. Offered as ARTH 335 and ARTH 435.

ARTH 340. Issues in the Art of China. 3 Units.
This is a topics course. Each offering will focus on a specific topic within the area of Chinese art. Sample topics may include: Women painters in Beijing, Modern Artists in China-1980-Present, Shang Dynasty Tombs, Yuan Dynasty Buddhist Art. Lectures, discussions, and reports. Offered as ARTH 340 and ARTH 440.

ARTH 341. Issues in the Art of Japan. 3 Units.
This is a topics course. Each offering will focus on a specific topic within the area of Japanese art. Sample topics may include: Muromachi Hanging Scrolls, Ryoan-ji Temple Garden Architecture, Rimpa School Panel Screens, Buddhist Painting in the Edo Period. Lectures, discussions, and reports. Offered as ARTH 341 and ARTH 441.

ARTH 344. Issues in the Art of Africa. 3 Units.
This is a topics course. Each offering will focus on a specific topic within the area of African art. Sample topics may include: Ritual Masks, Sub-Saharan Religious Architecture, Carvings of Twins in Fertility Rites, Benin Bronze Warrior Reliefs. Lectures, discussions, and reports. Offered as ARTH 344 and ARTH 444.

ARTH 349. Gothic Art: Vision and Matter. 3 Units.
This course will examine the development and dissemination of Gothic art in Western Europe in the High and Late Middle Ages. We will consider a variety of media, including architecture, metalwork, sculpture, manuscript illumination, panel paintings, fresco cycles, and small devotional objects. As we study medieval art in its socio-historical contexts--private and public, monastic and political, liturgical and lay--we will pay special attention to issues of patronage, relationships between texts and images, the introduction of visionary and mystical devotion, attitudes towards education and authority, differences between male and female piety, modes of medieval viewing, and reception and manipulation of art by medieval audiences. Visits to the CMA will form an integral part of the course. Offered as ARTH 349 and ARTH 449.

ARTH 350. Issues in Medieval Art. 3 Units.
Various topics in Medieval Art. Lectures, discussions, and reports. Offered as ARTH 350 and ARTH 450.

ARTH 351. Late Gothic Art in Italy. 3 Units.
Sculpture of the Pisani; early trends in Pisa, Siena, and Florence; Cimabue and Giotto; Duccio, Simone Martini, and the Lorenzetti; painting in Florence and Siena after the Black Death. Offered as ARTH 351 and ARTH 451.

ARTH 352. Italian Art of the 15th Century. 3 Units.
The early 15th century in Florence, civic humanism, the sculpture of Ghiberti and Donatello, the painting of Masaccio; the International Style in painting, the art of Uccello, Piero della Francesca, Mantegna, and Botticelli; Carpaccio and the Bellini in Venice. Offered as ARTH 352 and ARTH 452.

ARTH 353. Sixteenth Century Italian Art. 3 Units.
The development of the High Renaissance and Mannerist styles in Italy and late 16th century trends: painting and sculpture. Offered as ARTH 353 and ARTH 453.
ARTH 358. Medieval Body. 3 Units.
This course will explore the meanings and representations of the body in western medieval culture. Topics will include bleeding bodies, fragmented bodies, lactating bodies, labile bodies, cosmic bodies, physiological bodies, mystical bodies, suffering bodies, edible bodies, enclosed bodies, gendered bodies, Christ's bodies, Mary's bodies, decomposing bodies, macabre bodies, resurrected bodies, dead bodies, intercessory bodies, unhinging bodies, translucent bodies, martyred bodies, desirable bodies, desirous bodies, abhorrent bodies, mimetic bodies, nude bodies, marginalized bodies, defleshed bodies, social bodies, political bodies, monstrous bodies, mnemonic bodies, and deformed bodies. We will explore the complex rhetoric of embodiment as it manifests itself in the ambiguous discourse—both medieval and contemporary—on the relationships between the material and intangible, spiritual and physical, somatic and mental, corporeal and ethereal. Offered as ARTH 358 and ARTH 458.

ARTH 359. Visual Culture of Medieval Women. 3 Units.
This course will explore works made by and for women—as well as images of women—in the Romanesque and Gothic periods. We will discuss female monastics who commissioned and produced art, and the roles of women as patrons and consumers. The course will explore different ways of seeing, reading, figuring, and interacting with images of the female body, frequently seen as a fraught site of desire and repulsion, fear and fascination. Primary sources will include works of Hildegard of Bingen, Christine of Pizan, and the Roman de la Rose among others. Students will be asked to read critical material that addresses different constructions of gender and sex in medieval images and secular as well as religious texts. The course, therefore, will not simply focus on artistic production, but will include readings and discussions of social and political history, theology, and literature of the Middle Ages. Offered as ARTH 359 and ARTH 459.

ARTH 360. Renaissance Art in Northern Europe. 3 Units.
Painting, sculpture, and the graphic arts in Belgium, France, Germany, and The Netherlands, 1400-1580, highlighting the careers and contributions of specific artists such as Jan van Eyck, Albrecht Durer, and Pieter Bruegel. We will also analyze the changing social, cultural, religious, and political circumstances of the art made during this period, which saw the invention of printmaking, the Protestant Revolution, and increased strife between rulers and their subjects. The rise of new subjects such as landscape and scene of everyday life will be explored, and changes in patronage will be discussed, concentrating on the shift from church and noble patronage to increasingly middle-class patronage related to the beginnings of the open art market. Offered as ARTH 360 and ARTH 450.

ARTH 361. 17th-Century Art in Belgium and The Netherlands. 3 Units.
The arts of painting, drawing, and printmaking in Belgium and The Netherlands are discussed in relationship to political, social, cultural, and religious contexts. We will explore the careers and production of individual artists such as Rubens, Van Dyck, Hals, Rembrandt, and Vermeer. Developments in new subjects, artistic specialization, and the expansion of the open market are seen as important factors in shaping Belgian and Dutch art. Offered as ARTH 361 and ARTH 461.

ARTH 362. Issues in Renaissance Art. 3 Units.
Various topics in Renaissance art. Lectures, discussions and reports. Offered as ARTH 362 and ARTH 462.

ARTH 367. 17th and 18th Century Art in France. 3 Units.
A Survey of the arts of painting, sculpture and architecture in France from 1600-1780, a period in which France became the leading political and cultural power in Europe. We will focus on the relationship between the arts and changing social, cultural, religious and political circumstances at a time that saw the rise of the absolute state before the French Revolution, the increased use of art for political propaganda, and the burgeoning of a consumer culture in the middle class. Offered as ARTH 367 and ARTH 467.

ARTH 374. Impressionism to Symbolism. 3 Units.
Major developments in European painting and sculpture during the latter half of the nineteenth century. Post-impressionism synthesis, symbolism, and the arts and crafts movement considered in their socio-cultural contexts. Works of Degas, Manet, Monet, Klimt, Bocklin, Gauguin, etc. Offered as ARTH 374 and ARTH 474.

ARTH 379. Issues in 19th Century Art. 3 Units.
Various topics in 19th century art, with class lectures, discussions and reports. Consult department for current topic. Offered as ARTH 379 and ARTH 479.

ARTH 380. Abstract Expressionism and Its Aftermath. 3 Units.
An examination of the development and influences of Abstract Expressionism, including the impact on the Beat Generation and Pop Art. Offered as ARTH 380 and ARTH 480.

ARTH 383. Gender Issues in Feminist Art: The 20th/21st Century. 3 Units.
An in-depth thematic approach to issues affecting works of art by and about women. Focus on the late 20th century. Emphasis on a specifically modern use of feminine myths, subjects and modes of production, and feminist criticism. Offered as ARTH 383, WGST 383 and ARTH 483.

ARTH 384. American Art and Architecture in the Age of Washington and Jefferson. 3 Units.
In the 18th century, Americans created not only a political revolution but an artistic and creative one as well. In the 17th century, most Americans were subsistence farmers and most of their products, manufactures, and buildings were relatively crude. In the 18th century, Americans not only established a new and lasting form of government, but for the first time produced paintings, buildings, furniture and silver that rivaled the finest productions of Europe. Notably, many of the leaders of the American Revolution, such as Paul Revere, George Washington, and Thomas Jefferson, also made significant contributions to the arts. Offered as ARTH 384 and ARTH 484.

ARTH 385. American Avant-Garde: 1900 - 1925. 3 Units.
An examination of the development of avant-garde styles in New York during the early twentieth century. In-depth discussion of the Photo-secession, Stieglitz's "291" gallery, the Armory Show, Marcel Duchamp's move to America, and the formation and demise of the New York Dada movement. Offered as ARTH 385 and ARTH 485.

ARTH 386. Issues in American Art. 3 Units.
Various topics in American art. Each offering will focus on a specific topic within American art. Lectures, discussions, and report. The course will entail regular oral classroom reports and short writing assignments as well as a final paper. Producing an intellectually significant final paper is the major goal of the class. Graduate students are expected to produce a final paper of greater length than Undergraduates and that shows evidence of original scholarship. Offered as ARTH 386 and ARTH 486.
ARTH 390. Introduction to the Art Object and its Explication. 3 Units.
A basic introduction to the museum and gallery worlds as institutions with a focus on the work of art, and on the institution's responsibility to the art object. Skills are to be developed in stylistic and conceptual analyses, problem solving, and critical thought. Emphasis will be placed on written and verbal expression to be developed to articulate visual works of art. The institutional function of the museum or gallery is studied as driven by the acquisition, care, and explication of the object as an entity, or in connection with others of like kind. That there is a building, a director, a Board of Trustees, curators, conservators, a Registrar, security officers, a maintenance crew, is all in response to the art object as one in a gathering of such, or collection. The course is intended as a pre-professional, experiential introduction to the functioning of the art museum with site visits and presentations by museum professionals. Prereq: ARTH 101, ARTH 102, and any 200-level ARTH course.

ARTH 392. Issues in 20th/21st Century Art. 3 Units.
Various topics in 20th/21st century art, with class lectures, discussions, and reports. Offered as ARTH 392 and ARTH 492.

ARTH 393. Contemporary Art: Critical Directions. 3 Units.
An examination of the directions taken by avant-garde American art and criticism in the aftermath of Abstract Expressionism. Includes the rise and fall of modernism in the 1960s and '70s, as well as an investigation of Post-modern trends and theories. Offered as ARTH 393 and ARTH 493.

ARTH 394. Departmental Seminar. 3 Units.
The Department of History of Art and Art departmental seminar. A topical course, emphasizing disciplinary writing and modes of investigation and analysis. It is recommended for Art History majors before the majors seminar/capstone course, typically taken in the junior or senior years. The course advances the goals of SAGES within the disciplinary context of art history by focusing on close readings of art history texts (with an emphasis upon methodological approaches), examination of original works of art when possible, analytical writing, and intensive seminar-style discussion. Prereq: ARTH 101 or ARTH 102 and at least one 200-level ARTH course.

ARTH 395. Internship. 3 Units.
This course is designated for students seeking professional experience in art history. It focuses on the museum experience (registration, exhibition, interpretation, and administration) although students may also elect to conduct internships in museum-related environments such as art conservation. Students are encouraged to have gained significant experience in art history coursework before embarking on an internship. Students must identify an internship and supervisor as well as a campus internship supervisor the semester before enrolling in the internship. Recommended preparation: ARTH 101, ARTH 102, or ARTH 104, and consent.

ARTH 396. Majors Seminar. 3 Units.
Capstone course required of all undergraduate Art History majors, typically taken in senior year. Requires professional-level research with peer and faculty oversight culminating in formal written and oral presentations. Limited to Art History majors.

ARTH 398. Independent Study in Art History. 1 - 3 Unit.
Individual research and reports on special topics.

ARTH 399. Honors Thesis. 3 Units.
Intensive study of a topic or problem leading to the preparation of an honors thesis.

ARTH 401. Museums and Globalization. 3 Units.
Museums are everywhere contested spaces today. Historically designed as symbols of power, centers for research, agents of public education and community formation in Western industrial societies, they have become sites of development and cultural controversy on a global scale. From Cleveland and Paris to Nairobi and Dubai museums figure in urban redevelopment, national identity formation, conflicts between religion and science, and global tourism. Questions we will consider in this course: what are the fundamental features of museums as institutions? what ties have linked them to wider national and international communities of academics, NGO's and business? to political, economic and social concerns? how do museums in Asia, Africa the Middle East and Latin America figure in the current international contention over heritage rights? This is an innovative course allowing students to collaborate on projects, engage with guest lecturers and access museums across the globe. The course is organized in three parts: Part I: National Identity Building and Museums; Part II: Museums and Identity Politics; Part III: Museums and Global Development. Offered as HSTY 329, ARTH 301, HSTY 429, and ARTH 401.

ARTH 402. Buddhist Art in Asia. 3 Units.
This course explores the visual culture of Buddhism in Asia from its origins in India to its transmission and transformation in China, Korea, Japan, Tibet, Nepal, and Southeast Asia. Our historically and culturally structured examination will trace major developments in Buddhist art and their relationship with belief, practice, and ritual. We will consider the ways that artistic traditions have adapted and evolved both within individual cultures and cross-culturally. The study of sculpture, architecture, and painting in their religious contexts will be our primary focus, but we will also consider the movement of Buddhist art from temples to sites of secular display in museums around the world and the religious and cultural issues that arise from these moves. Topics include: representations of the life of the historical Buddha; visual programs of temples; artistic representations of paradises and hells; sacred sites and architecture; Imperial patronage of Buddhist art; the role of art in pilgrimage and ritual; and visual imagery associated with schools of Buddhism such as Pure Land, Chan, and Zen. Offered as ARTH 302 and ARTH 402.

ARTH 407. Arts of China. 3 Units.
A survey of the major developments in Chinese art from the Neolithic period to the present, including archaeological discoveries, bronzes, calligraphy, painting, sculpture, ceramics, architecture, performance art, and installations. Among topics covered are: ancient funerary art and tombs; painting and sculpture of early Buddhist grottoes; landscape painting; art commissioned and collected by the imperial court; literati painting and calligraphy; public and private art associated with Daoist; Buddhist, and Confucian religious practices and sites; art produced during periods of non-Chinese rule under the Tanguts, Mongols, and Manchus; foreign influences on Chinese artists; and the role of Chinese artists in the contemporary international art market. The course explores factors behind the creation and reception of works of art, including social, political and religious meanings, while examining the historical contexts for and artistic traditions of the visual culture of China. Recommended preparation: Students with some Asian studies, Chinese language, Chinese history, or other appropriate background. Offered as ARTH 307 and ARTH 407.
ARTH 408. Arts of Japan. 3 Units.
A survey of the major developments in Japanese art from prehistoric times to the present in a wide range of media, including sculpture, ceramics, architecture, calligraphy, painting, garden design, woodblock prints, film, and installations. Among topics covered are: Buddhist art, narrative handscrolls, ink painting and portraiture associated with Zen, ceramics for tea ceremony, Edo and Meiji period woodblock prints, and Western and Chinese influences on Japanese artists. Modern and contemporary artists and filmmakers such as Isamu Noguchi, Akira Kurosawa, Yayoi Kusama, Yasumasa Morimura, and Takashi Murakami are also investigated. The course explores factors behind the making of works of art, including social and religious meanings, while examining the historical contexts for and aesthetic principles of the arts of Japan. Prerequisites include one previous art history course at the 100- or 200-level or permission of instructor. Students with some Asian studies, Japanese language, Japanese history, or other appropriate background by be permitted to enroll at the discretion of the instructor. Offered as: ARTH 308 and ARTH 408. Prerequisite: One 100- or 200-level ARTH course or by permission of instructor.

ARTH 411. Rome: City and Image. 3 Units.
This course studies the architectural and urban history of Rome from the republican era of the ancient city up to the eighteenth century using the city itself as the major "text." The emphasis will be placed on the extraordinary transformations wrought in the city, or at least in key districts, by powerful rulers and/or elites, especially in the ancient empire and in the Renaissance and baroque eras. In a larger perspective, the great construction projects exerted a far-reaching effect within and beyond Europe, but we will study them in relation to their topographical situation, their functions, and their place in a long history of variations on prestigious themes since many of the artworks and the urban settings featured in the course carry the mark of the Long history of the city itself. Recommended preparation: At least one 200-level course in ANTH, ARTH, CLSC, ENGL, HSTY, or RLGN. Offered as ARTH 311/411 and CLSC 311.

ARTH 432. Art and Archaeology of Ancient Italy. 3 Units.
The arts of the Italian peninsula from the 8th century B.C. to the 4th century A.D., with emphasis on recent archaeological discoveries. Lectures deal with architecture, sculpture, painting, and the decorative arts, supplemented by gallery tours at the Cleveland Museum of Art. Offered as ARTH 332, CLSC 332, and ARTH 432.

ARTH 433. Greek and Roman Painting. 3 Units.
Greek vase painting, Etruscan tomb painting and Roman wall painting. The development of monumental painting in antiquity. Offered as ARTH 333, CLSC 333, and ARTH 433.

ARTH 434. Art and Archaeology of Greece. 3 Units.
A survey of the art and architecture of Greece from the beginning of the Bronze Age (3000 B.C.) to the Roman conquest (100 B.C.) with emphasis on recent archaeological discoveries. Lectures deal with architecture, sculpture, painting, and the decorative arts, supplemented by gallery tours at the Cleveland Museum of Art. Offered as ARTH 334, CLSC 334, and ARTH 434.

ARTH 435. Issues in Ancient Art. 3 Units.
Various topics in Ancient art. Lectures, discussions and reports. Offered as ARTH 335 and ARTH 435.

ARTH 440. Issues in the Art of China. 3 Units.
This is a topics course. Each offering will focus on a specific topic within the area of Chinese art. Sample topics may include: Women painters in Beijing, Modern Artists in China-1980-Present, Shang Dynasty Tombs, Yuan Dynasty Buddhist Art. Lectures, discussions, and reports. Offered as ARTH 340 and ARTH 440.

ARTH 441. Issues in the Art of Japan. 3 Units.
This is a topics course. Each offering will focus on a specific topic within the area of Japanese art. Sample topics may include: Muromachi Hanging Scrolls, Ryoan-ji Temple Garden Architecture, Rimpa School Panel Screens, Buddhist Painting in the Edo Period. Lectures, discussions, and reports. Offered as ARTH 341 and ARTH 441.

ARTH 444. Issues in the Art of Africa. 3 Units.
This is a topics course. Each offering will focus on a specific topic within the area of African art. Sample topics may include: Ritual Masks, Sub-Saharan Religious Architecture, Carvings of Twins in Fertility Rites, Benin Bronze Warrior Reliefs. Lectures, discussions, and reports. Offered as ARTH 344 and ARTH 444.

ARTH 449. Gothic Art: Vision and Matter. 3 Units.
This course will examine the development and dissemination of Gothic art in Western Europe in the High and Late Middle Ages. We will consider a variety of media, including architecture, metalwork, sculpture, manuscript illumination, panel paintings, fresco cycles, and small devotional objects. As we study medieval art in its socio-historical contexts--private and public, monastic and political, liturgical and lay--we will pay special attention to issues of patronage, relationships between texts and images, the introduction of visionary and mystical devotion, attitudes towards education and authority, differences between male and female piety, modes of medieval viewing, and reception and manipulation of art by medieval audiences. Visits to the CMA will form an integral part of the course. Offered as ARTH 349 and ARTH 449.

ARTH 450. Issues in Medieval Art. 3 Units.
Various topics in Medieval Art. Lectures, discussions, and reports. Offered as ARTH 350 and ARTH 450.

ARTH 451. Late Gothic Art in Italy. 3 Units.
Sculpture of the Pisani; early trends in Pisa, Siena, and Florence; Cimabue and Giotto; Duccio, Simone Martini, and the Lorenzetti; painting in Florence and Siena after the Black Death. Offered as ARTH 351 and ARTH 451.

ARTH 452. Italian Art of the 15th Century. 3 Units.
The early 15th century in Florence, civic humanism, the sculpture of Ghiberti and Donatello, the painting of Masaccio; the International Style in painting, the art of Uccello, Piero della Francesca, Mantegna, and Botticelli; Carpaccio and the Bellini in Venice. Offered as ARTH 352 and ARTH 452.

ARTH 453. Sixteenth Century Italian Art. 3 Units.
The development of the High Renaissance and Mannerist styles in Italy and late 16th century trends: painting and sculpture. Offered as ARTH 353 and ARTH 453.
ARTH 458. Medieval Body. 3 Units.
This course will explore the meanings and representations of the body in western medieval culture. Topics will include bleeding bodies, fragmented bodies, lactating bodies, labile bodies, cosmic bodies, physiological bodies, mystical bodies, suffering bodies, edible bodies, enclosed bodies, gendered bodies, Christ's bodies, Mary's bodies, decomposing bodies, macabre bodies, resurrected bodies, dead bodies, intercessory bodies, unhinging bodies, translucent bodies, martyred bodies, desirable bodies, desirous bodies, abhorrent bodies, mimetic bodies, nude bodies, marginalized bodies, defleshed bodies, social bodies, political bodies, monstrous bodies, mnemonic bodies, and deformed bodies. We will explore the complex rhetoric of embodiment as it manifests itself in the ambiguous discourse—both medieval and contemporary—on the relationships between the material and intangible, spiritual and physical, somatic and mental, corporeal and ethereal. Offered as ARTH 358 and ARTH 458.

ARTH 459. Visual Culture of Medieval Women. 3 Units.
This course will explore works made by and for women—as well as images of women—in the Romanesque and Gothic periods. We will discuss female monastics who commissioned and produced art, and consider the roles of women as patrons and consumers. The course will explore different ways of seeing, reading, figuring, and interacting with images of the female body, frequently seen as a fraught site of desire and repulsion, fear and fascination. Primary sources will include works of Hildegard of Bingen, Christine of Pizan, and the Roman de la Rose among others. Students will be asked to read critical material that addresses different constructions of gender and sex in medieval images and secular as well as religious texts. The course, therefore, will not simply focus on artistic production, but will include readings and discussions of social and political history, theology, and literature of the Middle Ages. Offered as ARTH 359 and ARTH 459.

ARTH 460. Renaissance Art in Northern Europe. 3 Units.
Painting, sculpture, and the graphic arts in Belgium, France, Germany, and The Netherlands, 1400-1580, highlighting the careers and contributions of specific artists such as Jan van Eyck, Albrecht Durer, and Pieter Bruegel. We will also analyze the changing social, cultural, religious, and political circumstances of the art made during this period, which saw the invention of printmaking, the Protestant Revolution, and increased strife between rulers and their subjects. The rise of new subjects such as landscape and scene of everyday life will be explored, and changes in patronage will be discussed, concentrating on the shift from church and noble patronage to increasingly middle-class patronage related to the beginnings of the open art market. Offered as ARTH 360 and ARTH 460.

ARTH 461. 17th-Century Art in Belgium and The Netherlands. 3 Units.
The arts of painting, drawing, and printmaking in Belgium and The Netherlands are discussed in relationship to political, social, cultural, and religious contexts. We will explore the careers and production of individual artists such as Rubens, Van Dyck, Hals, Rembrandt, and Vermeer. Developments in new subjects, artistic specialization, and the expansion of the open market are seen as important factors in shaping Belgian and Dutch art. Offered as ARTH 361 and ARTH 461.

ARTH 462. Issues in Renaissance Art. 3 Units.
Various topics in Renaissance art. Lectures, discussions and reports. Offered as ARTH 362 and ARTH 462.

ARTH 467. 17th and 18th Century Art in France. 3 Units.
A Survey of the arts of painting, sculpture and architecture in France from 1600-1780, a period in which France became the leading political and cultural power in Europe. We will focus on the relationship between the arts and social change, cultural, religious and political circumstances at a time that saw the rise of the absolute state before the French Revolution, the increased use of art for political propaganda, and the burgeoning of a consumer culture in the middle class. Offered as ARTH 367 and ARTH 467.

ARTH 474. Impressionism to Symbolism. 3 Units.
Major developments in European painting and sculpture during the latter half of the nineteenth century. Post-impressionism synthethism, symbolism, and the arts and crafts movement considered in their socio-cultural contexts. Works of Degas, Manet, Monet, Klimt, Bocklin, Gauguin, etc. Offered as ARTH 374 and ARTH 474.

ARTH 479. Issues in 19th Century Art. 3 Units.
Various topics in 19th century art, with class lectures, discussions and reports. Consult department for current topic. Offered as ARTH 379 and ARTH 479.

ARTH 480. Abstract Expressionism and Its Aftermath. 3 Units.
An examination of the development and influences of Abstract Expressionism, including the impact on the Beat Generation and Pop Art. Offered as ARTH 380 and ARTH 480.

ARTH 483. Gender Issues in Feminist Art: The 20th/21st Century. 3 Units.
An in-depth thematic approach to issues affecting works of art by and about women. Focus on the late 20th century. Emphasis on a specifically modern use of feminine myths, subjects and modes of production, and feminist criticism. Offered as ARTH 383, WGST 383 and ARTH 483.

ARTH 484. American Art and Architecture in the Age of Washington and Jefferson. 3 Units.
In the 18th century, Americans created not only a political revolution but an artistic and creative one as well. In the 17th century, most Americans were subsistence farmers and most of their products, manufactures, and buildings were relatively crude. In the 18th century, Americans not only established a new and lasting form of government, but for the first time produced paintings, buildings, furniture and silver that rivaled the finest productions of Europe. Notably, many of the leaders of the American Revolution, such as Paul Revere, George Washington, and Thomas Jefferson, also made significant contributions to the arts. Offered as ARTH 384 and ARTH 484.

ARTH 485. American Avant-Garde: 1900 - 1925. 3 Units.
An examination of the development of avant-garde styles in New York during the early twentieth century. In-depth discussion of the Photo-secession, Stieglitz’s “291” gallery, the Armory Show, Marcel Duchamp’s move to America, and the formation and demise of the New York Dada movement. Offered as ARTH 385 and ARTH 485.

ARTH 486. Issues in American Art. 3 Units.
Various topics in American art. Each offering will focus on a specific topic within American art. Lectures, discussions, and report. The course will entail regular oral classroom reports and short writing assignments as well as a final paper. Producing an intellectually significant final paper is the major goal of the class. Graduate students are expected to produce a final paper of greater length than Undergraduates and that shows evidence of original scholarship. Offered as ARTH 386 and ARTH 486.
ARTH 489. M.A. Qualifying Paper. 3 Units.
Individual research and intensive study of a specific topic in art history that culminates in a written M.A. Qualifying Paper. Prereq: To be taken only after completion of 18 credit hours of graduate Art History coursework.

ARTH 490A. Visual Arts and Museums I. 3 Units.
This course examines the idea of the art museum in both its historical and contemporary manifestations, focusing on the context of Western Europe and the United States. As a result of this course, students should be familiar with the following topics: the historic development of the museum, from its origins in collecting practices to its modern incarnation as an institution; the development and care of a collection, including acquisition, cataloguing, and conservation; the display and housing of a collection, including internal and external museum architecture; the study and interpretation of the collection/exhibition, considering diverse publics; the governance of the institution, including project management, finance, and administration. Through the study of these topics, the student should be familiar with the following concepts: the museum as a place for learning, research and scholarship and the museum as steward of cultural property and the attendant issues of ethics and the law. ARTH 490A concentrates on museum collections and related aspects of care, research, interpretation and scholarship. Students who successfully complete ARTH 490A and ARTH 490B may be considered for admission into ARTH 491A, a supervised internship in an art museum or gallery situation.

ARTH 490B. Visual Arts and Museums: II. 3 Units.
This course examines the idea of the art museum in both its historical and contemporary manifestations, focusing on the context of Western Europe and the United States. As a result of this course, students should be familiar with the following topics: the historic development of the museum, from its origins in collecting practices to its modern incarnation as an institution; the development and care of a collection, including acquisition, cataloguing, and conservation; the display and housing of a collection, including internal and external museum architecture; the study and interpretation of the collection/exhibition, considering diverse publics; the governance of the institution, including project management, finance, and administration. Through the study of these topics, the student should be familiar with the following concepts: the museum as a place for learning, research and scholarship and the museum as steward of cultural property and the attendant issues of ethics and the law. ARTH 490B concentrates on the museum as an institution, including physical aspects, management and governance, and as a site of learning. The interconnections between these broad fields and individual departments will be demonstrated and reinforced throughout the semester. Students who successfully complete ARTH 490A and ARTH 490B may be considered for admission into ARTH 491A, a supervised internship in an art museum or gallery situation.

ARTH 491A. Visual Arts and Museums: Internship. 1 Unit.
Recommended preparation: ARTH 490.

ARTH 491B. Visual Arts and Museums: Internship. 3 Units.
Second semester of Internship sequence. This internship focuses on the implementation of a comprehensive project that would serve a function similar to the requirement of a qualifying paper for the completion of a master’s degree in art history. It is recommended that students undertake this internship in the same division in which their first internship was situated although students may find opportunities to parlay the skills acquired in the first internship to successful advanced work in another division. The key distinction here is that the work in ARTH 491B should build upon the expertise developed in ARTH 491 and represent a significant advance in responsibilities and skills. By week 10 of ARTH 491, students should begin to identify a potential project for ARTH 491B. By the first week of the semester in which ARTH 491B is to be completed, the student must file an internship agreement form with the department that includes a brief description of the project to be completed, including a summary of the project and major milestones/time line. In addition to working under the direct supervision of a museum mentor, the student must obtain a faculty mentor for the project and this information should be included in the internship agreement form. Students must file a mid-term and final report describing their duties and responsibilities and a self-assessment of their performance and a final portfolio with a final version of their project as well as examples of drafts and feedback received in the course of completing the project. Students must also keep a journal that tracks their milestones in completing their projects. The faculty supervisor will solicit a letter of assessment from the internship supervisor immediately upon the close of the internship and in sufficient time for final grades. Recommended preparation: ARTH 490, ARTH 491A.

ARTH 492. Issues in 20th/21st Century Art. 3 Units.
Various topics in 20th/21st century art, with class lectures, discussions, and reports. Offered as ARTH 392 and ARTH 492.

ARTH 493. Contemporary Art: Critical Directions. 3 Units.
An examination of the directions taken by avant-garde American art and criticism in the aftermath of Abstract Expressionism. Includes the rise and fall of modernism in the 1960s and ’70s, as well as an investigation of Post-modern trends and theories. Offered as ARTH 393 and ARTH 493.

ARTH 494A. Directed Readings in Non-Western Art. 1 - 3 Unit.
Directed reading.

ARTH 494B. Ancient Art. 1 - 3 Unit.

ARTH 494C. Medieval Art. 1 - 3 Unit.

ARTH 494D. Renaissance and Baroque Art. 1 - 3 Unit.

ARTH 494E. American Art. 1 - 3 Unit.

ARTH 494F. Modern Art. 1 - 3 Unit.

ARTH 495. Methodologies of Art History. 3 Units.
The study of art history as a discipline in its practical and theoretical aspects. Consideration given to research methods, style and historical context, and a critical examination of selected major art historical texts with a view to understanding traditional as well as recent approaches. Special attention is given to art historical writing, employing selected original works in the Cleveland Museum of Art. Required of first-year graduate students in the Ph.D. and Master’s programs.

ARTH 512. Seminar in Ancient Art. 3 Units.
ARTH 518B. Seminar in Asian Art. 3 Units.

ARTH 545B. Seminar in Medieval Art. 3 Units.

ARTH 551. Seminar in Renaissance Art. 3 Units.

ARTH 552. Seminar in Baroque Art. 3 Units.

ARTH 565. Seminar in American Art. 3 Units.

ARTH 570. Seminar: 19th Century Art. 3 Units.

ARTH 575. Critical Theory Seminar. 3 Units.
In-depth study of controversial revisionist writings which demonstrate the strong impact of structuralist, poststructuralist, semiotic, Marxist, psychoanalytic, film, and gender theories on recent art historical discourse. Discussion of a wide range of current theoretical positions applied to visual and critical analysis of 19th and 20th century art works. Recommended preparation: ARTH 495.

ARTH 576. Seminar in Modern Art. 3 Units.

ARTH 590. History and Practice of Connoisseurship. 3 Units.
In this seminar we will consider the history, historiography, and practice of connoisseurship. In western cultures connoisseurship, the practice of attributing works of art to specific artists, regions, and time periods and assessing their quality, can be traced back to classical antiquity. It was practiced with renewed vigor in Europe from the sixteenth century onward and in the nineteenth century was a foundational methodology for the academic discipline of art history. While it came under criticism in the twentieth century as a method too closely aligned with the art market, connoisseurship continues to be practiced today, especially in museums and auction houses, as a vital and necessary methodological approach. In recent decades art historians have also begun to reevaluate the history, practices and historiographic importance of this methodology. Class discussions of the scholarly literature of connoisseurship and case studies of its practice will alternate with sessions held in the Cleveland Museum of Art to examine objects from the permanent collections. The museum sessions, led by curators and conservators, will also emphasize the role that physical condition plays in making connoisseurship assessments. Specific topics will be designated each time the course is offered. Prereq: ARTH 495.

ARTH 601. Research in Art History. 1 - 18 Unit.
(Credit as arranged.)

ARTH 610A. Advanced Visual Arts and Museums: Internship I. 3 Units.
First semester of the internship sequence. The intern will work under the supervision of a museum professional to plan and execute a specific project. The student must also obtain a faculty mentor for the project. An internship agreement form must be filed with the department by the end of the first week of classes that includes a brief description of the project. If it is a project to be completed in one semester, a time line should be included as well. The intern must file a mid-term and final report describing their duties and responsibilities and a self-assessment of their performance. A portfolio kept in the department will include the final version of their project as it stands at the end of the semester, as well as examples of drafts and any evaluation received in the course of completing the project. The intern must also keep a journal that tracks their milestones in the execution of their project. The faculty supervisor will solicit a letter of assessment from the museum supervisor immediately upon the close of the internship and in sufficient time to assign a final grade. Prereq: ARTH 490A and ARTH 490B.

ARTH 610B. Advanced Visual Arts and Museums Internship II. 3 Units.
Second semester of the internship sequence. The intern will either continue with the execution of the project begun in the first semester (ARTH 610A) or, when appropriate, undertake a new project. The intern will work under the supervision of a museum professional, and must obtain a faculty mentor for the project. An internship agreement form must be filed with the department by the end of the first week of classes that includes a brief description of the project. A time line should be included as well. The intern must file a mid-term and final report describing their duties and responsibilities and a self-assessment of their performance. A portfolio kept in the department will include the final version of their project as it stands at the end of the semester, as well as examples of drafts and any evaluation received in the course of completing the project. The intern must also keep a journal that tracks their milestones in the execution of their project. The faculty supervisor will solicit a letter of assessment from the museum supervisor immediately upon the close of the internship and in sufficient time to assign a final grade. Prereq: ARTH 490A and 490B and ARTH 610A.

ARTH 701. Dissertation Ph.D.. 1 - 18 Unit.
(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

ARTS Courses

ARTS 101. Design and Color I. 3 Units.
Organizational and structural projects as a basis for the development of style. Studies in line, texture, shape, space, value, color, and two dimensional composition through studio problems, art studio media and techniques.

ARTS 106. Creative Drawing I. 3 Units.
Development of graphic fluency in black and white through direct observation of nature and the model. Drawing as a means of enlarging visual sensitivity using a wide range of media and subject matter. Work from nude model.

ARTS 201. Design and Color II. 3 Units.
ARTS 204. Printmaking. 3 Units.
Printmaking is an introductory studio class of basic fine art printmaking processes. Students will learn how to make original printed images from a wide variety of matrix printing surfaces, including linoleum, copper metal plate, plastic and cardboard. Intaglio and relief processes will be learned. Prereqs: ARTS 101 or ARTS 106.

ARTS 206. Creative Drawing II. 3 Units.
Continuation of ARTS 205. Advanced work in graphic representation. Development of visual acuity and a personal drawing style while working in color. Work from nude model. Prereq: ARTS 106.

ARTS 210. Enameling and Jewelry I. 3 Units.
Techniques in the application of vitreous enamel on copper and of constructed metal jewelry. Technical skill and suitability of design as applied to the medium.

ARTS 212. Weaving, Fibers, and Textiles I. 3 Units.

ARTS 214. Ceramics I. 3 Units.
The techniques of hand building in pinch, coil and slab methods. Development of sensitivity to design and form. Basic work in stoneware, earthenware, and glazing.

ARTS 216. Painting I. 3 Units.
The creative, conceptual, visual, and technical aspects of painting. Style ranging from naturalism to abstraction. Work in acrylic and mixed media.

ARTS 220. Photography Studio I. 3 Units.
Camera, film, and darkroom techniques. Development of basic black and white perceptual and photographic skills. Darkroom and photographic field and lab work. 35mm camera required.

ARTS 295. Introduction to Art Education. 3 Units.
General history and theories of art education. Development of personal philosophy as basis for teaching art. Topics in professional standards, creativity, aesthetic theory, and art criticism. (Clinical/field experience required.)

ARTS 300. Current Issues in Art Education. 3 Units.
Contemporary issues in Art Education; understanding art goals and standards of National Art Education Association and the Ohio State Department of Education for teachers, students and administrators. Special topics: art and technology, multiculturalism, special populations and classroom management. Offered as ARTS 300 and ARTS 400. Prereq: ARTS 295.

ARTS 302. Architecture and City Design I. 3 Units.
The social, spatial, and aesthetic elements in architecture; the components of the building: the window, door, roof, enclosing walls, and character of interior and exterior space. Projects related to small, intimate scale and residential structures. Lectures, field trips, studio experiences. Recommended ARTS 101 or ARTS 106 courses prior to enrollment. Offered as ARTS 302 or ARTS 402.

ARTS 303. Architecture and City Design II. 3 Units.
The social, spatial, and aesthetic elements of the urban setting of architecture, the organizational components of the city, the path, the node, the edge, and the grid. Projects related to large-scale and public buildings and their relationship to the encompassing visual world. Lectures, field trips, studio experiences. Recommended ARTS 101 or ARTS 106 courses prior to enrollment. Offered as ARTS 303 or ARTS 403.

ARTS 304. Architecture and City Design III. 3 Units.
A study of historic precedents and the social implications of modern and contemporary architecture including analysis and form interpretation as it relates to building and materials technologies. Practical application and synthesis of architectural knowledge through site visits and research of local and regional architecture. Discussions of historic and contemporary architects, engineers and significant architecture and engineering firms. Prereq: ARTS 302 and ARTS 303.

ARTS 310. Enameling and Jewelry II. 3 Units.

ARTS 312. Weaving, Fibers, and Textiles II. 3 Units.
Continuation of ARTS 212. Exploration of a selected area of textiles in surface design or constructed textiles. Development of a personal aesthetic through design and execution of a series of projects. Prereq: ARTS 212.

ARTS 314. Ceramics II. 3 Units.

ARTS 316. Painting II. 3 Units.
The creative, conceptual, visual and technical aspects of painting. Styles ranging from expressionism, cubism, surrealism and abstraction. Work in acrylic and mixed media leading to the development of personal painting style. Prereq: ARTS 216.

ARTS 320. Photography Studio II. 3 Units.
Continuation of ARTS 220. Advanced theory and black and white techniques. Development of personal aesthetic encouraged. Field work. 35mm camera required. Prereq: ARTS 220.

ARTS 322. Digital Photography I. 3 Units.

ARTS 325. Creative Photography. 3 Units.
Creative photography through photographing and responding to photographs. The question of self-expression and photographic medium explored in the pursuit of understanding images. Prereq: ARTS 220 and ARTS 320 or ARTS 322.
ARTS 350. Multimedia I. 3 Units.
Fundamental concepts and skills for using technology to design, create, express, and present. This project-oriented class will develop knowledge and competencies related to digital imaging, animation, video, multimedia, production and presentation. Offered as ARTS 350 and ARTS 450. Prereq: One from ARTS 101, ARTS 106, ARTS 216, or ARTS 220 or permission of the Director of Art Education.

ARTS 365A. Painting. 3 Units.
Advanced painting projects determined in consultation with instructor. Prereq: ARTS 216 and ARTS 316.

ARTS 365B. Design and Color. 3 Units.
Advanced design projects determined in consultation with instructor. Prereq: ARTS 101 and ARTS 201.

ARTS 365C. Enameling and Jewelry. 3 Units.
Advanced enameling and jewelry projects determined in consultation with instructor. Prereq: ARTS 210 and ARTS 310.

ARTS 365D. B&W Photography Studio. 3 Units.
Advanced black and white projects determined in consultation with instructor. Prereq: ARTS 220 and ARTS 320.

ARTS 365E. Color Studio. 3 Units.
Advanced digital color studio projects determined in consultation with instructor. Prereq: ARTS 220 and ARTS 322.

ARTS 365G. Ceramics. 3 Units.
Advanced ceramics projects determined in consultation with instructor. Prereq: ARTS 214 and ARTS 314.

ARTS 365H. Weaving, Fibers, and Textiles. 3 Units.
Advance textile projects determined in consultation with instructor. Prereq: ARTS 212 and ARTS 312.

ARTS 366A. Student Teaching in Art: Pre-K - 6th Grade. 4 Units.

ARTS 366B. Student Teaching in Art: 7th - 12th Grade. 4 Units.

ARTS 385. Clinical/Field Based Experience I. 1 Unit.
Art education students observe and assist art teachers in classes in a variety of public and private educational environments such as local schools, Cleveland Museum of Art. Students study, identify, and analyze differences in art curriculum taught at the various art programs that they observe. Written reports using departmental observation guidelines are required. Prereq: ARTS 295.

ARTS 386. Clinical/Field Based Experience II. 1 Unit.
Art education students become sensitized to serving needs of "special" populations. Observation of educational strategies for teaching learning disabled and/or physically disabled students. Written reports using departmental observation guidelines required. Prereq: ARTS 295.

ARTS 387. Clinical/Field Based Experience III. 1 Unit.
Art education students observe and assist in art programs for artistically gifted students working in specialized art areas (drawing, painting, sculpture, printmaking, art history). Written reports using departmental observation guidelines are required. Prereq: ARTS 295.

ARTS 389. Art Content, Pedagogy, Methodology, and Assessment. 3 Units.
Growth and development of image making from Pre-K through young adult. Principles and practices of art instruction in grades Pre-K through 12th grade. Issues in art education. Curriculum construction, implementation and assessment of art lessons that address content areas of art production, art history, art appreciation, and art criticism. Clinical field experiences required. Offered as ARTS 393 and ARTS 493. Prereq: ARTS 295.

ARTS 395. Introduction to Multimedia Technology. 3 Units.
Fundamental concepts and skills for using technology in art, electronic portfolio development, and teaching and learning. This project-oriented class will develop knowledge and competencies related to digital imaging and video, multimedia production and presentation, the Internet, information processing, computer systems and management as they relate to art education. Offered as ARTS 395 and ARTS 495. Prereq: ARTS 101 and ARTS 201 or ARTS 220 and ARTS 320.

ARTS 399. Independent Study in Art Studio. 1 - 3 Unit.
Independent Study in Art Studio; by permit of Director only.

ARTS 400. Current Issues in Art Education. 3 Units.
Contemporary issues in Art Education; understanding art goals and standards of National Art Education Association and the Ohio State Department of Education for teachers, students and administrators. Special topics: art and technology, multiculturalism, special populations and classroom management. Offered as ARTS 300 and ARTS 400.

ARTS 402. Architecture and City Design I. 3 Units.
The social, spatial, and aesthetic elements in architecture; the components of the building: the window, door, roof, enclosing walls, and character of interior and exterior space. Projects related to small, intimate scale and residential structures. Lectures, field trips, studio experiences. Recommended ARTS 101 or ARTS 106 courses prior to enrollment. Offered as ARTS 302 or ARTS 402.

ARTS 403. Architecture and City Design II. 3 Units.
The social, spatial, and aesthetic elements of the urban setting of architecture, the organizational components of the city, the path, the node, the edge, and the grid. Projects related to large-scale and public buildings and their relationship to the encompassing visual world. Lectures, field trips, studio experiences. Recommended ARTS 101 or ARTS 106 courses prior to enrollment. Offered as ARTS 303 or ARTS 403.

ARTS 450. Multimedia I. 3 Units.
Fundamental concepts and skills for using technology to design, create, express, and present. This project-oriented class will develop knowledge and competencies related to digital imaging, animation, video, multimedia, production and presentation. Offered as ARTS 350 and ARTS 450.
ARTS 465. Seminar for Art Teachers. 4 Units.
For art education majors and teacher licensure candidates. Principles and practice in school art instruction grades Pre-K through 12th grade. Organization and management of the art program that incorporates writing sequential art curriculum that integrates art production, art history, appreciation, and criticism. Planning, development, and evaluation of teaching materials, lessons, and units. The seminar includes discussion of professional issues, ethics, art advocacy, and classroom management. Prereq: ARTS 295 or ARTS 602, and ARTS 393 or ARTS 493. Coreq: ARTS 366A and ARTS 366B or ARTS 466A and ARTS 466B.

ARTS 466A. Student Teaching in Art: Pre-K - 6th Grade. 4 Units.
Teaching art for early childhood, elementary, and middle school students in a school setting. Includes art curriculum development, implementation, and assessment. Professional standards and practices. Offered as ARTS 366A and ARTS 466A. Prereq: ARTS 385, ARTS 386, ARTS 387, ARTS 400, ARTS 493, and ARTS 602. Coreq: ARTS 465 and ARTS 466B.

ARTS 466B. Student Teaching in Art: 7th - 12th Grade. 4 Units.
Teaching adolescents and young adults art in a school setting. Includes art curriculum development, implementation, assessment and classroom management. Professional standards and practices. Offered as ARTS 366B and ARTS 466B. Prereq: ARTS 385, ARTS 386, ARTS 387, ARTS 400, ARTS 493, and ARTS 602. Coreq: ARTS 465 and ARTS 466A.

ARTS 493. Art Content, Pedagogy, Methodology, and Assessment. 3 Units.
Growth and development of image making from Pre-K through young adult. Principles and practices of art instruction in grades Pre-K through 12th grade. Issues in art education. Curriculum construction, implementation and assessment of art lessons that address content areas of art production, art history, art appreciation, and art criticism. Clinical field experiences required. Offered as ARTS 393 and ARTS 493. Prereq: ARTS 602.

ARTS 494. Teaching Art. 3 Units.
Research contrasting theories of art education in relationship to a variety of educational settings in elementary and secondary schools. Developing innovative, interdisciplinary, comprehensive curriculum models for a specific organization. For licensed art teachers only or consent of instructor.

ARTS 495. Introduction to Multimedia Technology. 3 Units.
Fundamental concepts and skills for using technology in art, electronic portfolio development, and teaching and learning. This project-oriented class will develop knowledge and competencies related to digital imaging and video, multimedia production and presentation, the Internet, information processing, computer systems and management as they relate to art education. Offered as ARTS 395 and ARTS 495.

ARTS 497. Summer Workshop in Art Education. 3 Units.
A current art education issue is covered in depth.

ARTS 602. Study in Art Education. 3 Units.
General history and theories of art education. Development of personal philosophy as basis for teaching art. Topics in professional standards, creativity, aesthetic theory, and art criticism. Students produce an art education research paper. Clinical/Field experiences are required.

ARTS 605. Final Creative Thesis. 1 - 3 Unit.
Students receive individual guidance for an approved self-designed creative project from program faculty members. A public exhibition or presentation is required. By permit only.
Department of Astronomy

The Department of Astronomy offers two undergraduate degrees, a Bachelor of Science and a Bachelor of Arts. The primary difference between them is that the BA degree allows somewhat more flexibility in choice of courses. The department offers a minor in astronomy as well.

The curriculum emphasizes a broad and substantial education in astronomy, physics and mathematics. A faculty actively engaged in research provides first-rate instruction and opportunities for undergraduate involvement in research.

A bachelor’s degree in astronomy can prepare students for graduate study in astronomy (about 50% of our graduates take this path), but those who seek employment in other fields can fill the same jobs as physics and computer science majors.

The department offers a graduate program leading to the degree of Doctor of Philosophy in astronomy. Current research provides opportunities in observational and theoretical studies of galaxy formation and evolution, galaxy cluster evolution, astronomical instrumentation, and cosmology.

Facilities

The Department of Astronomy operates the Kitt Peak Station of the Warner and Swasey Observatory near Tucson, Arizona, home of the Burrell Schmidt telescope. This telescope is used for surveys and ultra-deep imaging with a large format CCD. The department is also a member of the Sloan Digital Sky Survey, which operates a 2.5m telescope with multi-object spectrographs and wide-field imager at Apache Point, New Mexico. The third incarnation of this survey includes a Baryon Oscillation survey of the large-scale structure of the universe and a spectroscopic survey of the Milky Way galaxy. A 9.5-inch refractor permanently mounted on the roof of the A. W. Smith Building is available for use by students. The department also houses a research and instruction computer laboratory and has access to the university’s high-performance computing cluster.

BS Astronomy I BA Astronomy I Minor

Bachelor of Science in Astronomy

The Bachelor of Science in astronomy requires 122 credit hours, including 20 hours in astronomy, 43 hours in physics, 14 hours in math, and 12 hours in technical electives.

Graduate Program

The PhD degree in astronomy is granted to those students who have shown an extensive knowledge of advanced astronomy and the ability to do original research. The student is required to pass a general qualifying examination in astronomy, usually taken at the end of the second year. The student must then prepare a dissertation based on the results of independent research. A PhD candidate must also satisfy the general requirements of the School of Graduate Studies.

Full-time graduate students who maintain satisfactory academic performance while pursuing the PhD degree in astronomy normally receive a stipend for teaching and/or research, which includes full tuition and a monthly amount sufficient to cover living expenses.

Department Faculty

J. Christopher Mihos, PhD
(University of Michigan)
Professor and Chair; Director of the Warner and Swasey Observatory
Galaxy evolution; interacting and merging galaxies; galaxy clusters; computational and observational astronomy

R. Earle Luck, PhD
(University of Texas, Austin)
Worcester R. and Cornelia B. Warner Professor of Astronomy
Stellar and galactic chemical evolution; stellar spectrophotometry

Stacy S. McGaugh, PhD
(University of Michigan)
Professor
Galaxy formation and evolution, low surface brightness galaxies, cosmology, dark matter, and gravity

Idit Zehavi, PhD
(Racah Institute of Physics, Hebrew University of Jerusalem)
Assistant Professor
Cosmology and the large-scale structure of the universe; galaxy biasing; galaxy formation and evolution; structure formation; clustering of galaxies; cosmic flows.

Minor in Astronomy

The requirements for the minor in astronomy are as follows:

One of the following: 4

<table>

Heather L. Morrison, PhD
(Australian National University)
Professor
Galaxy formation via observational studies of the Milky Way and nearby galaxies; dark matter

Idit Zehavi, PhD
(Racah Institute of Physics, Hebrew University of Jerusalem)
Assistant Professor
Cosmology and the large-scale structure of the universe; galaxy biasing; galaxy formation and evolution; structure formation; clustering of galaxies; cosmic flows.

Secondary Faculty

John Ruhl, PhD
(Princeton University)
Professor, Department of Physics
Experimental astrophysics and cosmology
ASTR 151. Doing Astronomy. 1 Unit.
This course is intended to introduce students to how astronomy is done. The course will focus on the astronomical research process, the scientific community, and on career paths in astronomy. Course activities will include readings and class discussions focusing on various topics in modern astronomy, including ongoing research activity in the department. This course is largely intended for first- and second-year students considering majoring or minoring in astronomy, or pursuing a career in astronomy. Prereq: First- or second-year academic standing.

ASTR 201. The Sun and its Planets. 3 Units.
An overview of the solar system; the planets and other objects that orbit about the Sun and the Sun itself as the dominant mass and the most important source of energy in the solar system. Concepts and the development of our knowledge will be emphasized. Not available for credit to astronomy majors.

ASTR 202. Stars, Galaxies, and the Universe. 3 Units.
Stellar structure, energy sources, and evolution, including red giants, white dwarfs, supernovae, pulsars, and black holes. Stellar populations in the Milky Way and external galaxies. The universe and its evolution. Not available for credit to astronomy majors.

ASTR 204. Einstein’s Universe. 3 Units.
This course is intended to introduce the non-scientist to the concepts of modern cosmology—the structure and evolution of the universe. No mathematical background beyond simple algebra is needed.

ASTR 206. Life in the Universe. 3 Units.
This course is intended to introduce the non-scientist to the field of astrobiology - the interdisciplinary study of, and the search for, extraterrestrial life and the conditions for extraterrestrial life in the Universe. We will explore questions such as: How did life begin on Earth? What conditions are necessary for life to survive? What conditions are required for the long-term habitability of the Earth? Can life exist elsewhere in our Galaxy? Students may receive credit for ASTR 206 or USNA 217 (Astrobiology), but not for both.

ASTR 221. Stars and Planets. 3 Units.

ASTR 222. Galaxies and Cosmology. 3 Units.

ASTR 223. The Local Universe. 3 Units.

ASTR 224. Cosmology and the Structure of the Universe. 3 Units.

ASTR 231. Stellar Physics. 3 Units.
Radiative transfer, atomic and molecular opacities, and the observable properties of stars. Stellar interiors, nuclear processes, and energy generation. The evolution of stars of varying mass and production of the elements within supernovae explosions. Offered as ASTR 311 and ASTR 411. Prereq: ASTR 222.

ASTR 306. Astronomical Techniques. 3 Units.
This course covers the techniques astronomers use to conduct research, including observations using ground- and space-based telescopes, computer simulations and other numerical methods, and statistical data mining of large on-line astronomical datasets. Offered as ASTR 306 and ASTR 406. Prereq: ASTR 222.

ASTR 309. Astrophysics Seminar I. 1 Unit.
Selected topics in astronomy not covered ordinarily in courses. Presentation of talks by the students.

ASTR 310. Astrophysics Seminar II. 1 Unit.
Selected topics in astronomy not covered ordinarily in courses. Presentation of talks by students.

ASTR 321. Stellar Structure and Energy Production. 3 Units.

ASTR 323. The Local Universe. 3 Units.

ASTR 351. Astronomy Capstone Project. 1 - 3 Unit.
A two semester course (1 hour in the Fall Semester and either 2 or 3 hours in the Spring Semester) for students desiring a Capstone Experience in astronomy. Students pursue a project based on experimental, theoretical or teaching research under the supervision of an astronomy faculty member. A departmental Capstone Project Committee must approve all project proposals (by the end of the Fall Semester) and this same committee will receive regular oral and written progress reports. Final results are presented at the end of the semester as a paper in a style suitable for publication in a professional journal as well as an oral report in a public symposium. Prereq: ASTR 222.

ASTR 369. Undergraduate Research. 1 - 3 Unit.
Supervised research on topics of interest. Can be used as a thesis course if desired. Students may register more than once for a maximum of 9 credits overall (1-3 credits each semester).
ASTR 396. Special Topics in Astronomy. 1 - 3 Unit.
Open to astronomy majors only.

ASTR 406. Astronomical Techniques. 3 Units.
This course covers the techniques astronomers use to conduct research, including observations using ground- and space-based telescopes, computer simulations and other numerical methods, and statistical data mining of large on-line astronomical datasets. Offered as ASTR 306 and ASTR 406.

ASTR 411. Stellar Physics. 3 Units.
Radiative transfer, atomic and molecular opacities, and the observable properties of stars. Stellar interiors, nuclear processes, and energy generation. The evolution of stars of varying mass and production of the elements within supernovae explosions. Offered as ASTR 311 and ASTR 411.

ASTR 423. The Local Universe. 3 Units.

ASTR 428. Cosmology and the Structure of the Universe. 3 Units.

ASTR 497. Special Topics in Astronomy. 1 - 3 Unit.

ASTR 601. Research. 1 - 18 Unit.
Original research under the guidance of the staff.

ASTR 651. Thesis M.S.. 1 - 18 Unit.
(Credit as arranged.)

(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
Department of Biology

The mission of the Department of Biology at Case Western Reserve University is to promote research programs of national and international prominence and to provide strong undergraduate and graduate educational programs that emphasize integrative approaches to biological problems. In doing so, our programs support preparation and professional development for careers related to the biological and health sciences.

The department offers courses leading to the degrees of Bachelor of Science, Bachelor of Science in Systems Biology, Bachelor of Arts, Master of Science, and Doctor of Philosophy. Cooperative programs between the Department of Biology and the Case Western Reserve University School of Medicine, the Cleveland Museum of Natural History, the Cleveland Botanical Garden, the Cleveland Metroparks Zoo, the Holden Arboretum, the Cleveland Institute of Art, and other departments in Case Western Reserve University significantly extend the range of resources available to biology students. Undergraduate students are encouraged to conduct individual supervised research projects with biology faculty and with faculty in cooperating departments. A supervised research project is required of all students in the BS biology program.

The undergraduate programs in biology provide excellent preparation for graduate or professional schools, including medical, dental, and veterinary schools and the many specialized graduate programs in the biological sciences. A biology degree also prepares students for careers in industry and government. For students interested in biotechnology—a field with growing career opportunities—the department offers elective sequences within the BA and BS degrees.

In addition to formal courses for credit, the department offers weekly seminars during the academic year, presenting recent advances in biology. These seminars are held every Thursday at 4:15 p.m. and are open to the university community.

BA Biology | BS Biology | Teacher Licensure | BS Systems Biology | Minors

Undergraduate Programs

Majors

Major programs share a core of foundation courses and provide options for specialization in a variety of areas, including biotechnology and genetic engineering, molecular and cellular biology, genetics, immunology, chemical biology, physiology and biophysics, neurobiology and animal behavior, developmental biology, population biology, ecology, and environmental science. Theoretical, mathematical, and computational approaches to these fields are emphasized in the Systems Biology BS program. Individual research projects form a significant part of the curriculum for many undergraduates in all programs, and are specifically required for students in the Biology BS program. Advanced biology majors may register, with permission, for graduate-level courses in the department and in the School of Medicine.

The department offers programs leading to the BA and BS degrees. Thirty hours of biology are required for the Biology BA, 39 hours for the Biology BS, and 30 hours for the Systems Biology BS. Ordinarily, all students begin their biology programs in the freshman year. All students must complete the SAGES seminar and General Education Requirements (GER) of the College of Arts and Sciences. While some BIOL courses serve as SAGES Departmental Seminars or SAGES Capstones, none of these are required courses for biology degree candidates, with the specific exception of BIOL 388S Undergraduate Research - SAGES Capstone for the Biology BS degree. A Biology BA student, for example, is free to take a non-BIOL SAGES Departmental Seminar or SAGES Capstone course, assuming that prerequisites are met (or waived by the instructor).

Bachelor of Arts in Biology

The Biology BA degree program provides a general background in biology, and has the most flexible scheduling of the three biology degrees offered. It is especially recommended for students who are pre-professional, have multiple majors, intend to do a junior year abroad or an internship program, or have significant extracurricular commitments (e.g., varsity athletics, student government, Greek life, or other campus involvement). Since the Biology BA degree does not formally require undergraduate research, students interested in graduate research careers should plan to take at least one semester of undergraduate research as an elective (BIOL 388 Undergraduate Research or BIOL 388S Undergraduate Research - SAGES Capstone) sometime during the senior year.

### Biology core courses

- **BIOL 214** Genes, Evolution and Ecology
- **BIOL 214L** Genes, Evolution and Ecology Lab
- **BIOL 215** Cells and Proteins
- **BIOL 215L** Cells and Proteins Laboratory
- **BIOL 216** Development and Physiology
- **BIOL 216L** Development and Physiology Lab

One course from any two of the following three subject areas (breadth requirement) 6

- **Cell and molecular biology**
  - **BIOL 308** Molecular Biology: Genes and Genetic Engineering
  - **BIOL 316** Fundamental Immunology
  - **BIOL 324** Introduction to Stem Cell Biology
  - **BIOL 325** Cell Biology
  - **BIOL 326** Genetics
  - **BIOL 328** Plant Genomics and Proteomics
- **BIOL 334** Structural Biology
- **BIOL 342** Parasitology
- **BIOL 343** Microbiology
- **BIOL 365** Evo-Devo: Evolution of Body Plans
- **BIOL 366** Genes, Embryos and Fossils

- **Organismal biology**
  - **BIOL 223** Vertebrate Biology
  - **BIOL 302** Human Learning and the Brain
  - **BIOL 314** Animal Cognition and Consciousness
  - **BIOL 318** Introductory Entomology
  - **BIOL 338** Ichthyology
  - **BIOL 340** Human Physiology
  - **BIOL 346** Human Anatomy
  - **BIOL 362** Principles of Developmental Biology
  - **BIOL 373** Introduction to Neurobiology
  - **BIOL 374** Neurobiology of Behavior
  - **BIOL 379** Neuroscience of Communication and Communication Disorders
  - **BIOL 382** Drugs, Brain, and Behavior
  - **BIOL 385** Seminar on Biological Processes in Learning and Cognition

- **Population biology and ecology**
  - **BIOL 225** Evolution
  - **BIOL 307** Evolutionary Biology of the Invertebrates
  - **BIOL 336** Aquatic Biology
  - **BIOL 351** Principles of Ecology
  - **BIOL 358** Animal Behavior
  - **BIOL 364** Research Methods in Evolutionary Biology
  - **BIOL 368** Topics in Evolutionary Biology
BIOL 384 Reading and Writing Like an Ecologist
BIOL 394 Seminar in Evolutionary Biology

Two additional laboratory courses (excluding BIOL 388, BIOL 388S, and BIOL 390) 4-8
BIOL 223 Vertebrate Biology
BIOL 300 Dynamics of Biological Systems: A Quantitative Introduction to Biology
BIOL 301 Biotechnology Laboratory: Genes and Genetic Engineering
BIOL 304 Fitting Models to Data: Maximum Likelihood Methods and Model Selection
BIOL 305 Herpetology
BIOL 312 Environmental Sculpture
BIOL 315 Quantitative Biology Laboratory
BIOL 339 Aquatic Biology Laboratory
BIOL 344 Laboratory for Microbiology
BIOL 345 Mammal Diversity and Evolution
BIOL 351 Laboratory for Ecology Laboratory
BIOL 358 Animal Behavior
BIOL 359 Genetic Basis of Behavior
BIOL 363 Experimental Developmental Biology
BIOL 376 Neurobiology Laboratory
BIOL 377 Biorobotics Team Research

Biological electives (excluding 100-level courses, BIOL 240, BIOL 250, BIOL 251, and BIOL 390) 6-8

Mathematics core courses
MATH 125 Math and Calculus Applications for Life, Managerial, and Social Sci I 4
or MATH 121 Calculus for Science and Engineering I
MATH 126 Math and Calculus Applications for Life, Managerial, and Social Sci II 4
or MATH 122 Calculus for Science and Engineering II

Chemistry core courses
CHEM 105 Principles of Chemistry I 3
CHEM 106 Principles of Chemistry II 3
CHEM 113 Principles of Chemistry Laboratory 2
CHEM 223 Introductory Organic Chemistry I 3
or CHEM 323 Organic Chemistry I
CHEM 224 Introductory Organic Chemistry II 3
or CHEM 324 Organic Chemistry II
CHEM 233 Introductory Organic Chemistry Laboratory I 2

Physics core courses
PHYS 115 Introductory Physics I 4
or PHYS 121 General Physics I - Mechanics
PHYS 116 Introductory Physics II 4
or PHYS 122 General Physics II - Electricity and Magnetism

Total Units 60-66

At least 15 hours of the selected electives and additional laboratory courses must be at the 300 level or higher.

**Teacher Licensure**

Students may become eligible for teacher licensure in the field of Life Sciences (Adolescents and Young Adults) by completing content area requirements as well as 35 semester hours in education courses (including student teaching) offered through Case Western Reserve and John Carroll University. For more details, please see the program requirements.
description for teacher licensure elsewhere in this bulletin. Students interested in pursuing this option should consult Richard F. Drushel, executive officer for the Department of Biology.

**Subject Area Requirements**

**Biology core courses**
- BIOL 214 Genes, Evolution and Ecology 3
- BIOL 214L Genes, Evolution and Ecology Lab 1
- BIOL 215 Cells and Proteins 3
- BIOL 215L Cells and Proteins Laboratory 1
- BIOL 216 Development and Physiology 3
- BIOL 216L Development and Physiology Lab 1

**Chemistry core courses**
- CHEM 105 Principles of Chemistry I 3
- CHEM 106 Principles of Chemistry II 3
- CHEM 113 Principles of Chemistry Laboratory 2
- CHEM 223 Introductory Organic Chemistry I 3
- CHEM 224 Introductory Organic Chemistry II 3
- CHEM 233 Introductory Organic Chemistry Laboratory I 2

**Mathematics core courses**
- MATH 125 Math and Calculus Applications for Life, Managerial, and Social Sciences I 4
- MATH 126 Math and Calculus Applications for Life, Managerial, and Social Sciences II 4

**One earth, environmental, and planetary sciences (EEPS) course**
- EEPS 101 The Earth and Planets 3
- EEPS 110 Physical Geology
- EEPS 115 Introduction to Oceanography
- EEPS 117 Weather and Climate

**One genetics or molecular biology course**
- BIOL 308 Molecular Biology: Genes and Genetic Engineering 3-4
- BIOL 326 Genetics
- BIOL 334 Microbiology

**One genetics or molecular biology laboratory course**
- BIOL 301 Biotechnology Laboratory: Genes and Genetic Engineering 2-3
- BIOL 344 Laboratory for Microbiology

**One animal behavior course**
- BIOL 358 Animal Behavior 3-4
- BIOL 373 Introduction to Neurobiology
- BIOL 374 Neurobiology of Behavior
- BIOL 382 Drugs, Brain, and Behavior

**One organismal biology laboratory course**
- BIOL 223 Vertebrate Biology 3-4
- BIOL 305 Herpetology
- BIOL 336 Aquatic Biology

**Physics core courses**
- PHYS 115 Introductory Physics I 4
- PHYS 116 Introductory Physics II 4

**Total Units** 58-62

**Bachelor of Science in Biology**

The Biology BS degree program is intended to prepare students for work as traditional bench or field research scientists. In addition to a general background in biology (the same as provided by the Biology BA program), the Biology BS program requires two semesters of undergraduate research, plus additional courses in quantitative methods (computer programming, statistics, data analysis) and physical chemistry. The research may be done at the university or at any of its affiliated institutions, but the biology department does not formally place students into laboratories. Because of the extra course work and research requirements, the Biology BS program may present scheduling challenges to students who wish to pursue multiple majors, a junior year abroad or internship, or significant extracurricular activities. Early, careful planning in consultation with the major advisor is essential to stay on schedule.

**Biology core courses**
- BIOL 214 Genes, Evolution and Ecology 3
- BIOL 214L Genes, Evolution and Ecology Lab 1
- BIOL 215 Cells and Proteins 3
- BIOL 215L Cells and Proteins Laboratory 1
- BIOL 216 Development and Physiology 3
- BIOL 216L Development and Physiology Lab 1

**One course from any two of the following three subject areas (breadth requirement)**
- BIOL 308 Molecular Biology: Genes and Genetic Engineering
- BIOL 316 Fundamental Immunology
- BIOL 324 Introduction to Stem Cell Biology

**One course from any two of the following three subject areas (breadth requirement)**
- BIOL 325 Cell Biology
- BIOL 326 Genetics
- BIOL 328 Plant Genomics and Proteomics

**One course from any two of the following three subject areas (breadth requirement)**
- BIOL 334 Structural Biology
- BIOL 342 Parasitology
- BIOL 343 Microbiology

**One course from any two of the following three subject areas (breadth requirement)**
- BIOL 365 Evo-Devo: Evolution of Body Plans
- BIOL 366 Genes, Embryos and Fossils

**Organismal biology**
- BIOL 223 Vertebrate Biology
- BIOL 302 Human Learning and the Brain
- BIOL 314 Animal Cognition and Consciousness
- BIOL 318 Introductory Entomology
- BIOL 338 Ichthyology
- BIOL 340 Human Physiology
- BIOL 346 Human Anatomy

**One course from any two of the following three subject areas (breadth requirement)**
- BIOL 362 Principles of Developmental Biology
- BIOL 373 Introduction to Neurobiology
- BIOL 374 Neurobiology of Behavior

**One course from any two of the following three subject areas (breadth requirement)**
- BIOL 379 Neuroscience of Communication and Communication Disorders
- BIOL 382 Drugs, Brain, and Behavior
- BIOL 385 Seminar on Biological Processes in Learning and Cognition

**Population biology and ecology**
- BIOL 225 Evolution
- BIOL 307 Evolutionary Biology of the Invertebrates
- BIOL 336 Aquatic Biology
- BIOL 358 Animal Behavior
- BIOL 364 Research Methods in Evolutionary Biology
- BIOL 368 Topics in Evolutionary Biology
- BIOL 384 Reading and Writing Like an Ecologist
- BIOL 394 Seminar in Evolutionary Biology

**One genetics course**
- BIOL 301 Biotechnology Laboratory: Genes and Genetic Engineering
- BIOL 328 Genetics

**One quantitative biology laboratory course**
- BIOL 300 Dynamics of Biological Systems: A Quantitative Introduction to Biology
- BIOL 304 Fitting Models to Data: Maximum Likelihood Methods and Model Selection
- BIOL 315 Quantitative Biology Laboratory

**One additional laboratory course (excluding BIOL 388, BIOL 388S, and BIOL 390)**
- BIOL 223 Vertebrate Biology
- BIOL 300 Dynamics of Biological Systems: A Quantitative Introduction to Biology
- BIOL 301 Biotechnology Laboratory: Genes and Genetic Engineering

Bachelor of Science in Systems Biology

Systems biology is a rapidly emerging area of research activity at the interface of mathematics, computer science, and the biological sciences. Many modern areas of biology research (e.g., biochemical, neural, behavioral, and ecosystem networks) require the mastery of advanced quantitative and computational skills. The Systems Biology BS degree program is intended to provide the quantitative and multidisciplinary understanding that is necessary for work in these areas. This skill set is different from that produced by traditional undergraduate programs in biology. Consequently, the Systems Biology BS program includes a specialized four-course core curriculum (different from the three-course core used in the Biology BA and BS programs), as well as foundation courses from computer science and advanced mathematics. Undergraduate research is recommended (as BIOL 388S Undergraduate Research and BIOL 390 Advanced Undergraduate Research), but is not required.

Total Units: 79 Units

Total Units in Sequence: 121-125
Concentrations in Areas of the Biological Sciences

Students are encouraged to utilize their elective courses in the biology major to take advantage of concentrations in various specialized areas. These concentrations have been developed between the biology department, the basic science departments of the School of Medicine, and other departments. Currently, concentrations have been developed in the following areas: biotechnology and genetic engineering; computational biology; developmental biology; genetics; cell and molecular biology; neurobiology and animal behavior; population biology, ecology and environmental science. Note: these concentrations are informal; they are not declared, and will not appear on the student’s diploma at graduation.

Co-op Program in Biology

The Co-op (Cooperative Education) program offers full-time undergraduate students in good academic standing the opportunity to engage in full-time, paid employment consistent with their major fields of study. Typically students participate in the co-op program for one or two seven-month periods, such as summer-fall and/or spring-summer, beginning after their sophomore or junior year. Although participation in this program extends the time required to achieve a bachelor’s degree, students often benefit from higher starting salaries and greater lifetime earnings that can result from the experience acquired in co-op assignments. Co-op employment opportunities may exist at local companies engaged in biotechnology research, pharmaceuticals, or other areas involving the life sciences. Students interested in this program should contact the biology department office.

Advising

Biology faculty advisors are assigned to students at the time of major or minor declaration. All biology majors are required to meet with their departmental advisors at least once each semester to discuss their academic program, receive clearance for electronic course registration, and obtain approval for any drops, adds, or withdrawals. Contact Richard F. Drushel, executive officer for the Department of Biology, for information about major or minor declaration.

Departmental Honors

To receive a bachelor’s degree “with Honors in Biology” (formally noted as such on the student’s diploma at graduation), the student must meet the following criteria:

1. Maintain a 3.4 overall grade point average, with a 3.6 in BIOL courses
2. Carry out two semesters of independent research (taken as BIOL courses) at Case Western Reserve University
3. Write a senior honors thesis with the approval of the faculty supervisor
4. Submit the thesis for review by an ad hoc honors committee
5. Successfully defend the thesis at an oral examination

Additional information and application forms are available from the biology department office.

Minors

Two tracks are available for the minor, each requiring a total of 16 hours of biology courses. One track consists of any two of the three biology core lectures with their associated laboratories, plus electives:

Any two of the following biology core classes (and associated labs) 8

BIOL electives (excluding 100-level courses, BIOL 240, BIOL 250, BIOL 251, and BIOL 390) 8
Total Units 16

An alternative track, for students using the Systems Biology core, consists of:

Required courses
- BIOL 250 Introduction to Cell and Molecular Biology Systems 3
- BIOL 251 Introduction to Organismal and Population Systems 3
- BIOL electives (excluding 100-level courses, BIOL 214, BIOL 215, BIOL 216, BIOL 240, and BIOL 390) 10
Total Units 16

Graduate Programs

Master of Science
The Department of Biology offers both thesis and non-thesis Master of Science degree programs. Both programs require a minimum of 30 semester hours of courses at the 300 level or higher. A minimum of 18 semester hours of formal course work is required for the thesis degree, and a minimum of 24 semester hours of formal course work for the non-thesis degree. The remaining credits may be research credits (BIOL 601 Research and BIOL 651 Thesis M.S.).

Doctor of Philosophy
The Doctor of Philosophy degree in biology is granted upon the completion of original research under the guidance of a faculty member in the Department of Biology.

Department Faculty

Christopher A. Cullis, PhD
(University of East Anglia, United Kingdom)
Francis Hobart Herrick Professor of Biology; Chair
Plant molecular biology and genetics; modifications of the information content of plant cells

Radhika Atit, PhD
(University of Cincinnati)
Associate Professor
Developmental biology and genetics; origin and patterning of skin

Michael F. Benard, PhD
(University of California, Davis)
George B. Mayer Chair in Urban and Environmental Studies; Assistant Professor
Ecology; evolutionary biology

Rebecca Benard, PhD
(University of California, Davis)
Instructor
Plant population ecology; physiology

Jean H. Burns, PhD
(Florida State University)
Assistant Professor
Plant ecology; community assembly; invasibility; the role of phylogeny in assembly; the role of demographic processes in biological invasions

Arnold I. Caplan, PhD
(Johns Hopkins University)
Professor; Director, Skeletal Research Center
Developmental biology and biochemistry; molecular and cellular aspects of muscle, cartilage, and bone development

Hillel J. Chiel, PhD
(Massachusetts Institute of Technology)
Professor
Neurobiology and animal behavior; cellular dynamics of neuronal computation

Richard F. Drushel, PhD
(Case Western Reserve University)
Instructor and Executive Officer
Vertebrate anatomy and physiology; kinematic modeling and neural control; autonomous robotics

Stephen E. Haynesworth, PhD
(Case Western Reserve University)
Associate Professor; Associate Dean, College of Arts and Sciences
Developmental and aging biology

Valerie Haywood, PhD
(University of California, Davis)
Instructor
Plant developmental biology; molecular biology

Emmitt R. Jolly, PhD
(University of California, San Francisco)
Assistant Professor
Molecular biology and genetics; developmental biology; parasitology; schistosomiasis

Barbara A. Kuemerle, PhD
(Case Western Reserve University)
Instructor
Molecular biology and genetics; developmental neuroscience

Claudia M. Mizutani, PhD
(Federal University of Rio de Janeiro, Brazil)
Assistant Professor
Developmental biology and genetics; embryonic body-axis formation

Ronald G. Oldfield, PhD
(University of Michigan)
Instructor
Evolutionary ecology of cichlid fishes; ichthyology

Roy E. Ritzmann, PhD
(University of Virginia)
Professor
Neurobiology of behavior; insect locomotion and brain studies

Charles E. Rozek, PhD
(Wayne State University)
Associate Professor; Vice Provost and Dean of Graduate Studies
Molecular genetics; developmental biology

Robin Snyder, PhD
(University of California, Santa Barbara)
Associate Professor
Theoretical ecology

Rui S. de Sousa-Neves, PhD
(Federal University of Rio de Janeiro, Brazil)
Instructor
Developmental biology; molecular genetics

Mark A. Willis, PhD
(University of California, Riverside)
Associate Professor
Neurobiology and behavior; sensorimotor control of insect flight; animal behavior
James E. Zull, PhD
(University of Wisconsin, Madison)
Professor
Human learning; brain function in education

Research Faculty

David A. Carrino, PhD
(Case Western Reserve University)
Research Professor
Extracellular matrix and its role in development and wound healing; structure and function of proteoglycans
Jean F. Welter, MD, PhD
(Leopold Franzens Universität, Austria; Case Western Reserve University)
Research Associate Professor
Tissue engineering and cell-based therapies; bioreactor design; mechanobiology; bone transplantation; imaging; fluorescence spectroscopy; drug delivery

Secondary Faculty

Darin Croft, PhD
(The University of Chicago)
Associate Professor, Department of Anatomy, School of Medicine
Vertebrate paleontology and fieldwork; mammals, especially those of South America; paleoecology and ancient ecosystems
Brian M. McDermott, PhD
(Columbia University)
Assistant Professor, Department of Otolaryngology, University Hospitals of Cleveland
Neurobiology; hearing and deafness; zebrafish; mechanotransduction; synapse development
Scott W. Simpson, PhD
(Kent State University)
Associate Professor, Department of Anatomy, School of Medicine
Homind paleontology and fieldwork; hominid dentition; locomotor capacities of early Homo erectus
Peter Thomas, PhD
(The University of Chicago)
Assistant Professor, Department of Mathematics
Synchronization and reliability of neural activity; gradient sensing, signal transduction and information theory; pattern formation in the visual cortex; malaria informatics

Adjunct Faculty

David J. Burke, PhD
(Rutgers University)
Adjunct Assistant Professor, Holden Arboretum
Rhizosphere ecology; plant-microbe interactions; molecular microbial ecology; plant ecology
Pam Dennis, PhD, DVM
(The Ohio State University; College of Veterinary Medicine, North Carolina State University)
Adjunct Assistant Professor, Clinical Assistant Professor, Cleveland Metroparks Zoo
Veterinary wildlife epidemiology in zoo and free-ranging animal populations
Anthony Giordano, PhD
(The Ohio State University)
Adjunct Assistant Professor, President and CEO, TheraVasc, Inc.
Drug discovery and development in the treatment of cancer, vascular diseases, and Alzheimer's disease; entrepreneurship
Ana B. Locci, PhD
(Case Western Reserve University)
Adjunct Assistant Professor, University Farm
Aquatic ecology and population biology
Kristen E. Lukas, PhD
(Georgia Institute of Technology)
Adjunct Assistant Professor, Curator, Conservation and Science, Cleveland Metroparks Zoo
Applied animal behavior; behavior and health; visitor attitudes and behavior
Kurt Smemo, PhD
(Cornell University)
Adjunct Assistant Professor, Holden Arboretum
Soil biogeochemistry
Mandi M. Vick, PhD
(University of Kentucky)
Adjunct Assistant Professor, Associate Research Curator, Cleveland Metroparks Zoo
Endocrinology and reproductive physiology
Peter A. Zimmerman, PhD
(Case Western Reserve University)
Professor, Center for Global Health and Diseases, School of Medicine
Infectious diseases; genetics; genomic epidemiology and evolution

Lecturers

James Bader, MS
(Case Western Reserve University)
Lecturer, Director, Center for Science and Mathematics Education
Aquatic ecology
Deborah L. Harris, MS
(Wright State University)
Lecturer
Aquatic biofouling; mycology
Dianne M. Kube, PhD
(University of North Dakota School of Medicine)
Lecturer, Microbiology
Cell biology, cystic fibrosis

Emeritus Faculty

Morris Burke, PhD
(University of New South Wales, Australia)
Professor Emeritus
Muscle physiology; protein chemistry
Robert P. Davis, PhD
(Cornell University)
Associate Professor Emeritus; Dean Emeritus of Collegiate Affairs
Developmental biology
Darhl L. Foreman, PhD
BIOL 114. Principles of Biology. 3 Units.
A one-semester course in biology designed for the non-major. A primary objective of this course is to demonstrate how biological principles impact an individual’s daily life. BIOL 114 introduces students to the molecules of life, cell structure and function, respiration and photosynthesis, molecular genetics, heredity and human genetics, evolution, diversity of life, and ecology. Minimal background is required; however, some exposure to biology and chemistry at the high school level is helpful. This course is not open to students with credit for BIOL 214 or BIOL 250. This course does not count toward any Biology degree. Prereq or Coreq: BIOL 114.

BIOL 116. Introduction to Human Anatomy and Physiology I. 3 Units.
This is the first course in a two-semester sequence that covers human anatomy and physiology for the non-major. BIOL 116 covers homeostasis, cell structure and function, membrane transport, tissue types and the integumentary, skeletal, muscular and nervous systems. This course is not open to students with credit for BIOL 216, BIOL 251, BIOL 340, or BIOL 346. This course does not count toward any Biology degree. Prereq or Coreq: BIOL 114.

BIOL 117. Introduction to Human Anatomy and Physiology II. 3 Units.
This is the second course in a two-semester sequence that covers human anatomy and physiology for the non-major. BIOL 117 covers the endocrine, circulatory, respiratory, digestive, lymphatic, urinary systems including acid-base regulation, and reproductive systems. This course is not open to students with credit for BIOL 216, BIOL 251, BIOL 340, or BIOL 346. This course does not count toward any Biology degree. Prereq: BIOL 114 and BIOL 116.

BIOL 119. Concepts for a Molecular View of Biology I. 3 Units.
The first semester of a two-course sequence in elementary inorganic, organic, and biochemistry, intended for nursing students or non-majors. Topics include: atomic theory, the periodic table, chemical bonds, molecular geometry, ideal gas laws, equilibrium and reaction rates, acids and bases, nuclear chemistry, and nomenclature and reactions of organic compounds (including alkyl, aryl, alcohol, carbonyl, and amino compounds). Problems involving numeric computation are emphasized. This course is not open to students with credit for CHEM 105 or CHEM 111. This course does not count toward any Biology degree. Prereq or Coreq: CHEM 106 or CHEM 111.

BIOL 214. Genes, Evolution and Ecology. 3 Units.
First in a series of three courses required of the Biology major. Topics include: biological molecules (focus on DNA and RNA); mitotic and meiotic cell cycles, gene expression, genetics, population genetics, evolution, biological diversity and ecology. Prereq or Coreq: CHEM 105 or CHEM 111.

BIOL 214L. Genes, Evolution and Ecology Lab. 1 Unit.
First in a series of three laboratory courses required of the Biology major. Topics include: biological molecules (with a focus on DNA and RNA); basics of cell structure (with a focus on malaria research); molecular genetics, biotechnology; population genetics and evolution, ecology. Assignments will be in the form of a scientific journal submission. Prereq or Coreq: BIOL 214.

BIOL 215. Cells and Proteins. 3 Units.
Second in a series of three courses required of the Biology major. Topics include: biological molecules (focus on proteins, carbohydrates, and lipids); cell structure (focus on membranes, energy conversion organelles and cytoskeleton); protein structure-function; enzyme kinetics, cellular energetics, and cell communication and motility strategies. Prereq: BIOL 214 and (CHEM 105 or CHEM 111). Prereq or Coreq: CHEM 106 or ENGR 145.

BIOL 215L. Cells and Proteins Laboratory. 1 Unit.
Second in a series of three laboratory courses required of the Biology major. Topics to include: protein structure-function, enzymes kinetics; cell structure; cellular energetics, respiration and photosynthesis. In addition, membrane structure and transport will be covered. Laboratory and discussion sessions offered in alternate weeks. This course is not available for students who have taken BIOL 215 as a 4-credit course. Prereq: BIOL 214L and Prereq or Coreq: BIOL 215.
BIOL 216. Development and Physiology. 3 Units.
This is the final class in the series of three courses required of the Biology major. As with the two previous courses, BIOL 214 and 215, this course is designed to provide an overview of fundamental biological processes. It will examine the complexity of interactions controlling reproduction, development and physiological function in animals. The Developmental Biology section will review topics such as gametogenesis, fertilization, cleavage, gastrulation, the genetic control of development, stem cells and cloning. Main topics included in the Physiology portion consist of: homeostasis, the function of neurons and nervous systems; the major organ systems and processes involved in circulation, excretion, osmoregulation, gas exchange, feeding, digestion, temperature regulation, endocrine function and the immunologic response. Prereq: BIOL 214.

BIOL 216L. Development and Physiology Lab. 1 Unit.
Third in a series of three laboratory courses required of the Biology major. Students will conduct laboratory experiments designed to provide hands-on, empirical laboratory experience in order to better understand the complex interactions governing the basic physiology and development of organisms. Laboratories and discussion sessions offered in alternate weeks. Prereq: BIOL 214L. Prereq or Coreq: BIOL 216.

BIOL 223. Vertebrate Biology. 3 Units.
A survey of vertebrates from jawless fishes to mammals. Functional morphology, physiology, behavior and ecology as they relate to the groups’ relationships with their environment. Evolution of organ systems. Two lectures and one laboratory per week. The laboratory will involve a study of the detailed anatomy of the shark and cat used as representative vertebrates. Students are expected to spend at least three hours of unscheduled laboratory each week. This course fulfills a laboratory requirement for the biology major.

BIOL 225. Evolution. 3 Units.
Multidisciplinary study of the course and processes of organic evolution provides a broad understanding of the evolution of structural and functional diversity, the relationships among organisms and their environments, and the phylogenetic relationships among major groups of organisms. Topics include the genetic basis of micro- and macro-evolutionary change, the concept of adaptation, natural selection, population dynamics, theories of species formation, principles of phylogenetic inference, biogeography, evolutionary rates, evolutionary convergence, homology, Darwinian medicine, and conceptual and philosophic issues in evolutionary theory. Offered as ANTH 225, BIOL 225, EEPS 225, HSTY 225, and PHIL 225.

BIOL 240. Personalized Medicine. 3 Units.
The emphasis of clinical practice is slowly shifting from one-disease and one-treatment-fits-all to more personalized care based on molecular markers of disease risk, disease subtype, drug effectiveness, and adverse drug reactions. This course, designed for non-biology majors, will introduce how the developments in gene sequencing, genetic markers, and stem cells can be applied for predictive testing and personalized therapies. Core concepts to be covered include the principles of genetics including the inheritance of traits determined by single genes and by multiple genes, the assignment of risk to particular genetic constitutions, and the nature and use of stem cells. The emergence of private companies as resources for the performance of the tests, and how the general public will be able to interpret their own data (with or without the access to genetic counselors), will also be covered. The course will include hands-on laboratory experiences of DNA manipulation and detection using the polymerase chain reaction and gel electrophoresis. The ethical, legal, and social issues associated with personal genetic testing will also be covered. This course does not count towards any Biology degree, nor towards the Biology minor.

BIOL 250. Introduction to Cell and Molecular Biology Systems. 3 Units.
This course will emphasize an understanding of living organisms at the cellular level from a molecular point of view. Topics to be covered will include: unity and diversity of living things, evolutionary relatedness, cells, tissues and organelles, life as a biochemical process, molecular building blocks of life, gene structure and function, uses of model organisms and molecular experimental methods. The topics to be covered are relevant to current practices in biotechnology, medicine and agriculture and these connections will be highlighted. This course is not open to students who have received credit for BIOL 214 and/or BIOL 215.

BIOL 251. Introduction to Organismal and Population Systems. 3 Units.
This course will emphasize an understanding of the regulation of the structure and function of organismal and population systems. Adopting an evolutionary perspective, the course will provide students with a comparative analysis of plant and animal solutions to the problem of multicellularity. Detailed exploration of animals will focus on the development of tissue and organ systems and their coordination at an organismal level. This systems approach will then be extended to regulation of ecosystems and abundance of organisms in populations.

BIOL 300. Dynamics of Biological Systems: A Quantitative Introduction to Biology. 3 Units.
This course will introduce students to dynamic biological phenomena, from the molecular to the population level, and models of these dynamical phenomena. It will describe a biological system, discuss how to model its dynamics, and experimentally evaluate the resulting models. Topics will include molecular dynamics of biological molecules, kinetics of cell metabolism and the cell cycle, biophysics of excitability, scaling laws for biological systems, biomechanics, and population dynamics. Mathematical tools for the analysis of dynamic biological processes will also be presented. Students will manipulate and analyze simulations of biological processes, and learn to formulate and analyze their own models. This course satisfies a laboratory requirement for the biology major. Offered as BIOL 300 and EBME 300.
BIOL 301. Biotechnology Laboratory: Genes and Genetic Engineering. 3 Units.
Laboratory training in recombinant DNA techniques. Basic microbiology, growth, and manipulation of bacteriophage, bacteria and yeast. Students isolate and characterize DNA, construct recombinant DNA molecules, and reintroduce them into eukaryotic cells (yeast, plant, animal) to assess their viability and function. Two laboratories per week. Offered as BIOL 301 and BIOL 401. Prereq: BIOL 215 or BIOL 250.

BIOL 302. Human Learning and the Brain. 3 Units.
This course focuses on the question, "How does the human brain learn?" Through assigned readings, extensive class discussions, and a major paper, each student will explore personal perspectives on learning. Specific topics include, but are not limited to: the brain's cycle of learning; neocortex structure and function; emotion and limbic brain; synapse dynamics and changes in learning; images in cognition; symbolic brain (language, mathematics, music); memory formation; and creative thought and brain mechanisms. The major paper will be added to each student's SAGES writing portfolio. In addition, near the end of the semester, each student will make an oral presentation on a chosen topic. Offered as: BIOL 302 and COGS 322.

BIOL 303. Principles of Chemical Biology. 4 Units.
This is a computer-assisted course and offers a detailed introduction into biological macromolecular structure and function with particular emphasis on proteins. Computer-assisted learning will follow each lecture and will involve either searching the Web for appropriate sources of information covered in the lecture or using spreadsheets and graphics to examine data extracted from the chemical biology and biomedical literature. For example, the protein database (PDB) and Rasmol software will be used to visualize and measure biological macromolecules and extracted data from the biomedical literature will be analyzed by standard graphical procedures employing the computer. This new format will offer the student the ability to learn to use the information resources on the Web together with the computing ability of the computer to explore the concepts presented in the course. This course satisfies a laboratory requirement for the biology major. Prereq: CHEM 105 and CHEM 106 or CHEM 111 and ENGR 145.

BIOL 304. Fitting Models to Data: Maximum Likelihood Methods and Model Selection. 3 Units.
This course will introduce students to maximum likelihood methods for fitting models to data and to ways of deciding which model is best supported by the data (model selection). Along the way, students will learn some basic tenets of probability and develop competency in R, a commonly used statistical package. Examples will be drawn from ecology, epidemiology, and potentially other areas of biology. The second half of the course is devoted to in-class projects, and students are encouraged to bring their own data. Offered as BIOL 304 and BIOL 404. Prereq: MATH 121 and MATH 122 OR MATH 125 and MATH 126.

BIOL 305. Herpetology. 4 Units.
Amphibians and reptiles exhibit tremendous diversity in development, physiology, anatomy, behavior and ecology. As a result, amphibians and reptiles have served as model organisms for research in many different fields of biology. This course will cover many aspects of amphibian and reptile biology, including anatomy, evolution, geographical distribution, physiological adaptations to their environment, reproductive strategies, moisture-, temperature-, and food-relations, sensory mechanisms, predator-prey relationships, communication (vocal, chemical, behavioral), population biology, and the effects of venomous snake bite. Laboratory sessions will be devoted to learning species identification and evolutionary relationships, discussion of the ecology of Ohio's amphibians and reptiles, survey techniques for determining population size and structure, and observations of the behavior of live reptiles and amphibians. Laboratory sessions may include trips to Squire Valleeve Farm, Cleveland Museum of Natural History, and Cleveland Metroparks Zoo. Prereq: BIOL 214 or BIOL 251.

BIOL 306. Dynamics of Biological Systems II: Tools for Mathematical Biology. 3 Units.
Building on the material in Biology 300, this course focuses on the mathematical tools used to construct and analyze biological models, with examples drawn largely from ecology but also from epidemiology, developmental biology, and other areas. Analytic "paper and pencil" techniques are emphasized, but we will also use computers to help develop intuition. By the end of the course, students should be able to recognize basic building blocks in biological models, be able to perform simple analysis, and be more fluent in translating between verbal and mathematical descriptions. Offered as BIOL 306 and MATH 376. Prereq: BIOL 300 or MATH 224 or MATH 228.

BIOL 307. Evolutionary Biology of the Invertebrates. 3 Units.
Important events in the evolution of invertebrate life, as well as structure, function, and phylogeny of major invertebrate groups.

BIOL 308. Molecular Biology: Genes and Genetic Engineering. 4 Units.
An examination of the flow of genetic information from DNA to RNA to protein. Topics include: nucleic acid structure; mechanisms and control of DNA, RNA, and protein biosynthesis; recombinant DNA; and mRNA processing and modification. Where possible, eukaryotic and prokaryotic systems are compared. Special topics include yeast as a model organism, molecular biology of cancer, and molecular biology of the cell cycle. Current literature is discussed briefly as an introduction to techniques of genetic engineering. Recommended preparation for BIOL 408 and BIOL 408: BIOC 307 or BIOL 214. Offered as BIOC 308, BIOL 308, BIOC 408, and BIOL 408. Prereq: BIOL 215 or BIOC 307.
BIOL 309. Introduction to Research in Mathematical Biology. 1 Unit.
The purpose of this seminar is to introduce students to some of the
research being done at Case that explores questions at the intersection
of mathematics and biology. Students will explore roughly five research
collaborations, spending two weeks with each research group. In the first
three classes of each two-week block, students will read and discuss
relevant papers, guided by members of that research group, and the two-
week period will culminate in a talk in which a member of the research
group will present a potential undergraduate project in that area. After
the final group’s talk, students will divide themselves into groups of two to
four people and choose one project for further exploration. Together, they
will write up this project as a research proposal, introducing the problem,
explaining how it connects to broader scientific questions, and outlining
the proposed work. It is expected that students will use the associated
research group as a resource, but the proposal should be their own work.
Students will submit a first draft, receive feedback, and then submit a
revised draft. Offered as BIOL 309 and MATH 342.

BIOL 312. Environmental Sculpture. 3 Units.
This course explores sculptural/architectural possibilities within three
environmental realms: the natural, urban, and social/communal. The
definition and application of “Sculpture” and “Architecture” may vary
dramatically from project to project, where the boundary between
sculpture and architecture may be blurred. Throughout, an emphasis on
ecological awareness will be maintained, as it relates to environmental
impact of structures in the landscape, as well as the materials and
pathway of construction. This course satisfies a laboratory requirement
for the biology major.

BIOL 314. Animal Cognition and Consciousness. 4 Units.
This course examines the notions of intelligence, cognition, reasoning,
consciousness, and mental content as they appear in the philosophical
views and empirical studies of animals in individual and social contexts.
We will review scientific findings that suggest striking likenesses and
intriguing differences in the (apparent) thought processes of humans
and animals, and ask whether the research techniques that brought us
these results are fully adequate to measuring such unobservable entities
as conscious experience and thought. Techniques of measurement
range from naturalistic observation, to the processing of vocalizations, to
memory and problem solving tasks, and the imaging of brain processes
through fMRI scans, etc. Students will face the challenges and rewards of
practicing these techniques and reworking philosophical theories in the
service component of the course. Students will participate in veterinary
or shelter work to provide needed animal care while studying animal
behavior using cognitive ethological methods. We will compare methods
for measuring consciousness and intelligence in animals to those used
for human beings, and ask questions about the possibility of machine
consciousness and the emergent property of group consciousness.
Offered as BIOL 314, COGS 314, PHIL 314 and PHIL 414.

BIOL 315. Quantitative Biology Laboratory. 3 Units.
This course will apply a range of quantitative techniques to explore
structure-function relations in biological systems. Using a case study
approach, students will explore causes of impairments of normal function,
will assemble diverse sets of information into a database format for the
analysis of causes of impairment, will analyze the data with appropriate
statistical and other quantitative tools, and be able to communicate their
results to both technical and non-technical audiences. The course has
one lecture and one lab per week. Students will be required to maintain a
journal of course activities and demonstrate mastery of quantitative tools
and statistical techniques. Graduate students will have a final project that
applies these techniques to a problem of their choice. Offered as BIOL
315 and BIOL 415. Prereq: BIOL 214 or BIOL 251.

BIOL 316. Fundamental Immunology. 4 Units.
Introductory immunology providing an overview of the immune system,
including activation, effector mechanisms, and regulation. Topics include
antigen-antibody reactions, immunologically important cell surface
receptors, cell-cell interactions, cell-mediated immunity, innate versus
adaptive immunity, cytokines, and basic molecular biology and signal
transduction in B and T lymphocytes, and immunopathology. Three
weekly lectures emphasize experimental findings leading to the concepts
of modern immunology. An additional recitation hour is required to
integrate the core material with experimental data and known immune
mediated diseases. Five mandatory 90 minute group problem sets per
semester will be administered outside of lecture and recitation meeting
times. Graduate students will be graded separately from undergraduates,
and 22 percent of the grade will be based on a critical analysis of a
recently published, landmark scientific article. Offered as BIOL 316, BIOL
416, CLBY 416, and PATH 416. Prereq: BIOL 215 and 215L.

BIOL 318. Introductory Entomology. 4 Units.
The goal of this course is to discover that, for the most part, insects
are not aliens from another planet. Class meetings will alternate with
some structured as lectures, while others are laboratory exercises.
Sometimes we will meet at the Cleveland Museum of Natural History,
or in the field to collect and observe insects. The 50 minute discussion
meeting once a week will serve to address questions from both lectures
and lab exercises. The students will be required to make a small but
comprehensive insect collection. Early in the semester we will focus on
collecting the insects, and later, when insects are gone for the winter,
we will work to identify the specimens collected earlier. Students will be
graded based on exams, class participation and their insect collections.
Offered as BIOL 318 and BIOL 418. Prereq: BIOL 214 and BIOL 215
and BIOL 216 or BIOL 250 and BIOL 251.
BIOL 319. Applied Probability and Stochastic Processes for Biology. 3 Units.
Applications of probability and stochastic processes to biological systems. Mathematical topics will include: introduction to discrete and continuous probability spaces (including numerical generation of pseudo random samples from specified probability distributions), Markov processes in discrete and continuous time with discrete and continuous state spaces, point processes including homogeneous and inhomogeneous Poisson processes and Markov chains on graphs, and diffusion processes including Brownian motion and the Ornstein-Uhlenbeck process. Biological topics will be determined by the interests of the students and the instructor. Likely topics include: stochastic ion channels, molecular motors and stochastic ratchets, actin and tubulin polymerization, random walk models for neural spike trains, bacterial chemotaxis, signaling and genetic regulatory networks, and stochastic predator-prey dynamics. The emphasis will be on practical simulation and analysis of stochastic phenomena in biological systems. Numerical methods will be developed using both MATLAB and the R statistical package. Student projects will comprise a major part of the course. Offered as BIOL 319, EECS 319, MATH 319, BIOL 419, EBMK 419, and PHOL 419. Prereq: MATH 224 or MATH 223 and BIOL 300 or BIOL 306 and MATH 201 or MATH 307 or consent of instructor.

BIOL 324. Introduction to Stem Cell Biology. 3 Units.
This discussion-based course will introduce students to the exciting field of stem cell research. Students will first analyze basic concepts of stem cell biology, including stem cell niche, cell quiescence, asymmetric cell division, cell proliferation and differentiation, and signaling pathways involved in these processes. This first part of the course will focus on invertebrate genetic models for the study of stem cells. In the second part of the course, students will search for primary research papers on vertebrate and human stem cells, and application of stem cell research in regenerative medicine and cancer. Finally, students will have the opportunity to discuss ethical controversies in the field. Students will rotate in weekly presentations, and will write two papers during the semester. Students will improve skills in searching and reading primary research papers, gain presentation skills, and further their knowledge in related subjects in the fields of cell biology, genetics and developmental biology. This course may be used as a cell/molecular subject area elective for the B.A. and B.S. Biology degrees. Offered as BIOL 324 and BIOL 424. Prereq: BIOL 325 or BIOL 326 or BIOL 362.

BIOL 325. Cell Biology. 3 Units.
This course will emphasize an understanding of the structure and function of eukaryotic cells from a molecular viewpoint. We will explore cell activities by answering the questions what do cells do and how do they do it. The answers to these questions will be developed using experimental evidence from the literature and explanations from the text. An important part of this course will be appreciation of the experimental evidence which supports our current understanding of cell function. To achieve this aim, students will read papers from the primary literature to supplement the text. Topics will include cell structure, protein structure and function, internal organization of the eukaryotic cell, membrane structure and function, protein sorting, organelle biogenesis, and cytoskeleton structure and function. The course will also cover the life cycles of cells, their interactions and finally use the immune response as a model of cell behavior. Prereq: BIOL 215 or BIOL 250.

BIOL 326. Genetics. 3 Units.
Transmission genetics, nature of mutation, microbial genetics, somatic cell genetics, recombinant DNA techniques and their application to genetics, human genome mapping, plant breeding, transgenic plants and animals, uniparental inheritance, evolution, and quantitative genetics. Offered as BIOL 326 and BIOL 426. Prereq: BIOL 214 or BIOL 250.

BIOL 328. Plant Genomics and Proteomics. 3 Units.
The development of molecular tools has impacted agriculture as much as human health. The application of new techniques to improve food crops, including the development of genetically modified crops, has also become controversial. This course covers the nature of the plant genome and the role of sequenced-based methods in the identification of the genes. The application of the whole suite of modern molecular tools to understand plant growth and development, with specific examples related agronomically important responses to biotic and abiotic stresses, is included. The impact of the enormous amounts of data generated by these methods and their storage and analysis (bioinformatics) is also considered. Finally, the impact on both the developed and developing world of the generation and release of genetically modified food crops will be covered. Recommended preparation: BIOL 326. Offered as BIOL 328 and BIOL 428.

BIOL 334. Structural Biology. 3 Units.
Introduces basic chemical properties of proteins and discusses the physical forces that determine protein structure. Topics include: the elucidation of protein structure by NMR and by X-ray crystallographic methods; the acquisition of protein structures from data bases; and simple modeling experiments based on protein structures. Offered as BIOL 334, BIOL 335, BIOL 434, and BIOL 435.

BIOL 336. Aquatic Biology. 3 Units.
Physical, chemical, and biological dynamics of lake ecosystems. Factors governing the distribution, abundance, and diversity of freshwater organisms. Prereq: BIOL 214 or BIOL 251.

BIOL 338. Ichthyology. 3 Units.
Biology of fishes. Students will first develop fundamental understanding of the evolutionary history and systematics of fishes to provide a context within which they can address diverse aspects of biology including anatomy, physiology (e.g., in species that change sex; osmoregulation in freshwater vs. saltwater), and behavior (e.g. visual, auditory, chemical, electric communication; social structures). Finally, this knowledge will be used to explore the biodiversity of fishes around the world, with emphasis on Ohio species, by examining preserved specimens in class and making two local field trips to (1) observe captive living specimens, and (2) to observe, capture, and identify wild fishes in their natural habitats. The course will conclude with an analysis of the current global fisheries crisis that has resulted from human activities. Fishes will be used to address broad topics in ecology and evolutionary biology that transcend the pure study of ichthyology. Recommended preparation for BIOL 438: BIOL 216. Offered as BIOL 338 and BIOL 438. Prereq: BIOL 216 or BIOL 251.

BIOL 339. Aquatic Biology Laboratory. 2 Units.
The physical, chemical, and biological limnology of freshwater ecosystems will be investigated. Emphasis will be on identification of the organisms inhabiting these systems and their ecological interactions with each other. This course will combine both field and laboratory analysis to characterize and compare the major components of these ponds. Students will have the opportunity to design and conduct individual projects. Prereq or Coreq: BIOL 336.
BIOL 340. Human Physiology. 3 Units.
This course will provide functional correlates to the students' previous knowledge of human anatomy. Building upon the basic principles covered in BIOL 216 and 346, the physiology of organs and organ systems of humans, including the musculoskeletal, nervous, cardiovascular, lymphatic, immune, respiratory, digestive, excretory, reproductive, and endocrine systems, will be studied at an advanced level. The contribution of each system to homeostasis will be emphasized. Prereq: BIOL 346 and BIOL 215 and BIOL 216 or BIOL 346 and BIOL 250 and BIOL 251.

BIOL 342. Parasitology. 3 Units.
This course will introduce students to classical and current parasitology. Students will discuss basic principles of parasitology, parasite life cycles, host-parasite interaction, therapeutic and control programs, epidemiology, and ecological and societal considerations. The course will explore diverse classes of parasitic organisms with emphasis on protozoan and helminthic diseases and the parasites' molecular biology. Group discussion and selected reading will facilitate further integrative learning and appreciation for parasite biology. This course counts as an elective in the cell/molecular biology subject area for the Biology BA and BS degrees. Offered as BIOL 342 and BIOL 442. Prereq: BIOL 214, 215, 216 and 326.

BIOL 343. Microbiology. 3 Units.
An introduction to the physiology, genetics, biochemistry, and diversity of microorganisms. The subject will be approached both as a basic biological science that studies the molecular and biochemical processes of cells and viruses, and as an applied science that examines the involvement of microorganisms in human disease as well as in workings of ecosystems, plant symbioses, and industrial processes. The course is divided into four major areas: bacteria, viruses, medical microbiology, and environmental and applied microbiology. Prereq: BIOL 215 or BIOL 250.

BIOL 344. Laboratory for Microbiology. 2 Units.
Practical microbiology, with an emphasis on bacteria as encountered in a variety of situations. Sterile techniques, principles of identification, staining and microscopy, growth and nutritional characteristics, genetics, enumeration methods, epidemiology, immunological techniques (including ELISA and T cell identification), antibiotics and antibiotic resistance, chemical diagnostic tests, sampling the human environment, and commercial applications. One lab per week. Prereq or Coreq: BIOL 343.

BIOL 345. Mammal Diversity and Evolution. 3 Units.
This course focuses on the morphologic and taxonomic diversity of mammals in a phylogenetic context. By the end of the course, students will be able to (1) describe the key morphological and physiological features of mammals; (2) identify the main anatomical characteristics of all orders and most families of extant, non-volant mammals; (3) interpret a phylogenetic tree and the data used to generate it; (4) appreciate major historical patterns in mammal diversity and biogeography. Two lectures and one lab each week; most labs will be specimen-based and will take place at the Cleveland Museum of Natural History. One weekend field trip to Cleveland Metroparks Zoo. This course satisfies a laboratory requirement for the biology major. Offered as ANAT 445, BIOL 345, and BIOL 445. Prereq: BIOL 214.

BIOL 346. Human Anatomy. 3 Units.
Gross anatomy of the human body. Two lectures and one laboratory demonstration per week. Prereq: BIOL 216 or BIOL 251.

BIOL 348. Human Anatomy and Physiology. 4 - 5 Units.
The anatomy and physiology of the human body. Enrollment is restricted to students majoring in nutrition. Four lectures and one laboratory per week. Offered as BIOL 348 and BIOL 448.

BIOL 351. Principles of Ecology. 3 Units.
This lecture course explores spatial and temporal relationships involving organisms and the environment at individual, population, and community levels. An underlying theme of the course will be neo-Darwinian evolution through natural selection with an emphasis on organismal adaptations to abiotic and biotic environments. Studies and models will illustrate ecological principles, and there will be some emphasis on the applicability of these principles to ecosystem conservation. Students taking the graduate level course will prepare a grant proposal in which hypotheses will be based on some aspect of ecological theory. Offered as BIOL 351 and BIOL 451. Prereq: BIOL 214 or BIOL 251.

BIOL 351L. Principles of Ecology Laboratory. 2 Units.
Students in this laboratory course will conduct a variety of ecological investigations that are designed to examine relationships involving organisms and the environment at individual, population, and community levels. Descriptive and hypothesis-driven investigations will take place at Case Western Reserve University's Squire Valleeve Farm, in both field and greenhouse settings. The course is designed to explore as well as test a variety of ecological paradigms. Students taking the graduate level course will prepare a grant proposal in which hypotheses will be based on a select number of lab investigations. This course satisfies a laboratory requirement for biology majors. Recommended preparation for BIOL 451L: prior or concurrent enrollment in BIOL 451. Offered as BIOL 351L and BIOL 451L. Prereq or Coreq: BIOL 351.

BIOL 353. Ecophysiology of Global Change. 3 Units.
Climate changes and natural selection, prior to human activities, have pre-equipped autotrophic organisms with a suite of adaptations to natural abiotic stress. Whether these adaptations are capable of dealing with current and future levels (magnitude, speed) of non-natural abiotic change is of great interest. This course will examine, in detail, the tight physiological interactions between plants and their variable environment. Emphasizing major aspects of indirect (UV-B, global warming, altered precipitation) and direct (CO2, O3, SOx, NOx) anthropogenic pollution, relevant plant cellular processes, and responses of plants to abiotic stress, will be examined. With this foundation, class discussions will explore scaled collective consequences of global change to plant-dominated terrestrial and aquatic ecosystems. Offered as BIOL 353 and BIOL 453. Prereq: BIOL 214 or BIOL 251.

BIOL 355. Ecophysiology of Global Change. 3 Units.
Climate changes and natural selection, prior to human activities, have pre-equipped autotrophic organisms with a suite of adaptations to natural abiotic stress. Whether these adaptations are capable of dealing with current and future levels (magnitude, speed) of non-natural abiotic change is of great interest. This course will examine, in detail, the tight physiological interactions between plants and their variable environment. Emphasizing major aspects of indirect (UV-B, global warming, altered precipitation) and direct (CO2, O3, SOx, NOx) anthropogenic pollution, relevant plant cellular processes, and responses of plants to abiotic stress, will be examined. With this foundation, class discussions will explore scaled collective consequences of global change to plant-dominated terrestrial and aquatic ecosystems. Offered as BIOL 353 and BIOL 453. Prereq: BIOL 214 or BIOL 251.
BIOL 357. Backyard Behavior Capstone. 3 Units.
Interesting animal behavior is all around us. We need not go into a laboratory to observe it, but laboratory tools can help to understand the behaviors that we encounter every day. We interact with animals in our homes, in forests and wilderness areas and even in our own backyards. As pet dogs or cats interact with wild squirrels and birds, they provide insights regarding predation, neumomechanics, and mating behaviors, just to list a few concepts. This course takes advantage of the rich behavior that exists around us to provide a capstone experience for students who have an interest in animal behavior. The course will be open to 10 senior Biology majors who have emphasized the animal behavior and neurobiology courses offered by the Biology department. Each student will have taken at least one advanced course in Animal Behavior, Neurobiology, or Neuroethology. Entry into the course will be by permit, and permits will be issued only after an interview in which each student demonstrates to the instructor a deep interest in animal behavior and underlying neural control systems. Through classroom discussion, viewing of behaviorally-based video shows, and field trips, each student will choose one behavior to investigate in detail over the course of the semester. In order to move beyond casual observation to in-depth analysis, video cameras will be available to the students, as well as computer based motion analysis systems. The class will meet as a group twice weekly. During this formal classroom period, students will discuss behaviors in general and , as the course progresses, the specific topics that each student is investigating. They will present journal articles that are relevant to their topics, a prospectus on their intended study, and ultimately describe their projects outside of class time and will present a poster at a public poster fair. Prereq: BIOL 305 or BIOL 318 or BIOL 358 or BIOL 373 or BIOL 374.

BIOL 358. Animal Behavior. 4 Units.
Ultimately the success or failure (i.e., life or death) of any individual animal is determined by its behavior. The ability to locate and capture food, avoid being food, acquiring and defending territory, and successfully passing your genes to the next generation, are all dependent on complex interactions between an animal’s design, environment and behavior. This course will be an integrative approach emphasizing experimental studies of animal behavior. You will be introduced to state-of-the-art approaches to the study of animal behavior, including neural and hormonal mechanisms, genetic and developmental mechanisms and ecological and evolutionary approaches. We will learn to critique examples of current scientific papers, and learn how to conduct observations and experiments with real animals. We will feature guest appearances by the Curator of Research from the Cleveland MetroParks Zoo and visits to working animal behavior research labs here at CWRU. Group discussions and writing will be emphasized. This course satisfies a laboratory requirement for biology majors. Offered as BIOL 358 and BIOL 458. Prereq: BIOL 214 and BIOL 215 and BIOL 216 or BIOL 250 and BIOL 251.

BIOL 359. Genetic Basis of Behavior. 3 Units.
In this course, students will discuss scientific papers on Drosophila behavior. Emphasis will be given to studies that employ the powerful genetic tools available in Drosophila to the study of behavior. The topics covered will include: innate behaviors (e.g. sexual behavior); learning and memory; sensory information processing; anatomy of the Drosophila adult brain; genetic screenings for behavioral mutants; genetic tools to interfere with behavioral response. Students will be required to write and develop an objective project that combines genetics with behavioral tests. Students will be graded in presentations as well as a final grant proposal. Lab component will consist of experimentation in flies using genetics and behavioral analyses, to be carried out in the last 6 weeks of the course. Counts as a Biology laboratory course for the B.A. and B.S. Biology degrees. Offered as BIOL 359 and BIOL 459. Prereq: BIOL 216 or BIOL 251.

BIOL 361. Building an Educational Website: Zebrafish in the Classroom. 3 Units.
Students with backgrounds in computer science and biology will work together to build a “Zebrafish in the Classroom” website. The zebrafish model system has many characteristics that make it an excellent tool for teaching: embryos are easy to obtain in large numbers, development can be observed in vivo using simple dissecting microscopes, and mutants can be used to demonstrate principles of development and genetics. Although scientists around the world are using zebrafish in their courses, there is no centralized place for educators and students to share ideas and materials. During this course, students will create content for and build a website that will disseminate ideas for using zebrafish as a teaching tool. In its mature form, the website will contain protocols for using zebrafish in laboratory courses for students at all stages of their education, tours, movies, discussion and question boards, and an online journal where students can publish their work. Students enrolling in this course should have background in web design or developmental biology. Prereq: BIOL 362.

BIOL 362. Principles of Developmental Biology. 3 Units.
The descriptive and experimental aspects of animal development. Gametogenesis, fertilization, cleavage, morphogenesis, induction, differentiation, organogenesis, growth, and regeneration. Prereq: BIOL 216 or BIOL 251 or EBME 201 and EBME 202.

BIOL 363. Experimental Developmental Biology. 3 Units.
This laboratory course will teach concepts and techniques in developmental biology. Emphasis will be on the mechanisms that pattern the embryo during development and how these mechanisms are explored using molecular, cellular, and genetic approaches. A term research paper is required. Students taking the graduate level course will prepare a grant proposal. One laboratory and one lecture per week. Offered as BIOL 363 and BIOL 463. Prereq: BIOL 362.
BIOL 364. Research Methods in Evolutionary Biology. 3 Units.
The process of evolution explains not only how the present diversity of life on earth has formed, but also provides insights into current pressing issues today, including the spread of antibiotic resistance, the causes of geographic variation in genetic diseases, and explanations for modern patterns of extinction risk. Students in Research Methods in Evolutionary Biology will be introduced to several of the major research approaches of evolutionary biology, including methods of measuring natural selection on the phenotypic and genotypic levels, quantifying the rate of evolution, reconstructing evolutionary relationships, and assessing the factors that affect rates of speciation and extinction. The course will consist of a combination of interactive lectures, in-class problem solving and data analysis, and the discussion of peer-reviewed scientific papers. Grades are based on participation in class, discussions and written summaries of published papers, in-class presentations, and two writing assignments. Offered as BIOL 364 and BIOL 464. Prereq: BIOL 214 or BIOL 251.

BIOL 365. Evo-Devo: Evolution of Body Plans. 3 Units.
This discussion-based course offers a detailed introduction to Evolutionary Developmental Biology. The field seeks to explain evolutionary events through the mechanisms of Developmental Biology and Genetics. The course is structured into different modules. First we will look at the developmental genetic mechanisms that can cause variation. Then we focus on how alterations of these mechanisms can generate novel structural changes. We will then examine a few areas of active debate, where Evo-Devo is attempting to solve major problems in evolutionary biology. We will conclude with two writing assignments. Students will be required to present, read, and discuss primary literature in each module. Offered as BIOL 365 and BIOL 465. Prereq: BIOL 225 or BIOL 251 or BIOL 362

BIOL 366. Genes, Embryos and Fossils. 3 Units.
This multidisciplinary seminar course is designed to help students understand fundamental concepts of development and evolution of biological systems. Because scientists communicate their ideas through journal articles, seminars, and in grant proposals, the course will focus upon reading and synthesizing primary literature. In this discussion-based course, students will also learn to effectively present and write on three topics that are at the exciting intersection of genetics, developmental biology, and evolution. Finally, students will be provided with the technical and intellectual skills which are needed to write a grant proposal and a literature review. Prereq: BIOL 225, BIOL 326, BIOL 251, BIOL 362 or BIOL 365.

BIOL 368. Topics in Evolutionary Biology. 3 Units.
The focus for this course on a special topic of interest in evolutionary biology will vary from one offering to the next. Examples of possible topics include theories of speciation, the evolution of language, the evolution of sex, evolution and biodiversity, molecular evolution. ANAT/ ANTH/EEPS/PHIL/PHOL 467/BIOL 468 will require a longer, more sophisticated term paper, and additional class presentation. Offered as ANTH 367, BIOL 368, EEPS 367, PHIL 367, ANAT 467, ANTH 467, BIOL 468, EEPS 467, PHIL 467 and PHOL 467.

BIOL 369. Evolutionary Biology Capstone. 3 Units.
This course focuses on a special topic of interest in evolutionary biology that will vary from one offering to the next. Examples of possible topics include theories of speciation, the evolution of language, the evolution of sex, evolution and biodiversity, molecular evolution. Students will participate in discussions and lead class seminars on evolutionary topics and in collaboration with an advisor or advisors, select a topic for a research paper or project. Each student will write a major research report or complete a major project and will make a public presentation of her/his findings. Offered as ANTH 368, BIOL 369, PHIL 368.

BIOL 373. Introduction to Neurobiology. 3 Units.
How nervous systems control behavior. Biophysical, biochemical, and molecular biological properties of nerve cells, their organization into circuitry, and their function within networks. Emphasis on quantitative methods for modeling neurons and networks, and on critical analysis of the contemporary technical literature in the neurosciences. Term paper required for graduate students. Offered as BIOL 373, BIOL 473, and NEUR 473.

BIOL 374. Neurobiology of Behavior. 3 Units.
In this course, students will examine how neurobiologists interested in animal behavior study the linkage between neural circuitry and complex behavior. Various vertebrate and invertebrate systems will be considered. Several exercises will be used in this endeavor. Although some lectures will provide background and context on specific neural systems, the emphasis of the course will be on classroom discussion of specific journal articles. In addition, students will each complete a project in which they will observe some animal behavior and generate both behavioral and neurobiological hypotheses related to it. In lieu of examinations, students will complete three written assignments, including a theoretical grant proposal, a one-page Specific Aims paper related to the project, and a final project paper. These assignments are designed to give each student experience in writing biologically-relevant documents. Classroom discussions will help students understand the content and format of each type document. They will also present their projects orally to the entire class. Offered as BIOL 374, BIOL 474, and NEUR 474.

BIOL 376. Neurobiology Laboratory. 3 Units.
Introduction to the basic laboratory techniques of neurobiology. Intracellular and extracellular recording techniques, forms of synaptic plasticity, patch clamping, immunohistochemistry and confocal microscopy. During the latter weeks of the course students will be given the opportunity to conduct an independent project. One laboratory and one discussion session per week. Recommended preparation for BIOL 476 and NEUR 476: BIOL 216. Offered as BIOL 376, BIOL 476 and NEUR 476. Prereq: BIOL 216 or BIOL 251.
BIOL 377. Biorobotics Team Research. 3 Units.
Many exciting research opportunities cross disciplinary lines. To participate in such projects, researchers must operate in multi-disciplinary teams. The Biorobotics Team Research course offers a unique capstone opportunity for undergraduate students to utilize skills they developed during their undergraduate experience while acquiring new teaming skills. A group of eight students form a research team under the direction of two faculty leaders. Team members are chosen from appropriate majors through interviews with the faculty. They will research a biological mechanism or principle and develop a robotic device that captures the actions of that mechanism. Although each student will cooperate on the team, they each have a specific role, and must develop a final paper that describes the research generated on their aspect of the project. Students meet for one class period per week and two 2-hour lab periods. Initially students brainstorm ideas and identify the project to be pursued. They then acquire biological data and generate robotic designs. Both are further developed during team meetings and reports. Final oral reports and a demonstration of the robotic device occur in week 15. Offered as BIOL 377, EMAE 377, BIOL 477, and EMAE 477.

BIOL 378. Computational Neuroscience. 3 Units.
Computer simulations and mathematical analysis of neurons and neural circuits, and the computational properties of nervous systems. Students are taught a range of models for neurons and neural circuits, and are asked to implement and explore the computational and dynamic properties of these models. The course introduces students to dynamical systems theory for the analysis of neurons and neural learning, models of brain systems, and their relationship to artificial and neural networks. Term project required. Students enrolled in MATH 478 will make arrangements with the instructor to attend additional lectures and complete additional assignments addressing mathematical topics related to the course. Recommended preparation: MATH 223 and MATH 224 or BIOL 300 and BIOL 306. Offered as BIOL 378, COGS 378, MATH 378, BIOL 478, EBME 478, EECS 478, MATH 478 and NEUR 478.

BIOL 379. Neuroscience of Communication and Communication Disorders. 3 Units.
The course focus is neuroanatomy and neurophysiology related to motor control and cognition, particularly aspects of cognition involved in language functions. Topics to be addressed include: principles of neurophysiology and neurochemistry; functional neuroanatomy of the central and peripheral nervous systems; neurological and neuropsychological assessment of communication; neurodiagnostic methods. In part, the course material will be presented in a problem-based learning format. That is, normal aspects of human neuroscience will be discussed in the context of neurological disorders affecting communication. COSI 405 is an introduction to COSI 557 and COSI 561. Offered as BIOL 379 and COSI 305 and COSI 405.

BIOL 382. Drugs, Brain, and Behavior. 3 Units.
This course is concerned with the mechanisms underlying neurochemical signaling and the impact of drugs on those mechanisms. The first half of the course emphasizes the fundamental mechanisms underlying intra- and extracellular communication of neurons and the basic principles of how drugs interact with the nervous system. The second half of the course emphasizes understanding the neural substrates of disorders of the nervous system, and the mechanisms underlying the therapeutic effects of drugs at the cellular and behavioral levels. This course will consist of lectures designed to give the student necessary background for understanding these basic principles and class discussion. The class discussion will include viewing video examples of behavioral effects of disorders of the nervous system, and analysis of research papers. The goal of the class discussions is to enhance the critical thinking skills of the student and expose the student to contemporary research techniques. Offered as BIOL 382, BIOL 482, and NEUR 482. Prereq: BIOL 215 and BIOL 216 or BIOL 250 and BIOL 251.

BIOL 384. Reading and Writing Like an Ecologist. 3 Units.
Students usually learn from textbooks, but scientists communicate with each other through journal articles. The purpose of this class is to help you learn to read and write like an ecologist. We will spend our time reading and discussing journal articles about three or four issues in ecology, including papers from both empirical and theoretical perspectives. In addition to the science, we’ll talk about strategies for how to keep reading when you encounter something you don’t understand and what makes a paper well or poorly written. At the end of each section, you will synthesize your ideas into a review article. Your initial paper will be submitted to me as hypothetical journal editor. I will send your paper out for review to two fellow classmates, and I’ll send their comments back to you along with brief comments of my own. As all scientists know, it is virtually unheard of for a journal to accept a paper for publication without revisions. After this peer review, you will revise your papers and resubmit them to me. Your grade will be based on your participation in class discussions, your papers (both drafts) and your work as a reviewer for other students. Prereq: BIOL 214 or BIOL 251.

BIOL 385. Seminar on Biological Processes in Learning and Cognition. 3 Units.
Students will read and discuss research papers on a range of topics relevant to the biological processes that lead to cognition and learning in humans. Sample topics are: cellular and molecular mechanisms of memory; visual sensory detection of images, movement, and color; role of slow neurotransmitters in synaptic plasticity; cortical distribution of cognitive functions such as working memory, decision making, and image analysis; functions of emotion-structures and their role in cognition; brain structures and mechanisms involved in language creation; others. Some papers will be assigned and others will be selected by students. Discussions will focus on the methods used, the experimental results, and the interpretations of significance. Students will work in groups on a research project to be presented near the end of the semester. Prereq: BIOL 302.

BIOL 388. Undergraduate Research. 1 - 3 Units.
Guided laboratory research under the sponsorship of a biology faculty member. May be carried out within the biology department or in associated departments. May be taken only one semester during the student’s academic career. Appropriate forms must be secured in the biology department office. A written report must be approved by the biology sponsor and submitted to the chairman of the biology department before credit is granted.
BIOL 388S. Undergraduate Research - SAGES Capstone. 3 Units.
Guided laboratory research under the sponsorship of a biology faculty member. May be carried out within the biology department or in associated departments. May be taken only one semester during the student's academic career. Appropriate forms must be secured in the biology department office. A written report must be approved by the biology sponsor and submitted to the chairman of the biology department before credit is granted. A public presentation is required.

BIOL 389. Selected Topics. 1 - 3 Unit.
Individual library research projects under the guidance of a biology sponsor. A major paper must be submitted and approved before credit is awarded.

BIOL 389S. Selected Topics in Biology--SAGES Capstone. 3 Units.
Individual library research projects under the guidance of a biology sponsor. A major paper must be submitted and approved before credit is awarded. A public presentation is required.

BIOL 390. Advanced Undergraduate Research. 1 - 3 Unit.
Offered on a credit only basis. Students may carry out research in biology or related departments, but a biology sponsor is required. Does not count toward the 30 hours required for a major in biology, but may be counted toward the total number of hours required for graduation. A written report must be submitted to the chairman's office and approved before credit is granted.

BIOL 394. Seminar in Evolutionary Biology. 3 Units.
This seminar investigates 20th-century evolutionary theory, especially the Modern Evolutionary synthesis and subsequent expansions of and challenges to that synthesis. The course encompasses the multidisciplinary nature of the science of evolution, demonstrating how disciplinary background influences practitioners' conceptualizations of pattern and process. This course emphasizes practical writing and research skills, including formulation of testable theses, grant proposal techniques, and the implementation of original research using the facilities on campus and at the Cleveland Museum of Natural History. Offered as ANTH 394, BIOL 394, EEPS 394, HSTY 394, PHIL 394, ANTH 494, BIOL 494, EEPS 494, HSTY 494, and PHIL 494.

BIOL 395. Research Discussions. 1 Unit.
This is a seminar course which provides a forum within which students performing undergraduate research, or who have done so previously, can present and discuss their projects. Discussions will cover all aspects of the students' research projects: background material, experimental design and methods, results and their analysis and conclusions. At the beginning of the semester, each student will briefly outline his or her project and distribute a few key papers to provide background reading for all participants. After this introductory phase, each student will make a presentation of his/her own research. Graded as pass/fail, based upon attendance and participation. Prereq: BIOL 388. Prereq or coreq: BIOL 390.

BIOL 396. Undergraduate Research in Evolutionary Biology. 3 Units.
Students propose and conduct guided research on an aspect of evolutionary biology. The research will be sponsored and supervised by a member of the CASE faculty or other qualified professional. A written report must be submitted to the Evolutionary Biology Steering Committee before credit is granted. Offered as ANTH 396, BIOL 396, EEPS 396, and PHIL 396.

BIOL 401. Biotechnology Laboratory: Genes and Genetic Engineering. 3 Units.
Laboratory training in recombinant DNA techniques. Basic microbiology, growth, and manipulation of bacteriophage, bacteria and yeast. Students isolate and characterize DNA, construct recombinant DNA molecules, and reintroduce them into eukaryotic cells (yeast, plant, animal) to assess their viability and function. Two laboratories per week. Offered as BIOL 301 and BIOL 401.

BIOL 402. Principles of Neural Science. 3 Units.
Lecture/discussion course covering concepts in cell and molecular neuroscience, principles of systems neuroscience as demonstrated in the somatosensory system, and fundamentals of the development of the nervous system. This course will prepare students for upper level Neuroscience courses and is also suitable for students in other programs who desire an understanding of neurosciences. Recommended preparation: CBIO 453. Offered as BIOL 402 and NEUR 402.

BIOL 404. Fitting Models to Data: Maximum Likelihood Methods and Model Selection. 3 Units.
This course will introduce students to maximum likelihood methods for fitting models to data and to ways of deciding which model is best supported by the data (model selection). Along the way, students will learn some basic tenets of probability and develop competency in R, a commonly used statistical package. Examples will be drawn from ecology, epidemiology, and potentially other areas of biology. The second half of the course is devoted to in-class projects, and students are encouraged to bring their own data. Offered as BIOL 304 and BIOL 404. Prereq: MATH 121 & 122 OR MATH 125 &126 or consent of instructor.

BIOL 407. General Biochemistry. 4 Units.
Overview of the macromolecules and small molecules key to all living systems. Topics include: protein structure and function; enzyme mechanisms, kinetics and regulation; membrane structure and function; bioenergetics; hormone action; intermediary metabolism, including pathways and regulation of carbohydrate, lipid, amino acid, and nucleotide biosynthesis and breakdown. One semester of biology is recommended. Offered as BIOC 307, BIOC 407, and BIOL 407.

BIOL 408. Molecular Biology: Genes and Genetic Engineering. 4 Units.
An examination of the flow of genetic information from DNA to RNA to protein. Topics include: nucleic acid structure; mechanisms and control of DNA, RNA, and protein biosynthesis; recombinant DNA; and mRNA processing and modification. Where possible, eukaryotic and prokaryotic systems are compared. Special topics include yeast as a model organism, molecular biology of cancer, and molecular biology of the cell cycle. Current literature is discussed briefly as an introduction to techniques of genetic engineering. Recommended preparation for BIOC 408 and BIOL 408: BIOC 307 or BIOL 214. Offered as BIOC 308, BIOL 308, BIOC 408, and BIOL 408. Prereq: BIOL 215 or BIOC 307.
BiOL 415. Quantitative Biology Laboratory. 3 Units.
This course will apply a range of quantitative techniques to explore structure-function relations in biological systems. Using a case study approach, students will explore causes of impairments of normal function, will assemble diverse sets of information into a database format for the analysis of causes of impairment, will analyze the data with appropriate statistical and other quantitative tools, and be able to communicate their results to both technical and non-technical audiences. The course has one lecture and one lab per week. Students will be required to maintain a journal of course activities and demonstrate mastery of quantitative tools and statistical techniques. Graduate students will have a final project that applies these techniques to a problem of their choice. Offered as BiOL 315 and BiOL 415.

BiOL 416. Fundamental Immunology. 4 Units.
Introductory immunology providing an overview of the immune system, including activation, effector mechanisms, and regulation. Topics include antigen-antibody reactions, immunologically important cell surface receptors, cell-cell interactions, cell-mediated immunity, innate versus adaptive immunity, cytokines, and basic molecular biology and signal transduction in B and T lymphocytes, and immunopathology. Three weekly lectures emphasize experimental findings leading to the concepts of modern immunology. An additional recitation hour is required to integrate the core material with experimental data and known immune mediated diseases. Five mandatory 90 minute group problem sets per semester will be administered outside of lecture and recitation meeting times. Graduate students will be graded separately from undergraduates, and 22 percent of the grade will be based on a critical analysis of a recently published, landmark scientific article. Offered as BiOL 316, BiOL 416, CLBY 416, and PATH 416. Prereq: Graduate standing.

BiOL 417. Cytokines: Function, Structure, and Signaling. 3 Units.
Regulation of immune responses and differentiation of leukocytes is modulated by proteins (cytokines) secreted and/or expressed by both immune and non-immune cells. Course examines the function, expression, gene organization, structure, receptors, and intracellular signaling of cytokines. Topic include regulatory and inflammatory cytokines, colony stimulating factors, chemokines, cytokine and cytokine receptor gene families, intracellular signaling through STAT proteins and tyrosine phosphorylation, clinical potential, and genetic defects. Lecture format using texts, scientific reviews and research articles. Recommended preparation: PATH 416 or equivalent. Offered as BiOL 417, CLBY 417, and PATH 417.

BiOL 418. Introductory Entomology. 4 Units.
The goal of this course is to discover that, for the most part, insects are not aliens from another planet. Class meetings will alternate; with some structured as lectures, while others are laboratory exercises. Sometimes we will meet at the Cleveland Museum of Natural History, or in the field to collect and observe insects. The 50 minute discussion meeting once a week will serve to address questions from both lectures and lab exercises. The students will be required to make a small but comprehensive insect collection. Early in the semester we will focus on collecting the insects, and later, when insects are gone for the winter, we will work to identify the specimens collected earlier. Students will be graded based on exams, class participation and their insect collections. Offered as BiOL 318 and BiOL 418. Prereq: BiOL 214, and BiOL 215, and BiOL 216.

BiOL 419. Applied Probability and Stochastic Processes for Biology. 3 Units.
Applications of probability and stochastic processes to biological systems. Mathematical topics will include: introduction to discrete and continuous probability spaces (including numerical generation of pseudo random samples from specified probability distributions), Markov processes in discrete and continuous time with discrete and continuous sample spaces, point processes including homogeneous and inhomogeneous Poisson processes and Markov chains on graphs, and diffusion processes including Brownian motion and the Ornstein-Uhlenbeck process. Biological topics will be determined by the interests of the students and the instructor. Likely topics include: stochastic ion channels, molecular motors and stochastic ratchets, actin and tubulin polymerization, random walk models for neural spike trains, bacterial chemotaxis, signaling and genetic regulatory networks, and stochastic predator-prey dynamics. The emphasis will be on practical simulation and analysis of stochastic phenomena in biological systems. Numerical methods will be developed using both MATLAB and the R statistical package. Student projects will comprise a major part of the course. Offered as BiOL 319, EECS 319, MATH 319, BiOL 419, EBME 419, and PHOL 419.

BiOL 424. Introduction to Stem Cell Biology. 3 Units.
This discussion-based course will introduce students to the exciting field of stem cell research. Students will first analyze basic concepts of stem cell biology, including stem cell niche, cell quiescence, asymmetric cell division, cell proliferation and differentiation, and signaling pathways involved in these processes. This first part of the course will focus on invertebrate genetic models for the study of stem cells. In the second part of the course, students will search for primary research papers on vertebrate and human stem cells, and application of stem cell research in regenerative medicine and cancer. Finally, students will have the opportunity to discuss about ethical controversies in the field. Students will rotate in weekly presentations, and will write two papers during the semester. Students will improve skills on searching and reading primary research papers, gain presentation skills, and further their knowledge in related subjects in the fields of cell biology, genetics and developmental biology. This course may be used as a cell/molecular subject area elective for the B.A. and B.S. Biology degrees. Offered as BiOL 324 and BiOL 424. Prereq: Graduate standing.

BiOL 426. Genetics. 3 Units.
Transmission genetics, nature of mutation, microbial genetics, somatic cell genetics, recombinant DNA techniques and their application to genetics, human genome mapping, plant breeding, transgenic plants and animals, uniparental inheritance, evolution, and quantitative genetics. Offered as BiOL 326 and BiOL 426.

BiOL 427. Neural Development. 3 Units.
Topics include cell commitment, regulation of proliferation and differentiation, cell death and trophic factors, pathfinding by the outgrowing nerve fiber, synapse formation, relationships between center and periphery in development and the role of activity. Offered as BiOL 427 and NEUR 427.
BIOL 428. Plant Genomics and Proteomics. 3 Units.
The development of molecular tools has impacted agriculture as much as human health. The application of new techniques to improve food crops, including the development of genetically modified crops, has also become controversial. This course covers the nature of the plant genome and the role of sequenced-based methods in the identification of the genes. The application of the whole suite of modern molecular tools to understand plant growth and development, with specific examples related agronomically important responses to biotic and abiotic stresses, is included. The impact of the enormous amounts of data generated by these methods and their storage and analysis (bioinformatics) is also considered. Finally, the impact on both the developed and developing world of the generation and release of genetically modified food crops will be covered. Recommended preparation: BIOL 326. Offered as BIOL 328 and BIOL 428.

BIOL 431. Statistical Methods I. 3 Units.
Application of statistical techniques with particular emphasis on problems in the biomedical sciences. Basic probability theory, random variables, and distribution functions. Point and interval estimation, regression, and correlation. Problems whose solution involves using packaged statistical programs. First part of year-long sequence. Offered as ANAT 431, BIOL 431, CRSP 431, EPBI 431, and MPHP 431.

BIOL 432. Statistical Methods II. 3 Units.
Methods of analysis of variance, regression and analysis of quantitative data. Emphasis on computer solution of problems drawn from the biomedical sciences. Design of experiments, power of tests, and adequacy of models. Offered as BIOL 432, CRSP 432, EPBI 432, and MPHP 432. Prereq: EPBI 431 or equivalent.

BIOL 434. Structural Biology. 3 Units.
Introduces basic chemical properties of proteins and discusses the physical forces that determine protein structure. Topics include: the elucidation of protein structure by NMR and by X-ray crystallographic methods; the acquisition of protein structures from data bases; and simple modeling experiments based on protein structures. Offered as BIOC 334, BIOL 334, BIOC 434, and BIOL 434.

BIOL 438. Ichthyology. 3 Units.
Biology of fishes. Students will first develop fundamental understanding of the evolutionary history and systematics of fishes to provide a context within which they can address diverse aspects of biology including anatomy, physiology (e.g., in species that change sex; osmoregulation in freshwater vs. saltwater), and behavior (e.g. visual, auditory, chemical, electric communication; social structures). Finally, this knowledge will be used to explore the biodiversity of fishes around the world, with emphasis on Ohio species, by examining preserved specimens in class and making two local field trips to (1) observe captive living specimens, and (2) to observe, capture, and identify wild fishes in their natural habitats. The course will conclude with an analysis of the current global fisheries crisis that has resulted from human activities. Fishes will be used to address broad topics in ecology and evolutionary biology that transcend the pure study of ichthyology. Recommended preparation for BIOL 438: BIOL 216. Offered as BIOL 338 and BIOL 438.

BIOL 442. Parasitology. 3 Units.
This course will introduce students to classical and current parasitology. Students will discuss basic principles of parasitology, parasite life cycles, host-parasite interaction, therapeutic and control programs, epidemiology, and ecological and societal considerations. The course will explore diverse classes of parasitic organisms with emphasis on protozoan and helminthic diseases and the parasites’ molecular biology. Group discussion and selected reading will facilitate further integrative learning and appreciation for parasite biology. This course counts as an elective in the cell/molecular biology subject area for the Biology BA and BS degrees. Offered as BIOL 342 and BIOL 442. Prereq: Graduate standing and consent of instructor.

BIOL 443. Advanced Microbiology. 3 Units.
The physiology, genetics, biochemistry, and diversity of microorganisms. The subject will be approached both as a basic biological science that studies the molecular and biochemical processes of cells and viruses, and as an applied science that examines the involvement of microorganisms in human disease as well as in the workings of ecosystems, plant symbioses, and industrial processes. The course is divided into four major areas: bacteria, viruses, medical microbiology, and environmental and applied microbiology. Recommended preparation: BIOL 215 or consent of instructor.

BIOL 445. Mammal Diversity and Evolution. 3 Units.
This course focuses on the morphologic and taxonomic diversity of mammals in a phylogenetic context. By the end of the course, students will be able to (1) describe the key morphological and physiological features of mammals; (2) identify the main anatomical characteristics of all orders and most families of extant, non-volant mammals; (3) interpret a phylogenetic tree and the data used to generate it; (4) appreciate major historical patterns in mammal diversity and biogeography. Two lectures and one lab each week; most labs will be specimen-based and will take place at the Cleveland Museum of Natural History. One weekend field trip to Cleveland Metroparks Zoo. This course satisfies a laboratory requirement for the biology major. Offered as ANAT 445, BIOL 345, and BIOL 445. Prereq: BIOL 214.

BIOL 448. Human Anatomy and Physiology. 4 - 5 Units.
The anatomy and physiology of the human body. Enrollment is restricted to students majoring in nutrition. Four lectures and one laboratory per week. Offered as BIOL 348 and BIOL 448.

BIOL 451. Principles of Ecology. 3 Units.
This lecture course explores spatial and temporal relationships involving organisms and the environment at individual, population, and community levels. An underlying theme of the course will be neo-Darwinian evolution through natural selection with an emphasis on organismal adaptations to abiotic and biotic environments. Studies and models will illustrate ecological principles, and there will be some emphasis on the applicability of these principles to ecosystem conservation. Students taking the graduate level course will prepare a grant proposal in which hypotheses will be based on some aspect of ecological theory. Offered as BIOL 351 and BIOL 451.
BIOL 451L. Principles of Ecology Laboratory. 2 Units.
Students in this laboratory course will conduct a variety of ecological investigations that are designed to examine relationships involving organisms and the environment at individual, population, and community levels. Descriptive and hypothesis-driven investigations will take place at Case Western Reserve University's Squire Valley Farm, in both field and greenhouse settings. The course is designed to explore as well as test a variety of ecological paradigms. Students taking the graduate level course will prepare a grant proposal in which hypotheses will be based on a select number of lab investigations. This course satisfies a laboratory requirement for biology majors. Recommended preparation for BIOL 451L: prior or concurrent enrollment in BIOL 451. Offered as BIOL 351L and BIOL 451L.

BIOL 453. Ecophysiology of Global Change. 3 Units.
Climate changes and natural selection, prior to human activities, have pre-equipped autotrophic organisms with a suite of adaptations to natural abiotic stress. Whether these adaptations are capable of dealing with current and future levels (magnitude, speed) of nonnatural abiotic change is of great interest. This course will examine, in detail, the tight physiological interactions between plants and their variable environment. Emphasizing major aspects of indirect (UV-B, global warming, altered precipitation) and direct (CO2, O3, SOx, NOx) anthropogenic pollution, relevant plant cellular processes, and responses of plants to abiotic stress, will be examined. With this foundation, class discussions will explore scaled collective consequences of global change to plant-dominated terrestrial and aquatic ecosystems. Offered as BIOL 353 and BIOL 453.

BIOL 454. Coadaptation of Organisms. 3 Units.
This graduate level course will examine biological interactions that result in organismal coadaptation and its ecological implications. Darwin was an avid observer of biological interactions that result in organismal coadaptation and its ecological implications. Darwin was an avid observer of biological interactions and his theory of evolution by natural selection focused primarily on one type of interaction: competition between individuals especially those of the same species. However, Darwin did not explicitly consider the role of cooperation in biological evolution. Nonetheless, cooperation can be a key agent in the coadaptation of organisms and in fact may have led to the evolution of eukaryotes. Three broad types of interactions will be examined in this course: competition, parasitism and cooperation. A particular focus of the course will be on biological cooperation or mutualism. Case studies will be presented to highlight the possible range of biological coadaptation. Lectures will be supplemented by discussion of the relevant literature.

BIOL 457. Proteins and Nucleic Acids. 3 Units.
The goal of this course is to provide a basic working knowledge of protein structure/function and molecular biology. The course begins with a discussion of protein structure and enzyme catalysis followed by protein purification and characterization. The course then addresses concepts relating to the application of modern molecular biology techniques. Students are taught how to clone genes and use these clones in animal and cell-based studies. The overall goal is to provide students with an understanding of proteins and genetic approaches that can be used in experimental work and to facilitate comprehension of the scientific literature. Offered as BIOL 457 and PHOL 456.

BIOL 458. Animal Behavior. 4 Units.
Ultimately the success or failure (i.e., life or death) of any individual animal is determined by its behavior. The ability to locate and capture food, avoid being food, acquiring and defending territory, and successfully passing your genes to the next generation, are all dependent on complex interactions between an animal's design, environment and behavior. This course will be an integrative approach emphasizing experimental studies of animal behavior. You will be introduced to state-of-the-art approaches to the study of animal behavior, including neural and hormonal mechanisms, genetic and developmental mechanisms and ecological and evolutionary approaches. We will learn to critique examples of current scientific papers, and learn how to conduct observations and experiments with real animals. We will feature guest appearances by the Curator of Research from the Cleveland MetroParks Zoo and visits to working animal behavior research labs here at CWRU. Group discussions and writing will be emphasized. This course satisfies a laboratory requirement for biology majors. Offered as BIOL 358 and BIOL 458.

BIOL 459. Genetic Basis of Behavior. 3 Units.
In this course, students will discuss scientific papers on Drosophila behavior. Emphasis will be given to studies that employ the powerful genetic tools available in Drosophila to the study of behavior. The topics covered will include: innate behaviors (e.g. sexual behavior); learning and memory; sensory information processing; anatomy of the Drosophila adult brain; genetic screenings for behavioral mutants; genetic tools to interfere with behavioral response. Students will be required to write and develop an objective project that combines genetics with behavioral tests. Students will be graded in presentations as well as a final grant proposal. Lab component will consist of experimentation in flies using genetics and behavioral analyses, to be carried out in the last 6 weeks of the course. Counts as a Biology laboratory course for the B.A. and B.S. Biology degrees. Offered as BIOL 359 and BIOL 459. Prereq: BIOL 216 or BIOL 251.

BIOL 462. Advanced Principles of Developmental Biology. 3 Units.
Same as BIOL 362 except the required term paper is an NIH-format research proposal. Recommended preparation: BIOL 216. Offered as ANAT 462 and BIOL 462.

BIOL 463. Experimental Developmental Biology. 3 Units.
This laboratory course will teach concepts and techniques in developmental biology. Emphasis will be on the mechanisms that pattern the embryo during development and how these mechanisms are explored using molecular, cellular, and genetic approaches. A term research paper is required. Students taking the graduate level course will prepare a grant proposal. One laboratory and one lecture per week. Offered as BIOL 363 and BIOL 463.
BIOL 464. Research Methods in Evolutionary Biology. 3 Units.
The process of evolution explains not only how the present diversity of life on earth has formed, but also provides insights into current pressing issues today, including the spread of antibiotic resistance, the causes of geographic variation in genetic diseases, and explanations for modern patterns of extinction risk. Students in Research Methods in Evolutionary Biology will be introduced to several of the major research approaches of evolutionary biology, including methods of measuring natural selection on the phenotypic and genotypic levels, quantifying the rate of evolution, reconstructing evolutionary relationships, and assessing the factors that affect rates of speciation and extinction. The course will consist of a combination of interactive lectures, in-class problem solving and data analysis, and the discussion of peer-reviewed scientific papers. Grades are based on participation in class, discussions and written summaries of published papers, in-class presentations, and two writing assignments. Offered as BIOL 364 and BIOL 464. Prereq: BIOL 214, BIOL 216, BIOL 251.

BIOL 465. Evo-Devo: Evolution of Body Plans. 3 Units.
This discussion-based course offers a detailed introduction to Evolutionary Developmental Biology. The field seeks to explain evolutionary events through the mechanisms of Developmental Biology and Genetics. The course is structured into different modules. First we will look at the developmental genetic mechanisms that can cause variation. Then we focus on how alterations of these mechanisms can generate novel structural changes. We will then examine a few areas of active debate, where Evo-Devo is attempting to solve major problems in evolutionary biology. We will conclude with two writing assignments. Students will be required to present, read, and discuss primary literature in each module. Offered as BIOL 365 and BIOL 465.

BIOL 467. Biobotics Team Research. 3 Units.
Many exciting research opportunities cross disciplinary lines. To participate in such projects, researchers must operate in multi-disciplinary teams. The Biobotics Team Research course offers a unique capstone opportunity for undergraduate students to utilize skills they developed during their undergraduate experience while acquiring new teaming skills. A group of eight students form a research team under the direction of two faculty leaders. Team members are chosen from appropriate majors through interviews with the faculty. They will research a biological mechanism or principle and develop a robotic device that captures the actions of that mechanism. Although each student will cooperate on the team, they each have a specific role, and must develop a final paper that describes the research generated on their aspect of the project. Students meet for one class period per week and two 2-hour lab periods. Initially students brainstorm ideas and identify the project to be pursued. They then acquire biological data and generate robotic designs. Both are further developed during team meetings and reports. Final oral reports and a demonstration of the robotic device occur in week 15. Offered as BIOL 377, EMAE 377, BIOL 477, and EMAE 477.

BIOL 468. Topics in Evolutionary Biology. 3 Units.
The focus for this course on a special topic of interest in evolutionary biology will vary from one offering to the next. Examples of possible topics include theories of speciation, the evolution of language, the evolution of sex, evolution and biodiversity, molecular evolution. ANAT/ANTH/EEPS/PHIL/PHOL 467/BIOL 468 will require a longer, more sophisticated term paper, and additional class presentation. Offered as ANTH 367, BIOL 368, EEPS 367, PHIL 367, ANAT 467, ANTH 467, BIOL 468, EEPS 467, PHIL 467 and PHOL 467.
BIOL 480. Physiology of Organ Systems. 4 Units.
Our intent is to expand the course from the current 3 hours per week (1.5 hour on Monday and Wednesday) to 4 hours per week (1.5 hours on Monday and Wednesday plus 1 hour on Friday). Muscle structure and function, Myasthenia gravis and Sarcopenia; Central Nervous System, (Synaptic Transmission, Sensory System, Autonomic Nervous System, CNS circuits, Motor System, Neurodegenerative Diseases, Paraplegia and Nerve Compression); Cardiovascular Physiology (Regulation of Pressure and flow; Circulation, Cardiac Cycle, Electrophysiology, Cardiac Function, Control of Cardiovascular function, Hypertension); Hemorrhage, Cardiac Hypertrophy and Fibrillation; Respiration Physiology (Gas Transport and Exchange, Control of Breathing, Acid/base regulation, Cor Pulmonaris and Cystic Fibrosis, Sleeping apnea and Emphysema); Renal Physiology (Glomerular Filtration, Tubular Function/transport, Glomerulonephritis, Tubulopathies); Gastro-Intestinal Physiology (Gastric motility, gastric function, pancreas and bile function, digestion and absorption, Liver Physiology; Pancreatitis, Liver Disease and cirrhosis); Endocrine Physiology (Thyroid, Adrenal glands, endocrine pancreas, Parathyroid, calcium sensing receptor, Cushing and diabetes, Reproductive hormones, eclampsia); Integrative Physiology (Response to exercise, fasting and feeding, aging). For all the classes, the students will receive a series of learning objectives by the instructor to help the students address and focus their attention to the key aspects of the organ physiology (and physiopathology). The evaluation of the students will continue to be based upon the students’ participation in class (60% of the grade) complemented by a mid-term and a final exam (each one accounting for 20% of the final grade). Offered as BIOL 480 and PHOL 480.

BIOL 482. Drugs, Brain, and Behavior. 3 Units.
This course is concerned with the mechanisms underlying neurochemical signaling and the impact of drugs on those mechanisms. The first half of the course emphasizes the fundamental mechanisms underlying intra- and extracellular communication of neurons and the basic principles of how drugs interact with the nervous system. The second half of the course emphasizes understanding the neural substrates of disorders of the nervous system, and the mechanisms underlying the therapeutic effects of drugs at the cellular and behavioral levels. This course will consist of lectures designed to give the student necessary background for understanding these basic principles and class discussion. The class discussion will include viewing video examples of behavioral effects of disorders of the nervous system, and analysis of research papers. The goal of the class discussions is to enhance the critical thinking skills of the student and expose the student to contemporary research techniques. Offered as BIOL 382, BIOL 482, and NEUR 482.

BIOL 491. Contemporary Biology and Biotechnology for Innovation I. 3 Units.
The first half of a two-semester sequence providing an understanding of biology as a basis for successfully launching new high-tech ventures. The course will examine physical limitations to present technologies and the use of biology to identify potential opportunities for new venture creation. The course will provide experience in using biology in both identification of incremental improvements and as the basis for alternative technologies. Case studies will be used to illustrate recent commercially successful (and unsuccessful) biotechnology-based venture creation and will illustrate characteristics for success.

BIOL 492. Contemporary Biology and Biotechnology for Innovation II. 3 Units.
Continuation of BIOL 491 with an emphasis on current and prospective opportunities for Biotechnology Entrepreneurship. Longer term opportunities for Biotechnology Entrepreneurship in emerging areas including (but not limited to) applications of DNA sequence information in medicine and agriculture; energy and the environment; biologically-inspired robots. Recommended preparation: BIOL 491 or consent of department.

BIOL 493. Feasibility and Technology Analysis. 3 Units.
This course provides the tools scientists need to determine whether a technology is ready for commercialization. These tools include (but are not limited to): financial analysis, market analysis, industry analysis, technology analysis, intellectual property protection, the entrepreneurial process and culture, an introduction to entrepreneurial strategy and new venture financing. Deliverables will include a technology feasibility analysis on a possible application in the student’s scientific area. Offered as BIOL 493, CHEM 493, and PHYS 493.

BIOL 494. Seminar in Evolutionary Biology. 3 Units.
This seminar investigates 20th-century evolutionary theory, especially the Modern Evolutionary synthesis and subsequent expansions of and challenges to that synthesis. The course encompasses the multidisciplinary nature of the science of evolution, demonstrating how disciplinary background influences practitioners’ conceptualizations of pattern and process. This course emphasizes practical writing and research skills, including formulation of testable theses, grant proposal techniques, and the implementation of original research using the facilities on campus and at the Cleveland Museum of Natural History. Offered as ANTH 394, BIOL 394, EEPS 394, HSTY 394, PHIL 394, ANTH 494, BIOL 494, EEPS 494, HSTY 494, and PHIL 494.

BIOL 530. Seminar in the Rhizosphere. 1 - 2 Unit.
The rhizosphere is the dynamic zone of soil that surrounds plant roots. Chemical and physical processes in the rhizosphere are controlled by the interaction between plants and a diverse soil microflora. This graduate-level seminar course will explore these processes and interactions as they affect nutrient cycling and the fertility of natural systems. Each week one student will present and lead the discussion on a seminal or current key scientific article dealing with one of the following general topics: Rhizosphere biogeochemistry, diversity and function of the rhizosphere biota, interaction of organisms inhabiting the rhizosphere, influence of rhizospheric processes in plant fitness and ecosystem function.

BIOL 531. Seminar in Experimental Ecology. 1 - 3 Unit.

BIOL 541. Topics in Integrative Biology. 1 - 3 Unit.
The goal of this course is to encourage graduate students to think about any question in biology from a broad-based perspective, focusing on the integration of three major themes: 1) evolution and its effects, 2) the cellular basis of life, and 3) systems level control. Each semester, the course may focus on a different topic, but it will be examined from the perspectives of these three focus areas. One faculty instructor with strength in each of these areas will present a few introductory lectures to provide the class with a basic understanding of the topic as it is studied in their area. Then, each student will research a subject covered that semester and develop and present this subject to the class with an explicit evolutionary, cellular or systems level approach. Students will be graded on the quality of their presentations and the overall level of their participation in class.
BIOL 549. Mathematical Life Sciences Seminar. 1 - 3 Unit.
Continuing seminar on areas of current interest in the applications of mathematics to the life sciences. Allows graduate and advanced undergraduate students to become involved in research. Topics will reflect interests and expertise of the faculty and may include topics in mathematical biology, computational neuroscience, mathematical modeling of biological systems, models of infectious diseases, computational cell biology, mathematical ecology and mathematical biomedicine broadly construed. May be taken more than once for credit.

BIOL 550C. Seminar: Experimental Biology. 1 - 3 Unit.

BIOL 561. Statistical Methods for Scientific Research. 3 Units.
This course will introduce students to traditional and novel statistical methods useful for experimental scientists. The emphasis will be on understanding theory and techniques that are used in research. We shall consider problems from astronomy, biology and particle-astro physics. The course will also cover topics of interest to engineers. Current collaborative research problems of the instructor will motivate some of the advanced statistical techniques. Topics to be covered include: Measuring uncertainty and probability distributions (low and high dimensional); point and interval estimation; curve fitting; likelihood and score type tests required for an experiment; posterior probabilities; dealing with small samples (which arise in search experiments); over- and under-coverage using confidence belts; and Monte Carlo simulation methods for planning experiments and evaluating the statistical significance of the results. "GGobi" and "R" open source software will be used for visualization (via dynamic and interactive graphics) and exploring high-dimensional data. Offered as BIOL 561 and PHYS 561.

BIOL 599. Advanced Independent Study for Graduate Students. 1 - 3 Unit.
Independent study of advanced topics in biology under the supervision of a biology faculty member. Registration requires submission of a proposal for a project or study and approval of the department.

BIOL 601. Research. 1 - 9 Unit.

BIOL 651. Thesis M.S.. 1 - 9 Unit.
Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

BIOL 701. Dissertation Ph.D.. 1 - 9 Unit.
Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
**Department of Chemistry**

The Department of Chemistry is the largest department representing the chemical sciences at Case Western Reserve University. It consists of 21 faculty members, 10 associated faculty, about 10 postdoctoral associates, approximately 90 graduate students, and over 100 undergraduate students majoring in chemistry. The department offers undergraduate and graduate degree programs leading to the Bachelor of Arts, Bachelor of Science, Master of Science, and Doctor of Philosophy.

The general focus of chemistry is on (1) understanding the basic properties of matter, and (2) employing this knowledge in the design, synthesis, and characterization of materials with novel and useful properties. The various degree programs strive to develop all aspects of the student’s chemical knowledge through a broad range of lecture and laboratory courses.

Chemical research is an integral part of the department’s activities: over $3 million of federal, state, and private research support flows into the department each year. State-of-the-art research facilities are available to both graduate and undergraduate students. Undergraduates are encouraged to participate in research projects with individual faculty members in order to expand their hands-on training, problem-solving skills, and understanding of the scientific method as applied in chemical research. These research projects typically involve interchange and collaboration across all levels of experience and may also involve scientists from other departments and institutions.

Chemistry is often referred to as “the central science” because of its key role in interdisciplinary studies. Correspondingly, a degree in chemistry affords a broad range of employment opportunities. Chemists can direct their talents to specialized problems of applied research, or they can choose to delve into fundamental investigations. A degree in chemistry can cover the spectrum of chemical specialties, from biochemistry to interstellar chemistry. The degree also provides valuable preparation for other professions, such as medicine, dentistry, and law.

The American Chemical Society ([http://bulletin.case.edu/collegeofartsandsciences/chemistry](http://bulletin.case.edu/collegeofartsandsciences/chemistry) or [www.acs.org](http://www.acs.org)), with more than 160,000 members, is the major professional society in the United States for practicing chemists. Both undergraduate and graduate students may join the society.

**Facilities**

The department’s facilities for experimental and theoretical research are modern and extensive. They include diverse major instruments for use by faculty and students, as well as specialized equipment serving individual research groups. Shared instrumentation includes 400- and 600-MHz NMR spectrometers, ultrafast laser systems in the Center for Chemical Dynamics, and a cyber-enabled X-ray crystallographic facility.

Other departmental instrumentation includes equipment for laser Raman spectroscopy, GC-MS and LC-MS/MS mass spectrometers, stopped-flow kinetics instrumentation, a circular dichroism spectrometer, an analytical ultracentrifuge, and equipment for electrochemical measurements. Access to very high-field NMR instrumentation is available on campus at the Cleveland Center for Membrane Structural Biology (CCMSB), which is equipped with numerous 500- to 900-MHz NMR spectrometers for solution and solid-state measurements. The chemistry department’s computers are part of the campus-wide fiber optic communications network operated by Information Technology Services, and the entire University Circle area offers wireless access. In addition to the full complement of software, Internet, and library database services offered by the university, connections to off-site databases, such as SciFinder and Ohio Supercomputer Center, are available to departmental users.

The department uses some of the foremost equipment available in high-resolution nuclear magnetic resonance spectroscopy and in tunable laser spectroscopy. Work on various aspects of chemistry as studied by these techniques is recognized throughout the world.

**BS Chemistry | BA Chemistry | Teacher Licensure | Minor**

**Undergraduate Programs**

**Majors**

The Department of Chemistry offers two curricula for undergraduate chemistry majors, leading to a Bachelor of Science (BS) or Bachelor of Arts (BA) degree.

**Bachelor of Science Program**

The BS program is designed for students who seek professional careers in the chemical sciences and is certified by the American Chemical Society. The BS curriculum provides a rigorous background in chemistry, yet offers considerable flexibility in the senior year in the choice of electives, allowing BS majors to pursue areas of chemistry of particular interest to them in greater depth. At least three units of research (CHEM 397 / CHEM 398) are required, and up to nine units of research may be credited toward the degree.

The American Chemical Society is the major professional society in the United States and has over 160,000 members. Its roles include promotion of chemistry and the advancement of the chemical sciences at Case Western Reserve University. It consists of 21 faculty members, 10 associated faculty, about 10 postdoctoral associates, approximately 90 graduate students, and over 100 undergraduate students majoring in chemistry.
The Bachelor of Arts Program

The BA program is intended for pre-professional students who plan careers in medicine, dentistry, veterinary medicine, and pharmacy or in other fields for which a baccalaureate degree in chemistry provides appropriate training. BA majors may supplement their required courses with additional chemistry courses or may utilize the curriculum’s flexibility to develop an interdisciplinary program of their choice. Many BA majors participate in undergraduate research within the Department of Chemistry (CHEM 397 / CHEM 398) or in other science departments, including those in the medical school.

Departmental Honors
Chemistry majors who have excellent academic records may participate in the Honors in Chemistry program. To graduate with honors in chemistry, a student must satisfy the following requirements:

1. A combined grade point average of 3.50 in chemistry, physics, and mathematics and an overall grade point average of 3.20
2. A minimum of six units of Undergraduate Research (CHEM 397), or chemical research done under another course number with departmental approval
3. A thesis approved by the department’s undergraduate affairs committee based on the level of research, quality of the manuscript, and chemical content

Teacher Licensure in Physical Science (Chemistry and Physics)
An option is available within the BA program for students to become eligible for licensure as teachers of physical science (chemistry and physics) in secondary schools (grades 9–12). Students interested in this option should contact Professor Michael Kenney. A total of 57 units in the subject area are required for teacher licensure, as well as a 35-unit sequence in professional education (including student teaching) taken here and at John Carroll University. For more information, see the program description for Teacher Licensure (p. 437) elsewhere in this bulletin.

Course requirements for students majoring in physics and seeking physical science teacher licensure are listed under the Department of Physics.

Minor

Students may complete a minor in chemistry, defined as one year of freshman chemistry (including laboratory); two additional three-unit lecture courses; and two additional laboratory or approved courses. A recommended sequence would include:

Graduate Programs

Master of Science Programs

The MS degree in chemistry may be obtained by completing (1) a program that includes the preparation of a master’s thesis, or (2) a program involving only course work. Both programs require a minimum of 27 units, of which up to six units may be for the master’s thesis. Course work for the master’s degree may be taken on a part-time basis, but thesis research can be undertaken only by full-time graduate students. Thus, only the master’s degree without thesis can be earned entirely on a part-time basis.

The Science and Technology Entrepreneurship Program (STEP) is a three- or four-semester professional MS degree offered in chemistry as well as in biotechnology and physics. Students enter the Chemistry Entrepreneurship program with a bachelor’s, master’s, or doctoral degree in a chemistry-related field. The program consists of advanced courses in chemistry, business, and technology innovation and an entrepreneurial project with technical content in an existing company or new venture.

Doctor of Philosophy Program

The PhD degree in chemistry is granted to those students who have shown an extensive knowledge of advanced chemistry and the ability to do original research. The program usually requires four years of full-time study after the bachelor’s degree. Besides advanced courses, the program consists of cumulative and oral examinations, seminars and colloquia, and an original research project. At least twelve months must be spent in residence on campus while fulfilling the PhD thesis research requirement.

Full-time graduate students who maintain satisfactory academic performance while pursuing the PhD degree in chemistry normally receive a stipend for teaching and/or research, which includes full tuition and a monthly amount sufficient to cover living expenses.

Research

The Department of Chemistry is noted for research programs in (1) chemical biology and (2) energy and materials. Projects range from...
synthetic studies of important bioactive substances, including antibiotics and DNA-binding substances, to detailed examination of the surface properties of materials used in batteries and electrolytic cells. Studies are being performed with molecules as simple as oxygen and as complicated as those which describe the active centers of enzymes or the protein core of insoluble aggregates that deposit in neurodegenerative disease. Efforts are being made to understand the basic chemical properties leading to reactive mediators generated from physiological lipids.

Other research is aimed at developing new drugs for photodynamic therapy and at understanding the mechanism of action of drugs for antiretroviral therapy. The influence of metal ions in modifying reactivity is a common interest of several members of the faculty, as is the development of organometallic compounds for materials and catalysis. Chemical surfaces are being studied, as are various applications of nanoparticles, from cells to the environment. Studies designed to characterize electrode–electrolyte interfaces, the electrochemical properties of new semiconductors, and single-cell microelectrodes are also ongoing. These efforts are complemented by theoretical studies on the interfacial structure and bonding of composite materials.

Case Western Reserve University ranks among the leading universities internationally in its strengths in electrochemistry and has brought these strengths together in the Yeager Center for Electrochemical Studies (YCES) (http://electrochem.cwru.edu). The interdisciplinary nature of electrochemistry involves the interaction of electrochemists in the chemistry and chemical engineering departments with metallurgists, surface physicists, inorganic and organic chemists, polymer chemists, and electrical engineers. Such interactions, lacking on most campuses, are promoted at Case Western Reserve University through YCES. Graduate students in the chemistry department have the opportunity to specialize in electrochemistry in one of the most extensive course and research programs in the United States.

Colloquia and Seminars
The department sponsors a rich program of colloquia and seminars on recent advances in chemical research. Most notable among these is the Frontiers in Chemistry Lecture Series, in which scientists of international distinction lecture on major discoveries and developments in chemistry. In addition, a weekly colloquium series provides lectures by invited speakers in a variety of fields of chemical investigation. Both of these programs are addressed to an audience of faculty, graduate students, and other chemical scientists in the university and the Cleveland area, and are a vital means to broaden current knowledge. Numerous other seminars and meetings are held on a more specialized and informal level. Most individual research groups conduct weekly discussions to evaluate their progress.

Department Faculty
Mary D. Barkley, PhD
(University of California, San Diego)

M. Roger Clapp University Professor of Arts and Sciences and Chair
Biophysical chemistry; fluorescence spectroscopy; tryptophan fluorescence; HIV reverse transcriptase

Alfred B. Anderson, PhD
(Johns Hopkins University)
Professordoctor
Pure and applied theoretical chemistry: surface science, catalysis, electrocatalysis and properties of doped diamond

Clemens Burda, PhD
(University of Basel, Switzerland)
Professor

Physical chemistry of nanostructures; molecular electronics; femtosecond laser spectroscopy
James D. Burgess, PhD
(Virginia Commonwealth University)
Associate Professor
Physical chemistry of platinum-based anticancer drugs; electrode-supported bilayer membranes; electron transfer enzymes
Carlos E. Crespo-Hernández, PhD
(University of Puerto Rico)
Assistant Professor
Ultrafast spectroscopy; organic photochemistry and photophysics; environmental chemistry; computational chemistry

Thomas G. Gray, PhD
(Harvard University)
Professor
Hurlbut Professor of Chemistry
Photodynamic therapy; porphyrin-like compounds; organosilicon compounds; flue gas desulfurization

Michael J. Kenney, PhD
(Iowa State University)
Senior Instructor and John Teagle Professorial Fellow in Chemistry
Chemical education

Irene Lee, PhD
(Pennsylvania State University)
Professor
Biochemistry; enzymology

Anthony J. Pearson, PhD
(University of Aston, Birmingham, England)
Rudolph and Susan Rense Professor of Chemistry
Natural products; organometallics; organic synthesis

John D. Protasiewicz, PhD
(Cornell University)
Professor and Associate Chair
Inorganic chemistry; organometallic reaction mechanisms; catalyzed oxidations

Robert G. Salomon, PhD
(University of Wisconsin, Madison)
Charles Frederic Mabery Professor of Research in Chemistry
Chemical biology; lipid oxidation and disease; organic synthesis and reaction mechanisms

Anna C. Samia, PhD
(Georgia Institute of Technology)
Assistant Professor
Analytical chemistry; inorganic chemistry; materials and energy; bio-inorganic chemistry; functional nanomaterials; nanotheranostics

Genevieve Sauve, PhD
(California Institute of Technology)
Assistant Professor
Organic electronics; alternative energy; synthesis of polymers and inorganic complexes; transistor and solar cell devices

Daniel A. Scherson, PhD
(University of California, Davis)
Case Western Reserve University

Frank Hovorka Professor of Chemistry
Electrochemistry; electrode kinetics; electrocatalysis; in-situ spectroscopic methods in electrochemistry
Rekha Srinivasan, PhD
(Case Western Reserve University)
Instructor
Chemical education
John E. Stuehr, PhD
(Case Western Reserve University)
Professor
Physical chemistry, chemical education
Gregory P. Tochtrop, PhD
(Washington University Medical School)
Associate Professor
Chemical biology; molecular recognition; NMR; diversity-oriented synthesis
Blanton S. Tolbert, PhD
(University of Rochester)
Assistant Professor
Biochemistry; Structural Biophysics; Viral RNA metabolism; HIV
Rajesh Viswanathan, PhD
(University of Indiana)
Assistant Professor
Chemical biology; microarrays; biosynthesis and biomimetic synthesis; total synthesis of natural products
Michael G. Zagorski, PhD
(Case Western Reserve University)
Professor
Organic chemistry; nuclear magnetic resonance; structure of peptides

Professor, Department of Macromolecular Science and Engineering, Case School of Engineering
Synthetic chemistry; supramolecular polymerization; reversible “dynamic” chemistry; chemical sensors; biomaterials; nanotechnology
Witold K. Surewicz, PhD
(University of Lodz, Poland)
Professor, Department of Physiology and Biophysics, School of Medicine
Protein aggregation and the pathogenesis of aging-related diseases; prion protein; protein folding and protein-membrane interaction
Yanming Wang, PhD
(ETH Zürich, Switzerland)
Associate Professor of Radiology; Director of Radiopharmaceutical Division, Case Center for Imaging Research, School of Medicine
Organic synthesis; molecular probes for in vivo imaging

Adjunct Faculty
M. Cather Simpson, PhD
(University of New Mexico)
Senior Lecturer in Chemistry and Physics; Associate Director, Dan Walls Centre for Pure and Applied Optics, University of Auckland, New Zealand
Biophysical chemistry; spectroscopic studies of biologically significant processes

Research Professors
Mikhail D. Linetsky, PhD
(Academy of Science of Ukraine)
Research Associate Professor
Biochemistry; chemical biology; protein chemistry; post-translational protein modification; proteomics

Courses
CHEM 102. The Molecules of Medicine. 1 Unit.
The central tenet of CHEM 102 is the identification and presentation of concrete examples to illustrate how basic scientific principles impact medicine in a substantive way. Several topics will be addressed that include medical diagnostics, medical instrument design, and drug development. An emphasis of this class will be to convey how topics being presented in other classes in the pre-medical curriculum have a direct and substantive impact on the practice of medicine.

CHEM 105. Principles of Chemistry I. 3 Units.
Atomic structure; thermochemistry; periodicity, bonding and molecular structure; intermolecular forces; properties of solids; liquids, gases and solutions. Recommended preparation: One year of high school chemistry.

CHEM 106. Principles of Chemistry II. 3 Units.
Thermodynamics, chemical equilibrium; acid/base chemistry; oxidation and reduction; kinetics; spectroscopy; introduction to nuclear, organic, inorganic, and polymer chemistry. Prereq: CHEM 105 or equivalent.

Secondary Faculty
Paul Carey, PhD
(University of Sussex, UK)
Professor, Department of Biochemistry, School of Medicine
Raman spectroscopy; proteins and protein-ligand interactions
John W. Crabb, PhD
(University of Kansas Medical Center)
Professor of Molecular Medicine, Cleveland Clinic Lerner College of Medicine, Case Western Reserve University
Proteomics of the visual cycle and age-related ocular diseases
Thomas Gerken, PhD
(Case Western Reserve University)
Professor, Department of Pediatrics, School of Medicine
Biochemistry of glycoproteins; NMR
Thomas Kelley, PhD
(University of Notre Dame)
Associate Professor, Department of Pediatrics, School of Medicine
Biochemistry; cell signaling and cholesterol processing in cystic fibrosis
John J. Mieyal, PhD
(Case Western Reserve University)
Professor, Department of Pharmacology, School of Medicine
Reactive oxygen species and sulfur biochemistry; enzymatic reaction mechanisms of intracellular sulfhydryl homeostasis and redox signal transduction
Stuart J. Rowan, PhD
(University of Glasgow, UK)
CHEM 111. Principles of Chemistry for Engineers. 4 Units.
A first course in university chemistry emphasizing chemistry of materials for engineering students. Atomic theory and quantitative relationships; gas laws and kinetic theory; solutions, acid-base properties and pH; thermodynamics and equilibrium; kinetics, catalysis, and mechanisms; molecular structure and bonding. Recommended preparation: One year of high school chemistry or permission of department.

CHEM 113. Principles of Chemistry Laboratory. 2 Units.
A one semester laboratory based on quantitative chemical measurements. Experiments include analysis, synthesis and characterization, thermochemistry and chemical kinetics. Computer analysis of data is a key part of all experiments. Prereq or Coreq: CHEM 105 or CHEM 111 and ENGR 145.

CHEM 114. Chemistry Frontiers Laboratory. 2 Units.
An introduction to laboratory techniques and computer-based methods for chemical research for the chemistry major. Scientific information databases, structural chemistry, experimental design and data handling, chemical synthesis and characterization. Prereq: CHEM 105 or CHEM 111, and CHEM 113. Coreq: CHEM 106.

CHEM 223. Introductory Organic Chemistry I. 3 Units.
Introductory course for science majors and engineering students. Develops themes of structure and bonding along with elementary reaction mechanisms. Includes treatment of hydrocarbons, alkyl halides, alcohols, and ethers as well as an introduction to spectroscopy. Prereq: CHEM 106 or CHEM 111.

CHEM 224. Introductory Organic Chemistry II. 3 Units.
Continues and extends themes of structure and bonding from CHEM 223 and continues spectroscopy and more complex reaction mechanisms. Includes treatment of aromatic rings, carbonyl compounds, amines, and selected special topics. Prereq: CHEM 223 or CHEM 323.

CHEM 223. Introductory Organic Chemistry Laboratory I. 2 Units.
An introductory organic laboratory course emphasizing microscale operations. Synthesis and purification of organic compounds, isolation of natural products, and systematic identification of organic compounds by physical and chemical methods. Prereq: CHEM 106 or CHEM 111 and CHEM 113 or equivalent. Coreq: CHEM 223 or CHEM 323.

CHEM 224. Introductory Organic Chemistry Laboratory II. 2 Units.
A continuation of CHEM 223, involving multi-step organic synthesis, peptide synthesis, product purification and analysis using sophisticated analytical techniques such as chromatography and magnetic resonance spectroscopy. Prereq: CHEM 223. Coreq: CHEM 224

CHEM 290. Chemical Laboratory Methods for Engineers. 3 Units.
Techniques of chemical synthesis, analysis, and characterization. Uses students' backgrounds in general and organic chemistry, but requires no background in chemical laboratory operations. Prereq or Coreq: CHEM 223 or CHEM 323.

CHEM 301. Introductory Physical Chemistry I. 3 Units.
First of a two-semester sequence covering principles and applications of physical chemistry, intended for chemistry and engineering majors and other students having primary interests in biochemical, biological or life-science areas. States and properties of matter. Thermodynamics and its application to chemical and biochemical systems. Chemical equilibrium. Electrochemistry. Recommended preparation: One year each of undergraduate physics and calculus, preferably including partial derivatives. Prereq: CHEM 106 or equivalent.

CHEM 302. Introductory Physical Chemistry II. 3 Units.

CHEM 304. Quantitative Analysis Laboratory. 2 Units.
A one-semester laboratory course providing practical experience in the analytical process. Focus is on statistical error analysis of measurements, method validation and instrument calibration, and reporting. Basic laboratory skills are developed and evaluated based on accuracy and precision of measurements. Experiments using titration, spectroscopy, electrochemistry, liquid and gas chromatography, and mass spectrometry are conducted. Prereq: CHEM 106 and CHEM 113. Coreq: CHEM 310.

CHEM 305. Introductory Physical Chemistry Laboratory. 3 Units.
A one-semester laboratory course focusing on the principles and quantitative characterization of chemical and biochemical systems. Experiments include chemical equilibrium kinetics, electrochemistry, spectroscopy and the use of computers for the statistical analysis of experimental data. Seminar discussions and disciplinary writing of results. Prereq: CHEM 301 and CHEM 304 or CHEM 335. Or Prereq or Coreq: CHEM 302 or CHEM 336.

CHEM 310. Foundations of Analytical Chemistry. 3 Units.
A one-semester lecture covering classical and modern aspects of the analytical process; analysis requirements, method selection including capabilities and limitations, sampling and sample processing, measurement data statistics for evaluation of precision and accuracy, method validation, and reporting. Fundamental concepts in equilibrium thermodynamics are covered in the context of chemical analysis. Methods based on titration, spectroscopy, electrochemistry, chromatography, and mass spectrometry are emphasized. Prereq: CHEM 106 and CHEM 113. Coreq: CHEM 304.

CHEM 311. Inorganic Chemistry I. 3 Units.
Fundamentals of inorganic chemistry. Topics include molecular structure, molecular shape and symmetry, structure of solids, d-metal complexes, oxidation and reduction, and acids and bases. Prereq or Coreq: CHEM 301 or CHEM 335.

CHEM 312. Inorganic Chemistry II. 3 Units.
Continuation of CHEM 311. Fundamentals of inorganic chemistry. Topics include electronic spectra of complexes, structures and properties of solids, organometallic compounds, and descriptive chemistry of representative elements. Prereq: CHEM 311.

CHEM 322. Laboratory Methods in Organic Chemistry. 3 Units.
Experimental approach to the synthesis, purification and characterization of organic compounds. Nuclear magnetic resonance (NMR) and infrared (IR) spectroscopies; chromatographic techniques. Prereq: CHEM 304 and CHEM 223 or CHEM 323. Prereq or Coreq: CHEM 224 or CHEM 324.
CHEM 323. Organic Chemistry I. 3 Units.
Relationships between molecular structure and chemical reactivity and development of sophisticated problem-solving skills in the context of organic reaction mechanisms and multi-step synthesis. Homolytic and heterolytic substitution, elimination, oxidation and reduction reactions; topics in stereochemistry and spectroscopy. Recommended for chemistry, biochemistry, and related majors. Prereq: CHEM 106 or equivalent.

CHEM 324. Organic Chemistry II. 3 Units.
Continuation of CHEM 323. Introduces the chemistry of carbonyl, aromatic and amino functional groups, and develops the concepts of conjugation and resonance, molecular orbital theory and pericyclic reactions. Prereq: CHEM 223 or CHEM 323.

CHEM 325. Physical Methods for Determining Organic Structure. 3 Units.
Structure determination of organic compounds using mass spectrometry and modern instrumental techniques such as infrared, ultraviolet, visible, and nuclear magnetic resonance spectroscopy. Recommended preparation: Two semesters of undergraduate organic chemistry. Offered as CHEM 325 and CHEM 425.

CHEM 328. Introductory Biochemistry. 3 Units.
A survey of biochemistry with a strong emphasis on the chemical logic underlying metabolic pathways and the evolution of biomolecules. Cellular architecture. Amino acids and protein structure, purification, analysis, and synthesis. DNA, RNA, the flow of genetic information, and molecular biological technology. Enzyme kinetics, catalytic, and regulatory strategies. Sugars, complex carbohydrates, and glycoproteins. Lipids and cell membranes. Glycolysis, gluconeogenesis, carbon fixation through the "dark reactions" of photosynthesis, aerobic catabolism through the citric acid cycle, and glycogen metabolism. Biosynthesis and degradation of fatty acids, amino acids, and proteins. Offered as CHEM 328 and CHEM 428. Prereq: CHEM 224 or CHEM 324.

CHEM 329. Chemical Aspects of Living Systems. 3 Units.

CHEM 331. Laboratory Methods in Inorganic Chemistry. 3 Units.
Synthesis, separation techniques, physical properties, and analysis. Advanced techniques of chemical synthesis, leading the student to the preparation of interesting inorganic and organometallic compounds. Prereq: CHEM 322.

CHEM 332. Laboratory Methods in Physical Chemistry. 3 Units.
Modern techniques of physicochemical measurement, including, kinetics, spectroscopy, and electrochemistry and the use of statistical methods for the analysis of experimental data. Seminar discussions and disciplinary writing of results. Prereq: CHEM 304. Prereq or Coreq: CHEM 336.

CHEM 333. Medicinal Chemistry and Drug Development. 3 Units.
This course provides an overview on how principles in chemistry and biology are integrated to facilitate drug development. Primary emphasis will be placed on the development of organic molecules as drugs and metabolic enzymes as drug targets. Subjects pertinent to the introduction of medicinal chemistry, evaluation of drug efficacies in vitro and in vivo, and drug metabolism will be covered. Offered as CHEM 333 and CHEM 433. Prereq: CHEM 223 or CHEM 323 and BIOL 215. Coreq: CHEM 224 or CHEM 324.

CHEM 335. Physical Chemistry I. 3 Units.

CHEM 336. Physical Chemistry II. 3 Units.

CHEM 337. Quantum Mechanics I. 3 Units.
Introduction to quantization, measurement and the Schrodinger equation; angular momentum and states of molecules. Perturbation theory, spectroscopy and chemical bonding. Variational theory and calculations of molecular properties. Offered as CHEM 337 and CHEM 446. Prereq: CHEM 336.

CHEM 339. Bioinorganic Chemistry. 3 Units.
An introduction to metal ions in biology and medicine. Topics of emphasis include metalloenzymes, inorganic elements in pharmaceuticals, and physical methods of characterization in biology. Course material will be presented through a seminar format, and will involve extensive class participation, student presentations, and literature research reports. Offered as CHEM 339 and CHEM 439. Prereq: CHEM 224 or CHEM 324.

CHEM 395. Chemistry Colloquium Series. 1 Unit.
Course content provided by Thursday chemistry department colloquia (or Frontiers in Chemistry lectures). Discussion sessions review previous lectures and lay foundation for forthcoming lectures.

CHEM 397. Undergraduate Research. 1 - 6 Unit.
Independent research project within a research group in the chemistry department or, by petition, within a research group in another Case department. Arrangements should be made with the faculty member selected. Open to all chemistry majors and other qualified students; required for Honors in Chemistry. A written report is required each semester.
CHEM 398. Undergraduate Research/Senior Capstone Project. 3 - 6 Units.
Independent research project within a research group in the chemistry department or, by petition, within a research group in another Case department. Arrangements should be made by consultation with the faculty member selected and the Senior Capstone Committee of the chemistry department. Open to all chemistry majors and other qualified students. Satisfies the research requirement for Honors in Chemistry. A written report and public oral presentations are required.

CHEM 406. Chemical Kinetics. 3 Units.
Theory and characterization of chemical rate processes. Recommended preparation: Two semesters of undergraduate physical chemistry.

CHEM 407. Chemical Thermodynamics. 3 Units.
Thermodynamics and statistical thermodynamics and their application to chemical problems. Recommended preparation: Two semesters of undergraduate physical chemistry.

CHEM 408. Advanced Physical Chemistry. 3 Units.
Topics in physical chemistry, intended for entering graduate students, giving background tools appropriate for graduate research in areas of chemistry other than physical chemistry. Illustrations from the contemporary chemical research literature will be emphasized. Thermodynamics and statistical mechanics, quantum chemistry and computation, spectroscopy, and chemical kinetics and dynamics. Recommended preparation: One year of undergraduate physical chemistry.

CHEM 412. Advanced Inorganic Chemistry I. 3 Units.
Chemistry of inorganic systems. Spectroscopy, magnetism, and stereochemistry of transition metal compounds. Recommended preparation: One semester of undergraduate inorganic chemistry and two semesters of undergraduate physical chemistry.

CHEM 414. Organometallic Reactions and Structures. 3 Units.
Bonding, structure, and mechanistic aspects of organometallic chemistry and the relevance of organometallic species to chemical catalysis. Recommended preparation: One semester of undergraduate inorganic chemistry.

CHEM 421. Advanced Organic Chemistry I. 3 Units.

CHEM 422. Advanced Organic Chemistry II. 3 Units.

CHEM 425. Physical Methods for Determining Organic Structure. 3 Units.
Structure determination of organic compounds using mass spectrometry and modern instrumental techniques such as infrared, ultraviolet, visible, and nuclear magnetic resonance spectroscopy. Recommended preparation: Two semesters of undergraduate organic chemistry. Offered as CHEM 325 and CHEM 425.

CHEM 428. Introductory Biochemistry. 3 Units.
A survey of biochemistry with a strong emphasis on the chemical logic underlying metabolic pathways and the evolution of biomolecules. Cellular architecture. Amino acids and protein structure, purification, analysis, and synthesis. DNA, RNA, the flow of genetic information, and molecular biological technology. Enzyme kinetics, catalytic, and regulatory strategies. Sugars, complex carbohydrates, and glycoproteins. Lipids and cell membranes. Glycolysis, gluconeogenesis, carbon fixation through the "dark reactions" of photosynthesis, aerobic catabolism through the citric acid cycle, and glycogen metabolism. Biosynthesis and degradation of fatty acids, amino acids, and proteins. Offered as CHEM 328 and CHEM 428.

CHEM 429. Chemical Aspects of Living Systems. 3 Units.

CHEM 430. Advanced Methods in Structural Biology. 1 - 6 Unit.
The course is designed for graduate students who will be focusing on one or more methods of structural biology in their thesis project. This course is divided into 3-6 sections (depending on demand). The topics offered will include X-ray crystallography, nuclear magnetic resonance spectroscopy, optical spectroscopy, mass spectrometry, cryo-electron microscopy, and computational and design methods. Students can select one or more modules. Modules will be scheduled so that students can take all the offered modules in one semester. Each section is given in 5 weeks and is worth 1 credit. Each section covers one area of structural biology at an advanced level such that the student is prepared for graduate level research in that topic. Offered as BIOC 430, CHEM 430, PHOL 430, and PHRM 430.

CHEM 433. Medicinal Chemistry and Drug Development. 3 Units.
This course provides an overview on how principles in chemistry and biology are integrated to facilitate drug development. Primary emphasis will be placed on the development of organic molecules as drugs and metabolic enzymes as drug targets. Subjects pertinent to the introduction of medicinal chemistry, evaluation of drug efficacies in vitro and in vivo, and drug metabolism will be covered. Offered as CHEM 333 and CHEM 433.

CHEM 435. Synthetic Methods in Organic Chemistry. 3 Units.

CHEM 436. Complex Molecular Synthesis. 3 Units.
An advanced organic chemistry course providing students with an in-depth examination of the art of total synthesis drawing from both classical and recent examples. Recommended preparation: Two semesters of undergraduate organic chemistry.
CHEM 439. Bioinorganic Chemistry. 3 Units.
An introduction to metal ions in biology and medicine. Topics of emphasis include metalloenzymes, inorganic elements in pharmaceuticals, and physical methods of characterization in biology. Course material will be presented through a seminar format, and will involve extensive class participation, student presentations, and literature research reports. Offered as CHEM 339 and CHEM 439. Prereq: Graduate standing.

CHEM 445. Electrochemistry I. 3 Units.
Electrochemical properties and processes of electrode/electrolyte interfaces. Fundamental background for work in corrosion, electrodeposition, industrial electrolysis, electro-organic synthesis, batteries, fuel cells, and photoelectrochemical energy conversion. Recommended preparation: One semester of undergraduate physical chemistry.

CHEM 446. Quantum Mechanics I. 3 Units.
Introduction to quantization, measurement and the Schrodinger equation; angular momentum and states of molecules. Perturbation theory, spectroscopy and chemical bonding. Variational theory and calculations of molecular properties. Recommended preparation: Two semesters of undergraduate physical chemistry. Offered as CHEM 335 and CHEM 446.

CHEM 447. Quantum Mechanics II. 3 Units.
Continuation of CHEM 446. Ab initio and semi-empirical methods, configuration interactions, time dependent phenomena, and introduction to band theory of solids. Prereq: CHEM 446.

CHEM 450. Molecular Spectroscopy. 3 Units.
Translation, rotation, vibration, and electronic transitions of molecules. Prereq: CHEM 446.

CHEM 475. Protein Biophysics. 3 Units.
This course focuses on in-depth understanding of the molecular biophysics of proteins. Structural, thermodynamic and kinetic aspects of protein function and structure-function relationships will be considered at the advanced conceptual level. The application of these theoretical frameworks will be illustrated with examples from the literature and integration of biophysical knowledge with description at the cellular and systems level. The format consists of lectures, problem sets, and student presentations. A special emphasis will be placed on discussion of original publications. Offered as BIOC 475, CHEM 475, PHOL 475, PHRM 475, and NEUR 475.

CHEM 491. Modern Chemistry for Innovation I. 3 Units.
The first half of a two-semester sequence providing an understanding of chemistry as a basis for successfully launching new high-tech ventures. The course will examine physical limitations to present technologies and the use of chemistry to identify potential opportunities for new venture creation. The course will provide experience in using chemistry for both identification of incremental improvements and as the basis for alternative technologies. Case studies will be used to illustrate recent commercially successful (and unsuccessful) venture creation and will illustrate characteristics for success. Admission to this course requires consent of the department.

CHEM 492. Modern Chemistry for Innovation II. 3 Units.
Continuation of CHEM 491, with an emphasis on current and prospective opportunities for Chemistry Entrepreneurship. Longer term opportunities for Chemistry Entrepreneurship in emerging areas, including (but not be limited to) biomaterials, pharmacogenomics, biocatalysis, and drug discovery. Prereq: CHEM 491.

CHEM 493. Feasibility and Technology Analysis. 3 Units.
This course provides the tools scientists need to determine whether a technology is ready for commercialization. These tools include (but are not limited to): financial analysis, market analysis, industry analysis, technology analysis, intellectual property protection, the entrepreneurial process and culture, an introduction to entrepreneurial strategy and new venture financing. Deliverables will include a technology feasibility analysis on a possible application in the student’s scientific area. Offered as BIOL 493, CHEM 493, and PHYS 493.

CHEM 501. Special Topics in Inorganic Chemistry. 1 - 6 Unit.
(Credit as arranged.) Lectures on advanced topics in inorganic chemistry presented by staff or visiting lecturers. Course title, content, and credit change from year to year.

CHEM 502. Special Topics in Inorganic Chemistry. 1 - 6 Unit.
(Credit as arranged.) Lectures on advanced topics in inorganic chemistry presented by staff or visiting lecturers. Course title, content, and credit change from year to year.

CHEM 504. Special Topics in Organic Chemistry. 1 - 6 Unit.
(Credit as arranged.) Lectures on advanced topics in organic chemistry presented by staff or visiting lecturers. Course title, content, and credit change from year to year.

CHEM 506. Special Topics in Physical Chemistry. 1 - 6 Unit.
(Credit as arranged.) Lectures on advanced topics in physical chemistry presented by staff or visiting lecturers. Course title, content, and credit change from year to year.

CHEM 507. Special Readings in Chemistry. 1 - 6 Unit.
Detailed study of a special topic in chemistry under the guidance of a faculty member.

CHEM 508. Special Readings in Chemistry. 1 - 6 Unit.
Detailed study of a special topic in chemistry under the guidance of a faculty member.

CHEM 509. Special Topics in Analytical Chemistry. 1 - 6 Unit.

CHEM 601. Research. 1 - 18 Unit.
(Credit as arranged.) Special research in an area of chemistry under the guidance of a faculty member.

CHEM 605. Chemistry Colloquium Series. 1 Unit.
Course content provided by Thursday chemistry department colloquia (or Frontiers in Chemistry lectures). Discussion sessions review previous lectures and lay foundation for forthcoming lectures.

CHEM 651. Thesis M.S.. 1 - 18 Unit.
(Credit as arranged.)

(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
Department of Classics

The Department of Classics introduces students to the culture, life, and legacy of ancient Greece and Rome through courses in the Greek and Latin languages and literatures, in ancient history and archaeology, and in the visual and material cultures of the ancient Mediterranean world. When justified by enrollment, the department offers courses in Sanskrit and in ancient Indian religious texts. A relatively recent development is a focus on the classical tradition in Europe and beyond. The department faculty represents a range of academic disciplines and is committed, where appropriate, to an interdisciplinary approach in teaching and research.

The core purpose of the department is to offer the opportunity for study of the ancient classical languages, as a crucial point of entry into the conceptual worlds of Greece and Rome. Students are also exposed to the various facets of antiquity that made the ancient Mediterranean world the progenitor of the modern West, not least in its mingling of cultures and belief systems. The different sub-disciplines and methodologies represented in the department involve multiple ways of exploring and understanding antiquity. Our students explore the philological, literary, and philosophical dimensions of ancient texts, and they engage with material and visual culture and city form through archaeology, epigraphy, and art and architectural history. Further, they study major moments of the revival of antiquity and the various lenses through which subsequent eras understood or appropriated the past.

Knowledge of classical antiquity constitutes the backbone of a liberal education. It also provides an excellent basis for further professional training in whatever field a student may ultimately pursue; for informed engagement with the political, social, and cultural issues of our turbulent times; and for the appreciation and enjoyment of artistic and cultural achievement. A major in classics, or even a minor, may be (as it often has been) profitably combined with programs aimed toward law, medicine, management, diplomatic service, banking, journalism, library science, or politics; religious, philosophic, literary, or historical studies; careers in the fine arts (visual or performing); or museum or archival work.

Undergraduate Programs

Major

The core of the classics major is the study of the languages and literatures of ancient Greece and Rome and the societies that spoke Greek and Latin until the end of the ancient world (usually taken as the 5th century of the Common Era). The major uniquely offers exposure to a range of approaches: literary, philological, historical, archaeological, art historical, philosophical, and anthropological. Further, the scope of the department has expanded to embrace the classical tradition in and even beyond Europe, with courses on literature and art and architecture up to the 20th century.

Concentrations

There are three separate tracks in the classics major. Philology (Track A) is devoted to ancient languages and their associated literatures in the original languages (Greek, Latin, or Greek and Latin). Classical Civilization (Track B) focuses on ancient history, literature in translation, and archaeology. Classical Tradition (Track C) explores the legacy of antiquity from the European Middle Ages to the contemporary world. The relevant courses examine the various ways that subsequent civilizations and movements have drawn on the classical world, for a wide range of purposes (some good, some nefarious), and with an equally wide range of effects. Please note that for Tracks B and C, students must complete study of either Greek or Latin to at least the intermediate level.

Each track requires 10 courses (30 hours), and at least two of these courses must be at the 300 level. For students who elect to complete their junior and senior year SAGES requirements in classics, two additional courses (6 hours) are required. CLSC 320 Departmental Seminar: Alexander the Great and CLSC 381 Classics Senior Capstone. (CLSC 320 may count as one of the classics 300-level courses, provided the student takes his or her junior SAGES requirements outside of classics.)

In the Philology Concentration (Track A), students can earn one of three degrees: BA in Classics: Greek; BA in Classics: Latin; or BA in Classics: Greek and Latin. Students in Track A are required to take CLSC 231 Greek Civilization and CLSC 232 Roman Civilization, then any combination of eight GREK or LATN courses, at least two of which (6 hours) must be at the 300-level. To receive the BA in Classics: Greek and Latin, students must complete at least one year of their second language.

In the Classical Civilization Concentration (Track B), students are required to take CLSC 231 Greek Civilization and CLSC 232 Roman Civilization; at least one 200-level or higher GREK or LATN course (for most students, this will mean taking GREK or LATN 101, 102 and 201); and any combination of GREK, LATN, or CLSC courses to bring their course total to 10 (30 hours), at least two of which must be at the 300 level. The elective CLSC courses should consist of courses that focus on the period before the 6th century of the Common Era and not the Classical Tradition (Track C).

In the Classical Tradition Concentration (Track C), students are required to take and CLSC 232 Roman Civilization and at least one course in Greek or Latin at the intermediate level or higher. (Students who enter the program without any Greek or Latin are required to take the introductory sequence in either language.) The department offers four 200-level courses in Classical Tradition, focusing respectively on the Renaissance and Baroque, the Enlightenment, Architecture and Urbanism from the Renaissance to the 20th Century, and Classics in Film (see list below). Students are required to take at least two of these courses.

<table>
<thead>
<tr>
<th>Students in the Classical Tradition Concentration must take two of the following four 200-level courses:</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLSC/ARTH 311 Roman: City and Image</td>
</tr>
<tr>
<td>CLSC 313/COGS 318 Thinking Communication in Ancient and Medieval Literature</td>
</tr>
<tr>
<td>CLSC 315 Erotic Literature Ancient to Modern</td>
</tr>
<tr>
<td>CLSC 319/ARTH 320 Epic: The Sublime and Terrible in Literature</td>
</tr>
<tr>
<td>CLSC/COGS 340 Seminar in Enlightenment Art and Literature: Piranesi and Vico</td>
</tr>
</tbody>
</table>

Keeping in mind that the student should have at least two 300-level courses out of ten, the remaining courses (two to four, depending on whether the student is required to take the beginning language sequence) may be chosen from the above lists or, subject to advisor’s approval, from the classics, Greek, or Latin courses in general.
Study in Related Fields
Each student completing the classics major is strongly advised to choose a related minor, selected in consultation with and approved by the departmental advisor, in such closely related fields as anthropology, art history, philosophy, comparative literature, history, theater, or English. The association between the department and the World Literature Program is especially close.

Departmental Honors
Departmental honors are given to students who earn the grade of A for their senior dissertation in CLSC 382 Senior Honors Thesis and maintain a GPA in the major of 3.5.

The Minor
A minor in classics is designed to acquaint the student with aspects of the ancient civilizations of Greece and Rome by means of 15 hours of course work. These 15 hours may be any combination of Greek, Latin, and classics courses, at least 3 hours of which must be at or above the 300 level. While the study of either Greek or Latin is encouraged, neither is required for the minor.

Graduate Study

Post-Baccalaureate
The department is about to launch a Classics Post-Bac program in which existing courses will be offered at the 400 level. Interested, qualified students should contact the chair.

World Literature MA: Classics Track
Qualified students may pursue graduate work in classics through the MA in the World Literature Program (p. 446) (WLIT). Classics courses at the 300 level may be taken for graduate credit in this way.

Department Faculty
Charles Burroughs, PhD  
(Warburg Institute, University of London)  
Elsie B. Smith Professor in the Liberal Arts and Chair  
Art and architecture in the classical tradition; Italian Renaissance; early modern urbanism; landscapes in Europe and the Americas

Ricardo A. Apostol, PhD  
(University of Michigan)  
Assistant Professor  
Augustan poetry and culture; Hellenistic poetry; material culture

Florin Berindeanu, PhD  
(University of Georgia)  
Instructor; Director, World Literature Program; Secondary Appointment, Department of Cognitive Science  
European literature; literary and semiotic theory; mysticism

Paul A. Iversen, PhD  
(Ohio State University)  
Associate Professor  
Greek and Roman New Comedy; Greek and Latin epigraphy; Hellenistic culture and society

Rachel Hall Sternberg, PhD  
(Bryn Mawr College)  
Associate Professor  
Greek language and literature; Greek social history; history of emotion; reception of the classical tradition in the age of Jefferson

Visiting Faculty
Timothy Wutrich, PhD  
(Tufts University)  
Visiting Assistant Professor  
Greek and Roman drama; classical tradition in literature and art; philosophical approaches to literature and art; Roman civilization; Vergil

Secondary Faculty
Jenifer Neils, PhD  
(Princeton University)  
Ruth Coulter Heede Professor of Art History; Department of Art History and Art  
Ancient art and classical archaeology

Deepak Sarma, PhD  
(University of Chicago)  
Associate Professor, Department of Religious Studies  
Hinduism; Indian philosophy; method and theory in the study of religion

Adjunct Faculty
Ramaswamy Sharma, PhD  
(Bharathidasan University, Trichy, India)  
Adjunct Instructor  
Sanskrit language and literature

CLSC Courses
CLSC 193. The Ancient World. 3 Units.  
Ancient Western history from the origins of civilization in Mesopotamia to the dissolution of the Roman Empire in the West. Offered as CLSC 193 and HSTY 193.

CLSC 199. Athens: Environment and Ethics. 3 Units.  
Students selected for their strong background or interest in Greek Civilization spend Spring Break in Athens, Greece (thanks to a collaboration between CWRU’s Department of Classics and the Athens Centre). They follow an intensive seven-day itinerary of travel, visiting major monuments and museums including the Acropolis, Delphi, Epidaurus, and Aegina. Two class sessions of instruction in modern Greek help them to interact with people they meet; but the overwhelming emphasis lies on Classical Athens, the historical-cultural setting for the emergence of Western moral philosophy. The focus of this mini-course is on the figure of Socrates and the agenda of moral philosophy that the Athenian sage established. Readings from Plato, Aristophanes, and Aristotle. Via the Socratic method, students will also study Aristotle’s Ethics and test the applicability of that foundational text to their own lives.

CLSC 202. Classical Mythology. 3 Units.  
The myths of Classical Greece and Rome, their interpretation and influence.

CLSC 203. Gods and Heroes in Greek Literature. 3 Units.  
This course examines major works of Greek literature and sets them in their historical and cultural context. Constant themes are war, wandering, tyranny, freedom, community, family, and the role of men and women within the household and the ancient city-state. Parallels with modern life and politics will be explored. Lectures and discussions. Offered as CLSC 203 and WLIT 203.
CLSC 204. Heroes and Hustlers in Latin Literature. 3 Units.
This course constitutes the second half of a sequence on Classical literature. Its main themes are heroism vs. self-promotion, love vs. lust, and the struggle between democracy and tyranny. These topics are traced in a variety of literary genres from the period of the Roman republic well into the empire. Parallels with modern life and politics will be drawn. Offered as CLSC 204 and WLIT 204.

CLSC 206. Ancient and Medieval Spain: Prehistory to 1492. 3 Units.
This course focuses on the history of the Iberian peninsula from before the Roman conquest from the Iberians, Greek, and Carthaginian settlements, through Roman, Visigothic, and Muslim rule to the conquest of Ferdinand and Isabella of the last non-Christian territory on the peninsula in 1492. The issues of conquest, frontier, cultural diversity, and change, tolerance, and intolerance will be examined. Offered as CLSC 206, HSTY 206.

CLSC 210. Byzantine World 300-1453. 3 Units.
Development of the Byzantine empire from the emperor Constantine’s conversion to Christianity and founding of the eastern capital at Constantinople to the fall of Constantinople to Turkish forces in 1453. Offered as CLSC 210 and HSTY 210.

CLSC 220. Art & Literature in the Classical Tradition, Pt 1: Renaissance and Baroque (14th to 17th centuries). 3 Units.
Through lectures, varied assignments, and visits to the Cleveland Museum of Art this course will introduce students to the major issues in the study of early modern art and literatures. The emphasis will inevitably be on Italy, as the place where the physical remains of ancient Rome confronted and inspired such remarkable masters as Michelangelo (as poet and artist), Palladio, Gian Lorenzo Bernini, Nicholas Poussin (Bernini and Poussin are represented in the CMAI), though some artists -- notably Leonardo -- resisted the lure of the classical past. From Italy new ideas spread to the rest of Europe and beyond. We will not have much time to study Shakespeare in the course, but we will not be able to ignore the greatest author of the Renaissance period. Like Shakespeare, we will move between the court and the city, between scenes of often-endangered order and scenes of sometimes-productive disorder, in which classical models provided a key cultural and even psychological resource in challenging times. Recommended preparation: CLSC 112. Offered as CLSC 220 and WLIT 220.

CLSC 221. Building on Antiquity. 3 Units.
Beginning with Ancient Greece and Rome and ending in Cleveland, the course will provide orientation in the architectural orders and in most periods of European and Euro-American architectural history, as well as, to an extent, architectural criticism. The issue of how architecture has meaning will be central, not least in connection with the formalized "language" of classicism and the emergence of development of building types (temple, museum, civic hall, transportation buildings, etc.). We will also review more subtle ways in which architecture conveys meaning or mood, and the assignment of gendered associations to certain architectural elements. The course will consider more or less blatant political uses of architecture and architectural imagery, but also more elusive and/or ambiguous cases, as well as the phenomenon of the shifting meanings of architecture through changes of era, owner, audience, etc. Offered as ARTH 221 and CLSC 221.

CLSC 222. Classical Tradition 2: Birth of Archaeology. 3 Units.
The course will focus on the history of diverse methods for studying societies remote in time and space; i.e., on the formation of the distinct disciplines of archaeology and anthropology, and the interest in the origins of human society and cultural practices. The birth of archaeology occurred in the context of the profound transformation of European cultural life in the eighteenth century, the era of the Enlightenment. On the basis of a range of cultural productions (literary and historical texts, objects of luxury and use, etc.), we will study visual and literary works and consider the relationship between different modes of artistic production and expression, as well as the marketing and display of prestigious objects, whether ancient or modern. We will consider the eighteenth-century model of experiential education, the "Grand Tour," and the formation of private and public collections, as well as the emergence of the museum as institution. Finally, we will also consider important recent work on the relationship between the production of luxury commodities (sugar, coffee, tea, etc.) through the plantation economy in the Americas and beyond and the development of attitudes and ideas in Europe. Offered as CLSC 222 and WLIT 222.

CLSC 224. Sword and Sandal: The Classics in Film. 3 Units.
Gladiator. Alexander. The 300. Contemporary society’s continuing fascination with putting the ancient world on the big screen is undeniable; and yet the causes underlying this phenomenon are not quite so readily apparent. In this course we will watch and discuss a number of movies about the ancient world, running the gamut from Hollywood classics such as Ben-Hur and Spartacus to more recent treatments (the aforementioned 300 and Gladiator, for starters), and from the mainstream and conventional (Clash of the Titans, Disney's Hercules) to the far-out and avant-garde (Fellini’s Satyricon, anyone?). As we do so we’ll learn quite a bit about the art and economics of film, on one hand, and the ancient world, on the other. And yet what we’ll keep coming back to are the big questions: what does our fascination with the ancient Mediterranean tell us about ourselves as a society? Why do such movies get made, and what kinds of agendas do they serve? To what extent can we recapture the past accurately? And if we can’t, are we doomed to just endlessly projecting our own concerns and desires onto a screen, and dressing them in togas? No knowledge of ancient languages is required for this course. Offered as CLSC 224 and WLIT 224.

CLSC 227. Ancient Cities and Sanctuaries. 3 Units.
A selection of cities and sanctuaries from the ancient Near East, Egypt, the Aegean, Greece, Etruria, and Rome; their political and religious institutions and the relationship to contemporary art forms. Offered as ARTH 227 and CLSC 227.

CLSC 228. Ancient Greek Athletics. 3 Units.
Exploration of the role of athletics in the ancient, primarily Greek world, and their reflection in the art of the period. Offered as ARTH 228 and CLSC 228.

CLSC 231. Greek Civilization. 3 Units.
This course constitutes the first half of a year-long sequence on classical civilization. It examines the enduring significance of the Greeks studied through their history, literature, art, and philosophy. Lectures and discussion. (For the second course in the sequence, see CLSC 232 and HSTY 232.) Offered as CLSC 231 and HSTY 231.

CLSC 232. Roman Civilization. 3 Units.
The enduring significance of the Romans studied through their history, literature, art, and philosophy. Lectures and discussion. Offered as CLSC 232 and HSTY 232.
CLSC 295A. Greek and Latin Elements in English: The Basic Course. 1.5 Unit.
A self-paced, computer-assisted course in the classical foundations of modern English in which the student learns the basic principles on which roots, prefixes, and suffixes combine to give precise meanings to composite words.

CLSC 295B. Greek and Latin Elements in English: Biomedical Terminology. 1.5 Unit.
(See CLSC 295A.) Advanced section that is oriented especially toward scientific and medical terminology. Prereq or Coreq: CLSC 295A.

CLSC 301. Ancient Philosophy. 3 Units.
Western philosophy from the early Greeks to the Skeptics. Emphasis on the pre-Socratics, Plato and Aristotle. Recommended preparation: PHIL 101 and consent of department. Offered as CLSC 301 and PHIL 301.

CLSC 302. Ancient Greece: Archaic, Classical, and Hellenistic Periods. 3 Units.
The rise of Hellenic thought and institutions from the eighth to the third centuries B.C., the rise of the polis, the evolution of democracy at Athens, the crises of the Persian and Peloponnesian Wars, fifth-century historiography, the growth of individualism, and the revival of monarchy in the Hellenistic period. Offered as CLSC 302 and HSTY 302.

CLSC 304. Ancient Rome: Republic and Empire. 3 Units.
Growth and development of the Roman state from the unification of Italy in the early third century B.C. to the establishment of the oriental despotism under Diocletian and Constantine. The rise of empire in the Punic Wars, the uncertain steps toward an eastern hegemony, the crisis in the Republic from the Gracchi to Caesar, the new regime of Augustus, the transformation of the leadership class in the early Empire, and the increasing dominance of the military over the civil structure. Offered as CLSC 304 and HSTY 304.

CLSC 305. Sanskrit Religious Texts. 3 Units.
Introduction to the Sanskrit language and culture through the reading of selected texts taken from the ancient religions of South Asia. Offered as CLSC 305 and RLGN 305.

CLSC 309. Advanced Sanskrit Religious Texts. 3 Units.
This class is a continuation of RLGN 305/CLSC 305, the introduction to the Sanskrit language and culture. In RLGN 309/CLSC 309 students will learn advanced Sanskrit grammar and syntax. Previous knowledge of Sanskrit is required. We will finish the lessons from Devavanipravesika that we began in the introductory course. We will then translate sections for the Bhagavad Gita. Offered as CLSC 309 and RLGN 309.

CLSC 311. Rome: City and Image. 3 Units.
This course studies the architectural and urban history of Rome from the republican era of the ancient city up to the eighteenth century using the city itself as the major “text.” The emphasis will be placed on the extraordinary transformations wrought in the city, or at least in key districts, by powerful rulers and/or elites, especially in the ancient empire and in the Renaissance and baroque eras. In a larger perspective, the great construction projects exerted a far-reaching effect within and beyond Europe, but we will study them in relation to their topographical situation, their functions, and their place in a long history of variations on prestigious themes since many of the artworks and the urban settings featured in the course carry the mark of the Long history of the city itself. Recommended preparation: At least one 200-level course in ANTH, ARTH, CLSC, ENGL, HSTY, or RLGN. Offered as ARTH311/411 and CLSC 311.

CLSC 312. Women in the Ancient World. 3 Units.
The course offers a chronological survey of women’s lives in Greece, Hellenistic Egypt, and Rome. It focuses on primary sources as well as scholarly interpretations of the ancient record with a view to defining the construction of gender and sexuality according to the Greco-Roman model. Additionally, the course aims to demonstrate how various methodological approaches have yielded significant insights into our own perception of sex and gender. Specific topics include matriarchy and patriarchy; the antagonism between male and female in myth; the legal, social, economic, and political status of women; the ancient family; women’s role in religion and cult; ancient theories of medicine regarding women; pederasty and homosexuality. Offered as CLSC 312 and WGST 312.

CLSC 313. Thinking Communication in Ancient and Medieval Literature. 3 Units.
The ancients were much concerned with the nature and validity of signs: Important decisions depended on the flight of birds or the coloration of the liver of a sacrificial victim. The relationship of language to truth, i.e., a reality beyond the contingent, was a crucial issue, not least because of the rise of sophist rhetoric: for an orator, language was a tool in a contest rather than a means to true understanding. The discipline of medicine, developed by such important figures as Galen and Hippocrates, depended on the interpretation of physical signs to diagnose and treat ailments of mind and body. The term for the theory of signs - semiotics - is derived from the Greek term "semeiotike", and for many Greek philosophers and their Roman and medieval successors the sign was a key issue. For Christians especially, new forms of vision and discerning truth presented particular problems: after all, the Christian God revealed his intentions through "portents" that had to be read and interpreted. And even if sacred scripture was in some way understood as encapsulating the whole word, there were countless passages requiring clarification or adaptation to contemporary situations. In other words, the concern was with the relationship between a universe of structured signs (the subject of semiotics) and structures of interpersonal communication (pragmatics). Offered as CLSC 313 and COGS 318. Prereq: WLIT 211 or WLIT 212.

CLSC 314. Love Poetry from Sappho to Shakespeare. 3 Units.
Introduction to the love poetry of ancient Greece and Rome and its impact on the later European tradition in such poets as Petrarch, Chaucer, and Shakespeare. Readings will focus especially on questions of generic convention, audience expectation, and the social setting of love poetry in the different ages under consideration. No knowledge of the original languages required. Offered as CLSC 314 and WLIT 314.
CLSC 315. Erotic Literature Ancient to Modern. 3 Units.
The erotic drive is a fundamental impulse in human beings, indeed in the animal world in general. Primordially, the erotic find expression in sexual desire and in associated behaviors, which in antiquity -- as in other myth-oriented cultures -- amounts to a production of poetry to aid in seduction, to praise an object of desire, or simply reflect the nature of love and/or sexual desire in general. Highly sexualized language appears in both ancient and modern texts that take into account a variety of foundational texts in Western culture. From Plato, who wrote a whole dialogue (Symposium) describing different kinds of love, to Christian interpreters of sacred texts, eroticism was a term that defined both pagan and religious experiences. This course will explore fictional as well as theoretical inquiries into the nature and purpose of erotic desire and its evaluation as aesthetic phenomenon. It will focus on texts such as Longus's Daphnis and Chloe, Abelard's Letters, Aucassin and Nicolette, mystical voices, Freudian theory and modern contribution such as Roland Barthes and Georges Bataille. Modern theoreticians as those mentioned here illustrate how the libidinal (whether understood as subjective drive or in Freudian terms) is inseparable from the aesthetic. Offered as: CLSC 315 and WLIT 317. Prereq: WLIT 211 and WLIT 212.

CLSC 316. Greek Tragedy. 3 Units.
This course provides students the opportunity to read a significant number of ancient Greek tragedies in modern English translations. We shall read, study, and discuss selected works by Aeschylus, Sophocles, and Euripides, and attempt to understand the plays as literature composed for performance. We shall study literary elements within the plays and theatrical possibilities inherent in the texts. As we read the plays, we shall pay close attention to the historical context and look for what each play can tell us about myth, religion, and society in ancient Athens. Finally, we shall give occasional attention to the way these tragic dramas and the theater in which they were performed have continued to inspire literature and theater for thousands of years. Lectures will provide historical background on the playwrights, the plays, the mythic and historical background, and possible interpretation of the texts as literature and as performance pieces. Students will discuss in class the plays that they read. The course has three examinations and a final project that includes a short essay and a group presentation. Offered as CLSC 316, WLIT 316, WLIT 416.

CLSC 317. Inspiration: The Topic of Creativity in Art and Literature--Ancient to Medieval. 3 Units.
Inspiration is an inextricably essential part of the aesthetic genesis, and it has instantly become one of the most frequented themes of artistic creation. Where does inspiration come from? Are artists "chosen ones" that implicitly stand out from the "non-inspired" rest? Trying to answer these questions and others related to the phenomenon of creativity, one direction that this course should take and focus on is the theme of "divine" or "transcendent" as a source of inspiration in art and literature. The course will start with the mystical teaching and theories of Pythagoras that influenced Plato and the Neo-Platists that will be carried on further in the general tradition of Christian literature. In this respect, the course will examine creativity in readings that include both Ancient and Medieval writers whose writings place the subject of inspiration at the center of their own aesthetic invention. Among the authors included in the course will be Pseudo-Dyonisius, Gregory Palamas, Jacopone da Todi, Caterina da Siena, Dante, Petrarch, and Meister Eckhart. Offered as: CLSC 317 and WLIT 319.

CLSC 318. Landscape Archaeology and Epigraphy. 3 Units.
Landscape archaeology addresses the complex ways that people have consciously and unconsciously shaped the land around them. As by-products of the interaction between people and place, landscapes designate spaces occupied by specific social groups whose members draw from their environs a shared identity and who situate their actions within specific normative frameworks. The landscapes of the Greek and Roman East are no exception to this. As "cultural landscapes," they were the scene of thousands of years of actions, including the organizing of space or the altering of the land for diverse purposes such as subsistence, or for economic, social, political, religious and military concerns. As such they offer us the possibility to investigate the agencies, actions, and negotiations between particular communities and the various greater powers that exercised control over them. This course will, therefore, introduce students to the study of Landscape Archaeology/Intensive Surveying through five weeks of hands-on fieldwork in the region of Isparta, Turkey, the locus of an ancient landscape called Northwestern Pisidia about which little is known. This landscape has a long storied past, lying as it did along a fault line between earthshaking empires, including the Hittites, Lydians and Persians to North and to the East, and the Greeks, Macedonians and Romans to the West. As such it was a contested space, not only in terms of the physical control of the land, but also the culture. This course will investigate this cultural landscape through the analysis of the archaeological material found. There will also be an opportunity to work with the archaeological material in the Isparta Museum, especially the epigraphical material there. We will also take field trips to important ancient sites and museums in the area to better grasp the region's ancient cultural profile and context. In addition, we will discuss archaeological ethics, issues of cultural patrimony, the importance of teamwork, and the need to work side by side with the local community. Offered as CLSC 318 and CLSC 418.

CLSC 319. Epic: The Sublime and Terrible in Literature. 3 Units.
The course focuses on the epic genre that dominates the dawn of Western literature as well as the literary traditions of much of the rest of the world. From the Homeric epic to the Middle Ages and deep into the Renaissance, there was a collective urge to record both in verse and in prose extraordinary adventures with exceptional heroes as central figures. Thus, the epic genre typically encouraged variations in the aesthetic treatment of the hero that eventually came to define distinct categories within the genre. "Sublime" and "terrible" are common notions in the aesthetics of classicism, from antiquity to the early modern period. Authors studied in the course include such key figures in the creation and development of epic as Homer, Virgil, Ovid, Gottfried von Strassburg, Dante, and Cervantes. The works of these authors exemplify, on the one hand, the aesthetic directions mentioned above and, on the other hand, provide opportunities for using the close engagement with particular texts to illuminate wider cultural fields, in which various aesthetic perceptions of social, political, and religious reality coexist and therefore stimulate remarkable innovations in the standard epic narrative. Offered as CLSC 319, CLSC 419, WLIT 320 and WLIT 420.
CLSC 320. Departmental Seminar: Alexander the Great. 3 Units.
This course is the Classics Departmental Seminar in the SAGES sequence, though it can also be taken for regular credit in Classics or History. The seminar on Alexander the Great is normally taken in the Spring semester of junior year, and offers students a firm grounding in the diverse materials, methods, and approaches that can be brought to bear on the study of Greco-Roman antiquity and of its legacy up to today. Alexander’s career is urgently relevant today for two primary reasons: the establishment of new forms of interaction between European/"western" and Asian/"eastern" civilizations; and the idea of global domination, wedding Greek and Asian as well as African (Egyptian) conceptions of rule and governance. Beyond the exploration of the ancient world of, or shaped by, Alexander, we will focus also on the reception of the historical figure, i.e., on the sometimes fantastic image of Alexander diffused in later epochs (Islamic, medieval) as well as on the more critical but often ideologically slanted early modern approach. Because of the expansion of the scope of the seminar (as of Alexander himself) beyond Europe and the critical examination of the traditional separation of East and West--or the three continents (Europe, Africa, and Asia) distinguished in antiquity--this course qualifies as a Global and Cultural Diversity course. Offered as CLSC 320 and HSTY 320.

CLSC 330. Topics in Classical Tradition. 3 Units.
This course will examine facets and tendencies of cultural development in modern Europe and beyond which involve the engagement of historians, philosophers, literary authors and critics, artists, architects, and/or society in general with the classical world and its legacy. In some cases courses will be programmatically associated with special events, e.g., exhibitions in The Cleveland Museum of Art. No prerequisites have been included, but students taking this course should have completed intermediate humanities courses, preferably in CLSC/LATN/GREK as well as WLIT. Offered as CLSC 330 and CLSC 430.

CLSC 332. Art and Archaeology of Ancient Italy. 3 Units.
The arts of the Italian peninsula from the 8th century B.C. to the 4th century A.D., with emphasis on recent archaeological discoveries. Lectures deal with architecture, sculpture, painting, and the decorative arts, supplemented by gallery tours at the Cleveland Museum of Art. Offered as ARTH 332, CLSC 332, and ARTH 432.

CLSC 333. Greek and Roman Painting. 3 Units.
Greek vase painting. Etruscan tomb painting and Roman wall painting. The development of monumental painting in antiquity. Offered as ARTH 333, CLSC 333, and ARTH 433.

CLSC 334. Art and Archaeology of Greece. 3 Units.
A survey of the art and architecture of Greece from the beginning of the Bronze Age (3000 B.C.) to the Roman conquest (100 B.C.) with emphasis on recent archaeological discoveries. Lectures deal with architecture, sculpture, painting, and the decorative arts, supplemented by gallery tours at the Cleveland Museum of Art. Offered as ARTH 334, CLSC 334, and ARTH 434.

CLSC 340. Seminar in Enlightenment Art and Literature: Piranesi and Vico. 3 Units.
This course explores aspects of the European eighteenth century as a transformative epoch in the history of western culture. Though the Enlightenment is usually associated especially with France, in this course we will focus on Italy, as the irresistible goal of travelers taking part in the "Grand Tour," and as a landscape of powerful ancient and modern architecture and artworks universally recognized as exemplary. In particular we will study one of the strangest and most fascinating visual artists of the period, the self-proclaimed architect Giovanni Battista Piranesi (1720-1778) famous no less now than in his own time for his fantastic prison engravings as well as his views of Rome, involving a radical rethink of the city as a particular kind of inhabited as well as imagined space. Piranesi’s polemical response to the advocates of the Greek revival, then coming into fashion, will lead into discussion of the key philosophical debates and aesthetic shifts of the time, notably the emergence of the notion of the sublime as a category eventually subversive of western ideals of rationality and still present -- and potent -- in our own culture. Finally we will place Piranesi within a current of discussion of the origins and nature of language and of human society in general, not least as manifested in architecture and other symbolic practices. The leading figure here is the Neapolitan G.B. Vico, whose New Science of 1725 remains one of the most stimulating texts in the western intellectual tradition. Offered as CLSC 340, COGS 340, WLIT 340, CLSC 440, and WLIT 440.

CLSC 381. Classics Senior Capstone. 3 Units.
The capstone is the final requirement of the SAGES program and is normally taken in the fall semester of senior year. It involves an independent study paper resulting from exploration of a topic chosen in consultation with the student's capstone advisor, who will regularly review progress on the project. In the capstone students employ, integrate, and demonstrate analytical, rhetorical, and practical skills developed and honed through the SAGES curriculum as well as their major or minor studies. The Capstone Project has both a written and an oral component: oral presentation and argumentation will be stressed. The product of the capstone may take different forms: there will always be a written component, but other forms of expression are also encouraged, such as a webpage or poster for a poster session. As for the kind of project that might be done: students interested in literature might work on an annotated translation of a classical text; archaeology students might produce a virtual exhibit centered on a specific site or problem. Prereq: CLSC 111 and CLSC 112, plus courses prescribed for each track of the major.

CLSC 382. Senior Honors Thesis. 3 Units.
A course of independent study and research culminating in the preparation of a thesis on a topic approved by the supervising faculty member. Enrollment in this course must be approved by the Chair of the Department. Prereq: CLSC 381.

CLSC 395. Directed Readings. 1 - 3 Unit.
Readings in English on a topic of interest to the student and acceptable to the instructor. Designed and completed under the supervision of the instructor with whom the student wishes to work.
CLSC 416. Greek Tragedy. 3 Units.
This course provides students the opportunity to read a significant number of ancient Greek tragedies in modern English translations. We shall read, study, and discuss selected works by Aeschylus, Sophocles, and Euripides, and attempt to understand the plays as literature composed for performance. We shall study literary elements within the plays and theatrical possibilities inherent in the texts. As we read the plays, we shall pay close attention to the historical context and look for what each play can tell us about myth, religion, and society in ancient Athens. Finally, we shall give occasional attention to the way these tragic dramas and the theater in which they were performed have continued to inspire literature and theater for thousands of years. Lectures will provide historical background on the playwrights, the plays, the mythic and historical background, and possible interpretation of the texts as literature and as performance pieces. Students will discuss in class the plays that they read. The course has three examinations and a final presentation. Offered as CLSC 316, WLIT 316, WLIT 416.

CLSC 418. Landscape Archaeology and Epigraphy. 3 Units.
Landscape archaeology addresses the complex ways that people have consciously and unconsciously shaped the land around them. As byproducts of the interaction between people and place, landscapes designate spaces occupied by specific social groups whose members draw from their environs a shared identity and who situate their actions within specific normative frameworks. The landscapes of the Greek and Roman East are no exception to this. As "cultural landscapes," they were the scene of thousands of years of actions, including the organizing of space or the altering of the land for diverse purposes such as subsistence, or for economic, social, political, religious and military concerns. As such they offer us the possibility to investigate the agencies, actions, and negotiations between particular communities and the various greater powers that exercised control over them. This course will, therefore, introduce students to the study of Landscape Archaeology/ Intensive Surveying through five weeks of hands-on fieldwork in the region of Isparta, Turkey, the locus of an ancient landscape called Northwestern Pisidia about which little is known. This landscape has a long storied past, lying as it did along a fault line between earthshaking empires, including the Hittites, Lydians and Persians to North and to the East, and the Greeks, Macedonians and Romans to the West. As such it was a contested space, not only in terms of the physical control of the land, but also the culture. This course will investigate this cultural landscape through the analysis of the archaeological material found.
There will also be an opportunity to work with the archaeological material in the Isparta Museum, especially the epigraphical material there. We will also take field trips to important ancient sites and museums in the area to better grasp the region's ancient cultural profile and context. In addition, we will discuss archaeological ethics, issues of cultural patrimony, the importance of teamwork, and the need to work side by side with the local community. Offered as CLSC 318 and CLSC 418.

CLSC 419. Epic: The Sublime and Terrible in Literature. 3 Units.
The course focuses on the epic genre that dominates the dawn of Western literature as well as the literary traditions of much of the rest of the world. From the Homeric epic to the Middle Ages and deep into the Renaissance, there was a collective urge to record both in verse and in prose extraordinary adventures with exceptional heroes as central figures. Thus, the epic genre typically encouraged variations in the aesthetic treatment of the hero that eventually came to define distinct categories within the genre. "Sublime" and "terrible" are common notions in the aesthetics of classicism, from antiquity to the early modern period. Authors studied in the course include such key figures in the creation and development of epic as Homer, Virgil, Ovid, Gottfried von Strassburg, Dante, and Cervantes. The works of these authors exemplify, on the one hand, the aesthetic directions mentioned above and, on the other hand, provide opportunities for using the close engagement with particular texts to illuminate wider cultural fields, in which various aesthetic perceptions of social, political, and religious reality coexist and therefore stimulate remarkable innovations in the standard epic narrative. Offered as CLSC 319, CLSC 419, WLIT 320 and WLIT 420.

CLSC 430. Topics in Classical Tradition. 3 Units.
This course will examine facets and tendencies of cultural development in modern Europe and beyond which involve the engagement of historians, philosophers, literary authors and critics, artists, architects, and/or society in general with the classical world and its legacy. In some cases courses will be programmatically associated with special events, e.g., exhibitions in The Cleveland Museum of Art. No prerequisites have been included, but students taking this course should have completed intermediate humanities courses, preferably in CLSC/LATN/GREK as well as WLIT. Offered as CLSC 330 and CLSC 430.

CLSC 440. Seminar in Enlightenment Art and Literature: Piranesi and Vico. 3 Units.
This course explores aspects of the European eighteenth century as a transformative epoch in the history of western culture. Though the Enlightenment is usually associated especially with France, in this course we will focus on Italy, as the irresistible goal of travelers taking part in the "Grand Tour," and as a landscape of powerful ancient and modern architecture and artworks universally recognized as exemplary. In particular we will study one of the strangest and most fascinating visual artists of the period, the self-proclaimed architect Giovanni Battista Piranesi (1720-1778) famous no less now than in his own time for his fantastic prison engravings as well as his views of Rome, involving a radical rethinking of the city as a particular kind of inhabited as well as imagined space. Piranesi's polemical response to the advocates of the Greek revival, then coming into fashion, will lead into discussion of the key philosophical debates and aesthetic shifts of the time, notably the emergence of the notion of the sublime as a category eventually subversive of western ideals of rationality and still present -- and potent -- in our own culture. Finally we will place Piranesi within a current of discussion of the origins and nature of language and of human society in general, not least as manifested in architecture and other symbolic practices. The leading figure here is the Neapolitan G.B. Vico, whose New Science of 1725 remains one of the most stimulating texts in the western intellectual tradition. Offered as CLSC 340, COGS 340, WLIT 340, CLSC 440, and WLIT 440.

CLSC 481. Special Studies. 1 - 6 Units.
Subject matter varies according to need.
GREK Courses

GREK 101. Elementary Greek I. 3 Units.
Beginning course in Greek language, covering grammar (forms and syntax) and the reading of elementary selections from ancient sources. Makes a start toward reading Greek authors.

GREK 102. Elementary Greek II. 3 Units.
Beginning course in Greek language, covering grammar (forms and syntax) and the reading of elementary selections from ancient sources. Makes a start toward reading Greek authors. Prereq: GREK 101 or equivalent.

GREK 201. Greek Prose Authors. 3 Units.
Readings from authors such as Plato, Lysias, Xenophon, and Herodotus. Prereq: GREK 102 or equivalent.

GREK 202. Introduction to Greek Poetry. 3 Units.
Primarily readings from Homer, Hesiod, and Theocritus. Selections from Greek lyric may be introduced at the instructor’s discretion. Prereq: GREK 201 or equivalent.

GREK 306. Tragedy. 3 Units.
Reading and interpretation of selected plays of Aeschylus, Euripides, and Sophocles. Prereq: GREK 202 or equivalent.

GREK 307. History. 3 Units.
Extensive reading in Thucydides’ History of the Peloponnesian War, especially Books VI and VII, the expedition against Syracuse. Prereq: GREK 202 or equivalent.

GREK 308. Comedy. 3 Units.
Origin, ambiance, and development of Greek Old Comedy and persisting characteristics of the genre. Translation of selected plays from Greek into English. Prereq: GREK 202 or equivalent.

GREK 311. Homer. 3 Units.
Reading and translation of extensive selections from the Odyssey. Introduction to epic meter, to Homeric Greek, and to the poet’s style. Consideration of evidences of oral composition and discussion of the heroic tradition. Prereq: GREK 202 or equivalent.

GREK 370. Greek Prose Composition. 3 Units.
This course introduces students to the principles and practice of composing continuous passages of Greek prose. It is designed to review and to strengthen students’ command of Attic forms while becoming more aware of the ways Greek syntax was employed to express thought. Via practice at writing Greek prose, the ultimate goal is for the students to become more proficient and sensitive readers of ancient Greek. Prereq: GREK 202.

GREK 380. Advanced Topics in Greek Literature. 3 Units.
Study and discussion of important authors, works, and topics not covered regularly. Content will reflect particular interests of students and faculty and timeliness of the topics. Prereq: GREK 202 or equivalent.

GREK 395. Directed Readings. 1 - 3 Unit.
Readings in Greek of authors selected to serve the individual interests and needs of undergraduate students. Each program planned and completed under the supervision of the instructor with whom the student wishes to work.

LATN Courses

LATN 101. Elementary Latin I. 3 Units.
An introduction to the elements of Latin: pronunciation, forms, syntax, vocabulary, and reading.

LATN 102. Elementary Latin II. 3 Units.
An introduction to the elements of Latin: pronunciation, forms, syntax, vocabulary, and reading. Prereq: LATN 101 or equivalent.

LATN 201. Latin Prose Authors. 3 Units.
Reading and discussion of such prose authors as Cicero, Caesar, Livy or Pliny. Prereq: LATN 102 or equivalent.

LATN 202. Vergil. 3 Units.
Primarily readings from The Aeneid; selections from Vergil’s other work may be introduced at instructor’s discretion. Recommended preparation: LATN 201 or equivalent.

LATN 305. Literature of the Republic. 3 Units.
A reading course in prose and poetry of the Roman Republic. Extensive selections from Cicero and Catullus, and one comedy of Terence. Prereq: LATN 202 or equivalent.

LATN 306. Survey of Latin Literature. 3 Units.
Reading and discussion of selections from the various genres of Latin literature of the Roman Republic and Empire such as historical narrative, lyric and elegiac poetry, comic drama, forensic rhetoric, philosophical dialogue, didactic literature, letters, and epigrams. Prereq: LATN 202 or equivalent.

LATN 307. Livy. 3 Units.
Readings in Books I and XXI, with other selections from this major Augustan historian. Prereq: LATN 202 or equivalent.

LATN 308. Horace: Odes and Epodes. 3 Units.
Readings and discussion of extensive selections from the poetry of Horace; consideration of Horace as exemplifying the spirit of the Augustan Age. Prereq: LATN 202 or equivalent.

LATN 309. Medieval Latin. 3 Units.
Reading and interpretation of Latin texts from the Middle Ages. Material selected according to the needs and interests of students. Prereq: LATN 202 or equivalent.

LATN 351. Latin Didactic Literature. 3 Units.
Readings from didactic poetry such as Lucretius and Vergil’s Georgics. Parodies like Ovid’s Ars Amatoria or prose treatises may also be introduced. Prereq: LATN 202 or equivalent.

LATN 354. Drama. 3 Units.
Reading of at least one play each by Plautus and Terence. Attention to the history of Latin and Greek New Comedy, and the contrasting styles of the two authors. Prereq: LATN 202 or equivalent.

LATN 370. Latin Prose Composition. 3 Units.
This course is designed to strengthen students’ active command of Latin grammar and idiomatic prose style. At a basic level, students are trained to pay attention to details and thus write grammatically correct. Going beyond this, the course teaches Latin Idioms. Finally, it aims to develop students’ intuitive feeling for the Latin language. The ultimate goal is to write in a Ciceronian prose style. Prereq: LATN 202.
LATN 380. Advanced Topics in Latin Literature. 3 Units.
Study and discussion of important authors, works, and topics not covered regularly. Content will reflect particular interests of students and faculty and timeliness of topics. Prereq: LATN 202 or equivalent.

LATN 395. Directed Readings. 1 - 3 Unit.
Directed readings in Latin of authors selected to serve the individual interests and needs of undergraduate students. Each program planned and completed under the supervision of the instructor with whom the student wishes to work.
Department of Cognitive Science

Cognitive science is the scientific study of the mind in a transdisciplinary framework. The Department of Cognitive Science at Case Western Reserve University is specifically dedicated to the study of human higher cognition, including language, gesture, advanced social cognition, mathematical invention, scientific discovery, art, religion, music, literature, advanced tool use and advanced technology, theater and dance, fashions of dress, sign systems, creativity, and culture. The department draws on methods of research in the biological sciences, the social sciences, and the humanities. Its educational mission is to provide students with the best possible opportunity to integrate a wide variety of approaches and apply them to the study of human higher cognition.

The department provides basic training in core disciplines, as well as in a range of philosophical, evolutionary, linguistic, and computational issues bearing on cognitive science. It seeks to place cognitive science in a wider, more ecologically valid context than traditional programs in this field have typically allowed, so as to broaden our theories of those high-end cognitive capacities that mark human beings as distinctive.

The department offers an undergraduate major and minor in cognitive science and a master’s degree in cognitive linguistics. By developing wide-ranging expertise in at least two or three relevant disciplines, our students can prepare for a variety of career options. Training in several disciplines will also provide increased choices for postgraduate study.

Undergraduate Programs

Major

In addition to meeting general education requirements, cognitive science majors must complete a minimum of 30 semester hours in cognitive science and approved related course work: 15 hours in the foundation component and 15 hours of elective course work. The foundation courses provide all students with a common basis for further study. They consist of:

- COGS 101 Introduction to Cognitive Science 3
- COGS 201 Human Cognition in Evolution and Development 3
- COGS 202 Human Cognition Viewed from a Cultural Perspective 3
- One of the following quantitative methods courses: 3
  - ANTH 319 Introduction to Statistical Analysis in the Social Sciences
  - PSCL 282 Quantitative Methods in Psychology
  - STAT 201 Basic Statistics for Social and Life Sciences
- Five elective courses (three must be at the 200 or 300 level) 15

Total Units 30

Minor

The minor requires students to take the following:

- COGS 101 Introduction to Cognitive Science 3
- One of the following: 3
  - COGS 102 Introduction to Cognitive Neuroscience
  - COGS 201 Human Cognition in Evolution and Development
  - COGS 202 Human Cognition Viewed from a Cultural Perspective
- Three COGS courses at the 200 or 300 level 9

Total Units 15

The minor provides a good basic grounding in cognitive science, and allows students to narrow their exposure to those aspects of the field most relevant to their other academic interests. Individual programs can be developed in consultation with the chair of the department.

Graduate Program

MA in Cognitive Linguistics

“Cognitive linguistics goes beyond the visible structure of language and investigates the considerably more complex backstage operations of cognition that create grammar, conceptualization, discourse, and thought itself. The theoretical insights of cognitive linguistics are based on extensive empirical observation in multiple contexts, and on experimental work in psychology and neuroscience. Results of cognitive linguistics, especially from metaphor theory and conceptual integration theory, have been applied to wide ranges of nonlinguistic phenomena.”

Candidates may apply for admission to the degree program in cognitive linguistics with the purpose of pursuing the MA, or for non-degree status with the purpose of taking courses for credit that can be transferred to other institutions. The MA follows Plan A as described in the School of Graduate Studies (p. 662) section of this bulletin. Accordingly, it requires 30 credit hours and a written MA thesis.

Department Faculty

Todd Oakley, PhD
(University of Maryland)
Professor and Chair
Cognitive linguistics; discourse analysis; attention

Anthony Jack, PhD
(University College London)
Assistant Professor
Cognitive neuroscience; social cognition; consciousness; neuroimaging

Fey Parrill, PhD
(University of Chicago)
Assistant Professor
Cognitive aesthetics and poetics; narratology; embodiment and performance

Vera Tobin, PhD
(Oxford University)
Assistant Professor
Cognitive linguistics; discourse analysis; attention

Mark Turner, PhD
(University of California, Berkeley)
Institute Professor
Higher-order cognition and creativity; conceptual integration

Secondary Faculty

Florin Berindeanu, PhD
(University of Georgia)
Instructor, Department of Classics

Richard J. Boland, Jr., PhD
(Case Western Reserve University)
Professor of Information Systems, Weatherhead School of Management

Patrizia Bonaventura, PhD
(Ohio State University)
Courses

COGS 101. Introduction to Cognitive Science. 3 Units.
This course introduces students to the field of cognitive science. Cognitive scientists are interested in the nature of the human mind--basically, we ask how humans think. This is a huge question, and has been addressed in one way or another by pretty much every academic field. Cognitive science tries to unite work from many different fields, including computer science, neuroscience, psychology, linguistics, philosophy, music, art, and literary theory. In this course, you'll get a basic introduction to some of the topics that are central to human cognition, such as intelligence, categorization, language, and creativity. We'll ask what can be gained by taking an integrated, cognitive scientific approach to these topics.

COGS 102. Introduction to Cognitive Neuroscience. 3 Units.
A survey of the fundamental methods, findings, and theories that attempt to understand the human mind from a neuroscientific standpoint. The course provides the student with background knowledge of brain processes underlying such psychological phenomena as consciousness, sensation, perception, thought, language, and voluntary action. Since many fields of neuroscience have contributed to cognitive neuroscience, the approach of this course is cross-disciplinary. It introduces theories and data from clinical and experimental neuropsychology, brain imaging, neuroelectric and neuromagnetic brain activity, the neuroscience of language, and behavioral neuroscience, among other fields.

COGS 201. Human Cognition in Evolution and Development. 3 Units.
COGS 201 covers mind unfolding in time, including the fundamental methods, findings, and theories of human mental phylo- and ontogenesis. It provides the student with background knowledge about the unfolding of cognitive structures and functions over time, in both the deep temporal perspective of evolution (measured across many lifetimes) and the shorter one of development (measured within single lifetimes). The approach of the course is cross-disciplinary, including approaches that come from anthropology, archaeology, philosophy, computing science, comparative psychology, primatology, and comparative linguistics, among others.

COGS 202. Human Cognition Viewed from a Cultural Perspective. 3 Units.
This course studies the human mind in its natural environment: culture. It covers the fundamental methods, findings, and theories that attempt to understand the growth and evolution of cognition from either a social science or humanistic standpoint. It provides the student with background knowledge of theories of human cultural evolution and change, of the relationship between the cognizing individual and larger social-cognitive structures, and of such phenomena as distributed networks, cooperative mental work, and the phenomenology of human experience. Many disciplines have contributed to this knowledge; hence the approach of this course is cross-disciplinary, including ideas from cultural anthropology, literary studies, art and art history, musicology, philosophy, and the history of technology, among others.
COGS 204. Cognition and Computation. 3 Units.
This course explores possible uses of computational technology in the study of cognition. (1) The human or animal mind-supporting brain is not in any technical sense "just" a computer, but it is relevant to stimulate various cognitive phenomena by computation in order to model their formal properties. From perception to conception, images schemas, categories, and meanings found in linguistic semantics and syntax, and from bodily motion to the processes of abstraction, intentional orientation, and spatial navigation, computational modeling can help us understand mental architecture, the interrelations between iconicity and symbolization in mental representations, and the constraints and indeterminacies at work in social cognitive networks (distributed cognition). (2) It also is relevant in this course to analyze the cognitive roles of actual computation as a social and communicational technology, mirroring certain of our mental routines on the screens we interact with and program to manifest symbolic and iconic behaviors in ever-changing patterns of "Interface" communication, while the underlying systems control our social and technical environment. (3) Recent developments in Cognitive Robotics finally invite for an integration of semantic stimulation and the elaboration and implementation of language-based and motion-based competencies in mobile robots. Computation serves, in this perspective, the construction of a dynamic model of meaning linked to interaction (human-machine, machine-machine, and machine to human).

COGS 205. Cognition and Design. 3 Units.
Urbanism is design; architecture is design; of course, the aesthetic shaping of artifacts (such as computers, cars, and coffee machines) is design. Configuring surfaces, volumes, and portions of space in special ways, creating and changing formats for things and places that allow cultural practices to unfold while delimiting them, are essential "designing" endeavors of human civilization and are, necessarily, activities based on the cognitive capacities and constraints of our species. We 'cognize' the human world in terms and frames of 'designed' surroundings. Design is a basic expressive activity, by which we interact with our artificial and natural surroundings and create 'interfaces' between mind and reality, thus upholding and interpretable world. Landscapes and citiescapes, workspaces of all sorts, buildings and parks, exteriors and interiors of homes, factories, institutions, and temples; furniture, artifacts such as machines, tools, weapons, symbolic objects, even the configuration ('building') of our own bodies, are design. An inquiry into cultural cognition, aiming to understand how humans as socio-cultural beings think and feel, therefore needs to explore this dimension of spatial expressivity and to acknowledge it as a constitutive fact of human meaning production; it needs to study the aesthetic and pragmatic, political and historical, philosophical and religious, and simply everyday practical, semiotic aspects of this basic form of human creativity. This course will focus on spatial expressivity--design--in several primary keys and scales, including design for learning; design for verbal and technical communication, interaction, and commerce; design for expressions of authority and deliberation; and design for emotional display.

COGS 272. Morality and Mind. 3 Units.
Recent research in cognitive science challenges ethical perspectives founded on the assumption that rationality is key to moral knowledge or that morality is the product of divine revelation. Bedrock moral concepts like free will, rights, and moral agency also have been questioned. In light of such critiques, how can we best understand moral philosophy and religious ethics? Is ethics primarily informed by nature or by culture? Or is ethics informed by both? This course examines 1) ways in which cognitive science--and related fields such as evolutionary biology--impact traditional moral perspectives, and 2) how the study of moral philosophy and comparative ethics forces reconsideration of broad cognitive science theories about the nature of ethics. The course examines the concept of free will as a case study in applying these interpretive viewpoints. Interdisciplinary readings include literature from moral philosophy, religious ethics, cognitive science, and evolutionary biology. Offered as COGS 272, RLGN 272.

COGS 301. Special Topics in Cognitive Science. 3 Units.
This course offers instructors the opportunity to cover a more advanced and specialized topic in the field of cognitive science for third and fourth year students. Topics will vary from year to year.

COGS 302. SAGES Departmental Seminar: Methods and Theories in Cognitive Science. 3 Units.
This course takes a look at the discipline of cognitive science by exploring the methods that cognitive scientists use in their research. We'll discuss how different methods reflect different approaches and traditions of thought and how they provide different answers to particular questions. We'll also discuss the process of translating research into writing and talk about how different kinds of writing reflect the many different methods used in cognitive science. Recommended preparation: COGS 101, COGS 102, COGS 201, COGS 202.

COGS 303. SAGES Departmental Seminar: Current Controversies in Cognitive Science. 3 Units.
This course takes a look at the discipline of cognitive science by exploring the current controversies that impact cognitive scientists in their research. We'll discuss how different controversies effect different approaches and traditions of thought and how they elicit different answers to particular questions. We'll also discuss the process of translating research into writing and talk about how different kinds of writing reflect the many different controversial issues presented in cognitive science. Recommended preparation: COGS 101, COGS 102, COGS 201, and COGS 202.

COGS 304. Conceptual Integration. 3 Units.
Conceptual Integration, otherwise known as "blending", is a defining feature of higher-order human cognition, indispensable for all behaviors typically taken as distinctive to human beings. This course presents the cognitive mechanisms of conceptual integration, the constraints on its operation, and its deployment and expression in a range of human behaviors such as learning, invention, mathematical and scientific discovery, language, art music, gesture, social understanding, institutional performance, reasoning, decision, judgment, choice, design, and engineering. A student in the class will work on an individual research project in any of a variety of fields, including engineering (e.g. designing with blends), computer science, the arts, the humanities, the social sciences, cognitive neuroscience, and linguistics. Only one of COGS 304 and COGS 404 can be taken for credit within any degree program. Offered as COGS 304 and COGS 404.
COGS 305. Departmental Seminar: Moral Boundaries and Limits of Science. 3 Units.
Cognitive Science is essentially interdisciplinary, and this seminar will focus on deep issues that lie at the intersection between science and philosophy. The class will explore how, and to what extent, science might both shape our ethical judgments and help us to understand them. We will also consider what, if anything, our deep moral intuitions, as evidenced by strong sentiments such as disgust or repugnance, tell us about the nature of morality. Current scholarship in moral psychology, moral neuroscience, and moral philosophy are shedding new light on these issues. We will focus on moral boundaries: distinctions between things that have powerful ethical and emotional significance, at least for some people. We will consider the following boundaries: -Male/ female and moral responses to homosexuality; -Human/animal and moral responses to bestiality and stem cell research that inserts human stem cells into animals; -Life/death and moral responses to euthanasia; -Human/machine and the moral responses to artificial intelligence, robots, and the use of steroids to enhance athletes and warfighters. In addition to learning and writing about relevant psychological and neuroscientific research, the course contains two other essential aspects. First, students will engage with relevant philosophical issues and arguments. Are there moral facts? If so, what is their basis? Second, the course will include experiential aspects—students will be asked to examine their own ethical responses, and to reexamine them in light of what they are learning. Recommended Preparation: (any two of following pre-requisites) COGS 101, COGS 102, COGS 201, COGS 202.

COGS 313. Special Topics in Cognitive Linguistics. 3 Units.
This course covers special topics in the field of cognitive linguistics. Topics will vary from semester to semester. Offered as COGS 313 and COGS 413.

COGS 314. Animal Cognition and Consciousness. 4 Units.
This course examines the notions of intelligence, cognition, reasoning, consciousness, and mental content as they appear in the philosophical views and empirical studies of animals in individual and social contexts. We will review scientific findings that suggest striking likenesses and intriguing differences in the (apparent) thought processes of humans and animals, and ask whether the research techniques that brought us these results are fully adequate to measuring such unobservable entities as conscious experience and thought. Techniques of measurement range from naturalistic observation, to the processing of vocalizations, to memory and problem solving tasks, and the imaging of brain processes through fMRI scans, etc. Students will face the challenges and rewards of practicing these techniques and reworking philosophical theories in the service component of the course. Students will participate in veterinary or shelter work to provide needed animal care while studying animal behavior using cognitive ethological methods. We will compare methods for measuring consciousness and intelligence in animals to those used for human beings, and ask questions about the possibility of machine consciousness and the emergent property of group consciousness. Offered as BIOL 314, COGS 314, PHIL 314 and PHIL 414.

COGS 315. Mental Space Theory. 3 Units.
This course covers theory of mental spaces and methodology of mental space analysis, with special emphasis on the use of mental space theory to analyze human performance in various areas of cognition, including reasoning, judgment, decision, counterfactual thought, inference, planning, communication and language, gesture, social cognition, cognitive design and engineering, representation, learning, humor, symbol systems, and invention. It includes a consideration of experimental methods that have arisen under the influence of mental space theory. A student may earn credit for either COGS 315 or COGS 415, but not both. Offered as COGS 315 and COGS 415.

COGS 316. Decision-Making. 3 Units.
This course is a topical introduction to decision-making, a major area of cognitive social science, with connections to economics, law, political science, business, policy, and related fields. Topics include game theory and rational calculation, equilibrium, kinds of choice, heuristics, the role of affect in decision, framing, bounded rationality, mechanisms of choice such as heuristics, the role of social cognition in choice, concepts of self and other, and computer modeling of choice. The course also includes an introduction to the design of empirical behavioral research. Offered as COGS 316 and COGS 416.

COGS 318. Thinking Communication in Ancient and Medieval Literature. 3 Units.
The ancients were much concerned with the nature and validity of signs: Important decisions depended on the flight of birds or the coloration of the liver of a sacrificial victim. The relationship of language to truth, i.e., a reality beyond the contingent, was a crucial issue, not least because of the rise of sophistic rhetoric: for an orator, language was a tool in a contest rather than a means to true understanding. The discipline of medicine, developed by such important figures as Galen and Hippocrates, depended on the interpretation of physical signs to diagnose and treat ailments of mind and body. The term for the theory of signs - semiotics - is derived from the Greek term "semeiotike", and for many Greek philosophers and their Roman and medieval successors the sign was a key issue. For Christians especially, new forms of vision and discerning truth presented particular problems: after all, the Christian God revealed his intentions through "portents" that had to be read and interpreted. And even if sacred scripture was in some way understood as encapsulating the whole word, there were countless passages requiring clarification or adaptation to contemporary situations. In other words, the concern was with the relationship between a universe of structured signs (the subject of semiotics) and structures of interpersonal communication (pragmatics). Offered as CLSC 313 and COGS 318. Prereq: WLIT 211 or WLIT 212.

COGS 322. Human Learning and the Brain. 3 Units.
This course focuses on the question, "How does the human brain learn?" Through assigned readings, extensive class discussions, and a major paper, each student will explore personal perspectives on learning. Specific topics include, but are not limited to: the brain's cycle of learning; neocortex structure and function; emotion and limbic brain; synapse dynamics and changes in learning; images in cognition; symbolic brain (language, mathematics, music); memory formation; and creative thought and brain mechanisms. The major paper will be added to each student's SAGES writing portfolio. In addition, near the end of the semester, each student will make an oral presentation on a chosen topic. Offered as BIOL 302 and COGS 322.
COGS 324. Discourse and Cognition. 3 Units.
This course explores discourse and interaction from a cognitive linguistic perspective, with special emphasis on mental space, conceptual integration, and cognitive grammar. Cognitive linguistics is a paradigm of language study that seeks to understand language structure, acquisition, and use as a function of embodied conceptualization. This means that it seeks to describe and explain language as a symbolic activity involving general cognitive processes, such as perception, attention, memory, categorization, framing and sensory-motor activities. Another burgeoning area of interest among cognitive linguists is social-cognition, gesture, and interaction. In each of these endeavors, the goal is to explain as much about language without having to posit autonomous and language-specific faculties. While cognitive linguists have always been seen discourse as a legitimate object of study, many still take the sentence, clause, and phrase as their primary unit of analysis. In this course, we shall focus on the relationship between discourse and relevant cognitive processes such as attention, memory, categorization, framing, and kinesthetic experience, with the intention of exploring who these cognitive processes shape discourse in English and other languages. We will subsequently reverse our orientation and explore how discourse (in text as well as embodied/face-to-face) in turn shapes how we pay attention, remember, categorize, frame, and even experience the world. The readings, discussion, and/or research projects for this course may include the following topics: interactional conduct, intersubjectivity, consciousness, co-speech gesture, mental spaces, prosody, time and temporality, and working memory. The international structure of this course will likely lead to focused discussion and research projects on English as a Second & Foreign Language. Offered as COGS 324 and COGS 424.

COGS 325. Cognitive Approaches to Literature. 3 Units.
This course approaches literature as a window into language, in which cognition is characterized by the same imaging and imaginary properties as artistic literature. It is an attempt to identify and analyze procedures as aesthetically interesting and generally relevant forms of human thinking, feeling, imagining, fantasizing, and conceptualizing. The course introduces current theories of literature in relation to language and mind, and it presents and discusses practical applications in critical reading and text analysis, using examples from modern literature in the main genres. A student may earn credit for either COGS 325 or COGS 425 but not both. Recommended preparation: COGS 101, COGS 202. Offered as COGS 325 and COGS 425.

COGS 326. Cognitive Approaches to Music. 3 Units.
This course will study the ways in which the presence of music relates to cognition and the semiotics of inter-subjective communication at large—the emergence of language, gesture, and symbolization of time. Topics of interests include: the ways that specific works of musical art invite semantic interpretation; how intelligible musical structure relates to meaning; how musical activities correspond to brain activity; and how music relates to and/or induces emotion. Recommended preparation: COGS 101, COGS 202. Offered as COGS 326 and COGS 426.

COGS 327. Gesture in Cognition and Communication. 3 Units.
Most people never notice that when they are talking, they’re also gesturing. Why do we produce these gestures? What can studying them tell us about the human mind? This course surveys scientific research on gesture, exploring topics such as the role of gesture in communication, cross-cultural differences in gesture, and the relationship between gesture and signed languages. The course will focus on gestures produced with speech, but will cover symbolic and ritualized gesture in the visual arts and in dance. Offered as COGS 327 and COGS 427 and MLIT 327.

COGS 328. Cognition and Visual Aesthetic Experience. 3 Units.
This course is offered as a reciprocal exchange between new research on the mind/brain and existing theories of visual aesthetics. It would appeal to students from diverse majors, ranging from art, language or philosophy, to psychology, computer science or pre-medicine. The material covered links a traditional approach to philosophical aesthetics with a most up-to-date research on visual perception and brain functioning. Recommended preparation: COGS 101, COGS 202.

COGS 329. Performance and the Embodied Mind. 3 Units.
In the past twenty years cognitive scientists working in neuroscience, psychology, linguistics, philosophy, and related fields have made great progress in understanding perception, empathy, the human mind’s sense of space and movement, emotions, meaning-making, and many other cognitive areas that are crucial to producing, enacting, and responding to performances on stage. This course will look at ways of incorporating many of the insights of cognitive science into the existing work of theatre and performance scholarship. The course will thus link a more traditional approach to the body in theatre and dance studies, where it has commonly been considered one of the main means of communication, to a most up-to-date research on embodied cognition. Observation of live and pre-recorded dance and theatre performances will regularly be used to supplement the theoretical discussion. Recommended preparation: COGS 101, COGS 202.

COGS 340. Seminar in Enlightenment Art and Literature: Piranesi and Vico. 3 Units.
This course explores aspects of the European eighteenth century as a transformative epoch in the history of western culture. Though the Enlightenment is usually associated especially with France, in this course we will focus on Italy, as the irresistible goal of travelers taking part in the “Grand Tour,” and as a landscape of powerful ancient and modern architecture and artworks universally recognized as exemplary. In particular we will study one of the strangest and most fascinating visual artists of the period, the self-proclaimed architect Giovanni Battista Piranesi (1720-1778) famous no less now than in his own time for his fantastic prison engravings as well as his views of Rome, involving a radical rethinking of the city as a particular kind of inhabited as well as imagined space. Piranesi’s polemical response to the advocates of the Greek revival, then coming into fashion, will lead into discussion of the key philosophical debates and aesthetic shifts of the time, notably the emergence of the notion of the sublime as a category eventually subversive of western ideals of rationality and still present -- and potent -- in our own culture. Finally we will place Piranesi within a current of discussion of the origins and nature of language and of human society in general, not least as manifested in architecture and other symbolic practices. The leading figure here is the Neapolitan G.B. Vico, whose New Science of 1725 remains one of the most stimulating texts in the western intellectual tradition. Offered as CLSC 340, COGS 340, WLIT 340, CLSC 440, and WLIT 440.
COGS 349. Biocultural Approaches to Religion. 3 Units.
This course studies religious beliefs and rituals from a biocultural perspective. A biocultural approach to religion is based on the idea that human religiosity is informed by both our evolutionary biological makeup and by our ability to construct culture to adapt to variable social worlds and environments. According to a biocultural view, humans are biologically constrained but have the cultural capacity to adapt to the world in a variety of ways. Thus, a biocultural approach to religion asserts that biology and culture operate in tandem and that both biological and cultural insights are required in order to understand and explain religious beliefs and practices. This course explores these assumptions and examines them against specific religious data. This course introduces students to major ideas, concepts, and questions that motivate biocultural approaches to religion. The course requires students to apply course material to a final research project that explores particular religious beliefs and/or practices in terms of the intersection of cultural choices and biological constraints. Students will present their research findings to the class. Students who take this course under the COGS designation are expected to engage substantively with the contemporary scientific study of the human mind in their research project and other course work. Offered as RLGN 349, RLGN 449 and COGS 349.

COGS 352. Language, Cognition, and Religion. 3 Units.
This course utilizes theoretical approaches found in cognitive semantics -- a branch of cognitive linguistics -- to study the conceptual structures and meanings of religious language. Cognitive semantics, guided by the notion that conceptual structures are embodied, examines the relationship between conceptual systems and the construction of meaning. We consider such ideas as conceptual metaphor theory, conceptual blending, Image schemas, cross-domain mappings, metonymy, mental spaces, and idealized cognitive models. We apply these ideas to selected Christian, Buddhist, and Chinese religious texts in order to understand ways in which religious language categorizes and conceptualizes the world. We examine both the universality of cognitive linguistic processes and the culturally specific metaphors, conceptual blends, image schemas, and other cognitive operations that particular texts and traditions utilize. Offered as RLGN 352, RLGN 452, COGS 352 and COGS 452.

COGS 363. Philosophy and Social Neuroscience. 3 Units.
A philosophical examination of recent research in human cognition and emotion at the intersection of the social sciences and neurological sciences. The course provides the student with background knowledge of brain processes underlying such social and cultural phenomena as bonding, aggression, imitation, mind-attribution, language, sexual behavior, moral action, and creativity. The approach of this course is at once scientific (comparing methods, findings and questions as they arise in clinical and experimental neuropsychology, brain imaging, neurolinguistics, and behavioral neuroscience) and humanistic, asking critical questions about the nature and methods of a science of cognition, and surveying moral responses from a neurologic and philosophic perspective. Recommended preparation: PHIL 101 or COGS 201. Offered as COGS 363 and PHIL 363.

COGS 365. Advanced Topics in Cognitive Neuroscience. 3 Units.
This course focuses on specific areas of research in cognitive neuroscience in some depth. The first half of the semester covers basics and fundamental research areas (e.g., perception, attention) and examines the (sometimes controversial) theoretical issue of what cognitive neuroscience techniques tell us about the mind. The second half of the semester is dedicated to examining selected research topics of interest to students. Students research and write 'grant proposals' for cognitive neuroscience experiments. The class culminates with students and invited faculty simulating a funding panel, and deciding which grants to 'fund' from a limited budget. Prereq: COGS 102.

COGS 366. Functional Magnetic Resonance Imaging. 3 Units.
fMRI is the workhorse of cognitive neuroscience research. This course will take an in-depth look at this methodology, including hands-on experience analyzing imaging data. The course will address the following issues: How do MRI and fMRI work? What does fMRI actually measure and how does that relate to cognition? What are the standard steps involved in processing and analyzing fMRI data to help answer specific questions? The course culminates in the production of a report of a novel analysis of imagining data that the students have performed (in small groups), including a broader description of what that analysis reveals about the neural basis of cognition. Prereq: COGS 102.

COGS 373. Intelligence and Cognition. 3 Units.
This course will focus on the notion and meaning of intelligence. What is intelligence? How is it measured, and are these measures adequate to the task? Is there more than one kind of intelligence? What is the relationship between individuals, genetic factors, biological factors, and socio-cultural-economic factors in the development of intelligence? How are language and thought related to intelligence? What is the difference between intelligence and talent? Intelligence seems to be necessary for culture, art, religious belief, the creation of theories and the quest for knowledge, truth and morality; thus intelligence is a necessary condition for the study of itself. To attempt to understand intelligence is an undertaking in which we will ask questions about the self and the common nature of humanity, while simultaneously examining the abilities of animals and machines. What is the mark of intelligence? Recommended preparation: PHIL 101 or COGS 201. Offered as COGS 373 and PHIL 373.

COGS 378. Computational Neuroscience. 3 Units.
Computer simulations and mathematical analysis of neurons and neural circuits, and the computational properties of nervous systems. Students are taught a range of models for neurons and neural circuits, and are asked to implement and explore the computational and dynamic properties of these models. The course introduces students to dynamical systems theory for the analysis of neurons and neural learning, models of brain systems, and their relationship to artificial and neural networks. Term project required. Students enrolled in MATH 478 will make arrangements with the instructor to attend additional lectures and complete additional assignments addressing mathematical topics related to the course. Recommended preparation: MATH 223 and MATH 224 or BIOL 300 and BIOL 306. Offered as BIOL 378, COGS 378, MATH 378, BIOL 478, EBME 478, EECS 478, MATH 478 and NEUR 478.
COGS 381. Philosophy and Cognitive Neuroscience. 3 Units.
This course will focus on the various methodologies used in the cognitive neurosciences, and explore their strengths and weaknesses from scientific and philosophical standpoints. We will begin by examining baseline measures (including IQ tests, tasks of cognitive flexibility, verbal and visual memory, causal/sequential thinking and narrative tasks) and their experimental design. Lesion methods will follow, with an eye toward understanding the strength of inferences that can be drawn from such data. The course will also focus on imaging techniques (CAT, PET, SPECT, FMRI, TMS, etc.) as well as measures of electrical activity such as EEG and single-cell recordings. Students will become familiar with many fundamental assumptions necessary for the implementation of each method, and philosophical questions associated with these endeavors and their potential impact on our knowledge and society. Recommend preparation: PHIL 101 or COGS 201. Offered as COGS 381 and PHIL 381.

COGS 383L. Vocalization and Cognition Lab. 1 Unit.
This is a laboratory section intended to provide hands-on training and experience with sound processing and analysis of animal vocalizations in the context of cognitive science, philosophy, and biology. Students will ask and answer questions surrounding language, meaning, mind, mental states, animal and human cognition. How does a science of content and language actually proceed? How do we measure behavior for use as an indicator of cognition? What pragmatic constraints are found when we explore the natural world? What causes us to interpret certain symbols as systematic? The laboratory work begins with an understanding of different software for sound analysis with an emphasis on the bioacoustic experimental method. Frog vocalization exercises will familiarize students with the process of data categorization, analysis and comparison, and will be the foundation for understanding hypothesis testing within a Darwinian theoretical backdrop. Cetacean vocalization analysis will press students to move beyond comparison and analysis to consider and evaluate the standard evidence types used in cognitive science to measure the mind. Recommended preparation: PHIL 101 or COGS 201. Offered as COGS 383L and PHIL 383L.

COGS 390. Introduction to General Semiotics. 3 Units.
Semiotics, the study of meaning and signs conveying meaning, is a central part of cognitive semiotics, or ‘high level’ cognitive semantics. This discipline is typically taught in departments of linguistics, cognitive science, philosophy, or cultural studies. The domain of semiotics is in fact widely intersecting with other disciplines (general linguistics, philosophy, neuroscience, anthropology, music, literature, architecture, and the arts). Sign theory, text theory, studies of narrative structure, enunciation, natural logic, rhetoric and poetics, speech act forms, are important components in this field.

COGS 391. Introduction to Text Semiotics. 3 Units.
Introduction to Text Semiotics addresses both students of Literature and students in Cognitive Science. Most of the authors included in the reading list extend their linguistic approach towards fields that intersect literature, psychology, philosophy, aesthetics, and anthropology. The scholarly traditions of text analysis and structural theory of meaning, including authors from classical formalism, structuralism, structural semiotics, and new criticism will be connected to cognitive theories of meaning construction in text, discourse, and cultural expressions in general. The focus of this course, taught as a seminar, is on empirical studies, specific text analyses, discourse analyses, speech act analyses, and other studies of speech, writing, and uses of language in cultural contexts. This course thus introduces to a study of literature and cultural expressions based on cognitive science and modern semiotics—the new view that has been coined Cognitive Semiotics. Offered as COGS 391 and WLIT 391.

COGS 397. SAGES Capstone in Cognitive Science. 3 Units.
Supervised original research on a topic in cognitive science, culminating in a public presentation. The research may be in the form of an independent research project, a literature review, or some other form approved by the department.

This course is for students with special interests and commitments that are not fully addressed in regular courses, and who wish to work independently.

COGS 401. Special Topics in Cognitive Science. 3 Units.
Special Topics in Cognitive Science at the 400-level. Topics vary. Permission of department is required.

COGS 404. Conceptual Integration. 3 Units.
Conceptual Integration, otherwise known as “blending”, is a defining feature of higher-order human cognition, indispensable for all behaviors typically taken as distinctive to human beings. This course presents the cognitive mechanisms of conceptual integration, the constraints on its operation, and its deployment and expression in a range of human behaviors such as learning, invention, mathematical and scientific discovery, language, art music, gesture, social understanding, institutional performance, reasoning, decision, judgment, choice, design, and engineering. A student in the class will work on an individual research project in any of a variety of fields, including engineering (e.g. designing with blends), computer science, the arts, the humanities, the social sciences, cognitive neuroscience, and linguistics. Only one of COGS 304 and COGS 404 can be taken for credit within any degree program. Offered as COGS 304 and COGS 404.

COGS 406. Theory of Cognitive Linguistics I. 3 Units.
COGS 406 is the first course in a two-course sequence designed to provide an introduction to cognitive linguistics at the M.A. level. It supports student work in COGS 408 and 409; the Workshop courses. This course begins with a discussion of major theoretical questions in linguistics. We first ask how these questions have been approached within theoretical frameworks which view language and general cognition as being separate from one another. The course then focuses on the methods that have been developed in cognitive linguistics in the last ten to twenty years for the study of phonology, syntax, semantics, and pragmatics. We ask how approaches that relate language to general cognitive processes (perception, memory, categorization, etc.) can lead to a deeper understanding both of language and of the human mind.
COGS 407. Theory of Cognitive Linguistics II. 3 Units.
COGS 407 is the second course in a two-course sequence designed to provide an introduction to theory of cognitive linguistics at the MA level. It covers contemporary theory in cognitive linguistics in greater detail and supports student work in COGS 408 and 409, the Workshop courses. Prereq: COGS 406 or consent of instructor.

COGS 408. Workshop on Cognitive Linguistics I. 3 Units.
This is the first in a two-course sequence (408 & 409) designed to provide experience in research methods in cognitive linguistics at the MA level. A workshop in which students read examples of cognitive linguistics research, develop their own topics (theoretical or empirical), and work on them to produce a final paper.

COGS 409. Workshop in Cognitive Linguistics II. 3 Units.
The second course in a two-course sequence (408 & 409) designed to provide experience in research methods in cognitive linguistics at the MA level. A workshop in which students read examples of cognitive linguistics research, develop their own topics (theoretical or empirical), and work on them to produce a final paper. Prereq: COGS 408 or consent of instructor.

COGS 413. Special Topics in Cognitive Linguistics. 3 Units.
This course covers special topics in the field of cognitive linguistics. Topics will vary from semester to semester. Offered as COGS 313 and COGS 413.

COGS 415. Mental Space Theory. 3 Units.
This course covers theory of mental spaces and methodology of mental space analysis, with special emphasis on the use of mental space theory to analyze human performance in various areas of cognition, including reasoning, judgment, decision, counterfactual thought, inference, planning, communication and language, gesture, social cognition, cognitive design and engineering, representation, learning, humor, symbol systems, and invention. It includes a consideration of experimental methods that have arisen under the influence of mental space theory. A student may earn credit for either COGS 315 or COGS 415, but not both. Offered as COGS 315 and COGS 415.

COGS 416. Decision-Making. 3 Units.
This course is a topical introduction to decision-making, a major area of cognitive social science, with connections to economics, law, political science, business, policy, and related fields. Topics include game theory and rational calculation, equilibria, kinds of choice, heuristics, the role of affect in decision, framing, bounded rationality, mechanisms of choice such as heuristics, the role of social cognition in choice, concepts of self and other, and computer modeling of choice. The course also includes an introduction to the design of empirical behavioral research. Offered as COGS 316 and COGS 416.

COGS 424. Discourse and Cognition. 3 Units.
This course explores discourse and interaction from a cognitive linguistic perspective, with special emphasis on mental space, conceptual integration, and cognitive grammar. Cognitive linguistics is a paradigm of language study that seeks to understand language structure, acquisition, and use as a function of embodied conceptualization. This means that it seeks to describe and explain language as a symbolic activity involving general cognitive processes, such as perception, attention, memory, categorization, framing and sensory-motor activities. Another burgeoning area of interest among cognitive linguists is social-cognition, gesture, and interaction. In each of these endeavors, the goal is to explain as much about language without having to posit autonomous and language-specific faculties. While cognitive linguists have always been seen discourse as a legitimate object of study, many still take the sentence, clause, and phrase as their primary unit of analysis. In this course, we shall focus on the relationship between discourse and relevant cognitive processes such as attention, memory, categorization, framing, and kinesthetic experience, with the intention of exploring who these cognitive processes shape discourse in English and other languages. We will subsequently reverse our orientation and explore how discourse (in text as well as embodied/face-to-face) in turn shapes how we pay attention, remember, categorize, frame, and even experience the world. The readings, discussion, and/or research projects for this course may include the following topics: interactional conduct, intersubjectivity, consciousness, co-speech gesture, mental spaces, prosody, time and temporality, and working memory. The international structure of this course will likely lead to focused discussion and research projects on English as a Second & Foreign Language. Offered as COGS 324 and COGS 424.

COGS 425. Cognitive Approaches to Literature. 3 Units.
This course approaches literature as a window into language, in which cognition is characterized by the same imaging and imaginary properties as artistic literature. It is an attempt to identify and analyze procedures as aesthetically interesting and generally relevant forms of human thinking, feeling, imagining, fantasizing, and conceptualizing. The course introduces current theories of literature in relation to language and mind, and it presents and discusses practical applications in critical reading and text analysis, using examples from modern literature in the main genres. A student may earn credit for either COGS 325 or COGS 425 but not both. Recommended preparation: COGS 101, COGS 202. Offered as COGS 325 and COGS 425.

COGS 426. Cognitive Approaches to Music. 3 Units.
This course will study the ways in which the presence of music relates to cognition and the semiotics of inter-subjective communication at large—the emergence of language, gesture, and symbolization of time. Topics of interests include: the ways that specific works of musical art invite semantic interpretation; how intelligible musical structure relates to meaning; how musical activities correspond to brain activity; and how music relates to and/or induces emotion. Recommended preparation: COGS 101, COGS 202. Offered as COGS 326 and COGS 426.
COGS 427. Gesture in Cognition and Communication. 3 Units.
Most people never notice that when they are talking, they’re also gesturing. Why do we produce these gestures? What can studying them tell us about the human mind? This course surveys scientific research on gesture, exploring topics such as the role of gesture in communication, cross-cultural differences in gesture, and the relationship between gesture and signed languages. The course will focus on gestures produced with speech, but will cover symbolic and ritualized gesture in the visual arts and in dance. Offered as COGS 327 and COGS 427 and MLIT 327.

COGS 452. Language, Cognition, and Religion. 3 Units.
This course utilizes theoretical approaches found in cognitive semantics -- a branch of cognitive linguistics -- to study the conceptual structures and meanings of religious language. Cognitive semantics, guided by the notion that conceptual structures are embodied, examines the relationship between conceptual systems and the construction of meaning. We consider such ideas as conceptual metaphor theory, conceptual blending, Image schemas, cross-domain mappings, metonymy, mental spaces, and idealized cognitive models. We apply these ideas to selected Christian, Buddhist, and Chinese religious texts in order to understand ways in which religious language categorizes and conceptualizes the world. We examine both the universality of cognitive linguistic processes and the culturally specific metaphors, conceptual blends, image schemas, and other cognitive operations that particular texts and traditions utilize. Offered as RLGN 352, RLGN 452, COGS 352 and COGS 452.

COGS 499. Independent Studies. 1 - 3 Unit.
This course is a face-to-face seminar between students and instructor, aiming at letting and helping the students independently develop original research on well-defined topics in the field of cognitive linguistics. Themes can vary within the wide area of cognition and culture.

COGS 651. Thesis. 1 - 6 Unit.
Conduct independent research and writing in Cognitive Linguistics under the guidance of a faculty adviser from Cognitive Science. The precise requirements of the course are to be determined by the faculty advisor. Prereq: COGS 406 and COGS 407 and COGS 408. Coreq: COGS 409.
Department of Dance

The Department of Dance offers education and participation in many aspects of dance, with course offerings in modern dance and ballet technique, choreography, kinesiology, history, production and more. Students have the opportunity to perform onstage as well as to serve on the technical crews in dance concerts. The high ratio of faculty to students ensures that students will be able to work closely with highly skilled professionals. The department treats all performances as educational experiences and welcomes the participation of all students, particularly in Mather Dance Collective (MaDaCo), regardless of their academic majors and career goals.

Graduates of the dance program are currently employed as modern dance company members (regionally and nationally), company directors/choreographers, and dance production managers, and as teachers, program directors, and administrators in colleges and universities. Others have transitioned into such disciplines as physical therapy and massage therapy.

Undergraduate Programs

Major

The basic course requirements for all dance majors are as follows:

- **DANC 121** Dance in Culture - Ethnic Forms 3
- **or DANC 122** Dance in Culture - Theatrical Forms
- **DANC 203** Second-Year Modern Dance Techniques I 3
- **DANC 204** Second-Year Modern Dance Techniques II 3
- **THTR 101** Acting I For Minors 3

At least 4 but no more than 8 hours of:

- **DANC 385/386** Rehearsal and Production 4-8
- Six hours from Anatomy, Art, English, Music, or Philosophy at or above the 300 level 6
- **DANC 303** Third-Year Modern Dance Techniques I
- **DANC 304** Third-Year Modern Dance Techniques II
- **DANC 355** History of Modern Dance
- **DANC 403** Fourth-Year Modern Dance Technique I
- **DANC 404** Fourth-Year Modern Dance Technique II
- **DANC 414** The Craft of Choreography
- **DANC 423** Light Design for Theatrical Dance
- **DANC 451** Costume Design and Construction for Dance
- **DANC 460** Ballet Technique for Modern Dance Students I
- **DANC 461** Ballet Technique for Modern Dance Students II

One of the following:

- **DANC 415** Choreography and Music
- **DANC 416** Choreography and Theatrical Elements
- **DANC 426** Advanced Topics in Choreography
- **DANC 445** Kinesiology for Dance
- **DANC 446** Topics in Dance Medicine, Science, and Wellness

Senior Capstone departmental course: 3

**DANC 396** SAGES Senior Capstone in Dance (recommended)

Total Units: 28-32

Total hours, not including DANC 385 Rehearsal and Production/DANC 386 Rehearsal and Performance: 40-43

Departmental Honors

All majors are encouraged to apply for DANC 397 Honors Studies I and DANC 398 Honors Studies II in their final year. This adds 6 hours to the total.

Minor

- **DANC 103** First-Year Modern Dance Techniques I 3
- **DANC 104** First-Year Modern Dance Techniques II 3
- **DANC 203** Second-Year Modern Dance Techniques I 3
- **DANC 204** Second-Year Modern Dance Techniques II 3

One of the following:

- **DANC 460** Ballet Technique for Modern Dance Students I
- **DANC 461** Ballet Technique for Modern Dance Students II
- **DANC 303** Third-Year Modern Dance Techniques I
- **DANC 304** Third-Year Modern Dance Techniques II

Total Units: 13

Graduate Programs

Master of Arts

Although the graduate dance program is geared toward the Master of Fine Arts degree (see below), all graduate students begin in the MA program. Advancement to the MFA program occurs upon faculty recommendation to the Dean of Graduate Studies in the third semester. The course work for the MA may be similar to that for the Master of Fine Arts, enhanced by related studies in theater and other departments. The candidate’s program of study will be designed by the primary dance faculty. As required by the School of Graduate Studies, students must maintain a minimum grade point average of 2.75. The Department of Dance requires an average of 3.0.

MA candidates must complete a minimum of 30 hours, following a program similar to that suggested below. The principal faculty advisor may suggest modifications.

**Technique Classes:** 9-12

- **DANC 417** Advanced Modern Dance Technique I
- **DANC 418** and Advanced Modern Dance Technique II
- **DANC 403** Fourth-Year Modern Dance Technique I
- **DANC 460** and Ballet Technique for Modern Dance Students I
- **DANC 461** Ballet Technique for Modern Dance Students II

**Choreography:** 6-9

- **DANC 414** The Craft of Choreography
- **DANC 415** Choreography and Music
- **DANC 416** Choreography and Theatrical Elements

**Eurhythmics:** 12

- **MUDE 501** Special Reading (M.M. and M.A.)

2-6 hours in Kinesiology and topics in dance medicine, science, and wellness: 2-6

**DANC 445/446** Kinesiology for Dance 3

One of the following suggested advanced electives: 3

- **DANC 535** Modern Dance Pedagogy
- **DANC 455** History of Modern Dance
- **DANC 505** Music Resources for Modern Dance

**Project-oriented seminars:** 2-4

- **DANC 601** Special Projects
- **DANC 423** Light Design for Theatrical Dance
- **DANC 451** Costume Design and Construction for Dance

Total Units: 41-53

The program recommends The School of Graduate Studies’ plan B, with requirements including a non-performance, non-production thesis on a topic approved by the primary program faculty. The thesis must be a substantial contribution to the field, with potential for publication or presentation. The MA thesis must be completed no later than one academic year beyond the completion of the course requirements.
Master of Fine Arts (Contemporary Dance)

The Master of Fine Arts degree, available with emphasis areas in choreography, performance, pedagogy, and complementary courses in dance science, is a terminal pre-professional degree. Candidacy for the MFA program requires an undergraduate degree with (ideally) a major in dance, equivalent training and experience, or demonstrable potential for work at the MFA level. In addition, each candidate must provide evidence of technical skill and creative ability. Participation as a part-time student is not recommended.

At the end of each semester in residence, the student’s skill and creative ability are evaluated in light of his or her work in the department. Only students who have clearly demonstrated growth and excellence are permitted to remain in the program. The award of the MFA degree is contingent upon the student’s academic progress and upon the faculty’s assessment that the candidate possesses the potential to work in the field of dance on a professional level.

Requirements for the MFA degree include:

1. A minimum of 60 semester hours of graduate work beyond the bachelor’s degree
2. A cumulative grade point average of 3.0 for all course work on the graduate level
3. Completion of the course requirements for the MFA Thesis Portfolio
4. Successful completion of the third year in performance in the Mather Dance Center mainstage season

Specific requirements for the MFA degree are as follows:

Department Faculty

Karen Potter, MFA
(Case Western Reserve University)
Associate Professor and Chair
Contemporary dance technique; choreography; pedagogy

Gary Galbraith, MFA
(Case Western Reserve University)
Professor; Artistic Director, Mather Dance Ensemble
Contemporary dance technique; choreography; dance wellness; production and technology

Courses

DANC 103. First-Year Modern Dance Techniques I. 3 Units.
Introduction to modern dance technique, through active participation, to serve individual development of basic movement principles, locomotor and axial skills and dance vocabulary, all in relation to time, space and dynamics and with a broad spectrum of applications, including dance, music, sports and theater. Explorations and investigations, both practical and cognitive, are designed to lay an introductory foundation for participating in and appreciating and understanding creative expressions.

DANC 104. First-Year Modern Dance Techniques II. 3 Units.
Continuation of DANC 103.

DANC 121. Dance in Culture - Ethnic Forms. 3 Units.
A lecture class designed to introduce dance as an art form and the many roles it plays in a variety of cultures. Focus will be on ethnic forms and primal cultures.

DANC 122. Dance in Culture - Theatrical Forms. 3 Units.
Introduction to an historical and cultural overview of many different forms of dance from various cultures specifically selected to encompass geographic diversity and represent different periods in history. Basic craft elements of the structures of dance will be introduced to provide a foundation for viewing dance and developing a personal aesthetic.

DANC 160. Introduction to Ballet Technique I. 3 Units.
This introductory-level course offers the beginning ballet student the basic tenets and principles of ballet technique. Classwork will involve strong emphasis on proper alignment of the body, dynamic timings, and a command of ballet terminology.

DANC 161. Introduction to Ballet Technique II. 3 Units.
Continuation of DANC 160. Prereq: DANC 160 or consent of department.

DANC 203. Second-Year Modern Dance Techniques I. 3 Units.
For the performing arts student, normative movement principles are formally extended in both theory and application to include individual correction, modification of adaptation as foundational preparation for the subsequent specialized training needs of the actor, dancer, and singer. Prereq: DANC 103 and DANC 104.

DANC 204. Second-Year Modern Dance Techniques II. 3 Units.
Continuation of DANC 203. Prereq: DANC 103 and DANC 104.

DANC 237. Religion and Dance in South Asia. 3 Units.
This is an experimental interdisciplinary course in religion, dance, and South Asian studies. We will explore the performance of religion in bharata natyam, one storytelling dance form from South Asia. This dance style draws upon Hindu devotional (bhakti) allegories of sacred and profane love in its choreography. Lover and beloved, as the ideal relationship between God and the human, becomes the model for the performed relationship between heroes and heroines (nayaka-nayaki) danced on stages and, more recently, Bollywood screens. To this end we will examine primary and secondary sources on bharata natyam and aesthetic theory/classical dramatics. We will also observe dance performances in the greater Cleveland area. Offered as RLGN 237 and DANC 237.

DANC 260. Second-Year Ballet Technique I. 3 Units.
In-depth exploration of principles and foundations of ballet technique as preparation for the specialized training needs of dancers.
DANC 261. Second-Year Ballet Technique II. 3 Units.
Continuation of DANC 260. Prereq: DANC 260 or consent of department.

DANC 303. Third-Year Modern Dance Techniques I. 3 Units.
For the dance major and upper level non-major. Formalities of dance technique as a contemporary American art form serve as the basis of the aesthetic and technical challenges explored in the course. Prereq: DANC 204.

DANC 304. Third-Year Modern Dance Techniques II. 3 Units.
Continuation of DANC 303. Recommended preparation: DANC 303 or consent of department.

DANC 314. The Craft of Choreography. 3 Units.
An in-depth investigation of choreographic craft elements is presented through lecture, practical involvement and specified studies. Emphasized are tools to discover primary movement vocabulary, development of vocabulary through permutative investigations and the co-ordering of movement vocabulary into phrases, structural units, and larger sections. Offered as DANC 314 and DANC 414.

DANC 315. Choreography and Music. 3 Units.
Combining craft resources with emphasis on use of music. Music selections, historically categorized, are chosen for the purpose of analyzing metric and structural characteristics in accord with which choreography will be created. Offered as DANC 315 and DANC 415. Prereq: DANC 314 or requisite not met permission.

DANC 317. Advanced Modern Dance Technique I. 1 - 3 Unit.
Emphasis on performing skills enlarged to include rehearsal and performance of full repertory works. Adaptability, versatility, and fidelity to choreographic intention stressed. Offered as DANC 317 and DANC 417. Prereq: DANC 304

DANC 318. Advanced Modern Dance Technique II. 1 - 3 Unit.
Continuation of DANC 317/417. Offered as DANC 318 and DANC 418. Prereq: DANC 317.

DANC 324. Dance Production Resources. 3 Units.
An examination of dance production resources such as costumes construction, lighting design, and management. Exercises include design, construction, and implementation to emphasize practical applications.

DANC 335. Modern Dance Pedagogy. 3 Units.
The study and investigation of the approaches and methods of teaching modern dance. Detailed study is made of kinesthetic, oral, and creative factors in teaching dance. Opportunity to assist and teach under supervision. Offered as DANC 335 and DANC 535.

DANC 345. Kinesiology for Dance. 3 Units.
Seminar and laboratory for assessment of kinesiological and biomechanical principles as related to dance. Assessment of current research will be implemented to affect cross-training protocols. Offered as DANC 345 and DANC 445.

DANC 355. History of Modern Dance. 3 Units.
Origins and development of contemporary dance in its historical context. Prereq: 100 level first year seminar in USFS, FSCC, FSNA, FSSQ, FSSY, or FSCS. Prereq or Coreq: FSTS 100.

DANC 360. Ballet Technique for Modern Dance Students I. 1 - 3 Unit.
Ballet Technique for Dancers will focus on developing the ballet skills required of the Modern Dance major. The technical level of the class will range from intermediate to advanced where applicable in barre work as well as center. Offered as DANC 360 and DANC 460.

DANC 361. Ballet Technique for Modern Dance Students II. 1 - 3 Unit.
Ballet Technique for Dancers will focus on developing the ballet skills required of the Modern Dance major. The technical level of the class will range from intermediate to advanced where applicable in barre work as well as center. Offered as DANC 361 and DANC 461. Prereq: DANC 360.

DANC 385. Rehearsal and Production. 1 - 3 Unit.
Practicum for students participating in production work in the Department of Dance. Supervised laboratory experience in technical theater, construction techniques, scenery, costumes, lighting, and props; production; ticket office operations, promotion, publicity and public relations; house management; wardrobe responsibilities; stage management; assistant directing; and other production positions relating to the mainstage performances in Mather Dance Center. Students are recommended to take one credit hour per production, with a maximum of 8 credit hours allowed during their undergraduate career.

DANC 386. Rehearsal and Performance. 0 Units.
Practicum for students participating in performance in the Department of Dance, relating to the mainstage productions at Mather Dance Center.

DANC 396. SAGES Senior Capstone in Dance. 3 Units.
The course will be centered on creative work in dance, its culmination in public performance, and its extension into a community-based project. Through a review of relevant creative material and building upon skills developed through the dance program curriculum, a capstone project will be developed that represents a culmination of the undergraduate dance experience in the SAGES program. Prereq: DANC 203, DANC 204, DANC 303, DANC 304, DANC 355, DANC 414, DANC 423, or DANC 451.

DANC 397. Honors Studies I. 3 Units.
Individual projects in dance.

DANC 398. Honors Studies II. 3 Units.
Individual projects in dance.

DANC 399. Independent Study in Dance. 1 - 3 Unit.
Independent research and project work in areas of dance and pedagogy.

DANC 403. Fourth-Year Modern Dance Technique I. 1 - 3 Unit.
A logical progression of modern technique, this class is designed for the upper level dance major and graduate student in dance to further develop technical acumen with emphasis on aesthetic and physical challenges. Prereq: DANC 303.

DANC 404. Fourth-Year Modern Dance Technique II. 1 - 3 Unit.
Continuation of DANC 403. Prereq: DANC 403.

DANC 414. The Craft of Choreography. 3 Units.
An in-depth investigation of choreographic craft elements is presented through lecture, practical involvement and specified studies. Emphasized are tools to discover primary movement vocabulary, development of vocabulary through permutative investigations and the co-ordering of movement vocabulary into phrases, structural units, and larger sections. Offered as DANC 314 and DANC 414.
DANC 415. Choreography and Music. 3 Units.
Combining craft resources with emphasis on use of music. Music selections, historically categorized, are chosen for the purpose of analyzing metric and structural characteristics in accord with which choreography will be created. Offered as DANC 315 and DANC 415. Prereq: DANC 414.

DANC 416. Choreography and Theatrical Elements. 3 Units.
Use of properties, costumes, and scenic elements in both "first- and second-function" (Northrop) or "literal" and "abstract" applications challenge the functional and aesthetic appropriateness of conjoined choices. Dance structures fully developed under supervision. Successful results may be programmed for performance and tested for applicability to the Production sequence. Prereq: DANC 414.

DANC 417. Advanced Modern Dance Technique I. 1 - 3 Unit.
Emphasis on performing skills enlarged to include rehearsal and performance of full repertory works. Adaptability, versatility, and fidelity to choreographic intention stressed. Offered as DANC 317 and DANC 417. Prereq: DANC 404.

DANC 418. Advanced Modern Dance Technique II. 1 - 3 Unit.
Continuation of DANC 317/417. Offered as DANC 318 and DANC 418. Prereq: DANC 417.

DANC 423. Light Design for Theatrical Dance. 2 Units.
Elements of stage light design and technology for theatrical dance. Lectures and laboratory experience on color, instruments, and computerized design.

DANC 426. Advanced Topics in Choreography. 3 Units.
Introduction and investigation of advanced topics in choreography including but not limited to dance and technology, directing ensemble dance, and dance and the narrative. This course work is explored in the format of in-studio practicum and lecture, discussion, and peer and instructor review of student generated work. Structured studies will be developed under instructor supervision; students will be required to dedicate time and energy in the studio outside of class meetings to develop choreography studies for in-class presentation and review. Prereq: DANC 414 and DANC 415 and DANC 416.

DANC 445. Kinesiology for Dance. 3 Units.
Seminar and laboratory for assessment of kinesiological and biomechanical principles as related to dance. Assessment of current research will be implemented to affect cross-training protocols. Offered as DANC 345 and DANC 445.

DANC 446. Topics in Dance Medicine, Science, and Wellness. 1 - 3 Unit.
Review and application of continually emerging information from the fields of Dance Medicine and Science that impacts general dancer health and the care and prevention and treatment of dance specific injuries. Participation in the Dancer Wellness Program is encouraged to facilitate continued application of principles developed in DANC 445.

DANC 450. Ballet Technique for Modern Dance Students I. 1 - 3 Unit.
Ballet Technique for Dancers will focus on developing the ballet skills required of the Modern Dance major. The technical level of the class will range from intermediate to advanced where applicable in barre work as well as center. Offered as DANC 360 and DANC 460.

DANC 451. Costume Design and Construction for Dance. 2 Units.
Lecture and studio course in selecting fabrics, draping techniques, construction, and design for concert dance.

DANC 455. History of Modern Dance. 3 Units.
Origin and development of modern dance in its historical context.
Department of Economics

The College of Arts and Sciences awards the Bachelor of Arts degree in economics. The required courses for the major and minor are offered by the Department of Economics in the Weatherhead School of Management.

For details about the department’s undergraduate programs, please consult the Weatherhead School of Management (p. 972) section of this bulletin.
Department of English

The Department of English offers courses of study leading to the Bachelor of Arts, Master of Arts, and Doctor of Philosophy degrees. Included among the department’s offerings are literary and cultural studies, linguistics, film, journalism and new media, creative writing, visual rhetoric, rhetoric, and professional writing.

Combining the intellectual resources of a major research university with a scale and set of values more typical of a liberal arts college, the department puts great stress on class discussion, individual conferences or tutorials, and other opportunities for students and faculty to work closely together. Likewise, the curriculum is deliberately flexible to respond to student needs and interests and to encourage close cooperation with the faculty in planning a course of study.

A major in English prepares one for various sorts of careers. Three paths are common:

- English leads readily to careers that put a premium on writing skills and on the ability to analyze complex human situations. In addition to the fields that have often been of first interest to English majors (writing and publishing, journalism, advertising, the film industry, public relations, and teaching), significant opportunities exist in the corporate world, in government, and in nonprofit organizations such as those devoted to social service, the environment, or the arts.
- The BA in English is usually essential to anyone expecting to do graduate work in English or to pursue a career as a teacher or a scholar in the field.
- The BA in English traditionally has been an important steppingstone to success in professional school, and many of our English majors choose this path. A significant number go on to law school, many to medical or business school, and some to nursing, journalism, social work, or library school, as well as directly into the business world.

Facilities

In addition to manuscript and rare-book holdings in the Special Collections Division, Kelvin Smith Library has strengths in Renaissance literature; 18th-, 19th-, and 20th-century English literature; and American literature. The library also houses an outstanding collection of several thousand films and other audiovisual materials, supported in part by English department endowment funds. In Strosacker Auditorium, the Film Society maintains facilities capable of projecting 35 mm and 16 mm films. In the library’s Freedman Center, students have access to video cameras, state-of-the-art digital editing software, and stations where they can view audiovisual materials from the library collection.

Teacher Licensure in Integrated Language Arts | Integrated Graduate Studies | Minors

Undergraduate Programs

Major

The major in English includes two tracks. The primary track consists of at least 30 semester hours in English above the 100 level (including 15 hours at the 300 level or above). The required courses are:

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENGL 300</td>
<td>English Literature to 1800</td>
<td>3</td>
</tr>
<tr>
<td>ENGL 302</td>
<td>English Literature since 1800</td>
<td>3</td>
</tr>
<tr>
<td>or ENGL 308</td>
<td>American Literature</td>
<td></td>
</tr>
<tr>
<td>ENGL 380</td>
<td>Departmental Seminar</td>
<td>3</td>
</tr>
<tr>
<td>ENGL 395</td>
<td>Capstone Seminar</td>
<td>3</td>
</tr>
<tr>
<td>One of the following:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Because of the flexibility of departmental requirements and the variety of career paths to which the major may lead, all students should confer frequently and closely with advisors. No courses outside the department are required for the major, but the department recommends courses in comparative literature, history, philosophy, history and criticism of the fine arts, theater, and literature in other languages. Students planning to go to graduate school are reminded of the importance of foreign language study.

Completion of the University composition requirement (ENGL 150 Expository Writing or SAGES First Seminar) is a prerequisite for most English courses at the 200 level and above.

Departmental Honors

To qualify for honors, English majors follow a track consisting of at least 36 hours above the 100 level, including the general requirements for the major (see above); ENGL 387 Literary and Critical Theory, or approved substitute: at least 18 hours of approved electives in literary and cultural studies; and one of the following language courses, or an equivalent in a language for which 300-level literature courses are available:

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>FRCH 202</td>
<td>Intermediate French II</td>
<td>4</td>
</tr>
<tr>
<td>GREEK 202</td>
<td>Introduction to Greek Poetry</td>
<td>3</td>
</tr>
<tr>
<td>GRMN 202</td>
<td>Intermediate German II</td>
<td>4</td>
</tr>
<tr>
<td>JAPN 202</td>
<td>Intermediate Japanese II</td>
<td>4</td>
</tr>
<tr>
<td>LATN 202</td>
<td>Vergil</td>
<td>3</td>
</tr>
<tr>
<td>SPAN 202</td>
<td>Intermediate Spanish II</td>
<td>4</td>
</tr>
</tbody>
</table>

The award of honors requires a minimum GPA of 3.5 in courses taken for the honors program.

Teacher Licensure in Integrated Language Arts

A special program is available that leads to the BA and candidacy for licensure by the State of Ohio to teach Integrated Language Arts in grades 7-12 (Adolescents to Young Adults). The teaching credential is valid in Ohio and honored in many other states. The program consists of a more prescriptive form of the normal English major and a series of education courses that includes student teaching in a local school. (See the program description for Teacher Licensure elsewhere in this bulletin.) Because of the student teaching and because some of the education courses must be taken at John Carroll University, early and careful planning is vital. Consult Denise K. Davis for details about this program.

The subject area requirements for teacher licensure (42 credit hours) are as follows:

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENGL 150</td>
<td>Expository Writing</td>
<td>3</td>
</tr>
<tr>
<td>ENGL 200</td>
<td>Literature in English</td>
<td>3</td>
</tr>
<tr>
<td>ENGL 202</td>
<td>Advanced Expository Writing</td>
<td>3</td>
</tr>
<tr>
<td>ENGL 204</td>
<td>Introduction to Journalism</td>
<td>3</td>
</tr>
<tr>
<td>ENGL 255</td>
<td>Major British Writers</td>
<td>3</td>
</tr>
</tbody>
</table>
ENGL 256  Major American Writers  3
ENGL 324  Shakespeare: Histories and Tragedies  3
or ENGL 325  Shakespeare: Comedies and Romances
ENGL 380  Departmental Seminar  3

One of the following:

ENGL 301  Linguistic Analysis  3
or ENGL 379  Topics in Language Studies
or COSI 313  Language Development

Two of the following:  6

ENGL 257B  Poetry
ENGL 270  Introduction to Gender Studies
ENGL 363H  African-American Literature
ENGL 365E  The Immigrant Experience
ENGL 365N  Topics in African-American Literature
ENGL 365Q  Post-Colonial Literature

One of the following:  3

ENGL 368B  History of Film
ENGL 368C  Topics in Film

Recommended electives:

ENGL 203  Introduction to Creative Writing
ENGL 213  Introduction to Fiction Writing
ENGL 214  Introduction to Poetry Writing
ENGL 303  Intermediate Writing Workshop: Fiction
ENGL 304  Intermediate Writing Workshop: Poetry
ENGL 310  History of the English Language
ENGL 392  Classroom Teaching

Integrative Graduate Studies

The department participates in the Integrated Graduate Studies Program (p. 549), which makes it possible to complete both a BA and an MA in English in about five years of full-time study. The department particularly recommends the program to qualified students who are interested in seeking admission to highly competitive professional schools or PhD programs. Interested students should note the general requirements and the admission procedures elsewhere in this bulletin.

Minors

Minor in English

The minor in English consists of at least 15 hours above the 100 level. Students who wish to minor in English arrange their sequence of courses in consultation with the department advisor. Minors are strongly advised to take ENGL 200 Literature in English early in the sequence. They should also keep in mind that the flexibility of the department’s requirements often makes it possible to take English as a second major.

Minor in Film Studies

Like the minor in English, the minor in Film Studies requires 15 hours:

ENGL 367  Introduction to Film (Though students are not required to take this course first, it is recommended that they take it first or as early in the sequence as possible.)  3

Up to 12 credits in the following:  3-12

ENGL 368B  History of Film
ENGL 368C  Topics in Film
ENGL 316  Screenwriting

Up to 6 credits of elective courses  0-6

Total Units  6-21

Graduate Programs

The Department of English offers programs in American and English literature and language leading to the Master of Arts and Doctor of Philosophy degrees. At either the MA or PhD level, students may elect a concentration in Writing History and Theory. The department also collaborates with the Department of Modern Languages and Literatures in offering a Master of Arts in world literature.

Candidates for graduate work in English should present an undergraduate major in English or a minimum of 18 semester hours of English (or its equivalent) beyond the freshman level. In some cases, students will be required to make up deficiencies without graduate credit. The department requires all candidates for admission to submit their scores on the aptitude sections of the Graduate Record Examination. Candidates are also required to submit a writing sample, consisting of at least 15 pages of academic writing. Students whose native language is not English are normally admitted only as provisional students. After 12 semester hours of satisfactory work, they are granted regular status.

A maximum of six semester hours of transfer credit will be accepted from another institution, provided they were earned in graduate-level courses, with the approval of the department and the dean of graduate studies. Such courses must have been taken within five years of matriculation at Case Western Reserve University and passed with grades of B or better. The department accommodates part-time students.

Teaching is viewed as an essential part of the education of graduate students aspiring to academic posts, and is required of all students working under assistantships. The department provides opportunities for graduate assistants to gain teaching experience in a variety of courses.

New and continuing graduate students may apply for graduate student assistantships, which are awarded by the dean on recommendation of the department. Applicants with previous teaching experience are preferred. Graduate assistants without previous teaching experience will be required to take ENGL 400 Rhetoric and Teaching of Writing before the first semester in which they teach.

Department Faculty

Mary Grimm, MA  
(Cleveland State University)  
Associate Professor and Chair  
Creative writing (fiction); contemporary literature; graphic novels

Michael Clune, PhD  
(Johns Hopkins University)  
Assistant Professor  
American literature; literature and science; poetry

Kimberly Emmons, PhD  
(University of Washington)  
Associate Professor; Director of Composition  
Rhetoric; composition; gender and language; medical humanities

Christopher Flint, PhD  
(University of Pennsylvania)
Associate Professor
18th-century English literature; print culture
T. Kenneth Fountain, PhD
(University of Minnesota)

Assistant Professor
Scientific and technical communication; visual culture; rhetorical theory
Sarah Gridley, MFA
(University of Montana)

Assistant Professor
Creative writing (poetry); feminist and eco-poetics
Megan Swihart Jewell, PhD
(Duquesne University)

Instructor; Director, Writing Resource Center
American literature; writing studies; poetics
Hee-Seung Kang, PhD
(University of Washington)

Associate Professor; Director of Graduate Studies
19th- and 20th-century British literature; postcolonial literature
James Kuzner, PhD
(Johns Hopkins University)

Assistant Professor
Renaissance literature; Shakespeare
William H. Marling, PhD
(University of California, Santa Barbara)

Professor
American and world literature; modernism; popular culture
Marilyn Sanders Mobley, PhD
(Case Western Reserve University)

Film studies
Gary Lee Stonum, PhD
(Johns Hopkins University)

Oviatt Professor of English
American literature; literary theory
Thrity Umrigar, PhD
(Kent State University)

Professor
Creative writing (fiction and memoir); journalism; African-American literature
Athena Vrettos, PhD
(University of Pennsylvania)

Associate Professor
19th-century British literature; literature and medicine; literature and psychology; women’s and gender studies
Martha Woodmansee, PhD
(Stanford University)

Professor; Professor of Law
Literary theory; 18th- and 19th-century comparative literature; copyright

Courses
ENGL 148. Introduction to Composition. 3 Units.
Practice and training in various modes and genres of writing. Undergraduate CIM students placed into ENGL 148 must complete the course with a grade of C or higher in order to enroll in ENGL 150.

ENGL 150. Expository Writing. 3 Units.
Substantial training and practice in academic writing.

ENGL 180. Writing Tutorial. 1 Unit.
Substantial scheduled tutorial work in writing.

ENGL 181. Reading Tutorial. 1 Unit.
Scheduled tutorial work in reading as well as time management and study strategies for both native and non-native speakers who need work beyond SAGES, or who come to the Writing Resource Center seeking substantial help. May work individually with instructor or in small groups. May be repeated in special instances, but only one semester-hour will count towards the degree.

ENGL 183. Academic Writing Studio. 1 Unit.
Practice and training in various aspects of academic writing in a small group workshop environment. Offered concurrently with First Seminar; provides supplementary instruction to help students meet First Seminar writing objectives. Please note: only one semester hour of English 183 will count toward a degree, but the course may be repeated.

ENGL 184. Research Writing Studio. 1 Unit.
Practice and training in various aspects of research in a small-group workshop environment. Offered concurrently with University Seminar; provides supplementary instruction to help students meet University Seminar writing objectives. Please note: only two semester hours of ENGL 184 will count towards a degree.
ENGL 200. Literature in English. 3 Units.
This course introduces students to the reading of literature in the English language. Through close attention to the practice of reading, students are invited to consider some of the characteristic forms and functions of imaginative literature that have taken place in what and how readers read. Recommended preparation: Concurrent enrollment in ENGL 150 or USFS 100.

ENGL 202. Advanced Expository Writing. 3 Units.
A workshop-style course for students that offers practice and training in genres of nonfiction prose. Special attention paid to style and presentation. Prereq: 100 level first seminar in FSCC, FSNA, FSSO, or FSSY.

ENGL 203. Introduction to Creative Writing. 3 Units.
A course exploring basic issues and techniques of writing narrative prose and verse through exercises, analysis, and experiment. For students who wish to try their abilities across a spectrum of genres. Recommended preparation: ENGL 150 or USFS 100.

ENGL 204. Introduction to Journalism. 3 Units.
Students will learn the basics of reporting and writing news stories, but also the traditions behind the craft and the evolving role of journalism in society. Instruction will include interviewing skills, fact-checking, word choice and story structure—all framed by guidance on making ethically sound decisions. Assignments could include stories from a variety of beats (business, entertainment, government, science), along with deadline stories and breaking news Web updates, profiles and obituaries.

ENGL 213. Introduction to Fiction Writing. 3 Units.
A beginning workshop in fiction writing, introducing such concepts as voice, point of view, plot, characterization, dialogue, description, and the like. May include discussion of literary examples, both classic and contemporary, along with student work. Recommended preparation: ENGL 150 or USFS 100.

ENGL 214. Introduction to Poetry Writing. 3 Units.
A beginning workshop, focusing on such elements of poetry as verse form, syntax, figures, sound, tone. May include discussion of literary examples as well as student work. Recommended preparation: ENGL 150 or USFS 100.

ENGL 217A. Business and Professional Writing. 3 Units.
An introduction to professional communication in theory and practice. Special attention paid to audience analysis, persuasive techniques in written and oral communication, document design strategies, and ethical communication practices. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 217B. Writing for the Health Professions. 3 Units.
This course offers practice and training in the professional and technical writing skills common to health professions (e.g., medicine, nursing, dentistry). Attention will be paid to the writing processes of drafting, revising, and editing. Typical assignments include: letters, resumes, personal essays, professional communication genres (e.g., email, reports, patient charts, and histories), and scholarly genres (e.g., abstracts, articles, and reviews). Recommended preparation: FSCC 100 or equivalent.

ENGL 255. Major British Writers. 3 Units.
Introduction to literary studies and survey of selected English authors from the Medieval period to the present. Recommended preparation: Concurrent enrollment in ENGL 150 or USFS 100.

ENGL 256. Major American Writers. 3 Units.
Introduction to literary studies and survey of literature of United States from colonial times to the present. Recommended preparation: Concurrent enrollment in ENGL 150 or USFS 100.

ENGL 257A. The Novel. 3 Units.
Introductory readings in the novel. May be organized chronologically or thematically. Some attention to the novel as a historically situated genre.

ENGL 257B. Poetry. 3 Units.
Introductory readings in poetry. May be organized chronologically or thematically. Attention to the formal qualities of poetry in relation to meaning, expressivity, etc.

ENGL 270. Introduction to Gender Studies. 3 Units.
This course introduces women and men students to the methods and concepts of gender studies, women’s studies, and feminist theory. An interdisciplinary course, it covers approaches used in literary criticism, history, philosophy, political science, sociology, anthropology, psychology, film studies, cultural studies, art history, and religion. It is the required introductory course for students taking the women’s and gender studies major. Offered as ENGL 270, HSTY 270, PHIL 270, RLGN 270, SOCI 201, and WGST 201. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 285. Special Topics Seminar. 1 Unit.
One-credit seminars on special topics in literature or language; see departmental listings for topics each term. Maximum of 3 credits. Recommended preparation: ENGL 150 or USFS 100.

ENGL 290. Masterpieces of Continental Fiction. 3 Units.
Major works of fiction from the 19th century and earlier. Offered as ENGL 290 and WLIT 290.

ENGL 291. Masterpieces of Modern Fiction. 3 Units.
Major works of fiction of the 20th century. Offered as ENGL 291 and WLIT 291.

ENGL 300. English Literature to 1800. 3 Units.
Introduction to literary studies and survey of selected English authors from the Medieval period to the present. Recommended preparation: Concurrent enrollment in ENGL 150 or USFS 100.

ENGL 301. Linguistic Analysis. 3 Units.
Analysis of modern English from various theoretical perspectives: structural, generative, discourse analytical, sociolinguistic, psycholinguistic, and cognitive linguistic. Some attention to the major dialects of American English. Offered as ENGL 301 and ENGL 401. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 302. English Literature since 1800. 3 Units.
A survey of major British authors from Wordsworth to the present. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.
ENGL 303. Intermediate Writing Workshop: Fiction. 3 Units.
Continues developing the concepts and practice of the introductory course, with reading, writing, and discussion of fiction in various forms, including the short story, the novella and the novel. Maximum 6 credits. Prereq: ENGL 203 or ENGL 213.

ENGL 304. Intermediate Writing Workshop: Poetry. 3 Units.
Continues developing the concepts and practice of the introductory course, with emphasis on experiment and revision as well as consideration of poetic genres through examples from established poets. Maximum 6 credits. Prereq: ENGL 203 or ENGL 214.

ENGL 305. Playwriting. 3 Units.
Theory and practice of dramatic writing, in the context of examples, classic and contemporary. Recommended preparation: ENGL 203 or ENGL 213 or ENGL 214 or ENGL 303 or ENGL 304. Offered as ENGL 305 and THTR 312.

ENGL 306. Intermediate Writing Workshop: Creative Non-Fiction. 3 Units.
A writing workshop that focuses on non-fiction. Students will study and write narrative journalism, the memoir, and the personal essay. Prereq: ENGL 203 or ENGL 213 or ENGL 214.

ENGL 307. Feature/Magazine Writing. 3 Units.
Continues developing the concepts and practices of the introductory course, with emphasis on feature writing for magazines (print and online), story structure, fact-checking, reporting techniques and freelancing. Prereq: ENGL 204 or instructor approval.

ENGL 308. American Literature. 3 Units.
A survey of major American authors from the Puritans to the present. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 309. Immersion Journalism/Multimedia Storytelling. 3 Units.
Students will spend the bulk of the semester documenting lives and stories from a local nursing home through audio slideshows and video projects. Prereq: ENGL 204 or instructor approval.

ENGL 310. History of the English Language. 3 Units.
An introductory course covering the major periods of English language development: Old, Middle, and Modern. Students will examine both the linguistic forms and the cultures in which the forms were used. Offered as ENGL 310 and ENGL 410. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 312. Chaucer. 3 Units.
An introduction to the work of Geoffrey Chaucer, with emphasis on "The Canterbury Tales." Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 314. Advanced Playwriting. 3 Units.
Theory and practice of dramatic writing with special focus on the craft of writing a full-length play. Offered as ENGL 314 and THTR 314. Prereq: ENGL 305 or THTR 312.

ENGL 316. Screenwriting. 3 Units.
A critical exploration of the craft of writing for film, in which reading and practicum assignments will culminate in the student submitting an original full-length screenplay. Offered as ENGL 316 and THTR 316.

ENGL 320. Renaissance Literature. 3 Units.
Aspects of English Renaissance literature and its contexts from 1500-ca. 1620. Genres studied might include poetry, drama, prose fiction, expository and polemic writing, or some works from Continental Europe. Writers such as Skelton, More, Erasmus, Wyatt, Sidney, Spenser, Marlowe, Lanier, Wroth, Shakespeare, Donne. Maximum 6 credits. Offered as ENGL 320 and ENGL 420. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 323. Milton. 3 Units.
Poetry and selected prose, including the careful study of "Paradise Lost." Offered as ENGL 323 and ENGL 423. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 324. Shakespeare: Histories and Tragedies. 3 Units.
Close reading of a selection of Shakespeare's tragedies and history plays (e.g., "Richard the Third," "Julius Caesar," "Hamlet," "King Lear"). Topics of discussion may include Renaissance drama as a social institution, the nature of tragedy, national history, gender roles, sexual politics, the state and its opponents, theatrical conventions. Assessment may include opportunities for performance. Offered as ENGL 324, ENGL 424, and THTR 334. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 325. Shakespeare: Comedies and Romances. 3 Units.
Close reading of selected plays of Shakespeare in the genres of comedy and romance (e.g., "The Merchant of Venice," "Twelfth Night," "Measure for Measure," "The Tempest"). Topics of discussion may include issues of sexual desire, gender roles, marriage, the family, genre conventions. Assessment may include opportunities for performance. Offered as ENGL 325, ENGL 425, and THTR 335. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 327. Eighteenth-Century Literature. 3 Units.
Survey of a variety of writings from or relevant to the eighteenth century. Writers discussed may include Dryden, Behn, Defoe, Pope, Swift, Gay, Fielding, Richardson, Burney, Wolstonecraft and others working in drama, lyric and epic poetry, biography and autobiography, political and philosophical writings and prose fiction. Thematic approaches may include: satire, journalism and literature, the rise of the novel. Maximum 6 credits. Offered as ENGL 327 and ENGL 427. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 328. Studies in the Eighteenth Century. 3 Units.
This course examines selected topics in the English literary culture of the eighteenth century, a culture which extended to the Americas and to other English colonies. Literary writings will be examined in relation to other aspects of the century culture, which may include visual arts, marital institutions, the printing industry, property law, medicine, and other topics. Maximum 6 credits. Offered as ENGL 328 and ENGL 428. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.
ENGL 329. English Literature, 1780-1837. 3 Units.
Aspects of English literature and its contexts in the early 19th century. Genres might include poetry, prose fiction, political and philosophical writing, literary theory of the period. Writers such as Wordsworth, Coleridge, Blake, Austen, Byron, the Shelleys. Maximum 6 credits. Offered as ENGL 329 and ENGL 429. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 330. Victorian Literature. 3 Units.
Aspects of English literature and its contexts during the reign of Queen Victoria. Genres studied might include poetry, prose fiction, political and philosophical writing. Writers such as the Brontes, Gaskell, Dickens, Eliot, Hardy, Tennyson, the Brownings, Arnold, Carlyle, Ruskin, Gosse, Swinburne, and Hopkins. Maximum 6 credits. Offered as ENGL 330 and ENGL 430. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 331. Studies in the Nineteenth-Century. 3 Units.
Individual topics in English literary culture of the 19th century. Topics might be thematic or formal, such as literature and science; medicine; labor; sexuality; Empire; literature and other arts; Gothic fiction; decadence. Maximum 6 credits. Offered as ENGL 331 and ENGL 431. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 332. Twentieth-Century British Literature. 3 Units.
Aspects of British literature (broadly interpreted) and its contexts during the 20th century. Genres studied might include poetry, fiction, and drama. Such writers as Joyce, Woolf, Conrad, Ford, Lawrence, Mansfield, Shaw, Beckett, Stoppard, Yeats, Edward or Dylan Thomas, Stevie Smith, Bowen, Spark. Maximum 6 credits. Offered as ENGL 332 and ENGL 432. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 333. Studies in the Twentieth and Twenty-first Centuries. 3 Units.
Individual topics in twentieth- and twenty-first century literary culture. Particular issues and topics may cross national boundaries and genre lines as well as exploring political, psychological, and social themes, such as movements, comparative studies across the arts, literature and war, literature and occultism. Maximum 6 credits. Offered as ENGL 333 and ENGL 433. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 341. Rhetoric of Science and Medicine. 3 Units.
This course explores the roles language and rhetoric play in constructing, communicating, and understanding science and medicine. It surveys current and historical debates, theories, research, and textual conventions of scientific and medical discourse. May be taught with a specific focus, such as scientific controversies, concepts of health and illness, visualizations of science, the body in medicine, and the history of scientific writing. Offered as: ENGL 341 and ENGL 441. Prereq: ENGL 150 or letter grade in SAGES First Seminar.

ENGL 343. Language and Gender. 3 Units.
This course introduces students to the study of language and gender by exploring historical and theoretical trends, methods, and research findings on the ways gender, sexuality, language, and discourse interact with and even shape each other. Topics may include “grammatical” versus “biological” gender, feminine écriture, the women and language debate, speech acts and queer performativity, nonsexist language policy, discourses of gender and sexuality, feminist stylistics, and LGBT sociolinguistics. Offered as: ENGL 343, ENGL 443, and WGST 343. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 353. Major Writers. 3 Units.
Close and detailed study of the work of one or two writers: development, social and aesthetic contexts, reception, interpretation, significance. Maximum 6 credits. Offered as ENGL 353 and ENGL 453. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 356. American Literature Before 1865. 3 Units.
Aspects of American literature and its contexts from the colonial period through the end of the Civil War. Writers such as Bradstreet, Taylor, Franklin, Poe, Stowe, Alcott, Melville, Hawthorne, Emerson, Douglass. Maximum 6 credits. Offered as ENGL 356 and ENGL 456. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 357. American Literature 1865-1914. 3 Units.
Aspects of American literature and its contexts from the Civil War to the First World War. Writers such as Whitman and Dickinson, Twain, Howells, James, Chopin, Wharton. Maximum 6 credits. Offered as ENGL 357 and ENGL 457. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 358. American Literature 1914-1960. 3 Units.
Aspects of American literature and its contexts from the First World War to the Cold War. Genres studied might include fiction, poetry, drama, polemics. Writers such as T.S. Eliot, Pound, Stevens, Moore, W.C. Williams, Dos Passos, West, Fitzgerald, Hemingway, Cather, Faulkner, Barnes, Miller, T. Williams, O’Neill. Maximum 6 credits. Offered as ENGL 358 and ENGL 458. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 359. Studies in Contemporary American Literature. 3 Units.
Individual topics in literary culture since the 1960s. Topics may include the Beats, literature of the Vietnam war, post-modern fiction, contemporary poetry, the documentary novel. Maximum 6 credits. Offered as ENGL 359 and ENGL 459. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.
ENGL 363H. African-American Literature. 3 Units.
A historical approach to African-American literature. Such writers as Wheatley, Equiano, Douglass, Jacobs, DuBois, Hurston, Hughes, Wright, Baldwin, Ellison, Morrison. Topics covered may include slave narratives, African-American autobiography, the Harlem Renaissance, the Black Aesthetic, literature of protest and assimilation. Maximum 6 credits. Offered as ENGL 363H, ETHS 363H, WLIT 363H, ENGL 463H, and WLIT 463H. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 365E. The Immigrant Experience. 3 Units.
Study of fictional and/or autobiographical narrative by authors whose families have experienced immigration to the U.S. Among the ethnic groups represented are Asian-American, Jewish-American, Hispanic-American. May include several ethnic groups or focus on a single one. Attention is paid to historical and social aspects of immigration and ethnicity. Maximum 6 credits. Offered as ENGL 365E, WLIT 365E, ENGL 465E, and WLIT 465E. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 365N. Topics in African-American Literature. 3 Units.
Selected topics and writers from nineteenth, twentieth, and twenty-first century African-American literature. May focus on a genre, a single author or a group of authors, a theme or themes. Maximum 6 credits. Offered as ENGL 365N, ETHS 365N, WLIT 365N, ENGL 465N, and WLIT 465N. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 365Q. Post-Colonial Literature. 3 Units.
Readings in national and regional literatures from former European colonies such as Australia and African countries. Maximum 6 credits. Offered as ENGL 365Q, ETHS 365Q, WLIT 365Q, ENGL 465Q, and WLIT 465Q. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 367. Introduction to Film. 3 Units.
An introduction to the aesthetics of film form. We will analyze the elements that make up a film, screening films that facilitate our discussion of how these elements interact with one another to constitute whole formal systems that generate meanings and other effects. We will bring various theoretical and historical considerations to bear as we explore and appreciate the art of cinema. Offered as ENGL 367 and ENGL 467.

ENGL 368B. History of Film. 3 Units.
Analysis of selected topics in film history, such as film before 1940, American cinema 1940 to the present, European or Asian cinema since 1940. Maximum 6 credits. Offered as ENGL 368B and ENGL 468B. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 368C. Topics in Film. 3 Units.
Individual topics in film, such as a particular national cinema, horror films, films of Alfred Hitchcock, images of women in film, film comedy, introduction to film genres, Asian cinema and drama, dance on screen, science fiction films, storytelling and cinema, and literature and film. Maximum 12 credits. Offered as ENGL 368C, WLIT 368C, ENGL 468C, and WLIT 468C.

ENGL 369. Children’s Literature. 3 Units.
Individual topics in 19th-, 20th-, and 21st-century children’s literature. Topics may focus on narrative and thematic developments in the genre, historical contexts, literary influences, or adaptations of children’s literature into film and other media. Offered as ENGL 369 and ENGL 469. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 371. Topics in Women's and Gender Studies. 3 Units.
Individual topics and issues in women’s studies relating to writing by and about women, such as feminist theory and criticism; the politics of gender and sexuality; women in popular culture; women in the writing business. Maximum 6 credits. Offered as ENGL 371 and ENGL 471. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 372. Studies in the Novel. 3 Units.
Selected topics in the history and formal development of the novel, such as detective novels; science fiction; epistolary novels; the rise of the novel; the stream of consciousness novel; the Bildungsroman in English. Maximum 6 credits. Offered as ENGL 372 and ENGL 472. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 373. Studies in Poetry. 3 Units.
Selected topics and issues in the study of poetry, such as reading poetry, the elegy, pastoral poetry, love poetry, the long poem, form and meter in poetry. Maximum 6 credits. Offered as ENGL 373 and ENGL 473. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 374. Internship in Journalism. 3 - 6 Units.
Students work as interns at area newspapers, magazines, trade publications, radio or television and meet as a class to share their experiences as interns and to focus on editorial issues--reporting, writing, fact-checking, editing--that are a part of any journalistic enterprise. Students are responsible for pre-arranging their internship prior to the semester they intend to take the class but can expect guidance from the instructor in this regard. Recommended preparation: ENGL 204 or permission of the department.

ENGL 376. Studies in Genre. 3 Units.
Topics in literary genres, such as comedy, biography and autobiography, satire, allegory, the short story, the apologue, narrative poetry. May cross over the prose/poetry boundary. Maximum 6 credits. Offered as ENGL 376 and ENGL 476. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 377. Studies in Drama. 3 Units.
Readings and discussion of plays and related critical literature pertaining to a specific period in American or British drama. Topics and material will vary from semester to semester. Offered as ENGL 377 and ENGL 477. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.
ENGL 378. Topics in Visual and New Media Studies. 3 Units.
This course will focus on selected topics in the study of visual rhetoric and/or new media, including theoretical, critical, and historical issues raised by texts and media platforms that communicate largely through visual means or through the interaction of visual and verbal modes. Possible syllabi may focus on topics such as visual rhetoric; new media story-telling; historical perspectives on visual rhetoric and/or new media; concentrations on a particular genre (for instance, the graphic novel, video games, etc); visual narrative; theories of new media; etc. Offered as ENGL 378 and ENGL 478. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 379. Topics in Language Studies. 3 Units.
Aspects of contemporary language studies. Topics might include history/theories of rhetoric, discourse studies, cognitive linguistics, metaphor, language acquisition, stylistics. Maximum 9 credits. Offered as ENGL 379 and ENGL 479. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 380. Departmental Seminar. 3 Units.
A topical course, emphasizing disciplinary forms of writing. Required of all English majors, preferable in the junior year; also fulfills a SAGES requirement. Prereq: ENGL 300.

ENGL 385. Special Topics in Literature. 3 Units.
Close study of a theme or aspect of literature not covered by traditional generic or period rubrics, such as "spatial imagination," "semiotics of fashion in literature," "epistolarity." Maximum 9 credits. Offered as ENGL 385 and ENGL 485. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 386. Studies in Literature and Culture. 3 Units.
Boundary-crossing study of the relations between literary and other aspects of a particular culture or society, including theoretical and critical issues raised by such study. For example, literature and medicine, law and literature, gay and lesbian literature, Asian/Western literary relations, emotion in literature, philosophy and literature, literature and music. Maximum 9 credits. Offered as ENGL 386 and ENGL 486. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 387. Literary and Critical Theory. 3 Units.
A survey of major schools and texts of literary and critical theory. May include e-mail, memos, letters, reports, documentation, and oral presentations. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

ENGL 388. Advanced Creative Writing. 3 Units.
Workshop for serious undergraduate and graduate writers. Offered alternate years; alternates between poetry and fiction. Admission requires review of writing sample by faculty. Maximum 6 credits. Prereq: Graduate standing.

ENGL 390. Independent Study and Creative Projects. 1 - 3 Unit.
Up to three semester hours of independent study may be taken in a single semester. Must have prior approval of faculty member directing the project. Projects may be critical or creative in nature.
ENGL 420. Renaissance Literature. 3 Units.
Aspects of English Renaissance literature and its contexts from 1500-ca. 1620. Genres studied might include poetry, drama, prose fiction, expository and polemic writing, or some works from Continental Europe. Writers such as Skelton, More, Erasmus, Wyatt, Sidney, Spenser, Marlowe, Lanier, Wroth, Shakespeare, Donne. Maximum 6 credits. Offered as ENGL 320 and ENGL 420. Prereq: Graduate standing.

ENGL 423. Milton. 3 Units.
Poetry and selected prose, including the careful study of "Paradise Lost." Offered as ENGL 323 and ENGL 423. Prereq: Graduate standing.

ENGL 424. Shakespeare: Histories and Tragedies. 3 Units.
Close reading of a selection of Shakespeare's tragedies and history plays (e.g., "Richard the Third," "Julius Caesar," "Hamlet," "King Lear"). Topics of discussion may include Renaissance drama as a social institution, the nature of tragedy, national history, gender roles, sexual politics, the state and its opponents, theatrical conventions. Assessment may include opportunities for performance. Offered as ENGL 324, ENGL 424, and THTR 334. Prereq: Graduate standing.

ENGL 425. Shakespeare: Comedies and Romances. 3 Units.
Close reading of selected plays of Shakespeare in the genres of comedy and romance (e.g., "The Merchant of Venice," "Twelfth Night," "Measure for Measure," "The Tempest"). Topics of discussion may include issues of sexual desire, gender roles, marriage, the family, genre conventions. Assessment may include opportunities for performance. Offered as ENGL 325, ENGL 425, and THTR 335. Prereq: Graduate standing.

ENGL 427. Eighteenth-Century Literature. 3 Units.
Survey of a variety of writings from or relevant to the eighteenth century. Writers discussed may include Dryden, Behn, Defoe, Pope, Swift, Gay, Fielding, Richardson, Burney, Wollstonecraft and others working in drama, lyric and epic poetry, biography and autobiography, political and philosophical writings and prose fiction. Thematic approaches may include: satire, journalism and literature, the rise of the novel. Maximum 6 credits. Offered as ENGL 327 and ENGL 427. Prereq: Graduate standing or permission of instructor.

ENGL 428. Studies in the Eighteenth Century. 3 Units.
This course examines selected topics in the English literary culture of the eighteenth century, a culture which extended to the Americas and to other English colonies. Literary writings will be examined in relation to other aspects of the century culture, which may include visual arts, marital institutions, the printing industry, property law, medicine, and other topics. Maximum 6 credits. Offered as ENGL 328 and ENGL 428. Prereq: Graduate standing.

ENGL 429. English Literature, 1780-1837. 3 Units.
Aspects of English literature and its contexts in the early 19th century. Genres might include poetry, prose fiction, political and philosophical writing, literary theory of the period. Writers such as Wordsworth, Coleridge, Blake, Austen, Byron, the Shelleys. Maximum 6 credits. Offered as ENGL 329 and ENGL 429. Prereq: Graduate standing.

ENGL 430. Victorian Literature. 3 Units.
Aspects of English literature and its contexts during the reign of Queen Victoria. Genres studied might include poetry, prose fiction, political and philosophical writing. Writers such as the Brontes, Gaskell, Dickens, Eliot, Hardy, Tennyson, the Brownings, Arnold, Carlyle, Ruskin, Gosse, Swinburne, and Hopkins. Maximum 6 credits. Offered as ENGL 330 and ENGL 430. Prereq: Graduate standing or permission of instructor.

ENGL 431. Studies in the Nineteenth-Century. 3 Units.
Individual topics in English literary culture of the 19th century. Topics might be thematic or formal, such as literature and science; medicine; labor; sexuality; Empire; literature and other arts; Gothic fiction; decadence. Maximum 6 credits. Offered as ENGL 331 and ENGL 431. Prereq: Graduate standing.

ENGL 432. Twentieth-Century British Literature. 3 Units.
Aspects of British literature (broadly interpreted) and its contexts during the 20th century. Genres studied might include poetry, fiction, and drama. Such writers as Joyce, Woolf, Conrad, Ford, Lawrence, Mansfield, Shaw, Beckett, Stoppard, Yeats, Edward or Dylan Thomas, Stevie Smith, Bowen, Spark. Maximum 6 credits. Offered as ENGL 332 and ENGL 432. Prereq: Graduate standing.

ENGL 433. Studies in the Twentieth and Twenty-first Centuries. 3 Units.
Individual topics in twentieth- and twenty-first century literary culture. Particular issues and topics may cross national boundaries and genre lines as well as exploring political, psychological, and social themes, such as movements, comparative studies across the arts, literature and war, literature and occultism. Maximum 6 credits. Offered as ENGL 333 and ENGL 433. Prereq: Graduate standing.

ENGL 441. Rhetoric of Science and Medicine. 3 Units.
This course explores the roles language and rhetoric play in constructing, communicating, and understanding science and medicine. It surveys current and historical debates, theories, research, and textual conventions of scientific and medical discourse. May be taught with a specific focus, such as scientific controversies, concepts of health and illness, visualizations of science, the body in medicine, and the history of scientific writing. Offered as: ENGL 341 and ENGL 441. Prereq: Graduate standing.

ENGL 443. Language and Gender. 3 Units.
This course introduces students to the study of language and gender by exploring historical and theoretical trends, methods, and research findings on the ways gender, sexuality, language, and discourse interact and even shape each other. Topics may include "grammatical" versus "biological" gender, feminine escritura, the women and language debate, speech acts and queer performativity, nonsexist language policy, discourses of gender and sexuality, feminist stylistics, and LGBT sociolinguistics. Offered as: ENGL 343, ENGL 443, and WGST 343. Prereq: Graduate standing.

ENGL 453. Major Writers. 3 Units.
Close and detailed study of the work of one or two writers: development, social and aesthetic contexts, reception, interpretation, significance. Maximum 6 credits. Offered as ENGL 353 and ENGL 453.

ENGL 456. American Literature Before 1865. 3 Units.
Aspects of American literature and its contexts from the colonial period through the end of the Civil War. Writers such as Bradstreet, Taylor, Franklin, Poe, Stowe, Alcott, Melville, Hawthorne, Emerson, Douglass. Maximum 6 credits. Offered as ENGL 356 and ENGL 456. Prereq: Graduate standing.

ENGL 457. American Literature 1865-1914. 3 Units.
Aspects of American literature and its contexts from the Civil War to the First World War. Writers such as Whitman and Dickinson, Twain, Howells, James, Chopin, Wharton. Maximum 6 credits. Offered as ENGL 357 and ENGL 457. Prereq: Graduate standing.
ENGL 458. American Literature 1914-1960. 3 Units.
Aspects of American literature and its contexts from the First World War to the Cold War. Genres studied might include fiction, poetry, drama, polemics. Writers such as T.S. Eliot, Pound, Stevens, Moore, W.C. Williams, Dos Passos, West, Fitzgerald, Hemingway, Cather, Faulkner, Barnes, Miller, T. Williams, O'Neill. Maximum 6 credits. Offered as ENGL 358 and ENGL 458. Prereq: Graduate standing.

ENGL 459. Studies in Contemporary American Literature. 3 Units.
Individual topics in literary culture since the 1960s. Topics may include the Beats, literature of the Vietnam war, post-modern fiction, contemporary poetry, the documentary novel. Maximum 6 credits. Offered as ENGL 359 and ENGL 459. Prereq: Graduate standing.

ENGL 460. Studies in American Literature. 3 Units.
Individual topics in American literary culture such as regionalism, realism, impressionism, literature and popular culture, transcendentality, the lyric, proletarian literature, the legacy of the Civil War. Maximum 6 credits. Offered as ENGL 360 and ENGL 460. Prereq: Graduate standing or permission of instructor.

ENGL 463H. African-American Literature. 3 Units.
A historical approach to African-American literature. Such writers as Wheatley, Equiano, Douglass, Jacobs, DuBois, Hurston, Hughes, Wright, Baldwin, Ellison, Morrison. Topics covered may include slave narratives, African-American autobiography, the Harlem Renaissance, the Black Aesthetic, literature of protest and assimilation. Maximum 6 credits. Offered as ENGL 363H, ETHS 363H, WLIT 363H, ENGL 463H, and WLIT 463H. Prereq: Graduate standing.

ENGL 465E. The Immigrant Experience. 3 Units.
Study of fictional and/or autobiographical narrative by authors whose families have experienced immigration to the U.S. Among the ethnic groups represented are Asian-American, Jewish-American, Hispanic-American. May include several ethnic groups or focus on a single one. Attention is paid to historical and social aspects of immigration and ethnicity. Maximum 6 credits. Offered as ENGL 365E, WLIT 365E, ENGL 465E, and WLIT 465E. Prereq: Graduate standing.

ENGL 465N. Topics in African-American Literature. 3 Units.
Selected topics and writers from nineteenth, twentieth, and twenty-first century African-American literature. May focus on a single author or a group of authors, a theme or themes. Maximum 6 credits. Offered as ENGL 365N, ETHS 365N, WLIT 365N, ENGL 465N, and WLIT 465N. Prereq: Graduate standing.

ENGL 465Q. Post-Colonial Literature. 3 Units.
Readings in national and regional literatures from former European colonies such as Australia and African countries. Maximum 6 credits. Offered as ENGL 365Q, ETHS 365Q, WLIT 365Q, ENGL 465Q, and WLIT 465Q. Prereq: Graduate standing.

ENGL 467. Introduction to Film. 3 Units.
An introduction to the aesthetics of film form. We will analyze the elements that make up a film, screening films that facilitate our discussion of how these elements interact with one another to constitute whole formal systems that generate meanings and other effects. We will bring various theoretical and historical considerations to bear as we explore and appreciate the art of cinema. Offered as ENGL 367 and ENGL 467. Prereq: Graduate standing.

ENGL 468B. History of Film. 3 Units.
Analysis of selected topics in film history, such as film before 1940, American cinema 1940 to the present, European or Asian cinema since 1940. Maximum 6 credits. Offered as ENGL 368B and ENGL 468B. Prereq: Graduate standing.

ENGL 468C. Topics in Film. 3 Units.
Individual topics in film, such as a particular national cinema, horror films, films of Alfred Hitchcock, images of women in film, film comedy, introduction to film genres, Asian-cinema and drama, dance on screen, science fiction films, storytelling and cinema, and literature and film. Maximum 12 credits. Offered as ENGL 368C, WLIT 368C, ENGL 468C, and WLIT 468C. Prereq: Graduate standing.

ENGL 469. Children's Literature. 3 Units.
Individual topics in 19th-, 20th-, and 21st-century children's literature. Topics may focus on narrative and thematic developments in the genre, historical contexts, literary influences, or adaptations of children's literature into film and other media. Offered as ENGL 369 and ENGL 469. Prereq: Graduate standing or requisites not met permission.

ENGL 471. Topics in Women's and Gender Studies. 3 Units.
Individual topics and issues in women's studies relating to writing by and about women, such as feminist theory and criticism; the politics of gender and sexuality; women in popular culture; women in the writing business. Maximum 6 credits. Offered as ENGL 371 and ENGL 471. Prereq: Graduate standing.

ENGL 472. Studies in the Novel. 3 Units.
Selected topics in the history and formal development of the novel, such as detective novels; science fiction; epistolary novels; the rise of the novel; the stream of consciousness novel; the Bildungsroman in English. Maximum 6 credits. Offered as ENGL 372 and ENGL 472. Prereq: Graduate standing.

ENGL 473. Studies in Poetry. 3 Units.
Selected topics and issues in the study of poetry, such as reading poetry, the elegy, pastoral poetry, love poetry, the long poem, form and meter in poetry. Maximum 6 credits. Offered as ENGL 373 and ENGL 473. Prereq: Graduate standing.

ENGL 476. Studies in Genre. 3 Units.
Topics in literary genres, such as comedy, biography and autobiography, satire, allegory, the short story, the apologue, narrative poetry. May cross over the prose/poetry boundary. Maximum 6 credits. Offered as ENGL 376 and ENGL 476. Prereq: Graduate standing.

ENGL 477. Studies in Drama. 3 Units.
Readings and discussion of plays and related critical literature pertaining to a specific period in American or British drama. Topics and material will vary from semester to semester. Offered as ENGL 377 and ENGL 477. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.
ENGL 478. Topics in Visual and New Media Studies. 3 Units.
This course will focus on selected topics in the study of visual rhetoric and/or new media, including theoretical, critical, and historical issues raised by texts and media platforms that communicate largely through visual means or through the interaction of visual and verbal modes. Possible syllabi may focus on topics such as visual rhetoric; new media story-telling; historical perspectives on visual rhetoric and/or new media; concentrations on a particular genre (for instance, the graphic novel, video games, etc); visual narrative; theories of new media; etc. Offered as ENGL 378 and ENGL 478.

ENGL 479. Topics in Language Studies. 3 Units.
Aspects of contemporary language studies. Topics might include history/theories of rhetoric, discourse studies, cognitive linguistics, metaphor, language acquisition, stylistics. Maximum 9 credits. Offered as ENGL 379 and ENGL 479. Prereq: Graduate standing.

ENGL 485. Special Topics in Literature. 3 Units.
Close study of a theme or aspect of literature not covered by traditional generic or period rubrics, such as "spatial imagination," "semiotics of fashion in literature," "epistololarity." Maximum 9 credits. Offered as ENGL 385 and ENGL 485. Prereq: Graduate standing.

ENGL 486. Studies in Literature and Culture. 3 Units.
Boundary-crossing study of the relations between literary and other aspects of a particular culture or society, including theoretical and critical issues raised by such study. For example, literature and medicine, law and literature, gay and lesbian literature, Asian/Western literary relations, emotion in literature, philosophy and literature, literature and music. Maximum 9 credits. Offered as ENGL 386 and ENGL 486. Prereq: Graduate standing.

ENGL 487. Literary and Critical Theory. 3 Units.
A survey of major schools and texts of literary and critical theory. May be historically or thematically organized. Maximum 6 credits. Offered as ENGL 387, WLIT 387, ENGL 487, and WLIT 487. Prereq: Graduate standing.

ENGL 501. Writing History and Theory. 3 Units.
This course addresses general research methods and theories specific to the study of writing, and functions as a required core course and overview for the Writing, History and Theory (WHIT) sequence in the English Department's Ph.D. program. Prereq: Graduate standing.

ENGL 506. Professional Writing: Theory and Practice. 3 Units.
Prepares graduate students to teach disciplinary forms of writing, including technical and professional writing, in academic and non-academic settings. Prereq: ENGL 400.

ENGL 508. Seminar: English Literature 1550-1660. 3 Units.
Prereq: Graduate standing.

ENGL 509. Seminar: English Literature 1660-1800. 3 Units.
Prereq: Graduate standing.

ENGL 510. Seminar: English Literature 1800-1900. 3 Units.
Prereq: Graduate standing.

ENGL 511. Seminar: 20th Century Literature. 3 Units.
Prereq: Graduate standing.

ENGL 512. Seminar: Novel. 3 Units.
Prereq: Graduate standing.

ENGL 513. Seminar: Topics in Poetry. 3 Units.
Prereq: Graduate standing.

ENGL 514. Seminar: Criticism and Other Special Topics. 3 Units.
Prereq: Graduate standing.

ENGL 515. Intellectual Property and the Construction of Authorship. 3 Units.
Study of the concepts, laws, norms, and practices through which writers and other creative producers establish "property" in their work. Offered as ENGL 515 and HSTY 515. Prereq: Graduate standing or permission.

ENGL 516. Seminar: American Literature. 3 Units.
Prereq: Graduate standing.

ENGL 517. Seminar: English Literature 1660-1800. 3 Units.
Prereq: Graduate standing.

ENGL 518. Seminar: English Literature 1800-1900. 3 Units.
Prereq: Graduate standing.

ENGL 519. Seminar: 20th Century Literature. 3 Units.
Prereq: Graduate standing.

ENGL 520. Seminar: Novel. 3 Units.
Prereq: Graduate standing.

ENGL 521. Seminar: Topics in Poetry. 3 Units.
Prereq: Graduate standing.

ENGL 522. Seminar: Criticism and Other Special Topics. 3 Units.
Prereq: Graduate standing.

ENGL 523. Seminar: Intellectual Property and the Construction of Authorship. 3 Units.
Prereq: Graduate standing or permission.

ENGL 524. Seminar: American Literature. 3 Units.
Prereq: Graduate standing.

ENGL 525. Seminar: English Literature 1660-1800. 3 Units.
Prereq: Graduate standing.

ENGL 526. Seminar: 20th Century Literature. 3 Units.
Prereq: Graduate standing.

ENGL 527. Seminar: Novel. 3 Units.
Prereq: Graduate standing.

ENGL 528. Seminar: Topics in Poetry. 3 Units.
Prereq: Graduate standing.

ENGL 529. Seminar: Criticism and Other Special Topics. 3 Units.
Prereq: Graduate standing.

ENGL 530. Seminar: Intellectual Property and the Construction of Authorship. 3 Units.
Prereq: Graduate standing or permission.
Department of Earth, Environmental, and Planetary Sciences

The earth, environmental and planetary sciences encompass a wide range of inquiries into the physical, chemical, and biological processes that shape the earth and the planets. Application of these inquiries to understanding a planet’s evolution through time is a unique attribute of geological investigations. Knowledge of the past and present reveals the constraints of our environment and serves as a guide for the future.

In recent years, significant advances have been made in the understanding of plate tectonics, properties of the earth’s interior, the nature of surface and near-surface processes, the history of the earth’s climate, the ecology of living and ancient organisms, and the comparative geology of other planets. Geologic knowledge is fundamental to resource conservation, land use planning, environmental geochemistry, hydrology, engineering construction works, and other environmental concerns.

Department faculty focus their research in three areas: surficial processes, planetary materials, and geochemistry. The department offers degree programs leading to the Bachelor of Arts (BA) and Bachelor of Science (BS) in geological sciences, BA in environmental geology, BA in environmental studies, Master of Science (MS), and Doctor of Philosophy (PhD). The Environmental Studies Program (p. 408) is described elsewhere in this bulletin.

Undergraduate Programs

Majors

Students in earth, environmental, and planetary sciences obtain a solid background in basic science and mathematics as well as intensive training in the major. In addition, because of the wide variety of ways in which geologic knowledge can be applied, all students are encouraged to take electives in subjects appropriate to their personal objectives, which may be as diverse as the engineering applications of geology or the socioeconomic and legal systems bearing on environmental issues. The undergraduate programs stress practical experience and fieldwork as well as classroom study. The environmental geology major combines courses in geological sciences with courses in basic and applied sciences to provide students with an understanding of environmental problems, with employable skills, and with a background for graduate study or professional school.

All students participate in a three-semester Senior Project sequence in which they propose a research project, conduct the research, write a thesis, and present it to the department.

Total Units 67
In the above majors, the student and his or her advisor will design the remainder of the curriculum based on individual interests, in accordance with departmental and college requirements. Through the Integrated Graduate Studies Program (p. 549), students may earn a bachelor’s and a master’s degree in five years. Special programs, such as interdisciplinary majors, also may be arranged.

Minor

Students may complete a minor in geological sciences by taking at least 15 hours of coursework.

Graduate Programs

Graduate programs leading to the Master of Science and Doctor of Philosophy degrees are offered. Both programs are flexible so as to meet the needs of the individual student. General areas of study include aquatic systems, aquatic and groundwater chemistry, environmental geochemistry, benthic ecology, biostratigraphy and paleontology, environmental and urban geology, geomorphology, limnology, paleoclimatology, petrology, sedimentary geochemistry, sedimentation and stratigraphy, stable isotope studies, meteoritics, planetary materials, geodynamics of planetary interiors, and planetary geology. More specific information is available from the departmental office, the departmental Web page, and the Office of Admission of the School of Graduate Studies.

Facilities

The department’s research facilities include thin sectioning and mineral separation facilities; laboratories for chemical analysis of water, including an ion chromatograph, colorimetric spectrometer, atomic absorption spectrophotometer, electrochemistry equipment, and an environmental glove box; alpha and gamma spectroscopic facilities for analysis of environmental nuclides; equipment for studying animal-sediment relations, including a scanning gamma spectrometer; scanning electron microscope; electron microprobe; chemical reactors and a diamond anvil press for high-temperature and high-pressure geochemical experiments; and high-speed computing equipment.

Also housed in the department are laboratories for paleontological and micropaleontological investigations and for work in ecology and sedimentology. A well-field owned by the university is available for groundwater sampling and analysis.

The department also contains a wide range of other equipment, such as reflected and transmitted light microscopes, fluid inclusion microscope, cathodoluminescence microscope, submicron and clay-silt-sand particle size analyzers, high magnetic field mineral separator, X-ray diffractometer, and field equipment for groundwater and geophysical work, including resistivity meter, seismic refraction instrument, ground conductivity meter, magnetometer, and gravimeter and field equipment for soil and sediment sampling.

Department Faculty

Gerald Matisoff, PhD

(Johns Hopkins University)
Professor and Chair
Sedimentary and environmental geochemistry

Ralph P. Harvey, PhD
(University of Pittsburgh)
Associate Professor
Planetary geology

Steven A. Hauck, II, PhD
(Washington University in St. Louis)
Assistant Professor
Geodynamics

Peter L. McCall, PhD, JD
(Yale University)
Professor; Director, Environmental Studies Program
Benthic ecology; paleoecology

Beverly Z. Saylor, PhD
(Massachusetts Institute of Technology)
Associate Professor
Sedimentary geology

James A. Van Orman, PhD
(Massachusetts Institute of Technology)
Professor
Geochemistry

Peter J. Whiting, PhD
(University of California, Berkeley)
Associate Professor and Associate Dean
Geomorphology; surface water hydrology; environmental geology

Adjunct Faculty

Philip O. Banks, PhD
(California Institute of Technology)
Adjunct Associate Professor
Geology; geochronology

George Collins, PhD
(University of Wisconsin)
Adjunct Professor
Astronomy

Andrew Dombard, PhD
(Washington University in St. Louis)
Adjunct Associate Professor; University of Illinois-Chicago
Planetary geophysics

Joseph Hannibal, PhD
(Kent State University)
Adjunct Associate Professor; Cleveland Museum of Natural History
Invertebrate paleontology

Michael Ketterer, PhD
(University of Colorado)
Adjunct Professor; Northern Arizona University
Analytical chemistry

David Saja, PhD
(University of Pennsylvania)
Adjunct Assistant Professor; Cleveland Museum of Natural History
Mineralogy

Richard C. Schmidt, PhD
(McGill University, Canada)
Adjunct Professor
Economic geology

Emeritus
Samuel M. Savin, PhD
(California Institute of Technology)
Jesse Earl Hyde Professor Emeritus of Geological Sciences and Dean Emeritus, College of Arts and Sciences
Isotope geochemistry

Courses

EEPS 100. Introduction to Geology in the Field. 3 Units.
This 3-week field course will serve as an introduction to geology by looking at the land around us: glacial features, sedimentary rocks, and the structures they form when continents collide. We will travel by van to six different states and visit some famous rock outcrops and glacial features, collect from some of the best fossil localities in the world, investigate some environmental geology problems (hazardous waste disposal and groundwater pollution, landslides, mining benefits and costs), and see how the Appalachian mountains were made. The course is constructed, operated, and graded assuming no prior geologic experience. Students will have multiple opportunities to observe, measure, and interpret at the outcrop level, and work together to piece together the history of a region. Discussion will proceed from what is observed to what is interpreted/inferred to its regional/larger significance. The course is carried out mostly in the field away from Cleveland; tent camping and hiking are required. Course fee in addition to summer tuition rates.

EEPS 101. The Earth and Planets. 3 Units.
An examination of the geological processes that have shaped the planets and moons of the inner solar system, focusing on those with relevance to our own planet Earth. Following an introduction to the fundamentals of planetary geology, lectures and exercises will explore how the inner planets (the asteroids, Mercury, Venus, Earth, the Moon, and Mars) exhibit the effects of planetary differentiation, impact cratering, volcanic activity, tectonics, climate, and interactions with life.

EEPS 110. Physical Geology. 3 Units.
Introduction to geologic processes and materials that shape the world we live in. Hydrologic cycle and evolution of landscapes. Earthquakes, volcanoes, plate tectonics, and geologic resources. Students desiring laboratory experience should enroll in EEPS 119 concurrently.

EEPS 115. Introduction to Oceanography. 3 Units.
The sciences of oceanography. Physical, chemical, biologic, and geologic features and processes of the oceans. Differences and similarities between the oceans and large lakes including the Great Lakes. Required: Sunday field trip.

EEPS 117. Weather and Climate. 3 Units.
Introduction to the study of weather and climate. Covers the basics of meteorology, climate zones, the hydrologic cycle, and weather prediction. Lectures address timely topics including greenhouse warming, past global climates, and recent advances in meteorology.

EEPS 119. Geology Laboratory. 1 Unit.
Principles and techniques common to the geological sciences including rock and mineral identification, map interpretation, land form analysis, application of geological information to engineering works, and more. One three-hour laboratory or field trip weekly. Recommended preparation: EEPS 110.

EEPS 202. Global Environmental Problems. 3 Units.
Global Environmental Problems is a course designed to provide students with an understanding of, and an appreciation for, human-influenced environmental changes that are global in scope. Accordingly, much of the material will focus on the nature and structure of natural global systems, how and where in those systems human influences occur, and will delve deeply into a few particular problems and solutions of current interest, such as population growth, climate change, ozone depletion, and fisheries, from a variety of viewpoints. Offered as ESTD 202 and EEPS 202.

EEPS 210. Historical Geology/Paleontology. 3 Units.
History of life as recorded in sedimentary rocks. Case histories of important basins of deposition; the interrelationships of paleogeography, plate tectonics, and evolution. Two lectures and one laboratory weekly.

EEPS 220. Environmental Geology. 3 Units.

EEPS 225. Evolution. 3 Units.
Multidisciplinary study of the course and processes of organic evolution provides a broad understanding of the evolution of structural and functional diversity, the relationships among organisms and their environments, and the phylogenetic relationships among major groups of organisms. Topics include the genetic basis of micro- and macro-evolutionary change, the concept of adaptation, natural selection, population dynamics, theories of species formation, principles of phylogenetic inference, biogeography, evolutionary rates, evolutionary convergence, homology, Darwinian medicine, and conceptual and philosophic issues in evolutionary theory. Offered as ANTH 225, BIOL 225, EEPS 225, HSTY 225, and PHIIL 225.

EEPS 301. Stratigraphy and Sedimentation. 3 Units.
Formation, distribution, and composition of sediments and sedimentary rocks. Modern depositional environments and their ancient analogues; principles of stratigraphic and biostratigraphic correlation. Two lectures and one laboratory per week.

EEPS 303. Environmental Law. 3 Units.
Introduction to treatment of environmental issues in legal proceedings. Sources of environmental law, legal procedure, common law remedies (toxic torts and human health, nuisance, contract law), statutes and regulations, endangered species, public lands, toxics regulation, nuclear power, coal. The course employs the case method of reading and recitation of appellate judicial opinions. We read both classic cases in environmental law as well as current controversies. Offered as ESTD 303 and EEPS 303.
EEPS 305. Geomorphology and Remote Sensing. 3 Units.
Recognition and interpretation of land forms and their significance in revealing present and past geologic processes. Introduction to acquisition and analysis of data through aerial photography and satellite imagery. Two lectures and one laboratory weekly. Recommended preparation: EEPS 110 and EEPS 119. Offered as EEPS 305 and EEPS 405.

EEPS 307. Evolutionary Biology and Paleobiology of Invertebrates. 3 Units.
Important events in the evolution of invertebrate life; structure, function, and phylogeny of major invertebrate groups.

EEPS 315. Structural Geology and Geodynamics. 3 Units.
Theoretical analysis of deformation in earth materials, with illustrations of deformational styles in various tectonic settings and the dynamics of the Earth’s interior. Recommended preparation: EEPS 110. Offered as EEPS 315 and EEPS 415.

EEPS 317. Introduction to Field Methods. 3 Units.
Practice in field procedures, recognition and testing of hypotheses in the field, field mapping and analysis of igneous, sedimentary, and metamorphic rocks in deformed and tectonically active settings. Weekly meeting plus spring break field trip. Students required to pay partial cost of meals, lodging, and travel. Offered as EEPS 317 and EEPS 417. Prereq: EEPS 119.

EEPS 318. Topics in Field Methods. 3 Units.
Field analysis of geological and environmental problems. Topics and locations will vary. Requires preparatory meetings and week-long field trip, usually during spring break. Students required to pay partial cost of meals, lodging, and travel. Recommended preparation: EEPS 119 or permission of instructor.

EEPS 321. Hydrogeology. 3 Units.
Basic and applied concepts pertaining to the occurrence and movement of groundwater. Definitions, basic equations, applications to a variety of geologic settings, wells. Requires one Saturday field trip to make field measurements, collect and analyze data, and prepare a report. Offered as EEPS 321 and EEPS 421.

EEPS 330. Geophysical Field Methods and Laboratory. 4 Units.
Use of seismic refraction and reflection, gravity, electrical, magnetic, and electromagnetic methods to infer the earth’s structure and composition. Application of inverse theory to estimate model parameters. Requires students to make field measurements, analyze data, and prepare a report. Includes several required Saturday field trips. Offered as EEPS 330 and EEPS 430.

EEPS 336. Aquatic Chemistry. 4 Units.
Chemical equilibria occurring in natural waters. Quantitative methods of describing acid-base, metal ion/ligand, precipitation/dissolution, and oxidation/reduction reactions. Geochemical cycling of trace metals and nutrients. Offered as EEPS 336 and EEPS 436.

EEPS 341. Mineralogy. 4 Units.
Crystallography, hand specimen mineralogy and petrology, principles of crystal structure and crystal chemistry, elementary thermodynamics and phase diagrams, and an introduction to the petrographic microscope. Three lectures and one three-hour laboratory weekly. Recommended preparation: EEPS 119.

EEPS 344. Igneous and Metamorphic Petrology. 4 Units.
Composition, classification, and genesis of igneous and metamorphic rocks, emphasizing physical and chemical principles governing their origin. Laboratory study of rocks in thin section. Two lectures and two three-hour laboratories weekly. Prereq: EEPS 341.

EEPS 345. Planetary Materials. 1 - 3 Units.
An introduction to the materials that make up the solid matter of the solar system. Student presentations will review our current understanding of accessible primitive materials such as meteorites, cosmic dust, lunar and ancient terrestrial rocks, and their relationship to modern natural materials and solar system processes. Offered as EEPS 345 and EEPS 445.

EEPS 349. Geological Problems. 1 - 3 Units.
Special work arranged according to the qualifications of the student.

EEPS 350. Geochemistry. 3 Units.
Introduction to geochemistry. Properties of the elements, elemental and isotopic fractionation, element transport, geochemical systems, geochronology, mineral reactions, the solid Earth, Earth in the solar system. A quantitative approach to modeling geochemical processes will be emphasized throughout. Offered as EEPS 350 and EEPS 450.

EEPS 360. Summer Field Camp. 6 Units.
Six-week course in geologic field methods and mapping. Not offered at CWRU; must be taken at another college or university. Credits will be transferred.

EEPS 367. Topics in Evolutionary Biology. 3 Units.
The focus for this course on a special topic of interest in evolutionary biology will vary from one offering to the next. Examples of possible topics include theories of speciation, the evolution of language, the evolution of sex, evolution and biodiversity, molecular evolution. ANAT/ANTH/EEPS/PHIL/PHOL/BIOL 467 will require a longer, more sophisticated term paper, and additional class presentation. Offered as ANTH 367, BIOL 368, EEPS 367, PHIL 367, ANAT 467, ANTH 467, BIOL 468, EEPS 467, PHIL 467 and PHOL 467.

EEPS 390. Introduction to Geological Research. 3 Units.
Examination of factors in the selection, design, and conduct of research projects and in the analysis and interpretation of research results. Consideration of ethical issues in scientific research. Development of a written research proposal and oral presentation of proposed research. Consultations with department faculty in development of research proposal. Research initiation. Offered as EEPS 390 and EEPS 490.

EEPS 391. Senior Project. 2 Units.
Research project required of all department majors, based on formal project proposals presented to department faculty. Proposals may be submitted prior to the semester in which EEPS 391 is taken. Grading based on project progress presentation that will include a statement of the problem, a literature review, a description of their field/lab work and presentation of their data collected to date. This course is the first of a 2 semester Senior Capstone (EEPS 391, 392) sequence. Recommended preparation: EEPS 390.
EEPS 392. Professional Presentation. 2 Units.
Preparation and presentation of final written and oral reports on individual Senior Projects. Class meetings focus on group discussion of problem areas in analysis and interpretation of project results, and in styles of writing poster and oral presentation as demonstrated by practice examples. This course is the second in a two-course (EEPS 391, 392) Senior Capstone sequence. Prereq: EEPS 390 and EEPS 391. Or Coreq: EEPS 390.

EEPS 394. Seminar in Evolutionary Biology. 3 Units.
This seminar investigates 20th-century evolutionary theory, especially the Modern Evolutionary synthesis and subsequent expansions of and challenges to that synthesis. The course encompasses the multidisciplinary nature of the science of evolution, demonstrating how disciplinary background influences practitioners’ conceptualizations of pattern and process. This course emphasizes practical writing and research skills, including formulation of testable theses, grant proposal techniques, and the implementation of original research using the facilities on campus and at the Cleveland Museum of Natural History. Offered as ANTH 394, BIOL 394, EEPS 394, HSTY 394, PHIL 394, ANTH 494, BIOL 494, EEPS 494, HSTY 494, and PHIL 494.

EEPS 396. Undergraduate Research in Evolutionary Biology. 3 Units.
Students propose and conduct guided research on an aspect of evolutionary biology. The research will be sponsored and supervised by a member of the CASE faculty or other qualified professional. A written report must be submitted to the Evolutionary Biology Steering Committee before credit is granted. Offered as ANTH 396, BIOL 396, EEPS 396, and PHIL 396.

EEPS 405. Geomorphology and Remote Sensing. 3 Units.
Recognition and interpretation of land forms and their significance in revealing present and past geologic processes. Introduction to acquisition and analysis of data through aerial photography and satellite imagery. Two lectures and one laboratory weekly. Recommended preparation: EEPS 110 and EEPS 119. Offered as EEPS 305 and EEPS 405.

EEPS 415. Structural Geology and Geodynamics. 3 Units.
Theoretical analysis of deformation in earth materials, with illustrations of deformational styles in various tectonic settings and the dynamics of the Earth's interior. Recommended preparation: EEPS 110. Offered as EEPS 315 and EEPS 415.

EEPS 417. Introduction to Field Methods. 3 Units.
Practice in field procedures, recognition and testing of hypotheses in the field, field mapping and analysis of sedimentary, igneous, and metamorphic rocks in deformed and tectonically active settings. Weekly meeting plus spring break field trip. Students required to pay partial cost of meals, lodging, and travel. Offered as EEPS 317 and EEPS 417.

EEPS 421. Hydrogeology. 3 Units.
Basic and applied concepts pertaining to the occurrence and movement of groundwater. Definitions, basic equations, applications to a variety of geologic settings, wells. Requires one Saturday field trip to make field measurements, collect and analyze data, and prepare a report. Offered as EEPS 321 and EEPS 421.

EEPS 425. Geotectonics. 3 Units.
Interpretation of the major crustal features of the earth in terms of plate tectonics and associated phenomena.

EEPS 430. Geophysical Field Methods and Laboratory. 4 Units.
Use of seismic refraction and reflection, gravity, electrical, magnetic, and electromagnetic methods to infer the earth's structure and composition. Application of inverse theory to estimate model parameters. Requires students to make field measurements, analyze data, and prepare a report. Includes several required Saturday field trips. Offered as EEPS 330 and EEPS 430.

EEPS 436. Aquatic Chemistry. 4 Units.
Chemical equilibria occurring in natural waters. Quantitative methods of describing acid-base, metal ion/ligand, precipitation/dissolution, and oxidation/reduction reactions. Geochemical cycling of trace metals and nutrients. Offered as EEPS 336 and EEPS 436.

EEPS 437. Chemistry of Natural Waters. 3 Units.
Advanced topics in aquatic chemistry. Thermodynamics models for ion/ligand speciation in natural waters; origin and composition of seawater, chemical and mineralogical sequence during evaporation, chemical weathering, groundwater and river water chemistry, chemical cycling and a global mass balances; perturbations on natural systems by man. Predictive capabilities of box models.

EEPS 444. Flow and Sediment Transport. 3 Units.
This course focuses on open channel flow and sediment transport mechanics. A mathematical framework for the description of free surface flow and various modes of particle transport is built. This framework is used in discussions of geomorphic and sedimentologic processes and features. Specific topics covered include dimensional analysis, forces on settling particles, fluid flow, initiation of particle movement, bedload and suspended load transport and their calculation, and channel form.

EEPS 445. Planetary Materials. 1 - 3 Unit.
An introduction to the materials that make up the solid matter of the solar system. Student presentations will review our current understanding of accessible primitive materials such as meteorites, cosmic dust, lunar and ancient terrestrial rocks, and their relationship to modern natural materials and solar system processes. Offered as EEPS 345 and EEPS 445.

EEPS 450. Geochemistry. 3 Units.
Introduction to geochemistry. Properties of the elements, elemental and isotopic fractionation, element transport, geochemical systems, geochronology, mineral reactions, the solid Earth, Earth in the solar system. A quantitative approach to modeling geochemical processes will be emphasized throughout. Offered as EEPS 350 and EEPS 450.

EEPS 455. Isotope Geochemistry. 3 Units.
Principles and applications of naturally occurring variations of isotopic abundances in geologic, hydrologic, and biologic systems. Includes consideration of radioactive and radiogenic isotopes and their use in geochronology and as tracers; consideration of isotopic fractionations (especially of light stable isotopes), their thermodynamic and kinetic causes, and their use in understanding mechanisms and conditions of geologic processes and as tracers.
EEPS 467. Topics in Evolutionary Biology. 3 Units.
The focus for this course on a special topic of interest in evolutionary biology will vary from one offering to the next. Examples of possible topics include theories of speciation, the evolution of language, the evolution of sex, evolution and biodiversity, molecular evolution. ANAT/ANTH/EEPS/PHIL/PHOL 467/BIOL 468 will require a longer, more sophisticated term paper, and additional class presentation. Offered as ANTH 367, BIOL 368, EEPS 367, PHIL 367, ANAT 467, ANTH 467, BIOL 468, EEPS 467, PHIL 467 and PHOL 467.

EEPS 490. Introduction to Geological Research. 3 Units.
Examination of factors in the selection, design, and conduct of research projects and in the analysis and interpretation of research results. Consideration of ethical issues in scientific research. Development of a written research proposal and oral presentation of proposed research. Consultations with department faculty in development of research proposal. Research initiation. Offered as EEPS 390 and EEPS 490.

EEPS 494. Seminar in Evolutionary Biology. 3 Units.
This seminar investigates 20th-century evolutionary theory, especially the Modern Evolutionary synthesis and subsequent expansions of and challenges to that synthesis. The course encompasses the multidisciplinary nature of the science of evolution, demonstrating how disciplinary background influences practitioners' conceptualizations of pattern and process. This course emphasizes practical writing and research skills, including formulation of testable theses, grant proposal techniques, and the implementation of original research using the facilities on campus and at the Cleveland Museum of Natural History. Offered as ANTH 394, BIOL 394, EEPS 394, HSTY 394, PHIL 394, ANTH 494, BIOL 494, EEPS 494, HSTY 494, and PHIL 494.

EEPS 503. Seminar: Geomorphology/Glacial Geology. 1 Unit.

EEPS 504. Seminar: Geochemistry. 1 Unit.

EEPS 506. Seminar in Geophysics. 1 - 3 Unit.
Selected topics in geophysics: advanced research issues, classical papers, current state of the field, advanced techniques. Course content will vary depending on interests of students and faculty.

EEPS 509. Seminar: Graduate Research. 1 Unit.

EEPS 511. Special Readings in Geology. 1 - 6 Unit.
Detailed study of a selected topic in geology under the guidance of a faculty member.

EEPS 512. Special Readings in Geology. 1 - 6 Unit.
Detailed study of a selected topic in geology under the guidance of a faculty member.

EEPS 601. Special Problems and Research. 1 - 18 Unit.
(Credit as arranged.)

EEPS 651. Thesis M.S.. 1 - 18 Unit.
(Credit as arranged.)

(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
Department of History

The Department of History offers comprehensive undergraduate and graduate programs in all fields of history, with particular strengths in American history; the history of science, technology, environment, and medicine; and social history and policy. Historical studies are sometimes categorized among humanistic studies and sometimes among the social sciences. Allied with both traditions, historians seek an understanding of the past by analyzing societies and how they change over time.

The Department of History offers instruction within the customary frameworks that have formed the basis of historical studies, and it also has developed special emphases in social, cultural, political, and economic perspectives that allow instruction and research on such topics as the African-American experience, the environment, business and economy, technology and science, medicine, women’s history and gender studies, legal history, and comparative social history. Courses in history, or a formal major or minor in history, traditionally have been attractive to students as preparation for a wide variety of career and professional interests, including teaching, law, government, and journalism, and such public history activities as archival administration, historical museum administration, restoration and preservation of historic sites, and writing.

Facilities

Case Western Reserve University, the other institutions in University Circle, and the Cleveland area in general offer excellent facilities for historical research. These facilities are especially strong in the fields of social history and policy and in the history of medicine, health care, nonprofit organizations, technology, and science. The university library’s extensive collections in these fields are significantly augmented by the holdings of the nationally ranked Allen Memorial Library in the history of medicine and health care, and of the equally distinguished Western Reserve Historical Society in regional economic, social, nonprofit, ethnic, African-American, and Jewish history. Both the Allen Memorial Library and the Western Reserve Historical Society library are adjacent to the campus. The Cleveland Public Library, just five miles from campus in downtown Cleveland, is the third largest public library in the U.S.; it maintains excellent research collections in Ohio, U.S., and British history, technology, and business. The university has also pioneered the development of electronic connections to other libraries and to research resources in general; Ohio’s many colleges and universities have one of the nation’s leading interlibrary loan programs.

Undergraduate Programs

Major

The history major may be elected in one of two formats: the regular major or the teacher licensure major.

Regular Major

The regular major requires a minimum of 30 hours in history courses, including:

- **HSTY 112** Introduction to American History 3
- **HSTY 113** Introduction to Modern World History 3
- **HSTY 250** Issues and Methods in History 3
- **HSTY 398** Senior Research Seminar 3

The major also requires six additional courses in history, four of which must be agreed upon in consultation with the departmental advisor to form a coherent field of historical inquiry. All majors are encouraged to take at least two courses focused in geographical areas outside of Europe and the United States. With permission, one course in a related discipline outside of the history department may be accepted towards the requirements of the major.

Teacher Licensure Major

The teacher licensure major requires 30 hours of history, including the same four courses required for the regular major and a minimum of six semester hours in each of three focus areas: United States history, world/European studies, and Asian, African, and Latin American studies. Candidates for teacher licensure (Integrated Social Studies, Adolescents and Young Adults) must also take courses in economics, political science, and sociology (9 hours), and 35 hours in education courses offered through Case Western Reserve and John Carroll University culminating in student teaching. Students interested in pursuing this option should confer with the department’s undergraduate advisor. See the Teacher Licensure (p. 437) section in this bulletin.

Subject area requirements:

- HSTY 112 Introduction to American History 3
- HSTY 113 Introduction to Modern World History 3
- HSTY 250 Issues and Methods in History 3
- HSTY 398 Senior Research Seminar 3

Two of the following: 6

- HSTY 152 Technology in America
- HSTY 206 Ancient and Medieval Spain: Prehistory to 1492
- HSTY 255 Economic History of the United States
- HSTY 256 American Political History
- HSTY 257 Immigrants in America
- HSTY 260 U.S. Slavery and Emancipation
- HSTY 262 African-American History Since 1945
- HSTY 325 U.S. Politics, Culture, and Society: 1790-1860
- HSTY 353 Women in American History I
- HSTY 354 Women in American History II
- HSTY 355 Age of American Civil War 1815-80
- HSTY 378 North American Environmental History

Two of the following: 6

- HSTY 151 Technology in European Civilization
- HSTY 211 The Medieval World, 300-1500
- HSTY 212 Modern European History
- HSTY 254 The Holocaust
- HSTY 309 Reformation Europe, 1500-1650
- HSTY 310 The French Revolutionary Era
- HSTY 334 History of 19th Century Germany
- HSTY 335 History of 20th Century Germany
- HSTY 342 Water

Two of the following: 6

- HSTY 135 Introduction to Modern African History
- HSTY 280 History of Modern Mexico
- HSTY 285 Modern Japan
- HSTY 383 Readings in PRC History

One of the following: 3

- ECON 102 Principles of Microeconomics
- ECON 103 Principles of Macroeconomics
- POSC 260 Introduction to Comparative Politics

One of the following: 3

- SOCI 101 Introduction to Sociology
- SOCI 113 Critical Problems in Modern Society
- SOCI 302 Race and Ethnic Minorities in American Society
- SOCI 310 The Individual in Society

Total Units: 36
(With advisor approval, the economics requirement may be met with HSTY 255 Economic History of the United States, the sociology requirement may be met with HSTY 262 African-American History Since 1945 or HSTY 325 U.S. Politics, Culture, and Society: 1790-1860, and the political science requirement may be met with HSTY 256 American Political History.)

**Integrated Graduate Studies**

The Department of History participates in the Integrated Graduate Studies (IGS) Program (p. 549). Interested students should note the general requirements and procedures of the Graduate School, but must also consult the departmental advisor about the specific requirements, guidelines, and opportunities for IGS in history.

**Minor**

A minor in history is available to all undergraduate students. It consists of 15 hours in history, including HSTY 112 Introduction to American History and HSTY 113 Introduction to Modern World History (history core courses) and three additional courses, chosen in consultation with the departmental advisor; these courses must form a coherent field of historical inquiry.

**Advanced Placement Credit**

Students with Advanced Placement (AP) scores of 5 or better will receive three semester hours of college credit, applicable to the total number of credits required for graduation as well as to any major, minor, or sequence in history. AP credit may not be applied to the HSTY 112 Introduction to American History and HSTY 113 Introduction to Modern World History core courses. Credit by way of AP examination in U.S. history is given for HSTY 256 American Political History or in European history for HSTY 212 Modern European History.

**Graduate Programs**

The Department of History offers both the MA and the PhD in history. Most but not all of our PhD students work within one of the department's two focused PhD programs: (1) Social History and Policy, and (2) History of Science, Technology, Environment and Medicine. In practice, these two programs are often closely related. The department also joins with the Law School to offer an MAJD dual-degree program. Applicants for graduate degrees in history must submit transcripts from all previous undergraduate, graduate, and professional study; scores on the GRE or a comparable standardized test; three letters of recommendation; application essays; and a writing sample.

**Master of Arts**

The MA in history requires 27 hours of course work, including 6 hours of carefully supervised work on a master's thesis (a work of original research based on primary sources). For the joint JD/MA program, students must be admitted to both the history graduate program and the law school. They can earn the degree in either three and one-half years or three years and two summers of study, completing a total of 106 hours (including double credits of up to nine hours).

**Doctor of Philosophy**

Students are admitted into the history department's graduate programs with or without a master's or professional degree. Students who do not have a master's degree in history will generally be required to complete that degree in the department before moving on to the PhD; those who have earned graduate or professional degrees closely related to their PhD programs may petition for direct admission to the PhD program. Students who first complete their MA in history at Case Western Reserve must complete an additional 24 hours of course work, pass the qualifying exams required by their program of study, and prepare a PhD dissertation while enrolling in at least 18 hours of supervised dissertation-writing work. Students who have completed their master's-level work before coming to Case Western Reserve must complete at least 24 hours of course work before taking their qualifying exams and proceeding to their dissertation. All PhD students are required to take:

**Social History and Policy Program (SHP)**

The Social History and Policy Program is designed to prepare students for careers either as analysts and administrators of social policy or as teachers and researchers in colleges and universities. The program defines social policy broadly to include not only welfare, family and juvenile matters, aging, health care, and medicine, but also education, urban history, environmental history, cultural policies regarding museums, libraries and similar agencies, and labor. The program recognizes that social policies are made and put into practice by private, nonprofit organizations and through legal institutions as well as through federal, state, and local legislatures and executives.

Entry into the program does not require an MA in history; several students have been admitted with JD, MSW, library science, or other degrees. However, the program often requires students with limited backgrounds in U.S. history to take extra course work.

More tightly structured than the traditional PhD, the Social History and Policy Program requires 18 hours of course work (and possibly additional hours to prepare for examinations); qualifying examinations in U.S. history and in the history of social policy; a cognate field; and a dissertation. The program also includes an option for the student to complete a policy-related internship; recent internships have been conducted with the Cleveland Federation for Community Planning, the Interchurch Council of Greater Cleveland, the Bureau of Jewish Education, the Sisters of Charity of St. Augustine, and the Hathaway Brown School.

**History of Science, Technology, Environment and Medicine Program (STEM)**

The History of Science, Technology, Environment and Medicine Program was established in 1961 as the first in the nation to emphasize the history of technology as well as the history of science. The program's areas of particular strength include the social and cultural history of technology, both American and European; technology and science policy; the history of the physical sciences since the Renaissance; gender issues in technology and science; the history of medicine; and the history of the environment. The course of study for the PhD includes the MA requirements, written and oral qualifying examinations, and a dissertation. While most graduates of the program teach in universities, others work in museums or archives or deal with science policy questions.

**General PhD Program**

In addition to the specialized SHP and STEM programs, the Department of History also offers a general PhD in history, allowing students to specialize in any geographical, temporal, or topical area of history adequately covered by department faculty. In the past, this general program has been largely restricted to students pursuing topics in U.S. history (including American women's history, African-American history, U.S. cultural history, and the history of social movements), but the gradual expansion of the department now allows us to support
PhD work in certain comparative or non-U.S. fields. All prospective graduate applicants are encouraged to examine the research specialties of department faculty before applying to the program.

**Department Faculty**

Jonathan Sadowsky, PhD  
(Johns Hopkins University)  
*Theodore J. Castele Professor; Associate Professor and Chair*  
Medical history; African history; comparative history

Molly W. Berger, PhD  
(Case Western Reserve University)  
*Instructor; Associate Dean, College of Arts and Sciences*  
History of technology; U.S. cultural history; nineteenth and twentieth centuries

John Broich, PhD  
(Stanford University)  
*Assistant Professor, and Director of Undergraduate Studies*  
British history; British Empire; environmental history; history of public health

Daniel Cohen, PhD  
(Brandeis University)  
*Associate Professor*  
Colonial America; U.S. cultural history

Jia-Chen Fu, PhD  
(Yale University)  
*Assistant Professor*  
Qing and 20th-century China; history of medicine; history of the body

Jay Howard Geller, PhD  
(Yale University)  
*Samuel Rosenthal Professor of Judaic Studies; Associate Professor*  
Jewish history, modern European history, modern German history

David C. Hammack, PhD  
(Columbia University)  
*Hiram C. Haydn Professor of History*  
American social and urban history; economic history; history of civil society and philanthropy

Marixa Lasso, PhD  
(University of Florida)  
*Associate Professor*  
Latin American and Caribbean history; race and nationalism; urban history

Kenneth F. Ledford, PhD, JD  
(Johns Hopkins University; University of North Carolina)  
*Associate Professor*  
Modern German history; Modern European history; European legal history; history of the professions

Miriam R. Levin, PhD  
(University of Massachusetts, Amherst)  
*Professor*  
History of industrial societies and cultures; history of modern France; women in science

Alan Rocke, PhD  
(University of Wisconsin, Madison)  

**Henry Eldridge Bourne Professor of History and Distinguished University Professor**  
History of science; science, technology, and society

Renée M. Sentilles, PhD  
(College of William and Mary)  
*Associate Professor*  
American women’s history; U.S. cultural history; American studies; children’s studies

Peter Shulman, PhD  
(Massachusetts Institute of Technology)  
*Assistant Professor*  
History of science, technology and American politics; environmental history and the history of energy; United States foreign relations

Theodore L. Steinberg, PhD  
(Brandeis University)  
*Adeline Barry Davie Distinguished Professor of History; Professor of Law*  
U.S. environmental and legal history

Gillian L. Weiss, PhD  
(Stanford University)  
*Associate Professor*  
Early modern France; comparative slavery; the Mediterranean

Rhonda Y. Williams, PhD  
(University of Pennsylvania)  
*Associate Professor; Director, CWRU Social Justice Institute; Director, Postdoctoral Fellowship in African American Studies*  
African American history; U.S. social history

**Secondary Faculty**

Rachel Sternberg, PhD  
(Bryn Mawr College)  
*Associate Professor, Department of Classics*  
Greek language and literature; Greek social history; history of emotion; reception of the classical tradition in the age of Jefferson

**Adjunct Faculty**

Amy Absher, PhD  
(University of Washington)  
*Lecturer and SAGES Fellow*  
US Urban history; race & ethnicity in America; American & European cultural & intellectual history

Elizabeth Bly, PhD  
(Case Western Reserve University)  
*Lecturer*  
Gender history/studies, sexuality, popular culture (U.S. 1945-present)

Virginia Dawson, PhD  
(Case Western Reserve University)  
*Adjunct Associate Professor*  
History of science and technology

James M. Edmonson, PhD  
(University of Delaware)  
*Adjunct Associate Professor; Director, Dittrick Medical History Center*  
Medical history

John Grabrowski, PhD  
(Case Western Reserve University)  
*Krieger-Mueller Joint Professor in Applied History*
HSTY 101. Technology & American Culture. 3 Units.

HSTY 112. Introduction to American History. 3 Units.
History of the United States from the first settlements to the present. Emphasis on themes such as political and social revolution, slavery and race relations, industrialism, and national cultures.

HSTY 113. Introduction to Modern World History. 3 Units.
The history of the nineteenth and twentieth centuries in global context. Emphasis on the forces that have created or shaped the modern world: industrialization and technological change; political ideas and movements such as nationalism; European imperialism and decolonization; and the interplay of cultural values.

HSTY 117. Exploring American History Through Biography. 3 Units.
This discussion and lecture class uses various forms of biography to explore issues of American Identity throughout the course of American history. The class will discuss how certain biographies have created archetypal American identities, and how issues such as race, class, gender, sexuality, religion, and historical context have shaped the writing, reading, and purpose of biography. The last third of the class will consider the process of "national memory," the way the United States has decide to remember its past. Here the "biography" is collective, and created by myriad strands of mass culture woven together to create a national mythology. We will explore the works of those striving to pull apart these different strands, and explore what these memories tell us about established national identity. Students will explore biographical process through their assignments, and consider such questions as: How do American biographies influence our understanding of what it means to be American? How does biographical medium affect the message? Can we accept biography as history? This course investigates biography as a constructed genre that comes in a variety of forms, including autobiography, biographical novels, oral histories, and film. Offered as AMST 117 and HSTY 117.

HSTY 133. Introduction to Chinese History and Civilization. 3 Units.
This course explains the continuities and discontinuities in the history of China by stressing the development and distinctive adaptations of cultural, religious, and political patterns from the origins of the Chinese civilization to the present. By focusing on major cultural, socioeconomic, and political issues such as Confucianism, Buddhism, trade relations, imperialism, and intellectual discourse in the overall Asian context (with particular reference to Korea and Japan), we discuss the historical development of China and its situation on entering the 21st century. Taking into account the key historical events in the last century, we examine the emergence of China as a modern nation-state and the fundamental transformation of Chinese society in the postwar period. Offered as ASIA 133 and HSTY 133.

HSTY 134. Introduction to Japanese History and Civilization. 3 Units.
This course provides an introduction to various aspects of Japanese civilization, from its origins to the present. By focusing on major cultural, socio-economic, and political issues such as the adaptation and transformation of Confucianism, Buddhism, Shintoism, social structures, material culture, foreign relations, militarism, nationalism, and intellectual discourse in the overall Asian context (with particular reference to Korea and China), we discuss the historical development of Japan and the country's position on entering the 21st century. We examine the emergence of Japan as a modern nation-state and the fundamental transformation of its society in the post-war period. Offered as ASIA 134 and HSTY 134.

HSTY 135. Introduction to Modern African History. 3 Units.
A general introduction to major themes in modern African history, with an emphasis on the nineteenth and twentieth centuries. Topics include oral tradition and narrative, economic structure and dynamics, religious movements, colonialism, nationalism, and the dilemmas of independent African states. Offered as ETHS 253A and HSTY 135.

HSTY 136. Introduction to Latin American History. 3 Units.
This course provides an introduction to the historical and cultural development of Latin America, in an attempt to identify the forces, both internal and external, which shape the social, economic and political realities in present day Latin America. Beginning with its pre-Columbian civilizations, the course moves through the conquest and colonial period of the Americas, the wars of independence and the emergence of nation-states in the nineteenth century, and the issues confronting the region throughout the turbulent twentieth century, such as migration and urbanization, popular protest and revolution, environmental degradation, great power intervention, the drug trade and corruption, and the integration of the region into the global economy. Offered as ETHS 253B and HSTY 136.

HSTY 151. Technology in European Civilization. 3 Units.
The history of technology in ancient Mediterranean, medieval, and modern European society until the First World War. The course introduces students to the relationship between technology and its social, political, and cultural settings, and to the values invested in technology at significant historical moments. There will be visits to local industrial sites, architectural and engineering monuments, and the Cleveland Museum of Art.

HSTY 152. Technology in America. 3 Units.
Origins and significance of technological developments in American history, from the first settlements to the present. Emphasis on the social, cultural, political, and economic significance of technology in American history.
HSTY 163. Modern Britain and Its Empire. 3 Units.
This lecture and discussion course covers the history of Britain at the height of its political and industrial power and the history of the expanding and contracting British Empire. Britain was a nation of great technological, economic, and military power, but it also experienced extraordinary stresses. Industrialization meant material prosperity for some, but hardship and dehumanization for others. Many questioned how overwhelming poverty and ignorance could be allowed to stand beside such vast affluence. And subjects of the British in India, Ireland, and elsewhere struggled for independence from an empire that claimed to bring freedom, reason, and equality. The British learned to their cost, too, that decolonization often meant being caught in the crossfire of ethnic rivals. This course will explore the many paradoxes of the history of the British at their most dominant.

HSTY 193. The Ancient World. 3 Units.
Ancient Western history from the origins of civilization in Mesopotamia to the dissolution of the Roman Empire in the West. Offered as CLSC 193 and HSTY 193.

HSTY 201. Science in Western Thought I. 3 Units.
The development of Western thinking about the natural world and our relation to it, as part of culture, from pre-classical civilizations to the age of Newton.

HSTY 202. Science in Western Thought II. 3 Units.
The development of Western thinking about the natural world and our relation to it, as part of culture, from Newton to the modern age. HSTY 201 is not a prerequisite.

HSTY 203. Natural Philosophy I. 3 Units.
Historical and philosophical interpretation of some epochal events in development of science. Copernican revolution, Newtonian mechanics, Einstein’s relativity physics, quantum mechanics, and evolutionary theory; patterns of scientific growth; structure of scientific “revolutions;” science and “pseudo-science.” First half of a year-long sequence. Offered as HSTY 203 and PHIL 203.

HSTY 204. Introduction to the Nonprofit Sector. 3 Units.
The United States has by far the largest and most important “nonprofit sector” in the world, a sector consisting of volunteer non-governmental organizations that provide health care, education and social services as well as arts, religious, and advocacy activities. Using mostly primary sources, this course considers the significance of the nonprofit sector in the U.S., its advantages and disadvantages, its uses for different groups of Americans, and current trends. Students have the option of writing either a standard term paper, or a study of strategic challenges facing a contemporary nonprofit organization. Offered as HSTY 204 and HSTY 404.

HSTY 206. Ancient and Medieval Spain: Prehistory to 1492. 3 Units.
This course focuses on the history of the Iberian peninsula from before the Roman conquest from the Iberians, Greek, and Carthaginian settlements, through Roman, Visigothic, and Muslim rule to the conquest of Ferdinand and Isabella of the last non-Christian territory on the peninsula in 1492. The issues of conquest, frontier, cultural diversity, and change, tolerance, and intolerance will be examined. Offered as CLSC 206, HSTY 206.

HSTY 207. Natural Philosophy II. 3 Units.
Conceptual, methodological, and epistemological issues about science: concept formation, explanation, prediction, confirmation, theory construction and status of unobservables; metaphysical presuppositions and implications of science; semantics of scientific language; illustrations from special sciences. Second half of a year-long sequence. Offered as HSTY 207 and PHIL 204.

HSTY 208. Social History of Crime. 3 Units.
This course explores the relationship between law and history in American society. It uses social history methodology to suggest new ways of understanding how the law works as a system of power to advance certain interests at the expense of less powerful groups. Emphasis is on issues of pressing concern to America’s poor and working class, including the death penalty, abortion, rape, the war on drugs, and the prison industry.

HSTY 210. Byzantine World 300-1453. 3 Units.
Development of the Byzantine empire from the emperor Constantine’s conversion to Christianity and founding of the eastern capital at Constantinople to the fall of Constantinople to Turkish forces in 1453. Offered as CLSC 210 and HSTY 210.

HSTY 211. The Medieval World, 300-1500. 3 Units.
Medieval history and civilization from the fall of the Roman Empire to the age of the Renaissance. Interactions between medieval Europe and other Mediterranean and Eurasian cultures.

HSTY 212. Modern European History. 3 Units.
The history of Europe from the late eighteenth century to the present. Themes include political upheavals and movements, as well as industrial, social, intellectual, and cultural changes. This course provides a solid foundation for those wishing to take more specialized courses in European history.

HSTY 215. Europe in the 20th Century. 3 Units.
The twentieth century has seen stupendous transformations in the internal structures of European politics, economics, society, and culture and in Europe’s place in the world. This course traces Europe’s transition from a continent of sovereign nation-states or empires ruled by monarchs with starkly hierarchical social structures, through wars, revolution, dictatorships, destruction, division, and destitution, to a conflicted present. The contradictory combination of peace, freedom, and pluralism combined with cultural critique of the very consumer society that has reduced conflict challenges students’ linear notions of historical development.

HSTY 216. Vikings and Medieval Scandinavia. 3 Units.
A survey of the history of the Vikings and medieval Scandinavia, covering approximately the eighth to the fifteenth centuries AD. Topics explored include: causes of the “outbreak” and cessation of Viking expeditions, the role of the Vikings as raiders and/or traders in Western Europe, the role of the Vikings in the emerging states of Russia, Iceland and medieval Scandinavian law, the historicity of the saga literature, and Viking descendents--Normans and “Rus.”
HSTY 217. History of Corporate America. 3 Units.
This course will explore the origins and evolution of big business’s role in American society. It is not a course about the history of corporations but rather a course that examines how corporate entities have affected fundamental aspects of political, social, and economic life. It will deal with the period from the late nineteenth century to the present and cover such topics as diverse as labor relations and advertising to media issues and lobbying. Our goal is to examine how an historical perspective can help us come to grips with topics of pressing importance to us as Americans today.

HSTY 218. Jews in Early Modern Europe. 3 Units.
This course surveys the history of Jews in Europe and the wider world from the Spanish expulsion through the French Revolution. Tracking peregrinations out of the Iberian Peninsula to the British Isles, France, Holland, Italy, Germany, Poland-Lithuania, the Ottoman Empire, and the American colonies, it examines the diverse ways Jews organized their communities, interacted with their non-Jewish neighbors, and negotiated their social, economic, and legal status within different states and empires. What role did Jews play and what symbolic place did they occupy during a period of European expansion, technological innovation, artistic experimentation, and religious and political turmoil? What internal and external dynamics affected Jewish experiences in the sixteenth, seventeenth, and eighteenth centuries? Through a selection of inquisitorial transcripts, government records, memoirs, and historical literature, we will explore topics such as persecution, conversion, messianism, toleration, emancipation, and assimilation. Offered as HSTY 218, JDST 218, and ETHS 218.

HSTY 224. Early Modern Europe. 3 Units.
Europe has not always existed. To find out who created it and when, this course will ask two fundamental questions: First, how did the geographic, linguistic, religious and ethnic characteristics of European identity develop over the course of the sixteenth, seventeenth and eighteenth centuries? Second, how did Europeans in this period influence other parts of the world? Through close readings of memoirs, treatises and chronicles, and discussions of secondary literature, we will explore the political, social, and religious history of Europe from roughly 1500 to 1800. Topics include: exploration and conquest; Protestant and Catholic reformations; witchcraft and popular culture; science and medicine; Enlightenment and Revolution.

HSTY 225. Evolution. 3 Units.
Multidisciplinary study of the course and processes of organic evolution provides a broad understanding of the evolution of structural and functional diversity, the relationships among organisms and their environments, and the phylogenetic relationships among major groups of organisms. Topics include the genetic basis of micro- and macro-evolutionary change, the concept of adaptation, natural selection, population dynamics, theories of species formation, principles of phylogenetic inference, biogeography, evolutionary rates, evolutionary convergence, homology, Darwinian medicine, and conceptual and philosophic issues in evolutionary theory. Offered as ANTH 225, BIOL 225, EEPS 225, HSTY 225, and PHIL 225.

HSTY 228. African Americans and Internationalism, 1885-1960s. 3 Units.
This course explores the development and articulation of African American Internationalism from the formal advent of the colonial project with the Berlin Conference in 1884-1885 up through the early stages of African decolonization in the 1960s. Internationalism is defined here, especially as it relates to African Americans, as the sustained interest among governmental and non-governmental actors in promoting a foreign policy agenda that sought to impact events in the Diaspora and on the African continent itself. Using Africa, Asia and the Caribbean as case studies, this course will excavate the role of governmental and non-governmental actors such as the African American press, church, civil rights organizations, advocacy groups and diplomats in developing a viable African American foreign policy constituency. This course will stress the centrality of race, gender and transnationalism as central proponents in the development of black internationalism. This course will examine a number of global events and the roles played by African Americans in shaping the outcomes including the Berlin Conference (1885), the Spanish American War (1898), the Russo-Japanese War (1905), The Mexican Revolution (1910-1920), World War I (1914-1919), the Italo-Ethiopian War (1935), World War II (1939-1945), and the beginning of the formal decolonization of Africa with Ghanaian independence in 1957 and the subsequent challenges faced by various African countries in the early 1960s. The course will utilize biographies, case studies, and primary documents to examine these issues.

HSTY 231. Greek Civilization. 3 Units.
This course constitutes the first half of a year-long sequence on classical civilization. It examines the enduring significance of the Greeks studied through their history, literature, art, and philosophy. Lectures and discussion. (For the second course in the sequence, see CLSC 232 and HSTY 232.) Offered as CLSC 231 and HSTY 231.

HSTY 232. Roman Civilization. 3 Units.
The enduring significance of the Romans studied through their history, literature, art, and philosophy. Lectures and discussion. Offered as CLSC 232 and HSTY 232.

HSTY 234. France and Islam. 3 Units.
This seminar examines French encounters with the Muslim world from the Middle Ages to the present. Over the last millennium, France has viewed Saracens, Moriscos, Turks, Berbers, and Arabs with admiration and fear, disdain and incomprehension. Between the eleventh and thirteenth centuries, French soldiers battled in the Holy Land; for several hundred years after that, France and the Ottoman Empire exchanged diplomats, traders and slaves. The colonial occupation of Algeria that began in 1830 ended violently in 1962. By then, the empire that struck hundred years after that, France and the Ottoman Empire exchanged diplomats, traders and slaves. The colonial occupation of Algeria that began in 1830 ended violently in 1962. By then, the empire that struck back had also come home through large waves of immigration. Today, the social and economic status, religious affiliation, political significance and cultural impact of French citizens of North African descent are the subject of burning national debate. Taking a long view on Franco-Muslim relations, the course will explore such topics as the Crusades, Mediterranean piracy and captivity, Napoleon’s Egyptian campaign, the Algerian War of Independence, the “veil affair,” riots in the suburbs of Paris and World Cup soccer. Offered as ETHS 234, HSTY 234.
HSTY 235. Pirates in the Early Modern World. 3 Units.
From the Caribbean to Somalia, pirates have captivated the American imagination. Beyond examining images of heroic outlaws and bloodthirsty criminals in popular culture and current affairs, this course investigates maritime predators of the early modern period (16th-18th centuries). With a focus on the Mediterranean and the Atlantic—and forays into the Indian Ocean, the Red Sea and elsewhere—it considers the motivations and strategies of sea robbers and the responses of states. What, it asks, can Barbary corsairs, Dutch freebooters, Spanish “sea dogs,” and Catholic privateers, teach us about social rebellion, religious conflict, economic development, political authority, legal norms, naval power and imperial expansion?

HSTY 238. Jews in the Modern World. 3 Units.
Investigation of the impact of modernity on the Jewish community. In particular, the course will examine the influence of the Emancipation and Enlightenment on the social situation of the Jews in Europe and America and the corresponding changes in Judaic religion, philosophy, social structure, and culture. Attention will be paid to the creation of a modern Jewish identity in the secular culture of the post-Modern world. Offered as HSTY 238, JDST 231, and RLGN 231.

HSTY 241. Inventing Public Health. 3 Units.
The core principle of this course is that public health is a concept that was formed in different ways at different times in different places. It had no existence as we know it before the nineteenth century, but course participants will learn how it grew out of an ancient tradition of the political elite’s concern that its subjects were a threat to them and the stability of the realm. Course participants will discover how, in the nineteenth century, it became a professional practice as we know it and realized advances in human health, longevity, and security perhaps greater than any made since. At the same time, the course will also cover how many of the assumptions of those that inaugurated public health were completely alien to present-day practitioners—even though in many ways it is a practice that helped inaugurate the modern world so familiar to us. Course participants will learn about the close relationship between public health agencies and agendas and various kinds of social authority: political power, moral influence, colonial power, and others. Ultimately, the aim of the course is to show participants that even though public health seems a supremely common sense practice, it had a highly contested birth and early life that was anything but natural or preordained. That complicated birth continues to shape public health to this day.

HSTY 243. The Age of Prozac: Social and Cultural Aspects of Depression. 3 Units.
Although often experienced as an intensely individual, private, and painfully isolated affliction, depression has profound social and cultural dimensions. This course will neglect neither biological (neurochemical or genetic) perspectives, nor personal or psychological aspects, but will emphasize perspectives derived from history, anthropology, and sociology. While there may be tangential attention to bi-polar disorder (“manic depression”), the emphasis will be on unipolar depression. The course will conclude with an in-depth exploration of the rise of pharmaceutical treatments.

HSTY 246. People and the Land in Pre-Modern Europe. 3 Units.
This course explores the relationship between the peoples of Europe and their environments as Europe changed from a backwater of the Roman Empire into the seat of a number of globe-spanning empires. It examines how Europeans changed the land over time in order to derive a subsistence, produce profit, and, later, to fuel the growth and power of early modern state. The course will delve into the ways that Europeans thought about nature and conceived of their place in it. It will also explore how the environment itself influenced the courses of European societies; how climate and disease, animals and energy sources affected population growth, industrial activity, and even legal systems. As European powers sent their conquerors and colonists across the globe, they carried with them a tradition of thinking about, and interacting with, the environment in ways that had dramatic consequences for the world beyond Europe, and this course investigates whence this tradition came.

HSTY 250. Issues and Methods in History. 3 Units.
A methodological introduction to historical research. Students use a variety of approaches to interpret and study historical problems. Specific topics and instructors normally vary from year to year.

HSTY 252A. Introduction to African-American Studies. 3 Units.
This course is designed to introduce students to the study of Black History, cultures, economics, and politics. Students will learn about the development of the field by exploring theoretical questions, methodological approaches, and major themes that have shaped the study of black people, primarily in the U.S. context. This is a seminar-style, discussion-based course that emphasizes critical analysis and expository writing. Offered as ETHS 252A and HSTY 252A.

HSTY 254. The Holocaust. 3 Units.
This class seeks to answer fundamental questions about the Holocaust: the German-led organized mass murder of nearly six million Jews and millions of other ethnic and religious minorities. It will investigate the origins and development of racism in modern European society, the manifestations of that racism, and responses to persecution. An additional focus of the course will be comparisons between different groups, different countries, and different phases during the Nazi era. Offered as HSTY 254, RLGN 254, ETHS 254, and JDST 254.

HSTY 255. Economic History of the United States. 3 Units.
The growth of the American economy from the colonial period to the present. Competing explanations of economic growth; significant attention to the political and legal environment in which the U.S. economy developed; “lessons” of past experience for contemporary policy; some attention to inequality and the changing distribution of wealth and income. Offered as ECON 255 and HSTY 255.

HSTY 256. American Political History. 3 Units.
From the origins of American politics in the colonial period to the present. The Revolution and Constitutional debate; presidential politics and leadership; voters and voting patterns; Congress and the courts. Emphasis both on the ideas that animated American politics and on the relation of politics to society.

HSTY 257. Immigrants in America. 3 Units.
Immigration to America has constantly reshaped the way the nation views itself. This course examines the overall history of immigration to the United States, but places that movement within a global context. It also pays particular attention to the roles that policy and technology have played in controlling or defining immigration to America.
HSTY 259. Introduction to Latina/o Studies. 3 Units.
Interdisciplinary introduction to the basis for a Latina/o ethnicity through an exploration of commonalities and differences in the peoples of Latin American and Caribbean origin within the continental United States. Topics include methodological and theoretical formulations central to the field (e.g., racial, gender, and sexual formations, modes and relations of production and class, nation and transnation), history and contemporary issues of identity, family, community, immigration, and the potential for a pan-ethnic identity. Discussions will focus on major demographic, social, economic and political trends: historical roots of Latinas/os in the U.S.; the evolution of Latina/o ethnicity and identity; immigration and the formation of Latina/o communities; schooling and language usage; tendencies and determinants of socioeconomic and labor force status; discrimination, segregation and bias in contemporary America; racial and gender relations; and political behavior among Latinas/os. Offered as: ETHS 252B and HSTY 259.

HSTY 260. U.S. Slavery and Emancipation. 3 Units.
Begin with the African encounter with Europeans during the emergence of the modern slave trade. Students are introduced to the documents and secondary literature on the creation and maintenance of slavery, first in colonial America, and then in the United States. The course concludes with the destruction of slavery. Offered as ETHS 260 and HSTY 260.

HSTY 261. African-American History 1865-1945. 3 Units.
Explores the fashioning of a modern African-American culture between emancipation and the end of World War II. Emergence of a northernbased leadership, the challenge of segregation, emergence of bourgeois culture, the fashioning of racial consciousness and black nationalism, the shift from a primarily southern and rural population to one increasingly northern and urban, the creation and contours of a modern African-American culture, the construction of racial/gender and racial/class consciousness. Offered as ETHS 261 and HSTY 261.

HSTY 262. African-American History Since 1945. 3 Units.
Completes the three-term sequence of the African-American history survey (although the first two courses are not prerequisites for this course). Explores some of the key events and developments shaping African-American social, political, and cultural history since 1945. Offered as HSTY 262 and ETHS 262.

HSTY 270. Introduction to Gender Studies. 3 Units.
This course introduces women and men students to the methods and concepts of gender studies, women’s studies, and feminist theory. An interdisciplinary course, it covers approaches used in literary criticism, history, philosophy, political science, sociology, anthropology, psychology, film studies, cultural studies, art history, and religion. It is the required introductory course for students taking the women’s and gender studies major. Offered as ENGL 270, HSTY 270, PHIL 270, RLGN 270, SOCI 201, and WGST 201. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

HSTY 272. Sports in America: From Play to Profit. 3 Units.
This course reviews the history of sports in America from the colonial period to the present. It gives particular attention to the evolution of sports as a major business and to the roles of gender, ethnicity, and race in the history of America sport, as well as to the emergence of sport as a major defining characteristic of America life and society.

HSTY 278. Nineteenth-Century Europe. 3 Units.
This course examines the history of Europe during the so-called long nineteenth century, lasting from the French Revolution, which signaled the end of the Old Order, through World War I, which led to the end of the European primacy in the world. Major themes include decline of aristocratic hegemony, the emergence of new ideologies (especially nationalism, liberalism, and socialism), the rise of the bourgeoisie, culture in Europe’s golden age, and increasing national rivalry and competition.

HSTY 280. History of Modern Mexico. 3 Units.
This course explores the major issues that have influenced the formation of modern Mexico. This class is organized around three major themes. First, we will examine Mexican identity formation and its political implications. Second, we will assess Mexican life in relation to the development of the Mexican economy. Finally, we will survey how elite and popular forms of violence have affected Mexican society. Throughout the course, we will discuss the significance of the colonial heritage, regional distinctions, racial and gender stratification, and the creation and reconfiguration of various types of borders. Offered as HSTY 280 and ETHS 280.

HSTY 285. Modern Japan. 3 Units.
This course introduces students to the many changes that characterize the social, political, economic, and intellectual history of modern Japan from the mid-19th century to the present. We discuss to what extent the Meiji state was built upon Japan’s “traditional” heritage, how modernization and Western influence were implemented in and perceived by society, and which factors led the government to adopt extreme imperialist and militarist policies in the early 20th century. Looking at the emergence of a new Japan after World War II, we focus on employment structures, mass culture, urbanization, gender roles, and social patterns in order to understand the transformation of modern Japanese society.

HSTY 287. State, War, Drugs, and Coffee in Colombia: History of Modern Colombia. 3 Units.
This course will analyze the major forces that have shaped Colombian history from the 19th century to the present. Colombia is one of the largest and most fascinating countries in Latin America. It has been intricately linked to the U.S. market as a major coffee producer and, more recently, as a major supplier of illicit drugs. Colombia has always been one of the wealthiest Latin American countries, and it has a high degree of electoral democracy. Paradoxically, however, Colombia has also experienced rather high levels of regionalism and political violence. This course seeks to explore the history of these paradoxes. It will situate Colombia’s contemporary conflicts within a larger historical perspective. Offered as ETHS 287 and HSTY 287.
HSTY 288. Imperial China: The Great Qing. 3 Units.
This course is an introduction to the history of Imperial China, from the fall of the Ming Dynasty in 1644 to the creation of the Chinese republic in 1912. We will explore the major historical transformations (political, economic, social, and cultural) of the last imperial dynasty, the Qing (1644-1911), and develop an understanding of the major social, political, economic, and intellectual cultural forces shaping the formation of modern China. Contrary to commonly-held ideas in both West and in China that traditional Chinese society was timeless or stagnant, historians now see dramatic and significant changes during this period—to the economy, to gender relations, to religion, and to many other aspects of life. This course surveys the social, political, economic, and cultural history of this era, with emphasis on recent research. The main goals of the course will be to acquaint students with the key changes and to show the interplay between economic, social, and cultural changes on the one hand and political developments on the other. By the end of the semester you should have a good sense of how Chinese society was transformed over the course of the 17th through early 20th centuries. The topics we will discuss include urbanization and commerce; gender, family and kinship; education and the examination system; opium and free trade; and ethnicity and nationalism. Offered as ASIA 288 and HSTY 288.

HSTY 289. History of Twentieth Century China. 3 Units.
Completes a two-term sequence of the Chinese history survey, although HSTY 288 is not a prerequisite for this course. Beginning with the First Sino-Japanese War (1895), we review the historical development of intellectual discourse, public reaction, and political protest in later Imperial China through the creation of the People’s Republic in 1949 forward to contemporary times. In contrast to the conventional description of China from a Western point of view, this course tries to explain the emergence of modern China in the context of its intellectual, political, and socio-economic transformation as experienced by Chinese in the late 19th and into the 20th century. By discussing the influence of the West, domestic rebellions, and political radicalism, we examine how the Chinese state and society interacted in search for modernization and reforms, how these reforms were continued during the Republican period, and to what extent historical patterns can be identified in China’s present-day development. Offered as ASIA 289 and HSTY 289.

HSTY 292. Energy and Environment in American History 1750-2010. 3 Units.
This course uses the prism of energy to examine the history of the United States from the colonial period to the present. We will consider how energy has affected, and is affected by, American society, culture, science and technology, politics, diplomacy, and the environment. Four broad, thematic questions will recur throughout the semester. First, how has increasing energy use transformed American social life, the economy, and politics? Second, what are the relationships between energy consumption and environmental change? Third, what are the relationships between scientific discoveries, technological innovation and social change? And finally, how did the United States grow to be the largest consumer of energy in the history of the world? Addressing these questions will reveal the fundamental ways in which energy has shaped American history.

HSTY 293. History of Drugs. 3 Units.
This course will survey the rise and political, social, and cultural effects of drugs in modern societies with an emphasis on the late 19th and 20th century United States. First we will examine the global emergence and popularization of drugs as part of what David Courtwright has coined the “psychoactive revolution.” Then, we will narrow this broad lens by shifting our gaze to narcotics in the expanding U.S. nation. Specifically, we will examine the shifting demographics, nature of, and debates regarding narcotic consumption, regulation, and policy—and how these disparately affect and shape the lives of diverse populations. Finally, we will explore the human toll of narcotics in post-World War II culture and cities.

HSTY 298. Departmental Seminar. 3 Units.
The Department of History Departmental Seminar. A topical course, emphasizing disciplinary forms of writing, it is recommended for students before the end of their junior years. The class will advance the goals of SAGES within the disciplinary context of history by focusing on close readings of texts, analytical writing, and intensive seminar-style classroom discussions.

HSTY 299. Topics in History. 3 Units.
Subject matter will vary with instructor but will focus on some particular topic or historical approach. Course description available from departmental office.

HSTY 302. Ancient Greece: Archaic, Classical, and Hellenistic Periods. 3 Units.
The rise of Hellenic thought and institutions from the eighth to the third centuries B.C., the rise of the polis, the evolution of democracy at Athens, the crises of the Persian and Peloponnesian Wars, fifth-century historiography, the growth of individualism, and the revival of monarchy in the Hellenistic period. Offered as CLSC 302 and HSTY 302.

HSTY 303. History of the Early Church: First Through Fourth Centuries. 3 Units.
Explores the development of the diverse traditions of Christianity in the Roman Empire from the first through the fourth centuries C.E. A variety of New Testament and extra-Biblical sources are examined in translation. Emphasis is placed on the place of Christianity in the larger Roman society, and the variety of early Christian ideals of salvation, the Church, and Church leadership. Offered as HSTY 303 and RLGN 373.

HSTY 304. Ancient Rome: Republic and Empire. 3 Units.
Growth and development of the Roman state from the unification of Italy in the early third century B.C. to the establishment of the oriental despotism under Diocletian and Constantine. The growth of empire in the Punic Wars, the uncertain steps toward an eastern hegemony, the crisis in the Republic from the Gracchi to Caesar, the new regime of Augustus, the transformation of the leadership class in the early Empire, and the increasing dominance of the military over the civil structure. Offered as CLSC 304 and HSTY 304.

HSTY 306. History of Museums: Theory and Reality. 3 Units.
This course is an intensive summer internship (10 hours per week) at the Western Reserve Historical Society, complemented by extensive readings in museum/archival theory and public historical perception. It is designed both to introduce students to museum/archival work and to compare theoretical concepts with actual museum situations. Interns will be assigned a specific project within one of the Society’s curatorial or administrative divisions, but will have the opportunity to work on ancillary tasks throughout the Historical Society’s headquarters in University Circle. Offered as HSTY 306 and HSTY 406.
HSTY 307. Development of Chemistry and Chemical Engineering. 3 Units.
The development of chemical ideas; theories of matter, composition, structure, and reaction; the application of chemistry and chemical theory from antiquity to the 20th century; all considered in social context.

HSTY 309. Reformation Europe, 1500-1650. 3 Units.
Origins and development of Protestantism, the Catholic Counter-Reformation, and the interaction between secular power and religious identity in Christian Europe. Offered as HSTY 309 and RLGN 374.

HSTY 310. The French Revolutionary Era. 3 Units.
Causes, progress, and results of the internal transformation of France from 1789 to 1815; impact of revolutionary ideas on other European and non-European societies.

HSTY 311. Seminar: Modern American Historiography. 3 Units.
This seminar examines the approaches that professional historians of the United States have taken to the writing of American history in the past fifty years, with emphasis on changes in historical concerns, master debates among historians, and contemporary interests. Topics covered include national politics and government, economic development, social history, the history of ethnicity, race, and gender, and foreign policy and international relations. Each student will read widely and will prepare a series of reports on selected books and authors. Offered as HSTY 311 and HSTY 411.

HSTY 315. Heresy and Dissidence in the Middle Ages. 3 Units.
Survey of heretical individuals and groups in Western Europe from 500-1500 A.D., focusing on popular rather than academic heresies. The development of intolerance in medieval society and the problems of doing history from hostile sources will also be explored. Offered as HSTY 315 and RLGN 315.

HSTY 318. History of Black Women in the U.S.. 3 Units.
Chronologically arranged around specific issues in black women's history organizations, participation in community and political movements, labor experiences, and expressive culture. The course will use a variety of materials, including autobiography, literature, music, and film. Offered as ETHS 318, HSTY 318, and WGST 318.

HSTY 319. The Crusades. 3 Units.
This course is a survey of the history of the idea of "crusade," the expeditions of Western Europeans to the East known as crusades, the Muslim and Eastern Christian cultures against which these movements were directed, as well as the culture of the Latin East and other consequences of these crusades. Offered as HSTY 319 and RLGN 319.

HSTY 320. Departmental Seminar: Alexander the Great. 3 Units.
This course is the Classics Departmental Seminar in the SAGES sequence, though it can also be taken for regular credit in Classics or History. The seminar on Alexander the Great is normally taken in the Spring semester of junior year, and offers students a firm grounding in the diverse materials, methods, and approaches that can be brought to bear on the study of Greco-Roman antiquity and of its legacy up to today. Alexander's career is urgently relevant today for two primary reasons: the establishment of new forms of interaction between European"western" and Asian"eastern" civilizations; and the idea of global domination, wedding Greek and Asian as well as African (Egyptian) conceptions of rule and governance. Beyond the exploration of the ancient world of, or shaped by, Alexander, we will focus also on the reception of the historical figure, i.e., on the sometimes fantastic image of Alexander diffused in later epochs (Islamic, medieval) as well as on the more critical but often ideologically slanted early modern approach. Because of the expansion of the scope of the seminar (as of Alexander himself) beyond Europe and the critical examination of the traditional separation of East and West--or the three continents (Europe, Africa, and Asia) distinguished in antiquity--this course qualifies as a Global and Cultural Diversity course. Offered as CLSC 320 and HSTY 320.

HSTY 325. U.S. Politics, Culture, and Society: 1790-1860. 3 Units.
This is a survey of the history of the United States during the years between the Revolutionary era and the Civil War, exploring the transformation of American politics, religion, and culture, as well as the emergence of distinctive regional economies and social systems in the South, the Midwest, and the Northeast. It focuses especially on the emergence of the social institutions, patterns, and conflicts that still characterize the United States during the early twenty-first century. Particular attention is also paid to the experience of women and African Americans.

HSTY 327. Comparative Environmental History. 3 Units.
Environmental history is the study of how humans have influenced the environments around them and how the environment itself has influenced the course of human societies. This course provides students with the skill to identify and analyze these interactions. It introduces course participants to the main themes of environmental history literature and the driving questions guiding environmental history research by examining case studies drawn around the globe, including Pre-Columbian America, Medieval Japan, Colonial Africa, and Modern Germany. This course will help course participants recognize the important patterns and developments that have led to present day human-environmental relationships. Offered as HSTY 327 and HSTY 427.
HSTY 328. Comparative Perspectives on Museum and Archive History and Practice. 3 Units.
Comparative Perspectives on Archives and Museum History and Practice is a distance learning based course shared with students at Bilkent University in Ankara, Turkey. The course focuses on a comparison of the history and development of archives and museums in the United States and in late Ottoman and Republican Turkey. Topics considered include the "ownership" of culture; state vs. private control of heritage; marketing of museums; and the impact of evolving technologies on the presentation and preservation of culture. Students work together via a shared, live lecture format. In addition to the instructor, museum and archive professionals from both the US and Turkey provide lectures and lead discussions during the semester. The primary intellectual product of the course is a final paper/project which compares the history, operational structure, and mission of a museum/archive in the US with a similar institution in Turkey. The paper/project is created by collaborative effort between a student at CWRU and one at Bilkent. Provided grant funding is available, the course may involve exchange visits to Turkey and the US. Offered as HSTY 328 and HSTY 428.

HSTY 329. Museums and Globalization. 3 Units.
Museums are everywhere contested spaces today. Historically designed as symbols of power, centers for research, agents of public education and community formation in Western industrial societies, they have become sites of development and cultural controversy on a global scale. From Cleveland and Paris to Nairobi and Dubai museums figure in urban redevelopment, national identity formation, conflicts between religion and science, and global tourism. Questions we will consider in this course: what are the fundamental features of museums as institutions? what ties have linked them to wider national and international communities of academics, NGO’s and business? to political, economic and social concerns? how do museums in Asia, Africa the Middle East and Latin America figure in the current international contention over heritage rights? This is an innovative course allowing students to collaborate on projects, engage with guest lecturers and access museums across the globe. The course is organized in three parts: Part I: National Identity Building and Museums; Part II: Museums and Identity Politics; Part III: Museums and Global Development. Offered as HSTY 329, ARTH 301, HSTY 429, and ARTH 401.

HSTY 330. European Diplomacy in the Age of Nationalism: 1789-1945. 3 Units.
Presents a broad interpretation of the development of the international system in Europe between the French Revolution of 1789 and the end of the European era in 1945. It explains why and how the closed European state system at the beginning of the nineteenth century evolved into an international transcontinental system by the early twentieth century. Approved SAGES Departmental Seminar.

HSTY 333. Reading Capital: Political Economy in the Age of Modern Industry. 3 Units.
Since its first publication in German in 1867, and its appearance in English in 1886, Karl Marx’s Capital: A Critique of Political Economy, Volume I, has occupied a seminal position in European thought. Beginning with the presumptions of classical liberal political economy, Marx employed his technique of the materialist dialectic to unmask, in his view, the contradictions and structural limitations that the capitalist mode of production imposed upon capitalists and proletarians alike. Much mentioned, but seldom read, Volume I of Capital remains a crucial window into understanding the intellectual, economic, social, and cultural currents of the 19th century, and its impact extends into the 21st . This course consists of a close, directed reading of the entire text of this volume, combined with discussion, research, and coordinated exploration, so that students can bring this powerful critique to bear on their reading of history and economics in the modern era.

HSTY 334. History of 19th Century Germany. 3 Units.
Examines the political, social, economic, and cultural history of Germany from the late eighteenth century to 1914. Explores the intellectual and social background to the rise of German liberalism and nationalism, the struggle with bureaucratic absolutism, the revolutions of 1848, industrial capitalism and the emergence of a class society, unification under Bismarck, the role of the state, culture, religion, and changes of mentality, the development of mass politics, and the coming of World War I.

HSTY 335. History of 20th Century Germany. 3 Units.
Examines the tumultuous history of Germany from 1914 to the unification of the two Germany’s in 1989-1990. From the totalizing and traumatic experience of World War I, through a failed revolution, the republican experiment of Weimar, the National Socialist dictatorship under Hitler and the divided Germany suspended between the superpowers, to the newly unified democratic Federal Republic. Examines the ways in which Germans have tried to reconcile the state to their society, economy, and individual lives.

HSTY 336. The Struggle for Justice in Latin America. 3 Units.
This course looks at how indigenous peoples, women, students, workers, peasants, and Afro-Latin Americans struggled for justice in Latin America. It will study how notions of justice have changed from colonial times to the present. It will also examine how different sectors of Latin American society understood the meaning of justice and how that understanding evolved through time. This class seeks to familiarize students with the history of the idea of justice in Latin America. At the end of this course students will understand the complex intellectual and political differences behind Latin America’s apparent chaotic and tumultuous political history. Second, it seeks to develop students’ critical thinking by examining how an abstract term, such as justice, changes across time and space. Offered as ETHS 336 and HSTY 336.
HSTY 338. History of the American West. 3 Units.
The U.S. West has meant many things throughout American history--early explorers called it the Great American Desert, railroad boosters lured settlers to it by promising to make the arid land bloom into an agricultural Eden, urban immigrants looked to its limitless stretches of land as an escape from industrial labor, children read dime novels that glorified its heroes, and millions of tourists celebrate its raw beauty by visiting Yellowstone, Yosemite, and the Grand Canyon. The West has also been home diverse native societies for thousands of years, Asian immigrants who viewed it as an eastern frontier, women who struggled to feed their children in an arid land, and Latin Americans, whose ancestors often preceded the entry of White Americans. This course introduces students to the themes, questions, and debates central to the study of the American west by drawing in primary source material and scholarly interpretations. The goal of this course is to provide students with an understanding of the human history of the American west and the ability to express that history in clear, passionate writing and in-class discussion.

HSTY 339. The Origins of the Arab-Israeli Conflict, 1900-1948. 3 Units.
The British Empire took control of Palestine after driving the Germans and Turks from the region near the end of World War I. From that moment on, the British had an increasingly difficult time administering the region. Jewish colonists had already been settling in the land for decades, and with their takeover, the British gave them and other Zionists reason to believe that the Empire would facilitate Jewish efforts. At the same time, the indigenous Arabs of Palestine appealed to the British to protect their very birthright, to keep their country from passing into someone else’s hands. The British gave Arabs, too, reason to believe that they would recognize and defend their claims. In the few decades that the British Mandate governed Palestine it oversaw riots, revolution, and terrorist bombings. When it withdrew from Palestine, its legacy was a brutal war between Arabs and Jews; and the legacy of that war holds an iron grip on the course of world history to this day. Had the British Empire not been in Palestine, and not made the fateful decisions that it did, there would be no Israel and no Arab-Israeli conflict as we know them. Course materials include histories of Zionism, pre-Zionist Palestine, the British Mandate years, the British Empire in other Arab lands, and the 1948 war and aftermath. Primary sources from the perspective British officials on the ground in Palestine receive much attention. The histories of engineering and agriculture are highlighted alongside traditional social and political perspectives.

HSTY 340. A History of Workers in the United States. 3 Units.
This course examines the experience of working people in the United States with an emphasis on twentieth-century social movements. It explores the lives of the women and men, skilled and unskilled, and rural and urban laborers that produce the goods and provide the services that society consumes. At crucial moments, working people have created or helped sustain national social movements in an effort to improve some aspect of their lives. We therefore will assess laborers in relation to several known and less known American social movements, such as the eight-hour day movement during the late nineteenth century, the peace movement during WWI, and the Civil Rights movement in the wake of WWII. Throughout the course we will also discuss the politics of time-managed work; the influence of public policy and government institutions; the role of unions within a competitive market economy; the relationship between industrial economies and functional blue-collar communities; and the correlation between immigration and globalization. Offered as HSTY 340, HSTY 430, and ETHS 340.

HSTY 341. Jewish Urban History. 3 Units.
This course examines the relationship between Jews and the modern urban environment. It seeks to answer questions such as: How did the modernization of cities affect Jews and Jewish communities? In what ways did Jews contribute to modern urban cultural and social forms? What is Jewish urban space, is it unique, and how is it remembered later on? Are there differences between the patterns in Europe, the Middle East, and the Americas? Offered as HSTY 341 and JDST 341.

HSTY 342. Water. 3 Units.
This seminar will explore the history of the meaning of water--that is, the social, cultural, and/or political significance placed on water by individuals and governments in different times and places. It will also examine how humans have acted upon water, and how it has acted upon humans, with great consequences for human life. This seminar will look at the history of water in the context of science, technology and society; public health; political science; and environmental history. Case studies will be drawn from a wide chronological and geographical range; from the ancient world to Renaissance Italy, nineteenth century India, modern Britain, Egypt, and the U.S. The course provides a wide perspective on the themes of the history of human-water interactions, but will also focus closely on some critical cases. Seminar participants will write a research paper on the topic of their choice in the environmental history of water. Offered as: HSTY 342, HSTY 442, POSC 342, POSC 442.

HSTY 343. Origins of the British Empire 1450-1750. 3 Units.
How did early modern England come to rule an empire upon which the sun never set? What compelled individuals to seek their fortunes abroad, planting the flag of St. George in the outlying areas of the archipelago and halfway across the globe? This course examines the troubled birth of an empire and of a place called "Britain" at the same time. This seminar provides history majors with an experience of working with early modern primary documents of a wide variety; essays and book chapters will be paired with documents from early modern England itself. How do documents, images, and quantitative analyses help historians explain how the British Empire came into being? Offered as HSTY 344 and HSTY 444.

HSTY 344. Origins of the British Empire 1450-1750. 3 Units.
How did early modern England come to rule an empire upon which the sun never set? What compelled individuals to seek their fortunes abroad, planting the flag of St. George in the outlying areas of the archipelago and halfway across the globe? This course examines the troubled birth of an empire and of a place called "Britain" at the same time. This seminar provides history majors with an experience of working with early modern primary documents of a wide variety; essays and book chapters will be paired with documents from early modern England itself. How do documents, images, and quantitative analyses help historians explain how the British Empire came into being? Offered as HSTY 344 and HSTY 444.

HSTY 345. The European City. 3 Units.
An examination of architectural, social, cultural, philosophical, political, and economic aspects of life in European cities. The principle focus will be the transition of medieval and early modern cities to modern metropolises, both spatially and socially. An additional theme will be urban development and concomitant social questions in non-European cities that were built either to serve expatriate Europeans or to emulate European modernity. Case studies may include London, Paris, Berlin, Vienna, Moscow, the provincial and national capitals of East-Central Europe, and cities in Africa, Asia, and Latin America. Offered as HSTY 345 and HSTY 445.
HSTY 346. Guns, Germs, and Steel. 3 Units.
Jared Diamond’s Guns, Germs, and Steel won the Pulitzer for non-fiction in 1998. Diamond, a physiologist, explains that Western Europe came to occupy and dominate large areas of the globe because of natural resources present in certain regions of the Old World since the end of the last Ice Age. Where a historian might look for answers in the written evidence left by historical individuals, Diamond examines ancient patterns of plant diffusion or the place of mountain ranges and deserts in the development of technologies. This seminar is about applying the history of a specific time and place namely North America from European contact to 1850 - to Diamond’s general environmental explanations and models. Placing Diamond’s broad explanations within specific historical contexts is revealing. A range of alternative methods, perspectives, primary sources from North America, and case studies (especially within environmental history) help develop a critical understanding of the complexities of European expansion into the New World. The course engages in an extended comparative exploration of the worldviews of different world cultures, most extensively comparing European worldviews with Native American, but also paying significant attention to Asian worldviews. The Native American cultures under consideration include those of both North and South America.

HSTY 348. History of Modern Political and Social Thought. 3 Units.
This course explores the responses of philosophers, economic theorists, culture critics, and public policy makers to changes in western society wrought by industrialization by focusing on their concerns with technological change. Offered as HSTY 348, HSTY 448 and POSC 348.

HSTY 351. Colonial America 1607-1763. 3 Units.
The formative years of American society and culture. Slavery and racism, expansionism, regionalism, the family, pluralism, sense of mission, and republican ideology.

HSTY 352. The Era of the American Revolution, 1763 - 1789. 3 Units.
This is an intensive survey of the Revolutionary period of American history, from the end of the French and Indian War in 1763 to the ratification of the U.S. Constitution in 1789, focusing especially on the underlying causes of the American Revolution, the chain of events leading to the Declaration of Independence, the war with England, the Constitutional Convention, and the ratification struggle that followed, with some background on the earlier period (1607-1763).

HSTY 353. Women in American History I. 3 Units.
The images and realities of women’s social, political, and economic lives in early America. Uses primary documents and biographers to observe individuals and groups of women in relation to legal, religious, and social restrictions. Offered as HSTY 353, WGST 353, and HSTY 453.

HSTY 354. Women in American History II. 3 Units.
With HSTY 353, forms a two-semester introduction to women’s studies. The politics of suffrage and the modern woman’s efforts to balance marriage, motherhood, and career. (HSTY 353 not a prerequisite.) Offered as HSTY 354, WGST 354, and HSTY 454.

HSTY 355. Age of American Civil War 1815-80. 3 Units.
This course examines the causes and consequences of the Civil War, focusing on the rise of sectionalism, the dynamics of conflict, and reconstruction. Heavy emphasis is placed on archival research in relevant first person accounts from the period.

HSTY 359. Books as Bombs: Books that Reshaped American Culture. 3 Units.
Every now and again a piece of prose profoundly reshapes American society and culture. In this advanced undergraduate seminar, students will read and discuss a selection of such works under the tutelage of Professors Shulman, a specialist in the History of Science and Technology, and Sentilles, who specializes in social and cultural history. The professors will set up the context of the work’s publication or creation and then lead the class in a lively dissection of both the work and its impact. The main question asked of each book is “how and why did this work have such an effect?” In attempting to answer that question, students will come to a greater understanding of society that created and then responded to each work. Offered as HSTY 359 and HSTY 459.

HSTY 361. Crime and Culture in Early America. 3 Units.
This course explores the intersection of crime, punishment, and popular culture in colonial British America and the early United States through 1860 by closely examining a series of popular crime genres, including execution sermons, criminal conversion narratives, criminal autobiographies, and trial reports. Readings in modern scholarship—drawing on several disciplines—will shed light on the popular literature and on underlying patterns of crime and punishment, while students will critically evaluate modern scholarly interpretations in light of the early crime publications. Types of crimes explored in the readings include witchcraft, piracy, burglary, robbery, and various types of murder, such as infanticide, familicide (cases of men murdering their wives and children), and sexual homicide. Each student will write several short analytical papers drawn from the shared readings and, at the end of the semester, produce an independent research paper. Offered as HSTY 361 and HSTY 461.

HSTY 363. Gender in America. 3 Units.
Gender is the term used to describe the social characteristics attributed to the different sexes by the larger contextual society. This social and cultural history seminar allows students to explore various constructions of masculine and feminine identity in America between the late 18th century and the end of the 20th century. This is a multicultural course using a mixture of historical texts, gender theory, and personal biography to explore changing notions of gender (and with it sexuality, race, and religion) over time in the United States. Offered as HSTY 363, HSTY 463 and WGST 363.

HSTY 366. Science, Technology, and Government. 3 Units.
Traces the development and influence of federal technology and science policies from colonial times to the present, with emphasis on the 20th century. Offered as HSTY 366 and POSC 365.

HSTY 371. Jews under Islam and Christianity. 3 Units.
This course examines the social and political status of Jews under Muslim and Christian rule since the Middle Ages. Themes include interfaith relations, Islamic and Christian beliefs regarding the Jews, Muslim and Christian regulation of Jewry, and the Jewish response. Offered as HSTY 371, JDST 371 and RLGN 371.
HSTY 373. Advanced Topics in American Women’s History. 3 Units.
This advanced seminar is designed to allow students to investigate aspects of American women’s history that are not deeply explored in other courses. The two central purposes of the course are to move students forward in their study of American women’s history and to provide advanced study for graduate students and other students interested in women-focused topics. The topic is subject to change, but may be any of the following or something similar: women and medicine, images of women in popular culture, growing up female, women and political movements, women and war, etc. Recommended preparation: HSTY 353/453 or HSTY 354/454. Offered as HSTY 373, WGST 373, and HSTY 473.

HSTY 375. Advance Readings in Latin American History. 3 Units.
This course will introduce graduate students and upper level undergraduates to the most important debates in the field of Latin American History. It will provide an overview of the evolution of the (English language) historical literature on Latin America during the past three decades. It will also help students with a field in Latin American history prepare for their comprehensive examinations. The course readings have been chosen thematically and chronologically. Student will critically engage a group of monographs that stand out for their historiographical and methodological value and that will help illuminate the discussions and approaches that guide research in this field. Offered as HSTY 375 and HSTY 475.

HSTY 376. North American Environmental History. 3 Units.
This course introduces major questions and approaches in the study of environmental history. Taking North American as our subject, we explore how humans have shaped the environment of the continent and how human history has, in turn been shaped by the natural world form antiquity to the present. Major topics include Pleistocene extinctions, the Columbian exchange, the market revolution in agriculture, American epidemics, industrialization, the origins of conservation, the environmental movement, and the globalization of America’s environmental footprint. Offered as: HSTY 378 and HSTY 463.

HSTY 378. The Sixties in America. 3 Units.
This course examines social, cultural, and political changes in the United States during the 1960s. We begin by examining the economic prosperity and "fragile" political consensus of the post-WWII period, as well as the undercurrent of poverty, dissent, and Cold War fears. We then cover the civil rights movement, student activism, the women’s movement, the growth of Liberal America and the welfare state, the Vietnam War, the counterculture and conservative youth movements, the growth of a national consumer-driven, mass-mediated market, and the music, art, and pop culture—as well as their growing reliance on technological intervention—during this period of creative efflorescence. We will do this through reading books, but also through "reading" contemporary evidence of life in America, including listening to music, viewing films, analyzing pictures and artifacts.

HSTY 379. City as Classroom. 3 Units.
In this course, the city is the classroom. We will engage with the urban terrain. We will meet weekly off-campus, interact with community members, and interface--both literally and figuratively--with the city as a way to examine the linkages between historical, conceptual, and contemporary issues, with particular attention paid to race and class dynamics, inequality, and social justice. This course will have four intersecting components, primarily focusing on American cities since the 1930s: the social and physical construction of urban space, the built environment, life and culture in the city, and social movements and grassroots struggles. Offered as HSTY 381, POSC 381, SOCI 381, HSTY 481, POSC 481, and SOCI 481.

HSTY 380. The Sixties in America: 1607 - 2000. 3 Units.
The primary goal of this course is to provide students an opportunity to explore at greater length specific topics in Chinese social and cultural history. The period covered by the assigned readings roughly spans the late eighteenth century through the first half of the twentieth century. Readings will cover a wide range of topical themes, including childhood, gender and sexuality, urban life, print media, religion, and the environment. Offered as HSTY 385 and HSTY 485.

HSTY 381. City as Classroom. 3 Units.
This course examines the historiography of several key issues in the history of the People’s Republic of China. Although the emphasis will be to explore at greater length and greater detail specific topics in post-1949 Chinese social, cultural, and political history, some topics will incorporate key historiographic works addressing the pre-1949 period as a point of comparison. We will explore the major historical transformations that led to a political break from China’s imperial past, and we will examine both the continuities and discontinuities shaping China’s experience as a modern nation during the latter half of the 20th century. Major themes covered include: the origins of the Chinese revolution, the Great Leap Forward, Cultural Revolution, rural-urban divide, the one-child policy, socialism with Chinese characteristics, et al.

HSTY 385. Readings in Society and Culture in Modern Chinese History. 3 Units.
The primary goal of this course is to provide students an opportunity to explore at greater length specific topics in Chinese social and cultural history. The period covered by the assigned readings roughly spans the late eighteenth century through the first half of the twentieth century. Readings will cover a wide range of topical themes, including childhood, gender and sexuality, urban life, print media, religion, and the environment. Offered as HSTY 385 and HSTY 485.

HSTY 387. Growing Up in America: 1607 - 2000. 3 Units.
Children have been growing up in the United States since it was declared independent, in 1776, but how adults conceive of (and therefore legislate and interpret) children and childhood constantly changes to fit current circumstances. The experiences of children themselves have varied not only in terms of race, class, gender, and religion but also depending on specific events (i.e., coming of age during the Civil War versus the Civil Rights movement) or geography (i.e., growing up in rural Hawaii vs. urban New Jersey). We cannot cover all of those histories in one course, so this seminar course instead focuses on exploring the interplay of ideas about children and the expressed or historical experiences of children. When the puritans and plantations members (slave, bonded and free) came to the Atlantic shore, they brought with them particular ideas about what is meant to be a child, and to experience childhood. They encountered already established residents who also had ideas about childhood. How did those concepts adjust/meld/contrast over time, and how do we see those ideas reflected or reshaped by actual experiences? This course engages particular lines of inquiry: How and why do we understand about what is “natural” for children change over time? How do variables like race, class, gender, etc., uphold the manifestation of such concepts? What is the role of the state in children’s lives and how has that changed over time? What is the impact of mass culture on modern childhood?
HSTY 388. The United States in the World. 3 Units.
Traditional accounts of American history usually stay within the geographical boundaries of the modern United States. Recent historical research, however, has found that many well-known events of the past, from the Revolution to Progressive Era social reforms to the environmental movement, make more sense when examined from a global perspective. Through approaches variously known as "transnational history," "International history," "global history," and "borderlands history," historians have come to redefine the United States' role in the world. This course offers an introduction to this literature. Motivating questions range over time and topic: How were the Americans a product of Early Modern globalization? Was (or is) the United States an empire? How has the meaning of this term changed over time? What role have racial issues played in American involvement overseas as well as at home? How have the global flows of commodities shaped economic development? How was the American Civil War actually a global event? How was domestic social policy shaped by the exchange of ideas across the globe? How did American ideas about political rights and the consumer economy become globalized? How did Americans use new forms of media technologies to interpret and affect people from other parts of the world? This is not a course in the history of American diplomacy (though diplomacy will often come up), nor is it a history of American warfare abroad (though war, too, will often come up as well). Instead, it is a broad, thematic survey of the ways that American ideas, institutions, and people have shaped—and been shaped by—the rest of the world. Primary emphasis is placed on reading and discussing recent historical work: books and articles, but also essays, fiction, and visual art as well.

HSTY 389. History of Zionism. 3 Units.
This course seeks to elucidate the major strands of Zionism, their origins, how they have interacted, and their impact on contemporary Israeli society. These may include political Zionism, cultural Zionism, socialist (labor) Zionism, Revisionist Zionism, and religious Zionism. This course will also examine the differences in the appeal of Zionism to Jews in different places, such as Western Europe, Eastern Europe and the United States. Offered as HSTY 389 and JDST 389.

HSTY 390. Senior Research Seminars in History and Philosophy of Science. 3 Units.
Directed independent research seminar for seniors who are majors in the History and Philosophy of Science program. The goal of the course is to develop and demonstrate command of B.A.-level factual content, methodologies, research strategies, historiography, and theory relevant to the field of history of science and/or philosophy of science. The course includes both written and oral components. Offered as HSTY 380 and PHIL 390.

HSTY 391. Food in History. 3 Units.
Food is inextricably interconnected with the development of agriculture and other technologies, with the rise and fall of empires, with increasing understanding of diet and nutrition, with laws and regulations, with the arts, with economic development and consumer culture, and with religious and ethnic identities. By examining selective and representative episodes pertaining to each of these topics, this course explores the global history of food, from the agricultural revolution of the neolithic era to the consumer revolution of the last generation. Offered as HSTY 391 and HSTY 491.

HSTY 393. Advanced Readings in the History of Race. 3 Units.
This course examines the concept of race as a social construction that carries political and economic implications. We begin by examining the histories of the early racial taxonomists (e.g., Bernier, Linnaeus, and Blumenbach among others) and the contexts that informed their writings. We then assess how the concept of race changed from the nineteenth to the twentieth century in the United States. We conclude by evaluating how the ideology of race has influenced U.S. domestic life and foreign policy at specific historical moments. Offered as HSTY 393, HSTY 493, and ETHS 393.

HSTY 394. Seminar in Evolutionary Biology. 3 Units.
This seminar investigates 20th-century evolutionary theory, especially the Modern Evolutionary synthesis and subsequent expansions of and challenges to that synthesis. The course encompasses the multidisciplinary nature of the science of evolution, demonstrating how disciplinary background influences practitioners' conceptualizations of pattern and process. This course emphasizes practical writing and research skills, including formulation of testable theses, grant proposal techniques, and the implementation of original research using the facilities on campus and at the Cleveland Museum of Natural History. Offered as ANTH 394, BIOL 394, EEPS 394, HSTY 394, PHIL 394, ANTH 494, BIOL 494, EEPS 494, HSTY 494, and PHIL 494.

HSTY 395. History of Medicine. 3 Units.
This course treats selected topics in the history of medicine, with an emphasis on social and cultural history. Focusing on the modern period, we examine illnesses, patients, and healers, with attention to the ways sickness and medicine touch larger questions of politics, social relations and identity. Offered as HSTY 395 and HSTY 495.

HSTY 396. Advanced Topics in History. 3 Units.
Advanced topics in history, changing from semester to semester. The course provides students an opportunity to explore special themes or theoretical issues in history that are too briefly covered in broader surveys. Students may take this course more than once for credit, when different topics are covered. Offered as HSTY 396 and HSTY 496.

HSTY 397. Undergraduate Tutorial. 1 - 3 Unit.
Individual instruction with members of the history faculty. Recommended preparation: 12 hours of History.

HSTY 398. Senior Research Seminar. 3 Units.
Training in the nature and methods of historical writing and research. Prereq: Majors only, Senior standing.

HSTY 399. Advanced Readings in Black History. 3 Units.
This is an advanced readings course that may change from semester to semester. This course will provide students with an opportunity to more deeply explore special themes and theoretical issues in the field of black history that are often quickly and briefly covered in broad survey courses. Readings may be organized around specific topics such as resistance and social protest, black intellectual history, black nationalism and identity, black film and historical literacy black cultural forms and politics, black urban history, or some such other combination. Students may take this course more than once and receive credit as long as the course topic differs. Students should contact the History Department for more details on course content during any given semester. Offered as ETHS 391, HSTY 399 and HSTY 499.
HSTY 400. Graduate Topical Seminar. 3 Units.
A rotating graduate seminar, offered every semester by a different faculty member. Each semester focuses on a topic of central historiographical or methodological importance. Prereq: Graduate standing or instructor permission.

HSTY 402. Introduction to Historiography of Science. 3 Units.
A graduate-level historiographic review of the history of the sciences from the seventeenth century to the present. Prereq: Graduate standing or instructor permission.

HSTY 404. Introduction to the Nonprofit Sector. 3 Units.
The United States has by far the largest and most important "nonprofit sector" in the world, a sector consisting of voluntary non-governmental organizations that provide health care, education and social services as well as arts, religious, and advocacy activities. Using mostly primary sources, this course considers the significance of the nonprofit sector in the U.S., its advantages and disadvantages, its uses for different groups of Americans, and current trends. Students have the option of writing either a standard term paper, or a study of strategic challenges facing a contemporary nonprofit organization. Offered as HSTY 204 and HSTY 404. Prereq: Graduate standing or instructor permission.

HSTY 406. History of Museums: Theory and Reality. 3 Units.
This course is an intensive summer internship (10 hours per week) at the Western Reserve Historical Society, complemented by extensive readings in museum/archival theory and public historical perception. It is designed both to introduce students to museum/archival work and to compare theoretical concepts with actual museum situations. Interns will be assigned a specific project within one of the Society's curatorial or administrative divisions, but will have the opportunity to work on ancillary tasks throughout the Historical Society's headquarters in University Circle. Offered as HSTY 306 and HSTY 406. Prereq: Graduate standing or instructor permission.

HSTY 410. Seminar: Early American Historiography. 3 Units.
This seminar examines the historiography of early America. It is designed to acquaint history doctoral students with the major themes, methods, and scholars of American history from the seventeenth century to the mid-nineteenth century. Students will be expected to read and report on major works in the field. Prereq: Graduate standing or instructor permission.

HSTY 411. Seminar: Modern American Historiography. 3 Units.
This seminar examines the approaches that professional historians of the United States have taken to the writing of American history in the past fifty years, with emphasis on changes in historical concerns, master debates among historians, and contemporary interests. Topics covered include national politics and government, economic development, social history, the history of ethnicity, race, and gender, and foreign policy and international relations. Each student will read widely and will prepare a series of reports on selected books and authors. Offered as HSTY 311 and HSTY 411. Prereq: Graduate standing or instructor permission.

HSTY 427. Comparative Environmental History. 3 Units.
Environmental history is the study of how humans have influenced the environments around them and how the environment itself has influenced the course of human societies. This course provides students with the skill to identify and analyze these interactions. It introduces course participants to the main themes of environmental history literature and the driving questions guiding environmental history research by examining case studies drawn around the globe, including Pre-Columbian America, Medieval Japan, Colonial Africa, and Modern Germany. This course will help course participants recognize the important patterns and developments that have led to present day human-environmental relationships. Offered as HSTY 327 and HSTY 427. Prereq: Graduate standing or instructor permission.

HSTY 428. Comparative Perspectives on Museum and Archive History and Practice. 3 Units.
Comparative Perspectives on Archives and Museum History and Practice is a distance learning based course shared with students at Bilkent University in Ankara, Turkey. The course focuses on a comparison of the history and development of archives and museums in the United States and in late Ottoman and Republican Turkey. Topics considered include the "ownership" of culture; state vs. private control of heritage; marketing of museums; and the impact of evolving technologies on the presentation and preservation of culture. Students work together via a shared, live lecture format. In addition to the instructor, museum and archive professionals from both the US and Turkey provide lectures and lead discussions during the semester. The primary intellectual product of the course is a final paper/project which compares the history, operational structure, and mission of a museum/archive in the US with a similar institution in Turkey. The paper/project is created by collaborative effort between a student at CWRU and one at Bilkent. Provided grant funding is available, the course may involve exchange visits to Turkey and the US. Offered as HSTY 328 and HSTY 428.

HSTY 429. Museums and Globalization. 3 Units.
Museums are everywhere contested spaces today. Historically designed as symbols of power, centers for research, agents of public education and community formation in Western industrial societies, they have become sites of development and cultural controversy on a global scale. From Cleveland and Paris to Nairobi and Dubai museums figure in urban redevelopment, national identity formation, conflicts between religion and science, and global tourism. Questions we will consider in this course: what are the fundamental features of museums as institutions? what ties have linked them to wider national and international communities of academics, NGO's and business? to political, economic and social concerns? how do museums in Asia, Africa the Middle East and Latin America figure in the current international contention over heritage rights? This is an innovative course allowing students to collaborate on projects, engage with guest lecturers and access museums across the globe. The course is organized in three parts: Part I: National Identity Building and Museums; Part II: Museums and Identity Politics; Part III: Museums and Global Development. Offered as HSTY 329, ARTH 301, HSTY 429, and ARTH 401. Prereq: Graduate standing or instructor permission.
HSTY 430. A History of Workers in the United States. 3 Units.
This course examines the experience of working people in the United States with an emphasis on twentieth-century social movements. It explores the lives of the women and men, skilled and unskilled, and rural and urban laborers that produce the goods and provide the services that society consumes. At crucial moments, working people have created or helped sustain national social movements in an effort to improve some aspect of their lives. We therefore will assess laborers in relation to several known and less known American social movements, such as the eight-hour day movement during the late nineteenth century, the peace movement during WWII, and the Civil Rights movement in the wake of WWII. Throughout the course we will also discuss the politics of time-managed work; the influence of public policy and government institutions; the role of unions within a competitive market economy; the relationship between industrial economies and functional blue-collar communities; and the correlation between immigration and globalization. Offered as HSTY 340, HSTY 430, and ETHS 340.

HSTY 440. Science and Society Through Literature. 3 Units.
This course will examine the interaction of scientific investigation and discovery with the society it occurred in. What is the effect of science on society and, as importantly, what is the effect of society on science? An introduction will consider the heliocentric controversy with focus on Galileo. Two broad areas, tuberculosis and the Frankenstein myth, will then be discussed covering the period 1800-present. With tuberculosis, fiction, art and music will be examined to understand the changing views of society towards the disease, how society's perception of tuberculosis victims changed, and how this influenced their treatments and research. With Frankenstein, the original novel in its historical context will be examined. Using fiction and film, the transformation of the original story into myth with different connotations and implications will be discussed. Most classes will be extensive discussions coupled with student presentations of assigned materials. Offered as PHRM 340, BETH 440, PHRM 440, and HSTY 440.

HSTY 442. Water. 3 Units.
This seminar will explore the history of the meaning of water—that is, the social, cultural, and/or political significance placed on water by individuals and governments in different times and places. It will also examine how humans have acted upon water, and how it has acted upon humans, with great consequences for human life. This seminar will look at the history of water in the context of science, technology and society; public health; political science; and environmental history. Case studies will be drawn from a wide chronological and geographical range; from the ancient world to Renaissance Italy, nineteenth century India, modern Britain, Egypt, and the U.S. The course provides a wide perspective on the themes of the history of human-water interactions, but will also focus closely on some critical cases. Seminar participants will write a research paper on the topic of their choice in the environmental history of water. Offered as: HSTY 342, HSTY 442, POSC 342, POSC 442.

HSTY 445. The European City. 3 Units.
An examination of architectural, social, cultural, philosophical, political, and economic aspects of life in European cities. The principle focus will be the transition of medieval and early modern cities to modern metropolises, both spatially and socially. An additional theme will be urban development and concomitant social questions in non-European cities that were built either to serve expatriate Europeans or to emulate European modernity. Case studies may include London, Paris, Berlin, Vienna, Moscow, the provincial and national capitals of East-Central Europe, and cities in Africa, Asia, and Latin America. Offered as HSTY 345 and HSTY 445.

HSTY 448. History of Modern Political and Social Thought. 3 Units.
This course explores the responses of philosophers, economic theorists, culture critics, and public policy makers to changes in western society wrought by industrialization by focusing on their concerns with technological change. Offered as HSTY 348, HSTY 448 and POSC 348.

HSTY 451. History of European Technology. 3 Units.
A graduate-level, research seminar on the history of European technology from the Industrial Revolution to the present. Special emphasis is on cultural history of technology with a transatlantic view. The themes of the seminar vary from year to year, but include: communications, industrialization, control, cultural and intellectual approaches to the history of technology. Required work includes a research paper based on original sources. Prereq: Graduate standing or instructor permission.

HSTY 452. Readings in the History of American Technology. 3 Units.
A graduate-level review of the history of American technology. Prereq: Graduate standing or instructor permission.

HSTY 453. Women in American History I. 3 Units.
The images and realities of women’s social, political, and economic lives in early America. Uses primary documents and biographers to observe individuals and groups of women in relation to legal, religious, and social restrictions. Offered as HSTY 353, WGST 353, and HSTY 453. Prereq: Graduate standing or instructor permission.

HSTY 454. Women in American History II. 3 Units.
With HSTY 353, forms a two-semester introduction to women’s studies. The politics of suffrage and the modern woman’s efforts to balance marriage, motherhood, and career. (HSTY 353 not a prerequisite.) Offered as HSTY 354, WGST 354, and HSTY 454. Prereq: Graduate standing or instructor permission.

HSTY 455. Books as Bombs: Books that Reshaped American Culture. 3 Units.
Every now and again a piece of prose profoundly reshapes American society and culture. In this advanced undergraduate seminar, students will read and discuss a selection of such works under the tutelage of Professors Shulman, a specialist in the History of Science and Technology, and Sentilles, who specializes in social and cultural history. The professors will set up the context of the work’s publication or creation and then lead the class in a lively dissection of both the work and its impact. The main question asked of each book is “how and why did this work have such an effect?” In attempting to answer that question, students will come to a greater understanding of society that created and then responded to each work. Offered as HSTY 359 and HSTY 459.
HSTY 473. Advanced Topics in American Women's History. 3 Units.
This advanced seminar is designed to allow students to investigate aspects of American women's history that are not deeply explored in other courses. The two central purposes of the course are to move students forward in their study of American women's history and to provide advanced study for graduate students and other students interested in women-focused topics. The topic is subject to change, but may be any of the following or something similar: women and medicine, images of women in popular culture, growing up female, women and political movements, women and war, etc. Recommended preparation: HSTY 353/453 or HSTY 354/454. Offered as HSTY 373, WGST 373, and HSTY 473. Prereq: Graduate standing or instructor permission.

HSTY 475. Advance Readings in Latin American History. 3 Units.
This course will introduce graduate students and upper level undergraduates to the most important debates in the field of Latin American History. It will provide an overview of the evolution of the (English language) historical literature on Latin America during the past three decades. It will also help students with a field in Latin American history prepare for their comprehensive examinations. The course readings have been chosen thematically and chronologically. Student will critically engage a group of monographs that stand out for their historiographical and methodological value and that will help illuminate the discussions and approaches that guide research in this field. Offered as HSTY 375 and HSTY 475.

HSTY 476. Seminar in Comparative History. 3 Units.
An introduction to comparative method for historians. The topics will vary year to year, but the course will require exposure to historical contexts outside of the United States. Prereq: Graduate standing or instructor permission.

HSTY 477. Modern Policy History of the United States. 3 Units.
This course offers a historical perspective on policy and policy making in the United States since the late nineteenth century. It emphasizes the increasing role of the federal government, the persisting importance of the states, the significance of the courts, the revolutionary impact of the women's and civil rights movements, and the consequences of the growth and transformation of the American economy. Each student selects a policy area for detailed exploration; students often choose topics related to civil rights, women's rights, health care, environmental reform, non-profit and non-governmental organizations, the arts, and education, but other topics are also appropriate. Prereq: Graduate standing or instructor permission.

HSTY 479. Historical Research and Writing. 3 Units.
Research seminar for graduate students. Intensive focus on processes of historical research and writing. Students produce conference paper and research paper based on primary sources. Prereq: Graduate standing or instructor permission.

HSTY 480. Public Policy and Aging. 3 Units.
Overview of aging and the aged. Concepts in the study of public policy. Policies on aging and conditions that they address. The politics of policies on aging. Emergent trends and issues. Offered as ANTH 498, BETH 496, EPBI 408, GERO 496, HSTY 480, MPHP 408, NURS 479, NURS 579, POSC 480, and SOCI 496.

HSTY 481. City as Classroom. 3 Units.
In this course, the city is the classroom. We will engage with the urban terrain. We will meet weekly off-campus, interact with community members, and interface--both literally and figuratively--with the city as a way to examine the linkages between historical, conceptual, and contemporary issues, with particular attention paid to race and class dynamics, inequality, and social justice. This course will have four intersecting components, primarily focusing on American cities since the 1930s: the social and physical construction of urban space, the built environment, life and culture in the city, and social movements and grassroots struggles. Offered as HSTY 381, POSC 381, SOCI 381, HSTY 481, POSC 481, and SOCI 481.
HSTY 485. Readings in Society and Culture in Modern Chinese History. 3 Units.
The primary goal of this course is to provide students an opportunity to explore at greater length specific topics in Chinese social and cultural history. The period covered by the assigned readings roughly spans the late eighteenth century through the first half of the twentieth century. Readings will cover a wide range of topical themes, including childhood, gender and sexuality, urban life, print media, religion, and the environment. Offered as HSTY 385 and HSTY 485.

HSTY 491. Food in History. 3 Units.
Food is inextricably interconnected with the development of agriculture and other technologies, with the rise and fall of empires, with increasing understanding of diet and nutrition, with laws and regulations, with the arts, with economic development and consumer culture, and with religious and ethnic identities. By examining selective and representative episodes pertaining to each of these topics, this course explores the global history of food, from the agricultural revolution of the neolithic era to the consumer revolution of the last generation. Offered as HSTY 391 and HSTY 491. Prereq: Graduate standing or instructor permission.

HSTY 493. Advanced Readings in the History of Race. 3 Units.
This course examines the concept of race as a social construction that carries political and economic implications. We begin by examining the histories of the early racial taxonomists (e.g., Bernier, Linnaeus, and Blumenbach among others) and the contexts that informed their writings. We then assess how the concept of race changed from the nineteenth to the twentieth century in the United States. We conclude by evaluating how the ideology of race has influenced U.S. domestic life and foreign policy at specific historical moments. Offered as HSTY 393, HSTY 493, and ETHS 393.

HSTY 494. Seminar in Evolutionary Biology. 3 Units.
This seminar investigates 20th-century evolutionary theory, especially the Modern Evolutionary synthesis and subsequent expansions of and challenges to that synthesis. The course encompasses the multidisciplinary nature of the science of evolution, demonstrating how disciplinary background influences practitioners' conceptualizations of pattern and process. This course emphasizes practical writing and research skills, including formulation of testable theses, grant proposal techniques, and the implementation of original research using the facilities on campus and at the Cleveland Museum of Natural History. Offered as ANTH 394, BIOL 394, EEPS 394, HSTY 394, PHIL 394, ANTH 494, BIOL 494, EEPS 494, HSTY 494, and PHIL 494.

HSTY 495. History of Medicine. 3 Units.
This course treats selected topics in the history of medicine, with an emphasis on social and cultural history. Focusing on the modern period, we examine illnesses, patients, and healers, with attention to the ways sickness and medicine touch larger questions of politics, social relations and identity. Offered as HSTY 395 and HSTY 495. Prereq: Graduate standing or instructor permission.

HSTY 496. Advanced Topics in History. 3 Units.
Advanced topics in history, changing from semester to semester. The course provides students an opportunity to explore special themes or theoretical issues in history that are too briefly covered in broader surveys. Students may take this course more than once for credit, when different topics are covered. Offered as HSTY 396 and HSTY 496.

HSTY 497. Graduate Independent Study. 1 - 3 Unit.
Independent reading and research programs with individual members of the faculty.

HSTY 499. Advanced Readings in Black History. 3 Units.
This is an advanced readings course that may change from semester to semester. This course will provide students with an opportunity to more deeply explore special themes and theoretical issues in the field of black history that are often quickly and briefly covered in broad survey courses. Readings may be organized around specific topics such as resistance and social protest, black intellectual history, black nationalism and identity, black film and historical literacy black cultural forms and politics, black urban history, or some such other combination. Students may take this course more than once and receive credit as long as the course topic differs. Students should contact the History Department for more details on course content during any given semester. Offered as ETHS 391, HSTY 399 and HSTY 499. Prereq: Graduate standing or instructor permission.

HSTY 525. Intellectual Property and the Construction of Authorship. 3 Units.
Study of the concepts, laws, norms, and practices through which writers and other creative producers establish "property" in their work. Offered as ENGL 525 and HSTY 525. Prereq: Graduate standing or permission.

HSTY 601. Independent Studies. 1 - 18 Unit.
(Credit as arranged.)

HSTY 651. Thesis M.A.. 1 - 18 Unit.
(Credit as arranged.)

HSTY 701. Dissertation Ph.D.. 1 - 18 Unit.
(Credit as arranged.) Limited to Ph.D. candidates actively engaged in the research and writing of their dissertations. Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
Department of Mathematics

The Department of Mathematics at Case Western Reserve University is an active center for mathematical research. Faculty members conduct research in algebra, analysis, applied mathematics, convexity, dynamical systems, geometry, imaging, inverse problems, life sciences applications, mathematical biology, modeling, numerical analysis, probability, scientific computing, stochastic systems, and other areas.

The department offers a variety of programs leading to both undergraduate and graduate degrees in traditional and applied mathematics. Undergraduate degrees are Bachelor of Arts or Bachelor of Science in mathematics and Bachelor of Science in applied mathematics. Graduate degrees are Master of Science and Doctor of Philosophy.

The BS/MS program allows a student to earn a Bachelor of Science in either mathematics or applied mathematics and a master’s degree from the mathematics department or another department in five years. The department, in cooperation with John Carroll University, offers a program for individuals interested in pre-college teaching. Together with the Department of Physics, it offers a specialized joint Bachelor of Science in Mathematics and Physics.

Mathematics plays a central role in the physical, biological, economic, and social sciences. Because of this, employment prospects are always strong for individuals with degrees in mathematics, and there are excellent career opportunities. A bachelor’s degree in mathematics or applied mathematics offers a strong background for graduate school in many areas (including computer science, medicine, and law, in addition to mathematics and science) or a position in the private sector. A master’s degree in mathematics or applied mathematics, or an undergraduate degree in applied mathematics combined with a master’s in a different area, is an excellent basis for employment in the private sector in a technical field. A PhD degree is usually necessary for college teaching and research.

Students in the mathematics department, both undergraduate and graduate, have opportunities to interact personally with faculty and other students, and research and other activities are available. In addition, undergraduates can obtain teaching experience via the department’s supplemental instruction program.

Teacher Licensure

(a) Completion of the BA program in mathematics, including the following as the three approved technical electives:

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>MATH 150</td>
<td>Mathematics from a Mathematician’s Perspective</td>
<td>3</td>
</tr>
<tr>
<td>MATH 304</td>
<td>Discrete Mathematics</td>
<td>3</td>
</tr>
<tr>
<td>STAT 312</td>
<td>Basic Statistics for Engineering and Science</td>
<td>3</td>
</tr>
<tr>
<td><strong>Total Units</strong></td>
<td></td>
<td><strong>9</strong></td>
</tr>
</tbody>
</table>

(b) The completion of a second major in teacher education. Students interested in this option should consult the description of the Teacher Licensure Program (p. 437) elsewhere in this bulletin or contact the director of teacher licensure.

Bachelor of Science in Mathematics

The BS degree in mathematics requires at least 50 hours of mathematics courses, including:

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>MATH 112</td>
<td>Calculus for Science and Engineering I</td>
<td>4</td>
</tr>
<tr>
<td>MATH 122</td>
<td>Calculus for Science and Engineering II</td>

* No more than one can be from outside the department.

** Or other approved computer science course.

Undergraduate Programs

Majors

A Bachelor of Arts in mathematics, a Bachelor of Science in mathematics, a Bachelor of Science in mathematics and physics, and a Bachelor of Science in applied mathematics are available to students at Case Western Reserve University. All undergraduate mathematics degrees are based on a four-course sequence in calculus and differential equations and a five-course mathematics core in analysis and algebra.

Bachelor of Arts in Mathematics

The BA degree in mathematics requires at least 38 hours of mathematics courses, including:

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>MATH 112</td>
<td>Calculus for Science and Engineering I</td>
<td>4</td>
</tr>
<tr>
<td>MATH 122</td>
<td>Calculus for Science and Engineering II</td>
<td>4</td>
</tr>
<tr>
<td>or MATH 124</td>
<td>Calculus II</td>
<td></td>
</tr>
<tr>
<td>MATH 223</td>
<td>Calculus for Science and Engineering III</td>
<td>3</td>
</tr>
</tbody>
</table>

Three approved technical electives *

* No more than one can be from outside the department.

** Or other approved computer science course.
Bachelor of Science in Applied Mathematics

A student in this degree program must design a program of study in consultation with his or her academic advisor. This program of study must explicitly list the mathematics electives and the professional core in the area of application.

Areas of research in applied mathematics well represented in the department include:

- Applied dynamical systems
- Applied probability and stochastic processes
- Imaging
- Life science
- Scientific computing

Study plans with emphasis on areas of application closely related to mathematics but centered in other departments will also be considered. Such areas might include engineering applications, biology, cognitive science, or economics.

The BS degree in applied mathematics requires at least 50 hours of course work in mathematics and related subjects, in addition to a professional core that is specific to the area of application of interest to the student, including:

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>MATH 121</td>
<td>Calculus for Science and Engineering I</td>
<td>4</td>
</tr>
<tr>
<td>MATH 122</td>
<td>Calculus for Science and Engineering II</td>
<td>4</td>
</tr>
<tr>
<td>or MATH 124</td>
<td>Calculus II</td>
<td>4</td>
</tr>
<tr>
<td>MATH 223</td>
<td>Calculus for Science and Engineering III</td>
<td>3</td>
</tr>
<tr>
<td>or MATH 227</td>
<td>Calculus III</td>
<td>3</td>
</tr>
<tr>
<td>MATH 224</td>
<td>Elementary Differential Equations</td>
<td>3</td>

<tr>
<td>or MATH 228</td>
<td>Differential Equations</td>
<td>3</td>
</tr>
<tr>
<td>MATH 304</td>
<td>Discrete Mathematics</td>
<td>3</td>
</tr>
<tr>
<td>MATH 307</td>
<td>Introduction to Abstract Algebra I</td>
<td>3</td>
</tr>
<tr>
<td>MATH 321</td>
<td>Fundamentals of Analysis I</td>
<td>3</td>
</tr>
<tr>
<td>MATH 322</td>
<td>Fundamentals of Analysis II</td>
<td>3</td>
</tr>
<tr>
<td>MATH 330</td>
<td>Introduction of Scientific Computing</td>
<td>3</td>
</tr>
</tbody>
</table>

One of the following two courses:

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>MATH 324</td>
<td>Introduction to Complex Analysis</td>
<td>3</td>
</tr>
<tr>
<td>MATH 425</td>
<td>Complex Analysis I</td>
<td>3</td>
</tr>
</tbody>
</table>

Approved mathematics electives:

- Four courses specific to the concentration area of interest to the student (12 units)
- Two MATH courses at the 300 level or higher (6 units)

Professional Core requirement

- 12 approved credit hours specific to an area of application. This requirement is intended to promote scientific breadth and encourage application of mathematics to other fields.

Non-mathematics requirements

The following three courses:

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>PHYS 121</td>
<td>General Physics I - Mechanics</td>
<td>4</td>
</tr>
<tr>
<td>PHYS 122</td>
<td>General Physics II - Electricity and Magnetism</td>
<td>4</td>
</tr>
<tr>
<td>PHYS 221</td>
<td>Introduction to Modern Physics</td>
<td>3</td>
</tr>
</tbody>
</table>

One of the following sequences:

- PHYS 315 Introduction to Solid State Physics
- PHYS 316 Introduction to Nuclear and Particle Physics
- PHYS 326 Physical Optics
- PHYS 327 Quantum Electronics
- PHYS 328 Cosmology and the Structure of the Universe
- PHYS 336 Modern Cosmology
- PHYS 365 General Relativity
- PHYS 423 Classical Electromagnetism
- PHYS 472 Graduate Physics Laboratory

Bachelor of Science in Mathematics and Physics

In contrast to the BS in applied mathematics or the BS in physics with a mathematical physics concentration, this degree provides a synergistic, coherent, and parallel education in mathematics and physics. To a close approximation, the challenging course work corresponds to combining the mathematics and physics cores, with the Physics Laboratory cluster replaced by a single, fourth-year laboratory semester. A student in this new program may use either of two official advisors, one available from each department, who would also constitute a committee for the administration of the degree and the approval of curriculum petitions.

The BS degree in mathematics and physics requires a total of 126 credits, including:

A. Mathematics requirements (35)

Two of the following:

PHYS 250 Computational Methods in Physics
PHYS 349 Methods of Mathematical Physics I
PHYS 350 Methods of Mathematical Physics II

C. Senior project and seminar; one of two options: (6-7)

C. (i) Mathematics option
MATH 351 Senior Project for the Mathematics and Physics Program
SAGES departmental seminar in Mathematics

C. (ii) Physics option
PHYS 303 Advanced Laboratory Physics Seminar
PHYS 351 Senior Physics Project Seminar

D. Other science requirements (9-11)

CHEM 105 Principles of Chemistry I 3-4
or CHEM 111 Principles of Chemistry for Engineers
CHEM 106 Principles of Chemistry II 3-4
or ENGR 145 Chemistry of Materials
ENGR 131 Elementary Computer Programming 3

Total Units 88-91

If approved by the M&P committee, other science sequence courses may be substituted.

In addition to the major coursework listed, there are requirements of 10 hours of SAGES First and University Seminars, 12 hours of CAS distribution requirements, and enough open electives to bring the total number of hours to at least 126.

Total Units in Sequence: 129-132

The "M&P group" of four courses corresponds to two physics courses and two mathematics courses. The physics courses would be chosen from PHYS 250, PHYS 349, and PHYS 350. The mathematics courses are subject to approval by the advisory committee and are hereby referred to as ‘approved electives.’ They may be chosen from the general list of mathematics courses at the 300 level or higher. Also subject to approval, students may choose a course from outside the mathematics and physics departments as a substitute in the M&P group.

The number of open electives will vary depending on whether students choose 3-credit or 4-credit courses to fulfill other requirements (chemistry, senior project).

An advanced physics course to be selected from the following list: PHYS 315 Introduction to Solid State Physics, PHYS 316 Introduction to Nuclear and Particle Physics, PHYS 326 Physical Optics, PHYS 327 Quantum Electronics, PHYS 328 Cosmology and the Structure of the Universe, PHYS 336 Modern Cosmology, PHYS 365 General Relativity.

The Senior Project and SAGES Departmental Seminar should either be the Mathematics option (MATH 351 Senior Project for the Mathematics and Physics Program and a Mathematics departmental seminar), or the Physics option (PHYS 351 Senior Physics Project, and PHYS 352 Senior Physics Project Seminar).
Integrated BS/MS Program in Mathematics and/or Applied Mathematics

The integrated BS/MS program is intended for highly motivated candidates for the BS in mathematics and applied mathematics who wish to pursue an advanced degree. Application to the BS/MS program must be made after completion of 75 semester hours of course work and prior to attaining senior status (completion of 90 semester hours). Generally, this means that a student will submit the application during his/her sixth semester of undergraduate course enrollment and will have no fewer than two semesters of remaining BS requirements to complete. Applicants should consult the dean of undergraduate studies.

A student admitted to the program may, in the senior year, take up to nine hours of graduate courses (400 level and above) that will count towards both BS and MS requirements. The courses to be doubled-counted must be specified at the time of application. Any undergraduate course work that is to be applied to the MS must be beyond that used to satisfy BS degree requirements and must conform to university, graduate school, and department rules. Students may petition to transfer graduate course work taken prior to application to the BS/MS program subject to the rules of the graduate school.

Students for whom the master’s project or thesis is a continuation and development of the senior project should register for (or the appropriate project course) during the senior year and are expected to complete all other courses for the BS before enrolling in further MS course work and thesis (continuing the senior project). Students for whom the master’s thesis or project is distinct from the senior project will be expected to complete the BS degree before taking further graduate courses for the master’s degree.

Integrated BS/MS in Applied Mathematics and Another Discipline

There is the possibility of an integrated five-year study plan leading to a BS in applied mathematics and an MS in the area of application. In order to complete the requirements for the BS/MS in five years, students must choose an area outside mathematics that integrates well with mathematics, such as computing/information science, operations research, systems engineering, control theory, biology, or cognitive science. The general academic requirements for Integrated BS/MS programs must be followed. (Since the graduate courses required for the MS degree are determined by the respective department, each student in the dual-degree program should have a secondary advisor in that department, starting no later than the junior year, and consult with this advisor concerning requirements for the MS degree.)

Minor

A minor in mathematics is available to all undergraduates. No more than two courses can be used to satisfy both minor requirements and the requirements of the student’s major field (meaning departmental degree requirements, including departmental technical electives and common course requirements of the student’s school).

The minor in mathematics requires 17 hours of mathematics courses, including:

<table>

</tbody>
</table>

* To count toward a minor in Mathematics, MATH 150 Mathematics from a Mathematician’s Perspective must be taken in the first or second year.

Graduate Programs

The department offers programs leading to the Master of Science and the Doctor of Philosophy degrees. At both the master’s and the doctoral levels, students may pursue degrees in mathematics or applied mathematics.

A student must satisfy all of the general requirements of the graduate school as well as the more specific requirements of the department to earn either a master’s or doctoral degree. Each graduate student is assigned a faculty advisory committee during the first year of study. The committee’s primary responsibility is to help the student plan an appropriate and sufficiently broad program of course work and study that will satisfy both the degree requirements and the special interests of the student. With the aid of the advisory committee, each student must present a study plan indicating how he or she intends to satisfy the requirements for a graduate degree.

The main requirements are as follows.

Master of Science in Mathematics

A minimum of 27 credit hours of approved course work, at least 18 of which must be at the 400 level or higher, is required for the MS degree in mathematics. Courses in two of the following three basic areas must be included among the 27 credit hours required for graduation:

<table>
<thead>
<tr>
<th>Area</th>
<th>Course Code</th>
<th>Course Title</th>
</tr>
</thead>
<tbody>
<tr>
<td>Abstract Algebra</td>
<td>MATH 401</td>
<td>Abstract Algebra I</td>
</tr>
<tr>
<td>or MATH 402</td>
<td>Abstract Algebra II</td>
<td></td>
</tr>
<tr>
<td>Analysis</td>
<td>MATH 423</td>
<td>Introduction to Real Analysis I</td>
</tr>
<tr>
<td>or MATH 424</td>
<td>Introduction to Real Analysis II</td>
<td></td>
</tr>
<tr>
<td>or MATH 425</td>
<td>Complex Analysis I</td>
<td></td>
</tr>
</tbody>
</table>
The student must pass a comprehensive oral examination on three areas, two of which must be selected from the basic ones listed above (although no particular courses are specified). The third area for the examination may be any approved subject.

A student in the MS program in mathematics may substitute the comprehensive exam examination requirement with an expository or original thesis, which will count as 6 credit hours of course work. The thesis will be defended in the course of an oral examination, during which the student will be questioned about the thesis and related topics. These two variants correspond to the graduate school’s plan A and plan B.

### Master of Science in Applied Mathematics

The department offers specialized programs in applied mathematics. For each of the programs, there is a minimum requirement of 27 credit hours of course work, at least 18 of which must be at the 400 level or higher. Students in the program must complete course work requirements in each of the following groups:

- At least 15 hours offered by the Department of Mathematics
- At least 6 hours of courses offered outside the Department of Mathematics
- 6 hours of thesis work (see below) or successful completion of a comprehensive exam

Given the great diversity of topics used in applications, there cannot be a large common core of requirements for the MS in applied mathematics. Still, all students pursuing this degree are strongly advised to take MATH 431 Introduction to Numerical Analysis I and MATH 441 Mathematical Modeling. In addition, to add breadth to the student’s education, the set of courses taken within the department must include three credit hours of approved course work in at least three of the following seven breadth areas. (The list includes suitable courses for each area. Please note that a course may be used to satisfy only one breadth area requirement.)

### Applied Mathematics Breadth Areas

**Analysis and Linear Analysis:**
- MATH 471 Advanced Engineering Mathematics
- MATH 423 Introduction to Real Analysis I
- MATH 405 Advanced Matrix Analysis

**Probability and its Applications:**
- MATH 491 Probability I
- MATH 493 Probability II

**Numerical Analysis and Scientific Computing:**
- MATH 431 Introduction to Numerical Analysis I
- MATH 432 Numerical Differential Equations
- MATH 433 Numerical Solutions of Nonlinear Systems and Optimization

**Differential Equations:**
- MATH 435 Ordinary Differential Equations
- MATH 445 Introduction to Partial Differential Equations
- MATH 449 Dynamical Models for Biology and Medicine

**Inverse Problems and Imaging:**
- MATH 439 Integrated Numerical and Statistical Computations
- MATH 440 Computational Inverse Problems
- MATH 475 Mathematics of Imaging in Industry and Medicine

**Logic and Discrete Mathematics:**
- MATH 406 Mathematical Logic and Model Theory
- MATH 408 Introduction to Cryptology

**Life Science:**

<table>

<tr>
<td>3</td>
<td>MATH 478 Computational Neuroscience</td>
</tr>
</tbody>
</table>

Not suitable for credit towards the PhD requirements.

Other suitable courses for students in applied mathematics include:

- MATH 424 Introduction to Real Analysis II
- MATH 425 Complex Analysis I
- MATH 427 Convexity and Optimization
- MATH 428 Fourier Analysis
- MATH 444 Mathematics of Data Mining and Pattern Recognition
- MATH 475 Mathematics of Imaging in Industry and Medicine
- MATH 492 Probability II

The student must pass a comprehensive oral examination on three areas, two of which must be on the list of breadth areas (although no particular courses are specified). The third area for the examination may be any approved subject.

A student in the MS program in applied mathematics may substitute the comprehensive examination requirement with an expository or original thesis, which will count as 6 credit hours of course work. The thesis will be defended in the course of an oral examination, during which the student will be questioned about the thesis and related topics. These two variants correspond to the graduate school’s plan A and plan B.

### PhD Program

The doctorate is conferred not merely upon completion of a stipulated course of study, but rather upon clear demonstration of scholarly attainment and capability of original research work in mathematics. A doctoral student may plan either a traditional program of studies in mathematics (mathematics track) or a program of studies oriented toward applied mathematics (applied mathematics track). In either case, each student must take 36 credit hours of approved courses with a grade average of B or better. For students entering with a master’s degree in a mathematical subject compatible with our program, as determined by the graduate committee, this requirement is reduced to 18 credit hours of approved courses.

In addition to the course work, all PhD students in both tracks must complete the following specific requirements:

- Pass the PhD qualifying examination, which consists of examinations on three different subjects. All examinations are general proficiency examinations which may or may not be connected to specific courses. The topics for each subject are spelled out in a syllabus, periodically updated, which is available to the student. Students are expected to take the qualifying examination by the end of the second year of study and to successfully pass all parts of it by the beginning of their sixth semester in the PhD program. The subject requirements are different in the two tracks; see below.

- Write an acceptable thesis that constitutes an original contribution to mathematical knowledge. It is the responsibility of the student to find a thesis advisor who is willing to help plan a program and guide his or her research. This should be done immediately after passing the qualifying examination. A copy of a student’s thesis is to be available no later than 10 days prior to the final oral examination (see below), and the student is required to deliver an expository lecture on the subject of his or her thesis sometime prior to the final oral examination. This lecture is open to all students and faculty.

- Pass a final oral examination consisting of a defense of the thesis. The examination committee, which consists of not fewer than four members of the faculty, including one whose appointment is outside
the mathematics department, is responsible for certifying that the material presented in the thesis meets acceptable scholarly standards. The examination may also include an inquiry into the student’s competence in the major and related fields. All faculty members are welcome to attend.

Requirements specific to the different tracks

Mathematics Track
A student in the traditional mathematics program must demonstrate knowledge of the basic concepts and techniques of algebra, analysis (real and complex), and topology. This includes taking all courses in the three basic areas, and successfully completing qualifying examinations in algebra and analysis.

Qualifying Examination
A doctoral student in the mathematics track must take examinations on abstract algebra and real analysis. The third subject is to be selected from the following list: complex analysis, control and calculus of variations, differential equations, dynamical systems, functional analysis, geometry, probability, and topology. The choice of the examination subjects should be finalized by the end of the first year of study.

18 credit hours of approved course work 18

Total Units 36

A student with a master’s degree in a mathematical subject compatible with our program, as determined by the graduate committee, must take 18 credit hours of approved courses. The graduate committee will determine which of the specific course requirements stated above have been satisfied by the master’s course work.

Applied Mathematics Track
A student in the applied mathematics track must demonstrate knowledge of scientific computing, mathematical modeling, and differential equations. This includes taking qualifying examinations in the areas of computational mathematics and mathematical modeling, and taking certain courses in these three areas, as specified below.

Qualifying Examination
A doctoral student in the applied mathematics track must take examinations in an area of computational mathematics and in an area of mathematical modeling. The third area of examination may be a more applied subject, including but not restricted to fluid mechanics, statistical mechanics, epidemiology, neuroscience, or a more traditional field of mathematics.

24 hours of approved courses * 24

Total Units 36

* Must include at least 9 hours of courses offered outside the Department of Mathematics and at least 9 credit hours offered by the Department of Mathematics.

A student with a master’s degree in a mathematical subject compatible with our program, as determined by the graduate committee, must take 18 credit hours of approved courses, which must include at least 6 credit hours of courses offered outside the Department of Mathematics and at least 9 credit hours offered by the Department of Mathematics. The graduate committee will determine which of the specific course requirements stated above have been satisfied by the master’s course work.

Sample study plans for students with concentrations in scientific computing, imaging, mathematical biology, and stochastics follow. The graduate committee will entertain ideas for other serious study plans or qualifying exam subjects in addition to the most common variants.

PhD students entering with a bachelor’s degree are subject to the same breadth requirements as students pursuing the MS degree in applied mathematics.

**Petitions**

Any exceptions to departmental regulations or requirements must have the formal approval of the department’s graduate committee. Such exceptions are to be sought by a written petition, approved by the student’s advisory committee or thesis advisor, to the graduate committee.

Any exception to university rules and regulations must be approved by the dean of graduate studies. Such exceptions are to be sought by presenting a written petition to the graduate committee for departmental endorsement and approval prior to forwarding the petition to the dean.

**Department Faculty**

Daniela Calvetti, PhD  
(University of North Carolina)  
*Armington Professor and Chair*  
Scientific computing; imaging, inverse problems; modeling and simulation in life science  

Alethea Barbaro, PhD  
(University of California, Santa Barbara)  
*Assistant Professor*  
Computational Science and Engineering  

Christopher Butler, MS  
(Case Western Reserve University)  
*Instructor and Theodore M. Focke Professorial Fellow*  
Teaching of mathematics  

John Duncan, PhD  
(Yale University)  
*Assistant Professor*  
The structure theory of vertex algebras; applications of vertex algebra in representation theory; algebraic geometry; number theory; topology  

Weihong Guo, PhD  
(University of Florida)  
*Assistant Professor*  
Image processing and analysis; compressive sensing; computational neuroscience; computer vision  

David Gurarie, PhD  
(Hebrew University, Jerusalem, Israel)  
*Professor*  
Applied mathematics (differential equations, dynamical systems) in physics, chemistry, biology; applications to population biology, infectious disease modeling, epidemiology, metabolism, geophysical fluid dynamics  

Michael Hurley, PhD  
(Northwestern University)  
*Professor*  
Dynamical systems; dynamics of cellular automata; dynamics of numerical methods  

Steven H. Izen, PhD  
(Massachusetts Institute of Technology)  
*Professor*  
Image reconstruction from projections, both theoretically and in applied situations  

Peter Kotelnenez, PhD  
(Universität Bremen)  
*Professor*  
Stochastic partial and ordinary differential equations; transitions from microscopic to macroscopic equations for particle systems; correlated Brownian motions and depletion phenomena in colloids; stochastic models in nanotechnology and complex systems  

Joel Langer, PhD  
(University of California, Santa Cruz)  
*Professor*  
Static and dynamics of curves and related physical models; the interplay between geometry and integrable Hamiltonian systems; geometry of finite and infinite dimensional spaces of curves  

Marshall J. Leitman, PhD  
(Brown University)  
*Professor and Theodore M. Focke Professorial Fellow*  
Continuum physics; integral equations; functional analysis; mechanics of materials  

Elizabeth Meckes, PhD  
(Stanford University)  
*Assistant Professor*  
Probability theory; probabilistic problems in geometry, topology, and physics; random matrix theory  

Mark Meckes, PhD  
(Case Western Reserve University)  
*Assistant Professor*  
Geometry in high dimensions; random matrix theory; geometric probability  

Benjamin Nill, PhD  
(Eberhard Karls Universität Tübingen)  
*Assistant Professor*  
Algebraic and toric geometry; convex and discrete geometry; geometric combinatorics  

David A. Singer, PhD  
(University of Pennsylvania)  
*Professor*  
Geometry; dynamical systems; variational problems  

Erkki Somersalo, PhD  
(University of Helsinki)  
*Professor*  
Modeling and simulation of complex biological systems; inverse problems and Bayesian scientific computing; medical imaging  

Stanislaw J. Szarek, PhD  
(Mathematical Institute, Polish Academy of Science)  
*Kerr Professor of Mathematics*  
Geometric functional analysis and its applications to study of high-dimensional phenomena including quantum information theory  

Peter Thomas, PhD  
(University of Chicago)  
*Assistant Professor*  
Synchronization and reliability of neural activity; gradient sensing, signal transduction and information theory; pattern formation in the visual cortex; malaria informatics  

Elisabeth Werner, PhD  
(Université Pierre et Marie Curie, Paris VI)
Introduction to multivariable calculus. Prereq: MATH 123 or placement by the department.

Continuation of MATH 121 covering differential equations, multivariable calculus, discrete methods. Partial derivatives, maxima and minima for functions of two variables, linear regression. Differential equations; first and second order equations, systems, Taylor series methods; Newton's method; difference equations. Prereq: MATH 121, MATH 123 or MATH 125.

MATH 120. Elementary Functions and Analytic Geometry. 3 Units.
Polynomial, rational, exponential, logarithmic, and trigonometric functions (emphasis on computation, graphing, and location of roots) straight lines and conic sections. Primarily a precalculus course for the student without a good background in trigonometric functions and graphing and/or analytic geometry. Not open to students with credit for MATH 121 or MATH 125. Prereq: Three years of high school mathematics.

MATH 121. Calculus for Science and Engineering I. 4 Units.
Functions, analytic geometry of lines and polynomials, limits, derivatives of algebraic and trigonometric functions. Definite integral, antiderivatives, fundamental theorem of calculus, change of variables. Prereq: Three and one half years of high school mathematics.

MATH 122. Calculus for Science and Engineering II. 4 Units.
Continuation of MATH 121. Exponential and logarithmic, growth and decay, inverse trigonometric functions, related rates, basic techniques of integration, area and volume, polar coordinates, parametric equations. Taylor polynomials and Taylor's theorem. Prereq: MATH 121, MATH 123 or MATH 126.

MATH 124. Calculus II. 4 Units.
MATH 301. Undergraduate Reading Course. 1 - 3 Unit.
Students must obtain the approval of a supervising professor before registration. More than one credit hour must be approved by the undergraduate committee of the department.

MATH 302. Departmental Seminar. 3 Units.
A seminar devoted to understanding the formulation and solution of mathematical problems. SAGES Department Seminar. Students will investigate, from different possible viewpoints, via case studies, how mathematics advances as a discipline—what mathematicians do. The course will largely be in a seminar format. There will be two assignments involving writing in the style of the discipline. Enrollment by permission (limited to majors depending on demand).

MATH 303. Elementary Number Theory. 3 Units.
Primes and divisibility, theory of congruencies, and number theoretic functions. Diophantine equations, quadratic residue theory, and other topics determined by student interest. Emphasis on problem solving (formulating conjectures and justifying them). Prereq: MATH 122 or MATH 124.

MATH 304. Discrete Mathematics. 3 Units.
A general introduction to basic mathematical terminology and the techniques of abstract mathematics in the context of discrete mathematics. Topics introduced are mathematical reasoning, Boolean connectives, deduction, mathematical induction, sets, functions and relations, algorithms, graphs, combinatorial reasoning. Offered as EECS 320 and MATH 304. Prereq: MATH 122, MATH 124 or MATH 126.

MATH 305. Introduction to Advanced Mathematics. 3 Units.
A course on the theory and practice of writing, and reading mathematics. Main topics are logic and the language of mathematics, proof techniques, set theory, and functions. Additional topics may include introductions to number theory, group theory, topology, or other areas of advanced mathematics. Prereq: MATH 122, MATH 124 or MATH 126.

MATH 306. Introduction to Linear Algebra. 3 Units.
First semester of an integrated, two-semester theoretical course in abstract and linear algebra, studied on an axiomatic basis. The major algebraic structures studied are groups, rings, fields, modules, vector spaces, and inner product spaces. Topics include homomorphisms and quotient structures, the theory of polynomials, canonical forms for linear transformations and the principal axis theorem. This course is required of all students majoring in mathematics. Only one of MATH 201 or MATH 306 may be taken for credit. Prereq: MATH 122 or MATH 124.

MATH 307. Introduction to Abstract Algebra I. 3 Units.
Continuation of MATH 306. Prereq: MATH 306.

MATH 308. Introduction to Abstract Algebra II. 3 Units.

MATH 309. Advanced Linear Algebra. 3 Units.
Continuation of MATH 306. Prereq: MATH 306.

MATH 310. Advanced Linear Algebra. 3 Units.

MATH 311. Introduction to Abstract Algebra I. 3 Units.

MATH 312. Introduction to Abstract Algebra II. 3 Units.
Continuation of MATH 311. Prereq: MATH 311.

MATH 313. Introduction to Advanced Mathematics. 3 Units.
A course on the theory and practice of writing, and reading mathematics. Main topics are logic and the language of mathematics, proof techniques, set theory, and functions. Additional topics may include introductions to number theory, group theory, topology, or other areas of advanced mathematics. Prereq: MATH 122, MATH 124 or MATH 126.

MATH 314. Introduction to Advanced Mathematics. 3 Units.
A course on the theory and practice of writing, and reading mathematics. Main topics are logic and the language of mathematics, proof techniques, set theory, and functions. Additional topics may include introductions to number theory, group theory, topology, or other areas of advanced mathematics. Prereq: MATH 122, MATH 124 or MATH 126.

MATH 315. Introduction to Advanced Mathematics. 3 Units.
A course on the theory and practice of writing, and reading mathematics. Main topics are logic and the language of mathematics, proof techniques, set theory, and functions. Additional topics may include introductions to number theory, group theory, topology, or other areas of advanced mathematics. Prereq: MATH 122, MATH 124 or MATH 126.

MATH 316. Introduction to Advanced Mathematics. 3 Units.
A course on the theory and practice of writing, and reading mathematics. Main topics are logic and the language of mathematics, proof techniques, set theory, and functions. Additional topics may include introductions to number theory, group theory, topology, or other areas of advanced mathematics. Prereq: MATH 122, MATH 124 or MATH 126.

MATH 317. Introduction to Advanced Mathematics. 3 Units.
A course on the theory and practice of writing, and reading mathematics. Main topics are logic and the language of mathematics, proof techniques, set theory, and functions. Additional topics may include introductions to number theory, group theory, topology, or other areas of advanced mathematics. Prereq: MATH 122, MATH 124 or MATH 126.

MATH 318. Introduction to Advanced Mathematics. 3 Units.
A course on the theory and practice of writing, and reading mathematics. Main topics are logic and the language of mathematics, proof techniques, set theory, and functions. Additional topics may include introductions to number theory, group theory, topology, or other areas of advanced mathematics. Prereq: MATH 122, MATH 124 or MATH 126.

MATH 319. Applied Probability and Stochastic Processes for Biology. 3 Units.
Applications of probability and stochastic processes to biological systems. Mathematical topics will include: introduction to discrete and continuous probability spaces (including numerical generation of pseudo random samples from specified probability distributions), Markov processes in discrete and continuous time with discrete and continuous sample spaces, point processes including homogeneous and inhomogeneous Poisson processes and Markov chains on graphs, and diffusion processes including Brownian motion and the Ornstein-Uhlenbeck process. Biological topics will be determined by the interests of the students and the instructor. Likely topics include: stochastic ion channels, molecular motors and stochastic ratchets, actin and tubulin polymerization, random walk models for neural spike trains, bacterial chemotaxis, signaling and genetic regulatory networks, and stochastic predator-prey dynamics. The emphasis will be on practical simulation and analysis of stochastic phenomena in biological systems. Numerical methods will be developed using both MATLAB and the R statistical package. Student projects will comprise a major part of the course. Offered as BIOL 319, EECES 319, MATH 319, BIOL 419, EBMIE 419, and PHOL 419. Prereq: MATH 224 or MATH 223 and BIOL 300 or BIOL 306 and MATH 201 or MATH 307 or consent of instructor.

MATH 320. Fundamentals of Analysis I. 3 Units.
Abstract mathematical reasoning in the context of analysis in Euclidean space. Introduction to formal reasoning, sets and functions, and the number systems. Sequences and series; Cauchy sequences and convergence. Required for all mathematics majors. Additional work required for graduate students. (May not be taken for graduate credit by graduate students in the Department of Mathematics.) Offered as MATH 320 and MATH 421. Prereq: MATH 223 or MATH 227.

MATH 321. Fundamentals of Analysis I. 3 Units.
Continuation of MATH 320. Point-set topology in metric spaces with attention to n-dimensional space; completeness, compactness, connectedness, and continuity of functions. Topics in sequences, series of functions, uniform convergence, Fourier series and polynomial approximation. Theoretical development of differentiation and Riemann integration. Required for all mathematics majors. Additional work required for graduate students. (May not be taken for graduate credit by graduate students in the Department of Mathematics.) Offered as MATH 322 and MATH 422. Prereq: MATH 321.

MATH 322. Fundamentals of Analysis II. 3 Units.
Continuation of MATH 321. Point-set topology in metric spaces with attention to n-dimensional space; completeness, compactness, connectedness, and continuity of functions. Topics in sequences, series of functions, uniform convergence, Fourier series and polynomial approximation. Theoretical development of differentiation and Riemann integration. Required for all mathematics majors. Additional work required for graduate students. (May not be taken for graduate credit by graduate students in the Department of Mathematics.) Offered as MATH 322 and MATH 422. Prereq: MATH 321.

MATH 323. Introduction to Complex Analysis. 3 Units.

MATH 324. Geometry and Complex Analysis. 3 Units.
The theme of this course will be the interplay between geometry and complex analysis, algebra and other fields of mathematics. An effort will be made to highlight significant, unexpected connections between major fields, illustrating the unity of mathematics. The choice of text(s) and syllabus itself will be flexible, to be adapted to the range of interests and backgrounds of pre-enrolled students. Possible topics include: the Mobius group and its subgroups, hyperbolic geometry, elliptic functions, Riemann surfaces, applications of conformal mapping, and potential theory in classical physical models. Offered as MATH 326 and MATH 426. Prereq: MATH 324.
MATH 327. Convexity and Optimization. 3 Units.
Introduction to the theory of convex sets and functions and to the extremes in problems in areas of mathematics where convexity plays a role. Among the topics discussed are basic properties of convex sets (extreme points, facial structure of polytopes), separation theorems, duality and polars, properties of convex functions, minima and maxima of convex functions over convex set, various optimization problems. Offered as MATH 327, MATH 427, and OPRE 427. Prereq: MATH 223 or MATH 227.

MATH 330. Introduction of Scientific Computing. 3 Units.
An introductory survey to Scientific Computing from principles to applications. Topics which will be covered in the course include: solution of linear systems and least squares, approximation and interpolation, solution of nonlinear systems, numerical integration and differentiation, and numerical solution of differential equations. Projects where the numerical methods are used to solve problems from various application areas will be assigned throughout the semester. Prereq or Coreq: MATH 224 or MATH 228.

MATH 333. Mathematics and Brain. 3 Units.
This course is intended for upper level undergraduate students in Mathematics, Cognitive Science, Biomedical Engineering, Biology or Neuroscience who have an interest in quantitative investigation of the brain and its functions. Students will be introduced to a variety of mathematical techniques needed to model and simulate different brain functions, and to analyze the results of the simulations and of available measured data. The mathematical exposition will be followed–when appropriate–by the corresponding implementation in Matlab. The course will cover some basic topics in the mathematical aspects of differential equations, electromagnetism, Inverse problems and imaging related to brain functions. Validation and falsification of the mathematical models in the light of available experimental data will be addressed. This course will be a first step towards organizing the different brain investigative modalities within a unified mathematical framework. A final presentation and written report are part of the course requirements. Prereq; MATH 224 or MATH 228.

MATH 338. Introduction to Dynamical Systems. 3 Units.
Nonlinear discrete dynamical systems in one and two dimensions. Chaotic dynamics, elementary bifurcation theory, hyperbolicity, symbolic dynamics, structural stability, stable manifold theory. Prereq; MATH 223 or MATH 227.

MATH 342. Introduction to Research in Mathematical Biology. 1 Unit.
The purpose of this seminar is to introduce students to some of the research being done at Case that explores questions at the intersection of mathematics and biology. Students will explore roughly five research collaborations, spending two weeks with each research group. In the first three classes of each two-week block, students will read and discuss relevant papers, guided by members of that research group, and the two-week period will culminate in a talk in which a member of the research group will present a potential undergraduate project in that area. After the final group’s talk, students will divide themselves into groups of two to four people and choose one project for further exploration. Together, they will write up this project as a research proposal, introducing the problem, explaining how it connects to broader scientific questions, and outlining the proposed work. It is expected that students will use the associated research group as a resource, but the proposal should be their own work. Students will submit a first draft, receive feedback, and then submit a revised draft. Offered as BIOL 309 and MATH 342.

MATH 343. Theoretical Computer Science. 3 Units.
Introduction to mathematical logic, different classes of automata and their correspondence to different classes of formal languages, recursive functions and computability, assertions and program verification, denotational semantics. MATH/EECS 343 and MATH 410 cannot both be taken for credit. Offered as EECS 343 and MATH 343. Prereq: MATH 304 and EECS 340.

MATH 351. Senior Project for the Mathematics and Physics Program. 2 Units.
A two-semester course (2 credits per semester) in the joint B.S. in Mathematics and Physics program. Project based on numerical and/or theoretical research under the supervision of a mathematics faculty member, possibly jointly with a faculty member from physics. Study of the techniques utilized in a specific research area and of recent literature associated with the project. Work leading to meaningful results which are to be presented as a term paper and an oral report at the end of the second semester. Supervising faculty will review progress with the student on a regular basis, including detailed progress reports made twice each semester, to ensure successful completion of the work.

MATH 352. Mathematics Capstone. 3 Units.
Mathematics Senior Project. Students pursue a project based on experimental, theoretical or teaching research under the supervision of a mathematics faculty member, a faculty member from another Case department or a research scientist or engineer from another institution. A departmental Senior Project Coordinator must approve all project proposals and this same person will receive regular oral and written progress reports. Final results are presented at the end of the second semester as a paper in a style suitable for publication in a professional journal as well as an oral report in a public Mathematics Capstone symposium.

MATH 361. Geometry I. 3 Units.
An introduction to the various two-dimensional geometries, including Euclidean, spherical, hyperbolic, projective, and affine. The course will examine the axiomatic basis of geometry, with an emphasis on transformations. Topics include the parallel postulate and its alternatives, isometrics and transformation groups, tilings, the hyperbolic plane and its models, spherical geometry, affine and projective transformations, and other topics. We will examine the role of complex and hypercomplex numbers in the algebraic representation of transformations. The course is self-contained. Prereq: MATH 224.

MATH 363. Knot Theory. 3 Units.
An introduction to the mathematical theory of knots and links, with emphasis on the modern combinatorial methods. Reidemeister moves on link projections, ambient and regular isotopies, linking number tricolorability, rational tangles, braids, torus knots, seifert surfaces and genus, the knot polynomials (bracket, X, Jones, Alexander, HOMFLY), crossing numbers of alternating knots and amphicheirality. Connections to theoretical physics, molecular biology, and other scientific applications will be pursued in term projects, as appropriate to the background and interests of the students. Prereq: MATH 223 or MATH 227.
MATH 376. Dynamics of Biological Systems II: Tools for Mathematical Biology. 3 Units.
Building on the material in Biology 300, this course focuses on the mathematical tools used to construct and analyze biological models, with examples drawn largely from ecology but also from epidemiology, developmental biology, and other areas. Analytic “paper and pencil” techniques are emphasized, but we will also use computers to help develop intuition. By the end of the course, students should be able to recognize basic building blocks in biological models, be able to perform simple analysis, and be more fluent in translating between verbal and mathematical descriptions. Offered as BIOL 306 and MATH 376. Prereq: BIOL 300 or MATH 224 or consent of instructor.

MATH 378. Computational Neuroscience. 3 Units.
Computer simulations and mathematical analysis of neurons and neural circuits, and the computational properties of nervous systems. Students are taught a range of models for neurons and neural circuits, and are asked to implement and explore the computational and dynamic properties of these models. The course introduces students to dynamical systems theory for the analysis of neurons and neural learning, models of brain systems, and their relationship to artificial and neural networks. Term project required. Students enrolled in MATH 478 will make arrangements with the instructor to attend additional lectures and complete additional assignments addressing mathematical topics related to the course. Recommended preparation: MATH 223 and MATH 224 or BIOL 300 and BIOL 306. Offered as BIOL 378, COGS 378, MATH 378, BIOL 478, EBME 478, EECS 478, MATH 478 and NEUR 478.

MATH 380. Introduction to Probability. 3 Units.

MATH 394. Introduction to Information Theory. 3 Units.
This course is intended as an introduction to information and coding theory with emphasis on the mathematical aspects. It is suitable for advanced undergraduate and graduate students in mathematics, applied mathematics, statistics, physics, computer science and electrical engineering. Course content: Information measures-entropy, relative entropy, mutual information, and their properties. Typical sets and sequences, asymptotic equipartition property, data compression. Channel coding and capacity: channel coding theorem. Differential entropy, Gaussian channel, Shannon-Nyquist theorem. Information theory inequalities (400 level). Additional topics, which may include compressed sensing and elements of quantum information theory. Recommended Preparation: MATH 201 or MATH 307. Offered as MATH 394, EECS 394, MATH 494 and EECS 494. Prereq: MATH 223 and MATH 380 or requisites not met permission.

MATH 400. Mathematics Teaching Practicum. 1 Unit.
Practicum for teaching college mathematics. Includes preparation of syllabi, exams, lectures. Grading, alternative teaching styles, use of technology, interpersonal relations and motivation. Handling common problems and conflicts.

MATH 401. Abstract Algebra I. 3 Units.
Basic properties of groups, rings, modules and fields. Isomorphism theorems for groups; Sylow theorem; nilpotency and solvability of groups; Jordan-Holder theorem; Gauss lemma and Eisenstein’s criterion; finitely generated modules over principal ideal domains with applications to abelian groups and canonical forms for matrices; categories and functors; tensor product of modules, bilinear and quadratic forms; field extensions; fundamental theorem of Galois theory, solving equations by radicals. Prereq: MATH 308.

MATH 402. Abstract Algebra II. 3 Units.
A continuation of MATH 401. Prereq: MATH 401.

MATH 405. Advanced Matrix Analysis. 3 Units.
An advanced course in linear algebra and matrix theory. Topics include variational characterizations of eigenvalues of Hermitian matrices, matrix and vector norms, characterizations of positive definite matrices, singular value decomposition and applications, perturbation of eigenvalues. This course is more theoretical than MATH 431, which emphasizes computational aspects of linear algebra. Prereq: MATH 307.

MATH 406. Mathematical Logic and Model Theory. 3 Units.
Propositional calculus and quantification theory; consistency and completeness theorems; Gödel incompleteness results and their philosophical significance; introduction to basic concepts of model theory; problems of formulation of arguments in philosophy and the sciences. Offered as PHIL 306, MATH 406 and PHIL 406.

MATH 408. Introduction to Cryptology. 3 Units.
Introduction to the mathematical theory of secure communication. Topics include: classical cryptographic systems; one-way and trapdoor functions; RSA, DSA, and other public key systems; Primality and Factorization algorithms; birthday problem and other attack methods; elliptic curve cryptosystems; introduction to complexity theory; other topics as time permits. Recommended preparation: MATH 303.

MATH 421. Fundamentals of Analysis I. 3 Units.
Abstract mathematical reasoning in the context of analysis in Euclidean space. Introduction to formal reasoning, sets and functions, and the number systems. Sequences and series; Cauchy sequences and convergence. Required for all mathematics majors. Additional work required for graduate students. (May not be taken for graduate credit by graduate students in the Department of Mathematics.) Offered as MATH 321 and MATH 421.

MATH 422. Fundamentals of Analysis II. 3 Units.
Continuation of MATH 321. Point-set topology in metric spaces with attention to n-dimensional space; completeness, compactness, connectedness, and continuity of functions. Topics in sequences, series of functions, uniform convergence, Fourier series and polynomial approximation. Theoretical development of differentiation and Riemann integration. Required for all mathematics majors. Additional work required for graduate students. (May not be taken for graduate credit by graduate students in the Department of Mathematics.) Offered as MATH 322 and MATH 422. Prereq: MATH 321 or MATH 421.
MATH 423. Introduction to Real Analysis I. 3 Units.

MATH 424. Introduction to Real Analysis II. 3 Units.

MATH 425. Complex Analysis I. 3 Units.
Analytic functions. Integration over paths in the complex plane. Index of a point with respect to a closed path; Cauchy's theorem and Cauchy's integral formula; power series representation; open mapping theorem; singularities; Laurent expansion; residue calculus; harmonic functions; Poisson's formula; Riemann mapping theorem. More theoretical and at a higher level than MATH 324. Prereq: MATH 322 or MATH 422.

MATH 426. Geometry and Complex Analysis. 3 Units.
The theme of this course will be the interplay between geometry and complex analysis, algebra and other fields of mathematics. An effort will be made to highlight significant, unexpected connections between major fields, illustrating the unity of mathematics. The choice of text(s) and syllabus itself will be flexible, to be adapted to the range of interests and backgrounds of pre-enrolled students. Possible topics include: the Mobius group and its subgroups, hyperbolic geometry, elliptic functions, Riemann surfaces, applications of conformal mapping, and potential theory in classical physical models. Offered as MATH 326 and MATH 426.

MATH 427. Convexity and Optimization. 3 Units.
Introduction to the theory of convex sets and functions and to the extremes in problems in areas of mathematics where convexity plays a role. Among the topics discussed are basic properties of convex sets (extreme points, facial structure of polytopes), separation theorems, duality and polars, properties of convex functions, minima and maxima of convex functions over convex set, various optimization problems. Offered as MATH 327, MATH 427, and OPRE 427.

MATH 428. Fourier Analysis. 3 Units.

MATH 431. Introduction to Numerical Analysis I. 3 Units.

MATH 432. Numerical Differential Equations. 3 Units.

MATH 433. Numerical Solutions of Nonlinear Systems and Optimization. 3 Units.
The course provides an introduction to numerical solution methods for systems of nonlinear equations and optimization problems. The course is suitable for upper-undergraduate and graduate students with some background in calculus and linear algebra. Knowledge of numerical linear algebra is helpful. Among the topics which will be covered in the course are Nonlinear systems in one variables; Newton's method for nonlinear equations and unconstrained minimization; Quasi-Newton methods; Global convergence of Newton's methods and line searches; Trust region approach; Secant methods; Nonlinear least squares. Prereq: MATH 223 or MATH 227, and MATH 431 or permission.

MATH 434. Optimization of Dynamic Systems. 3 Units.

MATH 435. Ordinary Differential Equations. 3 Units.
A second course in ordinary differential equations. Existence, uniqueness, and continuation of solutions of ODE. Linear systems, fundamental matrix, qualitative methods (phase plane). Dependence on initial data and parameters (Gronwall's inequality, nonlinear variation of parameters). Stability for linear and nonlinear equations, linearization, Poincare-Bendixson theory. Additional topics may include regular and singular perturbation methods, autonomous oscillations, entrainment of forced oscillators, and bifurcations. Prereq: MATH 224 and either MATH 201 or MATH 307.
MATH 439. Integrated Numerical and Statistical Computations. 3 Units.
This course will embed numerical methods into a Bayesian framework. The statistical framework will make it possible to integrate a priori information about the unknowns and the error in the data directly into the most efficient numerical methods. A lot of emphasis will be put on understanding the role of the priors, their encoding into fast numerical solvers, and how to translate qualitative or sample-based information—or lack thereof—into a numerical scheme. Confidence on computed results will also be discussed from a Bayesian perspective, at the light of the given data and a priori information. The course should be of interest to anyone working on signal and image processing statistics, numerical analysis and modeling. Recommended Preparation: MATH 431. Offered as MATH 439 and STAT 439.

MATH 440. Computational Inverse Problems. 3 Units.
This course will introduce various computational methods for solving inverse problems under different conditions. First the classical regularization methods will be introduced, and the computational challenges which they pose, will be addressed. Following this, the statistical methods for solving inverse problems will be studied and their computer implementation discussed. We will combine the two approaches to best exploit their potentials. Applications arising from various areas of science, engineering, and medicine will be discussed throughout the course.

MATH 441. Mathematical Modeling. 3 Units.
Mathematics is a powerful language for describing real world phenomena and providing predictions that are otherwise hard or impossible to obtain. The course gives the students pre-requisites for translating qualitative descriptions given in the professional non-mathematical language into the quantitative language for mathematics. While the variety in the subject matter is wide, some general principles and methodologies that a modeler can pursue are similar in many applications. The course focuses on these similarities. The course is based on representative case studies that are discussed and analyzed in the classroom, the emphasis being on general principles of developing and analyzing mathematical models. The examples will be taken from different fields of science and engineering, including life sciences, environmental sciences, biomedical engineering and physical sciences. Modeling relies increasingly on computation, so the students should have basic skills for using computers and programs like Matlab or Mathematica. Prereq: MATH 224 or MATH 228.

MATH 444. Mathematics of Data Mining and Pattern Recognition. 3 Units.
This course will give an introduction to a class of mathematical and computational methods for the solution of data mining and pattern recognition problems. By understanding the mathematical concepts behind algorithms designed for mining data and identifying patterns, students will be able to modify them suitable for specific applications. Particular emphasis will be given to matrix factorization techniques. The course requirements will include the implementations of the methods in MATLAB and their application to practical problems. Prereq: MATH 201 or MATH 307.

MATH 445. Introduction to Partial Differential Equations. 3 Units.
Method of characteristics for linear and quasilinear equations. Second order equations of elliptic, parabolic, type; initial and boundary value problems. Method of separation of variables, eigenfunction expansions, Sturm-Liouville theory. Fourier, Laplace, Hankel transforms; Bessel functions, Legendre polynomials. Green’s functions. Examples include heat diffusion, Laplace’s equation, wave equations, one dimensional gas dynamics and others. Appropriate for seniors and graduate students in science, engineering, and mathematics. Prereq: MATH 201 or MATH 308 and MATH 224 or MATH 228.

MATH 449. Dynamical Models for Biology and Medicine. 3 Units.
Introduction to discrete and continuous dynamical models with applications to biology and medicine. Topics include: population dynamics and ecology; models of infectious diseases; population genetics and evolution; biological motion (reaction-diffusion and chemotaxis); Molecular and cellular biology (biochemical kinetics, metabolic pathways, immunology). The course will introduce students to the basic mathematical concepts and techniques of dynamical systems theory (equilibria, stability, bifurcations, discrete and continuous dynamics, diffusion and wave propagation, elements of system theory and control). Mathematical exposition is supplemented with introduction to computer tools and techniques (Mathematica, Matlab). Prereq: MATH 224 or MATH 228, or BIOL/EBME 300, and MATH 201.

MATH 461. Introduction to Topology. 3 Units.

MATH 462. Algebraic Topology. 3 Units.
The fundamental group and covering spaces; van Kampen’s theorem. Higher homotopy groups; long-exact sequence of a pair. Homology theory; chain complexes; short and long exact sequences; Mayer-Vietoris sequence. Homology of surfaces and complexes; applications. Prereq: MATH 461.

MATH 465. Differential Geometry. 3 Units.
Manifolds and differential geometry. Vector fields; Riemannian metrics; curvature; intrinsic and extrinsic geometry of surfaces and curves; structural equations of Riemannian geometry; the Gauss-Bonnet theorem. Prereq: MATH 321.

MATH 467. Differentiable Manifolds. 3 Units.
Differentiable manifolds and structures on manifolds. Tangent and cotangent bundle; vector fields; differential forms; tensor calculus; integration and Stokes’ theorem. May include Hamiltonian systems and their formulation on manifolds; symplectic structures; connections and curvature; foliations and integrability. Prereq: MATH 322.

MATH 471. Advanced Engineering Mathematics. 3 Units.
MATH 475. Mathematics of Imaging in Industry and Medicine. 3 Units.
The mathematics of image reconstruction; properties of radon transform, relation to Fourier transform; inversion methods, including convolution, backprojection, rho-filtered layergram, algebraic reconstruction technique (ART), and orthogonal polynomial expansions. Reconstruction from fan beam geometry, limited angle techniques used in MRI; survey of applications. Recommended preparation: PHYS 431 or MATH 471.

MATH 478. Computational Neuroscience. 3 Units.
Computer simulations and mathematical analysis of neurons and neural circuits, and the computational properties of nervous systems. Students are taught a range of models for neurons and neural circuits, and are asked to implement and explore the computational and dynamic properties of these models. The course introduces students to dynamical systems theory for the analysis of neurons and neural learning, models of brain systems, and their relationship to artificial and neural networks. Term project required. Students enrolled in MATH 478 will make arrangements with the instructor to attend additional lectures and complete additional assignments addressing mathematical topics related to the course. Recommended preparation: MATH 223 and MATH 224 or BIOL 300 and BIOL 306. Offered as BIOL 378, COGS 378, MATH 378, BIOL 478, EBME 478, EECS 478, MATH 478 and NEUR 478.

MATH 491. Probability I. 3 Units.

MATH 492. Probability II. 3 Units.

MATH 494. Introduction to Information Theory. 3 Units.
This course is intended as an introduction to information and coding theory with emphasis on the mathematical aspects. It is suitable for advanced undergraduate and graduate students in mathematics, applied mathematics, statistics, physics, computer science and electrical engineering. Course content: Information measures-entropy, relative entropy, mutual information, and their properties. Typical sets and sequences, asymptotic equipartition property, data compression. Channel coding and capacity; channel coding theorem. Differential entropy, Gaussian channel, Shannon-Nyquist theorem. Information theory inequalities (400 level). Additional topics, which may include compressed sensing and elements of quantum information theory. Recommended Preparation: MATH 201 or MATH 307. Offered as MATH 394, EECS 394, MATH 494 and EECS 494.

MATH 499. Special Topics. 3 Units.
Special topics in mathematics.

MATH 528. Analysis Seminar. 1 - 3 Unit.
Continuing seminar on areas of current interest in analysis. Allows graduate and advanced undergraduate students to become involved in research. Topics will reflect interests and expertise of the faculty and may include functional analysis, convexity theory, and their applications. May be taken more than once for credit. Consent of department required.

MATH 535. Applied Mathematics Seminar. 1 - 3 Unit.
Continuing seminar on areas of current interest in applied mathematics. Allows graduate and advanced undergraduate students to become involved in research. Topics will reflect interests and expertise of the faculty and may include topics in applied probability and stochastic processes, continuum mechanics, numerical analysis, mathematical physics or mathematical biology. May be taken more that once for credit.

MATH 549. Mathematical Life Sciences Seminar. 1 - 3 Unit.
Continuing seminar on areas of current interest in the applications of mathematics to the life sciences. Allows graduate and advanced undergraduate students to become involved in research. Topics will reflect interests and expertise of the faculty and may include mathematical biology, computational neuroscience, mathematical modeling of biological systems, models of infectious diseases, computational cell biology, mathematical ecology and mathematical biomedicine broadly constructed. May be taken more than once for credit.

MATH 601. Reading and Research Problems. 1 - 18 Unit.
Presentation of individual research, discussion, and investigation of research papers in a specialized field of mathematics.

MATH 651. Thesis (M.S.). 1 - 18 Unit.

Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
Department of Modern Languages and Literatures

The Department of Modern Languages and Literatures is committed to helping students become informed and liberally educated citizens of the world. Through the acquisition of language skills and cultural awareness, our students prepare for careers that have an international dimension. To that end, we strongly encourage them to spend their junior year abroad in order to immerse themselves in a foreign culture and perfect their language skills. We also run our own study abroad programs: one German program ("The Munich Experience"), two French programs ("The Paris Experience" and "The Montreal Experience"), three Spanish programs ("The Cuban Experience," "The Buenos Aires Experience" and "Advanced Spanish in Spain"), and one in Italy ("The Italian Experience").

We work closely with other university departments and interdisciplinary programs as well as with the cultural institutions of University Circle to provide students with a broad understanding of the many opportunities that language and culture study offer. The department has strong interdisciplinary ties with the college’s programs in Asian studies, French and Francophone studies, German studies, international studies, women’s and gender studies, and world literature. Students also gain practical experience in different cultural and language environments through service learning in the Spanish, French, and Russian communities of Cleveland.

Undergraduate Programs

The Department of Modern Languages and Literatures offers courses of study leading to the Bachelor of Arts in French, German, Japanese Studies, and Spanish. In addition, the department offers minors in Chinese, Hebrew, Italian, and Russian, as well as course work in Arabic and Portuguese. Except in the case of courses cross-listed with the World Literature Program, all courses in modern languages and literatures are taught primarily in the target language. In addition to class meetings, work outside of class with audio materials is an integral part of all elementary and intermediate language courses taught by the department. Career opportunities exist in college and university teaching, translation and interpretation, diplomatic and other government service, business, international nonprofit agencies, and the arts, and are often enhanced by a double major.

Placement Procedure

Students with prior experience in French, German, or Spanish, however gained (e.g., in high school, with or without AP courses, at another institution, via study abroad), must take a placement examination before the first week of the semester in which they enroll in one of those languages. Placement depends both on examination results and on consultation with individual faculty members.

Majors

French, German, Japanese Studies, and Spanish

Majors in French, German, Japanese Studies, and Spanish are expected: 1) to acquire the ability to understand, speak, read, and write the language(s) of their choice; and 2) to develop a sound understanding of the relevant cultures and literatures. The major in French, German, or Spanish consists of 30-32 hours of course work and will vary based on students’ background in the language. The major in Japanese Studies requires a minimum of 35 credit hours. Individual counseling and placement tests are provided by the department.

Course requirements are as follows:

- For students placed into the 200 level: 201-202 and eight courses at the 300 level taught in the target language, or six 300-level courses plus two related courses.
- For students placed into the 300-level: ten 300-level courses taught in the target language, or eight 300-level courses plus two related courses.

Related courses are those outside the department which are closely related to French, German, Japanese, and Spanish cultures, as well as those departmental courses cross-listed with World Literature.

Additional Information for French Major

- Students who take both FRCH 311 and 312 may count only one of these toward the major.
- At least two of the 300-level courses should be numbered above 320 and taught in French.
- At least two courses numbered 320 or higher should be taken in residence at CWRU.
- French courses taught in English end with -5 (FRCH 295, 335, etc.)

Integrated Graduate Studies (French)

The department participates in the Integrated Graduate Studies Program, which makes it possible to complete both a BA and an MA in French in about five years of full-time study. The department particularly recommends the program to qualified students who are interested in seeking admission to highly competitive professional schools or PhD programs. Interested students should note the general requirements and the admission procedures listed elsewhere in the general bulletin.

Additional Information for Spanish Major

- At least three of the 300-level courses should be numbered above 320.

SPAN 370 Special Topics in Spanish ** 3
SPAN 385 Hispanic Literature in Translation ** 3
SPAN 398 Honors Thesis II ** 3
SPAN 399 Independent Study ** 1

* Required only for students who begin their Spanish major at the intermediate level.

** Students at the intermediate (200) level select five courses (15 credit hours); students entering the program at the advanced (300) level select seven courses (21 credit hours).

Departmental Honors
The departmental honors program is for especially dedicated majors. Requirements for honors in modern languages and literatures are: 1) a GPA of at least 3.5 in the major, and 2) an honors thesis (FRCH, GRMN, JAPN, or SPAN 397 and 398, beyond the 30-32 hours required for the major) devoted to the investigation of a literary, linguistic, or cultural topic. The thesis is written in the target language, except in the case of Japanese Studies, which may permit papers in English. It must be read and approved by two readers and will be accepted for honors only if it achieves a grade of B or better. Students who qualify receive their degree “with Honors in Modern Languages and Literatures.” A registration form for students electing honors is available in the departmental office.

Minors
Chinese, French, German, Hebrew, Italian, Japanese Studies, Russian, Spanish

Course requirements for the minors are as follows:

• For students placed into the introductory level (no previous knowledge of the language): 101, 102, 201, 202, and one 300-level course.

• For students placed into the 200 level or higher: five courses at the 200 and 300 levels.

Hebrew language courses may also count toward the minor in Judaic Studies.

Graduate Programs
The department offers the Master of Arts degree in French and, together with the Departments of English and Classics, the Master of Arts degree in world literature.

• The standard MA in French requires 27-28 semester hours. An MA in French with a minor concentration in German, Japanese, or Spanish requires 36 hours.

• The MA in world literature, emphasizing Francophone and Anglophone literature, requires 27 hours.

Full-time students are expected to complete the MA within two academic years.

Department Faculty
Antonio Candau, PhD
(University of Massachusetts, Amherst)
Associate Professor and Chair
19th- to 21st-century Spanish culture; Golden Age literature

Christine M. Cano, PhD
(Yale University)
Associate Professor
20th- and 21st-century French literature and culture

Denise Caterinacci, MA
(Kent State University)
Instructor
Italian language and culture; language pedagogy; the role of motivation in language learning

M. Gabriela Copertari, PhD
(Georgetown University)
Associate Professor
Latin American literature and film, especially Argentinian; women’s writing; the modernista novel

Margaretmary Daley, PhD
(Yale University)
Associate Professor
18th- and 19th-century German literature; German women writers; women’s studies; feminist literary criticism

Gilbert Doho, Docteur d’Etat
(University of the Sorbonne Nouvelle)
Associate Professor
French drama; African Francophone theater and film; people theater and social movements; playwriting; African performing arts

Linda C. Ehrlich, PhD
(University of Hawaii/East-West Center)
Associate Professor
Asian (Japanese) cinema; traditional Asian theatre; set design, landscape architecture, and film; Japanese poetry; literature and film; cinema of Spain

Cristián G. Gómez Olivares, PhD
(University of Iowa)
Assistant Professor
20th century Latin American narrative and poetry

Takao Hagiwara, PhD
(University of British Columbia)
Associate Professor
Japanese literature, especially modern prose and poetry; classical and modern Japanese literature; pre-modern Japanese sensibilities and (post) modernism

Jutta Ittner, PhD
(University of Hamburg)
Associate Professor
20th-century German literature; contemporary women writers; poetry; literary translation; German culture; representation of animals in contemporary literature

Marie Lathers, PhD
(Brown University)
Elizabeth M. and William C. Treuhaft Professor of Humanities
Women and the visual arts; 19th-century French literature and the arts (painting, sculpture, photography, film); gender, science, and technology; feminist theory; space studies

Jacqueline C. Nanfito, PhD
(University of California, Los Angeles)
Associate Professor
Colonial and 19th-century Latin American literature; Golden Age Hispanic literature; literary theory; Chicano literature; contemporary Latin American women writers
Damaris Punales-Alpizar, PhD  
(University of Iowa)  
*Assistant Professor*  
20th-century Latin American literature; Latin American cinema; Cuban cinema; contemporary Cuban and Caribbean narrative; 19th- and 20th-century Latin American poetry; 20th-century peninsular literature

Cheryl Toman, PhD  
(University of Illinois, Urbana-Champaign)  
*Associate Professor*  
African and Middle Eastern Francophone literature, especially Cameroon; women's writing; immigrant communities in France

Susanne Vees-Gulani, PhD  
(University of Illinois, Urbana-Champaign)  
*Associate Professor*  
20th- and 21st-century literature and literary movements; German cultural studies; science and literature; medicine and literature; trauma studies; victim discourses; literary and cultural responses to World War II; German civil defense strategies in World War II

Peter Jianhua Yang, PhD  
(University of Utah)  
*Associate Professor*  
German literature, emphasis on 20th-century German literature; German theater; technology-enhanced language teaching; teaching pedagogy; business German; theatricality

Tatiana Zilotina, PhD  
(University of Virginia)  
*Instructor*  
19th- and 20th-century Russian literature; the poetry of Marina Tsvetaeva; women writers; Russian culture; Russian folklore

**Lecturers**

Man-Lih Chai, MA  
(University of Illinois, Urbana-Champaign)  
*Lecturer* (*Chinese*)

Yoram Daon, MBA  
(Keller Graduate School of Management, DeVry University)  
*Lecturer* (*Hebrew*)

Elena Fernández, MA  
(Cleveland State University)  
*Lecturer* (*Spanish*)

Margaret M. Fitzgerald, MA  
(The Ohio State University)  
*Lecturer* (*Japanese*)

Ramez Islambouli, MA  
(Case Western Reserve University)  
*Lecturer* (*Arabic*)

Yoshiko Kishi, MA  
(New York University)  
*Lecturer* (*Japanese*)

Clara Lipszyz-Arroyo, MA  
(University of Western Ontario)  
*Lecturer* (*Portuguese and Spanish*)

Enno Lohmeyer, PhD  
(University of Kansas)  
*Lecturer* (*German*)

Silvia Marotta, MA  
(Youngstown State University)  
*Lecturer* (*Italian*)

Carolina Perera Olivares, MA  
(University of South Florida)  
*Lecturer* (*Spanish*)

Fabienne Pizot-Haymore, MA  
(Université Paul Valéry, Montpellier III)  
*Lecturer* (*French*)

**ARAB Courses**

**ARAB 101. Beginning Arabic I. 4 Units.**  
The course introduces learners of Arabic to the sound and writing systems of this language and provides them with basic structural and lexical knowledge to enable them to say things in Arabic, such as greeting others, thanking someone, introducing oneself, describing one's background, seeking and providing info and so forth. The ability to perform these language functions in real-life or lifelike situations is developed by engaging the learner in structured functional activities and grammatical exercises.

**ARAB 102. Beginning Arabic II. 4 Units.**  
ARAB 102 builds on the proficiency that students should have acquired in ARAB 101. The course follows a student-centered communicative approach in which class time is used in active learning through pair or group activities, role-play, games, selective listening and reading and other activities. The course emphasizes the four basic skills, reading, speaking, listening and writing. Students will be exposed to real audiovisual material in order to enhance comprehension and they will have to develop short oral and written responses about it. Aspects of culture across the Arab world will be included as a element of learning the language. Recommended preparation: ARAB 101

**ARAB 201. Intermediate Arabic I. 4 Units.**  
Intensive review of grammar and conversational skills in modern Arabic through readings, discussions and other activities that explore contemporary Arab life and culture. Recommended preparation: ARAB 102 or equivalent.

**ARAB 202. Intermediate Arabic II. 4 Units.**  
ARAB 202 is a continuation of ARAB 201 and will enable the students to develop advanced communicative skills for the use of Modern Arabic. It will focus on speaking, listening, reading and writing skills, and emphasize creative use of the language. Recommended preparation: ARAB 201 or equivalent.

**ARAB 301. Advanced Arabic I. 3 Units.**  
This is a higher level of Arabic study. The course objectives are to enhance the student's language skills and to develop ability to use high-level Arabic effectively. It is designed to help students move from the intermediate level of proficiency, which centers on daily life and the immediate world, to the advanced, which broadens to include topics of general and professional interest. Recommended preparation: ARAB 202 or equivalent.

**ARAB 399. Independent Study in Arabic. 1 - 3 Unit.**  
Topics will be constructed to fit the interest of a student who has already taken an advanced course in Arabic. Prereq: ARAB 301.
CHIN Courses

CHIN 101. Elementary Chinese I. 4 Units.
Introductory course in speaking, understanding, reading and writing Chinese. Students are expected to achieve control of the sound system and basic sentence patterns of standard Mandarin Chinese. The course emphasizes speaking and aural comprehension.

CHIN 102. Elementary Chinese II. 4 Units.
Continuation of CHIN 101. Recommended preparation: Consent of department.

CHIN 201. Intermediate Chinese I. 4 Units.
Emphasizes basic structures of standard Mandarin Chinese; helps students improve reading, writing, listening and speaking abilities. Chinese culture, society, and people introduced through supplementary materials and activities. Recommended preparation: CHIN 102 or equivalent.

CHIN 202. Intermediate Chinese II. 4 Units.
Continuation of CHIN 201. Students must use course material offered by the Online Language Learning Center in addition to class meetings. Recommended preparation: CHIN 201.

CHIN 203. Intermediate Chinese III. 4 Units.
As the continuation of CHIN 202, CHIN 203 is the third course at the intermediate level in Chinese language at CWRU. In this course, students focus on conversation combined with further study of grammatical and syntactic rules, and of cultural elements. The objective is a further development of communicative skills in listening, speaking, reading, and writing. Upon completion of this course, students' proficiency will be optimal for entering CHIN 301. The course is a 4 credit course. The course uses integrated Chinese Level 2, Part 1, from the same series of textbooks for CHIN 201 and 202. The course covers 7 lessons of the book, two weeks for each lesson, in average. Students are expected to preview each lesson before class, to complete the assigned homework, and to study after class the content covered that day. The final grade will be based on the mid-term and final exams, and on quizzes. There will be a quiz at the end of each lesson. Chinese word-processing ability is one of the objectives of this course. Students will learn how to type Chinese texts using the Pinyin input method. Prereq: CHIN 202, or two years of study, or requisites not met permission.

CHIN 301. Advanced Chinese I. 4 Units.
Students work to achieve fluency in listening, speaking, reading and writing. Students must attend Language Resource Center in addition to class meetings. Recommended preparation: CHIN 202 or equivalent.

CHIN 302. Advanced Chinese II. 4 Units.
Continuation of CHIN 301.

CHIN 303. Topics in Chinese. 3 Units.

CHIN 304. Topics in Chinese. 3 Units.

CHIN 315. Business Chinese. 3 Units.
The Business Chinese course is designed to enhance students' listening, speaking, reading, and writing skills in Chinese through a variety of activities. It will focus on China’s contemporary international business issues and practices. At the end of the semester, the students will have a basic knowledge of China’s socio-cultural values, trade policy, and role in the world economy after its entry into the WTO and the ability to hold conversations on selected business topics with correct business vocabulary and in a culturally appropriate manner; to read business-related materials; and to write basic business communications including letters, reports and resumes. It is taught in Chinese and English. Offered as CHIN 315 and CHIN 415. Prereq: CHIN 202 or equivalent.

CHIN 399. Independent Study. 1 - 3 Unit.
Directed study for those students who have progressed beyond available course offerings. Prereq: CHIN 202.

FRCH Courses

FRCH 101. Elementary French I. 4 Units.
Emphasizes conversational skills. Students are expected to achieve control of sound system and basic sentence structures of French. Students must complete assignments at the Online Language Learning Center in addition to attending scheduled class meetings.

FRCH 102. Elementary French II. 4 Units.

FRCH 201. Intermediate French I. 4 Units.
Intensive review of grammar and usage through readings, discussions and other activities that emphasize contemporary French life. Students must complete assignments at the Online Language Learning Center in addition to attending scheduled class meetings. Recommended preparation: FRCH 102 or equivalent.

FRCH 202. Intermediate French II. 4 Units.
A continuation of FRCH 201, the course focuses on the acquisition of intermediate-level skills in language and culture. Students must complete assignments at the Online Language Learning Center in addition to attending scheduled class meetings. Recommended preparation: FRCH 201 or equivalent.
FRCH 208. The Montreal Experience. 1 Unit.
One-week immersion learning experience performing community service in Montreal, Canada. Students meet several times for orientation before spending spring break in French-speaking Montreal. Community service may include volunteering in a homeless center, a hospital, or school. Application available from Department office. This course may be repeated once. Permit required. Prereq or Coreq: FRCH 202 or equivalent.

FRCH 295. The Francophone World. 3 Units.
The course offers an introduction to the Francophone World from a historical, cultural, and literary perspective. The Francophone World includes countries and regions around the globe with a substantial French-speaking population (and where French is sometimes, but not always, an official language): North America (Louisiana, Quebec, and Acadia); North Africa (Tunisia, Morocco, Algeria, and Egypt); the Middle-East (Lebanon, Syria); the Caribbean (Martinique, Guadeloupe, Haiti); Southeast Asia (Vietnam); and Europe (France, Belgium, Switzerland, and Luxembourg). FRCH 295 provides a comprehensive overview of the Francophone World, while focusing on a particular area or areas in any given semester. Offered as ETHS 295, FRCH 295, and WLIT 295.

FRCH 308. The Paris Experience. 3 Units.
Three-week immersion learning experience living and studying in Paris. The focus of the course is the literature and culture of the African, Arab, and Asian communities of Paris. Students spend a minimum of fifteen hours per week visiting cultural centers and museums and interviewing authors and students about the immigrant experience. Assigned readings complement course activities. Students enrolled in FRCH 308/408 do coursework in French. WLIT 308/408 students have the option of completing coursework in English. Graduate students have additional course requirements. Offered as FRCH 308, WLIT 308, FRCH 408, and WLIT 408. Prereq: FRCH 202.

FRCH 310. Advanced Composition and Reading. 3 Units.
An initiation to the literature of Francophone expression with a focus on close reading. Texts may include short stories, essays, and novels. Students engage in the discussion of their readings and learn how to express their ideas both orally and in written form. Prereq: FRCH 202 or equivalent.

FRCH 311. Advanced Conversation I. 3 Units.
Designed to enhance pronunciation, speaking and listening-comprehension through the discussion of French literature and media for children. Required for Teacher Licensure candidates. Prereq: FRCH 202 or equivalent.

FRCH 312. Advanced Conversation II. 3 Units.
A functional approach to conversation. Students work to develop fluency in spoken French using current colloquial vocabulary and focusing on current issues. Practice in using speech appropriate to a variety of situations, including public debates. Prereq: FRCH 202 or equivalent.

FRCH 314. Translation Techniques. 3 Units.
Contrastive grammar analysis and stylistics are used to foster linguistic awareness and to introduce students to the methods and skills of translation. Recommended preparation: FRCH 310. Prereq: FRCH 202.

FRCH 315. Business French. 3 Units.
Business French is an upper-level course with a focus on the economic life of France and other Francophone countries. Students gain knowledge of the economic structures and the business organization of Francophone countries as they enhance the linguistic skills used in professional communication. Prereq: FRCH 202 or equivalent.

FRCH 316. Contemporary France. 3 Units.
A study of contemporary France, this course features discussions and lectures on a variety of topics (geography, political and social life, contemporary culture) to develop factual knowledge about France and a sound understanding of current issues as presented in the media. Prereq: FRCH 202 or equivalent.

FRCH 317. French Cinema. 3 Units.

FRCH 318. The Origins of France. 3 Units.
Examination through texts, films, and other media of major historical, intellectual, and artistic influences that have shaped the evolution of French civilization. Students will attempt to identify the values and myths that have contributed to the ongoing formation of modern France. Recommended preparation: FRCH 310. Prereq: FRCH 202.

FRCH 319. Modern France. 3 Units.
A study of France’s political, social and cultural history from the French Revolution to World War II, with emphasis on the events, movements, and people that have shaped Modern France. Highly recommended for students of Nineteenth- and Twentieth-Century French culture. Recommended preparation: FRCH 310. Prereq: FRCH 202.

FRCH 320. Introduction to French Literature. 3 Units.
Taught in French. An introduction to literary analysis through the study of important works of French literature. Written assignments are designed to develop skills in close reading, to introduce students to literary terminology in French, and to develop a capacity for clear, precise communication of an argument. Classes are discussion-based. Recommended preparation: FRCH 310. Prereq: FRCH 202.

FRCH 331. Seventeenth-Century French Literature. 3 Units.
The Age of Classicism, from Racine to Mme de Lafayette. Authors, works and topics may vary. Prereq: FRCH 320.

FRCH 335. Women in Developing Countries. 3 Units.
This course will feature case studies, theory, and literature of current issues concerning women in developing countries primarily of the French-speaking world. Discussion and research topics include matriarchal traditions and FGM in Africa, the Tunisian feminist movement, women, Islam, and tradition in the Middle East, women-centered power structures in India (Kerala, Pondichery), and poverty and women in Vietnam, Laos, and Cambodia. Guest speakers and special projects are important elements of the course. Seminar-style format, taught in English, with significant disciplinary writing in English for WGST, EThS, and some WLIT students, and writing in French for FRCH and WLIT students. Writing assignments include two shorter essays and a substantial research paper. Offered as EThS 335, FRCH 335, WLIT 335, WGST 335, FRCH 435 and WLIT 435.
FRCH 338. The Cameroon Experience. 3 Units.
Three-week immersion learning experience living and studying in Cameroon. The focus of the course is the culture, language, and literature of Francophone Cameroon, with some emphasis on Anglophone Cameroon. Students spend a minimum of fifteen hours per week visiting cultural sites and attending arranged courses at the University of Buea. Students will prepare a research paper. Coursework is in French. To do coursework in English, students should enroll in WLIT 338/438 or ETHS 338/438. Offered as ETHS 338, FRCH 338, WLIT 338, ETHS 438, FRCH 438, and WLIT 438. Prereq: FRCH 202.

FRCH 341. Eighteenth-Century French Literature. 3 Units.
Topics from the Age of Enlightenment, from libertinage to revolution. Authors and works may vary. Offered as FRCH 341 and FRCH 441. Prereq or Coreq: FRCH 320.

FRCH 351. Nineteenth-Century French Literature. 3 Units.
Romanticism, realism, and naturalism in the novel and the dramatic tradition. Authors, works, and topics may vary. Offered as FRCH 351 and FRCH 451. Prereq or Coreq: FRCH 320.

FRCH 361. Twentieth-Century French Literature. 3 Units.
A study of representative novelists (e.g., Proust, Gide, Colette, Sartre, Beauvoir) and playwrights (e.g., Claudel, Beckett, Genet) in historical context. Authors, works, and topics may vary. Offered as FRCH 361 and FRCH 461. Prereq or Coreq: FRCH 320.

FRCH 372. Topics in French Drama. 3 Units.
A topical approach to issues and problems specific to drama. Plays, playwrights, aesthetic theories, and historical periods studied in this course may vary. Offered as FRCH 372 and FRCH 472. Prereq or Coreq: FRCH 320.

FRCH 373. The Novel and the Novella. 3 Units.
A study of narrative fiction focused on either a particular genre (the novel, the short story) or a particular type of novel (psychological novel, realist novel, detective novel), tale (the fantastic tale, the fairytale), or novella. Offered as FRCH 373 and FRCH 473. Prereq or Coreq: FRCH 320.

FRCH 374. Major Writers and Literary Movements. 3 Units.
In-depth study of the work of a major writer, film director, or intellectual figure; or of a significant literary, intellectual, or artistic movement. Approaches, content, and instructor will vary. Offered as FRCH 374 and FRCH 474. Prereq: FRCH 320.

FRCH 375. Francophone Literature. 3 Units.
An examination of Francophone literature focused on the problematics of identity within the colonial and post-colonial context. Writers and works may vary. Offered as FRCH 375 and FRCH 475. Prereq or Coreq: FRCH 320.

FRCH 376. Women Writers. 3 Units.
An examination of important literary texts by French and Francophone women writers. Critical essays are also studied to introduce historical and theoretical perspectives. Offered as FRCH 376 and FRCH 476. Prereq or Coreq: FRCH 320.

FRCH 377. Special Topics. 3 Units.
The special topics course is designed to provide a forum for specific themes or subjects not otherwise covered in the curriculum. Approaches and content will vary. Maximum 6 credits. Offered as FRCH 377 and FRCH 477. Prereq or Coreq: FRCH 320.

FRCH 378. Francophone Literature in Translation. 3 Units.
Topics vary according to student and faculty interest. May include Francophone literature, literature and cinema, women writers, contemporary literature. Counts toward French major only as related course. No knowledge of French required. Offered as FRCH 395, WLIT 395, FRCH 495, and WLIT 495.

FRCH 394. Senior Capstone - French. 3 Units.
The Senior Capstone in French in an independent study project chosen in consultation with a capstone advisor. The capstone project should reflect both the student’s interest within French and/or Francophone Studies and the courses he or she has taken to fulfill the major. The project requires independent research using an approved bibliography and plan of action. In addition to written research, the student will also present the capstone project in a public forum that is agreed upon by the project advisor and the student. Prereq: Senior status required. Major in French or Francophone Studies required.

FRCH 399. Independent Study. 1 - 3 Units.
The course is for students who have special interests and commitments that are not addressed in regular courses, and who wish to work independently.

FRCH 408. The Paris Experience. 3 Units.
Three-week immersion learning experience living and studying in Paris. The focus of the course is the literature and culture of the African, Arab, and Asian communities of Paris. Students spend a minimum of fifteen hours per week visiting cultural centers and museums and interviewing authors and students about the immigrant experience. Assigned readings complement course activities. Students enrolled in FRCH 308/408 or the Paris Experience. Offered as FRCH 308, WLIT 308, FRCH 408, and WLIT 408. Prereq: Graduate standing.

FRCH 435. Women in Developing Countries. 3 Units.
This course will feature case studies, theory, and literature of current issues concerning women in developing countries primarily of the French-speaking world. Discussion and research topics include matriarchal traditions and FGM in Africa, the Tunisian feminist movement, women, Islam, and tradition in the Middle East, women-centered power structures in India (Kerala, Pondichery), and poverty and women in Vietnam, Laos, and Cambodia. Guest speakers and special projects are important elements of the course. Seminar-style format, taught in English, with significant disciplinary writing in English for WGST, ETHS, and some WLIT students, and writing in French for FRCH and WLIT students. Writing assignments include two shorter essays and a substantial research paper. Offered as ETHS 335, FRCH 335, WLIT 335, WGST 335, FRCH 435, and WLIT 435.
FRCH 438. The Cameroon Experience. 3 Units.
Three-week immersion learning experience living and studying in Cameroon. The focus of the course is the culture, literature, and language of Francophone Cameroon, with some emphasis on Anglophone Cameroon. Students spend a minimum of fifteen hours per week visiting cultural sites and attending arranged courses at the University of Buea. Students will prepare a research paper. Coursework is in French. To do coursework in English, students should enroll in WLIT 338/438 or ETHS 338/438. Offered as ETHS 338, FRCH 338, WLIT 338, ETHS 438, FRCH 438, and WLIT 438.

FRCH 441. Eighteenth Century French Literature. 3 Units.
Topics from the Age of Enlightenment, from libertinage to revolution. Authors and works may vary. Offered as FRCH 341 and FRCH 441.

FRCH 451. Nineteenth-Century French Literature. 3 Units.
Romanticism, realism, and naturalism in the novel and the dramatic tradition. Authors, works, and topics may vary. Offered as FRCH 351 and FRCH 451.

FRCH 461. Twentieth-Century French Literature. 3 Units.
A study of representative novelists (e.g., Proust, Gide, Colette, Sartre, Beauvoir) and playwrights (e.g., Claudel, Beckett, Genet) in historical context. Authors, works, and topics may vary. Offered as FRCH 361 and FRCH 461.

FRCH 472. Topics in French Drama. 3 Units.
A topical approach to issues and problems specific to drama. Plays, playwrights, aesthetic theories, and historical periods studied in this course may vary. Offered as FRCH 372 and FRCH 472.

FRCH 473. The Novel and the Novella. 3 Units.
A study of narrative fiction focused on either a particular genre (the novel, the short story) or a particular type of novel (psychological novel, realist novel, detective novel), tale (the fantastic tale, the fairytale), or novella. Offered as FRCH 373 and FRCH 473.

FRCH 474. Major Writers and Literary Movements. 3 Units.
In-depth study of the work of a major writer, film director, or intellectual figure; or of a significant literary, intellectual, or artistic movement. Approaches, content, and instructor will vary. Offered as FRCH 374 and FRCH 474. Prereq: Graduate standing.

FRCH 475. Francophone Literature. 3 Units.
An examination of Francophone literature focused on the problematic of identity within the colonial and post-colonial context. Writers and works may vary. Offered as FRCH 375 and FRCH 475.

FRCH 476. Women Writers. 3 Units.
An examination of important literary texts by French and Francophone women writers. Critical essays are also studied to introduce historical and theoretical perspectives. Offered as FRCH 376 and FRCH 476.

FRCH 477. Special Topics. 3 Units.
The special topics course is designed to provide a forum for specific themes or subjects not otherwise covered in the curriculum. Approaches and content will vary. Maximum 6 credits. Offered as FRCH 377 and FRCH 477.

FRCH 479. French Literature in Translation. 3 Units.
Topics vary according to student and faculty interest. May include Francophone literature, literature and cinema, women writers, contemporary literature. Counts toward French major only as related course. No knowledge of French required. Offered as FRCH 395, WLIT 395, FRCH 495, and WLIT 495. Coreq: Graduate standing.

FRCH 590. Seminar: Topics in Modern Literature and Culture. 3 Units.
French literature and culture since the Revolution of 1789. Topics vary depending on student and instructor interests; may include realism and naturalism, Proust, contemporary film, or French philosophy. Maximum 9 credits. Prereq: Graduate standing.

FRCH 595. Independent Research. 1 - 3 Unit.
Graded independent work on a literary topic arranged individually with the instructor. Prereq: Graduate standing.

FRCH 601. Independent Study. 1 - 18 Unit.
For individual students or larger groups with special interests.

FRCH 651. Thesis M.A.. 6 - 9 Unit.
Thesis M.A. serves the graduate plan A of the Graduate Handbook.

GRMN Courses

GRMN 101. Elementary German I. 4 Units.
Introductory course emphasizing conversational skills. Students achieve control of the sound system and basic sentence structures of spoken and written German. Students must use the course material offered by the Online Language Learning Center in addition to class meetings.

GRMN 102. Elementary German II. 4 Units.
Continuation of GRMN 101, emphasizing conversational skills. Prereq: GRMN 101 or equivalent.

GRMN 201. Intermediate German I. 4 Units.
Emphasizes both language and culture and is taught in German. Review of grammar and usage of German while studying texts and videotapes which focus on contemporary life in Germany. Prereq: GRMN 102 or equivalent.

GRMN 202. Intermediate German II. 4 Units.
Continuation of GRMN 201; conducted in German. Study of texts and videotapes which focus on contemporary life in Germany. Prereq: GRMN 201 or equivalent.

GRMN 303. German Culture & Civilization. 3 Units.
Examines aspects of contemporary Germany, including political and social systems and cultural life through seminar discussions of texts, films, and other media. Along with oral presentations and essay tests, students must select a research topic of interest to the discipline and write an analytic essay in German on the topic. Prereq: GRMN 202.
GRMN 308. The Munich Experience: Spring Course/Summer Study Advanced Level. 3 Units.
A semester seminar class, conducted in German, which culminates with a three-week immersion learning experience spent living and studying in Munich. Students reside with German families, study German daily in a formal setting, and practice comprehension, speaking, reading, and writing. Regular visits to museums, galleries, and cultural events; first-hand observation of history, life, and architecture of a major cultural center; day trips to cultural phenomena and events in the German countryside. Prereq or Coreq: GRMN 202 or equivalent.

GRMN 310. Advanced German Reading and Composition. 3 Units.
An advanced-level skills course focusing on reading and writing for students who have already studied intermediate German. Develops abilities to read authentic, unabridged texts, such as contemporary newspaper and magazine articles; readings increase progressively in length and vary in genre. Also practices composition skills by composing academic prose such as subjective summaries, reviews, precis, letters, short creative texts, and analytic written forms such as short essays to produce increasingly sophisticated analytical compositions in German. Includes instruction on use of English- and German-language research tools, German-German dictionaries, and study guides. Taught in German. Prereq: GRMN 202 or equivalent.

GRMN 311. Advanced Conversation. 3 Units.
Students work to improve fluency in spoken German. Topics include contemporary issues; current vocabulary is stressed. Students practice using speech appropriate to various situations. Prereq: GRMN 202 or equivalent.

GRMN 312. German Proficiency Through Drama. 3 Units.
Readings begin with single scenes and progress to full length radio plays and theater plays which gradually increase in linguistic difficulty and complexity of central themes. Introduction to the elements of drama such as dialogue, character and dramatic structure, as well as the genres of tragedy, comedy, and tragicomedy. Focus: effective communication of critical, interpretative, and analytic ideas in discussion and in writing. Prereq: GRMN 202 or equivalent.

GRMN 313. Intro to German Literature. 3 Units.
Introduction to German literature and the cultural issues it addresses. Readings include the main literary and folk genres (short texts or excerpts), gradually increasing in linguistic difficulty and complexity of central themes. They cover the major literary periods from the 18th to the 21st centuries. Focus: effective communication of critical, interpretative, and analytic ideas in discussion and in writing. Prereq: GRMN 202 or equivalent.

GRMN 315. Business German. 3 Units.
This course is taught in German. It is designed to enhance students’ German listening, speaking, reading, and writing skills through a variety of activities. It also aims at developing students’ cross-cultural awareness and communicative competence in the specialized field of German for Business and Economics in an increasingly global workplace. The course will explore German demography and economic geography; the European Union, the Euro, and Germany’s role in this union; German economic systems, industries, banking systems, advertising and sales, transportation and tourism; Germany’s corporate culture, industrial relations, codetermination in German companies, etc. Prereq: GRMN 202 or equivalent.

GRMN 320. Topics in Narrative. 3 Units.
This course examines representative prose works (tales, novellas, short novels, letters, and essays) chosen to present reactions and impressions to social and aesthetic conditions in German-speaking countries and to introduce students to different styles and varieties of German prose. Prereq: One 300-level GRMN course.

GRMN 326. Witches, Weddings, and Wolves. 3 Units.
Intensive study of German Folk Tales as collected and altered by the Brothers Grimm. The Maerchen as both children’s and adult literature. Prereq: One 300-level GRMN course.

GRMN 330. Topics in German Cinema. 3 Units.
Overview of German Cinema from the beginning to the present. Film selection representative of major directors, major periods (such as expressionism or The New German Cinema), particular themes from different historical perspectives, and literature in film. All films are in German. Taught in German. Prereq: One 300-level GRMN course.

GRMN 340. Topics in German Drama. 3 Units.
Overview of German drama from the beginning to the present. Explores German plays by applying different disciplinary approaches such as historical, cultural, and literary analyses. All plays are in German. Taught in German. Prereq: One 300-level GRMN course.

GRMN 350. Topics in German Lyric. 3 Units.
This course presents a detailed study of German lyric through the frequent writing of critical papers and literary analysis of the formal elements of poetry: rhyme schemes, diction, meter, figures of speech. The poems selected cover a variety of styles, a range of historical periods, and a sampling of authors. Readings and discussions in German. Prereq: One 300-level GRMN course.

GRMN 360. Topics in Major German Authors. 3 Units.
Concentrates on a specific author or small group of authors within an aesthetic or historical context, for example: Goethe, Heine, Bachmann, Junges Deutschland, or die Gruppe 47. Examines the breadth of themes and styles and may include literary, philosophical, biographical, and other kinds of texts. Readings and discussions in German. Prereq: One 300-level GRMN course.

GRMN 365. German Literature in Translation. 3 Units.
Goethe defined “World Literature” (Weltliteratur) as “Intellectual Trade Relations” (geistiger Handelsverkehr). This course gives students the opportunity to study German literary works in translation and thus to trade intellectual relations with a literary culture previously unknown to them. Counts toward the German major only as a related course. No knowledge of German required. Offered as GRMN 365 and WLT 365.

GRMN 367. German Classicism/Romanticism. 3 Units.
Selected works of Goethe, Schiller, Hölderlin, von Kleist, and others. Prereq: One 300-level GRMN course.

GRMN 370. Topics in Literary Periods. 3 Units.
Overview of German literary periods from the beginning to the present. Explores German literary works in all three major genres from the historical, social, and literary perspectives. All works are in German. Taught in German. Prereq: One 300-level GRMN course.
GRMN 380. Topics in Advanced German Culture Studies. 3 Units.
Exploration of the culture of the arts, political culture, and the cultural self-expression of the German-speaking countries from their beginnings to the present. Focus: The cultural changes within certain historical periods. Examination of particular aspects such as culture as mass deception in fascist Germany and the GDR, the reflection of contemporary culture in literature and cinema, problems of cultural identity and multiculturalism, and the role of postmodern culture industry and the critical discourse today. Taught in German. Prereq: One 300-level GRMN course.

GRMN 395. Special Topics in German Literature. 3 Units.
For majors and advanced students upon presentation of a written plan of investigation. Consent of department required. Prereq: One 300-level GRMN course.

GRMN 396. Senior Capstone - German. 3 Units.
The Senior Capstone in German in an independent study project chosen in consultation with a capstone advisor. The capstone project should reflect both the student’s interest within German and/or German studies and the courses he or she has taken to fulfill the major. The project requires independent research using and approved bibliography and plan of action. In addition to written research, the student will also present the capstone project in a public forum that agreed upon by the project advisor and the students. Prereq: Senior status required. Major in German required.

GRMN 397. Honors Thesis I. 3 Units.
Intensive study of a literary, linguistic, or cultural topic with a faculty member, leading to the writing of a research paper in German. Limited to senior majors. Permit required. Prereq: One 300-level GRMN course.

GRMN 398. Honors Thesis II. 3 Units.
Continuation of GRMN 397. Limited to senior majors. Permit required. Prereq: GRMN 397.

GRMN 399. Independent Study in German. 1 - 3 Unit.
For majors and advanced students under special circumstances. Permit required.

HBRW Courses
HBRW 101. Elementary Modern Hebrew I. 4 Units.
The course objective is to enable students to develop basic communicative skills in standard Modern Hebrew. Students will become acquainted with the Hebrew alphabet and vowels, and with basic grammar and vocabulary.

HBRW 102. Elementary Modern Hebrew II. 4 Units.
The course objective is to continue to develop the students’ basic communicative skills in standard Modern Hebrew. Students will be introduced to more complex grammatical constructs, linguistic forms and vocabulary. Prereq: HBRW 101 or consent of department.

HBRW 201. Intermediate Modern Hebrew I. 4 Units.
The course objective is to advance the students’ Hebrew communicative skills by studying the language in its cultural context. The focus will be on speaking, reading, and writing, with an emphasis on the use of the language as reflected in Israeli culture. Prereq: HBRW 102 or consent of department.

HBRW 202. Intermediate Modern Hebrew II. 4 Units.
The course objectives are to enhance and strengthen the students’ Hebrew language skills, and to develop the ability to express thoughts, ideas and opinions freely, in both verbal and written forms. Prereq: HBRW 201 or consent of department.

HBRW 301. Advanced Modern Hebrew I. 3 Units.
The course objectives are to enhance the students’ language skills and to develop their ability to use an advanced level of Hebrew effectively. Classes will be conducted in Hebrew, and will focus on speaking, reading, and writing with an emphasis on active and creative use of the language. Prereq: HBRW 202 or consent of department.

HBRW 302. Advanced Modern Hebrew II. 3 Units.
The course objectives are to enhance the students’ language skills within the domain of Modern Hebrew literature, and to enable them to use their Hebrew skills to perform detailed literary analyses in Hebrew. Classes will be conducted in Hebrew. Prereq: HBRW 301 or consent of department.

HBRW 399. Independent Studies. 1 - 3 Unit.
The course is for students with special interests and commitments that are not fully addressed in regular courses, and who wish to work independently. Prereq: HBRW 301 or consent of department.

ITAL Courses
ITAL 101. Elementary Italian I. 4 Units.
Introductory course; stress on mastery of the sound system and basic sentence structure of spoken and written Italian. Independent laboratory practice is a requirement.

ITAL 102. Elementary Italian II. 4 Units.
Continuation of ITAL 101; independent laboratory practice is required in addition to scheduled class meetings. Prereq: ITAL 101.

ITAL 201. Review and Progress in Italian. 4 Units.
Emphasizes language and culture. Review of Italian grammar and usage while studying written forms. Independent laboratory practice is required in addition to scheduled class meetings. Prereq: ITAL 102 or equivalent.

ITAL 202. Read and Discuss Italian Texts. 4 Units.
Focus on increasing proficiency acquired in elementary Italian and on mastering short narratives. Review of Italian grammar and usage through reading, conversation, and media. Independent laboratory practice is required in addition to scheduled class meetings. Prereq: ITAL 201 or equivalent.
ITAL 308. The Italian Experience. 3 Units.
A three-week summer study abroad course spent at a university in an Italian city well-known for its cultural and linguistic heritage and at other important sites during travel. Focus: Language immersion and processing of cultural experience. Main features: 1. Intense collaboration with an Italian university. Students interact with Italian peers; seminars are co-taught by Italian faculty. 2. Creation of an individual journal that synthesizes students’ perception of and reflections on their experience, records the progress of their final project, and documents their improvement in language proficiency. 3. Final project. Students meet M-F in a formal setting for advanced language study designed to improve proficiency in speaking, comprehension, reading, and writing. They attend seminars on varied topics in literature, history, and civilization. Visits to museums, galleries, and attendance at cultural events are included. Prereq: ITAL 202 or equivalent.

ITAL 311. Conversation in Italian. 3 Units.
Focused on oral communication, ITAL 311 is designed to enhance listening/comprehension skills in Italian. Using audio-visual materials, students acquire the skills necessary to understand conversations between native-speakers and to emulate them. The situational and functional approach to the course facilitates progress towards advanced-level fluency in Italian. Prereq: ITAL 202 or equivalent.

ITAL 370. Special Topics in Italian Literature. 3 Units.
Special topics in Italian literature, literary criticism, and culture. Prereq: ITAL 202 or equivalent.

ITAL 399. Independent Study. 1 - 3 Unit.
The course is for students with special interests and commitments that are not fully addressed in regular courses, and who wish to work independently.

JAPN Courses

JAPN 101. Elementary Japanese I. 4 Units.
Introduction to understanding, speaking, reading, and writing Japanese. Students learn to read and write hiragana and katakana syllabaries and 50 kanji characters. Students are expected to achieve control of the sound system and basic structure of the language. Emphasizes aural comprehension and speaking.

JAPN 102. Elementary Japanese II. 4 Units.

JAPN 201. Intermediate Japanese I. 4 Units.
Further study of fundamental structures of Japanese. Students improve aural comprehension, speaking, reading, and writing abilities and learn approximately 100 new characters. Recommended preparation: JAPN 102 or equivalent.

JAPN 202. Intermediate Japanese II. 4 Units.
Continuation of JAPN 201. Students learn an additional 100 kanji characters. With the completion of JAPN 201 - 202, students should have control of the fundamentals of modern Japanese and a firm foundation in the writing system. Recommended preparation: JAPN 201 or equivalent.

JAPN 203. Japanese Women Writers. 3 Units.
Recommended preparation: JAPN 301 or equivalent. This course highlights salient aspects of modern Japanese popular culture as expressed in animation, comics and literature. The works examined include films by Hayao Miyazaki, writings by Kenji Miyazawa, Haruki Murakami and Banana Yoshimoto, among others. The course introduces students to essential aspects of modern Japanese popular culture and sensibility. Offered as JAPN 225 and WLIT 225.

JAPN 204. Classical Japanese Literature in Translation. 3 Units.
Readings, in English translation, of classical Japanese poetry, essays, narratives, and drama to illustrate essential aspects of Japanese culture and sensibility before the Meiji Restoration (1868). Lectures explore the sociohistorical contexts and the character of major literary genres; discussions focus on interpreting the central images of human value within each period. Japanese sensibilities compared to and contrasted with those of Western and other cultures. Offered as JAPN 245 and WLIT 245.

JAPN 205. Modern Japanese Literature in Translation. 3 Units.
Focus on the major genres of modern Japanese literature, including poetry, short story, and novel (shosetsu). No knowledge of Japanese language or history is assumed. Lectures, readings, and discussions are in English. Films and slides complement course readings. Offered as JAPN 255 and WLIT 255.

JAPN 301. Advanced Japanese I. 4 Units.
Emphasizes conversational proficiency and reading. Students must use the course material offered by the Online Language Learning Center in addition to class meetings. Recommended preparation: JAPN 202 or equivalent.

JAPN 302. Advanced Japanese II. 4 Units.
Continuation of JAPN 301; emphasizes conversational proficiency and reading. Japanese life and culture introduced through supplemental materials and activities. Students must use the course material offered by the Online Language Learning Center in addition to class meetings. Recommended preparation: JAPN 301 or equivalent.

JAPN 345. Japanese Women Writers. 3 Units.
Contributions of women writers to the literature of pre-modern and modern Japan; investigations of how their works exemplify and diverge from "mainstream" literary practices. Emphasis on the social and cultural contexts of the texts. Offered as JAPN 345 and WLIT 345.

JAPN 350. Contemporary Japanese Texts I. 3 Units.
The primary aim of this course is to develop communication skills in Japanese based on those that the students have acquired in JAPN 302 or equivalent. The students will read and discuss various texts such as daily conversations, essays, and news scripts with the assistance of vocabulary and kanji (Chinese character) lists and formal grammar explanations. Attention also will be given to enhancing the students’ writing and aural/oral proficiencies through regularly assigned homework, presentations, tape listening, video viewing, and classroom discussion. Recommended preparation: JAPN 302 or equivalent.
JAPN 351. Contemporary Japanese Texts II. 3 Units.
This course is a continuation of JAPN 350 and its primary aim overlaps with that of JAPN 350: to develop more sophisticated communication skills in Japanese. Students will read and discuss various texts such as daily conversations, essays, and news scripts largely with the assistance of vocabulary and kanji (Chinese character) lists. Attention will be given to enhancing the students’ writing and aural/oral proficiencies through regularly assigned homework, presentations, tape listening, video viewing, and classroom discussion. Prereq: JAPN 350 or consent of instructor.

JAPN 355. Modern Japanese Novels and the West. 3 Units.
This course will compare modern Japanese and Western novelas, drama, and novels. Comparisons will focus on the themes of family, gender and alienation, which subsume a number of interrelated sub-themes such as marriage, home, human sexuality, amae (dependence), innocence, experience, death, God/gods, and nature (the ecosystem). Offered as JAPN 355, WLIT 355.

JAPN 356. Senior Capstone - Japanese. 3 Units.
The Senior Capstone in Japanese is an independent study project chosen in consultation with a capstone advisor. The capstone project should reflect both the student’s interest within Japanese and the courses he or she has taken to fulfill the major. The project requires independent research using an approved bibliography and plan of action. In addition to written research, the student will also present the capstone project in a public forum that is agreed upon by the project advisor and the student. Prereq: Senior status required. Major in Japanese required.

JAPN 357. Senior Thesis I. 3 Units.
Intensive study of a literary, linguistic, or cultural topic with a faculty member, leading to the writing of a research paper in English or Japanese. Limited to senior majors. Permit required.

JAPN 358. Senior Thesis II. 3 Units.
Continuation of JAPN 357. Limited to senior majors. Prereq: JAPN 357.

JAPN 359. Independent Study. 1 - 3 Unit.
Directed study for students who have progressed beyond available course offerings.

JAPN 360. Japanese in Cultural Context I. 3 Units.
The primary aim of this graduate course is to develop sophisticated communication skills (listening, speaking, reading, and writing) in Japanese. The students will read and discuss various texts in the original, such as essays, news scripts, and literary works. Classroom instruction and discussion will be conducted in Japanese. The students also will be required to write a research paper of 4000-6000 letters/characters (10-15 genkoyoshi pages) in Japanese on a topic related to Japan and the student’s specialty. Recommended preparation: JAPN 351 or equivalent.

JAPN 361. Japanese in Cultural Context II. 3 Units.
This course is a continuation of JAPN 360 and it aims at a further development of sophisticated communication skills (listening, speaking, reading, and writing) in Japanese. The students will read and discuss various texts in the original, such as essays, news scripts, and literary works both classical and modern. Classroom instruction and discussion will be conducted in Japanese. The students also will be required to write a research paper of 6000-8000 letters/characters (15-20 genkoyoshi pages) in Japanese on a topic related to Japan and the student’s specialty. Recommended preparation: JAPN 450 or equivalent.

MLIT Courses

MLIT 315. Mysticism and Literature. 3 Units.
This co-taught seminar will explore and compare mystical elements in selected literary and theoretical works from the West and the East. Comparisons will focus on a number of interrelated sub-themes such as mind, language, alienation, innocence, experience, life, death, cosmogony, cosmology, good, evil, God/gods, and nature (the ecosystem). Offered as MLIT 315, WLIT 315, MLIT 415 and WLIT 415.

MLIT 325. Seminar in Cognitive Poetics and Text Analysis. 3 Units.
This seminar will cover the methodology of text analysis and the theory of cognitive poetics. The latter includes the study of formal semantic structures occurring in the primarily aesthetic aspects of written language. The seminar will cover narratology, metaphor, metonymy, and related conceptual phenomena in texts and discourse. Offered as MLIT 325 and MLIT 425.

MLIT 327. Gesture in Cognition and Communication. 3 Units.
Most people never notice that when they are talking, they’re also gesturing. Why do we produce these gestures? What can studying them tell us about the human mind? This course surveys scientific research on gesture, exploring topics such as the role of gesture in communication, cross-cultural differences in gesture, and the relationship between gesture and signed languages. The course will focus on gestures produced with speech, but will cover symbolic and ritualized gesture in the visual arts and in dance. Offered as COGS 327 and COGS 427 and MLIT 327.

MLIT 328. Seminar in Intercultural Communication: A Multilingual Media Approach. 3 Units.
This seminar will study communication, especially news communication, through current media in different languages and cultures. It will compare discourse, terminology, vocabulary, and general rhetorical features of the genres of media-borne languages taught in the department. It will enhance the student’s general knowledge of contemporary use of discourse in the foreign language.

MLIT 415. Mysticism and Literature. 3 Units.
This co-taught seminar will explore and compare mystical elements in selected literary and theoretical works from the West and the East. Comparisons will focus on a number of interrelated sub-themes such as mind, language, alienation, innocence, experience, life, death, cosmogony, cosmology, good, evil, God/gods, and nature (the ecosystem). Offered as MLIT 315, WLIT 315, MLIT 415 and WLIT 415.

MLIT 425. Seminar in Cognitive Poetics and Text Analysis. 3 Units.
This seminar will cover the methodology of text analysis and the theory of cognitive poetics. The latter includes the study of formal semantic structures occurring in the primarily aesthetic aspects of written language. The seminar will cover narratology, metaphor, metonymy, and related conceptual phenomena in texts and discourse. Offered as MLIT 325 and MLIT 425.

PORT Courses

PORT 101. Elementary Portuguese I. 4 Units.
Introductory course. Students achieve control of the sound system and basic sentence structures of spoken and written Portuguese. Students use materials offered through the Language Center in addition to class meetings.
PORT 102. Elementary Portuguese II. 4 Units.
Continuation of PORT 101, emphasizing conversational skills. Prereq: PORT 101 or equivalent.

PORT 201. Intermediate Portuguese I. 4 Units.
PORT 201 is an intermediate language course. It assumes a fair knowledge of basic grammar that is reviewed and expanded. The course needs the student to show a strong determination to engage in conversation in Portuguese, and to commit to develop better writing in Portuguese. The student learns more about cultural aspects in the Portuguese-speaking world. The course is taught completely in Portuguese. Prereq: PORT 102 or equivalent.

PORT 399. Independent Study. 1 - 3 Unit.
This course is for students with special interests and commitments that are not addressed in regular courses and who wish to work independently.

RUSN Courses

RUSN 101. Elementary Russian I. 4 Units.
Introductory course emphasizing conversational skills. Students achieve control of alphabet, sound system, and basic sentence structures in spoken and written Russian. Students must use the course material offered by the Online Language Learning Center in addition to class meetings.

RUSN 102. Elementary Russian II. 4 Units.

RUSN 201. Intermediate Russian. 4 Units.
Furthers students’ ability in four basic language skills: understanding, speaking, reading and writing; expands knowledge of Russian grammar and vocabulary. Recommended preparation: RUSN 102.

RUSN 202. Introduction to Contemporary Civilization. 4 Units.
Continuation of RUSN 201; introduces contemporary Russian culture through readings and discussion. Recommended preparation: RUSN 201.

RUSN 311. Advanced Conversation. 3 Units.
Students work to improve fluency in spoken Russian. Topics of conversation include aspects of contemporary civilization; current vocabulary is stressed. Recommended preparation: RUSN 202.

RUSN 319. Life in Modern Russia. 3 Units.
Examines aspects of life in modern Russia, between the 1917 Revolution and the present, including political and social systems and cultural life through the study of texts, films and other media. Recommended preparation: RUSN 202.

RUSN 320. Introduction to Russian Literature. 3 Units.
Introduction to major literary movements, principal writers, and outstanding works of Russian literary works. Recommended preparation: RUSN 202 or equivalent.

RUSN 375. Russian Literature in Translation. 3 Units.
Topics vary according to student and faculty interest. May include Russian classical and modern literature, cinema, women writers, individual authors. May count towards Russian minor. No knowledge of Russian required. Offered as RUSN 375 and WLIT 375.

RUSN 399. Independent Study. 1 - 3 Unit.

SPAN Courses

SPAN 101. Elementary Spanish I. 4 Units.
Introductory course. Students achieve control of the sound system and basic sentence structures of spoken and written Spanish. Students must use the course material offered by the Online Language Learning Center in addition to class meetings.

SPAN 102. Elementary Spanish II. 4 Units.
Continuation of SPAN 101, emphasizing conversational skills. Recommended preparation: SPAN 101.

SPAN 201. Intermediate Spanish I. 4 Units.
Intensive review of grammar and usage through readings, discussions, and other activities. Recommended preparation: SPAN 102 or equivalent.

SPAN 202. Intermediate Spanish II. 4 Units.
Continues grammar review of SPAN 201. Students will study texts and cultural documents which focus on contemporary life in Hispanic countries. Recommended preparation: SPAN 201 or equivalent.

SPAN 285. The Hispanophone World. 3 Units.
A survey of the imaginative literatures in a variety of genres from the Spanish-speaking world, including texts authored by Hispanics living in the United States. The selections will help students gain a greater understanding and appreciation of the impact and adaptation of Spanish language and culture among widely diverse populations of the world over the past centuries. Counts towards Spanish major as related course. No knowledge of Spanish required. Offered as SPAN 285 and WLIT 285.

SPAN 305. Spanish for Political Science and International Relations. 3 Units.
Spanish 305 is an upper-level Spanish language course designed to give students interested in political science and international relations specific field-related vocabulary and cultural information not found in basic textbooks. The course is divided into two parts: the first deals with political science; the second with international relations. Readings, discussions, and lectures are conducted in Spanish. Prereq: SPAN 202 or requisites not met permission.
SPAN 306. The Cuban Experience: an immersion in its culture and society. 3 Units.
This is a three week study-abroad intensive course that takes place at Editorial Vigía, in Matanzas, Cuba. The course combines the unique advantages of a total immersion environment in Spanish with a classroom curriculum that includes conversation practice and study of relevant cultural, literary and historical issues. Students complete three hours of classroom instruction and an hour and a half of publishing workshop four days per week. In this workshop, they work in the edition of a bilingual book. In addition, they participate in organized visits to historic sites and museums connected to the culture curriculum. The focus of the culture curriculum is the study of Cuban history and culture through its literature, visual arts, films, and music. After applying and being accepted in the program, students meet for personal advising with the program director and attend four different one hour orientation-information meetings in the spring semester. After successful completion of the study-abroad program, students receive 3 upper-level credits in Spanish. The course is interdisciplinary in approach and provides students with the tools they need to analyze and understand the complexities of modern Cuba. Students will have formal classes taught by their professor and talks and meetings with specialists on Cuban literature, art, architecture, history and other aspects of culture and society. In addition, they will attend lectures, participate in discussions, and take field trips that will expose them to many aspects of Cuban culture, such as art, architecture, music, dance, film, literature, artisan work, folklore, history and urban growth. Offered as SPAN 306, SPAN 406, and ETHS 306. Prereq: SPAN 202.

SPAN 307. Spanish Phonetics and Phonology. 3 Units.
Spanish Phonetics and Phonology is designed to introduce students to the study and practice of the sound system of Spanish. The course will focus on the articulatory descriptions of native pronunciations, the differences between letters and sounds, and the classification of sounds. The course will focus mainly on the sounds of Spanish but will also include the differences with English Language sounds. It will also develop awareness of the different dialectal variations of Spanish across the world. In addition, cultural competency will be achieved through a contextualized approach. The main goal of this course is to improve pronunciation and intonation in Spanish with special emphasis in the production of native-like sounds. Prereq: SPAN 202.

SPAN 308. Advanced Spanish in Spain. 3 Units.
Three week study-abroad intensive course that takes place in Valladolid, Spain. The course combines the unique advantages of a total immersion environment in Spanish with a classroom curriculum that includes grammar review, conversation practice, and study of relevant cultural issues. The focus of the culture curriculum is the study of Spain’s key historical moments through the city of Valladolid and nearby communities: their literature, visual arts, films, and music. The cultural component is enhanced by visits to historic and cultural sites and museums. Four different one-hour orientation meetings during Spring semester. Prereq: SPAN 202 or equivalent.

SPAN 309. The Buenos Aires Experience. 3 Units.
Three week study-abroad intensive course that takes place in Buenos Aires, Argentina. The course combines the unique advantages of a total immersion environment in Spanish with a classroom curriculum that includes grammar review, conversation practice, and study of relevant cultural issues. The focus of the culture curriculum is the study of the city of Buenos Aires’ history and culture through its literature, visual arts, films, and music. The cultural component is enhanced by visits to historic and cultural sites and museums. Four different one-hour orientation meetings during Spring semester. Prereq: SPAN 202 or equivalent.

SPAN 310. Advanced Composition and Reading. 3 Units.
Designed to facilitate the transition between lower and upper division courses in Spanish, and focus upon the simultaneous development of the reading and writing skills expected of students in all advanced Spanish courses. Prereq: SPAN 202.

SPAN 311. Advanced Spanish Conversation. 3 Units.
Engages students in conversation so that they develop oral proficiency. Short essays and newspaper articles dealing with everyday activities, socio-cultural roles and experiences, and self-awareness and life goals discussed; some literary materials discussed. Prereq: SPAN 202.

SPAN 312. Business Spanish. 3 Units.
Spanish for business is an upper-level language and culture course which is designed for students at the advance intermediate level. The course stresses the vocabulary and expressions used to describe economic and commercial structure, the language to solve problems and conduct negotiations, and the culture of specific aspects of the Spanish world of the business. Students will continue being exposed to listening, speaking, reading and writing through a variety of activities. Prereq: SPAN 202 or permission.

SPAN 313. Spanish for Health Professionals. 3 Units.
Designed for students who are majoring in, or considering a major in, a health-related field. Focus on the vocabulary and expressions needed for the workplace, task-based practical skills, and grammatical structures. Prereq: SPAN 202 or equivalent.

SPAN 314. Practice of Translation. 3 Units.
Students learn necessary skills and techniques for solving linguistic problems in translation. Texts with a variety of contents, including articles from current press, will be translated from English into Spanish and occasionally from Spanish into English. Prereq: SPAN 202.

SPAN 315. Latin American Cultural Conflicts. 3 Units.
Evolution of Latin American socioeconomic characteristics and artistic production up to the present. Class discussions of diverse literary works, social research essays, and testimonials focus on conflicting elements in class structures, ethnicity, and urban modernization as well as family ethos, religious trends, cultural identity, and educational problems. Prereq: SPAN 202.

SPAN 316. Studies in Civilization. 3 Units.
Major historical, intellectual, and artistic influences that have shaped the evolution of Spanish civilization. Prereq: SPAN 202.
SPAN 317. Contemporary Latin American Culture. 3 Units.
An intensive study of Latin American culture and civilization through the examination of its arts: literature, music, film, painting, photography, popular art. Designed to bring together the various strands of Latin American realities, emphasis is placed on the predominant view among Latin American intellectuals that artists and intellectuals have the power and the obligation to modify society. Prereq: SPAN 202.

SPAN 318. Contemporary Spanish Culture. 3 Units.
Study of several key historical moments and several key aspects in contemporary Spain: Spanish civil war, Franco's dictatorship, and democratic Spain; rural-urban differences, industrialization and migratory movements; nationalism and terrorism; foreign immigration and tourism, the cultural renaissance and the cultural wars in Madrid and Barcelona. Feature films and literary texts will illustrate the issues under study. Prereq: SPAN 202.

SPAN 319. Spanish for Legal Professionals. 3 Units.
Spanish for Legal Professionals is designed to familiarize students with technical language, legal topics, and documents used in legal professions. The course will focus in the American common law system but will also include comparison with the civil law tradition as applied in Latin America. It will also develop oral and written communication skills in order to improve the communication with Spanish speaking clients and the Hispanic community as required. In addition, cultural competency will be achieved through a contextualized approach. This course reviews the grammar studied in previous courses and promotes class discussions and includes readings as well as translation of legal documents. Prereq: SPAN 202 or equivalent.

SPAN 320. Introduction to Readings in Hispanic Literature. 3 Units.
Introduction to major literary movements and genres, and the works of outstanding authors of Spanish and Latin American literature through close readings and seminar-based discussions of the texts, as well as to disciplinary modes of inquiry and presentation. Requirements include active participation in seminar discussions, oral presentations, tests, and several written assignments, such as response papers, in-class writing exercises, and an analytic essay in Spanish on a research topic of interest to the discipline. Prereq: SPAN 202.

SPAN 321. Spanish Golden Age Literature. 3 Units.
The history and development of the Latin American short story from the nineteenth century to the present. Intertextuality, rise of the Nuevo Cuento, and major characteristics of the works. Prereq: SPAN 320.

SPAN 322. Latin American Short Story. 3 Units.
The history and development of the Latin American short story from the nineteenth century to the present. Intertextuality, rise of the Nuevo Cuento, and major characteristics of the works. Prereq: SPAN 320.

SPAN 325. Hispanic Intellectuals and Society: A Critical Approach. 3 Units.
This course offers an overview of the most important critical approaches to Spanish American culture and literature, with a socio-historical emphasis. Some of the authors we will discuss are Angel Rama, Jose Antonio Cornejo Polar and Nestor Garcia Canclini. We will analyze how the Latin American intellectuals had thought about specific issues such as identity, race, ideology, colonial and post-colonial relations with the metropolis and the process of formation of the nations in the continent. The class, the discussions, exams, oral presentations and papers will be in Spanish. Some of the readings must be in English, but most of them will be in Spanish. Prereq: SPAN 320.

SPAN 326. The Fantastic in Latin American Prose. 3 Units.
Introduction to a distinctive trend in contemporary Latin American literature, the prose portrayal of the "fantastic," a new narrative mode in Latin America. Critical examination of selected texts reveals new concepts of space and time and an increasing complexity of structure and style, one which juxtaposes and analyzes fantasy and reality. Offered as SPAN 326 and SPAN 426. Prereq: SPAN 320.

SPAN 331. Spanish Golden Age Literature. 3 Units.
Through close reading and discussion of representative texts, we will study different examples of Spanish and Latin American writing from the Middle Ages, Renaissance and Baroque periods. We will stress connections between Spain and Latin America, as well as cultural and literary topics of special relevance for contemporary Hispanic cultures. Prereq: SPAN 320.

SPAN 332. Contemporary Caribbean Literature. 3 Units.
In addition to developing a general familiarity with the literature and history of this region, students will acquire an awareness of the interrelationship of national identity, memory, and language in the texts produced by contemporary Caribbean authors, and of the cultural hybridity characteristic of this production. The themes treated by these authors include colonialism and postcolonialism, cultural and religious syncretism, and sexual politics. Prereq: SPAN 320.

SPAN 333. Contemporary Caribbean Literature. 3 Units.
An introduction to Chicana/o literature written after 1943. Literary history, clarification of linguistic terminology, and an examination of the cultural components of each work. Readings, discussions, and lectures in Spanish. Prereq: SPAN 320.

SPAN 339. Latin American Poetic Revolt. 3 Units.
Introduction to most important poets in contemporary Latin America, a region home to a significant number of eminent poets, including Nobel Laureates from Chile, Gabriela Mistral and Pablo Neruda. The course focuses on detailed textual analysis of pivotal works, combined with historical-literary perspective, so students gain insight into the diverse styles and tendencies that reflect the tumultuous history of poetry’s development in a relentless search for a Latin American cultural identity. Prereq: SPAN 320.

SPAN 340. Contemporary Latin-American Narrative. 3 Units.
Students explore the most significant narrative techniques since 1945 in Latin American fiction: Borges, Cortazar, Garcia Marquez, Vargas Llosa, Isabel Allende. Prereq: SPAN 320.

SPAN 342. Latin American Feminist Voices. 3 Units.
Examination of the awakening of feminine and feminist consciousness in the literary production of Latin American women writers, particularly from the 1920s to the present. Close attention paid to the dominant themes of love and dependency; imagination as evasion; alienation and rebellion; sexuality and power; the search for identity and the self-preservation of subjectivity. Readings include prose, poetry, and dramatic texts of female Latin American writers contributing to the emerging of feminist ideologies and the mapping of feminist identities. Offered as SPAN 342, SPAN 442, ETHS 342, WGST 342, WLIT 342, and WLIT 442. Prereq: SPAN 320.
SPAN 343. The New Drama in Latin American. 3 Units.
Representative works of contemporary Latin American drama. Critical examination of selected dramatic works of twentieth-century Latin America provides students insight into the nature of drama and into the structural and stylistic strategies utilized by Latin American dramatists to create the "new theater," one which is closely related to Latin American political history. Prereq: SPAN 320.

SPAN 345. Hispanic Autobiographical Writing. 3 Units.
The course studies issues of self-representation through the reading of autobiographical works from different periods from Latin America, Spain, and the U.S., and of theoretical works that address topics of first-person narratives, autobiography, and sub-alternity. IT SATISFIES GLOBAL AND CULTURAL DIVERSITY REQUIREMENT. Offered as SPAN 345 and SPAN 445. Prereq: SPAN 320.

SPAN 350. Spanish Fiction. 3 Units.
Narrative masterpieces from Cervantes and the picaresque (El Lazarillo) to the short stories and novels of 19th and 20th century authors. Prereq: SPAN 320.

SPAN 351. Hispanic Turn of the Century Literature. 3 Units.
Cultural and political transitions between 19th and 20th Century, between Spain and Latin America, and between literary models. Study of Spanish and Latin American writers and their literary connections (Generation of 1898, modernistas) in the context of colonial conflicts and economic changes. Offered as SPAN 351 and SPAN 451. Prereq: SPAN 320.

SPAN 353. Transatlantic Vanguard. 3 Units.
Presentation of transatlantic tendencies of the early vanguard movements represented by poets from Spain, Central and South America. Beginning with the advent of Modernism in Latin America and Symbolism in Spain, this course will trace the development of resulting movements in the early twentieth century. Surrealism, Creationism, Futurism, Ultralism and Dadaism forged a vital link between poets and artists from the Americas and their European counterparts. We will focus on the similarities and differences between these "isms" while drawing conclusions about the uniqueness of vanguard movements on both sides of the Atlantic. Offered as SPAN 353 and SPAN 453. Prereq: SPAN 320.

SPAN 356. Afro-Hispanic Literature. 3 Units.
This course will survey the literary and cultural production of writers and artists of African descent in Latin America and the Caribbean, paying attention to both their creative and theoretical texts. Discussion of questions of race and ethnicity will allow students to explore the ways in which these texts reformulate the idea of national identity and cultural belonging in the context of the nation-state, whose traditional centrality is being weakened through the effects of migration and exile. Readings include works by writers from Cuba, Puerto Rico, Dominican Republic, Costa Rica, Colombia, Panama, Ecuador, and Peru. Prereq: SPAN 320 or equivalent.

SPAN 358. Latin American Cinema. 3 Units.
This course is designed to introduce students to the basic tools of film analysis as well as to the major trends and movements in Latin American cinema from the 1960s to the present. Through the analysis of representative films from Latin America, the course will examine the development of a variety of cinematic styles, paying particular attention to the historical contexts in which the films were produced and to the political, cultural, and aesthetic debates that surrounded their production. Prereq: SPAN 320 or equivalent.

SPAN 370. Special Topics in Spanish. 3 Units.
This course is designed to respond to students' and faculty interest in specific themes or issues not otherwise covered in the curriculum. Approaches, content, and instructor will vary and this course may have a focus that crosses generic, artistic, historical, disciplinary, and geographical boundaries. The honing of analytical and interpretative skills as well as the further development of Spanish language skills also are integral objectives of this course. The class is conducted in Spanish. Prereq: SPAN 320 or equivalent.

SPAN 385. Hispanic Literature in Translation. 3 Units.
Critical analysis and appreciation of representative literary masterpieces from Spain and Latin America, and by Hispanics living in the U.S. Texts cover a variety of genres and a range of literary periods, from works by Cervantes to those of Gabriel Garcia Marquez. The course will examine the relationship between literature and other forms of artistic production, as well as the development of the Hispanic literary text within the context of historical events and cultural production of the period. Counts toward Spanish major only as related course. No knowledge of Spanish required. Offered as ETNS 385, ETNS 485, SPAN 385, SPAN 485, WLIT 385, and WLIT 485.

SPAN 396. Senior Capstone - Spanish. 3 Units.
The Senior Capstone in Spanish in an independent study project chosen in consultation with a capstone advisor. The capstone project should reflect both the student’s interest within Spanish and the courses he or she has taken to fulfill the major. The project requires independent research using an approved bibliography and plan of action. In addition to written research, the student will also present the capstone project in a public forum that is agreed upon by the project advisor and the student. Senior status required. Major in Spanish required.

SPAN 397. Honors Thesis I. 3 Units.
Intensive study of a literary, linguistic, or cultural topic with a faculty member, leading to the writing of a research paper in Spanish. Limited to senior majors.

SPAN 398. Honors Thesis II. 3 Units.
Continuation of SPAN 397. Limited to senior majors. Permit required. Prereq: SPAN 397.

SPAN 399. Independent Study. 1 - 3 Unit.
The course is for students with special interests and commitments that are not fully addressed in regular courses, and who wish to work independently.
SPAN 406. The Cuban Experience: an immersion in its culture and society. 3 Units.
This is a three week study-abroad intensive course that takes place at Editorial Vigía, in Matanzas, Cuba. The course combines the unique advantages of a total immersion environment in Spanish with a classroom curriculum that includes conversation practice and study of relevant cultural, literacy and historical issues. Students complete three hours of classroom instruction and an hour and a half of publishing workshop four days per week. In addition, they participate in organized visits to historic sites and museums connected to the culture curriculum. The focus of the culture curriculum is the study of Cuban history and culture through its literature, visual arts, films, and music. After applying and being accepted in the program, students meet for personal advising with the program director and attend four different one hour orientation-information meetings in the spring semester. After successful completion of the study-abroad program, students receive 3 upper-level credits in Spanish. The course is interdisciplinary in approach and provides students with the tools they need to analyze and understand the complexities of modern Cuba. Students will have formal classes taught by their professor and talks and meetings with specialists on Cuban literature, art, architecture, history and other aspects of culture and society. In addition, they will attend lectures, participate in discussions, and take field trips that will expose them to many aspects of Cuban culture, such as art, architecture, music, dance, film, literature, artisan work, folklore, history and urban growth. Offered as SPAN 306, SPAN 406, and ETHS 306. Prereq: SPAN 202.

SPAN 426. The Fantastic in Latin American Prose. 3 Units.
Introduction to a distinctive trend in contemporary Latin American literature, the prose portrayal of the "fantastic," a new narrative mode in Latin America. Critical examination of selected texts reveals new concepts of space and time and an increasing complexity of structure and style, one which juxtaposes and analyzes fantasy and reality. Offered as SPAN 326 and SPAN 426.

SPAN 442. Latin American Feminist Voices. 3 Units.
Examination of the awakening of feminine and feminist consciousness in the literary production of Latin American women writers, particularly from the 1920s to the present. Close attention paid to the dominant themes of love and dependency; imagination as evasion; alienation and rebellion; sexuality and power; the search for identity and the self-preservation of subjectivity. Readings include prose, poetry, and dramatic texts of female Latin American writers contributing to the emerging of feminist ideologies and the mapping of feminist identities. Offered as SPAN 342, SPAN 442, ETHS 342, WGST 342, WLIT 342, and WLIT 442.

SPAN 445. Hispanic Autobiographical Writing. 3 Units.
The course studies issues of self-representation through the reading of autobiographical works from different periods from Latin America, Spain, and the U.S., and of theoretical works that address topics of first-person narratives, autobiography, and sub-alternity. IT SATISFIES GLOBAL AND CULTURAL DIVERSITY REQUIREMENT. Offered as SPAN 345 and SPAN 445. Prereq: SPAN 320.

SPAN 451. Hispanic Turn of the Century Literature. 3 Units.
Cultural and political transitions between 19th and 20th Century, between Spain and Latin America, and between literary models. Study of Spanish and Latin American writers and their literary connections (Generation of 1898, modernistas) in the context of colonial conflicts and economic changes. Offered as SPAN 351 and SPAN 451.

SPAN 453. Transatlantic Vanguard. 3 Units.
Presentation of transatlantic tendencies of the early vanguard movements represented by poets from Spain, Central and South America. Beginning with the advent of Modernism in Latin America and Symbolism in Spain, this course will trace the development of resulting movements in the early twentieth century. Surrealism, Creationism, Futurism, Ultralism and Dadaism forged a vital link between poets and artists from the Americas and their European counterparts. We will focus on the similarities and differences between these "isms" while drawing conclusions about the uniqueness of vanguard movements on both sides of the Atlantic. Offered as SPAN 353 and SPAN 453.

SPAN 485. Hispanic Literature in Translation. 3 Units.
Critical analysis and appreciation of representative literary masterpieces from Spain and Latin America, and by Hispanics living in the U.S. Texts cover a variety of genres and a range of literary periods, from works by Cervantes to those of Gabriel Garcia Marquez. The course will examine the relationship between literature and other forms of artistic production, as well as the development of the Hispanic literary text within the context of historical events and cultural production of the period. Counts toward Spanish major only as related course. No knowledge of Spanish required. Offered as ETHS 385, ETHS 485, SPAN 385, SPAN 485, WLIT 385, and WLIT 485. Prereq: Graduate standing.
Department of Music

The Department of Music offers a range of degree programs and ensemble experiences for undergraduate and graduate students. Thanks to the diverse interests of our faculty, our students can explore everything from medieval music to rock and pop. The department offers the following degree programs:

- Music (Bachelor of Arts within the context of liberal arts; see list of concentrations under “Majors” below)
- Music Education (Bachelor of Science, Master of Arts, Master of Arts for Teacher Licensure, Doctor of Philosophy)
- Historical Performance Practice (Master of Arts, Doctor of Philosophy, Doctor of Musical Arts)
- Music History and Literature (Master of Arts)
- Musicology (Doctor of Philosophy)

Since 1968, the department has participated in a Joint Music Program (JMP) with the Cleveland Institute of Music (http://www.cim.edu) (CIM). Through our JMP, students enjoy the advantages of a top research university while receiving conservatory-level training in theory and performance. They also benefit from our active collaborations with the Cleveland Orchestra, the Rock and Roll Hall of Fame and Museum, the Cleveland Museum of Art, the Music Settlement, and other local cultural and educational institutions.

The Department of Music offers private instruction. Music majors should consult with their program advisor before registering for lessons. Non-major students interested in private instruction should visit the department office (Haydn 201) to begin the lesson registration process and learn further details.

A number of music ensembles (http://music.case.edu/ensembles) are open to all students. Entrance into the primary ensembles may be subject to a gateway audition; others require an audition for part assignment. Students may elect to earn one credit unit per semester for participation. Auditions for ensembles are held during the first week of classes each semester. Further information is available on the department website (http://music.case.edu/spotlight).

Facilities

Haydn Hall

Haydn Hall houses the Department of Music faculty and staff offices, classrooms, the Kulas Music Library, the Music Education Resource Center, and The Core (see below). It is located in the heart of the Mather Quad. Originally a combination of a dormitory and classrooms, this building served as the only student center on campus. It was given to the college by Flora Stone Mather and named in honor of Hiram Collins Haydn, fifth president of Western Reserve University, pastor of the Old Stone Church, and the individual most active in convincing Western Reserve College to move to Cleveland. Charles F. Schweinfurth, the premier residential architect of Euclid Avenue ("Millionaires' Row") mansions, who also rebuilt the interior of the Old Stone Church in 1884 and designed Trinity Cathedral, designed Haydn Hall.

Florence Harkness Memorial Chapel

Harkness Chapel, built in 1902, features neo-Gothic architecture, antique oak and Georgia pine woodwork, and Tiffany windows. It is a warm, intimate, and acoustically resonant space for the performance of vocal and instrumental chamber music. The building provides space for concerts, music classes, and department recitals. Harkness Chapel was built to honor Florence Harkness Severance, the only daughter of Stephen Harkness and his second wife, Anna M. Richardson Harkness.

Kulas Music Library

Kulas Music Library is a satellite library of Kelvin Smith Library, the university’s main library. It contains more than 45,000 items, including music scores, books on music, sound recordings, video recordings, microforms, and music periodicals. The library also contains a listening room for use of the sound recording and video collections. Music majors at the university also have access to the Robinson Music Library of the Cleveland Institute of Music. The Case Western Reserve Kulas Music Library and the CIM Robinson Music Library coordinate acquisitions and services, and their collections reflect institutional strengths as well as support the CWRU-CIM Joint Music Program.

The Core

The Core is a Macintosh computer classroom and lab dedicated to mind, sound, and vision. The Core is a collaborative space for all CWRU students, faculty and staff, as well as the University Circle community, to gather and collaborate, design in visual and aural mediums, and create masterpieces. It offers not only computers and software, but also video and digital cameras and microphones for checkout, one-on-one tutorial time, classes, and a meeting space. The Core is actively involved in bringing technology to the community, particularly younger children, and it works closely with faculty in providing support facilities for the department’s technology-related courses.

Denison/Wade Rehearsal Facility

The Denison/Wade Rehearsal Facility, located on East 115th Street, is used primarily for ensemble rehearsals. This facility houses several Wenger practice rooms, one of which is a "virtual reality" acoustic room; a percussion studio; and a music library. Classrooms include the Wade Rehearsal Hall, Denison Rehearsal Hall, and Denison Chamber Room. The facility also has storage lockers available on a first-come-first-serve basis. In general, Denison/Wade facilities are to be utilized by students who are music majors or are enrolled in Department of Music ensembles.

Kulas Collection of Early Instruments

The department maintains an impressive collection of modern reproductions of early instruments. The instruments are used by the Collegium Musicum, the Case/CIM Baroque Orchestra, and the department’s program in historical performance practice. The collection includes medieval, Renaissance, and baroque strings, as well as brass, woodwinds, and keyboards.

Music Education Resource Center

The department provides a resource center for music education students to prepare educational materials and research projects. The center is in Haydn Hall, Room 12, and contains a variety of audiovisual media, including a library of education-oriented music software. Students may borrow items from a large collection of music textbooks, educational recordings, testing materials, vocal and instrumental books, curriculum guides, and classroom instruments. Use of this center is encouraged, and sometimes required, for many of the projects and assignments in courses throughout the music education curriculum.

BA in Music | BS in Music Education | Minor
Undergraduate Programs

Majors

Students who wish to major in music must pass a performance audition on an acceptable instrument or in voice and take a music theory placement test. Arrangements for this audition and test must be made directly through the department website (http://music.case.edu/prospective/undergraduate). All performance and course requirements are detailed in the Undergraduate Music Handbook (http://music.case.edu/current/handbooks/undergrad).

Double Major and Dual-Degree Opportunities. The department encourages qualified students to consider a double or dual major in music and another subject. More than one half of music majors at Case Western Reserve pursue a double major. Typical combinations include the Bachelor of Arts in music with theater, English, classics, psychology, sociology, or the natural sciences. Once the Arts and Sciences SAGES requirements (39 hours) have been met, a BA student can add another major by meeting the course and hour requirements found in this bulletin under the appropriate department. In most cases, it is possible to finish a double major with music in four years.

It is also possible to receive two degrees, although this usually takes five years. Typical combinations of dual degrees include the Bachelor of Arts in music with the Bachelor of Science in engineering, or the Bachelor of Science in music education with the Bachelor of Music degree from the Cleveland Institute of Music. All admissions requirements must be met for each school, and course and hour requirements for each degree must be fulfilled. Students interested in dual degrees should declare their intent as early as possible and receive advice from faculty about both degrees.

Bachelor of Arts in Music

The Bachelor of Arts degree in music stresses a humanistic orientation and situates music study in the context of the liberal arts.

Approximately one half of the total 120 semester credit hours necessary for the degree are devoted to music study, with the remaining credits devoted to the SAGES and general education requirements (39 hours), a possible minor program, and a liberal selection of elective courses. The specific program of study differs from student to student.

The department offers several concentrations within the music portion of the degree: music history, music theory, historical performance practice, performance, general musicianship, and audio recording technology. The general musicianship concentration is particularly suitable for students interested in music as part of a double major or dual degree.

Core courses for the Bachelor of Arts in music are as follows:

Performance instruction: MUAP (applied music) for a minimum of 10 semester hours

Additional requirements:

1. Participation in assigned musical ensemble every semester of major (6 semesters for audio concentration)
2. Participation in additional musical ensemble for one year (audio concentration excepted)
3. Recital class attendance and performance every year of principal MUAP study (auto-enrolled with MUAP course)
4. Two semesters of eurhythmics (fulfills physical education requirement)

Additional course requirements for each concentration are as follows:

Music History

- Additional applied music study at the 200 level: 2
- Three electives from music history or literature courses at the 300 level or above: 9
- Foreign Language: 6-8

Total Units: 17-19

Music Theory

- Additional applied music study at the 200 level: 2
- MUTH 311 16th Century Counterpoint (CIM class): 2
- MUTH 312 Eighteenth Century Counterpoint (CIM class): 3
- One elective from music history or literature courses at the 300 level or above: 3

Foreign Language: 6-8

Total Units: 10

Historical Performance Practice

- Additional applied music study at the 200 level: 2
- MUTH 341 Introduction to Historical Performance Practice: 3
- MUTH 342 Seminar in Historical Performance Practice: 3
- One elective from music history or literature courses at the 300 level or above: 3

Foreign Language: 6-8

Total Units: 17-19

Performance

- Additional applied music study at the 300 and 400 levels: 6
- One elective from music history or literature courses at the 300 level or above: 3

Foreign Language: 6-8

Total Units: 15-17

General Musicianship

One elective from music history or literature courses at the 300 level or above (3).

Audio Recording Technology

- MUAR 151B Case Audio Internship I: 1
- MUAR 152B Case Audio Internship II: 1
- MUAR 153B Case Audio Internship III: 1

- MUAR 200 Audio Recording I (CIM class): 2
- MUAR 201 Audio Recording II (CIM class): 2
- MUAR 251B Case Audio Recording Internship I: 0
- MUAR 252B Case Audio Recording Internship II: 0
- MUAR 253B Case Audio Recording Internship III: 0
- MUAR 254B Case Audio Recording Internship IV: 0
- MUAR 300 Advanced Recording Techniques I (CIM class): 2
- MUAR 301 Advanced Recording Techniques II (CIM class): 2
A minor in electronics is available from the Department of Electrical Engineering and Computer Science in the Case School of Engineering. A five-year, dual-degree program is also available in which the student earns a BA in music/audio and a BS in an elective field of engineering.

**Bachelor of Science in Music Education**

The mission of the Music Education Program is to prepare proactive scholar-practitioners who will develop into leaders, teachers, and talented musicians in the field of music education. The nationally recognized program faculty specialize in research in music education, music technology, string pedagogy, and wind conducting and repertoire. The faculty are active in their respective professional organizations and as clinicians, conductors, lecturers, and authors.

The Bachelor of Science degree in music education requires a total of 122 credits and is designed to educate professional teachers of music education for public and private schools. The program meets the requirements of the Ohio Department of Education to prepare students to take the state-mandated teacher exam (Praxis II) and apply for teaching licensure. Most states recognize the Ohio teaching license through reciprocity.

Music education students benefit from a wide range of instrumental, vocal, and general classroom methods courses. As an additional part of the program, students benefit from plentiful hands-on experiences by teaching sample lessons and conducting rehearsals in actual teaching situations.

Requirements for the Bachelor of Science in music education are as follows:

**SAGES Requirements (22)**

22 hours in addition to those major courses that fulfill SAGES requirements

1. Strings: MUEN 385 Case/University Circle Orchestra or MUEN 386 Case Camerata Chamber Orchestra
2. Winds/Percussion: MUEN 383 Symphonic Winds
3. Piano: MUEN 389 Keyboard Ensemble
4. Voice: MUEN 382 Case Concert Choir or MUEN 387 University Singers; in some cases, MUEN 396 Early Music Singers
5. Guitar: MUEN 355 Miscellaneous Ensembles

See: Required Methods and Secondary Instrument Courses by Music Education Focus Area, below

2. PSCL 101 General Psychology I is a prerequisite
Official admission to the Music Education Program generally occurs at the Program Decision Point 1: Application for Admission to Western Reserve. Denial of admission at any decision point means the admission; conditional admission with a prescribed remedial plan which of the decision points, there are three possible outcomes: unconditional admission and retention in music education for the Ohio Provisional Music (Pre-K-12) License to teach education for the Ohio Provisional Music (Pre-K-12) License to teach.

There are four decision points in the Music Education Program. For each of the decision points, there are three possible outcomes: unconditional admission; conditional admission with a prescribed remedial plan which when successfully completed will result in unconditional admission; or denial of admission. Denial of admission at any decision point means the student is no longer able to pursue a music education degree at Case Western Reserve.

**Decision Point 1: Application for Admission to the Program**

Official admission to the Music Education Program generally occurs at the end of the freshman year. Admission to the program requires:

1. being accepted to Case Western Reserve
2. being accepted as a music major through an audition process before matriculation
3. successful completion of MUED 240 Foundations of Music Education, including evaluation of an initial Teaching ePortfolio
4. a cumulative Case Western Reserve GPA of 2.5 or better

5. submission of a signed Statement of Assurance of Good Moral Character, and
6. a satisfactory interview with music education faculty, documented on the Teacher Licensure Admission Assessment Form

**Decision Point 2: Application for Advanced Standing**

Application for Advanced Standing should be submitted by week 10 of the second semester after Decision Point 1 (usually the spring of the sophomore year). Application for Advanced Standing requires:

1. a successful review of the updated Teaching ePortfolio
2. submission of a current Academic Requirements Report documenting the following: a cumulative GPA of 2.5 or better, a music GPA of 2.5 or better, and an education GPA of 3.0 or better
3. a passing score on the Candidate Disposition Assessment Inventory completed by the music education faculty

**Decision Point 3: Application for Student Teaching**

Application for Student Teaching should be completed by Week 4 of the semester prior to student teaching. The application requires:

1. a successful review of the updated Teaching ePortfolio
2. submission of a current Academic Requirements Report documenting the following: a cumulative GPA of 2.5 or better, a music GPA of 2.5 or better, and an education GPA of 3.0 or better
3. a passing score on the Candidate Disposition Assessment Inventory completed by the music education faculty
4. passing a TB test
5. presenting documentation of Hepatitis B vaccination
6. passing an official criminal background check

**Decision Point 4: Application for Initial Licensure**

Application for Initial Licensure occurs after successful completion of all degree requirements. This application requires:

1. a successful review of the updated Teaching ePortfolio
2. submission of a current Academic Requirements Report documenting the following: a cumulative GPA of 2.5 or better, a music GPA of 2.5 or better, and an education GPA of 3.0 or better
3. a passing score on the Candidate Disposition Assessment Inventory completed by the music education faculty
4. achievement of state-mandated scores on the two Praxis II national teacher exams
5. completion of the Case Teacher Licensure Exit Interview and Survey
6. completion of the Case Student Teaching Final Assessment by the cooperating teacher and university supervisor with a grade of B or better:

**Courses by Music Education Focus Area**

### Choral/General Focus

**Required Methods Specialization Class:**

- MUED 353 Choral Methods and Materials

**Secondary Instruments:**

- MUED 200A Basic Skills and Pedagogy: Voice
- MUED 200B Basic Skills and Pedagogy: Guitar
- MUED 200P Basic Skills and Pedagogy: Percussion
- MUED 200H Basic Skills and Pedagogy: Strings

**Two of the following:**

- MUED 200C Basic Skills and Pedagogy: Upper Brass
- MUED 200D Basic Skills and Pedagogy: Lower Brass
- MUED 200E Basic Skills and Pedagogy: Clarinet and Saxophone
- MUED 200F Basic Skills and Pedagogy: Double Reeds and Flute

**Intrumental Focus - Winds/Percussion**

**Required Methods Specialization Class:**

- MUED 352 Instrumental Methods and Materials

**Secondary Instruments:**

- MUED 200A Basic Skills and Pedagogy: Voice
- MUED 200G Basic Skills and Pedagogy: Violin
- or MUED 200H Basic Skills and Pedagogy: Strings
- MUED 200P Basic Skills and Pedagogy: Percussion

**Three of the following:**

- MUED 200C Basic Skills and Pedagogy: Upper Brass
- MUED 200D Basic Skills and Pedagogy: Lower Brass
- MUED 200E Basic Skills and Pedagogy: Clarinet and Saxophone
- MUED 200F Basic Skills and Pedagogy: Double Reeds and Flute

**Intrumental Focus - Strings**

**Required Methods Specialization Class:**

- MUED 352 Instrumental Methods and Materials

**Secondary Instruments:**

- MUED 200A Basic Skills and Pedagogy: Voice
- MUED 200C Basic Skills and Pedagogy: Upper Brass
- or MUED 200D Basic Skills and Pedagogy: Lower Brass
- MUED 200E Basic Skills and Pedagogy: Clarinet and Saxophone
- or MUED 200F Basic Skills and Pedagogy: Double Reeds and Flute
- MUED 200G Basic Skills and Pedagogy: Violin
- MUED 200H Basic Skills and Pedagogy: Strings
- MUED 200P Basic Skills and Pedagogy: Percussion

**Admission and Retention in Music Education**

After successfully completing all requirements at the four decision points, the student is recommended by the university’s director of teacher education for the Ohio Provisional Music (Pre-K-12) License to teach.
music in the public schools in Ohio and more than 40 reciprocating states.

Completion of the Bachelor of Science degree does not ensure that the State of Ohio music teacher license will be awarded. Additional information is available from the Teacher Licensure (p. 437) section in this bulletin.

Departmental Honors

Departmental honors programs for the Bachelor of Arts and Bachelor of Science degrees have the following admission and completion requirements:

For all students, admission to honors status requires an overall GPA of at least 3.2, a music GPA of at least 3.5, evidence of exceptional musicianship and scholarly interests, petition to the music faculty, nomination by a faculty member, and acceptance by the music faculty. The honors project must first be approved by the faculty project advisor, with the specific project timeline to be determined in consultation with the advisor. The student must submit a proposal to the faculty before the project start date, typically by the midpoint of the spring semester preceding the senior year.

For BA students, second-semester sophomore or junior standing is required for admission to honors status. The honors project should then be completed as part of the SAGES Capstone Seminar. For BS students, admission to honors status requires advanced standing in music education. The student must register for independent study or an approved seminar during the project period, and the honors project may not be pursued or completed during student teaching.

Minor

The music minor requires 15 credits: 6 in music theory (MUTH), 6 in music history or appreciation (MUHI or MUGN) and 3 others, which may include MUAP or MUEN. For questions regarding eligible course substitutions, please contact the Department of Music Minor Advisor.

<table>
<thead>
<tr>
<th>Music Theory:</th>
<th>6</th>
</tr>
</thead>
<tbody>
<tr>
<td>MUTH 102</td>
<td>Theory I</td>
</tr>
<tr>
<td>MUTH 104</td>
<td>Theory II</td>
</tr>
</tbody>
</table>

Music History (one of the following): 6

| MUGN 201  | Introduction to Music: Listening Experience I |
| & MUGN 202  | Introduction to Music: Listening Experience II |
| MUHI 301  | History of Western Music I |
| & MUHI 302  | History of Western Music II |

At least 3 additional hours, either in MUAP or MUEN 3

Total Units 15

A minor in music education may be devised in consultation with a music education advisor. CIM students may pursue a minor in music history by taking 15 hours of MUHI courses. The department welcomes students’ initiative in the development of minor programs suited to their needs. Courses can be substituted with the approval of the music minor program advisor.

Electives for Non-Music Majors

Electives designed for students not majoring in music are:

| MUTH 103  | Theory I |
| MUTH 104  | Theory II |
| MUGN 201  | Introduction to Music: Listening Experience I |
| MUGN 202  | Introduction to Music: Listening Experience II |
| MUGN 215  | History and Styles of Jazz |

MUGN 308 Digital Music: Composition and Production is designed for music majors but is open to non-music majors with the permission of the instructor. MUGN 212: History of Rock & Roll is meant for non-majors in music.

Individual instruction (MUAP) in keyboard, voice, and all instruments is available with consent of the department (additional fee for non-major). For more information about the department’s applied music offerings, please contact the Music Office 216.368.2400 or info@music.case.edu.

Non-music majors may also audition for admission to music ensembles (MUEN).

MA Programs | PhD and DMA Programs | Applied Music

Graduate Programs

General descriptions are given here; complete information on all degrees is available from the department (http://music.case.edu/prospective/graduate). Admission to each degree follows established guidelines of the School of Graduate Studies. Scores from the Graduate Record Examination are required for admission to programs in music history, musicology, and historical performance practice, and an audition is necessary for students interested in the historical performance practice program.

Master of Arts Degree

The Master of Arts degree is offered in the fields of:

1. music history and literature
2. music education

Within music history and literature, students may choose concentrations in music history and literature or in historical performance practice. Master’s degree candidates in music education may also choose to add course work that will qualify them to take teaching licensure exams for the State of Ohio.

Master of Arts in Music History and Literature

The concentration in music history and literature emphasizes research, history, literature, and the theory of music. Within the 30 hours required, the following are minimum requirements:

| Music History | 9 |
| Research      | 6-9 |
| Theory-Analysis | 6 |
| Electives       | 6-9 |
| Total Units    | 27-33 |

The concentration in historical performance practice presupposes the same strong liberal arts training as the music history and literature concentration, plus a strong performance interest and background. Research and its application to music performance are stressed. Within the 27 hours required, the following are minimum requirements:

| Bibliography and Research | 3 |
| Performance Practice    | 6 |
| Notation Theory          | 6 |
| Lecture-Recital and Document | 6 |
| Total Units              | 21 |

In both concentrations, remaining hours are freely elected in music history and research with advisor’s approval. For students pursuing the degree in historical performance practice, however, at least two semesters of applied music (0 credits) are required, in addition to MUAP 651 M.A. Lecture - Recital and Document, near the completion of the degree program. Ensemble participation is also required for performance practice students but does not earn credit hours toward the degree.
Examinations include initial placement tests in history and theory, and a reading test in a foreign language pertinent to the student’s field. In addition, performance practice students must audition as part of the admissions process. At least 18 credit hours must be at the 400 level or higher.

**Fast Track MA/PhD Program**

Students in the MA in music history and literature program are eligible for a fast track option to the PhD in historical musicology. To qualify for this option, students must complete 36 hours in the MA program and are advised to pursue the thesis option. By the end of the third semester of study (prior to the completion of the 36 hours), the student must inform the director of graduate studies of his/her desire to enter the PhD program, and, in consultation with the director, must present a petition to the musicology faculty for candidacy. Once faculty consent is secured, all remaining requirements of the degree program, as detailed above, remain the same.

**Master of Arts in Music Education**

This degree is built on a set of foundation courses in philosophy, curriculum, psychology, research, evaluation, and musicianship. Additional courses and independent studies enable students to tailor programs to their interests and needs.

Three degree options are available. Students who choose Plan A (thesis option) write a thesis based on original research and defend the thesis in an oral examination. Students who choose Plan B (comprehensive exam option) complete a comprehensive examination in music education. Applicants for Plans A or B should have a bachelor’s degree in music education, an undergraduate GPA of 3.0 or better, and at least one year of successful music teaching experience, usually in the public schools.

Students seeking teacher licensure credentials pursue Plan C (MA for Licensure, or MAL). The program includes a core of graduate music education courses, graduate music courses, undergraduate music education methods courses, and one semester of student teaching. Applicants for MAL should have a bachelor’s degree in music (BA or BM), an undergraduate GPA of 3.0 or better, and some prior experience in working with children. The regulations for students in the BS program regarding advanced standing, grade point averages, and the Praxis II exam apply to graduate students in Plan C as well. Completion of the Plan C degree does not ensure that the State of Ohio music teacher license will be awarded.

Foundation courses for Plan A and Plan B include:

<table>
<thead>
<tr>
<th>Course Description</th>
<th>Units (Total)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Music education core of philosophy, curriculum, and research</td>
<td>12</td>
</tr>
<tr>
<td>Music core of history, theory, and applied music</td>
<td>9-12</td>
</tr>
<tr>
<td>Electives</td>
<td>0-9</td>
</tr>
<tr>
<td>Total Units</td>
<td>21-33</td>
</tr>
</tbody>
</table>

Students in Plan A receive 6 credit hours for thesis research. Students in Plan B complete a comprehensive written examination at the conclusion of course work, whereas students in Plan C complete a comprehensive oral examination.

A minimum of 30 credit hours is required for Plans A and B. Plan C requires a minimum of 65 hours, including:

<table>
<thead>
<tr>
<th>Course Description</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>Music education licensure core</td>
<td>35</td>
</tr>
<tr>
<td>Teacher licensure professional education core</td>
<td>9</td>
</tr>
<tr>
<td>Graduate music education core</td>
<td>12</td>
</tr>
<tr>
<td>Graduate music core</td>
<td>9</td>
</tr>
<tr>
<td>Total Units</td>
<td>65</td>
</tr>
</tbody>
</table>

To remain in Plan C’s MAL program, students must meet GPA and professional standards each year. For more information, contact the director of music education.

**Doctor of Philosophy Degree**

The Doctor of Philosophy degree is offered in two fields: (1) musicology (with concentrations in music history and historical performance practice), and (2) music education.

**Doctor of Philosophy in Musicology**

The PhD in historical musicology is granted in recognition of superior scholarly ability and attainment. Award of the degree is based not only on computation of time or enumeration of courses, but also upon distinguished work. Highly qualified applicants may enter this program directly upon completion of a bachelor’s degree. All programs of study are formulated to suit the individual needs of the student and require the consent of the advisor.

**Music History Concentration**

The PhD requires 36 credit hours of course work and an additional 18 credit hours of dissertation research. Required course work includes MUHI 610 Bibliography and Research Methods in Music and MUTH 424 Introduction to Schenkerian Analysis as well as three doctoral seminars. In the first two years, students will be expected to take three courses (or 9 credits) per semester, for a total of 36 hours.

Students admitted to the program will take diagnostic examinations prior to the start of classes in their first year. Based on these examinations, students may be required to enroll in specific courses to address deficiencies; these course credits may be applied toward the degree requirements. At the end of the first year of study, the musicology faculty will conduct a formal review with each student. This process will include an evaluation of progress to date and advisement regarding the remainder of the program.

A written summary of this review, along with course grades and materials, will constitute the beginnings of the portfolio maintained by the director of graduate studies that will be the basis for considering each student’s advancement into the PhD program.

At the end of the second year of course work, students will be asked to submit a qualifying paper, which will be added to the portfolio. At the beginning of the fall in the third year of study, students will take comprehensive examinations, which will also function as qualifying exams for advancement to the PhD program. These examinations will consist of written and oral sections, and will be conducted and evaluated by the musicology faculty. Following the examinations, the faculty will review each student’s portfolio and, based on work contained therein, make a decision regarding advancement to candidacy in the PhD program. Students who do not advance but who have done satisfactory work will be eligible to receive the MA in music history at this juncture.

Students who advance to candidacy for the PhD will register for dissertation research credits and begin research for the dissertation. Working with a faculty advisor, each student will develop a proposal for the dissertation, which will be presented in writing to the faculty no later than the end of the third year of study. It is expected that the fourth and possibly fifth year of study will be devoted to work on the dissertation. Upon completion of the thesis, each student will present a formal defense to the musicology faculty.

Under the rules of the School of Graduate Studies, a student must complete the thesis no later than five years after registering for the first dissertation research (701) credits.
The PhD in historical musicology with a concentration in historical performance practice requires a minimum of 36 hours of course work, seminars, and tutorials, and an additional 18 credit hours of dissertation research. Course distribution is as follows:

<table>
<thead>
<tr>
<th>Course</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bibliography and research</td>
<td>3</td>
</tr>
<tr>

</tr>
<tr>
<td>MUAP 751 Doctoral Lecture-Recital and Document I</td>
<td>0</td>
</tr>
<tr>
<td><strong>Total Units</strong></td>
<td><strong>27-30</strong></td>
</tr>
</tbody>
</table>

Remaining hours are freely elected in music history and research with the advisor’s approval. At least three semesters of applied music (0 credits) are required. Ensemble participation is also required for performance practice students but does not earn credit hours toward the degree.

For other musicology students, private lessons at the 500 level, although not required, may be counted up to a maximum of six credits, at the discretion of the advisor.

Examinations include initial placement tests in history and theory; reading tests in two foreign languages pertinent to the student’s field; and comprehensive examinations in history and theory, including written and oral sections, prior to admission to candidacy. Upon completion of the dissertation, an oral defense is held. In addition, performance practice students must audition as part of the admissions process. The candidate must teach a college-level course in music history and literature (or historical performance practice) under the supervision of a faculty member, or have had the equivalent experience before the dissertation is completed.

The PhD in historical musicology with a concentration in historical performance practice requires a minimum of 36 hours of course work, seminars, and tutorials, and an additional 18 credit hours of dissertation research. Course distribution is as follows:

<table>
<thead>
<tr>
<th>Course</th>
<th>Units</th>

</tr>
<tr>
<td><strong>Total Units</strong></td>
<td><strong>27-30</strong></td>
</tr>
</tbody>
</table>

Remaining hours are freely elected in music history and research with the advisor’s approval. At least three semesters of applied music (0 credits) are required. Ensemble participation is also required for performance practice students but does not earn credit hours toward the degree.

For other musicology students, private lessons at the 500 level, although not required, may be counted up to a maximum of six credits, at the discretion of the advisor.

Examinations include initial placement tests in history and theory; reading tests in two foreign languages pertinent to the student’s field; and comprehensive examinations in history and theory, including written and oral sections, prior to admission to candidacy. Upon completion of the dissertation, an oral defense is held. In addition, performance practice students must audition as part of the admissions process. The candidate must teach a college-level course in music history and literature (or historical performance practice) under the supervision of a faculty member, or have had the equivalent experience before the dissertation is completed.

**Doctor of Philosophy in Music Education**

The doctorate in music education is offered to persons who have shown a strong and continuing dedication to music teaching and scholarship. Applicants must have completed at least three years of full-time music teaching, usually in the public schools. The degree is designed to prepare professionals to assume positions of leadership in elementary, secondary, and collegiate instruction. Prior to graduation, doctoral students demonstrate competency in teaching, research, and musicianship. Every effort will be made to plan a program based on individual student needs and interests while maintaining standards of musical and scholarly excellence. Electives, therefore, will be chosen in consultation with a faculty advisor in order to ensure a balance between individual interests and traditional graduate expectations. To remain in the program, students must meet GPA and professional standards each year. For more information, contact the director of music education.

A total of 60 credit hours is required for the doctoral degree beyond the master’s level. Courses include:

<table>
<thead>
<tr>
<th>Course</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>Music education: research, philosophy, cognition/psychology, curriculum, and assessment</td>
<td>15</td>
</tr>
<tr>
<td>Music: theory, history, applied music</td>
<td>9-12</td>

<td>6</td>
</tr>
<tr>
<td>Music education electives</td>
<td>9-12</td>
</tr>
<tr>
<td>Dissertation</td>
<td>18</td>
</tr>
<tr>
<td><strong>Total Units</strong></td>
<td><strong>57-63</strong></td>
</tr>
</tbody>
</table>

A comprehensive examination follows the completion of course work, prior to beginning research for the dissertation. Upon completion of the dissertation, an oral defense is held. The dissertation topic is chosen by the student in consultation with the faculty.

**Doctor of Musical Arts in Historical Performance Practice**

This doctorate is granted in recognition of outstanding performing ability in early music combined with superior scholarly ability in the field of historical performance practice. All programs are formulated to suit the needs of the individual student and require the consent of a faculty advisor.

A minimum of 36 hours of course work, seminars, and tutorials is required. Distribution is as follows:

<table>
<thead>
<tr>
<th>Course</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bibliography and Research</td>
<td>3</td>
</tr>

Applied music (0 credits) must be taken every semester the student is on campus. Ensemble participation is required but does not earn credit hours toward the degree.

Examinations include a performance audition; initial placement tests in history and theory; reading tests in two foreign languages pertinent to the student’s field; and a comprehensive examination with history, theory, performance practice, and oral sections. Exceptional students may be admitted to a combined MA/DMA degree program in early music.

**Applied Music**

All Master of Arts and Doctor of Philosophy degree students in the department must satisfy the applied music requirements specified in their degree programs. Graduate students who anticipate private lesson instruction in their programs should consult an advisor before registration. Students register for individual applied music instruction in courses titled Principal Performance Area and Secondary Performance Area.

**Department Faculty**

William I. Bauer, PhD
(Kent State University)

Associate Professor; Director of Graduate Studies in Music Education
Music teacher education; research; technology

L. Peter Bennett, D Phil
(Oxford University)

Associate Professor
17th-century French music; early music performance

Francesca Brittan, PhD
(Cornell University)

Assistant Professor
19th-century France; Romantic aesthetics; popular music

Gary M. Ciepluch, PhD
(University of Wisconsin, Madison)

Associate Professor
Director of bands; conducting; music teacher education

Georgia J. Cowart, PhD
(Rutgers University)

Professor
17th and 18th centuries; music, the arts, and politics
Ross W. Duffin, DMA
(Stanford University)
Fynette H. Kulas Professor of Music; Interim Chair
Early music performance practice; Shakespeare
Paul S. Ferguson, MM
(Eastman School of Music)
Instructor
Jazz studies and contemporary media
Matthew L. Garrett, PhD
(Florida State University)
Assistant Professor
Choral music education; conducting
Daniel Goldmark, PhD
(UCLA)
Associate Professor; Director of Graduate Studies
American popular music; film music; history of the music industry
Stephen E. Hefling, PhD
(Yale University)
Professor
Mahler; 18th and 19th centuries; chamber music; analysis
Kathleen A. Horvath, PhD
(Ohio State University)
Associate Professor; Director of Undergraduate Studies in Music Education
Music teacher education; string education and pedagogy
Lisa L. Koops, PhD
(Michigan State University)
Assistant Professor
Music teacher education; general music
Susan McClary, PhD
(Harvard University)
Professor
Musicology
David J. Rothenberg, PhD
(Yale University)
Associate Professor; Director of Undergraduate Studies, BA Music
Medieval; Renaissance; musical symbolism
Robert Walser, PhD
(University of Minnesota)
Professor
American music; jazz history; popular music studies; implications of recent neuroscience for humanistic scholarship; contemporary music production technology

Full-time Lecturers
Julie Andrijeski, DMA
(Case Western Reserve University)
Director, Case/CIM Baroque Orchestra
Performance practices; dance
Eric Charnofsky, MM
(The Juilliard School)
20th-century music; piano accompanying; keyboard repertoire
Juanita Karp, DMA
(University of Georgia)
Music history; Undergraduate Admission and First-Year Advisor

MUAP Courses
MUAP 10. Progress Jury Examination. 0 Units.
Progress Jury Examination (All BA and BS Music Majors)
MUAP 11. Recital Class. 0 Units.
MUAP 121. Principal Performance Area I. 2 Units.
Limited to music and music education majors. Recommended preparation: Entrance Jury/Audition
MUAP 122. Principal Performance Area II. 2 Units.
Limited to music and music education majors. Prereq: MUTH 003 and MUAP 121. Coreq: MUTH 003.
MUAP 131. Secondary Performance Area I. 1 - 2 Unit.
Open to all university students.
MUAP 132. Secondary Performance Area II. 1 - 2 Unit.
Open to all university students. Prereq: MUAP 131.
MUAP 133. Secondary Performance Area III. 1 - 2 Unit.
Open to all university students. Prereq: MUAP 132.
MUAP 134. Secondary Performance Area IV. 1 - 2 Unit.
Open to all university students. Prereq: MUAP 133.
MUAP 135. Secondary Performance Area V. 1 - 2 Unit.
Open to all university students. Prereq: MUAP 134.
MUAP 136. Secondary Performance Area VI. 1 - 2 Unit.
Open to all university students. Prereq: MUAP 135.
MUAP 20. Level 300 Applied Music Entrance Jury Exam. 0 Units.
Level Jury Examination
MUAP 221. Principal Performance Area III. 2 Units.
Limited to music and music education majors. Prereq: MUTH 107 or MUTH 101/105, MUAP 122, Passed Progress Jury. Coreq: MUTH 107 or MUTH 101/105.
MUAP 222. Principal Performance Area IV. 2 Units.
MUAP 223. Principal Performance Area V. 2 Units.
Limited to music and music education majors. Prereq: MUTH 207 or MUTH 201/205, MUAP 222. Coreq: MUTH 207 or MUTH 201/205.
MUAP 224. Principal Performance Area VI. 2 Units.
Limited to music and music education majors. Prereq: MUTH 208 or MUTH 202/206, MUAP 223. Coreq: MUTH 207 or MUTH 202/206.
MUAP 225. Principal Performance Area VII. 2 Units.
Limited to music and music education majors. Prereq: MUAP 224.
MUAP 226. Principal Performance Area VIII. 2 Units.
Limited to music and music education majors. Prereq: MUAP 225.
MUAP 25. BA Exit Jury Examination. 0 Units.
BA Exit Jury Examination (Audio and General Music Concentrations)

MUAP 26. BA Exit Jury Examination. 0 Units.
BA Exit Jury Examination (Music History, Music Theory, and Early Music Performance Practice)

MUAP 30. BA Performance Exit Jury Examination. 0 Units.
BA Performance Exit Jury Examination

MUAP 321. Principal Level Performance Area V. 2 Units.

MUAP 322. Principal Level Performance Area VI. 2 Units.

MUAP 323. Principal Performance Area VII. 2 Units.
Limited to music performance and music education majors.

MUAP 35. BS Music Education Jury Examination. 0 Units.
BS Music Education Jury Examination

MUAP 421. Principal Level Performance Area VII. 2 Units.
Limited to music and music education majors. Prereq: MUAP 322.

MUAP 422. Principal Level Performance Area VII. 2 Units.
Limited to music and music education majors. Prereq: MUAP 421.

MUAP 521. Principal Performance Area IX. 0 - 3 Units.
Limited to music and music education majors.

MUAP 522. Principal Performance Area IX. 0 - 3 Units.
Limited to music and music education majors.

MUAP 523. Principal Performance Area IX. 0 - 3 Units.
Limited to music and music education majors.

MUAP 524. Principal Performance Area IX. 0 - 3 Units.
Limited to music and music education majors.

MUAP 525. Principal Performance Area IX. 0 - 3 Units.
Limited to music and music education majors.

MUAP 526. Principal Performance Area IX. 0 - 3 Units.
Limited to music and music education majors.

MUAP 531. Secondary Performance Area IX. 0 - 3 Units.
Open to all university students.

MUAP 532. Secondary Performance Area X. 0 - 3 Units.
Open to all university students.

MUAP 533. Secondary Performance Area IX. 0 - 3 Units.
Open to all university students.

MUAP 534. Secondary Performance Area IX. 0 - 3 Units.
Open to all university students.

MUAP 535. Secondary Performance Area IX. 0 - 3 Units.
Open to all university students.

MUAP 536. Secondary Performance Area IX. 0 - 3 Units.
Open to all university students.

MUAP 651. M.A. Lecture - Recital and Document. 3 - 6 Units.
M.A. Lecture - Recital for students in Historical Performance Practice.

MUAP 751. Doctoral Lecture-Recital and Document I. 0 - 3 Units.

MUAP 752. Doctoral Lecture-Recital and Document II. 3 Units.

MUAP 753. Doctoral Lecture-Recital and Document III. 6 Units.

MUAR Courses

MUAR 151B. Case Audio Internship I. 1 Unit.
Development of recording engineering skills through professional level work in the Harkness audio service. Recommended preparation: Open only to audio recording majors.

MUAR 152B. Case Audio Internship II. 1 Unit.
Recommended preparation: MUAR 151B.

MUAR 153B. Case Audio Internship III. 1 Unit.
Recommended preparation: MUAR 152B.

MUAR 154B. Case Audio Internship IV. 1 Unit.
Recommended preparation: MUAR 153B.

MUAR 200. Audio Recording I. 2 Units.
A study of basic recording principles and systems and techniques of recording and editing. Recommended preparation: Audio recording majors only.

MUAR 201. Audio Recording II. 2 Units.
Further study of basic recording principles and systems with an introduction to digital recording. Recommended preparation: MUAR 200.

MUAR 251B. Case Audio Recording Internship I. 0 Units.
Professional level work in the Case Western Reserve University Harkness audio service.

MUAR 252B. Case Audio Recording Internship II. 0 Units.

MUAR 253B. Case Audio Recording Internship III. 0 Units.

MUAR 254B. Case Audio Recording Internship IV. 0 Units.

MUAR 300. Advanced Recording Techniques I. 2 Units.
A study of advanced microphone, recording, and monitoring systems and techniques with an emphasis on two track digital recordings of classical music and critical listening. Recommended preparation: MUAR 201.

MUAR 301. Advanced Recording Techniques II. 2 Units.
Further study of advanced microphone, recording, and monitoring systems and techniques, with an emphasis on two track digital recordings of large ensemble classical music. Recommended preparation: MUAR 300.
MUAR 302. Multitrack Recording Techniques I. 2 Units.
A study of multitrack recording and mixdown techniques. Recommended preparation: MUAR 301. Audio recording majors only.

MUAR 303. Multitrack Recording Techniques II. 2 Units.
Further study of multitrack recording and mixdown techniques, with an emphasis on synchronization to video. Recommended preparation: MUAR 302.

MUAR 310. Recording Studio Maintenance I. 1 Unit.
Study of techniques for optimizing professional recording equipment performance. Recommended preparation: MUAR 201. Audio recording majors only.

MUAR 311. Recording Studio Maintenance II. 1 Unit.

MUAR 320. Acoustics of Music I. 1 Unit.
A seminar in the basic concepts of musical acoustics and research in this area. The students actively participate in experiments exploring various topics in musical acoustics.

MUAR 321. Acoustics of Music II. 1 Unit.
A seminar in the basic concepts of musical acoustics and research in this area. The students actively participate in experiments exploring various topics in musical acoustics.

MUAR 322. Recording Workshop I. 1 Unit.
Recording Workshop provides an increased level of hands-on intensive study of microphone placement. Each week a different instrument or group of instruments will be available for experimentation. Each class represents a recording session centered on a specific instrument, resulting in a comprehensive set of test recordings at the end of each semester. These will provide the basis of reference for future recording decisions. Recommended preparation: MUAR 200.

MUAR 323. Recording Workshop II. 1 Unit.
Recording Workshop provides an increased level of hands-on intensive study of microphone placement. Each week a different instrument or group of instruments will be available for experimentation. Each class represents a recording session centered on a specific instrument, resulting in a comprehensive set of test recordings at the end of each semester. These will provide the basis of reference for future recording decisions. Recommended preparation: MUAR 200.

MUAR 380. Junior Recording Techniques Thesis. 3 Units.

MUAR 385. Recording Studio Internship. 4 Units.

MUAR 390. Senior Recording Tech Thesis/Senior Capstone. 6 Units.
Students will originate, design, organize, and complete a project that will demonstrate and document proficiency with his/her accumulated audio recording technology skills. This project must include evidence of critical thinking, clear planning, and establishment of reasonable goals with an appropriate plan of action. There is a significant written component that requires regular submission of drafts, progress reports, evidence of project advancement, and a final written document. There must also be a public presentation of the project in a venue approved by the department.

MUCP Courses

MUCP 399. Undergraduate Independent Studies. 1 - 3 Unit.
Each student develops a topic of interest to be explored with a faculty member.

MUCP 751. Composition Document-D.M.A.. 3 Units.

MUED Courses

MUED 200A. Basic Skills and Pedagogy: Voice. 1 Unit.
Designed for music education majors to provide the fundamentals of teaching methods for various instruments. Recommended preparation: Music education majors. Non-music majors accepted with consent of department.

MUED 200B. Basic Skills and Pedagogy: Guitar. 1 Unit.
Designed for music education majors to provide the fundamentals of teaching methods for various instruments. Recommended preparation: Music education majors. Non-music majors accepted with consent of department.

MUED 200C. Basic Skills and Pedagogy: Upper Brass. 1 Unit.
Designed for music education majors to provide the fundamentals of teaching methods for various instruments. Recommended preparation: Music education majors. Non-music majors accepted with consent of department.

MUED 200D. Basic Skills and Pedagogy: Lower Brass. 1 Unit.
Designed for music education majors to provide the fundamentals of teaching methods for various instruments. Recommended preparation: Music education majors. Non-music majors accepted with consent of department.

MUED 200E. Basic Skills and Pedagogy: Clarinet and Saxophone. 1 Unit.
Designed for music education majors to provide the fundamentals of teaching methods for various instruments. Recommended preparation: Music education majors. Non-music majors accepted with consent of department.

MUED 200F. Basic Skills and Pedagogy: Double Reeds and Flute. 1 Unit.
Designed for music education majors to provide the fundamentals of teaching methods for various instruments. Recommended preparation: Music education majors. Non-music majors accepted with consent of department.

MUED 200G. Basic Skills and Pedagogy: Violin. 1 Unit.
Designed for music education majors to provide the fundamentals of teaching methods for various instruments. Recommended preparation: Music education majors. Non-music majors accepted with consent of department.

MUED 200H. Basic Skills and Pedagogy: Strings. 1 Unit.
Designed for music education majors to provide the fundamentals of teaching methods for various instruments. Recommended preparation: Music education majors. Non-music majors accepted with consent of department.
MUED 200P. Basic Skills and Pedagogy: Percussion. 1 Unit.
Designed for music education majors to provide the fundamentals of teaching methods for various instruments. Recommended preparation: Music education majors. Non-music majors accepted with consent of department.

MUED 240. Foundations of Music Education. 3 Units.
An introduction to and overview of the music education profession. Philosophical, historical and psychological perspectives on music education in schools, including contemporary topics and trends. Introduction of Ohio academic content standards and curriculum model for music, along with K-12 National Music Standards. Observation of area music teachers and peer-teaching experience. Recommended preparation: Music education major or permission.

MUED 275. Elements of Conducting. 2 Units.
This course is designed to develop the physical tools, and philosophical and aesthetic ideologies necessary for students to conduct in an effective and appropriate manner. Students develop baton technique through systematic physical/pattern exercises, and class and field conducting experiences (elementary through adult). Observations and written evaluations of Cleveland Orchestra rehearsals and concerts, along with video analysis/self-evaluation of personal conducting experiences are among the activities required in this course. Topics and content include: philosophical foundations for the conductor, considerations for selecting repertoire and creating a supportive learning environment; rehearsal techniques; planning for the rehearsal and record keeping; rehearsal management; group motivation; score analysis and preparation; participation in professional activities; effective use of technology for the conductor; and national, state, and professional standards. Clinical/Field experiences (all ages) required.

MUED 276. Advanced Conducting. 2 Units.
This course continues in-depth development of the physical tools, and philosophical and aesthetic ideologies presented in MUED 275. Students develop baton techniques (with experiences in complex and changing time signatures) through systematic physical/pattern exercises, along with continuous evaluations, from their class and field conducting experiences (elementary through adult), observations and written evaluations of Cleveland Orchestra Rehearsals and Concerts, written critiques from historically significant Master Conductors (from videos in the University’s Music Library), along with video analysis of personal class and field conducting, are among the activities required in this course. Topics and content include: philosophical foundations for the conductor, considerations for selecting repertoire and creating a supportive learning environment; rehearsal techniques; planning for the rehearsal and record keeping; rehearsal management; group motivation; score analysis and preparation; participation in professional activities; effective use of technology for the conductor; and national and state standards. Clinical/Field experiences (all ages) required.

MUED 270. Technology Assisted Music Teaching and Learning. 3 Units.
Fundamental concepts and skills for using technology in music teaching and learning. This project-oriented class will develop knowledge and competencies related to electronic musical instruments, MIDI sequencing, music notation software, computer-assisted instruction, digital media, the Internet, information processing, computer systems, and lab management as they relate to music education in K-12 schools. Recommended preparation: MUED 240. Offered as MUED 320 and MUED 420.

MUED 305. World Music in Education. 3 Units.
This course acquaints students with the use of world music, or multicultural music, in the music education classroom. Students are given an overview of the history of world music within American music education, discuss topics related to world music in education, research diverse world music practices, and lead lessons based on this research. Topics and content include: definitions of world/multicultural music; philosophical basis for world music in education; diversity in our Cleveland community; authenticity; ethnomusicology; informal/formal music learning; international perspectives; pedagogical approaches; addressing the State and National Standards through world music in education; and the development of culturally informed music pedagogy based on the study of diverse music. Throughout the course students will become acquainted with the music of diverse cultures and people groups; these will be chosen in part based on student’s own research interests. In addition to the musical cultures chosen by students for study and presentation, the music of The Gambia, West Africa; the Caribbean; and India will be highlighted during in-class activities and lessons. Recommended preparation: MUED 240.

MUED 310. Instrumental and Choral Arranging. 3 Units.
Techniques of writing and arranging for instruments of the band and orchestra and voice. Study of scoring problems for school instrumental and vocal groups of all ages and abilities.

MUED 320. Technology Assisted Music Teaching and Learning. 3 Units.
Fundamental concepts and skills for using technology in music teaching and learning. This project-oriented class will develop knowledge and competencies related to electronic musical instruments, MIDI sequencing, music notation software, computer-assisted instruction, digital media, the Internet, information processing, computer systems, and lab management as they relate to music education in K-12 schools. Recommended preparation: MUED 240. Offered as MUED 320 and MUED 420.

MUED 350. General Music Methods A. 3 Units.
General Music A introduces student to methods and materials for planning and implementing general music experiences for all ages, with concentration on Pre-K through sixth grade children. Topics of the course include: multiple meanings of music for children; characteristics/needs of young children and creating a supportive learning environment; theories of music learning and teaching; learning styles and collaborative learning; assorted teaching methods, rhythm, pitch, listening, movement, performing, composing; curriculum design; technology for music instruction; multicultural music; music for exceptional children; integrating music with the arts and other curricula; motivation and classroom management; lesson planning and record keeping; developing a personal philosophy of music education; national, state, and professional standards; and assessment. Clinical/Field experiences (Clinical-all ages; Field-focus on Pre-K through elementary) required.
MUED 352. Instrumental Methods and Materials. 3 Units.
This course acquaints students with effective ways to develop, organize, and maintain a successful instrumental program for any age group, based on a comprehensive instrumental music education model. Students are given a "womb to tomb" view of the instrumentalists' development, including physiological development and age appropriate instrumental exceptions. Topics and content include: philosophical basis for music education, considerations for selecting repertoire including multicultural music; rehearsal techniques; assessment and record keeping; planning for the rehearsal; recruitment; auditioning; and placement; motivation and classroom management; team teaching and collaborative learning; managing an instrumental program; participation in professional activities; effective use of technology in the instrumental program; philosophy; and national, state, and professional standards. Clinical/Field experiences (all ages) required.

MUED 353. Choral Methods and Materials. 3 Units.
This course acquaints students with effective ways to develop a successful choral program for any age group, based on a comprehensive choral music education model. Students are given a "womb to tomb" view of the singing voice, including physiological development, age appropriate vocal expectations, and establishing and maintaining vocal health. Topics include: philosophical basis for vocal music education; the child voice, the adolescent voice, and the adult voice; vocal tone; considerations for selecting repertoire including ensemble assessment, music evaluation, and multicultural music; rehearsal techniques, collaborative learning, and motivation; planning for the rehearsal; developing conducting technique; recruitment; auditioning; placement; score analysis and preparation; classroom management; managing a choral program; participation in professional activities; effective use of technology in a choral program; and national state, and professional standards. Clinical/Field experiences (all ages) required. Recommended preparation: MUED 276.

MUED 355. Instructional Design in Music Education. 3 Units.
This Music Education Department Seminar brings together all strands of the Music Education program by focusing on curriculum as the organizational element of instruction. Topics and content include: understanding the issues presented by special learners; techniques for integrating special learners into the music teaching environment; developing learning outcomes; designing instruction; planning classroom experiences; defining assessment and measurement; assessment techniques and instruments for the music classroom; and exploring elements of school music program organization and administration. Professional writing and clinical and field experiences will be a large part of the activities in this course. This course is presented in a seminar format that provides for discussions of classroom topics and commentary on field experiences.

MUED 359. Music in Early Childhood. 3 Units.
The goal of the course is to provide students with an understanding of the role of music in early childhood and approaches to music education with young children. Students will experience an overview of selected theories of musical development of young children, discuss the importance of music to various areas of child development, explore cultural perspectives and influences on musical development, evaluate curricular materials and methods used in early childhood music education, observe children's music making in early childhood classrooms, and develop teaching skills for early childhood music settings. Topics and content of this course include: music's role in early childhood development; music aptitude and its measurement; theories of early childhood music learning; early childhood making; evaluating curricular materials for early childhood music; the importance of play in early childhood musical development; incorporating State and National Music Education Standards; designing instruction for early childhood music settings; assessment in early childhood music; cultural perspectives on music in early childhood; cultural influences on musical development; music therapy with young children; benefits of family interaction in music; the role of listening in early childhood musical development; and formal music instruction with young children. The class will participate in a weekly service learning project providing music instruction for young children and parents or caregivers from an underserved population. Offered as MUED 391 and MUED 491.

MUED 396A. Student Teaching in Music Education. 9 Units.
Teaching music in both elementary and secondary schools, full-time five days a week for 15 weeks. Closely supervised field experiences of all types with a wide variety of students. Emphasis on planning lessons and organizing materials, teaching methodologies, motivation, and student assessment. Topics addressed include communications and the arts, technology in learning, interdisciplinary learning, collaborative learning and teaching, creating a supportive environment, and professional development. Development of skills needed for self-assessment as well as student assessment. Clinical/Field experiences (all ages) required. Recommended preparation: Concurrent enrollment in MUED 396B. Offered as MUED 396A and MUED 496A. Prereq: EDUC 255 and MUAP 323 and MUAP 35.

MUED 396B. Student Teaching Seminar in Music Education. 3 Units.
This is the SAGES Senior Capstone requirement for students majoring in Music Education. Taken at the same time as the student teaching experience (MUED 396A/496A), this seminar will guide students through preparation for entering the professional world of music education, and mentor them in their preparation of their Senior Capstone Project and Presentation. Recommended preparation: Concurrent enrollment in MUED 496A. Offered as MUED 396B and MUED 496B.

MUED 399. Undergraduate Independent Studies. 1 - 3 Units.
Each student develops a topic of interest to be explored with a faculty member.

MUED 400. Clinical/Field Experience. 3 Units.
This provides clinical/field experiences with all ages of students in all teaching areas. Students from a variety of socioeconomic and cultural backgrounds are encountered. Clinical/Field experiences (all ages) required.
MUED 420. Technology Assisted Music Teaching and Learning. 3 Units.
Fundamental concepts and skills for using technology in music teaching and learning. This project-oriented class will develop knowledge and competencies related to electronic musical instruments, MIDI sequencing, music notation software, computer-assisted instruction, digital media, the Internet, information processing, computer systems, and lab management as they relate to music education in K-12 schools. Recommended preparation: MUED 240. Offered as MUED 320 and MUED 420.

MUED 441. Philosophical Foundations of Music Education. 3 Units.
In this course, students explore major aesthetic philosophies that have influenced contemporary music education, and discuss current issues central to our field. Among topics included: basic views about art/music; creating art/music; meaning in art/music, experiencing art/music; music and aesthetic education; criticism in music; multicultural music; and critical theories and inquiry regarding music education. Students are asked to assess their own roles in music education, as well as their obligations and potential capacities for leadership in the profession. Students will work toward development of a personal professional philosophy of music education.

MUED 442. Curriculum and Assessment in Music Education. 3 Units.
This course is designed to give graduate music education students thorough knowledge of the overarching role of curriculum and assessment as the organizational elements of instruction. In depth coverage of such topics as: the role of assessment and measurement in teaching; epistemology; scope and sequence; backward design; instructional goals; validity; reliability; performance assessments; measuring assessment; curriculum design; and teaching for understanding. These concepts and procedures will be explored in depth to give daily music instruction a global framework in the larger organizational structure of profession, state, national, and accreditation standards for P-12 and college music settings.

MUED 443. Music Cognition and Learning. 3 Units.
Survey and critical review of the literature as it relates to music teaching and learning, and music performance. Specific topics may include basic psychoacoustical processes, auditory perception, cognitive organization of musical sound, tonal and musical memory, neuromusical research, affective and physiological responses to music, learning theory, musical aptitude, developmental processes, and motivation.

MUED 444. Research in Music Education. 3 Units.
Paradigms and methods in music education research. Specific topics and assignments include research-related resources, tools and materials; research problems; research literature; research procedures, research proposals; qualitative and quantitative research studies; computer-assisted data analysis; and empirical research reports.

MUED 491. Music in Early Childhood. 3 Units.
The goal of the course is to provide students with an understanding of the role of music in early childhood and approaches to music education with young children. Students will experience an overview of selected theories of musical development of young children, discuss the importance of music to various areas of child development, explore cultural perspectives and influences on musical development, evaluate curricular materials and methods used in early childhood music education, observe children’s music making in early childhood classrooms, and develop teaching skills for early childhood music settings. Topics and content of this course include: music’s role in early childhood development; music aptitude and its measurement; theories of early childhood music learning; early childhood making; evaluating curricular materials for early childhood music; the importance of play in early childhood musical development; incorporating State and National Music Education Standards; designing instruction for early childhood music settings; assessment in early childhood music; cultural perspectives on music in early childhood; cultural influences on musical development; music therapy with young children; benefits of family interaction in music; the role of listening in early childhood musical development; and formal music instruction with young children. The class will participate in a weekly service learning project providing music instruction for young children and parents or caregivers from an underserved population. Offered as MUED 391 and MUED 491.

MUED 496A. Student Teaching in Music Education. 9 Units.
Teaching music in both elementary and secondary schools, full-time five days a week for 15 weeks. Closely supervised field experiences of all types with a wide variety of students. Emphasis on planning lessons and organizing materials, teaching methodologies, motivation, and student assessment. Topics addressed include communications and the arts, technology in learning, interdisciplinary learning, collaborative learning and teaching, creating a supportive environment, and professional development. Development of skills needed for self-assessment as well as student assessment. Clinical/Field experiences (all ages) required. Recommended preparation: Concurrent enrollment in MUED 396B. Offered as MUED 396A and MUED 496A. Prereq: EDUC 255.

MUED 496B. Student Teaching Seminar in Music Education. 3 Units.
This is the SAGES Senior Capstone requirement for students majoring in Music Education. Taken at the same time as the student teaching experience (MUED 396A/496A), this seminar will guide students through preparation for entering the professional world of music education, and mentor them in their preparation of their Senior Capstone Project and Presentation. Recommended preparation: Concurrent enrollment in MUED 496A. Offered as MUED 396B and MUED 496B.

MUED 501. Special Reading (M.A. and M.M.). 1 - 18 Unit.

MUED 544. Advanced Research in Music Education. 3 Units.
Advanced studies in models and methods of music education research. Research projects using data analysis. In-depth examination of selected quantitative and/or qualitative research designs according to student interests. Discussion of thesis and dissertation proposal format process. Recommended preparation: MUED 444.
MUEN 591. Music Education Seminar in Conducting. 3 Units.
In this course, students focus on advanced score study, preparation, and analysis. In depth conducting techniques on contemporary music and mixed meter compositions, along with the development of a comprehensive conducting bibliography are the major components in this seminar. Historical research, analytical evaluation, and the practical elements of the physical techniques required for one to conduct a chosen composition are all addressed for each composition studies. Seminar discussions include aesthetic and philosophical ideologies, and the practical issues a conductor faces when put in control of the advanced ensemble.

MUEN 696. College Teaching Practicum. 0 Units.
Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

MUEN Courses

MUEN 324. Case Percussion Ensemble. 0 - 2 Units.
The Case Percussion Ensemble is open to all interested Case-affiliated individuals who seek to continue their musical development by performing percussion ensemble literature. Membership is contingent on an audition that demonstrates moderate percussion ability and the ability to read music. Audition materials can be acquired through the director. Recommended preparation: Audition required.

MUEN 355. Miscellaneous Ensembles. 0 - 2 Units.

MUEN 356. University Circle Wind Ensemble. 1 Unit.
Designed for the most advanced woodwind, brass, and percussion players. Stresses the single-performance concept utilizing only players needed for a given piece. Audition required.

MUEN 357. New Music Ensemble. 1 - 2 Unit.

MUEN 365. Case Chamber Music. 0 - 1 Units.
This course will utilize wind instruments in different combinations, performing chamber music dating from the Renaissance to the 21st Century. The creation of new works and the adaptations of other repertoire will also be encouraged for unique/non-standard instrumentations. All combinations of Woodwinds, Brass, Voice, Strings, Guitar, Harp, Percussion, and Keyboard instruments will be considered; repertoire will be determined by available instrumentation. Membership is contingent on an audition that demonstrates moderate proficiency and the ability to read music. Audition materials can be acquired through the director.

MUEN 373. Jazz Ensemble I. 0 - 1 Units.
Recommended preparation: Audition required.

MUEN 374. Jazz Ensemble II. 0 - 1 Units.

MUEN 382. Case Concert Choir. 0 - 1 Units.
This select choral group performs a wide variety of a cappella and accompanied choral works. Membership is gained only through an audition with the director. Recommended preparation: Audition required.

MUEN 383. Symphonic Winds. 0 - 1 Units.
Performance of advanced symphonic band repertoire. Open to all Case students, faculty and staff. Audition required for part placement only.

MUEN 384. Spartan Marching Band. 0 - 1 Units.

MUEN 385. Case/University Circle Orchestra. 0 - 1 Units.
The orchestra is comprised of Case students, faculty, staff and community players who play strings, woodwinds, brass and percussion. Recommended preparation: Audition required.

MUEN 386. Case Camerata Chamber Orchestra. 0 - 1 Units.
This chamber string ensemble is open to all interested Case affiliated individuals who seek to continue their music development by performing orchestral literature. Each person is required to audition to determine initial placement, section assignment, and seating. All members are required to perform a minimum of 2 concerts per academic year. Recommended preparation: Audition required.

MUEN 387. University Singers. 0 - 1 Units.
Chorus performing a wide variety of traditional and popular choral works. Open to all Case students. No audition required.

MUEN 389. Keyboard Ensemble. 0 - 1 Units.
Intensive study of the repertory for keyboard instruments, including solo literature, chamber music, and other collaborative genres. Master class format with regular performances by enrolled students. Enrollment limited to CWRU keyboard majors. Must be enrolled in applied lessons.

MUEN 393. Baroque Chamber Ensembles. 0 - 1 Units.
Designed for students interested in exploring baroque music in a chamber setting on historical instruments. Prereq: Audition required.

MUEN 394. Baroque Dance Ensemble. 0 - 1 Units.
This course allows musicians and dancers alike to explore historical dance steps and notation. History of dance and its relationships to music will be emphasized as students learn and perform historical dances. Prereq: MUHI 342 or MUHI 442 or permission of Instructor.

MUEN 395. Collegium Musicum. 0 - 1 Units.
Recommended preparation: Audition required.

MUEN 396. Early Music Singers. 0 - 1 Units.
Recommended preparation: Audition required.

MUEN 397. Baroque Orchestra. 0 - 1 Units.
Recommended preparation: Audition required.

MUEN 398. Cleveland Orchestra Chorus. 0 - 1 Units.
Recommended preparation: Audition required.

MUGN Courses

MUGN 201. Introduction to Music: Listening Experience I. 3 Units.
A flexible approach to the study of the materials and literature of music. Aural and analytical skills primarily for classical music.

MUGN 202. Introduction to Music: Listening Experience II. 3 Units.
Application of the skills developed in MUGN 201 to the understanding of historical and stylistic content of Western music. Focus is on particular works in context of the era of composition. Recommended preparation: MUGN 201 or consent of department.
MUGN 215. History and Styles of Jazz. 3 Units.
Musical styles and structures of jazz and American popular music since 1900. Recommended preparation: MUGN 201.

MUGN 308. Digital Music: Composition and Production. 3 Units.
Course focuses on digital music creation and composition using audio sequencing software. Topics include song writing, synthesizers, recording, editing, mixing, and film scoring. Course is open to music majors, minors, and non-majors with sufficient musical background. Emphasis on group work, creativity, and imagination. All work done on Macintosh computers in The Core, the Department of Music’s multimedia classroom.

MUGN 319. Jazz Skills I. 3 Units.
This class is designed to teach students basic skills in jazz improvisation, jazz keyboard, arranging/composition and pedagogy. Basic theory is required. Students will eventually arrange their own composition for big band, which will feature them as the improvising soloist. Recommended preparation: MUTH 102/MUTH 106, MUHI 108 or permission of instructor.

MUGN 320. Jazz Skills II. 3 Units.
This course will build on the foundational skills developed in Jazz Skills I, providing a more intensive study of jazz harmony, improvisation and melodic construction. It is designed to give students an advanced experiential understanding of the theory and performance of jazz. Recommended preparation: MUGN 319.

MUGN 399. Undergraduate Independent Studies. 1 - 3 Unit.
Each student develops a topic of interest to be explored with a faculty member.

MUGN 501. Special Reading (M.A. and M.M.). 1 - 18 Unit.

MUGN 751. Recital Document I-D.M.A.. 1 - 3 Unit.

MUGN 752. Recital Document II - D.M.A.. 1 - 3 Unit.

MUHI Courses

MUHI 301. History of Western Music I. 3 Units.
Developments in Western music from early Christian times to c1700. Recommended preparation or concurrent enrollment: MUTH 102, MUTH 104, or MUTH 108.

MUHI 302. History of Western Music II. 3 Units.
Developments in Western music from c1700 to c1900. Recommended preparation: MUTH 102, MUTH 104, or MUTH 108.

MUHI 303. History of Western Music III. 3 Units.
Music of the twentieth century, covering history, analysis, and aesthetic issues. Recommended preparation: MUHI 301 or MUHI 302, MUTH 104 or MUTH 108.

MUHI 310. Music Cultures of the World: Music of Asia and Africa. 3 Units.
A one-semester introduction to musics of Asia and Africa, focusing on the relationship of musical traditions and practices to culture and society. Recommended preparation: MUTH 106.

MUHI 311. Music Cultures of the World II: Music of the Americas. 3 Units.
Introduction to selected multicultural musics of North America and Latin America, focusing on the relationship of musical traditions and practices to culture and society. Recommended preparation: MUTH 106.

MUHI 312. History of Rock and Roll: The Deep View. 3 Units.
This course surveys American popular song from the 1890s to the present, with an emphasis on rock ‘n’ roll and pop music of the last sixty years. The relationship of popular song to important currents in American life and culture will be examined. The origins of various styles of song in the cultures of different ethnic and national groups will be discussed, along with the subsequent diffusion and transformation of such music through mass mediation. The characteristics and meanings of music, lyrics, and images will be discussed with the aid of sound recordings, music videos and films. Students taking this course may not receive credit for MUGN 212. Prereq: For Music Majors only.

MUHI 315. History of Jazz and American Popular Music. 3 Units.
Musical styles and structures of jazz and American popular music; emphasis on music since 1900. Recommended preparation: MUTH 202 or MUHI 302.

MUHI 341. Introduction to Historical Performance Practice. 3 Units.
Summary and perspective of the problems and issues associated with the field of historical performance practices. Offered as MUHI 341 and MUHI 441. Prereq: MUHI 301 and MUHI 302.

MUHI 342. Seminar in Historical Performance Practice. 3 Units.
Seminar in a specific instrument and/or vocal area of historical performance practices, such as baroque vocal, instrumental, or keyboard practices. May be repeated because topics vary. Offered as MUHI 342 and MUHI 442. Prereq: MUHI 341 or MUHI 441

MUHI 350. Topics in Music History. 3 Units.
Close study of a theme or aspect of music such as “Music and Gender,” “Symphonies of Mahler,” and “Wagner’s Ring.” Offered as MUHI 350 and MUHI 450.

MUHI 390. Undergraduate Seminar in Music History. 3 Units.
An intensive research seminar in music history for music majors.

MUHI 395. SAGES Capstone for Music Majors. 3 - 6 Units.
Required for music majors, except in the case of double majors or dual degree candidates who opt to fulfill the capstone in the area of the second major. Course consists of projects varying according to the student’s area of study and interests, but each must include a document of appropriate length and scope. The project must be presented publicly in an appropriate forum.

MUHI 399. Undergraduate Independent Studies. 1 - 3 Unit.
Each student develops a topic of interest to be explored with a faculty member.

MUHI 401. Methodologies of Music History. 3 Units.
Introduction to the scholarly study of music, including principles of music bibliography, techniques of library research, and evaluation of editions. Special emphasis given to the relationship between musical performance and research in the history and criticism of music. Attention will also be given to design of program notes and essays. Required of first-year students in the Master of Music degree program.
MUHI 430. Music History for Educators. 3 Units.
Examines the intersections of composers’ musical output as it overlaps with theories of general education, music education, and pedagogy.

MUHI 431. Medieval Music: Early Christian to 1425. 3 Units.
The mass, liturgical drama, and early polyphony through the Ars Nova.

MUHI 432. Music of the Renaissance. 3 Units.
Vocal polyphonic music from the Burgundian school through the Elizabethan madrigal.

MUHI 433. Music of the Baroque. 3 Units.
Musical developments from Monteverdi to Bach and Handel.

MUHI 434. Viennese Classicism. 3 Units.
Development of the symphony, concerto, chamber music, and opera in the works of the Mannheim composers, Haydn, Mozart, and Beethoven.

MUHI 435. Nineteenth Century Music. 3 Units.
Romanticism and other 19th century trends in music up to impressionism.

MUHI 436. Twentieth Century Music. 3 Units.
Critical and analytical study of music since 1900. Examination and discussion of stylistic characteristics and aesthetic aims of contemporary composers.

MUHI 441. Introduction to Historical Performance Practice. 3 Units.
Summary and perspective of the problems and issues associated with the field of historical performance practices. Offered as MUHI 341 and MUHI 441.

MUHI 442. Seminar in Historical Performance Practice. 3 Units.
Seminar in a specific instrument and/or vocal area of historical performance practices, such as baroque vocal, instrumental, or keyboard practices. May be repeated because topics vary. Offered as MUHI 342 and MUHI 442. Prereq: MUHI 341 or MUHI 441.

MUHI 443. Medieval/Renaissance Notation. 3 Units.
Theory of chant, modal, mensural, and tablature notations. Practice in making literal transcriptions, editing, and preparing scores for performances.

MUHI 450. Topics in Music History. 3 Units.
Close study of a theme or aspect of music such as “Music and Gender,” “Symphonies of Mahler,” and “Wagner’s Ring.” Offered as MUHI 350 and MUHI 450.

MUHI 501. Special Reading (M.A. and M.M.). 1 - 18 Unit.

MUHI 590. Seminar in Musicology. 3 Units.
Problems in musical criticism, aesthetics, and analysis, as well as interdisciplinary methodologies.

MUHI 610. Bibliography and Research Methods in Music. 3 Units.
Seminar in research methods and techniques, stressing the analytic and functional approaches to bibliography.

MUHI 611. Doctor of Musical Arts Seminar. 3 Units.
Recommended preparation: MUHI 610.

Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

MUHI 751. Recital Document I-D.M.A.. 1 - 3 Unit.
MUHI 752. Recital Document II- D.M.A.. 1 - 3 Unit.
MUHI 753. Recital Document III-D.M.A.. 1 - 6 Unit.

MUPM Courses

MUPM 212. History of Rock and Roll. 3 Units.
This course surveys the musical practices of the rock and roll era, broadly defined to include much popular music since the 1950s. Music majors are to enroll in MUHI 312. Prereq: For Non-Music Majors only.

MUTH Courses

MUTH 101. Harmony-Keyboard I. 2 Units.
Scales, intervals, triads, seventh chords, and their inversions. Harmonization of melodies and basses, chorale study, modulation, analysis. Creative use of material. Correlated and taken concurrently with MUTH 105 and 106. Both aspects of the course must be passed in order to complete requirements.

MUTH 102. Harmony-Keyboard II. 2 Units.
(See MUTH 101.)

MUTH 103. Theory I. 3 Units.
Music theory for the nonmusic major. Intervals, scales, rhythmic drill, sight singing, eartraining, keyboard work, and harmony through inversions of triads and seventh chords. Not open to music majors.

MUTH 104. Theory II. 3 Units.
(See MUTH 103.) Recommended preparation: MUTH 103 or consent of department.

MUTH 107. Theory for Music Majors I. 4 Units.
This course is the first of four semesters of music theory requirements for Case music majors. It will include the study of harmony, analysis, eartraining, and keyboard skills. Recommended preparation: Placement exam through department.

MUTH 108. Theory for Music Majors II. 4 Units.
This course is the second of four semesters of music theory for Case music majors. It includes further study of harmony, analysis, eartraining, sightsinging, and keyboard. Recommended preparation: MUTH 107 or placement exam through department.

MUTH 201. Harmony-Keyboard III. 2 Units.
Continuation of MUTH 101 and 102. Chromatically altered triads and 7th chords; 9th, 11th, 13th. Neapolitan and augmented 6th chords, regular and irregular solutions. Correlated and taken concurrently with MUTH 205 and 206. Both aspects of the course must be passed in order to complete requirements. Students cannot earn credit for both MUTH 201/205 and MUTH 207. Recommended preparation: MUTH 102 or placement examination.
MUTH 202. Harmony-Keyboard IV. 2 Units.
(See MUTH 201.) Recommended preparation: MUTH 102 or placement examination.

MUTH 207. Theory for Music Majors III. 4 Units.
This course is the third of four semesters of music theory for music majors. Continued study of harmony, analysis, ear-training, sight-singing, and keyboard, including use of dissonance and chromaticism, diatonic modulation. Students cannot earn credit for both MUTH 201/205 and MUTH 207. Recommended preparation: MUTH 108 or placement exam through department.

MUTH 208. Theory for Music Majors IV. 4 Units.
This course is the fourth of four semesters of music theory for CWRU music majors. Continued study of harmony, analysis, ear-training, sight-singing, and keyboard. Use of dissonance and chromaticism, chromatic voice leading technique, tonal and post-tonal topics. Recommended preparation: MUTH 207 or placement exam through department.

MUTH 311. 16th Century Counterpoint. 2 Units.
Sixteenth century modal counterpoint. Exercises in the five species. Writing of short compositions and motets in two, three and four voices. Recommended preparation: MUTH 202 or MUTH 206.

MUTH 312. Eighteenth Century Counterpoint. 3 Units.
Analysis and writing of inventions in two parts, and fugues in three and four parts. Recommended preparation: MUTH 202 or MUTH 206.

MUTH 320. Form and Analysis. 3 Units.
aural and visual analysis of structural and stylistic features of 16th through 20th century music. Prereq: MUTH 202 and MUTH 206, or MUTH 208.

MUTH 399. Undergraduate Independent Studies. 1 - 3 Unit.
Each student develops a topic of interest to be explored with a faculty member.

MUTH 400A. Review of Musical Structure. 3 Units.
Instruction of fundamentals of form, counterpoint, and four-part harmony. Designed for graduate students; credit not applicable toward degree requirements.

MUTH 400B. Sightsinging and Eartraining Review. 2 Units.
Background in fundamentals of sight singing in four clefs; melodic and harmonic dictation including chromatic harmony and modulation. Designed for graduate students; credit not applicable toward degree requirements.

MUTH 416. Pre-common Practice Theory and Analysis. 3 Units.
An exploration of treatises and analytical methods appropriate to music of the Medieval and Renaissance eras.

MUTH 422. Musical Analysis for Educators. 3 Units.
Musical Analysis for Educators is designed to strengthen the analysis skills of music educators and explore practical application of these skills. Recommended preparation: Placement exam.

MUTH 423. Analysis of Musical Styles. 3 Units.
Analysis of selected musical compositions from various periods of the common practice era. Emphasis on traditional structures, stylistic features, and the relationship of analysis and performance.

MUTH 424. Introduction to Schenkerian Analysis. 3 Units.

MUTH 495. Seminar in Music Theory. 3 Units.

MUTH 501. Special Reading (M.A. and M.M.). 1 - 18 Unit.
Department of Philosophy

The Department of Philosophy offers an undergraduate major leading to the Bachelor of Arts degree. It also offers minor programs for undergraduates as well as graduate-level courses for candidates for the Master of Arts degree in such fields as biomedical ethics, history, English, mathematics, and the sciences.

The department’s course offerings are designed not only to provide knowledge and skills required for students whose main interest is in philosophy, but also to educate students in general about the intellectual issues that a reflective person is likely to encounter in various contexts of civilized life. The department emphasizes the relevance of philosophy to mathematics, computer science, the natural sciences, the social sciences, the humanities and arts, and law.

The major program in philosophy, besides offering a solid foundation for advanced study in philosophy and enriching programs in other disciplines, develops the skills for analytical and critical thinking, effective communication, and rational decision making needed in a wide range of endeavors. The program thus provides majors with unusual flexibility in the choice of subsequent careers, including law, medicine, and management, while complementing the pursuit of career objectives with a greater perspective and a richer quality of intellectual life.

In collaboration with the Department of History, the department participates in an interdisciplinary major program in the history and philosophy of science and technology, leading to the Bachelor of Arts degree. The department also participates in, and contributes courses to, the interdisciplinary minor in artificial intelligence.

Undergraduate Programs

Major

The major consists of 30 hours (ten 3-credit courses) in philosophy, including PHIL 101, 201, 301, 302, and six other elective philosophy courses to be determined in consultation with the department’s undergraduate advisor. However, a student may request permission to take up to 6 hours (two 3-credit courses) of the required 18 hours of philosophy electives in another field or other fields. Such a request should be supported by considerations showing how the substitution(s) would strengthen the student’s major in philosophy. The advisor must approve the substitution(s) in advance.

Total Units 30

Departmental Honors

The department offers an honors program for students pursuing a major in philosophy. Students in this program must complete a substantial thesis, pass an oral examination on the thesis, and maintain a B average in philosophy courses. To be eligible for admission, a student should have an overall grade point average of B or better, and a grade of B or better in each philosophy course already taken. A student normally should have taken at least four, and at most seven, philosophy courses at the time of application for admission. An honors student should register for PHIL 399, Directed Study (3), to do honors work. Interested students should apply for admission to the program during the first semester of junior year.

Minor

The department offers a range of possible minor programs, each of which must include PHIL 101 and four other courses in philosophy at the 200 or 300 level (excluding PHIL 390 and 399), chosen to meet the specific needs of students majoring in other fields. The undergraduate advisor will assist students in devising minor programs.

Total Units 15

Philosophy Capstone

Students may fulfill their SAGES capstone requirement in philosophy by registering for PHIL 399 Directed Study after devising a suitable project in consultation with the undergraduate advisor and the supervising faculty member.

Department Faculty

Laura E. Hengehold, PhD
(Loyola University of Chicago)
Associate Professor and Chair
Political and social philosophy; philosophy of feminism; Foucault; contemporary continental philosophy

Jeremy Bendik-Keymer, PhD
(University of Chicago)
Elmer G. Beamer-Hubert H. Schneider Professor in Ethics; Associate Professor
Ethics and moral philosophy; environmental philosophy; philosophy of education; meta-philosophy; history of ethics and moral philosophy

Shannon D. French, PhD
(Brown University)
Inamori Professor of Ethics; Associate Professor
Military ethics; leadership ethics; professional ethics; moral psychology; biomedical and environmental ethics

Chris Haufe, PhD
(Columbia University)
Assistant Professor
Philosophy of science, philosophy of biology

Chin-Tai Kim, PhD
(Harvard University)
Professor
History of philosophy (17th, 18th, and 19th centuries); theory of knowledge; metaphysics; foundations of ethics; phenomenology; comparative philosophy

Colin McLarty, PhD
(Case Western Reserve University)
Truman P. Handy Professor of Philosophy
Logic; philosophy of logic; philosophy of mathematics; philosophy of science; contemporary French philosophy

Adjunct Faculty

Joel Levin, DPhil
(University of Oxford, U.K.)
involved in thinking clearly about these issues. Students will become more informed about the intricacies of scientific language; reductionism; space, time and relativity; philosophical issues about life and death; and "pseudo-science." First half of a year-long sequence. Offered as ENGL 270, HSTY 270, PHIL 270, RLGN 270, SOCI 201, and WGST 201. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

PHIL 271. Bioethics: Dilemmas. 3 Units.
We have the genetic technology to change nature and human nature, but should we? We have the medical technology to extend almost any human life, but is this always good? Should we clone humans? Should we allow doctor-assisted suicide for the terminally ill? This course invites students from all academic disciplines and fields to examine current and future issues in bioethics--e.g., theory and methods in bioethics; death and dying; organ transplantation; genetics; aging and dementia; fertility and reproduction; distributive justice in health care access. The course will include guest lecturers from nationally-known Bioethics faculty. Offered as BETH 271, PHIL 271.

PHIL 270. Introduction to Gender Studies. 3 Units.
This course introduces women and men students to the methods and concepts of gender studies, women's studies, and feminist theory. An interdisciplinary course, it covers approaches used in literary criticism, history, philosophy, political science, sociology, anthropology, psychology, film studies, cultural studies, art history, and religion. It is the required introductory course for students taking the women's and gender studies major. Offered as ENGL 270, HSTY 270, PHIL 270, RLGN 270, SOCI 201, and WGST 201. Prereq: ENGL 150 or passing letter grade in a 100 level first year seminar in USFS, FSCC, FSNA, FSSO, FSSY, FSTS, FSCS.

PHIL 225. Evolution. 3 Units.
Multidisciplinary study of the course and processes of organic evolution provides a broad understanding of the evolution of structural and functional diversity, the relationships among organisms and their environments, and the phylogenetic relationships among major groups of organisms. Topics include the genetic basis of micro- and macro-evolutionary change, the concept of adaptation, natural selection, population dynamics, theories of species formation, principles of phylogenetic inference, biogeography, evolutionary rates, evolutionary convergence, homology, Darwinian medicine, and conceptual and philosophic issues in evolutionary theory. Offered as ANTH 225, BIOL 225, EEPS 225, HSTY 225, and PHIL 225.

PHIL 221. Indian Philosophy. 3 Units.
A survey of Indian philosophical thought with emphasis on the Vedas, early Hindu, and Jain literature. Offered as PHIL 221 and RLGN 221.

PHIL 201. Introduction to Logic. 3 Units.
Presentation, application, and evaluation of formal methods for determining the validity of arguments. Discussion of the relationship between logic and other disciplines.

PHIL 203. Natural Philosophy I. 3 Units.
Historical and philosophical interpretation of some epochal events in development of science. Copernican revolution, Newtonian mechanics, Einstein's relativity physics, quantum mechanics, and evolutionary theory; patterns of scientific growth; structure of scientific "revolutions;" science and "pseudo-science." First half of a year-long sequence. Offered as HSTY 203 and PHIL 203.

PHIL 204. Natural Philosophy II. 3 Units.
Conceptual, methodological, and epistemological issues about science: concept formation, explanation, prediction, confirmation, theory construction and status of unobservables; metaphysical presuppositions and implications of science; semantics of scientific language; illustrations from special sciences. Second half of a year-long sequence. Offered as HSTY 207 and PHIL 204.

PHIL 206. Contemporary Moral Issues: Experiential. 3 Units.
What is good and how is it different from evil? How do you know when you have done the right thing? Is there an absolute grounding to morality? What is the role of reason in our lives? What is human nature? Are human beings essentially creatures of emotion? What bearing do these questions have on our basic moral determinations of good and evil? How are all these questions related to concerns about personal identity? Using sources from different eras and schools of philosophic thought, students will become more informed about the intricacies involved in thinking clearly about these issues.

Secondary Faculty
Insoo Hyun, PhD
(Brown University)
Associate Professor, Department of Bioethics
Bioethics; moral and political philosophy
Anthony Jack, PhD
(University College London)
Assistant Professor, Department of Cognitive Science
Cross-cultural study of theory of mind and moral reasoning
Deepak Sarma, PhD
(University of Chicago)
Professor, Department of Religious Studies
Hinduism; Indian philosophy; philosophy of religion; method and theory

Courses
PHIL 304. Science and Engineering Ethics. 3 Units.
This course prepares students to recognize ethical problems that commonly arise in the scientific and engineering workplace, to understand ethical concepts, to evaluate ethical arguments, and to critically examine responses to problems and their ethical ramifications. It addresses questions such as: What are the criteria of fairness in crediting contributions to research? How safe is safe enough? What are professional responsibilities, and how do they change over time? What is research misconduct? When is ignorance culpable? What is intellectual property and what protections does it deserve? When is biological testing of workers justified? What are responsible ways of raising concerns, and what supports do good organizations give for raising them? What treatment counts as harassment or as an expression of prejudice? What are good means for controlling it? What are scientists' and engineers' responsibilities for environmental protection? What is a "conflict of interest" and how is it controlled? What protections for human research subjects are warranted? What, if any, use of animals in research is justified? Recommended preparation: PHIL 101 or PHIL 102 or PHIL 205. Offered as PHIL 304 and PHIL 404.

PHIL 305. Ethics. 3 Units.
Analysis of ethical theories and concepts of goodness, right, and obligation. Discussion of nature of justice, problem of justification of moral principles, and relation between facts and values. Recommended preparation: PHIL 101, PHIL 102 or PHIL 205. Offered as PHIL 305 and PHIL 405.

PHIL 306. Mathematical Logic and Model Theory. 3 Units.
Propositional calculus and quantification theory; consistency and completeness theorems; Gödel incompleteness results and their philosophical significance; introduction to basic concepts of model theory; problems of formulation of arguments in philosophy and the sciences. Offered as PHIL 306, MATH 406 and PHIL 406.

PHIL 313. Philosophy of Mathematics. 3 Units.
Logical paradoxes and their effects on foundations of mathematics. Status of mathematical entities and nature of mathematical truths. Formalist, logicist, and intuitionist positions. Recommended preparation: PHIL 101 or PHIL 201. Offered as PHIL 313 and PHIL 413.

PHIL 314. Animal Cognition and Consciousness. 4 Units.
This course examines the notions of intelligence, cognition, reasoning, consciousness, and mental content as they appear in the philosophical views and empirical studies of animals in individual and social contexts. We will review scientific findings that suggest striking likenesses and intriguing differences in the (apparent) thought processes of humans and animals, and ask whether the research techniques that brought us these results are fully adequate to measuring such unobservable entities as conscious experience and thought. Techniques of measurement range from naturalistic observation, to the processing of vocalizations, to memory and problem solving tasks, and the imaging of brain processes through fMRI scans, etc. Students will face the challenges and rewards of practicing these techniques and reworking philosophical theories in the service component of the course. Students will participate in veterinary or shelter work to provide needed animal care while studying animal behavior using cognitive ethological methods. We will compare methods for measuring consciousness and intelligence in animals to those used for human beings, and ask questions about the possibility of machine consciousness and the emergent property of group consciousness. Offered as BIOL 314, COGS 314, PHIL 314 and PHIL 414.

PHIL 315. Selected Topics in Philosophy. 3 Units.
Examination of views of a major philosopher or philosophical school, a significant philosophical topic, or a topic that relates to philosophy and other discipline. Recommended preparation: PHIL 101. Offered as PHIL 315 and PHIL 415.

PHIL 316. African Political Thought. 3 Units.
Introduction to select themes in the work of contemporary African philosophers, with special emphasis on political thought. In this course, students will learn something about factors affecting the creation and flow of knowledge and ideas about Africa and discuss the relative importance of the "nation-state" as an idea in Europe, pre-colonial Africa, and postcolonial Africa. Offered as PHIL 316/416 and ETHS 316/416. Prereq: PHIL 101.

PHIL 317. War and Morality. 3 Units.
The aim of this course is to explore a wide range of ethical issues relating to the decision to take a nation to war, how wars are conducted, and efforts to establish order in the wake of a conflict. Topics include the Just War tradition, pacifism, humanitarian intervention, moral repair and the establishment of a just peace, conduct of war, warrior codes, warrior transitions, and civil-military relations. We will examine the ethics of war from the perspectives of both states and individuals. War is a crucible that strips those caught up in its horrors down to their fundamental selves inspiring acts of both inhuman depravity and seemingly superhuman nobility. This course is presented in a seminar format with lively discussions centering on contemporary readings in military ethics from texts and journals. Offered as PHIL 317 and PHIL 417.

PHIL 320. The Phenomenological Tradition. 3 Units.
The background of phenomenology: Descartes, Kant, and Brentano. The epistemological rationale of Husserl's phenomenology and its ontological implications; the powers and limits of the phenomenological method. Heidegger's transformation of phenomenology to interpretive ontology of human existence. The development of interpretation theory as the foundation of all human existence. The development of interpretation theory as the foundation of all human sciences in Gadamer and Ricoeur. Recommended preparation: PHIL 101, PHIL 320 and PHIL 420.

PHIL 321. Advanced Indian Philosophy. 3 Units.
We will closely examine a limited number of texts in Jain, Hindu, and/or Buddhist philosophy. Our concern will be the methods, presuppositions, arguments, and goals of these schools and trajectories of thought. What were their theories on the nature of the person, the nature of reality, and the nature and process of knowing? What were the debates between the schools and the major points of controversy? We will spend the majority of time analyzing the arguments or positions as they are found in primary texts (in translation). We will rely on the primary sources found in Sarma Introduction to Classical Indian Philosophy as well as PDFs provided by the instructor. Students will read texts out loud in class and will be expected to comment on the passage or passages. Students are expected to use outside sources in their preparations. The goal of the class is to continue to learn how to make and write arguments against (or in support of) the various positions using the prasangika (reductio ad absurdum) method. The papers are rigorous ones and require the student to present the position and then to posit arguments against it, finding internal incoherences. This is a writing-intensive class. Students will continue to learn how to write as per the genre of Indian philosophy. Offered as RLGN 321 and PHIL 321. Prereq: RLGN 221 or PHIL 221.
PHIL 325. Philosophy of Feminism. 3 Units.
Dimensions of gender difference. Definition of feminism. Critical examination of feminist critiques of culture, including especially politics, ideology, epistemology, ethics, and psychology. Readings from traditional and contemporary sources. Offered as PHIL 325 and PHIL 425 and WGST 325. Prereq: PHIL 101.

PHIL 330. Topics in Ethics. 3 Units.
Examination of views in ethics of a major philosopher or philosophical school, a significant philosophical topic in ethics, or a topic that relates ethics to philosophy and another discipline. Recommended preparation: PHIL 101, PHIL 102, or PHIL 205. Offered as PHIL 330 and PHIL 430.

PHIL 332. Classical Jewish Religious Thought. 3 Units.
The thought of some major biblical and Rabbinic writings and of the classic age of medieval Jewish philosophy. Offered as JDST 330, PHIL 332, and RLGN 330.

PHIL 333. Philosophy of Religion. 3 Units.
Topics include: classical and contemporary arguments for God’s existence; divine foreknowledge and human freedom; the problem of evil and theodicy; nature and significance of religious experience; mysticism; varieties of religious metaphysics; knowledge, belief and faith; nature of religious discourse. Readings from traditional and contemporary sources. Recommended preparation for PHIL 433 and RLGN 433: PHIL 101 or RLGN 102. Offered as PHIL 333, RLGN 333, PHIL 433, and RLGN 433.

PHIL 334. Political and Social Philosophy. 3 Units.
Justification of social institutions, primarily political ones. Such distinctions as that between de facto and legitimate authority; analysis of criteria for evaluation, such as social justice and equality; inquiry into theories of justification of the state; theory of democratic government and its alternatives. Readings from classical and contemporary sources. Recommended preparation: PHIL 101. Offered as PHIL 334, POSC 354, PHIL 434, and POSC 454.

PHIL 335. Philosophy of Law. 3 Units.
This is an examination of the general nature of law, the broad concerns of jurisprudence, the study of comparative law, and many of the issues raised in the literature of legal philosophy. Students will examine the principles of legal positivism, mitigated natural law, and rights theory. Selected readings and cases will illustrate these theories, which will also be examined in the context of rule selection by new governments in developing or revolutionary societies. The course also looks at the general nature of legal systems: how politics, morality, and individual views of justice and rights affect particular court cases and the course and development of law generally. Topics will include abortion, obscenity and sin, civil disobedience, affirmative action, surrogatehood, and the death penalty. This is unlike any other of the legal theory or jurisprudence courses, and those who have sampled legal theory elsewhere in a different form are welcome and encouraged to enroll. Recommended preparation: PHIL 101. Offered as LAWS 353, PHIL 335, and PHIL 435.

PHIL 345. Epistemology and Metaphysics. 3 Units.
Traditional problems of epistemology, such as definition of knowledge, justification of belief, nature of evidence and foundationalism, skepticism, the a priori, and the role of sense perception in knowledge. Metaphysical presuppositions and implications of epistemological views. Forms of realism and anti-realism. Recommended preparation: PHIL 101. Offered as PHIL 345 and PHIL 445.

PHIL 355. 19th and Early 20th Century Philosophy. 3 Units.
History of philosophy after Kant up to and including logical empiricism. Interpretation and comparison of important philosophers and philosophical schools of the period in terms of common methods, problems, themes, doctrines, and ideologies. Emphasis on Schopenhauer, Hegel, Kierkegaard, Marx, and Nietzsche. Recommended preparation: PHIL 101. Offered as PHIL 355 and PHIL 455.

PHIL 356. Comparative Philosophy. 3 Units.
Philosophy in the etymological sense of the term, love of wisdom, subsumes ontological, ethical and epistemological inquires addressing fundamental questions about reality, the place of humans in that reality, the values of things and human obligations, and the sources of knowledge. The major purpose of this course is to discover, understand, explicate and articulate the affinities and differences in the way the fundamental questions are addressed in different cultural contexts, thereby to appreciate the cross-cultural kinship among human minds as well as to be challenged by the differences that may engender conflicts. We will explore the possibility of building a trans-cultural meta-cultural meta-discourse in which thinkers from many traditions can participate on equal footing. We will come to face up to the question whether truly universal philosophy is possible, upon what conditions. Representative texts from the Western, Chinese and Buddhist traditions including selected works of Plato, Aristotle, Augustine, Descartes, Kant, Nietzsche, Heidegger, Lao Tzu, Confucius, Chuang Tzu, Dhammapada of the Buddha and D. Suzuki’s Zen Buddhism will be read. Offered as PHIL 356 and PHIL 456. Prereq: PHIL 101 or requisites not met permission.

PHIL 363. Philosophy and Social Neuroscience. 3 Units.
A philosophical examination of recent research in human cognition and emotion at the intersection of the social sciences and neurological sciences. The course provides the student with background knowledge of brain processes underlying such social and cultural phenomena as bonding, aggression, imitation, mind-attribution, language, sexual behavior, moral action, and creativity. The approach of this course is at once scientific (comparing methods, findings and questions as they arise in clinical and experimental neuropsychology, brain imaging, neurolinguistics, and behavioral neuroscience) and humanistic, asking critical questions about the nature and methods of a science of cognition, and surveying moral responses from a neurologic and philosophic perspective. Recommended preparation: PHIL 101 or COGS 201. Offered as COGS 363 and PHIL 363.

PHIL 367. Topics in Evolutionary Biology. 3 Units.
The focus for this course on a special topic of interest in evolutionary biology will vary from one offering to the next. Examples of possible topics include theories of speciation, the evolution of language, the evolution of sex, evolution and biodiversity, molecular evolution. ANAT/ANTH/EEPS/PHIL/PHOL/467/BIOL 468 will require a longer, more sophisticated term paper, and additional class presentation. Offered as ANTH 367, BIOL 368, EEPS 367, PHIL 367, ANAT 467, ANTH 467, BIOL 468, EEPS 467, PHIL 467 and PHOL 467.
PHIL 368. Evolutionary Biology Capstone. 3 Units.
This course focuses on a special topic of interest in evolutionary biology that will vary from one offering to the next. Examples of possible topics include theories of speciation, the evolution of language, the evolution of sex, evolution and biodiversity, molecular evolution. Students will participate in discussions and lead class seminars on evolutionary topics and in collaboration with an advisor or advisors, select a topic for a research paper or project. Each student will write a major research report or complete a major project and will make a public presentation of her/his findings. Offered as ANTH 368, BIOL 369, PHIL 368.

PHIL 373. Intelligence and Cognition. 3 Units.
This course will focus on the notion and meaning of intelligence. What is intelligence? How is it measured, and are these measures adequate to the task? Is there more than one kind of intelligence? What is the relationship between individuals, genetic factors, biological factors, and socio-cultural-economic factors in the development of intelligence? How are language and thought related to intelligence? What is the difference between intelligence and talent? Intelligence seems to be necessary for culture, art, religious belief, the creation of theories and the quest for knowledge, truth and morality; thus intelligence is a necessary condition for the study of itself. To attempt to understand intelligence is an undertaking in which we will ask questions about the self and the common nature of humanity, while simultaneously examining the abilities of animals and machines. What is the mark of intelligence? Recommended preparation: PHIL 101 or COGS 201. Offered as COGS 373 and PHIL 373.

PHIL 375. Issues in Aesthetics. 3 Units.
This course will seek to offer insight into the nature of artistic expression, the role of criticism in the arts, and the place of the arts in society. The term “arts” will be construed broadly to include painting, photography, theater, film, music, dance, poetry, etc. The following are examples of questions we will discuss. What does the term “beautiful” mean? Are there other measures of aesthetic value besides beauty? Do the arts, like the sciences, offer us knowledge of the world? What value do the arts have for society? Can aesthetic value conflict with moral value? Do artists have a responsibility to society? Should art ever be censored? What is the relationship between art and entertainment? Is the meaning and value of an artistic work a matter of individual opinion? What is the purpose of art criticism? How are interpretations and evaluations of art influenced by race, gender, class, etc.? What is creativity in the arts? Does it differ from creativity in the sciences? How important is originality in art? Offered as PHIL 375 and PHIL 475. Prereq: PHIL 101 or requisite not met permission.

PHIL 381. Philosophy and Cognitive Neuroscience. 3 Units.
This course will focus on the various methodologies used in the cognitive neurosciences, and explore their strengths and weaknesses from scientific and philosophical standpoints. We will begin by examining baseline measures (including IQ tests, tasks of cognitive flexibility, verbal and visual memory, causal/sequential thinking and narrative tasks) and their experimental design. Lesion methods will follow, with an eye toward understanding the strength of inferences that can be drawn from such data. The course will also focus on imaging techniques (CAT, PET, SPECT, IMRI, TMS, etc.) as well as measures of electrical activity such as EEG and single-cell recordings. Students will become familiar with many fundamental assumptions necessary for the implementation of each method, and philosophical questions associated with these endeavors and their potential impact on our knowledge and society. Recommended preparation: PHIL 101 or COGS 201. Offered as COGS 381 and PHIL 381.

PHIL 383L. Vocalization and Cognition Lab. 1 Unit.
This is a laboratory section intended to provide hands-on training and experience with sound processing and analysis of animal vocalizations in the context of cognitive science, philosophy, and biology. Students will ask and answer questions surrounding language, meaning, mind, mental states, animal and human cognition. How does a science of content and language actually proceed? How do we measure behavior for use as an indicator of cognition? What pragmatic constraints are found when we explore the natural world? What causes us to interpret certain symbols as systematic? The laboratory work begins with an understanding of different software for sound analysis with an emphasis on the bioacoustic experimental method. Frog vocalization exercises will familiarize students with the process of data categorization, analysis and comparison, and will be the foundation for understanding hypothesis testing within a Darwinian theoretical backdrop. Cetacean vocalization analysis will press students to move beyond comparison and analysis to consider and evaluate the standard evidence types used in cognitive science to measure the mind. Recommended preparation: PHIL 101 or COGS 201. Offered as COGS 383L and PHIL 383L.

PHIL 390. Senior Research Seminars in History and Philosophy of Science. 3 Units.
Directed independent research seminar for seniors who are majors in the History and Philosophy of Science program. The goal of the course is to develop and demonstrate command of B.A.-level factual content, methodologies, research strategies, historiography, and theory relevant to the field of history of science and/or philosophy of science. The course includes both written and oral components. Offered as HSTY 380 and PHIL 390.

PHIL 394. Seminar in Evolutionary Biology. 3 Units.
This seminar investigates 20th-century evolutionary theory, especially the Modern Evolutionary synthesis and subsequent expansions of and challenges to that synthesis. The course encompasses the multidisciplinary nature of the science of evolution, demonstrating how disciplinary background influences practitioners' conceptualizations of pattern and process. This course emphasizes practical writing and research skills, including formulation of testable theses, grant proposal techniques, and the implementation of original research using the facilities on campus and at the Cleveland Museum of Natural History. Offered as ANTH 394, BIOL 394, EEPS 394, HSTY 394, PHIL 394, ANTH 494, BIOL 494, EEPS 494, HSTY 494, and PHIL 494.
PHIL 396. Undergraduate Research in Evolutionary Biology. 3 Units.
Students propose and conduct guided research on an aspect of evolutionary biology. The research will be sponsored and supervised by a member of the CASE faculty or other qualified professional. A written report must be submitted to the Evolutionary Biology Steering Committee before credit is granted. Offered as ANTH 396, BIOL 396, EEPS 396, and PHIL 396.

PHIL 399. Directed Study. 3 Units.
Under faculty supervision, students will undertake a project that demonstrates critical thinking, has clear goals, features periodic reporting of progress, and will result in a final report and public presentation.

PHIL 403. Topics in Philosophy of Science. 3 Units.
In-depth study of selected topics in general philosophy of science or philosophy of physical, biological, or social science. Topics may include: theories of explanation, prediction, and confirmation; semantics of scientific language; reductionism; space, time and relativity; philosophical issues about quantum mechanics; philosophical issues about life sciences (e.g., evolution, teleology, and functional explanation); explanation and understanding in social sciences; value in social science. Recommended preparation: PHIL 101 or PHIL 201 or PHIL 203. Offered as PHIL 303 and PHIL 403.

PHIL 404. Science and Engineering Ethics. 3 Units.
This course prepares students to recognize ethical problems that commonly arise in the scientific and engineering workplace, to understand ethical concepts, to evaluate ethical arguments, and to critically examine responses to problems and their ethical ramifications. It addresses questions such as: What are the criteria of fairness in crediting contributions to research? How safe is safe enough? What are professional responsibilities, and how do they change over time? What is research misconduct? When is ignorance culpable? What is intellectual property and what protections does it deserve? When is biological testing of workers justified? What are responsible ways of raising concerns, and what supports do good organizations give for raising them? What treatment counts as harassment or as an expression of prejudice? What are good means for controlling it? What are scientists’ and engineers’ responsibilities for environmental protection? What is a “conflict of interest” and how is it controlled? What protections for human research subjects are warranted? What, if any, use of animals in research is justified? Recommended preparation: PHIL 101 or PHIL 102 or PHIL 205. Offered as PHIL 304 and PHIL 404.

PHIL 405. Ethics. 3 Units.
Analysis of ethical theories and concepts of goodness, right, and obligation. Discussion of nature of justice, problem of justification of moral principles, and relation between facts and values. Recommended preparation: PHIL 101, PHIL 102 or PHIL 205. Offered as PHIL 305 and PHIL 405.

PHIL 406. Mathematical Logic and Model Theory. 3 Units.
Propositional calculus and quantification theory; consistency and completeness theorems; Gödel incompleteness results and their philosophical significance; introduction to basic concepts of model theory; problems of formulation of arguments in philosophy and the sciences. Offered as PHIL 306, MATH 406 and PHIL 406.

PHIL 413. Philosophy of Mathematics. 3 Units.
Logical paradoxes and their effects on foundations of mathematics. Status of mathematical entities and nature of mathematical truths. Formalist, logicist, and intuitionist positions. Recommended preparation: PHIL 101 or PHIL 201. Offered as PHIL 313 and PHIL 413.

PHIL 414. Animal Cognition and Consciousness. 4 Units.
This course examines the notions of intelligence, cognition, reasoning, consciousness, and mental content as they appear in the philosophical views and empirical studies of animals in individual and social contexts. We will review scientific findings that suggest striking likenesses and intriguing differences in the (apparent) thought processes of humans and animals, and ask whether the research techniques that brought us these results are fully adequate to measuring such unobservable entities as conscious experience and thought. Techniques of measurement range from naturalistic observation, to the processing of vocalizations, to memory and problem solving tasks, and the imaging of brain processes through fMRI scans, etc. Students will face the challenges and rewards of practicing these techniques and reworking philosophical theories in the service component of the course. Students will participate in veterinary or shelter work to provide needed animal care while studying animal behavior using cognitive ethological methods. We will compare methods for measuring consciousness and intelligence in animals to those used for human beings, and ask questions about the possibility of machine consciousness and the emergent property of group consciousness. Offered as BIOL 314, COGS 314, PHIL 314 and PHIL 414.

PHIL 415. Selected Topics in Philosophy. 3 Units.
Examination of views of a major philosopher or philosophical school, a significant philosophical topic, or a topic that relates to philosophy and other discipline. Recommended preparation: PHIL 101. Offered as PHIL 315 and PHIL 415.

PHIL 416. African Political Thought. 3 Units.
Introduction to select themes in the work of contemporary African philosophers, with special emphasis on political thought. In this course, students will learn something about factors affecting the creation and flow of knowledge and ideas about Africa and discuss the relative importance of the “nation-state” as an idea in Europe, pre-colonial Africa, and postcolonial Africa. Offered as PHIL 316/416 and ETHS 316/416.

PHIL 417. War and Morality. 3 Units.
The aim of this course is to explore a wide range of ethical issues relating to the decision to take a nation to war, how wars are conducted, and efforts to establish order in the wake of a conflict. Topics include the Just War tradition, pacifism, humanitarian intervention, moral repair and the establishment of a just peace, conduct of war, warrior codes, warrior transitions, and civil-military relations. We will be examining the ethics of war from the perspectives of both states and individuals. War is a crucible that strips those caught up in its horrors down to their fundamental selves inspiring acts of both inhuman depravity and seemingly superhuman nobility. This course is presented in a seminar format with lively discussions centering on contemporary readings in military ethics from texts and journals. Offered as PHIL 317 and PHIL 417.
PHIL 420. The Phenomenological Tradition. 3 Units.
The background of phenomenology: Descartes, Kant, and Brentano. The epistemological rationale of Husserl’s phenomenology and its ontological implications; the powers and limits of the phenomenological method. Heidegger’s transformation of phenomenology to interpretive ontology of human existence. The development of interpretation theory as the foundation of all human existence. The development of interpretation theory as the foundation of all human sciences in Gadamer and Ricoeur. Recommended preparation: PHIL 101. Offered as PHIL 320 and PHIL 420.

PHIL 425. Philosophy of Feminism. 3 Units.
Dimensions of gender difference. Definition of feminism. Critical examination of feminist critiques of culture, including especially politics, ideology, epistemology, ethics, and psychology. Readings from traditional and contemporary sources. Offered as PHIL 325 and PHIL 425 and WGST 325.

PHIL 430. Topics in Ethics. 3 Units.
Examination of views in ethics of a major philosopher or philosophical school, a significant philosophical topic in ethics, or a topic that relates ethics to philosophy and another discipline. Recommended preparation: PHIL 101, PHIL 102, or PHIL 205. Offered as PHIL 330 and PHIL 430.

PHIL 433. Philosophy of Religion. 3 Units.
Topics include: classical and contemporary arguments for God’s existence; divine foreknowledge and human freedom; the problem of evil and theodicy; nature and significance of religious experience; mysticism; varieties of religious metaphysics; knowledge, belief and faith; nature of religious discourse. Readings from traditional and contemporary sources. Recommended preparation for PHIL 433 and RLGN 433: PHIL 101 or RLGN 102. Offered as PHIL 333, RLGN 333, PHIL 433, and RLGN 433.

PHIL 434. Political and Social Philosophy. 3 Units.
Justification of social institutions, primarily political ones. Such distinctions as that between de facto and legitimate authority; analysis of criteria for evaluation, such as social justice and equality; inquiry into theories of justification of the state; theory of democratic government and its alternatives. Readings from classical and contemporary sources. Recommended preparation: PHIL 101. Offered as PHIL 334, POSC 354, PHIL 434, and POSC 454.

PHIL 435. Philosophy of Law. 3 Units.
This is an examination of the general nature of law, the broad concerns of jurisprudence, the study of comparative law, and many of the issues raised in the literature of legal philosophy. Students will examine the principles of legal positivism, mitigated natural law, and rights theory. Selected readings and cases will illustrate these theories, which will also be examined in the context of rule selection by new governments in developing or revolutionary societies. The course also looks at the general nature of legal systems: how politics, morality, and individual views of justice and rights affect particular court cases and the course and development of law generally. Topics will include abortion, obscenity and sin, civil disobedience, affirmative action, surrogatehood, and the death penalty. This is unlike any other of the legal theory or jurisprudence courses, and those who have sampled legal theory elsewhere in a different form are welcome and encouraged to enroll. Recommended preparation: PHIL 101. Offered as LAWS 353, PHIL 335, and PHIL 435.

PHIL 445. Epistemology and Metaphysics. 3 Units.
Traditional problems of epistemology, such as definition of knowledge, justification of belief, nature of evidence and foundationalism, skepticism, the a priori, and the role of sense perception in knowledge. Metaphysical presuppositions and implications of epistemological views. Forms of realism and anti-realism. Recommended preparation: PHIL 101. Offered as PHIL 345 and PHIL 445.

PHIL 455. 19th and Early 20th Century Philosophy. 3 Units.
History of philosophy after Kant up to and including logical empiricism. Interpretation and comparison of important philosophers and philosophical schools of the period in terms of common methods, problems, themes, doctrines, and ideologies. Emphasis on Schopenhauer, Hegel, Kierkegaard, Marx, and Nietzsche. Recommended preparation: PHIL 101. Offered as PHIL 355 and PHIL 455.

PHIL 456. Comparative Philosophy. 3 Units.
Philosophy in the etymological sense of the term, love of wisdom, subsumes ontological, ethical and epistemological inquires addressing fundamental questions about reality, the place of humans in that reality, the values of things and human obligations, and the sources of knowledge. The major purpose of this course is to discover, understand, explicate and articulate the affinities and differences in the way the fundamental questions are addressed in different cultural contexts, thereby to appreciate the cross-cultural kinship among human minds as well as to be challenged by the differences that may engender conflicts. We will explore the possibility of building a trans-cultural meta-cultural meta-discourse in which thinkers from many traditions can participate on equal footing. We will come to face up to the question whether truly universal philosophy is possible, upon what conditions. Representative texts from the Western, Chinese and Buddhist traditions including selected works of Plato, Aristotle, Augustine, Descartes, Kant, Nietzsche, Heidegger, Lao Tzu, Confucius, Chuang Tzu, Dhammapada of the Buddha and D. Suzuki’s Zen Buddhism will be read. Offered as PHIL 356 and PHIL 456.

PHIL 467. Topics in Evolutionary Biology. 3 Units.
The focus for this course on a special topic of interest in evolutionary biology will vary from one offering to the next. Examples of possible topics include theories of speciation, the evolution of language, the evolution of sex, evolution and biodiversity, molecular evolution. ANAT/ANTH/EEPS/PHIL/PHOL 467/BIOL 468 will require a longer, more sophisticated term paper, and additional class presentation. Offered as ANTH 367, BIOL 368, EEPS 367, PHIL 367, ANAT 467, ANTH 467, BIOL 468, EEPS 467, PHIL 467 and PHOL 467.

PHIL 475. Issues in Aesthetics. 3 Units.
This course will seek to offer insight into the nature of artistic expression, the role of criticism in the arts, and the place of the arts in society. The term “arts” will be construed broadly to include painting, photography, theater, film, music, dance, poetry, etc. The following are examples of questions we will discuss. What does the term “beautiful” mean? Are there other measures of aesthetic value besides beauty? Do the arts, like the sciences, offer us knowledge of the world? What value do the arts have for society? Can aesthetic value conflict with moral value? Do artists have a responsibility to society? Should art ever be censored? What is the relationship between art and entertainment? Is the meaning and value of an artistic work a matter of individual opinion? What is the purpose of art critics? How are interpretations and evaluations of art influenced by race, gender, class, etc.? What is creativity in the arts? Does it differ from creativity in the sciences? How important is originality in art? Offered as PHIL 375 and PHIL 475.
PHIL 494. Seminar in Evolutionary Biology. 3 Units.
This seminar investigates 20th-century evolutionary theory, especially the Modern Evolutionary synthesis and subsequent expansions of and challenges to that synthesis. The course encompasses the multidisciplinary nature of the science of evolution, demonstrating how disciplinary background influences practitioners' conceptualizations of pattern and process. This course emphasizes practical writing and research skills, including formulation of testable theses, grant proposal techniques, and the implementation of original research using the facilities on campus and at the Cleveland Museum of Natural History. Offered as ANTH 394, BIOL 394, EEPS 394, HSTY 394, PHIL 394, ANTH 494, BIOL 494, EEPS 494, HSTY 494, and PHIL 494.

PHIL 699. Advanced Tutorial and Dissertation for Candidates in fields related to Philosophy. 1 - 3 Unit.
This course enables students in departments offering the Ph.D. to pursue intensive directed study with a faculty member in Philosophy, on philosophical aspects of their dissertation topic. Students should consult with the instructor and with their dissertation director before enrolling.
Department of Physics

The Department of Physics offers programs leading to the following undergraduate degrees: Bachelor of Arts, Bachelor of Science in physics, Bachelor of Science in mathematics and physics, and Bachelor of Science in engineering with an engineering physics major. Associated with the Bachelor of Science in physics degree are optional concentrations in mathematical physics and in biophysics. The department also offers the graduate degrees Master of Science and Doctor of Philosophy, as well as a unique master’s degree in entrepreneurship.

All of these programs involve the study of the basic laws of nature and the properties of energy and matter in their various forms. The curriculum reflects the varied interests of the faculty and will prepare students for a wide range of future activities. At the undergraduate level, open electives and engineering physics concentration area courses tailor the programs to the student’s interests and career plans. Employment opportunities at the bachelor’s level include research, development, and technical assistance (engineering, computer programming, management) in industrial, government, and university settings.

A similar flexibility exists in the first few years of graduate study. The research leading to the PhD degree normally centers on a specific area of physics. However, even at this stage, the broad background and training characteristic of a physics degree are emphasized.

BA in Physics | BS in Physics | BSE in Engineering Physics | BS Math and Physics | Minor

Undergraduate Programs

Majors

Course requirements and typical schedules for the majors are summarized in the Plan of Study Grids.

Bachelor of Arts in Physics

The BA physics major includes a large number of elective courses, making it easy for the student to pursue other interests or complete a second major while earning a degree in physics.

Teacher Licensure Option

A teacher certification program (grades 7-12), based on the BA degree, is available for students interested in a career teaching physics at the secondary level. In addition to content (subject area) requirements, a 36 semester-hour sequence in professional education is required, comprising courses taken at Case Western Reserve University and at John Carroll University, and culminating in student teaching. (For details on education course work, see the program description for Teacher Licensure (p. 437) elsewhere in this bulletin.)

Bachelor of Science in Physics

The BS degree has two alternatives to the standard program: a mathematical physics concentration and a biophysics concentration.

BSE Degree in Engineering Physics

The BSE degree in engineering physics supplies an excellent background for graduate studies in physics, but is also designed for students who value an engineering credential and who are considering a career in engineering, either through employment following the BSE or through engineering graduate studies. This degree is awarded by the Case School of Engineering and includes the Engineering Core Curriculum. The technical electives in this program are concentrated in any of sixteen specific engineering areas.

BS in Mathematics and Physics

The BS in mathematics and physics is a single degree for students interested in advanced mathematics and theoretical physics and their relationships. This degree is distinct from the mathematical physics concentration in the BS in physics degree. The program is jointly administered by the Departments of Physics and Mathematics, and students may be advised by faculty members from either department.

All BS, BA, and BSE candidates complete a year-long senior project in which they work one-on-one with a faculty researcher, write a senior thesis, and present their work in public.

Minor

Course requirements for the minor in physics are as follows:

The Case School of Engineering has a policy stating that “no more than two courses taken for the minor may be used simultaneously to satisfy the requirements of the student’s major field, including departmental requirements, technical electives and the Engineering Core.” Thus, engineering students may have to choose between using physics courses as technical electives or counting them as part of a minor in physics.

Graduate Programs

The Department of Physics offers programs of study and research leading to both the Master of Science and the Doctor of Philosophy degrees. Graduate assistantships are available for the full-time support of qualified students. All MS programs in physics, with or without a thesis, normally can be completed in less than two years. The requirements for the PhD degree in physics include a flexible program of courses that typically is completed within three years, and a concurrent program of directed research with less course work and more research in each succeeding year.
Master of Science in Entrepreneurship

In addition to a traditional physics program, the department has created a Physics Entrepreneurship master’s degree program, which is part of the university’s larger Science and Technology Entrepreneurship Program. This two-year program is designed to empower physicists as entrepreneurs. It enables students and graduates to build on their physics skills to start new high-tech businesses or to launch new product lines in existing companies. The program provides top-level academic instruction and real-world entrepreneurial experience while connecting students with the business executives and leaders, experts, and venture capitalists who are crucial to success in start-up and growing ventures.

Doctor of Philosophy

For the PhD degree, the student is required to pass a general qualifying examination in physics, which is normally taken after the first year of study, and a topical oral examination within one year of joining a research group. The student must then prepare a dissertation based on the results of independent research. There is no foreign language requirement. Research pursuant to any of the graduate degree programs in physics may be carried out in five areas:

Condensed Matter Physics. An extensive experimental and theoretical program in the electronic properties of solids; quantum liquids; mesoscopic physics; localization and quantum Hall effect; the physics of polymers, liquid crystals, and complex fluids; thin films; fluids dynamics; materials synthesis; the physics of surfaces and interfaces; electronic structure of materials and their defects; vibrational properties of solids (phonons); magnetism and magnetic materials; nano- and organic electronics.

Particle/Astrophysics and Cosmology. The experimental efforts in this area include the study of the nature of dark matter in the universe, observations of high-energy gamma rays and cosmic rays, and measurements of the cosmic microwave background. Theoretical studies include the cosmic microwave background, gravitational lensing, dark matter, dark energy, structure formation, neutrino astrophysics, topological defects, phase transitions, inflation, non-gaussianities, gravitational waves, black holes, extra dimensions, modified gravity, and tests of General Relativity.

The Center for Education and Research in Cosmology and Astrophysics (CERCA) comprises groups from the Departments of Physics and Astronomy and the Cleveland Museum of Natural History. The center organizes international conferences, hosts visitors and lectures, and supports students and faculty in their research. As it grows, it will provide postdoctoral research positions and will also prepare public programs on cosmology and astrophysics.

Elementary Particle Physics. Theoretical studies in the strong, weak, and electromagnetic interactions of the elementary particles, and in all areas of particle theory, gravitation, and cosmology.

Optics and Optical Materials. Both experimental and theoretical programs in nonlinear optics, integrated optics, ultrafast optics, and the optical properties of fluids, liquid crystals, polymers, and crystals, including semiconductors, semiconductor mesoscopic systems, photonic crystals, and nanoscopic systems.

Imaging Physics, Biophysics, and Inverse Problems. An experimental and theoretical program in aspects of non-invasive imaging, including magnetic resonance imaging and ultrasound; medical diagnostic techniques to measure iron in the liver; and industrial and medical applications in electromagnetic field modeling.

Requirements Tables for Physics Programs

Bachelor of Arts in Physics

The Bachelor of Arts degree with a physics major requires completion of the Arts and Sciences General Education Requirements (GER) and 120 total credits, of which 59 are specified by the physics department as shown below. Courses specified for this major satisfy the 6-credit Arts and Sciences GER in Sciences and Mathematics.

Total Units: 120
PHYS 303 Advanced Laboratory Physics Seminar + PHYS 352 Senior Physics Project Seminar satisfy the SAGES departmental seminar requirement. PHYS 351 Senior Physics Project is an approved SAGES capstone course.

Students may choose only one of these two courses to satisfy the requirements of the BA degree.

A two-course science sequence chosen from CHEM 105 Principles of Chemistry I and CHEM 106 Principles of Chemistry II; CHEM 111 Principles of Chemistry for Engineers and ENGR 145 Chemistry of Materials; BIOL 214 Genes, Evolution and Ecology and BIOL 215 Cells and Proteins; or another two-course sequence totaling 6 or more credits in a quantitative science (other than physics), with written approval of the physics undergraduate curriculum committee.

Or other approved computational course.

The breadth requirements include 6 hours of Social Sciences and 6 hours of Arts and Humanities. This may increase by 3 credits if the required Global and Cultural Diversity course is not also one of the breadth requirement courses. Courses required for the BA in Physics satisfy the 6-credit GER for Natural Sciences and Mathematics as well as the Quantitative Reasoning course requirement.

The BA degree requires a minimum of 30 semester hours at the 300-400 level, of which only 22 are specified as PHYS courses.

1. PHYS 303 Advanced Laboratory Physics Seminar + PHYS 352 Senior Physics Project Seminar satisfy the SAGES departmental seminar requirement. PHYS 351 Senior Physics Project is an approved SAGES capstone course.

2. Or other approved computational course.

3. The breadth requirements include 6 hours of Social Sciences and 6 hours of Arts and Humanities. This may increase by 3 credits if the required Global and Cultural Diversity course is not also one of the breadth requirement courses. Courses required for the BS in physics satisfy the 6-credit GER for Natural Sciences and Mathematics as well as the Quantitative Reasoning course requirement.

4. The number of open electives may vary, depending on how many credits a student needs to reach the required total of 127.

**Bachelor of Science in Physics with Mathematical Physics Concentration**

Students who are interested in theoretical physics and who have a strong background in mathematics may consider this concentration. The program is based on the BS in physics, but with certain substitutions in the course requirements. Several of the laboratory courses are replaced
by advanced mathematics courses, and some of the undergraduate physics courses are replaced by graduate courses.

This program is not the same as the BS program in mathematics and physics, which provides a coherent and parallel education in both mathematics and physics.

The following table shows the requirements for the Bachelor of Science in physics with mathematical physics concentration.

Total Units in Sequence: 130-132

Bachelor of Science in Physics with Biophysics Concentration

This concentration is directed towards students interested in the combined study of biology and physics. The degree is a track within the standard BS in physics, in which four physics courses and certain open electives are replaced by a “biogroup” of five courses and a technical elective. All substitutions must be approved by a physics faculty committee.

The following table illustrates the requirements for the Bachelor of Science in physics with biophysics concentration.

| PHYS 121 | General Physics I - Mechanics | 4 |
| or PHYS 123 | Physics and Frontiers I - Mechanics | |
| PHYS 122 | General Physics II - Electricity and Magnetism | 4 |
| or PHYS 124 | Physics and Frontiers II - Electricity and Magnetism | |
| PHYS 221 | Introduction to Modern Physics | 3 |
| PHYS 203 | Analog and Digital Electronics | 4 |
| PHYS 204 | Advanced Instrumentation Laboratory | 4 |
| PHYS 250 | Computational Methods in Physics | 3 |
| PHYS 310 | Classical Mechanics | 3 |
| PHYS 301 | Advanced Laboratory Physics I | 3 |
| PHYS 303 | Advanced Laboratory Physics Seminar | 1 |
| PHYS 313 | Thermodynamics and Statistical Mechanics | 3 |
| PHYS 331 | Introduction to Quantum Mechanics I | 3 |
| PHYS 324 | Electricity and Magnetism I | 3 |
| PHYS 325 | Electricity and Magnetism II | 3 |
| Technical Elective | 3 |
| PHYS 351 | Senior Physics Project (PHYS 351 is taken twice for 2 credit hours each) | 4 |
| PHYS 352 | Senior Physics Project Seminar (PHYS 352 is taken twice for 1 credit hour each) | 2 |
| CHEM 105 | Principles of Chemistry I | 3-4 |
| or CHEM 111 | Principles of Chemistry for Engineers | |

PHYS 303 Advanced Laboratory Physics Seminar + PHYS 352 Senior Physics Project Seminar satisfy the SAGES departmental seminar requirement. PHYS 351 Senior Physics Project is an approved SAGES capstone course.

Suggested technical electives include PHYS 315 Introduction to Solid State Physics, PHYS 316 Introduction to Nuclear and Particle Physics, PHYS 326 Physical Optics, PHYS 327 Quantum Electronics, PHYS 328 Cosmology and the Structure of the Universe, PHYS 336 Modern Cosmology, PHYS 365 General Relativity.

B-group 1-5 are to be chosen from among approved biology, biophysics, biochemistry, and biomedical engineering courses, including certain prerequisites as needed (e.g., chemistry), BIOL 214 Genes, Evolution and Ecology and BIOL 215 Cells and Proteins are suggested for B-group 1 and 2. The listing of credits includes numbers for the most likely choices of courses and, in parentheses, possible alternatives.

The breadth requirements include 6 hours of Social Sciences and 6 hours of Arts and Humanities. This may increase by 3 credits if the required Global and Cultural Diversity course is not also one of the breadth requirement courses. Courses required for the B.S. in physics satisfy the 6-credit GER for Natural Sciences and Mathematics as well as the Quantitative Reasoning course requirement.

The number of open electives may vary, depending on the number of credits a student needs to reach the required total of 127.

Bachelor of Science in Engineering with Engineering Physics Major

The engineering physics major allows students with strong interests in both physics and engineering to concentrate their studies in the common areas of these disciplines. The major prepares students to pursue careers in industry, either directly after undergraduate studies, or following graduate study in engineering or physics. Many employers value the unique problem-solving approach of physics, especially in industrial research and development.

Students majoring in engineering physics complete the Engineering Core as well as a rigorous course of study in physics. Students select a concentration area from an engineering discipline, and must complete a sequence of at least four courses in this discipline. In addition, a senior research project under the guidance of a faculty member is required. The project includes a written report and participation in the senior seminar and symposium.

1. Selected students may be invited to take MATH 123, 124, 227, and 228 in place of MATH 121, 122, 223, and 224.
2. Selected students may be invited to take PHYS 123, 124 (Physics and Frontiers I, II Honors) in place of PHYS 121, 122.
3. Engineering physics concentration courses are flexible, but they must be in a specific engineering discipline or study area and approved by an advisor. Possible concentration areas include aerospace engineering, biomedical engineering “hardware,” biomedical engineering “software,” chemical engineering, civil engineering (solid mechanics, structural and geotechnical, environmental), computer science, computer systems hardware, computer systems software, control systems and automation, electrical engineering, macromolecular science, materials science and engineering, mechanical engineering, signal processing, systems analysis and decision making. PHYS 332, PHYS 327/427, EEAP 321, EEAP 420, EMSE 314, or EMSE. Students may choose to fulfill this requirement in their third year.
4. Either MATH 351 or PHYS 351 will be taken twice.

<td>3</td>
</tr>
</tbody>
</table>

1. Other science sequence courses may be substituted if approved by the mathematics and physics (MP) committee.
2. Or other approved computational course
3. The “MP group” of four courses corresponds to two physics courses and two mathematics courses. The physics courses are chosen from PHYS 250 Computational Methods in Physics, PHYS 349 Methods of Mathematical Physics I, and PHYS 350 Methods of Mathematical Physics II. The mathematics courses are subject to approval by the MP committee and are hence referred to as “approved electives.” They may be chosen from the general list of mathematics courses at the 300 level or higher. It may also be possible to choose a course outside the mathematics and physics departments as a substitute in the MP group, subject to approval by the committee.
4. An advanced physics course to be selected from the following list: PHYS 315 Introduction to Solid State Physics, PHYS 316 Introduction to Nuclear and Particle Physics, PHYS 326 Physical Optics, PHYS 327 Quantum Electronics, PHYS 328 Cosmology and the Structure of the Universe, PHYS 336 Modern Cosmology, PHYS 365 General Relativity.
PHYS 303 Advanced Laboratory Physics Seminar + PHYS 352 Senior Physics Project Seminar satisfy the SAGES departmental seminar requirement. PHYS 351 Senior Physics Project is an approved SAGES capstone course.

Students may take either the math or physics SAGES departmental seminar, but must take their SAGES capstone course from the same department. The physics version consists of 1 credit of PHYS 303 Advanced Laboratory Physics Seminar plus two credits of PHYS 352 Senior Physics Project Seminar.

The breadth requirements include 6 hours of Social Sciences and 6 hours of Arts and Humanities. This may increase by 3 credits if the required Global and Cultural Diversity course is not also one of the breadth requirement courses. Courses required for the BS in mathematics and physics satisfy the 6-credit GER for Natural Sciences and Mathematics as well as the Quantitative Reasoning course requirement.

The number of open electives may vary, depending on how many credits the student needs to reach the required total of 126.

**Total Units in Sequence:** 126-128

### Department Faculty

**Kathleen Kash, PhD**  
(Massachusetts Institute of Technology)  
Professor and Chair  
Experimental condensed matter and mesoscopic physics; synthesis of novel semiconductors

**Daniel S. Akerib, PhD**  
(Princeton University)  
Professor  
Experimental astrophysics

**Jesse Berezovsky, PhD**  
(University of California, Santa Barbara)  
Assistant Professor  
Imaging coherent transport in mesoscopic graphene; optical readout of single spin dynamics in a quantum dot; spin dynamics in layered core/shell nanocrystal quantum dots; measurements of nuclear and electron spin at a ferromagnetic/semiconductor interface; spatio-temporal imaging and simulation of magnetization dynamics in ferromagnetic structures

**Robert W. Brown, PhD**  
(Massachusetts Institute of Technology)  
Distinguished University Professor and Institute Professor  
Medical imaging; industrial physics; particle physics theory; cosmology

**Gary S. Chottiner, PhD**  
(University of Maryland)  
Professor and Director of Undergraduate Studies  
Experimental physics of surfaces and thin films

**Corbin E. Covault, PhD**  
(Harvard University)
Professor
Experimental high-energy astrophysics
Claudia de Rham, PhD
(University of Cambridge)
Assistant Professor
Massive gravity and degravitation; Supersymmetric Large Extra Dimensions (SLED); physics of codimension-2 objects; cosmological perturbations
Diana I. Driscoll, PhD
(Case Western Reserve University)
Instructor
Introductory physics
Xuan Gao, PhD
(Columbia University)
Assistant Professor
Experimental condensed matter physics; nanomaterials; electron transport in nanostructures; correlated electrons in low dimensions
Kenneth L. Kowalski, PhD
(Brown University)
Professor
Theoretical and experimental particle physics
Walter R. Lambrecht, PhD
(University of Ghent)
Professor
Theoretical condensed matter physics; electronic structure-based physics of materials
Michael A. Martens, PhD
(Case Western Reserve University)
Associate Professor
Medical imaging physics, high energy particle physics, accelerator physics
Harsh Mathur, PhD
(Yale University)
Associate Professor
Condensed matter theory, particle-astrophysics theory
Rolfe G. Petschek, PhD
(Harvard University)
Professor
Theoretical condensed matter; optical materials
Charles Rosenblatt, PhD
(Harvard University)
Professor
Experimental condensed matter; liquid crystals and complex fluids
John E. Ruhl, PhD
(Princeton University)
Professor
Experimental astrophysics and cosmology
Jie Shan, PhD
(Columbia University)
Associate Professor
Experimental condensed matter physics; electronic and optoelectronic properties and dynamics of nanoscale materials
Thomas A. Shutt, PhD
(University of California, Berkeley)
Agnar Pytte Professor
Experimental astrophysics
Kenneth D. Singer, PhD
(University of Pennsylvania)
Ambrose Swasey Professor of Physics; Director, Engineering Physics Experimental condensed matter physics; nonlinear optics
Glenn D. Starkman, PhD
(Stanford University)
Professor: Director, Center for Education and Research in Cosmology and Astrophysics (CERCA) Theoretical cosmology, particle physics, astrophysics
Giuseppe Strangi, PhD
(University of Calabria, Italy)
Ohio Research Scholar in Surfaces of Advanced Materials; Professor Opto-Plasmonics of Soft Composite Metamaterials; Liquid Crystal Photonics
Cyrus C. Taylor, PhD
(Massachusetts Institute of Technology)
Albert A. Michelson Professor in Physics; Dean, College of Arts and Sciences Theoretical and experimental particle physics; physics entrepreneurship
Philip L. Taylor, PhD
(University of Cambridge)
Distinguished University Professor and Perkins Professor of Physics Theory of solids, polymers and other materials
Andrew J. Tolley, PhD
(University of Cambridge)
Baldwin Assistant Professor Early universe cosmology; dark energy; gravity; extra dimensions; branes

Secondary Faculty
J. Iwan Alexander, PhD
(Washington State University)
Professor, Department of Mechanical and Aerospace Engineering, Case School of Engineering Fluid dynamics, energy research
Roger H. French, PhD
(Massachusetts Institute of Technology)
F. Alex Nason Professor, Department of Materials Science and Engineering, Case School of Engineering Optical materials and technologies; experimental VIS/UV/VUV optical properties and long range interactions
Mark A. Griswold, PhD
(University of Wuerzburg) Associate Professor, Department of Radiology, School of Medicine Medical imaging, MRI
Eckhard Jankowsky, PhD
(Dresden Institute of Technology) Associate Professor, Department of Biochemistry, School of Medicine Proteins and enzymes; structural biology; regulation of gene expression
R. Earle Luck, PhD
(University of Texas at Austin) Worcester R. and Cornelia B. Warner Professor of Astronomy Stellar and galactic chemical evolution; stellar spectrophotometry
J. Christopher Mihos, PhD
(University of Michigan) Professor, Department of Astronomy
Galaxy formation and evolution; galaxy interactions; clusters of galaxies; observational and computational astrophysics

Heather Morrison, PhD (Australian National University) 
*Professor, Department of Astronomy*
Galactic structure; stellar populations; dark matter

Idit Zehavi, PhD (Hebrew University of Jerusalem) 
*Assistant Professor, Department of Astronomy*
Astrophysics

### Lecturer

Edward M. Caner, MS (Case Western Reserve University) 
*Lecturer; Director, Science and Technology Entrepreneurship Program*
Science entrepreneurship

### Adjunct Faculty

James H. Andrews, PhD (Case Western Reserve University) 
*Adjunct Professor; Professor of Physics, Youngstown State University*
Optical materials

Pierre Carles, PhD, Habilitation (National Polytechnic Institute, Toulouse) 
*Adjunct Associate Professor; Associate Professor, Université Pierre et Marie Curie, Paris*
Fluid mechanics; critical behavior; stability

Craig J. Copi, PhD (University of Chicago) 
*Adjunct Instructor; Senior Research Associate*
Theoretical cosmology; particle physics; astrophysics

Michael R. Dragowsky, PhD (Oregon State University) 
*Adjunct Associate Professor*
Nuclear and particle astrophysics experiment

Jeffrey S. Dyck, PhD (Case Western Reserve University) 
*Adjunct Associate Professor; Associate Professor, John Carroll University*
Experimental condensed matter physics

Karsten Eggert, PhD (RWTH Aachen University) 
*Adjunct Professor*
Experimental particle physics; cosmic ray physics; diffractive physics; TOTEM experiment at CERN

Hiroyuki Fujita, PhD (Case Western Reserve University) 
*Adjunct Professor; President and CEO, Quality Electrodynamics and eQED*
Hardware technology in imaging and renewable energies

Evalyn Gates, PhD (Case Western Reserve University) 
*Adjunct Professor; Executive Director and CEO, Cleveland Museum of Natural History*
Cosmology and particle astrophysics

John T. Giblin, Jr., PhD (Yale University) 
*Adjunct Assistant Professor*
Theoretical cosmology; high energy physics and particle physics; high performance computing and gravitational waves

E. Mark Haacke, PhD (University of Toronto) 
*Adjunct Professor; Professor, Wayne State University*
Physics of imaging; experimental biophysics

Daeseung Kang, PhD (Case Western Reserve University) 
*Adjunct Associate Professor*
Experimental condensed matter; liquid crystal

Peter J. Kernan, PhD (Ohio State University) 
*Adjunct Lecturer; Senior Research Associate*
Cosmology; Astrophysics

Gerald T. Mearini, PhD (Case Western Reserve University) 
*Adjunct Associate Professor; Genvac Aerospace Corporation*
Timothy Peshek, PhD (Case Western Reserve University) 
*Adjunct Assistant Professor*
Experimental semiconductor physics

Andrey Petukhov, PhD (St. Petersberg State Technical University) 
*Adjunct Associate Professor; Associate Professor of Physics, South Dakota School of Mines and Technology*

Irina Shiyanovskaya, PhD (Institute of Physics, National Academy of Science of Ukraine) 
*Adjunct Associate Professor; Kent Displays, Inc.*

Shmaryu Shvartsman, PhD (Tomsk State University) 
*Adjunct Professor; Principal Scientist, ViewRay Inc.*
General physics research and development

Mano Singham, PhD (University of Pittsburgh) 
*Adjunct Associate Professor; Director, University Center for Innovation in Teaching and Education (UCITE)*
Particle physics; physics teaching

Michael Thompson, PhD (Case Western Reserve University) 
*Adjunct Assistant Professor*
Experimental semiconductor physics

Mesfin Tsige, PhD (Case Western Reserve University) 
*Adjunct Associate Professor*
Theory of solids; polymers and other materials

### Visiting Faculty

Jesse M. Kinder, PhD (University of Pennsylvania) 
*Visiting Assistant Professor*
Theoretical solid state physics; nanotechnology; strongly correlated systems; modeling and method development
Research Professors

Ina Martin
(Coordinating Professor of Physics, Faculty of Natural Sciences, Colorado State University)

MORE Center Director of Operations

Thermal management materials; photovoltaic materials

Courses

**PHYS 101. Distinguishing Science from Pseudo-Science.** 3 Units.
There are many current issues arising in popular discourse, ranging from the believability of ESP to reincarnation, to "free energy" machines, which can benefit from simple physical analyses. This course will provide an introduction to the use of basic principles of physics to explore the viabiliy of these ideas. A seminar format will be utilized with specific topics presented by students and by the instructor. Recommended preparation: PHYS 100, PHYS 115, PHYS 121, or PHYS 123.

**PHYS 113A. Principles of Physics Laboratory - Mechanics.** 1 Unit.
The laboratory portion of first semester introductory physics.

**PHYS 113B. Principles of Physics Laboratory - Electricity and Magnetism.** 1 Unit.
The laboratory portion of the second semester of physics.

**PHYS 115. Introductory Physics I.** 4 Units.
First part of a two-semester sequence directed primarily towards students working towards a B.A. in science, with an emphasis on the life sciences. Kinematics; Newton's laws; gravitation; simple harmonic motion; mechanical waves; fluids; ideal gas law; heat and the first and second laws of thermodynamics. This course has a laboratory component.

**PHYS 116. Introductory Physics II.** 4 Units.
Electrostatics, Coulomb's law, Gauss's law; capacitance and resistance; DC circuits; magnetic fields; electromagnetic induction; RC and RL circuits; light; geometrical optics; interference and diffraction; special relativity; introduction to quantum mechanics; elements of atomic, nuclear and particle physics. This course has a laboratory component. Prereq: PHYS 115.

**PHYS 121. General Physics I - Mechanics.** 4 Units.
Particle dynamics, Newton's laws of motion, energy and momentum conservation, rotational motion, and angular momentum conservation. This course has a laboratory component. Recommended preparation: MATH 121 or MATH 123 or MATH 125 or one year of high school calculus.

**PHYS 122. General Physics II - Electricity and Magnetism.** 4 Units.
Electricity and magnetism, emphasizing the basic electromagnetic laws of Gauss, Ampere, and Faraday. Maxwell's equations and electromagnetic waves, interference, and diffraction. This course has a laboratory component. Prereq: PHYS 121 or PHYS 123. Prereq or Coreq: MATH 122 or MATH 124 or MATH 126.

**PHYS 123. Physics and Frontiers I - Mechanics.** 4 Units.
The Newtonian dynamics of a particle and of rigid bodies. Energy, momentum, and angular momentum conservation with applications. A selection of special frontier topics as time permits, including fractals and chaos, special relativity, fluid mechanics, cosmology, quantum mechanics. This course has a laboratory component. Admission to this course is by invitation only.

**PHYS 124. Physics and Frontiers II - Electricity and Magnetism.** 4 Units.
Time-independent and time-dependent electric and magnetic fields. The laws of Coulomb, Gauss, Ampere, and Faraday. Microscopic approach to dielectric and magnetic materials. Introduction to the usage of vector calculus; Maxwell's equations in integral and differential form. The role of special relativity in electromagnetism. Electromagnetic radiation. This course has a laboratory component. Prereq: PHYS 123. Prereq or Coreq: MATH 122 or MATH 124.

**PHYS 137. The Scientific Frontier: Origins, from the Big Bang to Life on Earth.** 3 Units.
This course will provide undergraduates, both science and non-science majors, with a general perspective of the modern state of our physical understanding of the universe, including outstanding puzzles at the forefront of modern science, focusing on the questions of origins: the origin of the universe, of our galaxy, of matter, of life, etc.

**PHYS 166. Physics Today and Tomorrow.** 1 Unit.
This course will provide students with an opportunity to learn about the most exciting and timely research areas in physics, as well as other topics germane to being a professional physicist. These discussions will cover fields such as nanoscience, ultrafast optics, exotic materials, biophysics, cosmology, string theory and the role of physicists in developing new technologies. Each week a member of the faculty will meet with students to discuss a topic of current interest, how a physicist approaches the problem, and how physicists interact with others to find a solution. Other topics germane to being a professional physicist also will be discussed, including the relationship among academic, industrial, and governmental laboratories; ethics, and non-traditional careers for students trained in physics.

**PHYS 203. Analog and Digital Electronics.** 4 Units.
Elements of both analog and digital electronics from the practical viewpoint of the experimental scientist; AC circuits, linear and non-linear operation of op-amps, logic gates, flip-flops, counters, display, memory, transducers, A/D and D/A conversion. Laboratory work involves quantitative investigation of the operation of all these elements, together with projects that explore their combination. Recommended preparation: PHYS 122 or PHYS 212.

**PHYS 203A. Analog and Digital Electronics for B.A..** 2 Units.
This course is the first half of the laboratory requirement for the B.A. degree in Physics and is the first half of PHYS 203. Elements of both analog and digital electronics from the practical viewpoint of the experimental scientist; AC circuits, linear and non-linear operation of op-amps, digital circuits including logic gates. This course includes weekly lecture and laboratory work in electronics; it may also include an additional weekly lecture, associated with PHYS 301, on topics such as error analysis, technical writing and oral presentations. Recommended preparation: PHYS 116, PHYS 122, or PHYS 124.

**PHYS 204. Advanced Instrumentation Laboratory.** 4 Units.
Principles of experimental design; limits of resolution via band-width, thermal noise, background signals; data acquisition and control by computer; computer simulation; signal processing techniques in frequency and time domains, FFT, correlations, and other transform methods; counting techniques. Applications include lock-in amplifiers, digitizing oscilloscopes and data acquisition systems. Recommended preparation: PHYS 203 and PHYS 221.
PHYS 208. Instrumentation and Signal Analysis Laboratory. 4 Units.
AC circuit theory, Fourier series, discrete Fourier series. Fourier integral, discrete Fourier integral; analysis in time and frequency domains, correlation, cross-correlation and other transform techniques; computer control of experiments via IEEE488 interface; advanced instrumentation; DMM, arbitrary waveform generator, multiplexing and digitizing oscilloscopes; experimental design, noise; design, construction, and testing of a lock-in amplifier. Recommended preparation: PHYS 221.

PHYS 221. Introduction to Modern Physics. 3 Units.
Concepts in special relativity, statistical mechanics and quantum mechanics. Applications to atomic structure, and selected topics in nuclear, condensed matter physics, particle physics, and cosmology. Prereq: PHYS 116 or PHYS 122 or PHYS 124.

PHYS 250. Computational Methods in Physics. 3 Units.

PHYS 301. Advanced Laboratory Physics I. 3 Units.
Problem solving approach with a range of available experiments in classical and modern physics. Emphasis on experimental techniques, data and error analysis, and the formal presentation of the work performed. Recommended preparation: PHYS 204. Coreq: PHYS 303.

PHYS 301B. Advanced Laboratory Physics for B.A.. 2 Units.
This course is the second half of the laboratory requirement for the B.A. degree in Physics and is the second half of PHYS 301. Problem solving approach with a range of available experiments in classical and modern physics. Emphasis on experimental technique and data and error analysis, and the formal presentation of the work performed. Recommended preparation: PHYS 203 or PHYS 203A and concurrent enrollment in PHYS 303.

PHYS 302. Advanced Laboratory Physics II. 4 Units.
Several projects using research-quality equipment in contemporary fields of experimental physics. Each requires reading appropriate literature, choosing appropriate instrumentation, performing data acquisition and analysis, and writing a technical paper. Topics include particle counting techniques, neutron activation, gamma-ray spectroscopy, a range of condensed matter experiments including temperature dependent properties between 10 and 350 K, modern optics, ultrahigh vacuum surface science. Recommended preparation: PHYS 301.

PHYS 303. Advanced Laboratory Physics Seminar. 1 Unit.
Students will discuss various issues associated with physics research. These include how to judge the quality of an experiment and data (error analysis), how to present your work in written and oral formats, safety and ethical concerns in the laboratory. Recommended preparation: PHYS 250.

PHYS 310. Classical Mechanics. 3 Units.
Lagrangian formulation of mechanics and its application to central force motion, scattering theory, rigid body motion, and systems of many degrees of freedom. Recommended preparation: PHYS 221 and either MATH 223 or MATH 227.

PHYS 313. Thermodynamics and Statistical Mechanics. 3 Units.

PHYS 315. Introduction to Solid State Physics. 3 Units.
Characterization and properties of solids; crystal structure, thermal properties of lattices, quantum statistics, electronic structure of metals and semiconductors. PHYS 415 for graduate students in engineering and science. (May not be taken for departmental credit by graduate students in the Department of Physics.) Prerequisite may be waived with consent of department. Recommended preparation for PHYS 415: PHYS 331. Offered as PHYS 315 and PHYS 415. Prereq: PHYS 331 or PHYS 481.

PHYS 316. Introduction to Nuclear and Particle Physics. 3 Units.
The physics of nuclei and elementary particles; experimental methods used to determine their properties; models and theories developed to describe their structure. Prereq: PHYS 331 or PHYS 481.

PHYS 317. Engineering Physics Laboratory I. 3 Units.
Laboratory course for engineering physics majors. Emphasis is on experimental techniques, data and error analysis, and written and oral presentation of work. Four experiments drawn from classical and modern physics are carried out. These emphasize condensed matter, material and optical physics. Experiments include electric fields, resistivity of materials, optical interference, chaotic systems, and spectroscopy. Design of data analysis systems and software is required. Prereq: PHYS 208. Coreq: PHYS 303.

PHYS 318. Engineering Physics Laboratory II. 4 Units.
Laboratory course for engineering physics majors. Several projects using research-quality equipment in contemporary fields of experimental physics. Open-ended experiments each require reading appropriate literature, designing the experiment, performing data analysis, and writing a technical paper. Topics are drawn from areas of modern physics, and concentrate on condensed matter, material, and optical physics. Prereq: PHYS 317.

PHYS 324. Electricity and Magnetism I. 3 Units.
First half of a sequence that constitutes a detailed study of the basics of electromagnetic theory and many of its applications. Electrostatics and magnetostatics of free space, conductors, dielectric and magnetic materials; basic theory illustrated with applications drawn from condensed matter physics, optics, plasma physics, and physical electronics. Prereq: PHYS 116 or PHYS 122 or PHYS 124.

PHYS 325. Electricity and Magnetism II. 3 Units.
(Continuation of PHYS 324.) Electrodynamics, Maxwell’s equations, electromagnetic waves, electromagnetic radiation and its interaction with matter, potential formulation of electromagnetism, and relativity. Prereq: PHYS 324.

PHYS 326. Physical Optics. 3 Units.
Geometrical optics and ray tracing, wave propagation, interaction of electromagnetic radiation with matter, interference, diffraction, and coherence. Supplementary current topics from modern optics such as nonlinear optics, holography, optical trapping and optical computing. Prerequisite(s) may be waived with consent of department. Offered as PHYS 326 and PHYS 426. Prereq: PHYS 122 or PHYS 124.
PHYS 327. Quantum Electronics. 3 Units.
An introduction to theoretical and practical quantum electronics covering topics in quantum optics, laser physics, and nonlinear optics. Topics to be addressed include the physics of two-level quantum systems including the density matrix formalism, rate equations, and semiclassical radiation theory; laser operation including oscillation, gain, resonator optics, transverse and longitudinal modes, Q-switching, mode-locking, and coherence; and nonlinear optics including the nonlinear susceptibility, parametric interactions, stimulated processes, and self-action. Recommended preparation for PHYS 427: PHYS 331 or PHYS 481. Offered as PHYS 327 and PHYS 427. Prereq: PHYS 331 or PHYS 481.

PHYS 328. Cosmology and the Structure of the Universe. 3 Units.

PHYS 329. Independent Study. 1 - 4 Unit.
An individual reading course in any topic of mutual interest to the student and the faculty supervisor.

PHYS 331. Introduction to Quantum Mechanics I. 3 Units.
Quantum nature of energy and angular momentum, wave nature of matter, Schroedinger equation in one and three dimensions; matrix methods; Dirac notation; quantum mechanical scattering. Two particle wave functions. Prereq: PHYS 221.

PHYS 332. Introduction to Quantum Mechanics II. 3 Units.
Continuation of PHYS 331. Spin and fine structure; Dirac equation; symmetries; approximation methods; atomic and molecular spectra; time dependent perturbations; quantum statistics; applications to electrons in metals and liquid helium. Prereq: PHYS 331.

PHYS 333. Modern Cosmology. 3 Units.
An introduction to modern cosmology and an exploration of current topics in the field. The first half of the course will cover the mathematical and physical basis of cosmology, while the second will delve into current questions and the observations that constrain them. Offered as PHYS 336 and PHYS 436. Prereq: PHYS 221.

PHYS 339. Seminar. 1 - 3 Unit.
Conducted in small sections with presentation of papers by students and informal discussion. Special problem seminars and research seminars offered according to interest and need, often in conjunction with one or more research groups.

PHYS 349. Methods of Mathematical Physics I. 3 Units.
Analysis of complex functions: singularities, residues, contour integration; evaluation and approximation of sums and integrals; exact and approximate solution of ordinary differential equations; transform calculus; Sturm-Liouville theory; calculus of variations. Additional work required for graduate students. Offered as PHYS 349 and PHYS 449. Prereq: MATH 224.

PHYS 350. Methods of Mathematical Physics II. 3 Units.
(Continuation of PHYS 349/449.) Special functions, orthogonal polynomials, partial differential equations, linear operators, group theory, tensors, selected specials topics. Additional work required for graduate students. Prereq: PHYS 349.

PHYS 351. Senior Physics Project. 2 Units.
A two semester course required for senior BS and BA physics majors. Students pursue a project based on experimental, theoretical or teaching research under the supervision of a physics faculty member, a faculty member from another CWRU department or a research scientist or engineer from another institution. A departmental Senior Project Committee must approve all project proposals and this same committee will receive regular oral and written progress reports. Final results are presented at the end of the second semester as a paper in a style suitable for publication in a professional journal as well as an oral report in a public symposium. Prereq: PHYS 303. Coreq: PHYS 352.

PHYS 352. Senior Physics Project Seminar. 1 Unit.
This two semester seminar is taken concurrently with the student’s two semester senior project. Students meet weekly to discuss their projects and the research experience. The class will include dialogues about professional issues such as ethics, graduate school, jobs, funding, professional organizations, public obligations, writing and speaking. Assignments include proposals, progress reports and posters. Coreq: PHYS 351 or PHYS 353.

PHYS 353. Senior Engineering Physics Project. 2 Units.
A two semester course required for BSE Engineering Physics majors. Students are expected to complete a research project in their concentration area under the supervision of a faculty member in science, engineering, or, with approval, a researcher at another institution or company. The project may be calculational, experimental or theoretical, and will address both the underlying physics and appropriate engineering and design principles. A program Senior Project Committee must approve all project proposals and will receive regular oral and written progress reports. Final results are presented at the end of the second semester as a paper in a style suitable for publication in a professional journal as well as an oral report in a public symposium. Prereq: PHYS 318. Coreq: PHYS 352.

PHYS 355. General Relativity. 3 Units.
This is an introductory course in general relativity. The techniques of tensor analysis will be developed and used to describe the effects of gravity and Einstein’s theory. Consequences of the theory as well as its experimental tests will be discussed. An introduction to cosmology will be given. Additional work required for graduate students. Offered as PHYS 365 and PHYS 465.

PHYS 390. Undergraduate Research in Physics. 3 - 6 Units.
Research conducted under the supervision of a faculty member in the Department of Physics. Arrangements must be made with a faculty member and a written description of these arrangements must be submitted to and approved by the department before a permit will be issued to register for this course. A final report must be supplied to the department at the end of the semester.

PHYS 413. Classical and Statistical Mechanics I. 3 Units.
An integrated approach to classical and statistical mechanics. Lagrangian and Hamiltonian formulations, conservation laws, kinematics and dynamics, Poisson brackets, continuous media, derivation of laws of thermodynamics, the development of the partition function. To be followed by PHYS 414.
PHYS 414. Classical and Statistical Mechanics II. 3 Units.
A continuation of PHYS 413. Noninteracting systems, statistical mechanics of solids, liquids, gases, fluctuations, irreversible processes, phase transformations. Recommended preparation: PHYS 413 or consent of department.

PHYS 415. Introduction to Solid State Physics. 3 Units.
Characterization and properties of solids; crystal structure, thermal properties of lattices, quantum statistics, electronic structure of metals and semiconductors. PHYS 415 for graduate students in engineering and science. (May not be taken for departmental credit by graduate students in the Department of Physics.) Prerequisite may be waived with consent of department. Recommended preparation for PHYS 415: PHYS 331. Offered as PHYS 315 and PHYS 415.

PHYS 423. Classical Electromagnetism. 3 Units.

PHYS 424. Quantum Electrodynamics. 3 Units.
Wave packet methods, bra-ket formalism, renormalization group, QED in vacuum and non-vacuum, vacuum polarization, second quantization, and applications to atomic and nuclear physics. Continuous and discrete symmetries of QED. Recommended preparation: PHYS 422. Offered as PHYS 324 and PHYS 424.

PHYS 426. Physical Optics. 3 Units.
Geometrical optics and ray tracing, wave propagation, interaction of electromagnetic radiation with matter, interference, diffraction, and coherence. Supplementary current topics from modern optics such as nonlinear optics, holography, optical trapping and optical computing. Prerequisite(s) may be waived with consent of department. Offered as PHYS 326 and PHYS 426.

PHYS 427. Quantum Electronics. 3 Units.
An introduction to theoretical and practical quantum electronics covering topics in quantum optics, laser physics, and nonlinear optics. Topics to be addressed include the physics of two-level quantum systems including the density matrix formalism, rate equations, and semiclassical radiation theory; laser operation including oscillation, gain, resonator optics, transverse and longitudinal modes, Q-switching, mode-locking, and coherence; and nonlinear optics including the nonlinear susceptibility, parametric interactions, stimulated processes, and self-action. Recommended preparation for PHYS 427: PHYS 331 or PHYS 481. Offered as PHYS 327 and PHYS 427.

PHYS 428. Cosmology and the Structure of the Universe. 3 Units.

PHYS 431. Physics of Imaging. 3 Units.
Description of physical principles underlying the spin behavior in MR and Fourier imaging in multi-dimensions. Introduction of conventional, fast, and chemical-shift imaging techniques. Spin echo, gradient echo, and variable flip-angle methods. Projection reconstruction and sampling theorems. Bloch equations, T1 and T2 relaxation times, rf penetration, diffusion and perfusion. Flow imaging, MR angiography, and functional brain imaging. Sequence and coil design. Prerequisite may be waived with consent of instructor. Recommended preparation: PHYS 122 or PHYS 124 or EBME 410. Offered as EBME 431 and PHYS 431.

PHYS 436. Modern Cosmology. 3 Units.
An introduction to modern cosmology and an exploration of current topics in the field. The first half of the course will cover the mathematical and physical basis of cosmology, while the second will delve into current questions and the observations that constrain them. Offered as PHYS 336 and PHYS 436.

PHYS 441. Physics of Condensed Matter I. 3 Units.
Crystal structure, x-ray diffraction, band theory and applications. Free electron theory of metals and electrons in magnetic fields.

PHYS 442. Physics of Condensed Matter II. 3 Units.
Continuation of PHYS 441. Lattice vibrations, thermal properties of solids, semiconductors, magnetic properties of solids, and superconductivity. Prerequisite may be waived with consent of department. Recommended preparation: PHYS 441.

PHYS 449. Methods of Mathematical Physics I. 3 Units.
Analysis of complex functions: singularities, residues, contour integration; evaluation and approximation of sums and integrals; exact and approximate solution of ordinary differential equations; transform calculus; Sturm-Liouville theory; calculus of variations. Additional work required for graduate students. Offered as PHYS 349 and PHYS 449.

PHYS 451. Empirical Foundations of the Standard Model. 3 Units.
The experimental basis for modeling the electroweak and strong interactions in terms of fundamental fermions, quarks and leptons, and gauge bosons, photons, the weak bosons, and gluons; particle accelerators and detection techniques; phenomenology of particle reactions, decays and hadronic structure; space, time and internal symmetries; symmetries; symmetry breaking.

PHYS 460. Advanced Topics in NMR Imaging. 3 Units.
Frontier issues in understanding the practical aspects of NMR imaging. Theoretical descriptions are accompanied by specific examples of pulse sequences, and basic engineering considerations in MRI system design. Emphasis is placed on implications and trade-offs in MRI pulse sequence design from real-world versus theoretical perspectives. Recommended preparation: EBME 431 or PHYS 431. Offered as EBME 460 and PHYS 460. Prereq: Graduate standing or Undergraduate with Junior or Senior standing and a cumulative GPA of 3.2 or above.

PHYS 465. General Relativity. 3 Units.
This is an introductory course in general relativity. The techniques of tensor analysis will be developed and used to describe the effects of gravity and Einstein’s theory. Consequences of the theory as well as its experimental tests will be discussed. An introduction to cosmology will be given. Additional work required for graduate students. Offered as PHYS 365 and PHYS 465.

PHYS 472. Graduate Physics Laboratory. 3 Units.
A series of projects designed to introduce the student to modern research techniques such as automated data acquisition. Students will be assessed as to their individual needs and a sequence of projects will be established for each individual. Topics may include low temperature phenomena, nuclear gamma ray detection and measurement and optics.
Several such courses may run concurrently.

Individual or small group instruction on topics of interest to the

PHYS 539. Special Topics Seminar. 1 - 3 Unit.
Session. Prereq: BIOL 493 or CHEM 493 or PHYS 493.

This course provides the advanced tools needed to develop,
articulate, and launch a venture plan for a technology identified
as likely to be successful through a feasibility analysis. Additional
topics include: entrepreneurial strategy, communication, sales,
negotiation, entrepreneurial finance, and leadership in an entrepreneurial
environment. Guest speakers will be featured in nearly every class
session. Prereq: BIOL 493 or CHEM 493 or PHYS 493.

PHYS 539. Special Topics Seminar. 1 - 3 Unit.
Individual or small group instruction on topics of interest to the
department. Topics include, but are not limited to, particle physics,
astrophysics, optics, condensed matter physics, biophysics, imaging.
Several such courses may run concurrently.

PHYS 481. Quantum Mechanics I. 3 Units.
Quantum mechanics with examples of applications. Schroedinger
method; matrix and operator methods. Approximation methods including
WKB, variational and various perturbation methods. Applications to
atomic, molecular and nuclear physics including both bound states and
scattering problems. Applications of group theory to quantum mechanics.

PHYS 482. Quantum Mechanics II. 3 Units.
Continuation of PHYS 481, including quantum field theory. Prerequisite
may be waived with consent of department. Recommended preparation:
PHYS 481 or consent of department.

PHYS 491. Modern Physics for Innovation I. 3 Units.
The first half of a two-semester sequence providing an understanding
of physics as a basis for successfully launching new high-tech ventures.
The course will examine physical limitations to present technologies,
and the use of physics to identify potential opportunities for new venture
creation. The course will provide experience in using physics for
both identification of incremental improvements, and as the basis for
alternative technologies. Case studies will be used to illustrate recent
commercially successful (and unsuccessful) physics-based venture
creation, and will illustrate characteristics for success.

PHYS 492. Modern Physics for Innovation II. 3 Units.
Continuation of PHYS 491, with an emphasis on current and prospective
opportunities for Physics Entrepreneurship. Longer term opportunities for
Physics Entrepreneurship in emerging areas including, but not limited to,
nanoscale physics and nanotechnology; biophysics and applications to
biotechnology; physics-based opportunities in the context of information
technology. Recommended preparation: PHYS 491.

PHYS 493. Feasibility and Technology Analysis. 3 Units.
This course provides the tools scientists need to determine whether a
technology is ready for commercialization. These tools include (but are
not limited to): financial analysis, market analysis, industry analysis,
technology analysis, intellectual property protection, the entrepreneurial
process and culture, an introduction to entrepreneurial strategy and
new venture financing. Deliverables will include a technology feasibility
analysis on a possible application in the student’s scientific area. Offered
as BIOL 493, CHEM 493, and PHYS 493.

PHYS 494. Technology-Based Venture Creation. 3 Units.
This course provides the advanced tools needed to develop,
and launch a venture plan for a technology identified
as likely to be successful through a feasibility analysis. Additional
topics include: entrepreneurial strategy, communication, sales,
negotiation, entrepreneurial finance, and leadership in an entrepreneurial
environment. Guest speakers will be featured in nearly every class
session. Prereq: BIOL 493 or CHEM 493 or PHYS 493.

PHYS 541. Quantum Theory of Solids I. 3 Units.
Elementary excitations in solids, including lattice vibrations, spin waves,
helicons, and polarons. Quasiparticles and collective coordinates.
Conduction electrons in magnetic fields and the quantum Hall effect.
Green function methods of many-body systems. Recommended
preparation: PHYS 442 or consent of department.

PHYS 561. Statistical Methods for Scientific Research. 3 Units.
This course will introduce students to traditional and novel statistical
methods useful for experimental scientists. The emphasis will be on
understanding theory and techniques that are used in research. We
shall consider problems from astronomy, biology and particle-astro
physics. The course will also cover topics of interest to engineers. Current
research problems and techniques, and we will cover some of the
advanced statistical techniques. Topics to be covered include: Measuring
uncertainty and probability distributions (low and high dimensional);
point and interval estimation; curve fitting; likelihood and score type tests
required for an experiment; posterior probabilities; dealing with small
samples (which arise in search experiments); over- and under-coverage
using confidence belts; and Monte Carlo simulation methods for planning
experiments and evaluating the statistical significance of the results.
“Gobi” and “R” open source software will be used for visualization (via
dynamic and interactive graphics) and exploring high-dimensional data.
Offered as BIOL 561 and PHYS 561.

PHYS 566. Cosmology. 3 Units.
Introduction to our current understanding of the origin and evolution
of the Universe and connection between our understanding of
elementary particle physics and cosmology. Specific topics will include:
General Parameters of Cosmology: Expansion, Lifetime, and Density
of the Universe. The Early Universe, Constraints on Elementary
Particles, Dark Matter and Dark Energy, Nucleosynthesis, Cosmic
Microwave Background, Inflation, Stellar Evolution, Gravitational Waves,
Baryogenesis. Some background in general relativity and particle physics
phenomenology is recommended.

PHYS 581. Quantum Mechanics III. 3 Units.
Continuation of PHYS 482. The methods of quantum field theory
applied to the nonrelativistic many-body problem, radiation theory, and
relativistic particle physics. Second quantization using canonical and
path integration techniques, constrained systems, and gauge theories.
Graphical perturbative methods and graphs summation approaches.
Topological aspects of field theories. Recommended preparation: PHYS
482 and consent of department.

PHYS 591. Gauge Field Theory I. 3 Units.
Noether’s theorem, symmetries and conserved currents, functional
integral techniques, quantization, Feynman rules, anomalies, QED,
electroweak interactions, QCD, renormalization, renormalization group,
asymptotic freedom and assorted other topics. Prereq: PHYS 581.

PHYS 592. Gauge Field Theory II. 3 Units.
(See PHYS 591.) Recommended preparation: PHYS 591.

PHYS 601. Research in Physics. 1 - 9 Unit.

PHYS 651. Thesis M.S.. 1 - 9 Unit.

PHYS 666. Frontiers in Physics. 0 Units.
Weekly colloquia given by eminent physicists from around the world on
topics of current interest in physics.
PHYS 701. Dissertation Ph.D.. 1 - 9 Unit.
Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
Department of Political Science

The study of political science is primarily concerned with the state, governmental structures and processes in world societies, citizen-state relations, and the exercise of political power. Faculty specialties in the department include American politics and governmental institutions; elections and political parties in the United States and abroad; violence and civil disorder; public policy analysis, including environmental policy and economic and welfare state issues; international relations conceived broadly; international political economy; religious and ethnic conflict; state-building; the politics of gender; political strategies; research methods; and comparative politics, with various regional concentrations. In its programs leading to the BA, MA, and PhD, the department makes a strong effort to relate the study of politics to students' needs and concerns and to reflect in its courses both the excitement and seriousness of real-world politics.

The study of political science can build a foundation for many types of future employment. Many political science majors are preparing for graduate study or law school. Others intend to pursue careers in journalism, teaching, or public administration, or in private industry and business. Both the public and private sectors hold career possibilities for the political science major.

Undergraduate Programs

Major

The major in political science leads to the Bachelor of Arts degree. The degree requires 30 hours of course work, distributed as follows:

<table>
<thead>
<tr>
<th>Required Courses:</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>POSC 109 The American Political System</td>
<td>3</td>
</tr>
<tr>
<td>Two POSC courses at the 200 level</td>
<td>6</td>
</tr>
<tr>
<td>Six POSC courses at the 300 level</td>
<td>18</td>
</tr>
<tr>
<td>POSC 396 Senior Project SAGES Capstone</td>
<td>3</td>
</tr>
<tr>
<td>Total Units</td>
<td>30</td>
</tr>
</tbody>
</table>

Students select courses based on their specific interests, with approval of the faculty advisor. No more than six hours of independent study (i.e., POSC 395 Special Projects and/or POSC 396 Senior Project SAGES Capstone) may count toward the major. Independent study completed through the Washington Center program is excluded from this limitation.

Departmental Honors

 Majors who maintain a grade point average of at least 3.3 overall on completion of senior year and 3.7 in political science courses, and who earn a grade of A in POSC 396, will be eligible to be nominated to receive their degrees with Honors in Political Science. To be considered for Honors, POSC 396 must be taken no later than the penultimate semester of the senior year, with the prospectus submitted no later than the end of the first week of the semester for late Fall registrants. Faculty will use the following semester to vote on honors. A paper can be considered for honors only if nominated by the project advisor. Two additional readers, who will be appointed by the department chair, must agree with the recommendation for honors. If one reader agrees and the other does not, honors will not be awarded.

Students who entered the university prior to Fall 2011 have the option of earning honors under an equivalent of the rules previously in effect. Under those rules, honors could be earned with an overall departmental GPA of 3.8 and a grade of A in POSC 396.

Integrated Graduate Studies

Application to the Integrated Graduate Studies (IGS) Program (p. 549) in political science must occur no later than the beginning of the second semester of the junior year, but preferably earlier. Upon completion of 90 undergraduate hours, the student must have satisfied all general requirements for the BA, including at least 21 hours in the political science major, the General Education Requirements, and one minor program, and must have a 3.5 grade point average in political science courses and 3.3 overall. If admitted to the IGS program, the student will take 30 hours of graduate-level political science courses during the senior year, adhering to the departmental regulations governing the master’s degree program. If completed successfully, these hours will count simultaneously toward both degrees in political science.

The BA will be awarded upon completion of all requirements for that degree, including total hours. The MA will be awarded upon successful completion of the 30 hours of graduate-level courses and the MA examination.

Minor

Political Science

A minor in political science consists of 15 hours (five courses) in the department, of which 9 hours must be at the 300 level. An elected minor sequence must be approved by a political science faculty advisor.

Public Policy

A minor in public policy is available to undergraduates in the College of Arts and Sciences and to undergraduates in the economics and management programs in the Weatherhead School of Management. Please see the Public Policy Program’s (p. 436) section of the bulletin for details.

Graduate Programs

Master of Arts

Applicants to the Master of Arts program in political science are required to submit their undergraduate transcripts and three letters of recommendation from former instructors. The admission requirements also include a minimum score of 500 on the verbal and quantitative segments of the Graduate Record Examination (GRE) and 4.5 on the analytical section. The department strongly prefers that applicants have a minimum GPA of 3.2 overall and a minimum GPA of 3.4 in political science courses. For students from other countries, the requirements are a minimum score of 550 on the paper version of the Test of English as a Foreign Language (TOEFL), or at least 215 on the computer version of the TOEFL; the minimum GRE scores indicated above; and transcripts of all undergraduate study, indicating completion of a Bachelor of Arts or Bachelor of Science degree program.

The Master of Arts in political science is a broadly based program in which the student is expected to acquire and exhibit general knowledge and skills. Therefore, within the 30 hours of graduate-level course work (400 level and above) required for the master’s, 12 hours must be distributed as follows:

<table>
<thead>
<tr>
<th>A class in the area of American government and politics</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>A class in the area of comparative politics</td>
<td>3</td>
</tr>
<tr>
<td>A class in the area of international relations</td>
<td>3</td>
</tr>
<tr>
<td>POSC 449 Political Science Research Methods</td>
<td>3</td>
</tr>
<tr>
<td>Total Units</td>
<td>12</td>
</tr>
</tbody>
</table>
Students who receive permission (due to special circumstances) from the graduate coordinator may take an alternative research methods course outside the department.

Among the remaining 18 hours of electives, the student may take courses oriented toward a general Master of Arts, covering the four broad areas listed above. Alternatively, the student may specialize in one area—one of these four or some other—approved by the graduate coordinator. A maximum of 9 hours may be taken outside the Department of Political Science, with prior approval from the graduate coordinator, for specialized work related to the master’s degree for which no political science course is appropriate. A maximum of nine hours of independent study (POSC 601 Individual Investigation) may count toward the degree.

A minimum grade point average of 3.0 must be maintained throughout the Master of Arts program. A master’s student who fails to maintain a GPA of 3.0 will be placed on academic probation for one semester. If the GPA is not returned to the 3.0 minimum by the end of the probationary semester, the student will be separated from further study in the department.

Upon completion of no fewer than 30 hours and no more than 42 hours of master’s-level course work, the student must request scheduling of the political science Master of Arts examination. The examination will cover the fields of American government and politics, comparative politics, and international relations.

**Doctor of Philosophy**

Requirements for admission to the Doctor of Philosophy program in political science are the same as for admission to the Master of Arts program, with the following additions. The department strongly prefers that applicants without an MA in political science have a minimum GPA of 3.2 overall and a minimum GPA of 3.4 in undergraduate political science courses, and that applicants with an MA degree in political science have a minimum GPA of 3.4 overall in their MA work. Because the department faculty is small, applicants should determine, prior to applying, whether one or more members of the department faculty are active in the applicant’s field of interest. PhD applications must specify the applicant’s field(s) of interest, as the Graduate Studies Committee will not recommend the admission of an applicant where the department faculty cannot support the applicant’s proposed course of study. Students who are accepted into the department’s MA program and then decide they would like to earn the PhD are expected to apply to the PhD program and meet the admission requirements. All PhD students must complete 45 hours of graduate-level courses, plus at least 18 hours of POSC 701 (Dissertation) credit. The required 45 hours of doctoral courses taken before dissertation credits must be distributed as follows:

<table>
<thead>
<tr>
<th>Course Type</th>
<th>Hours</th>
</tr>
</thead>
<tbody>
<tr>
<td>12 hours in a primary subfield (American, comparative, or international relations)</td>
<td>12</td>
</tr>
<tr>
<td>9 hours in secondary subfield (one of the remaining two fields)</td>
<td>9</td>
</tr>
<tr>
<td>6 hours in the remaining subfield</td>
<td>6</td>
</tr>
<tr>
<td>6 hours in Research Methods: POSC 449 (Political Science Research Methods)</td>
<td>6</td>
</tr>
<tr>
<td>12 hours of electives</td>
<td>12</td>
</tr>
<tr>
<td><strong>Total Units</strong></td>
<td>45</td>
</tr>
</tbody>
</table>

A maximum of 9 hours of independent study (POSC 601 Individual Investigation) may be undertaken. University regulations require PhD students to spend at least one academic year in full-time residence (two consecutive regular semesters with a minimum of 9 hours’ registration each semester).

Doctoral students whose MA in political science has been certified, and doctoral students with an MA in political science from Case Western Reserve, need complete only 18 of the 45 hours of doctoral course work. The graduate coordinator will set distribution requirements on an individual basis, reflecting the course work completed for the MA. Doctoral students without a completed MA must pass the MA examination. They must take the examination upon completion of no fewer than 30 hours and no more than 36 hours of course work. A student who does not pass this examination may not continue in the PhD program. See the description of the MA examination above for further information.

Upon completion of 45 hours of course work, the student must pass the PhD comprehensive examinations in his or her primary and secondary subfields. After passing the examinations, a student must complete a dissertation, typically 150-400 pages in length, that draws on the student’s original research to make a contribution to the field of political science.

**Dual JD/MA**

Students accepted to the School of Law may pursue a Masters of Arts in Political Science in conjunction with their JD degree. Completion of the program requires 97 hours of course work, and so would be expected to require seven semesters. Students wishing to enroll in the dual-degree program must be separately admitted to each program, but the department will waive the GRE requirement and accept the LSAT within the admissions process. Students must complete a total of 21 hours of credit within the political science department, including at least three credit hours in American politics, comparative politics, international relations, and research methods. Dual-degree students will normally begin study in the law school and defer enrollment in the MA program until their second year. They must pass the MA comprehensive examination upon completion of their political science course work.

**Department Faculty**

Joseph White, PhD  
(University of California, Berkeley)  
*Luxenberg Family Professor of Public Policy and Chair; Director, Center for Policy Studies and Public Policy Program; Professor of Epidemiology and Biostatistics, School of Medicine*  
American government; Congress; public policy; health and welfare policy; comparative politics of rich democracies

Karen Beckwith, PhD  
(Syracuse University)  
*Flora Stone Mather Professor*  
Politics of gender; mass political participation; comparative political movements; democracy and representation

Justin Buchler, PhD  
(University of California, Berkeley)  
*Associate Professor*  
Congress; redistricting; political strategy; parties and elections

Jessica F. Green, PhD  
(Princeton University)  
*Assistant Professor*  
Global governance; international environmental law and policy; international law; international organizations; transnational regulation; qualitative methods

Kathryn C. Lavelle, PhD  
(Northwestern University)  
*Ellen and Dixon Long Professor in World Affairs*  
International relations; international organizations; Congress in world politics; politics of stock markets; governing institutions of national
and international finance; U.S. foreign economic policy; Congress and banking policy

Vincent E. McHale, PhD
(Pennsylvania State University)
M. A. Hanna Professor of Political Science
Comparative politics; Europe; political sociology; methodology

Kelly M. McMann, PhD
(University of Michigan)
Associate Professor; Director, International Studies Program
Comparative politics; Central Asia; Russia and former East Bloc; democratization

Peter W. Moore, PhD
(McGill University)
Associate Professor
Comparative politics and political economy of the Middle East and Africa

Elliot Posner, PhD
(University of California, Berkeley)
Associate Professor
International relations; international and comparative political economy; politics of finance; international organizations; European Union

Laura Y. Tartakoff, JD, MA
(Case Western Reserve University School of Law; Tufts University)
Instructor
Constitutional law; civil liberties; comparative constitutionalism

Secondary Faculty
Jonathan L. Entin, JD
(Northwestern University)
Professor, School of Law
American constitutional law; social science and the law

Adjunct Faculty
Lev Gonick, PhD
(York University, Toronto)
Adjunct Professor, CWRU Vice President for Information Technology
Comparative historical international political economy; technology and government

Karl Kaltenthaler, PhD
(Washington University)
Adjunct Professor
Comparative politics, political behavior/public opinion, political extremism and violence, political economy, Europe

Andrew M. Lucker, PhD
(Case Western Reserve University)
Adjunct Assistant Professor
American government; state politics and government; history of political science

Visiting Faculty
Mark Major, MA
(Rutgers)
Visiting Instructor
American politics, presidency, media

Paul Schroeder, PhD
(Ohio State University)
Visiting Assistant Professor
Politics of China, development, international relations

Courses

POSC 109. The American Political System. 3 Units.
Introduction to the study of American politics, addressing the questions “Who rules?” and “Who benefits?” in the American political system. Explores the nature of constitutional limits, the role of public participation, the impact of pressure groups, and the influence of various governmental institutions on American political life.

POSC 260. Introduction to Comparative Politics. 3 Units.
Comparative politics is the study of processes and institutions within countries. Prompted by real-world puzzles, comparativists investigate broad, theoretical questions: What constitutes a revolution, and why do revolutions occur? How does one country become more democratic than another? Why do relations between some ethnic groups turn violent? This course introduces students to some of the central puzzles and theories of comparative politics in order to help them better understand world events.

POSC 272. Introduction to International Relations. 3 Units.
Survey of the principles of international relations, politics, law and organization; the rise, development and change of the nation-state system; development of international cooperation; methods of studying international relations.

POSC 301. Decision-Making in American Cities. 3 Units.
Localities are the primary interface with government and provide the basic psychological place identification for most Americans. The course will explore this assertion in the context of urban America today. How are decisions made in cities? Who shapes these decisions and why? What role is played by shifting demographics, race, and poverty? What can the individual do to influence local decision-making? Offered as POSC 301 and POSC 401.

POSC 302. State Politics and Policy. 3 Units.
State governments may make more decisions that affect the life of an average citizen than does the federal government. The study of state politics and policy includes the different ways states organize the basic parts of American political systems (such as legislatures, executives, courts and parties); how state cultures, economies, and other factors shape how political institutions work; institutions of state governance that do not exist at the national level (such as the initiative and referendum); and the continual contest between state and federal governments to control policy, shift costs, and avoid blame. Offered as POSC 302 and POSC 402.

POSC 306. Interest Groups in the Policy Process. 3 Units.
Introduction to the institutions and processes that make up the political environment of nonprofit and other organizations in the United States, beginning with an examination of the role of civil society in a democracy and continuing with the framing of issues, role of political entrepreneurs and organized interests, elections, the legislative process and strategies for influencing it, and the roles of executive institutions and the courts. Offered as POSC 306 and POSC 406.
POSC 308. The American Presidency. 3 Units.
The sources of, strategies of, and restraints on presidential leadership in the United States. Emphasis on problems of policy formation, presidential relations with Congress and executive agencies, and the electoral process. Offered as POSC 308 and POSC 408.

POSC 310. The Legislative Process. 3 Units.
Legislative, representative, and other functions of Congress and state legislatures; legislative relations with the executive and with private interests; powers and limitations of the legislature as a policy-making institution. Offered as POSC 310 and POSC 410.

POSC 320B. The U.S. Midterm Elections. 3 Units.
Analysis of the midterm elections in the United States. Covers congressional and state elections in all regions, focusing on the issues, personalities, campaign strategies, and voter trends in this key electoral battle held between presidential elections. Offered every four years in conjunction with the election cycle. Offered as POSC 320B and POSC 420B.

POSC 320C. The Presidential Election. 3 Units.
Analysis of the upcoming presidential election in the United States. Focuses on the issues and personalities, polls and public opinion, campaign strategies, and electoral behavior. Offered every four years in conjunction with the United States presidential election cycle. Offered as POSC 320C and POSC 420C.

POSC 321. News Media and Politics. 3 Units.
Analysis of the political role of the news media in American government and politics. Examines the fascinating relationship between reporters and politicians. Covers the overall structure and legal position of the media as well as the media's impact on the American political system. Offered as POSC 321 and POSC 421.

POSC 322. Political Movements and Political Participation. 3 Units.
Political Movements and Political Participation is concerned with the variety of ways citizens engage in collective activism in the United States and across national boundaries, and with the conditions under which citizens identify common concerns and join together in political movements to bring about change. The course begins with an examination of three general bodies of theory and research on political movements: resource mobilization, political opportunity structures, and cultural framing. We will also investigate frameworks of political participation for understanding the relationships among different expressions of collective activism and representation. In the context of these sometimes competing theories, we will consider 1) the conditions under which political movements are likely to emerge, as well as the circumstances in which collective political action is precluded; 2) how citizens come to recognize collective grievances and shared political identities; 3) the strategies and tactics of organized movements, and their likelihood of political success; and 4) the relationship between political movements, political parties, and the state. Offered as POSC 322 and POSC 422.

POSC 323. Judicial Politics. 3 Units.
Rejecting the view that judges mechanically apply the law, the study of judicial politics seeks to understand the behavior of judges as political actors with policy goals. Topics include judicial selection and socialization, judicial policy change, judicial strategy (especially the strategic interaction of judges on multi-judge panels), the interaction of courts in hierarchical judicial systems, the policy impact of judicial decisions, and the courts' interactions with coordinate branches of government (the executive, Congress, state governments, state courts). Primary focus will be on the federal judiciary, with some discussion of state judicial systems. Offered as POSC 323 and POSC 423.

POSC 325. American Constitutional Law. 3 Units.
An introductory survey of U.S. constitutional law. Special attention given to the historical, philosophical, and political dimensions of landmark Supreme Court cases. Judicial review, federalism, separation of powers, due process, and equal protection. Supreme Court's involvement in major political controversies: the New Deal, abortion, physician-assisted suicide, school desegregation, and affirmative action. Offered as POSC 325 and POSC 425.

POSC 326. Constitutions in Practical Politics. 3 Units.
Overview of ancient Greek and Roman constitution-making, medieval principles, emergence of modern constitutionalism, and the constitutionalist vision of the American and French Revolutions. Examination of contemporary constitutional issues and developments in countries such as Canada, France, Germany, Great Britain, Ethiopia, India, and the United States. Offered as POSC 326 and POSC 426.

POSC 327. Civil Liberties in America. 3 Units.
Supreme Court's interpretation of the First Amendment: liberty of religion through the establishment and free exercise clauses, freedoms of speech and the press, of assembly and association. The "pure tolerance" view examined against subversive speech, "fighting words," libel, and obscenity. Survey of content-neutral regulation, symbolic expression, and current efforts to limit expression (census speech codes and the feminist anti-pornography movement). Offered as POSC 327 and POSC 427.

POSC 328. Topics in Civil Liberties. 3 Units.
Rights of the accused as outlined in the Fourth, Fifth, Sixth, and Eighth Amendments. Topics covered are (1) arrests, searches, and seizures, (2) the privilege against compelled self-incrimination, (3) the rights to counsel, confrontation, and jury trial, and (4) the prohibition against cruel and unusual punishments. Case-specific approach but presents interplay of history, philosophy, and politics as background of each topic. Offered as POSC 328 and POSC 428.

POSC 334. Violence and the Political System. 3 Units.
Empirical analysis of various theories advanced in the cross-cultural explanation of factors which cause and mediate the occurrence of violence—revolutions, terrorism, and civil disorder—within the political system. Offered as POSC 334 and POSC 434.

POSC 341. Elections, Voters, and Political Parties. 3 Units.
Examination of American political parties, their activities, organization, characteristics, and functions. Candidate strategies and electoral history viewed within the context of voter orientations and predispositions, stressing linkages between citizen and party and between party and government. Offered as POSC 341 and POSC 441.
POSC 342. Water. 3 Units.
This seminar will explore the history of the meaning of water—that is, the social, cultural, and/or political significance placed on water by individuals and governments in different times and places. It will also examine how humans have acted upon water, and how it has acted upon humans, with great consequences for human life. This seminar will look at the history of water in the context of science, technology and society; public health; political science; and environmental history. Case studies will be drawn from a wide chronologically and geographically range; from the ancient world to Renaissance Italy, nineteenth century India, modern Britain, Egypt, and the U.S. The course provides a wide perspective on the themes of the history of human-water interactions, but will also focus closely on some critical cases. Seminar participants will write a research paper on the topic of their choice in the environmental history of water. Offered as: HSTY 342, HSTY 442, POSC 342, POSC 442.

POSC 343. Public Opinion and American Democracy. 3 Units.
Examination of theories, concepts and empirical research related to attitudes and the political behavior of mass publics. Offered as POSC 343 and POSC 443.

POSC 346. Women and Politics. 3 Units.
Women and Politics involves a critical examination of the impact of gender on the forms and distributions of power and politics, with primary reference to the experience of women in the United States. Major concerns of the course include what we mean by "sex," "gender," and "politics"; the relationship between women and the state; how women organize collectively to influence state policies; and how the state facilitates and constrains women's access to and exercise of political power. The course is organized around four foci central to the study of women and politics. The first section of the course focuses on what we mean by "women," "gender," and "politics." In this section, we will consider how these concepts intersect and the ways in which each may be used to deepen our understanding of the workings of governments and political systems, and of women's relative political powerlessness. The second section of the course employs these concepts to understand the (re) emergence of the US feminist movement, its meanings, practices, and goals, and its transformation across US political history. In the third section, we turn to conventional electoral politics, focusing on women's candidacies, their campaigns, and women's voting behavior. In the final section of the course, we consider those general factors that might provide for increased gender equality and improved life status for women, in global, comparative perspective. Offered as POSC 346 and POSC 446 and WGST 346.

POSC 348. History of Modern Political and Social Thought. 3 Units.
This course explores the responses of philosophers, economic theorists, culture critics, and public policy makers to changes in western society wrought by industrialization by focusing on their concerns with technological change. Offered as HSTY 348, HSTY 448 and POSC 348.

POSC 349. Political Science Research Methods. 3 Units.
This course examines approaches that political scientists use to understand events and processes. In doing so, the course provides students with skills helpful to completing senior projects, such as the ability to evaluate and conduct research. Through exercises and projects, students will take part in the research process from constructing a question to developing a research design to interpreting results. Students will learn and apply key techniques, including inductive and deductive reasoning, hypothesis construction, operationalization of concepts, measurements, sampling and probability, causal inference, and the logic of controls. They will produce materials common to the discipline, such as research designs. Offered as POSC 349 and POSC 449.

POSC 351. Modern Political Thought. 3 Units.
Examination of a limited topic in the study of modern political thought. Topics vary. Offered as POSC 351 and POSC 451.

POSC 352. American Political Thought. 3 Units.
Examination of the unique contribution to the science of government made by American political thinkers. Offered as POSC 352 and POSC 452.

POSC 354. Political and Social Philosophy. 3 Units.
Justification of social institutions, primarily political ones. Such distinctions as that between de facto and legitimate authority; analysis of criteria for evaluation, such as social justice and equality; inquiry into theories of justification of the state; theory of democratic government and its alternatives. Readings from classical and contemporary sources. Recommended preparation: PHIL 101. Offered as PHIL 334, POSC 354, PHIL 434, and POSC 454.

POSC 355. Modern Political Ideologies. 3 Units.
Substance and nature of ideological thinking in the contemporary world via a survey of political "isms"—for example, liberalism, libertarianism, conservatism, fascism, socialism, and even more recent trends such as feminism, environmentalism, etc. Offered as POSC 355 and POSC 455.

POSC 357. Democratic Politics: Theory and Practice. 3 Units.
Study of the theory and application of democracy. The concept of democracy will be examined from the Athenian model to contemporary debates over participatory and deliberative models. Then the concept will be applied to understanding issues of democratic practice and the study of politics in American, comparative, and international arenas. Finally, the course will address the potential effects, both good and ill, of technological innovation on democratic practices, such as "distance" participation, the Internet, and other communication technology. Offered as POSC 357 and POSC 457.

POSC 358. Political Strategy. 3 Units.
This course examines practical applications of prominent political science theories. It is partly a how-to course covering a broad range of political activities, but the primary objective is to link practical issues with theories to help you understand why events happen the way they do. The course focuses on American politics, but the materials will be applicable to a wide range of situations. The course is a seminar requiring regular student presentations that will generate discussion about the readings and current events. Papers consist of analysis of current events, and require students to analyze the strategies used by prominent figures in the context of the theories we discuss in class. Offered as POSC 358 and POSC 458.
POSC 361. State-Building and State Collapse. 3 Units.
Are nation-states the most effective means of organizing society? This course explores this question by examining the historical rationales behind the development of the nation-state, contemporary challenges to the nation-state, and potential alternatives to the nation-state. Possible challenges to the nation-state include multinational corporations, international humanitarian intervention, and regional integration. Alternative providers of state services include charities, companies, and mercenaries. Offered as POSC 361 and POSC 461.

POSC 362. Politics of Central Asia. 3 Units.
Once an unfamiliar region to many people of the world, Central Asia took center stage in the fall of 2001 as a result of the U.S. campaign against terrorism. This course will introduce students to the politics of Central Asia, focusing on the region today composed of Uzbekistan, Turkmenistan, Tajikistan, Kyrgyzstan, and Kazakhstan. We will review the nationalism, foreign relations, religion, ethnicity, and economics of the region. Offered as ETHS 362, POSC 362, and POSC 462.

POSC 363. Comparative Analysis of Elections and Electoral Systems. 3 Units.
Elections involve more than a simple act of voting to express individual preferences. The rules under which worldwide elections are held determine who controls the executive and how votes are converted into legislative seats. The mechanics of various electoral arrangements will be examined in detail and the consequences for the political system discussed in terms of strategies and desired outcomes on the part of contestants. Students will research individual countries and analyze recent elections from both qualitative and quantitative perspectives, including introduction to geospatial data for mapping variations in electoral behavior. Offered as POSC 363 and POSC 463.

POSC 364. Dictatorship and Democracy in Modern Latin America. 3 Units.
Examination of political leadership in 20th-century Latin America, exploring the nature, causes, and consequences of dictatorship and democracy in the region, moving from the collapse of oligarchic rule and the emergence of populism in the 1930s and 1940s, to the end of democracy and establishment of military regimes in the 1960s and 1970s, and ultimately to the contemporary processes of democratization and economic liberalization. Offered as ETHS 364, POSC 364, and POSC 464.

POSC 365. Science, Technology, and Government. 3 Units.
Traces the development and influence of federal technology and science policies from colonial times to the present, with emphasis on the 20th century. Offered as HSTY 366 and POSC 365.

POSC 366. Government and Politics of Africa. 3 Units.
Comparative analysis of the political forces and organizations currently functioning in Africa, as well as a survey of the formal government institutions. Special emphasis on single-party rule, military rule, and the political ramifications of African socialism, tribalism and the problems of national integration. Offered as ETHS 366, POSC 366, and POSC 466.

POSC 367. Western European Political Systems. 3 Units.
Comparative analysis of sociopolitical systems of selected Western European industrial democracies, using North American systems as a point of comparison. Offered as POSC 367 and POSC 467.

POSC 369. Current Controversies in Latin American Politics and Society. 3 Units.
In addition to questions about race, religion, abortion, the drug industry, immigration, democracy, private property, and free trade, the course will tackle Latin America's apparent shift to the political and ideological left, Chavez's "Imperialism," and Cuba's humanitarian aid. Offered as ETHS 369, POSC 369 and POSC 469.

POSC 370A. Political Economy. 3 Units.
Focus on debates concerning the proper relationship between political and economic systems, including conservative, liberal, and radical perspectives. The politics of international economics and the economics of international politics receive separate attention. The course concludes with study of "modern" political economy and the application of economic theory to the study of political systems. Offered as POSC 370A and POSC 470A.

POSC 370C. The United States and Asia. 3 Units.
Survey and analysis of U.S.-Asia relations in the post-World War II period. Focus specifically is on the interaction of politics and economics in the United States' relations with Japan, China, and Southeast Asian countries. Topics will include the role of Asia in U.S. Cold War policies, the dynamics of U.S.-Japan alliance politics, post-Cold War issues involving U.S. foreign policy toward Asia, a history and analysis of economic conflict cooperation, and an examination of the move toward Asia-Pacific "regionalism." Offered as POSC 370C and POSC 470C.

POSC 370D. The Politics of China. 3 Units.
Now more than ever, the Chinese state and society are facing tremendous economic, social, and political challenges. This course presents an overview of current issues facing the People's Republic, including a changing (or not) political culture, policy processes and outcomes at the national and local levels, reform and economic growth, the resultant societal changes and pressures, and the consequent challenges the Communist Party faces as demand for political reform grows. The class involves a mixture of lectures and discussion and draws on a combination of primary and secondary sources, including current news reports and films. Offered as POSC 370D and POSC 470D.

POSC 370F. Financial Politics in the United States and the World. 3 Units.
This course explores how political institutions make policy in the financial area with particular emphasis on the United States. Using a bureaucratic politics framework, it examines money, banks and the securities industry by integrating a wide range of literature in economics and political science. Specific objectives include familiarizing students with different approaches to the political economy of finance from different disciplines, exploring the historical evolution of finance, examining the changing relationship between public and private authority within the financial system, considering how politics operates in a crisis, and evaluating the role of international financial institutions in the global economy. By taking this course, students will equip themselves for further research into politics and economics, as well as offer them tools to analyze future policy developments as they unfold. Offered as POSC 370F and POSC 470F.
POSC 370G. U.S. Intelligence and National Security. 3 Units.
Examination of the impact of the intelligence process on foreign policy making and superpower relations. Covers the life cycle of United States strategic intelligence from the collection of data to formulation of analytic judgments and the policy-level uses of intelligence. Emphasis on contemporary intelligence issues and processes, but includes the formative period of modern American intelligence in the World War II era. Offered as POSC 370G and POSC 470G.

POSC 370H. China’s Foreign Policy. 3 Units.
The rise of China is evident in the country’s more forward and robust foreign policy that began in 1979. At every turn, nations throughout the world must now consider China wherever their interests are at stake, be it Korea and Northeast Asia, Indochina and Southeast Asia, India/ Pakistan and South Asia, or Afghanistan and Iran in the Middle East, not to mention the many African states that welcome Chinese investment but chafe at China’s presence. Further, China is increasingly aggressive in international trade, a major determinant of its foreign policy. This course describes the key factors that make up Chinese foreign policy, including its cultural tradition, policy-making institutions, the role of the military, and domestic determinants of foreign policy. The course also examines China’s ever-changing foreign policy strategies, from an aggressive posture to charming its neighbors only to become more strident once again. The course will also examine China’s role involving possible mercantilism, currency manipulation, and the hunt for traditional and alternative energy sources. Throughout the course, we will pay attention to how China’s foreign policy relates to international relations theories and what strategies might be used to manage China’s growing role in international affairs. Offered as POSC 370H and POSC 470H.

POSC 370J. International Law and Organizations. 3 Units.
Study of international organizations and international law as two means for regulating and coordinating nation-state behavior. History of the two techniques will be traced, covering 19th century efforts at cooperation, the League of Nations and the United Nations, regional and specialized global organization. The functions of international law in global politics will be stressed, with primary focus on the evolving role of law in dealing with global problems, e.g., war, the environment, economic cooperation, and human rights. Offered as POSC 370J and POSC 470J.

POSC 370K. Nationalism, Ethnicity, and Religion in World Politics. 3 Units.
Examination of the post-Cold War surge in conflicts among nationalisms, ethnic groups, and religions with particular attention to the former Yugoslavia, Ireland, India, Africa, and the Middle East. Offered as ETHS 370K, POSC 370K, and POSC 470K.

POSC 370M. Theories of Political Economy. 3 Units.
This course is a SAGES departmental seminar in political economy that brings a wide range of theoretical perspectives to bear on the relations between market and state in the contemporary world. It focuses on three questions: What have been the major debates concerning the role of the government in the economy? How were these debates resolved in the compromise of embedded liberalism, and What experiences have individual states had with these questions of political economy? To answer these questions, we will read original literature to uncover the connections among politics, economics, and the world of ideas that has resulted in the political debates we confront today. Offered as POSC 370M and POSC 470M.

POSC 371. Natural Resources and World Politics. 3 Units.
Examination of the political causes and ramifications of the uneven distribution of the valuable natural resources for modern industrial societies. Strategic and military issues and the exploitation of the seabed. Examination in some detail of selected commodity issues, including petroleum, copper and uranium. Offered as POSC 371 and POSC 471.

POSC 373. Politics of the European Union. 3 Units.
Study of the origins, operations, and prospects for the European Union. This can include the historical context for the effort to restrict national rivalries (which fueled two world wars) and create common interests; the diplomatic challenges in finding common ground; the tasks and processes of governance within the EU, including its governing institutions, enforcement of terms for European Monetary Union and the operations of its bureaucracies; the social pressures that create policy challenges (such as agriculture policy and immigration); broad tensions within the enterprise (e.g., “broadening” vs. “deepening”), and the EU’s potential place in international politics, especially the efforts to create a common foreign and security policy and the possible implications of the Euro for international political economy. Offered as POSC 373 and POSC 473.

POSC 374. Politics of Development in the Global South. 3 Units.
Exploration of the post-World War II emergence of the Global South nations of Africa, Asia, the Middle East, Latin America, and the Eastern Europe arena. Offered as ETHS 374, POSC 374, and POSC 474.

POSC 376. United States Foreign Policy. 3 Units.
Focus on U.S. foreign policy making with a dynamic network of executive and congressional actors and organizations; analysis of traditional and contemporary U.S. foreign policies from nuclear defense to current economic resource issues; future role of the United States in world affairs. Offered as POSC 376 and POSC 476.

POSC 377. Politics of Russia. 3 Units.
Russia faces three problems: the creation of a sovereign state, the development of a new political system, and the restructuring of its economy. In this course we will challenge the assumption that the outcome of these three transitions will be a strong, democratic, capitalist country. We will ask whether civil war, organized crime, an immature party system, poor social services, and nomenklatura privatization bode poorly for these three transformations. Offered as POSC 377 and POSC 477.

POSC 378. International Relations Theory. 3 Units.
This course is a seminar in international relations theory. As such, we will bring a wide range of theoretical perspectives to bear on issues and debates in the area of international relations by systematically studying the evolution of the world system. The seminar is roughly divided into a first half focusing on war and the political system, and a second half focusing on trade, finance and the economic system. Each section devotes particular attention to ethical problems associated with political and economic issues. This course should develop students’ ability to read and critically evaluate academic literature in the field of international relations, and enable students to produce a scholarly paper on one substantive area of the field. Offered as POSC 378 and POSC 478.
POSC 379. Introduction to Middle East Politics. 3 Units.
This is an introductory course about Middle East Politics, in regional as well as international aspects. In this course we will explore broad social, economic, and political themes that have defined the region since the end of World War Two. Since this is an introductory course, a major goal will be to gain comparative knowledge about the region's states and peoples. The countries that comprise the modern Middle East are quite diverse; therefore, we will only be able to focus on a few cases in depth. A second goal is to use the tools and theories social scientists employ to answer broad questions related to the region, such as: How have colonial legacies shaped political and economic development in the Middle East? How do oil, religion, and identity interact with politics? How have external powers affected the region's political development? What do the uprisings of 2011 hold for the region's future? Offered as POSC 379 and POSC 479.

POSC 380. State and War in Africa and the Middle East. 3 Units.
The Middle East, North Africa, and Sub-Saharan Africa remain the most volatile and conflict prone regions of the world. Traditional approaches to war and state conflict have emphasized systemic variables, such as balance of power, military capabilities, perceptions, the security dilemma, and of course anarchy. While these concepts have generated much academic interest, their ability to explain and understand conflict in the developing world is severely limited. This is due to the basic fact that nearly all conflict in the world today is not between states but is taking place within state boundaries. What drives these conflicts? Are there common factors and patterns within the Middle East and Africa? How does sub-state conflict affect political and economic development? What are the most likely resolution strategies? Recommended preparation: POSC 379.

POSC 381. City as Classroom. 3 Units.
In this course, the city is the classroom. We will engage with the urban terrain. We will meet weekly off-campus, interact with community members, and interface--both literally and figuratively--with the city as a way to examine the linkages between historical, conceptual, and contemporary issues, with particular attention paid to race and class dynamics, inequality, and social justice. This course will have four intersecting components, primarily focusing on American cities since the 1930s: the social and physical construction of urban space, the built environment, life and culture in the city, and social movements and grassroots struggles. Offered as HSTY 381, POSC 381, SOCI 381, HSTY 481, POSC 481, and SOCI 481.

POSC 383. Health Policy and Politics in the United States. 3 Units.
Overview of the principal institutions, processes, social forces, and ideas shaping the U.S. health system. Historical, political, economic, and sociological perspectives on the health system are explored as well as the intellectual context of recent policy changes, challenges, and developments. Students will acquire a sense of how health services are financed and delivered in the U.S. They will also learn how to assess its performance compared to that of other similar countries. Offered as POSC 383 and POSC 483.

POSC 384. Ethics and Public Policy. 3 Units.
Evaluation of ethical arguments in contemporary public policymaking discourse. That is, approaches to evaluating not only the efficiency of policy (Will this policy achieve its end for the least cost?) but also the ethics of policy (Are a policy's intended ends ethically justified or "good," and are our means to achieve those ends moral or "just"). Overview of political ideologies that supply U.S. political actors with their ethical or moral arguments when proposing and implementing public policy, followed by an application of these differing perspectives to selected policy areas such as welfare, euthanasia, school choice, drug laws, censorship, or others. Offered as POSC 384 and POSC 484.

POSC 385. U.S. Bureaucratic Politics. 3 Units.
Bureaucracy is one of civilization's most important inventions. It is a way of coordinating very large numbers of people so as to do work, make decisions, and exercise power. Without it, much of modern life would be impossible. Yet "bureaucracy" is normally seen, in public discussion, as a problem, instead of as a solution. This course will consider both the reasons for and pathologies of bureaucratic organization. Its special focus is bureaucracy in American government. The course therefore will provide some introduction to the study of American public administration, but with special emphasis on how the work and performance of public bureaucracies in the United States is shaped by the specific tasks they are given and the distribution of power in the American political arena. Offered as POSC 385 and POSC 485.

POSC 386. Making Public Policy. 3 Units.
Politics is about who wins, who loses, and why. Policy, by contrast, is often depicted as more "neutral:" policies are the means through which political decisions are carried out. In this class, we examine the notion that policy is the rational, impartial counterpart to the political arena. We will ask: How are public policies made? Why do some issues make it on to the agenda, while others do not? Can we separate facts from values, or are both always contested? We will examine how decision-making in a group introduces distinct challenges for policymaking. The course focuses on widely applicable themes of policymaking, drawing on both domestic and international examples. Offered as POSC 386 and POSC 486.

POSC 388. Politics, Policy, and the Global Environment. 3 Units.
This course examines the law, politics and policy surrounding global environmental challenges such as climate change. The course aims to provide a broad overview of the key concepts, actors, debates, and issues in global environmental politics. It aims to illustrate the complexities of addressing environmental problems-from the proliferation of global institutions and international actors, to the absence of central enforcement mechanisms. We examine the causes of environmental degradation and competing views on the gravity of the problem. Using concepts from political science and economics, we investigate the challenges in getting states to act jointly to address environmental problems. We examine the actors and institutions of global environmental politics, to understand how conditions are defined as problems and responses are chosen and implemented. The course concludes by applying the tools and concepts to the case of climate change. Offered as POSC 388, ESTD 388, POSC 488.

POSC 389. Special Topics in American Politics and Policy. 3 Units.
Specific topic will vary but will consist of an in-depth investigation of a particular policy area or political phenomenon. Topics will involve policy controversies of some current interest. Offered as POSC 389 and POSC 489.
POS 395. Special Projects. 1 - 6 Unit.
Study of a topic of particular interest, or an approved internship. The student must submit to the departmental office a project prospectus form, approved and signed by the faculty supervisor, no later than the end of the second week of classes. The prospectus must outline the goals of the project and the research methodology to be used and is part of the basis for grading. The prospectus form is available from the departmental office of from the department’s Web page.

POS 396. Senior Project SAGES Capstone. 3 Units.
Capstone experience for political science majors or senior POSC minors as part of the SAGES program, providing opportunity to do an in-depth paper on a topic of particular interest to them. Students must obtain approval from a faculty project advisor and list that advisor on the registration form. The advisor must sign and student submit to department a prospectus including goals, schedule, and research methodology. This paper should demonstrate, and ideally even extend, the skills and expertise developed over the course of study in the department. Upon completion of the capstone, students will be expected to present their work in a public forum. Recommended preparation: Junior or Senior political science major or senior political science minor and departmental prospectus form.

POS 401. Decision-Making in American Cities. 3 Units.
Localities are the primary interface with government and provide the basic psychological place identification for most Americans. The course will explore this assertion in the context of urban America today. How are decisions made in cities? Who shapes these decisions and why? What role is played by shifting demographics, race, and poverty? What can the individual do to influence local decision-making? Offered as POSC 301 and POSC 401.

POS 402. State Politics and Policy. 3 Units.
State governments may make more decisions that affect the life of an average citizen than does the federal government. The study of state politics and policy includes the different ways states organize the basic parts of American political systems (such as legislatures, executives, courts and parties); how state cultures, economies, and other factors shape how political institutions work; institutions of state governance that do not exist at the national level (such as the initiative and referendum); and the continual contest between state and federal governments to control policy, shift costs, and avoid blame. Offered as POSC 302 and POSC 402.

POS 406. Interest Groups in the Policy Process. 3 Units.
Introduction to the institutions and processes that make up the political environment of nonprofit and other organizations in the United States, beginning with an examination of the role of civil society in a democracy and continuing with the framing of issues, role of political entrepreneurs and organized interests, elections, the legislative process and strategies for influencing it, and the roles of executive institutions and the courts. Offered as POSC 306 and POSC 406.

POS 408. The American Presidency. 3 Units.
The sources of, strategies of, and restraints on presidential leadership in the United States. Emphasis on problems of policy formation, presidential relations with Congress and executive agencies, and the electoral process. Offered as POSC 308 and POSC 408.

POS 410. The Legislative Process. 3 Units.
Legislative, representative, and other functions of Congress and state legislatures; legislative relations with the executive and with private interests; powers and limitations of the legislature as a policy-making institution. Offered as POSC 310 and POSC 410.

POS 420B. The U.S. Midterm Elections. 3 Units.
Analysis of the midterm elections in the United States. Covers congressional and state elections in all regions, focusing on the issues, personalities, campaign strategies, and voter trends in this key electoral battle held between presidential elections. Offered every four years in conjunction with the election cycle. Offered as POSC 320B and POSC 420B.

POS 420C. The Presidential Election. 3 Units.
Analysis of the upcoming presidential election in the United States. Focuses on the issues and personalities, polls and public opinion, campaign strategies, and electoral behavior. Offered every four years in conjunction with the United States presidential election cycle. Offered as POSC 320C and POSC 420C.

POS 421. News Media and Politics. 3 Units.
Analysis of the political role of the news media in American government and politics. Examines the fascinating relationship between reporters and politicians. Covers the overall structure and legal position of the media as well as the media’s impact on the American political system. Offered as POSC 321 and POSC 421.

POS 422. Political Movements and Political Participation. 3 Units.
Political Movements and Political Participation is concerned with the variety of ways citizens engage in collective activism in the United States and across national boundaries, and with the conditions under which citizens identify common concerns and join together in political movements to bring about change. The course begins with an examination of three general bodies of theory and research on political movements: resource mobilization, political opportunity structures, and cultural framing. We will also investigate frameworks of political participation for understanding the relationships among different expressions of collective activism and representation. In the context of these sometimes competing theories, we will consider 1) the conditions under which political movements are likely to emerge, as well as the circumstances in which collective political action is precluded; 2) how citizens come to recognize collective grievances and shared political identities; 3) the strategies and tactics of organized movements, and their likelihood of political success; and 4) the relationship between political movements, political parties, and the state. Offered as POSC 322 and POSC 422.

POS 423. Judicial Politics. 3 Units.
Rejecting the view that judges mechanically apply the law, the study of judicial politics seeks to understand the behavior of judges as political actors with policy goals. Topics include judicial selection and socialization, judicial policy change, judicial strategy (especially the strategic interaction of judges on multi-judge panels), the interaction of courts in hierarchical judicial systems, the policy impact of judicial decisions, and the courts’ interactions with coordinate branches of government (the executive, Congress, state governments, state courts). Primary focus will be on the federal judiciary, with some discussion of state judicial systems. Offered as POSC 323 and POSC 423.
POSC 425. American Constitutional Law. 3 Units.
An introductory survey of U.S. constitutional law. Special attention given to the historical, philosophical, and political dimensions of landmark Supreme Court cases. Judicial review, federalism, separation of powers, due process, and equal protection. Supreme Court's involvement in major political controversies: the New Deal, abortion, physician-assisted suicide, school desegregation, and affirmative action. Offered as POSC 325 and POSC 425.

POSC 426. Constitutions in Practical Politics. 3 Units.
Overview of ancient Greek and Roman constitution-making, medieval principles, emergence of modern constitutionalism, and the constitutionalist vision of the American and French Revolutions. Examination of contemporary constitutional issues and developments in countries such as Canada, France, Germany, Great Britain, Ethiopia, India, and the United States. Offered as POSC 326 and POSC 426.

POSC 427. Civil Liberties in America. 3 Units.
Supreme Court's interpretation of the First Amendment: liberty of religion through the establishment and free exercise clauses, freedoms of speech and the press, of assembly and association. The "pure tolerance" view examined against subversive speech, "fighting words," libel, and obscenity. Survey of content-neutral regulation, symbolic expression, and current efforts to limit expression (campus speech codes and the feminist anti-pornography movement). Offered as POSC 327 and POSC 427.

POSC 428. Topics in Civil Liberties. 3 Units.
Rights of the accused as outlined in the Fourth, Fifth, Sixth, and Eighth Amendments. Topics covered are (1) arrests, searches, and seizures, (2) the privilege against compelled self-incrimination, (3) the rights to counsel, confrontation, and jury trial, and (4) the prohibition against cruel and unusual punishments. Case-specific approach but presents interplay of history, philosophy, and politics as background of each topic. Offered as POSC 328 and POSC 428.

POSC 429. Courts, Public Policy, and Social Change. 2 Units.
Examines the social impact of law and use of social research in the legal process, assesses efforts to use law to effect social reform, and empirical studies of legal processes and institutions. Recommended preparation: Graduate standing or consent of department. Offered as LAWS 285 and POSC 429.

POSC 434. Violence and the Political System. 3 Units.
Empirical analysis of various theories advanced in the cross-cultural explanation of factors which cause and mediate the occurrence of violence--revolutions, terrorism, and civil disorder--within the political system. Offered as POSC 334 and POSC 434.

POSC 441. Elections, Voters, and Political Parties. 3 Units.
Examination of American political parties, their activities, organization, characteristics, and functions. Candidate strategies and electoral history viewed within the context of voter orientations and predispositions, stressing linkages between citizen and party and between party and government. Offered as POSC 341 and POSC 441.

POSC 442. Water. 3 Units.
This seminar will explore the history of the meaning of water--that is, the social, cultural, and/or political significance placed on water by individuals and governments in different times and places. It will also examine how humans have acted upon water, and how it has acted upon humans, with great consequences for human life. This seminar will look at the history of water in the context of science, technology and society; public health; political science; and environmental history. Case studies will be drawn from a wide chronological and geographical range; from the ancient world to Renaissance Italy, nineteenth century India, modern Britain, Egypt, and the U.S. The course provides a wide perspective on the themes of the history of human-water interactions, but will also focus closely on some critical cases. Seminar participants will write a research paper on the topic of their choice in the environmental history of water. Offered as: HSTY 342, HSTY 442, POSC 342, POSC 442.

POSC 443. Public Opinion and American Democracy. 3 Units.
Examination of theories, concepts and empirical research related to attitudes and the political behavior of mass publics. Offered as POSC 343 and POSC 443.

POSC 444. Women and Politics. 3 Units.
Women and Politics involves a critical examination of the impact of gender on the forms and distributions of power and politics, with primary reference to the experience of women in the United States. Major concerns of the course include what we mean by "sex," "gender," and "politics"; the relationship between women and the state; how women organize collectively to influence state policies; and how the state facilitates and constrains women's access to and exercise of political power. The course is organized around four foci central to the study of women and politics. The first section of the course focuses on what we mean by "women," "gender," and "politics." In this section, we will consider how these concepts intersect and the ways in which each may be used to deepen our understanding of the workings of governments and political systems, and of women's relative political powerlessness. The second section of the course employs these concepts to understand the (re) emergence of the US feminist movement, its meanings, practices, and goals, and its transformation across US political history. In the third section, we turn to conventional electoral politics, focusing on women's candidacies, their campaigns, and women's voting behavior. In the final section of the course, we consider those general factors that might provide for increased gender equality and improved life status for women, in a global, comparative perspective. Offered as POSC 346 and POSC 446 and WGST 346.

POSC 449. Political Science Research Methods. 3 Units.
This course examines approaches that political scientists use to understand events and processes. In doing so, the course provides students with skills helpful to completing senior projects, such as the ability to evaluate and conduct research. Through exercises and projects, students will take part in the research process from constructing a question to developing a research design to interpreting results. Students will learn and apply key techniques, including inductive and deductive reasoning, hypothesis construction, operationalization of concepts, measurements, sampling and probability, causal inference, and the logic of controls. They will produce materials common to the discipline, such as research designs. Offered as POSC 349 and POSC 449.

POSC 451. Modern Political Thought. 3 Units.
Examination of a limited topic in the study of modern political thought. Topics vary. Offered as POSC 351 and POSC 451.
POSC 452. American Political Thought. 3 Units.
Examination of the unique contribution to the science of government made by American political thinkers. Offered as POSC 352 and POSC 452.

POSC 454. Political and Social Philosophy. 3 Units.
Justification of social institutions, primarily political ones. Such distinctions as that between de facto and legitimate authority; analysis of criteria for evaluation, such as social justice and equality; inquiry into theories of justification of the state; theory of democratic government and its alternatives. Readings from classical and contemporary sources. Recommended preparation: PHIL 101. Offered as PHIL 334, POSC 354, PHIL 434, and POSC 454.

POSC 455. Modern Political Ideologies. 3 Units.
Substance and nature of ideological thinking in the contemporary world via a survey of political "isms"--for example, liberalism, libertarianism, conservatism, fascism, socialism, and even more recent trends such as feminism, environmentalism, etc. Offered as POSC 355 and POSC 455.

POSC 457. Democratic Politics: Theory and Practice. 3 Units.
Study of the theory and application of democracy. The concept of democracy will be examined from the Athenian model to contemporary debates over participatory and deliberative models. Then the concept will be applied to understanding issues of democratic practice and the study of politics in American, comparative, and international arenas. Finally, the course will address the potential effects, both good and ill, of technological innovation on democratic practices, such as "distance" participation, the Internet, and other communication technology. Offered as POSC 357 and POSC 457.

POSC 458. Political Strategy. 3 Units.
This course examines practical applications of prominent political science theories. It is partly a how-to course covering a broad range of political activities, but the primary objective is to link practical issues with theories to help you understand why events happen the way they do. The course focuses on American politics, but the materials will be applicable to a wide range of situations. The course is a seminar requiring regular student presentations that will generate discussion about the readings and current events. Papers consist of analysis of current events, and require students to analyze the strategies used by prominent figures in the context of the theories we discuss in class. Offered as POSC 358 and POSC 458.

POSC 459. Economic Systems. 3 Units.
Examination of economic systems, including introduction to geospatial data for mapping variations in recent elections from both qualitative and quantitative perspectives, including introduction to geospatial data for mapping variations in electoral behavior. Offered as POSC 363 and POSC 463.

POSC 464. Dictatorship and Democracy in Modern Latin America. 3 Units.
Examination of political leadership in 20th-century Latin America, exploring the nature, causes, and consequences of dictatorship and democracy in the region, moving from the collapse of oligarchic rule and the emergence of populism in the 1930s and 1940s, to the end of democracy and establishment of military regimes in the 1960s and 1970s, and ultimately to the contemporary processes of democratization and economic liberalization. Offered as ETHS 364, POSC 364, and POSC 464.

POSC 466. Government and Politics of Africa. 3 Units.
Comparative analysis of the political forces and organizations currently functioning in Africa, as well as a survey of the formal government institutions. Special emphasis on single-party rule, military rule, and the political ramifications of African socialism, tribalism and the problems of national integration. Offered as ETHS 366, POSC 366, and POSC 466.

POSC 467. Western European Political Systems. 3 Units.
Comparative analysis of sociopolitical systems of selected Western European industrial democracies, using North American systems as a point of comparison. Offered as POSC 367 and POSC 467.

POSC 469. Current Controversies in Latin American Politics and Society. 3 Units.
In addition to questions about race, religion, abortion, the drug industry, immigration, democracy, private property, and free trade, the course will tackle Latin America's apparent shift to the political and ideological left, Chavez's "Imperialism," and Cuba's humanitarian aid. Offered as ETHS 369, POSC 369 and POSC 469.

POSC 470A. Political Economy. 3 Units.
Focus on debates concerning the proper relationship between political and economic systems, including conservative, liberal, and radical perspectives. The politics of international economics and the economics of international politics receive separate attention. The course concludes with study of "modern" political economy and the application of economic theory to the study of political systems. Offered as POSC 370A and POSC 470A.

POSC 470C. The United States and Asia. 3 Units.
Survey and analysis of U.S.-Asia relations in the post-World War II period. Focus specifically is on the interaction of politics and economics in the United States' relations with Japan, China, and Southeast Asian countries. Topics will include the role of Asia in U.S. Cold War policies, the dynamics of U.S.-Japan alliance politics, post-Cold War issues involving U.S. foreign policy toward Asia, a history and analysis of economic conflict cooperation, and an examination of the move toward Asia-Pacific "regionalism." Offered as POSC 370C and POSC 470C.
POSC 470D. The Politics of China. 3 Units.
Now more than ever, the Chinese state and society are facing tremendous economic, social, and political challenges. This course presents an overview of current issues facing the People’s Republic, including a changing or not) political culture, policy processes and outcomes at the national and local levels, reform and economic growth, the resultant societal changes and pressures, and the consequent challenges the Communist Party faces as demand for political reform grows. The class involves a mixture of lectures and discussion and draws on a combination of primary and secondary sources, including current news reports and films. Offered as POSC 370D and POSC 470D.

POSC 470F. Financial Politics in the United States and the World. 3 Units.
This course explores how political institutions make policy in the financial area with particular emphasis on the United States. Using a bureaucratic politics framework, it examines money, banks and the securities industry by integrating a wide range of literature in economics and political science. Specific objectives include familiarizing students with different approaches to the political economy of finance from different disciplines, exploring the historical evolution of finance, examining the changing relationship between public and private authority within the financial system, considering how politics operates in a crisis, and evaluating the role of international financial institutions in the global economy. By taking this course, students will equip themselves for further research into politics and economics, as well as offer them tools to analyze future policy developments as they unfold. Offered as POSC 370F and POSC 470F.

POSC 470G. U.S. Intelligence and National Security. 3 Units.
Examination of the impact of the intelligence process on foreign policy making and superpower relations. Covers the life cycle of United States strategic intelligence from the collection of data to formulation of analytic judgments and the policy-level uses of intelligence. Emphasis on contemporary intelligence issues and processes, but includes the formative period of modern American intelligence in the World War II era. Offered as POSC 370G and POSC 470G.

POSC 470H. China’s Foreign Policy. 3 Units.
The rise of China is evident in the country’s more forward and robust foreign policy that began in 1979. At every turn, nations throughout the world must now consider China wherever their interests are at stake, be it Korea and Northeast Asia, Indochina and Southeast Asia, India/ Pakistan and South Asia, or Afghanistan and Iran in the Middle East, not to mention the many African states that welcome Chinese investment but chafe at China’s presence. Further, China is increasingly aggressive in international trade, a major determinant of its foreign policy. This course describes the key factors that make up Chinese foreign policy, including its cultural tradition, policy-making institutions, the role of the military, and domestic determinants of foreign policy. The course also examines China’s ever-changing foreign policy strategies, from an aggressive posture to charming its neighbors only to become more strident once again. The course will also examine China’s role involving possible mercantilism, currency manipulation, and the hunt for traditional and alternative energy sources. Throughout the course, we will pay attention to how China’s foreign policy relates to international relations theories and what strategies might be used to manage China’s growing role in international affairs. Offered as POSC 370H and POSC 470H.

POSC 470J. International Law and Organizations. 3 Units.
Study of international organizations and international law as two means for regulating and coordinating nation-state behavior. History of the two techniques will be traced, covering 19th century efforts at cooperation, the League of Nations and the United Nations, regional and specialized global organization. The functions of international law in global politics will be stressed, with primary focus on the evolving role of law in dealing with global problems, e.g., war, the environment, economic cooperation, and human rights. Offered as POSC 370J and POSC 470J.

POSC 470K. Nationalism, Ethnicity, and Religion in World Politics. 3 Units.
Examination of the post-Cold War surge in conflicts among nationalisms, ethnic groups, and religions with particular attention to the former Yugoslavia, Ireland, India, Africa, and the Middle East. Offered as ETHS 370K, POSC 370K, and POSC 470K.

POSC 470M. Theories of Political Economy. 3 Units.
This course is a SAGES departmental seminar in political economy that brings a wide range of theoretical perspectives to bear on the relations between market and state in the contemporary world. It focuses on three questions: What have been the major debates concerning the role of the government in the economy? How were these debates resolved in the compromise of embedded liberalism, and What experiences have individual states had with these questions of political economy? To answer these questions, we will read original literature to uncover the connections among politics, economics, and the world of ideas that has resulted in the political debates we confront today. Offered as POSC 370M and POSC 470M.

POSC 471. Natural Resources and World Politics. 3 Units.
Examination of the political causes and ramifications of the uneven distribution of the valuable natural resources for modern industrial societies. Strategic and military issues and the exploitation of the seabed. Examination in some detail of selected commodity issues, including petroleum, copper and uranium. Offered as POSC 371 and POSC 471.

POSC 473. Politics of the European Union. 3 Units.
Study of the origins, operations, and prospects for the European Union. This can include the historical context for the effort to restrict national rivalries (which fueled two world wars) and create common interests; the diplomatic challenges in finding common ground; the tasks and processes of governance within the EU, including its governing institutions, enforcement of terms for European Monetary Union and the operations of its bureaucracies; the social pressures that create policy challenges (such as agriculture policy and immigration); broad tensions within the enterprise (e.g., “broadening” vs. “deepening”), and the EU’s potential place in international politics, especially the efforts to create a common foreign and security policy and the possible implications of the Euro for international political economy. Offered as POSC 373 and POSC 473.

POSC 474. Politics of Development in the Global South. 3 Units.
Exploration of the post-World War II emergence of the Global South nations of Africa, Asia, the Middle East, Latin America, and the Eastern Europe arena. Offered as ETHS 374, POSC 374, and POSC 474.
POSC 476. United States Foreign Policy. 3 Units.
Focus on U.S. foreign policy making with a dynamic network of executive and congressional actors and organizations; analysis of traditional and contemporary U.S. foreign policies from nuclear defense to current economic resource issues; future role of the United States in world affairs. Offered as POSC 376 and POSC 476.

POSC 477. Politics of Russia. 3 Units.
Russia faces three problems: the creation of a sovereign state, the development of a new political system, and the restructuring of its economy. In this course we will challenge the assumption that the outcome of these three transitions will be a strong, democratic, capitalist country. We will ask whether civil war, organized crime, an immature party system, poor social services, and nomenklatura privatization bode poorly for these three transformations. Offered as POSC 377 and POSC 477.

POSC 478. International Relations Theory. 3 Units.
This course is a seminar in international relations theory. As such, we will bring a wide range of theoretical perspectives to bear on issues and debates in the area of international relations by systematically studying the evolution of the world system. The seminar is roughly divided into a first half focusing on war and the political system, and a second half focusing on trade, finance and the economic system. Each section devotes particular attention to ethical problems associated with political and economic issues. This course should develop students' ability to read and critically evaluate academic literature in the field of international relations, and enable students to produce a scholarly paper on one substantive area of the field. Offered as POSC 378 and POSC 478.

POSC 479. Introduction to Middle East Politics. 3 Units.
This is an introductory course about Middle East Politics, in regional as well as international aspects. In this course we will explore broad social, economic, and political themes that have defined the region since the end of World War Two. Since this is an introductory course, a major goal will be to gain comparative knowledge about the region's states and peoples. The countries that comprise the modern Middle East are quite diverse; therefore, we will only be able to focus on a few cases in depth. A second goal is to use the tools and theories social scientists employ to answer broad questions related to the region, such as: How have colonial legacies shaped political and economic development in the Middle East? How do oil, religion, and identity interact with politics? How have external powers affected the region's political development? What do the uprisings of 2011 hold for the region's future? Offered as POSC 379 and POSC 479.

POSC 480. Public Policy and Aging. 3 Units.
Overview of aging and the aged. Concepts in the study of public policy. Policies on aging and conditions that they address. The politics of policies on aging. Emergent trends and issues. Offered as ANTH 498, BETH 496, EPBI 408, GERO 496, HSTY 480, MPHP 408, NURS 479, NURS 579, POSC 480, and SOCI 496.

POSC 481. City as Classroom. 3 Units.
In this course, the city is the classroom. We will engage with the urban terrain. We will meet weekly off-campus, interact with community members, and interface—both literally and figuratively—with the city as a way to examine the linkages between historical, conceptual, and contemporary issues, with particular attention paid to race and class dynamics, inequality, and social justice. This course will have four intersecting components, primarily focusing on American cities since the 1930s: the social and physical construction of urban space, the built environment, life and culture in the city, and social movements and grassroots struggles. Offered as HSTY 381, POSC 381, SOCI 381, HSTY 481, POSC 481, and SOCI 481.

POSC 483. Health Policy and Politics in the United States. 3 Units.
Overview of the principal institutions, processes, social forces, and ideas shaping the U.S. health system. Historical, political, economic, and sociological perspectives on the health system are explored as well as the intellectual context of recent policy changes, challenges, and developments. Students will acquire a sense of how health services are financed and delivered in the U.S. They will also learn how to assess its performance compared to that of other similar countries. Offered as POSC 383 and POSC 483.

POSC 484. Ethics and Public Policy. 3 Units.
Evaluation of ethical arguments in contemporary public policymaking discourse. That is, approaches to evaluating not only the efficiency of policy (Will this policy achieve its end for the least cost?) but also the ethics of policy (Are a policy's intended ends ethically justified or "good," and are our means to achieve those ends moral or "just"?). Overview of political ideologies that supply U.S. political actors with their ethical or moral arguments when proposing and implementing public policy, followed by an application of these differing perspectives to selected policy areas such as welfare, euthanasia, school choice, drug laws, censorship, or others. Offered as POSC 384 and POSC 484.

POSC 485. U.S. Bureaucratic Politics. 3 Units.
Bureaucracy is one of civilization's most important inventions. It is a way of coordinating very large numbers of people so as to do work, make decisions, and exercise power. Without it, much of modern life would be impossible. Yet "bureaucracy" is normally seen, in public discussion, as a problem, instead of as a solution. This course will consider both the reasons for and pathologies of bureaucratic organization. Its special focus is bureaucracy in American government. The course therefore will provide some introduction to the study of American public administration, but with special emphasis on how the work and performance of public bureaucracies in the United States is shaped by the specific tasks they are given and the distribution of power in the American political arena. Offered as POSC 385 and POSC 485.

POSC 486. Making Public Policy. 3 Units.
Politics is about who wins, who loses, and why. Policy, by contrast, is often depicted as more "neutral;" policies are the means through which political decisions are carried out. In this class, we examine the notion that policy is the rational, impartial counterpart to the political arena. We will ask: How are public policies made? Why do some issues make it on to the agenda, while others do not? Can we separate facts from values, or are both always contested? We will examine how decision-making in a group introduces distinct challenges for policymaking. The course focuses on widely applicable themes of policymaking, drawing on both domestic and international examples. Offered as POSC 386 and POSC 486.
**POSC 488. Politics, Policy, and the Global Environment. 3 Units.**
This course examines the law, politics and policy surrounding global environmental challenges such as climate change. The course aims to provide a broad overview of the key concepts, actors, debates, and issues in global environmental politics. It aims to illustrate the complexities of addressing environmental problems—from the proliferation of global institutions and international actors, to the absence of central enforcement mechanisms. We examine the causes of environmental degradation and competing views on the gravity of the problem. Using concepts from political science and economics, we investigate the challenges in getting states to act jointly to address environmental problems. We examine the actors and institutions of global environmental politics, to understand how conditions are defined as problems and responses are chosen and implemented. The course concludes by applying the tools and concepts to the case of climate change. Offered as POSC 388, ESTD 388, POSC 488.

**POSC 489. Special Topics in American Politics and Policy. 3 Units.**
Specific topic will vary but will consist of an in-depth investigation of a particular policy area or political phenomenon. Topics will involve policy controversies of some current interest. Offered as POSC 389 and POSC 489.

**POSC 495. Independent Study. 3 Units.**
Graduate level independent study taken for a grade.

**POSC 601. Individual Investigation. 1 - 6 Unit.**
The student must submit to the departmental office a project prospectus form, approved and signed by the faculty project supervisor, no later than the end of the second week of classes. The prospectus must outline the goals of the project and the research methodology to be used and is part of the basis for grading. The prospectus form is available from the departmental office. Prereq: Departmental prospectus form, graduate standing, and consent of department.

**POSC 701. Dissertation Ph.D.. 1 - 9 Unit.**
Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
Department of Psychological Sciences

Communication Sciences Program I Psychology Program

The Department of Psychological Sciences combines the areas of study found in many psychology departments with those typically found in communication sciences departments. Our distinctive department offers undergraduate majors and minors in communication sciences and in psychology. We also offer a minor in health communications. For graduate students, our psychology program offers accredited doctoral training in clinical psychology and in experimental psychology. Our accredited Communication Sciences Program offers a master’s degree in speech-language pathology as well as a doctorate in communication sciences.

Communication Sciences

Cleveland Hearing & Speech Center, 11635 Euclid Ave, Room 333
Phone: 216.368.2470

The Department of Psychological Sciences offers courses of study in communication sciences leading to Bachelor of Arts, Master of Arts, and Doctor of Philosophy degrees. The Communication Sciences Program prepares undergraduate and graduate students to address broad issues of human communication processes and disorders through the application of cutting-edge technology and rigorous clinical training. We provide a comprehensive foundation in normal and disordered human communication and combine it with innovative interdisciplinary experiences that capitalize on the extensive resources of the university and the surrounding medical community. The department enjoys a particularly close relationship with Cleveland Hearing & Speech Center (http://bulletin.case.edu/collegeofartsandsciences/psychology/http://www.chsc.org), an outstanding independent, nonprofit provider of care in speech-language pathology and audiology; in fact, the program is housed within the center.

Many students pursue undergraduate study in communication disorders as preparation for further study in other fields or in conjunction with study in other fields. For example, one can combine a major in communication disorders with a major in sociology or psychology or with a minor in gerontological studies. Professionals in human services fields such as medicine, social work, nursing, or education often work with persons with communication disorders. For students interested in academic or research careers, investigation in the field of communication disorders is often done alongside investigation of normal human behavior. For example, one might study the word learning of children with normal language as well as that of children with language impairment.

Psychology

103 Mather Memorial Building
Phone: 216.368.2686

The Psychology Program offers the combined advantages of a strong liberal arts college and a major university. There are classes in all major areas of the psychology field. We encourage close student-faculty relationships and offer many opportunities for individualized study and research.
