This course is designed to introduce students to the ethical, policy, and legal issues raised by research involving human subjects. It is intended for law students, post-doctoral trainees in health-related disciplines and other students in relevant fields. Topics include (among others): regulation and monitoring of research; research in third-world nations; research with special populations; stem cell and genetic research; research to combat bioterrorism; scientific misconduct; conflicts of interest; commercialization and intellectual property; and the use of deception and placebos. Course will meet once per week for 2 hours throughout the semester. Grades will be given based on class participation and a series of group projects and individual short writing assignments. Offered as BETH 503, CRSP 603 and LAWS 603.

BETH 504. Critical Readings in Bioethics. 3 Units.
This course will focus on both normative (traditional) and descriptive (empirical) approaches to bioethics. It will be co-directed by two faculty members, one with a specialization in normative bioethics and one with a specialization in descriptive bioethics.

BETH 505. Methods in Normative Bioethics I. 3 Units.
The first of the two required Methods seminars is designed to give graduate students an intensive introduction to the modes of moral reasoning that have been adopted and adapted by contemporary Bioethics, and the major critical perspectives that have been brought to bear upon them.

BETH 506. Methods in Normative Bioethics II. 3 Units.
The second of the two required Methods seminars is designed to give graduate students an intensive introduction to the modes of moral reasoning that have been adopted and adapted by contemporary Bioethics, and the major critical perspectives that have been brought to bear upon them.

BETH 507. Research Design in Bioethics I. 3 Units.
The first of two empirical research courses will introduce students to theoretical and methodological approaches in the design and implementation of empirical research on topics in biomedical ethics. Students will be provided with a comprehensive and robust exploration of empirical models for the development of bioethics research and the skills for critically assessing the optimal methods for designing studies relevant to ethical issues in biomedicine.

BETH 508. Research Design in Bioethics II. 3 Units.
The second of two empirical research courses will introduce students to theoretical and methodological approaches in the design and implementation of empirical research on topics in biomedical ethics. Students will be provided with a comprehensive and robust exploration of empirical models for the development of bioethics research and the skills for critically assessing the optimal methods for designing studies relevant to ethical issues in biomedicine. Prereq: BETH 507.

BETH 511. Grant Writing. 3 Units.
This course will teach students the fundamentals of writing a grant proposal. We will concentrate on NIH-style applications, although the principals of grant writing can be applied to any venue. In the process of working through devising a research question and study design, students will be encouraged to use this as an opportunity to think about their dissertation topic. In addition to applying theoretical and research design knowledge gained through their other core course work, the course will also teach students about how to complete application forms and to create a budget. We will also familiarize students with the peer review process. Each student will produce a draft grant application. The students will form a mock peer review section and will critique the grants.

BETH 512. Clinical Ethics Rotation - Ph.D.. 1.5 Unit.
In this course students will become familiar with the clinical, psychological, social, professional, and institutional context in which ethical problems arise. This course exposes students to clinical cases, hospital ethics committees and ethics consultation programs, to institutional review boards (IRB), and to hospital policies covering the “do not resuscitate” orders (DNR), advance directives, withdrawal of artificial feeding, organ procurement and transplantation, and medical futility. Requires minimum of 10 total hours of rotation experience per week during two semester 10-week rotations. Locations for this course include: MetroHealth Medical Center, University Hospitals of Cleveland, and the Hospice of the Western Reserve. Recommended preparation: BETH 520/521 or concurrent enrollment.

BETH 520. Foundations in Bioethics I - Ph.D.. 3 Units.
The first of the two required seminar courses, this course covers five basic topic areas in bioethics: death and dying; health professional-patient relationship; method and theory in bioethics; organ transplantation; and ethics and children. The course meets twice weekly and is taught in seminar format by Center faculty members who are experts on specific topics.
BETH 521. Foundations in Bioethics II - Ph.D. 3 Units.
The second of the two required seminar courses, this course covers five basic topic areas in bioethics: death and dying; health professional-patient relationship; method and theory in bioethics; organ transplantation; and ethics and children. The course meets twice weekly and is taught in seminar format by Center faculty members who are experts on specific topics.

BETH 602. Special Topics in Bioethics. 1 - 3 Unit.
Students will explore particular issues and themes in biomedical ethics in depth through independent study and research under the direction of a faculty member.

BETH 603. Bioethics Research. 6 Units.
Research leading toward the MD/MA degree is Bioethics.

BETH 604. Advanced Research Ethics Seminar. 0 Units.
This course meets for two hours each month and is focused on the following topics and the development of the stated competencies:
September Introduction; How to critically analyze the literature; Facilitator critique of assigned manuscript; Designing re-entry projects Critical analysis of literature. October Trainee #1 critique of assigned manuscript; Methodological and ethical issues in designing and reviewing research; Trainee presentation of concept papers for re-entry projects Critical review of research protocols and manuscripts; Issues in designing research. November Trainee #2 critique of assigned manuscript; How to prepare and present professional presentations Critical analysis of literature; Oral presentation skills December Trainee #3 critique of assigned manuscript; Principles of adult education Critical analysis of literature; Oral presentation skills; Development of teaching skills. January Trainee #1 critique of assigned manuscript; Principles of adult education Critical analysis of literature; Oral presentation skills. February Trainee #2 critique of assigned manuscript; Developing submissions for IRB review Critical analysis of literature; Oral presentation skills; Identifying and addressing ethical issues in research; Preparation of IRB submissions. March Trainee #3 critique of assigned manuscript; Update on development of re-entry projects; Logistical issues related to re-entry projects; Manuscript preparation Critical analysis of literature; Oral presentation skills; Implementing research; Preparing work for publication; Negotiation skills. April Re-entry issued Implementing research; Readjustment. This course is only open to trainees in the Fogarty-funded Training Program in International Research Ethics.

BETH 605. Special Study: IRB Administration. 1.5 Unit.
This course is limited to Fogarty-sponsored trainees in the Training Program in International Research Ethics. The course, which meets 1.5 hours per week, focuses on issues relevant to the management and administrations of the various functions of research ethics review committees. Topics to be covered include identification and selection of appropriate community representatives for membership and/or consultation, utilization of independent experts/consultants, recordkeeping, approaches to communication with investigators, and others. Regular guest lectures will be provided by members of the various local IRBs, staff members of local IRBs, and senior investigators. The course will utilize a case-based approach.

(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
Department of Genetics and Genome Sciences

Clarice Young (http://bulletin.case.edu/schoolofmedicine/genetics/mailto:clarice.young@case.edu), Coordinator

The Department of Genetics & Genome Sciences embraces a unified program devoted to outstanding research and teaching in all areas of genetics, with particular emphasis on genomics, human genetics and animal models, development, and chromosome structure and function. Faculty conduct internationally recognized research programs in each of these areas. The also are committed to training the next generations of leading genetics researchers. The department has three special programs: the Center for Human Genetics, the Center for Computational Genomics, and the Genomic Medicine Institute (descriptions appear later in this narrative).

Programs offered lead to the PhD, combined MD/PhD degree, or MS with a special emphasis in genetic counseling. In addition to required and elective coursework, students participate in ongoing journal clubs, research seminars and grand rounds. A program of departmental and interdepartmental seminars by outstanding visiting scientists provides regular exposure to a broad range of current research in genetics.

The department accepts direct on-line applications (http://genetics.case.edu/page.php?page_id=126) to the doctoral program by those who have significant prior research experience in genetics and are committed to careers in genetics research. The PhD program also participates in the integrated Biomedical Sciences Training Program (BSTP, please see separate listing in this publication and/or BSTP Web site). Students interested in pursuing the combined MD/PhD program are admitted through the Medical Scientist Training Program (MSTP, please see separate listing in this publication). Those interested in careers in genetic counseling apply directly to the Genetic Counseling Training Program, via the common Graduate Studies application (http://gradstudies.case.edu).

The Center for Human Genetics is an integral part of the Department of Genetics and consists of both research and clinical laboratories involved in human and clinical genetics. This center supports research and clinical programs focusing on the molecular basis of inherited disease, human genetic disease mapping, and the genetic dissection of complex disease, as well as providing clinical care and training for postdoctoral fellows and genetic counseling students.

The Center for Computational Genomics is an interdisciplinary research and training program involving faculty in the Department of Epidemiology and Biostatistics in the School of Medicine and in the Department of Electrical Engineering and Computer Science in the School of Engineering. The center provides opportunities to combine research in genetics, genomics, epidemiology, biostatistics, computer science, and systems biology.

The Genomic Medicine Institute is a joint program involving the Cleveland Clinic Foundation and Case. Its emphasis involves translating discoveries in basic and clinical research to clinical practice. The mission is to exploit the discoveries in genomics, epidemiology, ethics, pharmacology, genetics and physiology to revolutionize the practice of medicine.

MS Genetic Counseling

The Genetic Counseling Training Program is a 40 credit hour program that spans four academic semesters and an intervening summer. Acquisition and mastery of clinical competencies are reflected in the Program’s didactic coursework, clinical rotations, thesis process and supplementary experiences. The sequence of medical genetics courses and genetic counseling courses are designed to introduce concepts regarding medical genetics, general medical practice, counseling theory and clinical skills such that they build from beginning skills to a more advanced skill set in the order needed for clinical experiences. The goal of the program is to provide students with the knowledge and clinical skills to function as competent and caring genetic counselors in a wide range of settings and roles. All of these activities enable successful graduates to meet the clinical competencies as outlined by the American Board of Genetic Counseling (ABGC).

Experiential professional training occurs concurrently with formal coursework and over the summer between years one and two. Clinical settings include a variety of clinics and inpatient services at the Center for Human Genetics at University Hospitals Case Medical Center, the Genomic Medicine Institute at the Cleveland Clinic, Genetic Services at MetroHealth Medical Center and Medical Genetics at Akron Children’s Hospital. Students also rotate through the Center for Human Genetics Diagnostic Laboratory which includes experiences in cytogenetics, molecular genetics, cancer cytogenetics and maternal serum screening. Student participation in these and other departmental professional and educational activities such as lectures, seminars, journal club, grand rounds, genetics conferences, and various research, counseling and patient management conferences is expected throughout the program. Coursework and clinical experiences are designed to develop the competencies expected by the ABGC.

The First Year

The major activities during the first year consist of course work (in plan of study below), clinical observations and defining a research question and preparing a research proposal. Observational clinical rotations begin early in October with students observing in prenatal genetics, cancer genetics, and general genetics clinics at the program’s three affiliated institutions. Additionally, students meet several times over the fall semester to discuss the thesis process, potential topics and are introduced to the faculty’s research areas of interest.

In addition to continuing clinical observational rotations and thesis work, students continue with course work including an introduction to research methods and more in-depth theory and practice in the psychosocial aspects of counseling during spring semester.

During the intervening summer of years 1 and 2, students begin clinical rotations at the Medical Genetics Division at Akron Children’s Hospital to gain exposure in various clinical settings including prenatal, general genetics, pediatrics, specialty clinics and cancer genetics clinic. They also rotate through the Center for Human Genetics Laboratory to become familiarized with the clinical aspects of a diagnostic cytogenetics and molecular genetics laboratory.

The Second Year

The major focus of the second year is continued clinical experiences, research and taking the comprehensive written and oral examination. Students also complete their coursework, taking one course each semester.

At the beginning of spring semester in January, the students sit for the written comprehensive examination (covering the didactic and clinical genetic counseling material covered to date in the program) and the oral section of the examination, which is given shortly after the written portion. Both examinations are intended to allow students to expand on their knowledge base of human and medical genetics and genetic counseling. Students are expected to pass both sections of the examination in order
to meet graduation requirements by the Program. The written portion of the examination is patterned after the certification examination given by the American Board of Genetic Counseling.

Students continue to work on data collection and analyses for their theses projects, which should result in a publishable document. They meet with the PD periodically to review their progress as well as with their thesis committee and of course, are meeting with their mentor on a more frequent basis. During the fall semester of second year the student also attend the National Society of Genetic Counselors annual education meeting. This provides an opportunity for students to meet genetic counselors from across the country, to attend scientific sessions to continue adding to their knowledge base and to meet and discuss job opportunities with prospective employers. Successful completion of the program fulfills the curricular and clinical training requirements for eligibility to sit for the certification examination given by the ABGC.

The sequence of courses for students graduating in 2012 is as follows:

**Total Units in Sequence:** 40

**PhD Genetics**

Admissions to the Genetics program may be obtained through the integrated Biomedical Sciences Training Program, by direct admission to the department or via the MSTP program. The following summary pertains to most incoming PhD students, regardless of the route through which they enter the program. Exceptions are occasionally made to reflect previous educational experiences (e.g., a prior MS degree).

**The First Year**

Course work, rotations in at least three laboratories, and participation in seminars, journal clubs, and research meetings are the major activities of first year students. During the Fall term, most students take core courses in Cell and Molecular Biology (CBIO 453 Cell Biology I/CBIO 455 Molecular Biology I) that are offered for Biomedical Sciences Training Program departments. Laboratory rotations begin in early July and the choice of a thesis advisor is usually made at the end of December (see below for more details on Choosing an Advisor).

During the Spring term, PhD students take the core Advanced Eukaryotic Genetics course sequence (GENE 500 Advanced Eukaryotic Genetics I/GENE 504 Advanced Eukaryotic Genetics II), which is followed by a written comprehensive examination in late May or early June. This core course is designed to acquaint students with fundamental principles and methodologies used in modern genetic research. The focus is on similarities and differences between different model organisms used in genetics research. Also during the Spring term and continuing into the Summer, students begin formulating a doctoral research proposal.

**The Second Year and Beyond**

During the second year, students participate in a Proposal Writing Workshop (GENE 511 Grant Writing and Reviewing Skills Workshop) and take other advanced elective courses based on the academic background and interest of the student. The remaining elective credits can be satisfied by choosing from the courses offered by departmental faculty or participating training faculty from other departments (see List of Courses below). At the end of the second academic year, students must pass an oral proposal defense in order to advance to candidacy for the PhD degree. An outline of the typical course of study is shown below.

Courses

GENE 367-1. Commercialization and Intellectual Property Management. 3 Units.
This interdisciplinary course covers a variety of topics, including principles of intellectual property and intellectual property management, business strategies and modeling relevant to the creation of start-up companies and exploitation of IP rights as they relate to biomedical-related inventions. The goal of this two-semester course is to address issues relating to the commercialization of biomedical-related inventions by exposing law students, MBA students, and Ph.D. candidates (in genetics and proteomics) to the challenges and opportunities encountered when attempting to develop biomedical intellectual property from the point of early discovery to the clinic and market. Specifically, this course seeks to provide students with the ability to value a given technological advance or invention holistically, focusing on issues that extend beyond scientific efficacy and include patient and practitioner value propositions, legal and intellectual property protection, business modeling, potential market impacts, market competition, and ethical, social, and healthcare practitioner acceptance. The course will meet over two consecutive semesters--fall and spring--and is six credit hours (three credits each semester). During these two semesters, law students, MBA students, and Ph.D. candidates in genomics and proteomics will work in teams of five (two law students, two MBA students and one Ph.D. candidate), focusing on issues of commercialization and IP management of biomedical-related inventions. The instructors will be drawn from the law school, business school, and technology-transfer office. To be eligible for this course, law students must also have a B.S or equivalent in the life sciences, such as biology, biochemistry, genomics, molecular biology, etc. Offered as LAWS 367, MGMT 467, GENE 367 and GENE 467.

GENE 367-2. Commercialization and Intellectual Property Management. 3 Units.
This interdisciplinary course covers a variety of topics, including principles of intellectual property and intellectual property management, business strategies and modeling relevant to the creation of start-up companies and exploitation of IP rights as they relate to biomedical-related inventions. The goal of this two-semester course is to address issues relating to the commercialization of biomedical-related inventions by exposing law students, MBA students, and Ph.D. candidates (in genetics and proteomics) to the challenges and opportunities encountered when attempting to develop biomedical intellectual property from the point of early discovery to the clinic and market. Specifically, this course seeks to provide students with the ability to value a given technological advance or invention holistically, focusing on issues that extend beyond scientific efficacy and include patient and practitioner value propositions, legal and intellectual property protection, business modeling, potential market impacts, market competition, and ethical, social, and healthcare practitioner acceptance. The course will meet over two consecutive semesters--fall and spring--and is six credit hours (three credits each semester). During these two semesters, law students, MBA students, and Ph.D. candidates in genomics and proteomics will work in teams of five (two law students, two MBA students and one Ph.D. candidate), focusing on issues of commercialization and IP management of biomedical-related inventions. The instructors will be drawn from the law school, business school, and technology-transfer office. To be eligible for this course, law students must also have a B.S or equivalent in the life sciences, such as biology, biochemistry, genomics, molecular biology, etc. Offered as MGMT 467, LAWS 367, GENE 367 and GENE 467.
GENE 451. Principles of Genetic Epidemiology. 3 Units.
A survey of the basic principles, concepts and methods of the discipline of genetic epidemiology, which focuses on the role of genetic factors in human disease and their interaction with environmental and cultural factors. Many important human disorders appear to exhibit a genetic component; hence the integrated approaches of genetic epidemiology bring together epidemiologic and human genetic perspectives in order to answer critical questions about human disease. Methods of inference based upon data from individuals, pairs of relatives, and pedigrees will be considered. The last third of the course (1 credit) is more statistical in nature. Offered as EPBI 451, GENE 451, and MPHP 451.

GENE 467-1. Commercialization and Intellectual Property Management. 3 Units.
This interdisciplinary course covers a variety of topics, including principles of intellectual property and intellectual property management, business strategies and modeling relevant to the creation of start-up companies and exploitation of IP rights as they relate to biomedical-related inventions. The goal of this two-semester course is to address issues relating to the commercialization of biomedical-related inventions by exposing law students, MBA students, and Ph.D. candidates (in genetics and proteomics) to the challenges and opportunities encountered when attempting to develop biomedical intellectual property from the point of early discovery to the clinic and market. Specifically, this course seeks to provide students with the ability to value a given technological advance or invention holistically, focusing on issues that extend beyond scientific efficacy and include patient and practitioner value propositions, legal and intellectual property protection, business modeling, potential market impacts, market competition, and ethical, social, and healthcare practitioner acceptance. The course will meet over two consecutive semesters—fall and spring—and is six credit hours (three credits each semester). During these two semesters, law students, MBA students, and Ph.D. candidates in genomics and proteomics will work in teams of five (two law students, two MBA students, and one Ph.D. candidate), focusing on issues of commercialization and IP management of biomedical-related inventions. The instructors will be drawn from the law school, business school, medical school, and technology-transfer office. To be eligible for this course, law students must also have a B.S. or equivalent in the life sciences, such as biology, biochemistry, genomics, molecular biology, etc. Offered as LAWS 367, MGMT 467, GENE 367 and GENE 467.

GENE 467-2. Commercialization and Intellectual Property Management. 3 Units.
This interdisciplinary course covers a variety of topics, including principles of intellectual property and intellectual property management, business strategies and modeling relevant to the creation of start-up companies and exploitation of IP rights as they relate to biomedical-related inventions. The goal of this two-semester course is to address issues relating to the commercialization of biomedical-related inventions by exposing law students, MBA students, and Ph.D. candidates (in genetics and proteomics) to the challenges and opportunities encountered when attempting to develop biomedical intellectual property from the point of early discovery to the clinic and market. Specifically, this course seeks to provide students with the ability to value a given technological advance or invention holistically, focusing on issues that extend beyond scientific efficacy and include patient and practitioner value propositions, legal and intellectual property protection, business modeling, potential market impacts, market competition, and ethical, social, and healthcare practitioner acceptance. The course will meet over two consecutive semesters—fall and spring—and is six credit hours (three credits each semester). During these two semesters, law students, MBA students, and Ph.D. candidates in genomics and proteomics will work in teams of five (two law students, two MBA students, and one Ph.D. candidate), focusing on issues of commercialization and IP management of biomedical-related inventions. The instructors will be drawn from the law school, business school, medical school, and technology-transfer office. To be eligible for this course, law students must also have a B.S. or equivalent in the life sciences, such as biology, biochemistry, genomics, molecular biology etc. Offered as MGMT 467, LAWS 367, GENE 367 and GENE 467.

GENE 488. Yeast Genetics and Cell Biology. 3 Units.
This seminar course provides an introduction to the genetics and molecular biology of the yeast S. cerevisiae and S. pombe by a discussion of current literature focusing primarily on topics in yeast cell biology. Students are first introduced to the tools of molecular genetics and special features of yeasts that make them important model eukaryotic organisms. Some selected topics include cell polarity, cell cycle, secretory pathways, vesicular and nuclear/cytoplasmic transport, mitochondrial import and biogenesis, chromosome segregation, cytoskeleton, mating response and signal transduction. Offered as CLBY 488, GENE 488, MBio 488, and PATH 488.

GENE 500. Advanced Eukaryotic Genetics I. 3 Units.
Fundamental principles of modern genetics; transmission, recombination, structure and function of the genetic material in eukaryotes, dosage compensation, behavior and consequences of chromosomal abnormalities, mapping and isolation of mutations, gene complementation and genetic interactions. Recommended preparation: BIOL 362.

GENE 503. Readings and Discussions in Genetics. 0 - 3 Units.
(Credit as arranged.) In-depth consideration of special selected topics through critical evaluation of classic and current literature.

GENE 504. Advanced Eukaryotic Genetics II. 3 Units.
Fundamental principles of modern genetics: population and quantitative genetics, dissection of genome organization and function, transgenics, developmental genetics, genetic strategies for dissecting complex pathways in organisms ranging from Drosophila and C. elegans to mouse and human. Recommended preparation: GENE 500 or permission of instructor.
GENE 505. Genetics Journal Club. 1 Unit.
Genetics Journal Club is a graduate level course designed to facilitate discussion of topics in Genetics. Students choose "hot" papers in Genetics and present them to their peers. Group presentations are designed to encourage audience participation. The intent of this class is to expose students to cutting edge topics in Genetics and to instill teaching and leadership skills.

GENE 508. Bioinformatics and Computational Genomics. 3 Units.
The course is designed to provide an understanding of theory and application of computational methods for molecular biology research. The course will be divided into four primary sections: DNA methods, protein methods, structure analysis (RNA and protein) and phylogenetic analysis. Special emphasis will be placed on the use and development of tools to search and analyze large amounts of sequence data generated as part of the Genome Projects in human, Drosophila and other eukaryotic organisms. The course offers extensive hands-on computational training using UNIX, Web and PC-based software. As such, for every hour of lecture material there will be two corresponding hours of computational laboratory time. In the initial year, enrollment will be limited to five students. Preference will be given to senior-level genetics graduate students or post-doctoral fellows. Recommended preparation: GENE 500 and GENE 504 or permission of instructor.

GENE 511. Grant Writing and Reviewing Skills Workshop. 3 Units.
This is an introductory graduate course in grant writing and reviewing skills. During this course each student will write a research grant on a topic of his or her choice. Proposals may form the basis for the written component of the preliminary examination in the Genetics Department. Students will also participate in editing and reviewing the proposals of their classmates. Prereq: GENE 500 and GENE 504 or consent of instructor.

GENE 513. Stem Cell Genetics. 3 Units.
This course focuses on fundamental aspects of development with implications for stem cell therapy, tissue engineering, regenerative medicine and postnatal health. The goal of the class is to inform and promote critical thinking and discussion of research topics of medical importance in developmental biology. The themes of the course will include the conditions and factors which promote pluripotency and differentiation, regeneration and repair, epigenetic stability and reprogramming, and prenatal conditions which affect postnatal health. The topics will include early embryonic development and embryonic stem cells, cardiac development and regeneration, bone development and repair, pancreatic development and regeneration, germ line stem cells and conditions affecting postnatal health. The course will be structured around facilitated discussion of the primary literature.

GENE 521. Chromatin, Epigenetics, and Disease. 3 Units.
The Departments of Genetics and Biochemistry are pleased to announce "Chromatin, Epigenetics, and Disease" advanced graduate students. This course will review the history of chromatin and cover the relationships between chromatin structure and the processes of transcription, gene silencing, cell fate determination, DNA methylation, and RNA interference and other biological processes. The course will also cover epigenetic mechanisms and their effects on human disease. The course will emphasize critical reading of articles from the primary literature, presentations by students, and be predominantly discussion based. Limit: 12 students. Offered as BIOC 521 and GENE 521.

GENE 523. Embryonic Patterning in Development. 3 Units.
This course will focus on current understanding of patterning mechanisms in animal development. The seminal contributions of Turing, Stern, Crick, Lawrence, Wolpert, and Lewis will be covered, as will the most recent advances in the field. Models and theory will be considered, in addition to experimental analysis and the identification of patterning molecules. The course will end with a consideration of how development changes to create different adult morphologies over the course of evolution.

GENE 524. Advanced Medical Genetics: Cytogenetics. 2 - 3 Units.
Fundamental principles regarding clinical cytogenetics including discussion of autosomal numerical and structural abnormalities; sex chromosome abnormalities; population cytogenetics; mosaicism; uniparental disomy; contiguous gene deletions, and cancer cytogenetics.

GENE 525. Advanced Medical Genetics: Clinical Genetics. 2 - 3 Units.
Fundamental principles regarding congenital malformations, dysmorphology and syndromes. Discussion of a number of genetic disorders from a systems approach: CNS malformations, neurodegenerative disorders, craniofacial disorders, skeletal dysplasias, connective tissue disorders, hereditary cancer syndromes, etc. Discussions also include diagnosis, etiology, genetics, prognosis and management.

GENE 526. Advanced Medical Genetics: Molecular and Quantitative Genetics. 2 - 3 Units.
Molecular: Fundamental principles of gene structure; mechanisms, detection and effects of mutations; imprinting; triplet repeat disorders; X-chromosome inactivation; application of molecular analysis to genotype/phenotype correlations and gene therapy. Quantitative: Fundamental principles of pedigree analysis, segregation analysis, Bayes theorem; linkage analysis and disequilibrium; risk assessment and consanguinity.

GENE 527. Advanced Medical Genetics: Biochemical Genetics. 2 - 3 Units.
Fundamental principles of metabolic testing; amino acid disorders; organic acid disorders; carbohydrate disorders; peroxisomal disorders; mitochondrial disorders; etc. Discussion of screening principles and newborn screening as well as approaches to diagnosis, management and therapy for metabolic diseases.

GENE 528. Principles and Practices of Genetic Counseling. 3 Units.
Fundamental principles needed for the practicing genetic counselor. Topics include skills in obtaining histories (prenatal, perinatal, medical, developmental, psychosocial and family); pedigree construction and analysis, physical growth and development; the genetic evaluation; the physical examination and laboratory analyses; prenatal issues, prenatal screening and diagnosis; and teratogenicity.

GENE 529. Psychosocial Issues in Genetic Counseling. 3 Units.
Fundamental principles regarding the psychosocial aspects of genetic disease and birth defects, its psychological and social impact on the individual and family. Topics include the genetic counseling interview process, issues regarding pregnancy and prenatal diagnosis, chronicity, death and loss. Cultural issues and their impact on the genetic counseling session are addressed. Resources for families are also explored. Basic interviewing skills are presented. Students will have an opportunity for practice of skills through role play and actual interviewing situations.
GENE 530. Ethical and Professional Issues in Genetic Counseling. 2 Units.
Professional issues inherent in medical genetics and genetic counseling are addressed, including ethical, legal, religious, and cultural concepts. Fundamental principles of ethics are explored in some depth as they relate to genetic issues, such as autonomy and informed consent; use of the NSGC Code of Ethics is emphasized. Genetic counseling roles and responsibilities and aspects of a career as a professional are explored.

GENE 531. Cancer Genetics. 2 - 3 Units.
This seminar will discuss basic concepts in cancer epidemiology, principles of cancer genetics, inherited cancer syndromes, cytogenetics of cancers, pedigree analysis for familial cancer risk and approaches to the differential diagnosis of inherited and familial cancers. Additionally, topics of risk assessment, genetic testing, screening, management and psychosocial issues in providing genetic counseling to patients with familial and inherited cancers will be discussed.

GENE 532. Clinical Practicum in Genetic Counseling. 1 - 6 Unit.
This clinical practicum provides the student an opportunity to function as a genetic counselor by preparing for cases; obtaining appropriate histories; determining risks; performing psychosocial assessments; discussing disease characteristics, inheritance, and natural history; providing anticipatory guidance and supportive counseling; using medical and community resources; and follow-up. Students rotate through four clinical areas and one laboratory and will register for a total of 12 hours over the course of the program. Recommended preparation: Admission to Genetic Counseling Training Program.

GENE 533. Genetics of Aging. 3 Units.
Topics covered this course will focus on our current understanding of the genetic mechanisms underlying cellular and organismal aging as well as age-related diseases. Theories of aging will be covered as well as the most recent experimental analysis in a variety of systems (yeast, worms, flies, mice, and humans). While aging research has long been primarily descriptive in nature, the most recent genetic-based experiments are providing the first insights into the molecular pathways involved with striking similarities across model systems. Recommended preparation: GENE 500, GENE 504, or consent of instructor.

GENE 537. Microscopy-Principles and Applications. 3 Units.
This course provides an introduction to various types of light microscopy, digital and video imaging techniques, and their applications to biological and biomedical sciences via lectures and hands-on experience. Topics covered include geometrical and physical optics; brightfield, darkfield, phase contrast, DIC, fluorescence and confocal microscopes; and digital image processing. Offered as GENE 537, MBIO 537, and PHOL 537.

GENE 601. Research in Genetics. 1 - 9 Unit.
(Credit as arranged.)

GENE 651. Thesis M.S.. 1 - 9 Unit.
(Credit as arranged.) Master's Thesis Plan A.

GENE 701. Dissertation Ph.D.. 1 - 9 Unit.
(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
Department of Neurosciences

Katie Wervey (http://bulletin.case.edu/schoolofmedicine/neurosciences/mailto:kathleen.wervey@case.edu), Department Assistant

Understanding how the nervous system develops and functions to process information and mediate behavior and how it is altered by disease, injury and the environment is one of the most exciting frontiers remaining in biological science. Neuroscience is inherently multidisciplinary and integrative and solving the major outstanding problems will require knowledge of molecular, cellular, systems, and behavioral levels of organization. It also requires a multidisciplinary approach combining the tools of electrophysiology, anatomy, biochemistry and molecular biology in studies of animals, brain slices, and tissue culture models.

The department offers a PhD program that provides interdisciplinary training in modern neurosciences through a combination of course work, seminars and research experience. Medical students are encouraged to pursue research projects with neurosciences faculty. Neuroscientists at CWRU are using state-of-the-art techniques and instrumentation to study diverse aspects of nervous system function, including neural circuitry and plasticity, development and regeneration, and cellular and molecular neurobiology. Techniques used include electrical recording and imaging to study the behavior of neurons from ion channels to how they function in awake, behaving animals; molecular genetic approaches to discover the roles of specific genes in circuit formation, synaptic function, and in neurological disorders; and anatomical, biochemical, computational, and behavioral methods to understand the normal nervous system and how it is affected by disease and injury.

PhD in Neurosciences

The Neurosciences graduate program has a strong emphasis on cellular and molecular mechanisms that mediate the function and development of the nervous system. Admissions to the Neurosciences PhD program may be obtained through the integrated Biomedical Sciences Training Program, by direct admission to the department or via the Medical Scientist Training Program. To earn a PhD in Neurosciences, a student must complete rotations in at least three laboratories, followed by selection of a research advisor, and complete Core and Elective coursework including responsible conduct of research as described in the plan of study, below. In general, students must be registered for a total of 9 credit hours each fall and spring semester until they advance to candidacy, at the end of their 2nd year. Students who previously completed relevant coursework, for example, with a MS, may petition to complete alternative courses. Each graduate program follows the overall regulations established and described in CWRU Graduate Studies and documented to the Regents of the State of Ohio.

In addition, each student must successfully complete a preliminary exam after year one, and a qualifier examination for advancement to candidacy in the form of a short grant proposal with oral defense. The qualifier is generally completed in the summer after year two. During the dissertation period, students are expected to meet twice a year with the thesis committee, present seminars in the department, and fulfill journal publication requirements. Throughout the doctoral training, students are expected to be enthusiastic participants in seminars, journal clubs, and research meetings in the lab and program. Completion of the PhD degree will require 36 hours of coursework (24 hours of which are graded) and 18 hours of NEUR 701 Dissertation Ph.D.

Total Units in Sequence: 34-97

* NEUR 540 Advanced Topics in Neuroscience Ethics is offered every other spring semester (beginning 2008), so can be taken in 3rd or 4th year.
Courses

NEUR 402. Principles of Neural Science. 3 Units.
Lecture/discussion course covering concepts in cell and molecular neuroscience, principles of systems neuroscience as demonstrated in the somatosensory system, and fundamentals of the development of the nervous system. This course will prepare students for upper level Neuroscience courses and is also suitable for students in other programs who desire an understanding of neurosciences. Recommended preparation: CBIO 453. Offered as BIOL 402 and NEUR 402.

NEUR 405. Cellular and Molecular Neurobiology. 3 Units.
Cell biology of nerve cells, including aspects of synaptic structure physiology and chemistry. The application of molecular biological tools to questions of synaptic function will be addressed. Recommended preparation: BIOL 473.

NEUR 411. Neurobiology of Disease. 3 Units.
Designed to show how basic research in neuroscience has contributed to the management of clinical problems in human neurology and to discuss some of the further challenges posed by human disease for research in neurobiology. The general format will include clinical descriptions of patient presentation, discussion of the disease mechanisms and an analysis of contributions of cellular and systems neuroscience to understanding of the human disorder. Specific topics to be discussed include Ischemia and Stroke, Neurodegenerative Diseases such as Alzheimer’s Parkinson’s Brain Tumors, Mood Disorders, and Demyelinating diseases such as Multiple Sclerosis. Recommended preparation: NEUR 402 or NEUR 405.

NEUR 415. Neuroscience Seminars. 1 Unit.
Current topics of interest in neurosciences. Students attend weekly seminars. From this series, students prepare critiques. No credit is given for less than 75% attendance.

NEUR 425. Stem Cell Biology and Therapeutics. 3 Units.
This course is intended to teach current understanding of stem cells as it relates to their characterization, function, and physiologic and pathological states. The course will expose students to the current understanding of various types of stem cells, including embryonic and adult stem cells of various tissues, techniques for their isolation and study. Experimental models and potential biomedical therapeutic applications will be discussed. The course will be taught by the faculty of the "Center for Stem Cell and Regenerative Medicine" who are affiliated with multiple departments of Case Western Reserve University, Cleveland Clinic Foundation and the partnering biomedical companies. Offered as NEUR 425 and PATH 425.

NEUR 427. Neural Development. 3 Units.
Topics include cell commitment, regulation of proliferation and differentiation, cell death and trophic factors, pathfinding by the outgrowing nerve fiber, synapse formation, relationships between center and periphery in development and the role of activity. Offered as BIOL 427 and NEUR 427.

NEUR 432. Current Topics in Vision Research. 3 Units.
Vision research is an exciting and multidisciplinary area that draws on the disciplines of biochemistry, genetics, molecular biology, structural biology, neuroscience, and pathology. This graduate level course will provide the student with broad exposure to the most recent and relevant research currently being conducted in the field. Topics will cover a variety of diseases and fundamental biological processes occurring in the eye. Regions of the eye that will be discussed include the cornea, lens, and retina. Vision disorders discussed include age-related macular degeneration, retinal ciliopathies, and diabetic retinopathy. Instructors in the course are experts in their field and are members of the multidisciplinary visual sciences research community here at Case Western Reserve University. Students will be exposed to the experimental approaches and instrumentation currently being used in the laboratory and in clinical settings. Topics will be covered by traditional lectures, demonstrations in the laboratory and the clinic, and journal club presentations. Students will be graded on their performance in journal club presentations (40%), research proposal (40%), and class participation (20%). Offered as NEUR 432, PATH 432, PHRM 432 and BIOC 432.

NEUR 435. Vision: Molecules to Perception. 3 Units.
The organization, physiology, and function of the vertebrate visual system are considered in detail. The visual pathway from retina to LGN and visual cortex is described with an emphasis on circuits that produce successively more complex receptive field properties. Classic papers and current literature form the basic course material. Assessment is based on student presentations, class participation, and a term paper. Recommended preparation: NEUR 402 or consent of department.

NEUR 466. Cell Signaling. 3 Units.
This is an advanced lecture/journal/discussion format course that covers cell signaling mechanisms. Included are discussions of neurotransmitter-gated ion channels, growth factor receptor kinases, cytokine receptors, G protein-coupled receptors, steroid receptors, heterotrimeric G proteins, ras family GTPases, second messenger cascades, protein kinase cascades, second messenger regulation of transcription factors, microtubule-based motility, actin/myosin-based motility, signals for regulation of cell cycle, signals for regulation of apoptosis. Offered as CLBY 466 and PHOL 466 and PHRM 466.

NEUR 473. Introduction to Neurobiology. 3 Units.
How nervous systems control behavior. Biophysical, biochemical, and molecular biological properties of nerve cells, their organization into circuitry, and their function within networks. Emphasis on quantitative methods for modeling neurons and networks, and on critical analysis of the contemporary technical literature in the neurosciences. Term paper required for graduate students. Offered as BIOL 373, BIOL 473, and NEUR 473.
NEUR 474. Neurobiology of Behavior. 3 Units.
In this course, students will examine how neurobiologists interested in animal behavior study the linkage between neural circuitry and complex behavior. Various vertebrate and invertebrate systems will be considered. Several exercises will be used in this endeavor. Although some lectures will provide background and context on specific neural systems, the emphasis of the course will be on classroom discussion of specific journal articles. In addition, students will each complete a project in which they will observe some animal behavior and generate both behavioral and neurobiological hypotheses related to it. In lieu of examinations, students will complete three written assignments, including a theoretical grant proposal, a one-page Specific Aims paper related to the project, and a final project paper. These assignments are designed to give each student experience in writing biologically-relevant documents. Classroom discussions will help students understand the content and format of each type document. They will also present their projects orally to the entire class. Offered as BIOL 374, BIOL 474, and NEUR 474.

NEUR 475. Protein Biophysics. 3 Units.
This course focuses on in-depth understanding of the molecular biophysics of proteins. Structural, thermodynamic and kinetic aspects of protein function and structure-function relationships will be considered at the advanced conceptual level. The application of these theoretical frameworks will be illustrated with examples from the literature and integration of biophysical knowledge with description at the cellular and systems level. The format consists of lectures, problem sets, and student presentations. A special emphasis will be placed on discussion of original publications. Offered as BIOC 475, CHEM 475, PHOL 475, PHRM 475, and NEUR 475.

NEUR 476. Neurobiology Laboratory. 3 Units.
Introduction to the basic laboratory techniques of neurobiology. Intracellular and extracellular recording techniques, forms of synaptic plasticity, patch clamping, immunohistochemistry and confocal microscopy. During the latter weeks of the course students will be given the opportunity to conduct an independent project. One laboratory and one discussion session per week. Recommended preparation for BIOL 476 and NEUR 476: BIOL 216. Offered as BIOL 376, BIOL 476 and NEUR 476.

NEUR 477. Cellular Biophysics. 4 Units.
This course focuses on a quantitative understanding of cellular processes. It is designed for students who feel comfortable with and are interested in analytical and quantitative approaches to cell biology and cell physiology. Selected topics in cellular biophysics will be covered in depth. Topics include theory of electrical and optical signal processing used in cell physiology, thermodynamics and kinetics of enzyme and transport reactions, single ion channel kinetics and excitability, mechanotransduction, and transport across polarized cell layers. The format consists of lectures, problem sets, computer simulations, and discussion of original publications. The relevant biological background of topics will be provided appropriate for non-biology science majors. Offered as BIOC 476, NEUR 477, PHOL 476, PHRM 476.

NEUR 478. Computational Neuroscience. 3 Units.
Computer simulations and mathematical analysis of neurons and neural circuits, and the computational properties of nervous systems. Students are taught a range of models for neurons and neural circuits, and are asked to implement and explore the computational and dynamic properties of these models. The course introduces students to dynamical systems theory for the analysis of neurons and neural learning, models of brain systems, and their relationship to artificial and neural networks. Term project required. Students enrolled in MATH 478 will make arrangements with the instructor to attend additional lectures and complete additional assignments addressing mathematical topics related to the course. Recommended preparation: MATH 222 and MATH 224 or BIOL 300 and BIOL 306. Offered as BIOL 378, COGS 378, MATH 378, BIOL 478, EBME 478, EECS 478, MATH 478 and NEUR 478.

NEUR 482. Drugs, Brain, and Behavior. 3 Units.
This course is concerned with the mechanisms underlying neurochemical signaling and the impact of drugs on those mechanisms. The first half of the course emphasizes the fundamental mechanisms underlying intra- and extracellular communication of neurons and the basic principles of how drugs interact with the nervous system. The second half of the course emphasizes understanding the neural substrates of disorders of the nervous system, and the mechanisms underlying the therapeutic effects of drugs at the cellular and behavioral levels. This course will consist of lectures designed to give the student necessary background for understanding these basic principles and class discussion. The class discussion will include viewing video examples of behavioral effects of disorders of the nervous system, and analysis of research papers. The goal of the class discussions is to enhance the critical thinking skills of the student and expose the student to contemporary research techniques. Offered as BIOL 382, BIOL 482, and NEUR 482.

NEUR 540. Advanced Topics in Neuroscience Ethics. 0 Units.
This course offers continuing education in responsible conduct of research for advanced graduate students. The course will cover the nine defined areas of research ethics through a combination of lectures, online course material and small group discussions. Six 2-hr meetings per semester. Maximum enrollment of 15 students with preference given to graduate students in the Neurosciences program. All neurosciences graduate students must complete this course during their 3rd or 4th year.

NEUR 601. Research in Neuroscience. 1 - 18 Unit.

NEUR 651. Master’s Thesis (M.S.). 1 - 6 Unit.
(Credit as arranged.) Recommended preparation: M.S. candidates only.

Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
Department of Nutrition

Pamela Woodruff (http://bulletin.case.edu/schoolofmedicine/nutrition/mailto:pamela.woodruff@case.edu), Graduate Student Coordinator

The department’s focus is on human nutrition and the application of the science of nutrition to the maintenance and improvement of health. Undergraduate programs are designed for students interested in nutritional biochemistry and metabolism, molecular nutrition, professional study in dietetics, public health nutrition, medicine, physical therapy, pharmacy or dentistry. Graduate programs emphasize dietetics, public health nutrition, nutritional biochemistry and molecular nutrition.

The Department of Nutrition offers programs leading to the bachelor of science degree in nutrition, bachelor of arts degree in nutrition, bachelor of arts degree in nutritional biochemistry and metabolism, bachelor of science degree in nutritional biochemistry and metabolism, master of science degree in nutrition, master of science degree in public health nutrition, and doctor of philosophy degree. A nutrition minor is available. Graduate certificate programs are available in areas such as maternal and child nutrition or gerontology. The specialty is in addition to the basic graduate degree.

Human Nutrition | Nutritional Biochemistry and Metabolism | Minors

Undergraduate Degrees (NTRN)

Major Programs

The undergraduate degree in nutrition is appropriate for students who wish to:

1. pursue graduate programs in nutritional biochemistry, molecular nutrition, dietetics, public health nutrition or other biomedical sciences
2. enter professional schools of dentistry, medicine, physical therapy, or pharmacy
3. apply to dietetic internships or approved experience programs in order to prepare for the professional practice of dietetics
4. pursue technical careers in the food or pharmaceutical industry

This major offers flexibility in course selection within a framework of general program requirements. The selection of courses depends on the student’s choice of emphasis. Students wishing to qualify for admission to professional or graduate programs need to include specific courses considered prerequisites for admission. Students interested in applying to dietetic internships must meet specific course requirements (Didactic Program in Dietetics) as required by the Accreditation Council for Education in Nutrition and Dietetics of the Academy of Nutrition and Dietetics. These requirements are met in the courses that comprise the Didactic Program in Dietetics (DPD). The DPD at Case Western Reserve University is currently granted Accreditation by the Accreditation Council for Education in Nutrition and Dietetics of the Academy of Nutrition and Dietetics, 120 South Riverside Plaza, Suite 2000, Chicago, IL 60606-6995, 800.877.1600. A department advisor should be consulted in the freshman year to plan the dietetics course work.

### Bachelor of Science degree requires:

#### Required courses:
- NTRN 201 Nutrition
- NTRN 342 Food Science
- NTRN 342L Food Science Lab
- NTRN 363 Human Nutrition I: Energy, Protein, Minerals
- NTRN 364 Human Nutrition II: Vitamins
- NTRN 397 SAGES Capstone Proposal Seminar
- NTRN 398 SAGES Senior Capstone Experience
- NTRN 452 Nutritional Biochemistry and Metabolism

One nutrition elective at 300-level or above 3

### Additional required courses:
- MATH 125 Math and Calculus Applications for Life, Managerial, and Social Sci 4
- or MATH 121 Calculus for Science and Engineering I

#### Bachelor of Arts degree requires:

- Additional required courses:
- NTRN 201 Nutrition
- NTRN 342 Food Science
- NTRN 342L Food Science Lab
- NTRN 363 Human Nutrition I: Energy, Protein, Minerals
- NTRN 364 Human Nutrition II: Vitamins
- NTRN 397 SAGES Capstone Proposal Seminar
- NTRN 398 SAGES Senior Capstone Experience
- NTRN 452 Nutritional Biochemistry and Metabolism

One nutrition elective at 300-level or above 3

### Additional required courses:
- MATH 125 Math and Calculus Applications for Life, Managerial, and Social Sci 4
- or MATH 121 Calculus for Science and Engineering I
## Bachelor of Arts in Nutrition - Nutritional Biochemistry and Metabolism Major Example Plan of Study

### Minor Programs

The basic sequence for a minor program consists:

- Required courses:
  - NTRN 201 Nutrition
  - NTRN 343 Dietary Patterns
  - Nine credits selected from:
    - NTRN 328 Child Nutrition, Development and Health
    - NTRN 342 Food Science
    - NTRN 351 Food Service Systems Management
    - NTRN 363 Human Nutrition I: Energy, Protein, Minerals
    - NTRN 364 Human Nutrition II: Vitamins
    - NTRN 365 Nutrition for the Prevention and Management of Disease: Pathophysiology
    - NTRN 435 Maternal and Child Nutrition
    - NTRN 437 Evaluation of Nutrition Information for Consumers
    - NTRN 440 Nutrition for the Aging and Aged
    - NTRN 452 Nutritional Biochemistry and Metabolism
    - NTRN 460 Sports Nutrition
    - NTRN 550A Advanced Community Nutrition

Total Units 31-32

Masters Degrees
MS Nutrition

This degree program offers two options. For those pursuing the thesis option, 30 semester hours of a planned program of study are required, including six to nine semester hours of research, as well as a final oral defense of the thesis. The non-thesis option requires 30 semester hours and a final written, comprehensive examination.

All candidates are required to take 15 semester hours of nutrition, including six hours of advanced human nutrition. In addition, students are encouraged to pursue complementary studies in the biomedical, social and behavioral sciences. The plan of study may vary considerably depending on the education, goals and specific interests of each student. Students may elect to focus on nutritional biochemistry and metabolism, and molecular nutrition. The individual program also may be planned to fulfill the academic requirements for dietetic registration (Didactic Program in Dietetics).

MS Public Health Nutrition/Internship

The primary goal of this program is to prepare nutrition specialists to function in public health/community agencies. A minimum of 30 semester hours of combined academic work and field experience is required to earn the degree. Course work focuses on human nutrition, dietetics, and the public health sciences. Field experience is concurrent with course work utilizing local community agencies for direct application of theory to practice. The final phase of the program is an eight-ten week, full-time experience with a public health agency that has a strong nutrition component. The student works closely with an advisor throughout the program, on an individual basis.

In addition to the general public health program, students may elect to specialize in maternal and child nutrition or gerontology. The gerontology specialty is certified through the Center on Aging and Health located on campus. Each specialty requires additional credits of academic work. A portion of the field experience is specified for either population group.

For students wishing to become eligible to take the registered dietitian (RD) examination, the program also currently is granted accreditation by the Commission on Accreditation for Dietetics Education (CADE) of the American Dietetic Association as a dietetic internship. CADE is a specialized accrediting body recognized by the United States Department of Education.

Coordinated Dietetic Internship/ Master's Degree Program

The Coordinated Dietetic Internship/Master's Degree Program combines academic work with clinical practice at either of the dietetic internships at University Hospitals of Cleveland or the Louis Stokes Cleveland Department of Veterans Affairs Medical Center. A minimum of 27 semester hours is required. Admission is contingent on the student’s being selected and matched to one of the hospitals. Appointment to these internships follows the admission procedure outlined by the Commission on Accreditation for Dietetics Education of the American Dietetic Association. Contact the Department of Nutrition for information regarding application.

Maternal and Child Nutrition (NTRN 435)
Students in Nutrition must complete:

- Selecting the appropriate courses for their interests.
- A mentor or the Graduate Program Director will assist the student in setting goals and responsibilities.
- Students must meet twice a year with the thesis committee, present seminars in the department, and fulfill journal publication requirements. Throughout the doctoral training, students are expected to meet twice a year with the thesis committee to discuss their progress.
- In addition, each student must successfully complete a qualifying examination for advancement to candidacy in the form of a short grant proposal with oral defense. During the dissertation period, students are expected to meet twice a year with the thesis committee, present seminars in the department, and fulfill journal publication requirements. Throughout the doctoral training, students are expected to meet twice a year with the thesis committee to discuss their progress.

**Total Units in Sequence:** 25-28

**MD/MS Biomedical Investigation--Nutrition Track**

For Admissions and MD requirements, see the MD Dual Degree Programs section (p. 792). This track is designed to provide medical students with more in-depth knowledge and research experience in nutrition. Students may elect to focus on nutrition biochemistry and metabolism or molecular nutrition or clinical nutrition. The student's mentor or the Graduate Program Director will assist the student in selecting the appropriate courses for their interests.

### Students in Nutrition must complete:

- 8-18 credits or three courses from those listed below:
- Nutrition for the Aging and Aged (NTRN 440)
- Sports Nutrition (NTRN 460)
- Public Health Nutrition Field Experience (NTRN 531)
- Advanced Public Health Nutrition Field Experience (NTRN 534)
- NTRN 433 Advanced Human Nutrition I
- NTRN 434 Advanced Human Nutrition II
- NTRN 435 Maternal and Child Nutrition
- NTRN 437 Evaluation of Nutrition Information for Consumers
- NTRN 438 Trends in Diet Therapy
- NTRN 440 Nutrition for the Aging and Aged
- NTRN 452 Nutritional Biochemistry and Metabolism
- NTRN 454 Isotope Tracer Methodology
- NTRN 455 Molecular Nutrition
- NTRN 460 Sports Nutrition
- NTRN 530 Public Health Nutrition
- NTRN 533 Nutritional Care of Neonate
- Certificate in Gerontology Option
- NTRN 440 Nutrition for the Aging and Aged
- GER 498 Seminar in Gerontological Studies
- NTRN 532C Specialized Public Health Nutrition Field Experience

**PhD in Nutrition**

The PhD degree in Nutrition is awarded for study and research in nutrition. Areas of concentration are nutritional biochemistry and metabolism, and molecular nutrition. Admissions to the PhD in Nutrition program are obtained through the integrated Biomedical Scientist Training Program (BSTP), by direct admission to the department or via the Medical Scientist Training Program (MSTP).

In order to earn a PhD in Nutrition, a student must complete rotations in at least three laboratories followed by selection of a research advisor, completion of Core and Elective coursework, including responsible conduct of research, as described in the plan of study. Each graduate program follows the overall regulations established and described in CWRU Graduate Studies and documented to the Regents of the State of Ohio. Completion of the PhD degree will require 36 hours of coursework (24 hours of which are graded) and 18 hours of NTRN 701 Dissertation Ph.D..

In addition, each student must successfully complete a qualifying examination for advancement to candidacy in the form of a short grant proposal with oral defense. During the dissertation period, students are expected to meet twice a year with the thesis committee, present seminars in the department, and fulfill journal publication requirements. Throughout the doctoral training, students are expected to be enthusiastic participants in seminars, journal clubs, and research meetings in the lab and program.

</table>
NTRN 201. Nutrition. 3 Units.
The nutrients, their functions, food sources, and factors affecting human needs throughout life.

NTRN 328. Child Nutrition, Development and Health. 3 Units.
The relationship between nutrition and physical/cognitive growth and development of the child from the prenatal period through adolescence, including individuality, maturation and biological needs. Nutritional influences (nutrient requirements, food choices, and nutritional/feeding problems) and effects on health are emphasized.

NTRN 342. Food Science. 3 Units.
Chemical, physical and biological properties of food constituents and their interactions in food preparation and processing and practical application of processing methods and their effect on nutritional quality and acceptability. Prereq: CHEM 106.

NTRN 342L. Food Science Lab. 2 Units.

NTRN 343. Dietary Patterns. 3 Units.
Examination of the food supply in the United States as it is affected by production, processing, marketing, government programs, regulation, and consumer selection. Nutritional evaluation of dietary patterns of different cultures. Recommended preparation: NTRN 201 or consent.

NTRN 351. Food Service Systems Management. 3 Units.
The application of organizational theory and skills in the preparation and service of quantity food. Laboratory experience in professional food services are included. Graduate students will analyze one aspect of food service management in depth. Offered as NTRN 351 and NTRN 451. Prereq: Nutrition major or consent of instructor.

NTRN 350. Investigative Methods in Nutrition. 4 Units.
Application of nutrition principles and knowledge for the prevention and management of disease. Case studies and other educational methods for the provision of nutrition services to individuals and groups. Principles of professional practice including ethics, standards, and regulatory issues. Recommended preparation: NTRN 363 or NTRN 433 or consent. Prereq: NTRN 201 and NTRN 342 or MS in Nutrition or MS in Public Health Nutrition.

NTRN 363. Human Nutrition I: Energy, Protein, Minerals. 3 Units.
Chemical and physiological properties of specific nutrients, including interrelationships and multiple factors, in meeting nutritional needs throughout the life cycle. Prereq: CHEM 223 and BIOL 216 (3 or 4 cr. hrs.).

NTRN 364. Human Nutrition II: Vitamins. 3 Units.
Chemical and physiological properties of vitamins, including interrelationships and multiple factors, in meeting nutritional needs throughout the life cycle. Prereq: NTRN 363.

NTRN 365. Nutrition for the Prevention and Management of Disease: Pathophysiology. 4 Units.
Interplay among etiology, metabolic perturbations, pathophysiology, clinical signs and symptoms, and nutrition principles for the prevention and management of disease. Prereq: NTRN 363 and BIOC 307 or equivalent or consent of instructor.

NTRN 366. Nutrition for the Prevention and Management of Disease: Clinical Applications. 3 Units.
Application of nutrition principles and knowledge for the prevention and management of disease. Case studies and other educational approaches and techniques will be used. Course includes evidence-based assessments and interpretation of key data (biochemical, dietary, physical) to develop nutritional interventions. Coreq: NTRN 365.

NTRN 371. Special Problems. 1 - 3 Unit.
Independent reading, research, or special projects supervised by a member of the nutrition faculty. Prereq: Junior or senior standing.

NTRN 372. Special Problems. 1 - 3 Unit.
Independent reading, research, or special projects supervised by a member of the nutrition faculty. Prereq: Junior or senior standing.
NTRN 388. Seminar in Nutrition. 1 - 3 Unit.
Prereq: Junior or senior standing.

NTRN 390. Undergraduate Research. 3 - 9 Units.
Guided laboratory research in nutritional biochemistry or molecular nutrition under the sponsorship of a nutrition faculty member.

NTRN 397. SAGES Capstone Proposal Seminar. 3 Units.
In this departmental seminar course, students will conceptualize, develop and prepare a written plan, known as the "Capstone Proposal," for their senior Capstone project (NTRN 398: Senior Capstone Experience). Discussion will include, but not be limited to basic research principles, different types of research, ethics and IRB procedures. The Capstone Proposal shall include the project design, aims, methodology, budget, data analysis and presentation. Upon completion of this course, students will have confirmed student/Capstone advisor and, if applicable, mentor relationships, written a Capstone proposal and given an oral presentation of their proposal at a departmental colloquium. Prereq: NTRN 201 and NTRN 342.

NTRN 398. SAGES Senior Capstone Experience. 3 Units.
Students will implement their "Capstone Proposal" projects as designed in NTRN 397: Capstone Proposal Seminar. Pertinent research activities will depend on the nature of the student's "Capstone Proposal" project. The student will meet regularly with their Capstone advisor, at least twice monthly, to provide progress reports, discuss the project, and for critique and guidance. By the end of this course, the student will have completed their SAGES Senior Capstone research project and presented their project results/findings orally at the Senior Capstone Fair and at a departmental colloquium. Prereq: NTRN 397.

NTRN 399. Senior Project. 3 Units.

NTRN 433. Advanced Human Nutrition I. 4 Units.
Emphasis on reading original research literature in energy, protein and minerals with development of critical evaluation and thinking skills. Recommended preparation: NTRN 201 and CHEM 223 and BIOL 348 or equivalent.

NTRN 434. Advanced Human Nutrition II. 3 Units.
Emphasis on reading original research literature on vitamins with development of critical evaluation and thinking skills. Recommended preparation: NTRN 433 or consent.

NTRN 435. Maternal and Child Nutrition. 3 Units.
Study of current research literature on nutrition for pregnancy, lactation, infancy and childhood, including assessment and requirements. Recommended preparation: Nutrition major or consent of instructor.

NTRN 437. Evaluation of Nutrition Information for Consumers. 3 Units.
Reading and appraisal of food and nutrition literature written for the general public, including books, magazines, newsletters. Prereq: Graduate standing and Nutrition or Public Health Nutrition major or consent of instructor.

NTRN 438. Trends in Diet Therapy. 3 Units.
Evaluation and interpretation of modern concepts of nutrition related to abnormalities requiring dietary modifications. Prereq: NTRN 365.

NTRN 440. Nutrition for the Aging and Aged. 3 Units.
Consideration of the processes of aging and needs which continue throughout life. The influences of food availability, intake, economics, culture, physical and social conditions and chronic disease as they affect the ability of the aged to cope with living situations. Recommended preparation: Nutrition major or consent of instructor.

NTRN 446. Advanced Maternal Nutrition: Special Topics. 3 Units.
Analysis of the problems commonly associated with high-risk pregnancies and fetal outcome. Discussion of causes, mechanisms, management and current research. Recommended preparation: NTRN 435 or consent.

NTRN 451. Food Service Systems Management. 3 Units.
The application of organizational theory and skills in the preparation and service of quantity food. Laboratory experience in professional food services are included. Graduate students will analyze one aspect of food service management in depth. Offered as NTRN 351 and NTRN 451. Prereq: Nutrition major.

NTRN 452. Nutritional Biochemistry and Metabolism. 3 Units.
Mechanisms of regulation of pathways of intermediary metabolism; amplification of biochemical signals; substrate cycling and use of radioactive and stable isotopes to measure metabolic rates. Recommended preparation: BIOC 307 or equivalent. Offered as BIOC 452 and NTRN 452.

NTRN 454. Isotope Tracer Methodology. 3 Units.
Stable and radioactive isotopes in metabolic research concentrating on the design of in-vitro and in-vivo investigative protocols using mostly stable isotopes and mass spectrometric analysis; critical interpretation of data from the recent literature; and pathway identification and kinetics. Recommended preparation: BIOC 407.

NTRN 455. Molecular Nutrition. 3 Units.
Nutrient control of gene expression in mammalian cells and deregulation of expression of these genes. The molecular basis of nutrition-related diseases, such as diabetes mellitus, PKU, and LDL-receptor deficiency, will be discussed. The application of genetic manipulation to metabolism and nutrition will be evaluated. Recommended preparation: BIOC 407.

NTRN 460. Sports Nutrition. 3 Units.
Study of the relationships of nutrition and food intake to body composition and human performance. Laboratory sessions include demonstrations of body composition and fitness measurements and participation in a research project. Recommended preparation: NTRN 363 or NTRN 433 or consent.

NTRN 516. Seminar in Dietetics I. 4 Units.
Study of scientific basis for clinical and community nutrition practice and developments in food service systems management. Recommended preparation: Dietetic internship.

NTRN 517. Seminar in Dietetics II. 4 Units.
Study of scientific basis for clinical and community nutrition practice and developments in food service systems management. Recommended preparation: Dietetic internship.

NTRN 528. Introduction to Public Health Nutrition. 3 Units.
Philosophy, objectives, organization, and focus of government and voluntary agencies with emphasis on nutrition components. Recommended preparation: Public health nutrition majors only.
NTRN 529. Nutritional Epidemiology. 3 Units.
This course uses epidemiology as a tool for assessing potential causal associations between dietary excesses, deficiencies and imbalances to the prevalent chronic diseases. It addresses the epidemiologic aspects of nutrition related chronic diseases, for example, the multi-factorial nature of etiology. Recommended preparation: Statistics and Public Health Nutrition students only.

NTRN 530. Public Health Nutrition. 3 Units.
Analysis of public health programs in government and voluntary health agencies and the effect of legislation. Emphasis on integration with other disciplines working in public health settings and the role of a public health nutritionist.

NTRN 531. Public Health Nutrition Field Experience. 1 - 6 Unit.
Individually planned public health experience. May be concurrent with course work in local agencies or in blocks of full-time work with a city, county, or state health agency. Prereq: Open to public health nutrition students only. Consent of instructor.

NTRN 532A. General Nutrition Care. 1 - 3 Unit.
Individually arranged clinical experience.

NTRN 532C. Specialized Public Health Nutrition Field Experience. 1 - 3 Unit.
Individually arranged clinical experience. Prereq: Public Health Nutrition students only. Consent of instructor.

NTRN 532E. Clinical Research: Methods in Nutrition and Metabolism. 3 Units.
Individually arranged.

NTRN 533. Nutritional Care of Neonate. 3 Units.
Nutritional assessment and management of high-risk newborns with emphasis on prematurity and low birth weight. Review of current literature coordinated with clinical experience in the neonatal intensive care unit. Issues on follow-up included. Recommended preparation: NTRN 435 or consent.

NTRN 534. Advanced Public Health Nutrition Field Experience. 1 - 6 Unit.
Individually planned advanced public health experience. Prereq: Open to public health nutrition students only.

NTRN 550A. Advanced Community Nutrition. 3 Units.
Development of skills needed by the community dietitian. Emphasis on effective tools for service development and delivery. Recommended courses of action for the professional. Prereq: Open to nutrition graduate students and senior undergraduate nutrition majors only.

NTRN 551. Seminar in Advanced Nutrition. 1 Unit.
Ph.D. students meet weekly to discuss topical journal articles. Students gain experience in critical evaluation of research and develop presentation/communication skills. Discussion of research integrity and ethics. Students participate in departmental seminars with invited speakers.

NTRN 561. Investigative Methods in Nutrition. 1 - 4 Unit.
Research methods appropriate for nutrition. Methods for conducting research in nutrition and food sciences, food service management and dietetics. Designing research proposals. Prereq: Nutrition major.

NTRN 601. Special Problems. 1 - 18 Unit.

NTRN 651. Thesis M.S.. 1 - 18 Unit.
Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
Department of Pathology

Christine Kehoe (http://bulletin.case.edu/schoolofmedicine/pathology/mailto:christine.kehoe@case.edu), Student Affairs

The clinical, research, and educational activities of the Case Department of Pathology are centered at the Case School of Medicine and University Hospitals Case Medical Center (UHCMC). The core components of the department are the Basic Science Pathology Program at Case School of Medicine and the three clinical divisions of Pathology at University Hospitals Health System (UHHS), including the Division of Anatomic Pathology at UHCMC, the Division of Clinical Pathology at UHCMC, and the UHHS Pathology Division of Community Hospitals. In addition, our affiliates include the Cuyahoga County Medical Examiner’s Office, the Pathology Department at the Louis Stokes Veteran’s Administration Medical Center, and the Pathology Department at MetroHealth Medical Center. Research laboratories of the department are located in the Wolstein Research Building and Institute of Pathology. Both are situated adjacent to University Hospitals of Cleveland, the primary teaching hospital of the Case School of Medicine and the location of the department’s Pathology Residency Program.

World-class research is conducted in the department in biomaterials biocompatibility, cancer biology, immunology, neuropathology and neurodegenerative disease, outcomes research, and tissue injury and healing. The department’s research activities are characterized by highly cooperative and collaborative interactions within the department, and with many other departments at Case and its affiliated institutions. In FY 2011, the department’s annual research grant support totaled $15,463,639, $13,080,886 of which was from NIH. This places the Department of Pathology 12th nationally amongst 91 medical school pathology/training/graduate.html).

Masters Degrees

MS in Pathology

A program leading to the Master of Science degree in Pathology is available to laboratory staff who are employed by Case Western Reserve University. Students in this program must be full-time university employees and must have the agreement of their supervisor to begin studies as a part-time student. Courses are available as an employee fringe benefit (up to 6 credits per semester for Fall and Spring, and 3 credits for Summer) and can only be taken as limited by the fringe benefit regulations.

A formal application for this program must be submitted to the graduate school. Prior to submission of this application, the employee, the supervisor, and the Director of the Pathology Graduate Program must meet to review and facilitate the student’s application for admission.

This program can lead to an M.S. degree through Plan A. Required core courses include CBIO 453 Cell Biology I (4 credits), CBIO 455 Molecular Biology I (4 credits), PATH 510 Basic Pathologic Mechanisms (4 credits), and participation in a seminar course (PATH 511 Experimental Pathology Seminar I and/or PATH 512 Experimental Pathology Seminar II) for at least one semester. CBIO 453 Cell Biology I, CBIO 455 Molecular Biology I and PATH 510 Basic Pathologic Mechanisms must be taken as graded courses (not P/F).

Plan A requires a minimum of 27 total coursework credits. In addition to the required core courses, the student must take a minimum of 6 credits of PATH 651 Thesis, which involves research in the laboratory of the supervisor (who serves as the M.S. Thesis Mentor) and thesis preparation. The student must register for at least one credit of PATH 651 Thesis M.S. every semester until graduation. A GPA of 2.75 or better must be maintained for a terminal M.S. (Students considering using the M.S. in Pathology as a “stepping stone” to the Ph.D. degree must maintain a GPA of 3.0 or better.) An M.S. thesis must be prepared based on the research, and the student must pass an M.S. Degree Examination in which the thesis is defended.

MD/MS Biomedical Investigation—Pathology Track

For Program Admissions and MD requirements, see MD Dual Degree Programs (p. 792). This track is designed to provide students with an in-depth understanding of the cellular basis of disease or immunity. During the first year of medical school the student should identify a mentor and begin planning coursework and a research project leading to the MS degree. Because the background and interest of applicants varies widely, members of the Program Oversight Committee will assist each student in designing an individualized schedule of graduate courses for any track.

Students are expected to complete at least two graduate courses (3 credits each or total 6 credits) before beginning the laboratory research period (year 3), and students should take three graduate courses before the research period if this is possible. For students to receive graduate credit for any medical coursework (as IBIS credit, e.g. IBIS 403 Integrated Biological Sciences III), they must register at the beginning of the semester. Students in the MD/MS joint degree program must attain a cumulative GPA of 3.0 in the graduate courses. Students in this program may participate in any of the three tracks of the Department of Pathology Graduate Program.

For information about the Pathology Track in the MD/MS program, contact Dr. James Anderson (http://bulletin.case.edu/schoolofmedicine/pathology/mailto:james.anderson@case.edu), 216.368.0279, or Dr. Clive Hamlin (http://bulletin.case.edu/schoolofmedicine/pathology/mailto:clive.hamlin@case.edu), 216.368.0512.

Students in the Pathology track must complete:

<table>
<thead>
<tr>

Total Units in Sequence: 32-34

* 15 graded credits of graduate school courses should be taken in the first 2 years, including IBIS 403 Integrated Biological Sciences III (6 credits) and three PATH graduate courses (3 credits each). Students may defer a maximum of one 3-credit hour course to Year 3.

PhD in Pathology

PhD Training in the Pathology Graduate Program occurs in three tracks that share a common core curriculum but provide additional track-specific curricular offerings. This provides a cohesive program that addresses the specific needs of different Pathology-related areas of research training. Section II of the handbook “Pathology PhD Program” describes core features of the program that are shared and provides detailed descriptions of the three training tracks:

- Molecular and Cellular Basis of Disease Training Program (MCBTP)
- Immunology Training Program (ITP)
- Cancer Biology Training Program (CBTP)

To earn a PhD in Pathology, a student must complete rotations in at least three laboratories followed by selection of a research advisor, and complete Core and Elective coursework including responsible conduct of research as described in the Course of Study, below. Students who previously completed relevant coursework, (for example, with a MS) may petition to complete alternative courses. Each training track follows the overall regulations established and described in CWRU Graduate Studies and documented to the Regents of the State of Ohio. Completion of the PhD degree will require 36 hours of coursework (24 hours of which are graded) and 18 hours of PATH 701 Dissertation Ph.D..

In addition, each PhD student must successfully complete a qualifier examination for advancement to candidacy in the form of a short grant proposal with oral defense. The qualifier is generally completed in the summer after year two. During the dissertation period, students are expected to meet twice a year with the thesis committee, present seminars in the department, and fulfill journal publication requirements. Throughout the doctoral training, students are expected to be enthusiastic participants in seminars, journal clubs, and research meetings in the lab and program.

Total Units in Sequence: 44-127

* Alternative courses for MSTP students: IBIS 401-404. MSTP students in the CBTP do not need to take CBIO 453 Cell Biology I, CBIO 455 Molecular Biology I, PATH 510 Basic Pathologic Mechanisms, or PATH 416 Fundamental Immunology, although PATH 416 Fundamental Immunology may still be taken as a Track Elective.

^ Alternate course is MSTP 400 Research Rotation in Medical Scientist Training Program for MSTP students with PATH 601 Special Problems for direct admit students.

** PATH 416 Fundamental Immunology is included as a Track Elective for CBTP students.

+ Petition to convert 601 credits to 701 credits for semester in which advancement occurs.

++ Once 36 credits including 24 graded credits have been completed, register for up to 6 credits of PATH 701 Dissertation Ph.D. per semester. Also petition to convert as many 601 credits as possible to 701 credits for semester in which advancement occurs. Exception: Take 1-3 credits of PATH 701 Dissertation Ph.D. if this will accelerate graduation. Also, take 1 credit of PATH 701 Dissertation Ph.D. if the PhD thesis will be completed in the summer semester (including anytime after the end of the spring semester).
Important: Students should take the following steps to reduce charges to their mentor and department:

AFTER ADVANCE TO CANDIDACY, IT IS NO LONGER NECESSARY TO REGISTER FOR 9 CREDITS PER SEMESTER TO MAINTAIN FULL-TIME STUDENT STATUS. In the first semester after advancement to candidacy, students should register only for the number of credits of PATH 701 Dissertation Ph.D. needed to bring their total number of accumulated credits of PATH 701 to 9 by the end of the semester (and should register for no other courses). In subsequent semesters, students should register for only 1 credit of PATH 701 (and no other courses), except that in the final semester registration should be for the number of credits of PATH 701 needed to complete a total of 18 credits by the end of the semester. EXCEPTION: IT IS IMPORTANT TO MAXIMIZE THE NUMBER OF PATH 701 CREDITS THAT CAN BE COMPLETED DURING PERIODS WHERE TRAINING GRANT SUPPORT IS AVAILABLE. If the student is on the NIH T32 training grant of NRSA award or other funding mechanism that supports this level of tuition, registration should be for the full 9 credits during semesters when grant support for tuition will be available, until a total of 18 credits of PATH 701 is accumulated, after which registration should be for only 1 credit of PATH 701 each semester until graduation. Even prior to advancing to candidacy, if a student has completed 36 "foundation" credits of graduate courses (at least 24 of which must be graded courses), the student should enroll in as many credits of PATH 701 as possible up to a maximum of 6 credits with the remaining credits to be graded courses or PATH 601. In the semester in which the student advances to candidacy, any PATH 601 credits for that semester that are beyond the 36 "foundation" credits should be converted to PATH 701 by petition to Graduate Studies. Students registering for PATH 601, PATH 651 or PATH 701 must indicate their thesis advisor as the Instructor. If a Class Section does not exist with your Thesis Advisor as Instructor, please see the Student Affairs Coordinator to add the Section in order for you to register.

NOTE: Schedule beyond year 5 will generally be the same as year 5.

Courses

PATH 316. Fundamental Immunology. 4 Units.
Introductory immunology providing an overview of the immune system, including activation, effector mechanisms, and regulation. Topics include antigen-antibody reactions, immunologically important cell surface receptors, cell-cell interactions, cell-mediated immunity, innate versus adaptive immunity, cytokines, and basic molecular biology and signal transduction in B and T lymphocytes, and immunopathology. Three weekly lectures emphasize experimental findings leading to the concepts of modern immunology. An additional recitation hour is required to integrate the core material with experimental data and known immune mediated diseases. Five mandatory 90 minute group problem sets per semester will be administered outside of lecture and recitation meeting times. Graduate students will be graded separately from undergraduates, and 22 percent of the grade will be based on a critical analysis of a recently published, landmark scientific article. Offered as BIOL 316, BIOL 416, CLBY 416, and PATH 416. Prereq: BIOL 215 and 215L.

PATH 390. Undergraduate Research in Cancer Biology, Immunology, or Pathology. 1 - 3 Unit.
Students undertake a research project directly related to ongoing research in the investigator's/instructor's laboratory. Written proposal outlining research topic, a schedule of meetings and format and length of final written report to be prepared prior to registration for credit. Recommended preparation: One year of college chemistry and consent of instructor.

PATH 395. Selected Readings in Immunology, Cancer Biology, or Pathology. 1 - 3 Unit.
Relevant readings and literature search on particular immunology, cancer biology or pathology topic(s) chosen by the student and directed by the instructor. Written proposal outlining chosen topic, type of work to be done, a schedule of meetings and format and length of final written report to be prepared prior to registration for credit.

PATH 410. Aging and the Nervous System. 1 Unit.
Lectures and discussion on aspects of neurobiology of aging in model systems; current research on Alzheimer’s, Parkinson’s, and Huntington’s diseases.

PATH 415. Cytoskeleton and Disease. 1 Unit.
Discussion of recent papers that have added to knowledge of normal cytoskeletal functions and their alterations in disease.

PATH 416. Fundamental Immunology. 4 Units.
Introductory immunology providing an overview of the immune system, including activation, effector mechanisms, and regulation. Topics include antigen-antibody reactions, immunologically important cell surface receptors, cell-cell interactions, cell-mediated immunity, innate versus adaptive immunity, cytokines, and basic molecular biology and signal transduction in B and T lymphocytes, and immunopathology. Three weekly lectures emphasize experimental findings leading to the concepts of modern immunology. An additional recitation hour is required to integrate the core material with experimental data and known immune mediated diseases. Five mandatory 90 minute group problem sets per semester will be administered outside of lecture and recitation meeting times. Graduate students will be graded separately from undergraduates, and 22 percent of the grade will be based on a critical analysis of a recently published, landmark scientific article. Offered as BIOL 316, BIOL 416, CLBY 416, and PATH 416. Prereq: Graduate standing and consent of instructor.
PATH 417. Cytokines: Function, Structure, and Signaling. 3 Units.
Regulation of immune responses and differentiation of leukocytes is modulated by proteins (cytokines) secreted and/or expressed by both immune and non-immune cells. Course examines the function, expression, gene organization, structure, receptors, and intracellular signaling of cytokines. Topic include regulatory and inflammatory cytokines, colony stimulating factors, chemokines, cytokine and cytokine receptor gene families, intracellular signaling through STAT proteins and tyrosine phosphorylation, clinical potential, and genetic defects. Lecture format using texts, scientific reviews and research articles. Recommended preparation: PATH 416 or equivalent. Offered as BIOL 417, CLBY 417, and PATH 417.

PATH 419. Reproductive Immunology. 3 Units.
This will be a lecture and literature-based course that will include classic and recent publications. The course will cover subjects related to the cellular and molecular biology of fertilization and development of the placenta and fetus in humans and how this process is affected by the maternal immune system. Specific areas of discussion will include mechanisms by which the antigenically foreign placenta and fetus create an apparent state of maternal immune tolerance, the physiologic role of endogenous retroviruses in trophoblast differentiation, the participation of maternal and placental cytokines in pregnancy, the effects of maternal alloimmune and autoimmune responses on differentiation of the trophoblast and development of the placenta/fetus, the development and effects of fetal lymphocyte microchimerism in maternal tissues, and a variety of current controversies in Reproductive Immunology. Recommended preparation: PATH 416 or equivalent, or permission of the instructor.

PATH 420. The Rhetoric of Science. 3 Units.
In this course, we shall analyze both written and oral communication of scientific results in order to understand the principles of effective exposition. The students will be expected to attend selected seminars and to participate in writing and speaking exercises. The goal of the course is to improve the written and oral communication skills of the students. Instructor approval is required for registration. Recommended preparation: Completion of the first year of the Biomedical Scientist Training Program.

PATH 422. Molecular Genetics of Cancer. 3 Units.
Cancer is a genetic disease, not only in the Mendelian sense of inheritance, but also in the sense that it is caused by somatic mutation. The targets of mutation are a set of proto-oncogenes and tumor suppressor genes whose products govern cellular proliferation, death and differentiation. The objectives of this course are to examine the types of genes that are the targets of mutational activation or inactivation and the mechanistic outcome of mutational changes that lead to oncogenesis. The course will also explore viral mechanisms of oncogenesis related to the products of cellular proto-oncogenes or tumor suppressor genes. In the course of these examinations we will explore the genetic and molecular genetic approaches used to identify and study oncogenes and tumor suppressor genes. Students should be prepared to present and discuss experimental design, data and conclusions from assigned publications. There will be no exams or papers but the course will end with a full-day, student-run symposium on topics to be decided jointly by students and instructors. Grades will be based on class participation and symposium presentation. Offered as BIOL 420, MBIO 420, MVIR 420, PATH 422, and PHRM 420. Prereq: CBIO 453 and CBIO 455.

PATH 425. Stem Cell Biology and Therapeutics. 3 Units.
This course is intended to teach current understanding of stem cells as it relates to their characterization, function, and physiologic and pathological states. The course will expose students to the current understanding of various types of stem cells, including embryonic and adult stem cells of various tissues, techniques for their isolation and study. Experimental models and potential biomedical therapeutic applications will be discussed. The course will be taught by the faculty of the “Center for Stem Cell and Regenerative Medicine” who are affiliated with multiple departments of Case Western Reserve University, Cleveland Clinic Foundation and the partnering biomedical companies. Offered as NEUR 425 and PATH 425.

PATH 430. Oxidative Stress and Disease Pathogenesis. 1 Unit.
Oxidative stress and free radicals are implicated in a number of disease processes including aging, arthritis, emphysema, Alzheimer’s disease and cancer. Lecture course with discussion of recent studies concerning the formation and destructive mechanisms of free radicals in the context of various disease processes. Students read assigned papers and discuss these in class.

PATH 432. Current Topics in Vision Research. 3 Units.
Vision research is an exciting and multidisciplinary area that draws on the disciplines of biochemistry, genetics, molecular biology, structural biology, neuroscience, and pathology. This graduate level course will provide the student with broad exposure to the most recent and relevant research currently being conducted in the field. Topics will cover a variety of diseases and fundamental biological processes occurring in the eye. Regions of the eye that will be discussed include the cornea, lens, and retina. Vision disorders discussed include age-related macular degeneration, retinal ciliopathies, and diabetic retinopathy. Instructors in the course are experts in their field and are members of the multidisciplinary visual sciences research community here at Case Western Reserve University. Students will be exposed to the experimental approaches and instrumentation currently being used in the laboratory and in clinical settings. Topics will be covered by traditional lectures, demonstrations in the laboratory and the clinic, and journal club presentations. Students will be graded on their performance in journal club presentations (40%), research proposal (40%), and class participation (20%). Offered as NEUR 432, PATH 432, PHRM 432 and BIOC 432.

PATH 435. Tissue Engineering and Regenerative Medicine. 3 Units.
This course will provide advanced coverage of tissue engineering with a focus on stem cell-based research and therapies. Course topics of note include stem cell biology and its role in development, modeling of stem cell function, controlling stem cell behavior by engineering materials and their microenvironment, stem cells’ trophic character, and state-of-the-art stem cell implementation in tissue engineering and other therapeutic strategies. Offered as EBME 425 and PATH 435. Prereq: EBME 325 or equivalent or graduate standing.

PATH 444. Neurodegenerative Diseases: Pathological, Cell. & Molecular Perspectives. 3 Units.
This course, taught by several faculty members, encompasses the full range of factors that contribute to the development of neurodegeneration. Subjects include pathological aspects, neurodegeneration, genetic aspects, protein conformation and cell biology in conditions such as Alzheimer’s disease, Parkinson’s disease, amyotrophic lateral sclerosis and prion diseases. Students read assigned primary literature and present and discuss these in class.
PATH 460. Introduction to Microarrays. 3 Units.
Microarray technology is an exciting new technique that is used to analyze gene expression in a wide variety of organisms. The goal of this course is to give participants a hands-on introduction to this technology. The course is intended for individuals who are preparing to use this technique, including students, fellows, and other investigators. This is a hands-on computer-based course, which will enable participants to conduct meaningful analyses of microarray data. Participants will gain an understanding of the principles underlying microarray technologies, including: theory of sample preparation, sample processing on microarrays, familiarity with the use of Affymetrix Microarray Suite software and generation of data sets. Transferring data among software packages to manipulate data will also be discussed. Importation of data into other software (GeneSpring and DecisionSite) will enable participants to mine the data for higher-order patterns. Participants will learn about the rationale behind the choice of normalization and data filtering strategies, distance metrics, use of appropriate clustering choices such as K-means, Hierarchical, and Self Organizing Maps. Course Offered as BIOC 460, PATH 460, CNCR 460.

PATH 477. Cellular and Molecular Basis of Immune Dysfunction. 3 Units.
Lectures and student presentations focusing on immunologic mechanisms of tissue injury, disorders of the immune response and diseases of immunocompetent cells. Hypersensitivity, allergy, immune complex disease, immune deficiency, lymphoma and multiple myeloma discussed from chemical, cellular and physiological perspectives. Recommended preparation: PATH 416 or consent of instructor.

PATH 480. Logical Dissection of Biomedical Investigations. 3 Units.
PATH 480 is an upper level graduate course encompassing discussion and critical appraisal of both published and pre-published research papers, book chapters, commentaries and review articles. Emphasis will be placed on evaluating the logical relationships connecting hypotheses to experimental design and experimental data to conclusions drawn. Thus, the course will aim to develop students’ capacities for independent thinking and critical analysis. Half of the course will be devoted to an analysis of fundamental conceptual issues pertaining to immunology, but this material will be applicable to a wide variety of fields. The other half of the course will be devoted to the analysis of papers that have been submitted for publication (with the students acting as primary reviewers of these papers). Our expectation is that this course will have practical relevance for students by providing them with methods to review their own prepublication manuscripts and eliminate common errors. It should also give students the tools to question widely held beliefs in diverse biomedical fields. Recommended preparation is completion of the C3MB curriculum and 2nd year or higher graduate school training. Previous exposure to immunology and molecular biology will be helpful but not required.

PATH 481. Immunology of Infectious Diseases. 3 Units.
Lectures and discussion on the immune response to infectious organisms, including bacteria, viruses and parasites. Emphasis on human responses but includes discussions of animal models. Other topics include vaccines and infections in immuno-compromised hosts. Recommended preparation: PATH 416 or consent of instructor. Offered as MVIR 481 and PATH 481.

PATH 486. HIV Immunology. 3 Units.
This course will examine the unique immunology of HIV disease. The course content will include the study of HIV pathogenesis, immune control, immune dysfunctions, HIV prevention and immune restoration. Students will be expected to attend lectures and participate in class discussions. A strong emphasis will be placed on reviewing scientific literature. Students will be asked to help organize and to administer an HIV immunology journal club and will be asked to prepare a written proposal in the area of HIV immunology. Offered as PATH 486 and MBIO 486. Prereq: PATH 416 or permission from the instructor.

PATH 488. Yeast Genetics and Cell Biology. 3 Units.
This seminar course provides an introduction to the genetics and molecular biology of the yeasts S. cerevisiae and S. pombe by a discussion of current literature focusing primarily on topics in yeast cell biology. Students are first introduced to the tools of molecular genetics and special features of yeasts that make them important model eukaryotic organisms. Some selected topics include cell polarity, cell cycle, secretory pathways, vesicular and nuclear/cyttoplasmic transport, mitochondrial import and biogenesis, chromosome segregation, cytoskeleton, mating response and signal transduction. Offered as CLBY 488, GENE 488, MBIO 488, and PATH 488.

PATH 510. Basic Pathologic Mechanisms. 4 Units.
An interdisciplinary introduction to the fundamental principles of molecular and cellular biology as they relate to the pathologic basis of disease. Lectures, laboratories, conferences.

PATH 511. Experimental Pathology Seminar I. 1 Unit.
Weekly discussions of current topics and research by students, staff and distinguished visitors.

PATH 512. Experimental Pathology Seminar II. 1 Unit.
Weekly discussions of current topics and research by students, staff and distinguished visitors.

PATH 520. Basic Cancer Biology and the Interface with Clinical Oncology. 3 Units.
This is an introductory cancer biology course that is intended to give students a broad and basic overview of Cancer Biology and Clinical Oncology. The course will cover not only fundamental principles of cancer biology, but will also highlight advances in the pathobiology and therapeutics of cancer. Classes will be of lecture and discussion format, with emphasis on critically reading original journal articles. The specific topics presented will include carcinogenesis, oncogenes, tumor suppressor genes, genetic epidemiology, DNA repair, growth factor action/signal transduction, apoptosis, cell cycle control, cell adhesion, angiogenesis, tumor cell heterogeneity, metastasis, chemotherapy, photodynamic therapy, gene therapy, signal transduction inhibitor therapy, chemoprevention, and clinical oncology of the breast, prostate, lymphatic tissue, colon and other related malignancies. Course grades will be from participation/discussion, presentation and mid-term/final exams. Recommended preparation: CBIO 453 and CBIO 455. Offered as PATH 520 and PHRM 520.
PATH 521. Special Topics in Cancer Biology and Clinical Oncology. 1 Unit.
This one credit hour course in Cancer Biology is intended to give students an opportunity to do independent literature research while enrolled in PHRM 520/PATH 520. Students must attend weekly Hematology/Oncology seminar series and write a brief summary of each of the lectures attended. In addition, students must select one of the seminar topics to write a term paper which fully reviews the background related to the topic and scientific and clinical advances in that field. This term paper must also focus of Clinical Oncology, have a translational research component, and integrate with concepts learned in PHRM 520/PATH 520. Pharmacology students must provide a strong discussion on Therapeutics, while Pathology students must provide a strong component on Pathophysiology of the disease. Recommended preparation: CBIO 453 and CBIO 455, or concurrent enrollment in PHRM 520 or PATH 520. Offered as PATH 521 and PHRM 521.

PATH 522. Skeletal Biology. 3 Units.
This is an advanced graduate level course for students interested in the morphogenesis, structure, function, and maintenance of the skeletal system taught jointly by faculty from Case Western Reserve University (CWRU), Cleveland Clinic Foundation (CCF), and the Northeastern Ohio Universities College of Medicine (NEOUCOM). It will meet twice per week for 90 minutes per session. The format will include an overview of the topic by the responsible faculty, followed by a discussion of important papers on the topic. The students will be expected to discuss the papers for each session and grading will be based on those discussions. The intent of the course is to enable students to understand the important problems in skeletal biology and both classical and modern approaches for solving them.

PATH 523. Histopathology of Organ Systems. 3 Units.
Comprehensive course covering the underlying basic mechanisms of injury and cell death, inflammation, immunity, infection, and neoplasia followed by pathology of specific organ systems. Material will include histological ('structure') and physiological ('function') aspects related to pathology (human emphasis). Recommended preparation: ANAT 412 or permission of instructor. Offered as ANAT 523 and PATH 523.

PATH 524. Cell Biology of Neurodegenerative Disorders. 3 Units.
PATH 524 is a course on neurodegenerative disorders intended for graduate, MSTP, first and second year medical students, and interested senior members of the community. This course will bridge the gap between molecular mechanisms at the cellular level with disease presentation and therapeutic strategies for a limited set of neurodegenerative conditions. The subject matter is intended to excite and prepare graduate and medical students for a career in translational research, and provide the necessary background for PATH 525, a more advanced seminar course on neurodegenerative disorders. This course will introduce the students to common neurodegenerative disorders of protein misfolding and metal mis-metabolism. Following an introductory lecture, the students will read assigned contemporary literature on a specific topic and discuss recent scientific reports in the class. The course will cover topics related to Alzheimer's disease, Parkinson's disease, Huntington's disease, Amyotrophic lateral sclerosis, Multiple sclerosis, Friedreich's ataxia, disorders of iron metabolism, disorders of copper metabolism, multiple system atrophy, metabolic disturbances including hypoglycemia and hepatic encephalopathy, toxic disorders including alcoholism, and other disorders of interest to the students. Students will be expected to participate actively in class and defend a research proposal for the final.

PATH 525. Transport and Targeting of Macromolecules in Health and Disease. 3 Units.
Each class includes introductory lecture, followed by student participation in interactive discussion of 3 to 5 research publications. At the end of the course, the students are expected to submit a paper or a short research proposal on any of the topics discussed during the course. Recommended preparation: CBIO 453, CBIO 454, CBIO 455, and CBIO 456. Offered as CLBY 525 and PATH 525.

PATH 601. Special Problems. 1 - 18 Unit.
Research on the nature and causation of disease and on host factors which tend to protect against disease. Special courses and tutorials in subspecialty areas of general and/or systemic anatomic and/or clinical pathology.

PATH 651. Thesis M.S.. 1 - 18 Unit.
Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
Department of Pharmacology

Cami Thompson (http://bulletin.case.edu/schoolofmedicine/pharmacology/mailto:camila.thompson@case.edu), Coordinator

The Department of Pharmacology offers training leading to MS, PhD or MD/PhD degrees for highly qualified post-undergraduate candidates committed to academic research careers in the biomedical sciences. Adequate preparation in the biological sciences, mathematics, organic chemistry, and physics or physical chemistry is a prerequisite for admission.

Multidisciplinary training, carried out by faculty in pharmacology and other basic science departments, emphasizes molecular, cellular, physiological, and clinical aspects of the pharmacological sciences. Areas of faculty expertise include drug/xenobiotic metabolism; receptor-ligand interactions, and biochemical reaction mechanisms; cell biology of signaling pathways; structure-function of membrane components; endocrine and metabolic regulation; cell surface and nuclear receptors, hormonal regulation of gene expression; cancer biology and therapeutics, bacterial and viral pathogenesis, neuroscience/neuropharmacology, and drug resistance.

Students who desire the combined MD/PhD degrees are admitted to the Medical Scientist Training Program (MSTP, please see separate listing in this publication). These students participate in the two-year integrated preclinical curriculum of the School of Medicine (University Program), which features clinical correlation of basic biologic concepts. Combined degree students who select the PhD in pharmacology undertake a series of advanced courses, research rotations, preliminary examinations and dissertation research in the same manner as that described for the PhD program.

Facilities

The Department of Pharmacology occupies about 25,000 net square feet distributed among several locations, namely the Biomedical Research Building, the School of Medicine Harland Golf Wood Building and the adjacent Wood Research Tower, as well as facilities in the West Quad Bldg. Facilities include extensive chromatographic and tissue culture facilities, a transgenic mouse laboratory, imaging and confocal microscopy equipment, and ready access to specialized research techniques, including various aspects of recombinant DNA and hybridoma technology, in situ hybridization histochemistry, fluorescence cell sorting, NMR and mass spectroscopy, X-ray crystallography, and cryo electron microscopy.

Masters Degrees

Although training efforts by the Department of Pharmacology are primarily directed toward the award of the PhD degree, training for the MS degree is offered also in a variety of contexts. For example, research assistants in the Department who seek educational advancement may pursue the MS degree via Plan A (thesis) or Plan B (coursework only). Medical students who seek to specialize in Pharmacology during the scholarly research component of their preclinical program may pursue the MS degree. Employees in the Biotechnology Industry may seek advanced training in Pharmacology by pursuing the MS degree at Case. Finally, a PhD candidate who is unable to complete the PhD requirements for extraordinary reasons may petition to have earned credits transferred to fulfill MS degree requirements.

Masters Plan B (Coursework, MS direct admit)

This program is aimed at students who seek a Master’s Degree but do not intend to specialize in research following their Master’s work. To satisfy the requirement for a Comprehensive Exam for the MS Degree, students register for 1 credit of EXAM 600 during their final semester and sit for an integrative essay question-style examination on the content of the required coursework. A total of 27 credit hours are required (see below).

The advancement of understanding and practice of therapeutics is based on research. Therefore all students in degree programs in Pharmacology are expected to become involved in independent research and scholarship. Registration for PHRM 601 Independent Study and Research requires a pre-arrangement with a faculty mentor who will oversee the combination of study and bench research and prescribe the basis for satisfactory performance, including oral and written reports. With pre-approval of the Departmental Director of Graduate Studies, a student’s study plan may substitute additional specific advanced courses to replace PHRM 601 Independent Study and Research credits.

Total Units in Sequence: 25-27

Masters Plan A (Research, direct admit)

In addition to the course requirements below, candidates for this degree are required to submit an acceptable written thesis based on their original research, and register for at least 9 credit hours of PHRM 651 Thesis M.S. (master’s dissertation research). The acceptability of the thesis will be determined by an oral examination administered by the student’s Thesis Advisory Committee. This committee must be chaired by a member of the primary Faculty of Pharmacology, and it should include the research mentor and two other faculty members (total of four faculty members, two from the Department of Pharmacology). As above, a minimum of 27 credit hours are required. For these students, passing the final exams in PHRM 401 Principles of Pharmacology I and PHRM 402 Principles of Pharmacology II: The Molecular Basis of Therapeutics satisfies the requirement for a Comprehensive Exam for the MS Degree.

PhD in Pharmacology

Students seeking the PhD degree are admitted directly into the Department of Pharmacology through the Molecular Therapeutics Training Program, through the Biomedical Sciences Training Program, each of which provides an introduction to many related training areas within the biomedical field during the first year, or through the Medical Scientist Training Program (MSTP).

The PhD program is divided into three phases. The first phase allows students to follow an integrated first-year sequence of course work that involves a core curriculum in cell and molecular biology. In addition, the first year includes three research rotations that allow the students to sample areas of research and become familiar with faculty members and their laboratories. Selection of a specific training program and thesis advisor is made before the end of the first year. The second phase involves a two part course in intensive Pharmacology study, oral presentations and laboratory experience, which cumulates in a comprehensive written exam designed to challenge students to apply key concepts in new context.

After advancing to PhD candidacy by passing the comprehensive written exam, students select one of four advanced tracks in Pharmacology. Choice among the tracks is based on the area of research expertise of the thesis advisor and the student’s interest in specific coursework. The four tracks are: Cancer Therapeutics, Membrane Biology and Pharmacology, Molecular Pharmacology and Cell Regulation, and Translational Therapeutics.

The PhD degree is awarded to students who complete a research project leading to two original and meritorious scientific contributions that are submitted for publication to leading journals in the field of study; at least one manuscript must be accepted for publication before scheduling the PhD defense. Completion of the PhD degree will also require 36 hours of coursework (24 hours of which are graded) and 18 hours of PHRM 701 Dissertation Ph.D..

Core course requirements for the PhD in Pharmacology

The first year consists of the Core curriculum in Cell Biology and Molecular Biology (CBIO 453 Cell Biology I, CBIO 455 Molecular Biology I) and research rotations, as well as a scientific ethics course (15 credit hours). This is included with the additional 15 formal course credit hours which are required in Pharmacology as listed and then described below.

PHRM 400 Research Experience in Pharmacology 0
CBIO 453 Cell Biology I 4
CBIO 455 Molecular Biology I 4
PHRM 401 Principles of Pharmacology I 3
PHRM 402 Principles of Pharmacology II: The Molecular Basis of Therapeutics 3

Total Units in Sequence: 26-79

* Rotation 1 takes place during Summer prior to First Year Fall Semester.

### Courses

**PHRM 301. Undergraduate Research.** 1 - 18 Unit.

**PHRM 309. Principles of Pharmacology.** 3 Units.

Principles of Pharmacology introduces the basic principles that underlie all of Pharmacology. The first half of the course introduces, both conceptually and quantitatively, drug absorption, distribution, elimination and metabolism (pharmacokinetics) and general drug receptor theory and mechanism of action (pharmacodynamics). Genetic variation in response to drugs (pharmacogenetics) is integrated into these basic principles. The second half of the course covers selected drug classes chosen to illustrate these principles. Small group/recitation sessions use case histories to reinforce presentation of principles and to discuss public perceptions of therapeutic drug use. Graduate students will be expected to critically evaluate articles from the literature and participate in a separate weekly discussion session. Recommended preparation for PHRM 409: Undergraduate degree in science or permission of instructor. Offered as PHRM 309 and PHRM 409. Prereq: CHEM 223 and CHEM 224 or EBME 201 and EBME 202 or BIOL 116 and BIOL 117

**PHRM 315. Nuclear Receptors in Health and Disease.** 3 Units.

This course focuses on hormone-gene interactions mediated by the ligand-inducible transcription factors termed nuclear hormone receptors. The class will address the mechanisms of action, regulatory features, and biological activities of several nuclear receptors. The usage of nuclear receptors as therapeutic targets in disease states such as cancer, inflammation, and diabetes will also be discussed. The course aims to teach students to critically evaluate primary literature relevant to nuclear hormone receptors biology, and to reinforce presentation/discussion skills. Grades for undergraduates will be based on midterm, final exam; grades for graduates will be based on midterm, final exam, and presentation of a recently published research article related to the role of nuclear receptors in health and disease. Offered as PHRM 315, BIOC 315, PHRM 415 and BIOC 415.

**PHRM 340. Science and Society Through Literature.** 3 Units.

This course will examine the interaction of scientific investigation and discovery with the society it occurred in. What is the effect of science on society and, as importantly, what is the effect of society on science? An introduction will consider the heliocentric controversy with focus on Galileo. Two broad areas, tuberculosis and the Frankenstein myth, will then be discussed covering the period 1800-present. With tuberculosis, fiction, art and music will be examined to understand the changing views of society towards the disease, how society’s perception of tuberculosis victims changed, and how this influenced their treatments and research. With Frankenstein, the original novel in its historical context will be examined. Using fiction and film, the transformation of the original story into myth with different connotations and implications will be discussed. Most classes will be extensive discussions coupled with student presentations of assigned materials. Offered as PHRM 340, BETH 440, PHRM 440, and HSTY 440.

**PHRM 400. Research Experience in Pharmacology.** 0 - 1 Units.

Research rotation in pharmacology.
PHRM 401. Principles of Pharmacology I. 3 Units.
This course focuses on the chemical and biochemical properties of therapeutic agents, molecular mechanisms of therapeutic action including kinetic and thermodynamic principles of enzyme catalysis and drug-receptor interactions, signal transduction, the genetic basis of disease states, and interindividual variation in response to drugs. The primary learning objective is to develop a self-directed, critical approach to the evaluation and design of experimental research in the broad context of specific diseases. This is a team-taught course involving focal lectures by faculty followed by student-directed learning experiences including discussion, problem solving applications, and primary literature presentations. A laboratory exercise introduces experimental methodologies widely applied during the study of molecular interactions between therapeutic agents and receptor targets to reinforce fundamental principles of molecular drug action. This 3 credit hour course meets 6 hours per week during the first half of the Spring semester (January through mid-February).

PHRM 402. Principles of Pharmacology II: The Molecular Basis of Therapeutics. 3 Units.
This course focuses on human physiology of organ systems that are involved in determining the time course of drug action in vivo (pharmacokinetics). Emphasis will be placed on fundamental principles of pharmacokinetics, including the absorption, distribution, metabolism, and excretion of drugs. Mathematical concepts needed to understand appropriate administration of drugs and maintaining therapeutic concentrations of drugs in the body will be discussed. A second broad area of emphasis is on fundamental principles of drug action within the body (pharmacodynamics), including drug-receptor theory, log dose-response relationships, therapeutic index, receptor turnover, and signal transduction mechanisms. This is a highly interactive course in which faculty lectures are minimized and student-directed learning in emphasized. An animal laboratory explores the actions of cardiovascular drugs in an in vivo setting. This 3-credit hour course meets 6 hours per week mid-February through April.

PHRM 403. Public and Professional Views of Modern Therapeutics. 3 Units.
This course will present the students with headline news stories from the popular press along with pertinent published articles from the scientific literature. The object is to engage the students in critical evaluation of the scientific literature and news reports to discern the scientific basis for decisions such as removal of drugs from the market. The course will focus on topics such as Cox-2 inhibitors and Heart Disease, Antidepressant Use for Adolescents, and Parkinson’s Disease and Stem Cell Therapy, among others. Evaluation will be based on participation in student-led discussion sessions, weekly topical quizzes, and on written critiques of the primary literature.

PHRM 409. Principles of Pharmacology. 3 Units.
Principles of Pharmacology introduces the basic principles that underlie all of Pharmacology. The first half of the course introduces, both conceptually and quantitatively, drug absorption, distribution, elimination and metabolism (pharmacokinetics) and general drug receptor theory and mechanism of action (pharmacodynamics). Genetic variation in response to drugs (pharmacogenetics) is integrated into these basic principles. The second half of the course covers selected drug classes chosen to illustrate these principles. Small group/recitation sessions use case histories to reinforce presentation of principles and to discuss public perceptions of therapeutic drug use. Graduate students will be expected to critically evaluate articles from the literature and participate in a separate weekly discussion session. Recommended preparation for PHRM 409: Undergraduate degree in science or permission of instructor. Offered as PHRM 309 and PHRM 409.

PHRM 412. Membrane Transport Processes. 3 Units.
Membranes and membrane transporters are absolutely required for all cells to take up nutrient, maintain membrane potential and efflux toxins. This course will consider the classification and structure of membrane transport proteins and channels, examine the common mechanistic features of all systems and the specific features of different classes of transporter. Understanding the physiological integration of transport processes into cell homeostasis and consideration of transporters and channels as drug targets will be a goal. Course format is minimal lecture, primarily student presentations of primary literature papers. Offered as PHOL 412, PHRM 412. Prereq: CBIO 453 and CBIO 455.

PHRM 415. Nuclear Receptors in Health and Disease. 3 Units.
This course focuses on hormone-gene interactions mediated by the ligand-inducible transcription factors termed nuclear hormone receptors. The class will address the mechanisms of action, regulatory features, and biological activities of several nuclear receptors. The usage of nuclear receptors as therapeutic targets in disease states such as cancer, inflammation, and diabetes will also be discussed. The course aims to teach students to critically evaluate primary literature relevant to nuclear hormone receptors biology, and to reinforce presentation/discussion skills. Grades for undergraduates will be based on midterm, final exam; grades for graduates will be based on midterm, final exam, and presentation of a recently published research article related to the role of nuclear receptors in health and disease. Offered as PHRM 315, BIOC 315, PHRM 415 and BIOC 415.
PHRM 420. Molecular Genetics of Cancer. 3 Units.
Cancer is a genetic disease, not only in the Mendelian sense of inheritance, but also in the sense that it is caused by somatic mutation. The targets of mutation are a set of proto-oncogenes and tumor suppressor genes whose products govern cellular proliferation, death and differentiation. The objectives of this course are to examine the types of genes that are the targets of mutational activation or inactivation and the mechanistic outcome of mutational changes that lead to oncogenesis. The course will also probe viral mechanisms of oncogenesis related to the products of cellular proto-oncogenes or tumor suppressor genes. In the course of these examinations we will explore the genetic and molecular genetic approaches used to identify and study oncogenes and tumor suppressor genes. Students should be prepared to present and discuss experimental design, data and conclusions from assigned publications. There will be no exams or papers but the course will end with a full-day, student-run symposium on topics to be decided jointly by students and instructors. Grades will be based on class participation and symposium presentation. Offered as BIOC 420, MBIO 420, MVIR 420, PATH 422, and PHRM 420. Prereq: CBIO 453 and CBIO 455.

PHRM 430. Advanced Methods in Structural Biology. 1 - 6 Unit.
The course is designed for graduate students who will be focusing on one or more methods of structural biology in their thesis project. This course is divided into 3-6 sections (depending on demand). The topics offered will include X-ray crystallography, nuclear magnetic resonance spectroscopy, optical spectroscopy, mass spectrometry, cryo-electron microscopy, and computational and design methods. Students can select one or more modules. Modules will be scheduled so that students can take all the offered modules in one semester. Each section is given in 5 weeks and is worth 1 credit. Each section covers one area of structural biology at an advanced level such that the student is prepared for graduate level research in that topic. Offered as BIOC 430, CHEM 430, PHOL 430, and PHRM 430.

PHRM 432. Current Topics in Vision Research. 3 Units.
Vision research is an exciting and multidisciplinary area that draws on the disciplines of biochemistry, genetics, molecular biology, structural biology, neurosciences, and pathology. This graduate level course will provide the student with broad exposure to the most recent and relevant research currently being conducted in the field. Topics will cover a variety of diseases and fundamental biological processes occurring in the eye. Regions of the eye that will be discussed include the cornea, lens, and retina. Vision disorders discussed include age-related macular degeneration, retinal ciliopathies, and diabetic retinopathy. Instructors in the course are experts in their field and are members of the multidisciplinary visual sciences research community here at Case Western Reserve University. Students will be exposed to the experimental approaches and instrumentation currently being used in the laboratory and in clinical settings. Topics will be covered by traditional lectures, demonstrations in the laboratory and the clinic, and journal club presentations. Students will be graded on their performance in journal club presentations (40%), research proposal (40%), and class participation (20%). Offered as NEUR 432, PATH 432, PHRM 432 and BIOC 432.

PHRM 434. Mechanisms of Drug Resistance. 3 Units.
Resistance to drugs is an important health concern in the new millennium. Over the past century, modern medicine has developed and prescribed drugs for various ailments and diseases with known therapeutic benefit. Since the discovery of antibiotics by Dr. Fleming, we have struggled with a new complication in infectious diseases, development of drug resistance. This course will focus on and compare the drug resistant mechanisms selected by viruses, bacteria, parasites, fungi, and tumor cells. Topics to be covered include antiretroviral resistance (e.g., AZT and protease inhibitors), antibiotic resistance (e.g., B-lactams), resistance to chemotherapy agents, and resistance to anti-malarial drugs (e.g., chloroquine). Offered as MBIO 434, MVIR 434, and PHRM 434.

PHRM 440. Science and Society Through Literature. 3 Units.
This course will examine the interaction of scientific investigation and discovery with the society it occurred in. What is the effect of science on society and, as importantly, what is the effect of society on science? An introduction will consider the heliocentric controversy with focus on Galileo. Two broad areas, tuberculosis and the Frankenstein myth, will then be discussed covering the period 1800-present. With tuberculosis, fiction, art and music will be examined to understand the changing views of society towards the disease, how society’s perception of tuberculosis victims changed, and how this influenced their treatments and research. With Frankenstein, the original novel in its historical context will be examined. Using fiction and film, the transformation of the original story into myth with different connotations and implications will be discussed. Most classes will be extensive discussions coupled with student presentations of assigned materials. Offered as PHRM 340, BETH 440, PHRM 440, and HSTY 440.

PHRM 466. Cell Signaling. 3 Units.
This is an advanced lecture/journal/discussion format course that covers cell signaling mechanisms. Included are discussions of neurotransmitter-gated ion channels, growth factor receptor kinases, cytokine receptors, G protein-coupled receptors, steroid receptors, heterotrimeric G proteins, ras family GTPases, second messenger cascades, protein kinase cascades, second messenger regulation of transcription factors, microtubule-based motility, actin/myosin-based motility, signals for regulation of cell cycle, signals for regulation of apoptosis. Offered as CLBY 466 and PHOL 466 and PHRM 466.

PHRM 475. Protein Biophysics. 3 Units.
This course focuses on in-depth understanding of the molecular biophysics of proteins. Structural, thermodynamic and kinetic aspects of protein function and structure-function relationships will be considered at the advanced conceptual level. The application of these theoretical frameworks will be illustrated with examples from the literature and integration of biophysical knowledge with description at the cellular and systems level. The format consists of lectures, problem sets, and student presentations. A special emphasis will be placed on discussion of original publications. Offered as BIOC 475, CHEM 475, PHOL 475, PHRM 475, and NEUR 475.
PHRM 476. Cellular Biophysics. 4 Units.
This course focuses on a quantitative understanding of cellular processes. It is designed for students who feel comfortable with and are interested in analytical and quantitative approaches to cell biology and cell physiology. Selected topics in cellular biophysics will be covered in depth. Topics include theory of electrical and optical signal processing used in cell physiology, thermodynamics and kinetics of enzyme and transport reactions, single ion channel kinetics and excitability, mechanotransduction, and transport across polarized cell layers. The format consists of lectures, problem sets, computer simulations, and discussion of original publications. The relevant biological background of topics will be provided appropriate for non-biology science majors. Offered as BIOC 476, NEUR 477, PHOL 476, PHRM 476.

PHRM 511. Pharmacology Seminar Series. 0 - 1 Units.
Current topics of interest in the pharmacologist sciences.

PHRM 513. Structural Journal Club. 1 Unit.
Current topics of interest in structural biology, and protein biophysics. Offered as PHOL 513 and PHRM 513.

PHRM 520. Basic Cancer Biology and the Interface with Clinical Oncology. 3 Units.
This is an introductory cancer biology course that is intended to give students a broad and basic overview of Cancer Biology and Clinical Oncology. The course will cover not only fundamental principles of cancer biology, but will also highlight advances in the pathobiology and therapeutics of cancer. Classes will be of lecture and discussion format, with emphasis on critically reading original journal articles. The specific topics presented will include carcinogenesis, oncogenes, tumor suppressor genes, genetic epidemiology, DNA repair, growth factor action/signal transduction, apoptosis, cell cycle control, cell adhesion, angiogenesis, tumor cell heterogeneity, metastasis, chemotherapy, photodynamic therapy, gene therapy, signal transduction inhibitor therapy, chemoprevention, and clinical oncology of the breast, prostate, lymphatic tissue, colon and other related malignancies. Course grades will be from participation/discussion, presentation and mid-term/final exams. Recommended preparation: CBIO 453 and CBIO 455. Offered as PATH 520 and PHRM 520.

PHRM 521. Special Topics in Cancer Biology and Clinical Oncology. 1 Unit.
This one credit hour course in Cancer Biology is intended to give students an opportunity to do independent literature research while enrolled in PHRM 520/PATH 520. Students must attend weekly Hematology/Oncology seminar series and write a brief summary of each of the lectures attended. In addition, students must select one of the seminar topics to write a term paper which fully reviews the background related to the topic and scientific and clinical advances in that field. This term paper must also focus of Clinical Oncology, have a translational research component, and integrate with concepts learned in PHRM 520/PATH 520. Pharmacology students must provide a strong discussion on Therapeutics, while Pathology students must provide a strong component on Pathophysiology of the disease. Recommended preparation: CBIO 453 and CBIO 455, or concurrent enrollment in PHRM 520 or PATH 520. Offered as PATH 521 and PHRM 521.

PHRM 525. Topics in Cell and Molecular Pharmacology. 0 - 18 Units.
Individual library research project under the guidance of a pharmacology sponsor. Projects will reflect the research interest of the faculty sponsor, including molecular endocrinology, neuropharmacology, receptor activation and signal transduction, molecular mechanisms of enzyme action and metabolic regulation.

PHRM 527. Pathways to Personalized Medicine. 3 Units.
This is a course of independent study designed to take the student from the bedside to the bench and back again. Students will select a problem from a list of important therapeutic issues related to variability in drug responsiveness and design a research program to elucidate its molecular, biochemical, genetic and pathophysiological basis. The resulting research proposal is expected to be multidimensional and include molecular, cellular, whole animal and clinical investigations. To guide the process students will assemble a mentoring group including at least one member of the Translational Therapeutics Track Faculty, a clinician working in the clinical realm in which the problem originates and a basic scientist with relevant experience. The written proposal will be defended orally. Recommended preparation: 1st year Pharm Graduate required courses.

PHRM 528. Classic and Contemporary Approaches to Drug Discovery. 3 Units.
This course will provide the student with a deeper understanding of the mechanism of drug action and target validation. The first portion of the course will describe the basis for classical approaches in drug discovery that include kinetic and thermodynamic analyses for small molecule interactions with enzymes and receptors. The second portion of the course will describe new technologies and agents such as interference RNA and peptoids as therapeutic agents. The final section will describe pre-clinical and clinical trials as well as practical issues for start-up companies and licensing agreements. Prereq: Public health nutrition students and graduate nutrition students only.

PHRM 555. Current Proteomics. 3 Units.
This course is designed for graduate students across the university who wish to acquire a better understanding of fundamental concepts of proteomics and hands-on experience with techniques used in current proteomics. Lectures will cover protein/peptide separation techniques, protein mass spectrometry, bioinformatics tools, and biological applications which include quantitative proteomics, protein modification proteomics, interaction proteomics, structural genomics and structural proteomics. Laboratory portion will involve practice on the separation of proteins by two-dimensional gel electrophoresis, molecular weight measurement of proteins by mass spectrometry, peptide structural characterization by tandem mass spectrometry and protein identification using computational tools. The instructors’ research topics will also be discussed. Recommended preparation: CBIO 453 and CBIO 455. Offered as PHRM 555 and SYBB 555.
PHRM 600. Preparation for Qualifying Exam. 1 Unit.
Students pursuing the M.S. or Ph.D. degrees in Pharmacology are required to prepare systematically for the comprehensive qualifying exam by reviewing the concepts of cellular and molecular biology and pharmacology. The qualifier is comprised of a two-part written exam administered simultaneously to all eligible students. It is designed to evaluate their understanding of concepts presented in the various core courses. It also assesses their skills in critical reading of research articles and design of experiments. The division into two parts allows each student to receive feedback on deficient areas and work toward improvement on the second segment. Eligibility: Students may register for the exam when they have fulfilled two criteria: (a) Successful completion (grade B or better) in all of the Core Courses, and an overall GPA of 3.0 or better. (b) Satisfactory performance in all research rotations and consistent research effort in the thesis laboratory as documented formally by the Ph.D. mentor. No student on probation may sit for the Qualifying Exam (Prelim I). Prereq: CBIO 453, CBIO 455, PHRM 401 and PHRM 402.

PHRM 601. Independent Study and Research. 1 - 18 Unit.

PHRM 651. Thesis M.S.. 1 - 18 Unit.

Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
Department of Physiology and Biophysics

Jean Davis (http://bulletin.case.edu/schoolofmedicine/physiologyandbiophysics/mailto:jean.davis@case.edu), Coordinator

The Department of Physiology and Biophysics at Case is a multidisciplinary department that takes great pride in its history of conducting research and training graduate students. The department includes 20 Primary and 33 Secondary faculty members, more than 25 post-doctoral associates, and 34, full-time PhD, MD/PhD, and Master of Science degree students. The training programs are designed to provide a mentored training environment that maximizes faculty-student interaction.

As outlined below, the department offers PhD, MD/PhD and Master of Science degrees. These programs are tailored to prepare students for successful careers in biomedical, pharmaceutical and industrial research. The department offers multiple graduate-level programs, each of which uses state-of-the-art molecular, cell biology, and biophysical approaches to study physiological questions at a variety of different organizational levels. The goal is to provide an outstanding training opportunity. The major goals of the PhD and Tech Masters programs are to provide students with a broad knowledge base in organ systems and integrated physiology and in-depth expertise and outstanding research potential in the fields of cellular and molecular physiology and molecular and cellular biophysics. These goals are accomplished using a series of foundation and advanced topic courses, skill development courses, laboratory rotations and thesis research. The MS in Medical Physiology program is a post-baccalaureate program designed to help students prepare for admission to medical, dental, pharmacy, or veterinary school or for opportunities to work in the biotechnology industry.

Masters Degrees

The Master’s Program in Medical Physiology is designed for students with at least a bachelor’s degree in a chemical, physical, or biological science who are seeking advanced training in the physiological sciences, typically in preparation for admission to a professional medical program (e.g. Medical School, Dental School). The program is flexible in duration. It can take as little as 1 year (2 semesters, 9 months) to complete the required 30 credit hours of course work. However, students who wish to decompress the program can take 14 months or more to complete the requirements. Core courses and flexible electives allow students to focus their work in key areas of medical physiology, including Anatomy, Biochemistry, or Pharmacology. Graduates of the Medical Physiology Master’s Program also can pursue careers in basic and clinical research, research administration, teaching or management in academia, the pharmaceutical and biotechnology industries, private research institutions, government science or regulatory agencies, or medicine and health care.

MS Physiology - Type A Thesis Option

The Department of Physiology and Biophysics encourages research staff members to expand their critical research knowledge and skills by enrolling in our Master’s of Science in Physiology and Biophysics program. This Tech Master’s Program, is specifically designed for staff working full time. Each employer has their own policy on allowing staff to take classes and enroll in graduate programs. CWRU’s policy is to allow staff, with their supervisor’s permission, to take up to 6 credit hours per term, with tuition being covered by CWRU as part of the employee benefit package. Staff are expected to make up the time they spend in class during the day after hours.

MD/MS Biomedical Investigation - Physiology Track

This track offers training in physiology and biomedical laboratory technology, including emphasis on mentored independent research training which includes both laboratory experience and formal course work in modern laboratory methodology and instrumentation.

Students in Physiology and Biotechnology track must complete:

- PHOL 498 \text{ Physiology and Biophysics Departmental Seminar } 1
- PHOL 601 \text{ Research } 1 - 18
- IBIS 600 \text{ Exam in Biomedical Investigation } 0

And 9 credits from the following course list:

- PHOL 432 \text{ Cell Structure and Function } 3
- PHOL 456 \text{ Proteins and Nucleic Acids } 3
- PHOL 466 \text{ Cell Signaling } 3
- PHOL 468 \text{ Membrane Physiology } 3
- PHOL 480 \text{ Physiology of Organ Systems } 4
- PHOL 530 \text{ Technology in Physiological Sciences } 3
PhD in Physiology and Biophysics

The Physiology and Biophysics Graduate Program provides comprehensive training leading to the PhD degree and MD/PhD degrees. This program has three tracks of study with emphasis on Cell and Molecular Physiology, Structural Biology and Biophysics, and Organ Systems Physiology. Admissions to the Physiology and Biophysics program may be obtained in the integrated Biomedical Sciences Training Program, by direct admission to the department or via the MSTP program.

To earn a PhD in Physiology and Biophysics, a student must complete rotations in at least three laboratories followed by selection of a research advisor, and complete Core and Elective coursework including responsible conduct of research as described in the course of study, below. Students who previously completed relevant coursework, for example with a MS, may petition to complete alternative courses.

Each graduate program follows the overall regulations established and described in CWRU Graduate Studies and documented to the Regents of the State of Ohio. Completion of the PhD degree will require 36 hours of coursework (24 hours of which are graded) and 18 hours of PHOL 701 Dissertation Ph.D..

In addition, each student must successfully complete a qualifier examination for advancement to candidacy in the form of a short grant proposal with oral defense. The qualifier is generally completed in the summer after year two. During the dissertation period, students are expected to meet twice a year with the thesis committee, present seminars in the department, and fulfill journal publication requirements. At the completion of the program, successful defense of a doctoral dissertation is required. Throughout the doctoral training, students are expected to be enthusiastic participants in seminars, journal clubs, and research meetings in the lab and program.

* After passing qualifying exam - full-time thesis research (701) - 18 total credit hours total

Courses

PHOL 351. Independent Study. 1 - 6 Unit.
This course is a guided program of study in physiology textbooks, reviews, and original articles. Guided laboratory projects to reproduce and extend classical physiological experiments are offered to the undergraduate science major. This course is being offered in conjunction with the Graduate level course PHOL 451. Students are required to consult with the faculty member whose work they have interest in and plan their individual experience.

PHOL 398. Physiology and Biophysics Departmental Seminar. 1 Unit.
Weekly one-hour reviews from invited speakers describing their research. Students will present literature reviews or summaries of their research.

PHOL 412. Membrane Transport Processes. 3 Units.
Membranes and membrane transporters are absolutely required for all cells to take up nutrient, maintain membrane potential and efflux toxins. This course will consider the classification and structure of membrane transport proteins and channels, examine the common mechanistic features of all systems and the specific features of different classes of transporter. Understanding the physiological integration of transport processes into cell homeostasis and consideration of transporters and channels as drug targets will be a goal. Course format is minimal lecture, primarily student presentations of primary literature papers. Offered as PHOL 412, PHRM 412. Prereq: CBIO 453 and CBIO 455.

PHOL 419. Applied Probability and Stochastic Processes for Biology. 3 Units.
Applications of probability and stochastic processes to biological systems. Mathematical topics will include: introduction to discrete and continuous probability spaces (including numerical generation of pseudo random samples from specified probability distributions), Markov processes in discrete and continuous time with discrete and continuous sample spaces, point processes including homogeneous and inhomogeneous Poisson processes and Markov chains on graphs, and diffusion processes including Brownian motion and the Ornstein-Uhlenbeck process. Biological topics will be determined by the interests of the students and the instructor. Likely topics include: stochastic ion channels, molecular motors and stochastic ratchets, actin and tubulin polymerization, random walk models for neural spike trains, bacterial chemotaxis, signaling and genetic regulatory networks, and stochastic predator-prey dynamics. The emphasis will be on practical simulation and analysis of stochastic phenomena in biological systems. Numerical methods will be developed using both MATLAB and the R statistical package. Student projects will comprise a major part of the course. Offered as BIOL 319, EECS 319, MATH 319, BIOL 419, EBME 419, and PHOL 419.

PHOL 430. Advanced Methods in Structural Biology. 1 - 6 Unit.
The course is designed for graduate students who will be focusing on one or more methods of structural biology in their thesis project. This course is divided into 3-6 sections (depending on demand). The topics offered will include X-ray crystallography, nuclear magnetic resonance spectroscopy, optical spectroscopy, mass spectrometry, cryo-electron microscopy, and computational and design methods. Students can select one or more modules. Modules will be scheduled so that students can take all the offered modules in one semester. Each section is given in 5 weeks and is worth 1 credit. Each section covers one area of structural biology at an advanced level such that the student is prepared for graduate level research in that topic. Offered as BIOC 430, CHEM 430, PHOL 430, and PHRM 430.
PHOL 432. Cell Structure and Function. 3 Units.
This course provides knowledge regarding cell structure and function, chiefly in mammalian cells but also in relevant model systems. The basic structure of the cell is discussed, as are various systems that regulate this structure. Topics to be covered include DNA transcription, translation and protein synthesis, intracellular transport, cell interaction with the external environment, cell cycle regulation, cell death and differentiation, signal transduction, and cell specialization and organization into tissues. The course emphasizes lectures and problem-based discussions with an emphasis on faculty-directed student self-learning. The major goals of this course are to provide students with a working knowledge of the cell to facilitate understanding of the scientific literature, and to familiarize students with current techniques in cell biology.

PHOL 451. Independent Study. 1 - 18 Unit.
Guided program of study using physiology textbooks, research reviews, and original research articles. An independent laboratory research project may also be included.

PHOL 456. Proteins and Nucleic Acids. 3 Units.
The goal of this course is to provide a basic working knowledge of protein structure/function and molecular biology. The course begins with a discussion of protein structure and enzyme catalysis followed by protein purification and characterization. The course then addresses concepts relating to the application of modern molecular biology techniques. Students are taught how to clone genes and use these clones in animal and cell-based studies. The overall goal is to provide students with an understanding of proteins and genetic approaches that can be used in experimental work and to facilitate comprehension of the scientific literature. Offered as BIOL 457 and PHOL 456.

PHOL 466. Cell Signaling. 3 Units.
This is an advanced lecture/journal/discussion format course that covers cell signaling mechanisms. Included are discussions of neurotransmitter-gated ion channels, growth factor receptor kinases, cytokine receptors, G protein-coupled receptors, steroid receptors, heterotrimeric G proteins, ras family GTPases, second messenger cascades, protein kinase cascades, second messenger regulation of transcription factors, microtubule-based motility, actin/myosin-based motility, signals for regulation of cell cycle, signals for regulation of apoptosis. Offered as CLBY 466 and PHOL 466 and PHRM 466.

PHOL 467. Topics in Evolutionary Biology. 3 Units.
The focus for this course is on a special topic of interest in evolutionary biology will vary from one offering to the next. Examples of possible topics include theories of speciation, the evolution of language, the evolution of sex, evolution and biodiversity, molecular evolution. ANAT/ANTH/EEPS/PHIL/PHOL 467/BIOL 468 will require a longer, more sophisticated term paper, and additional class presentation. Offered as ANTH 367, BIOL 368, EEPS 367, PHIL 367, ANAT 467, ANTH 467, BIOL 468, EEPS 467, PHIL 467 and PHOL 467.

PHOL 468. Membrane Physiology. 3 Units.
This student-guided discussion/journal course focuses on biological membranes. Topics discussed include thermodynamics and kinetics of membrane transport, oxidative phosphorylation and bioenergetics, electro-physiology of excitable membranes, and whole and single channel electrophysiology, homeostasis and pH regulation, volume and calcium regulation. Offered as CLBY 468 and PHOL 468.

PHOL 475. Protein Biophysics. 3 Units.
This course focuses on in-depth understanding of the molecular biophysics of proteins. Structural, thermodynamic and kinetic aspects of protein function and structure-function relationships will be considered at the advanced conceptual level. The application of these theoretical frameworks will be illustrated with examples from the literature and integration of biophysical knowledge with description at the cellular and systems level. The format consists of lectures, problem sets, and student presentations. A special emphasis will be placed on discussion of original publications. Offered as BIOC 475, CHEM 475, PHOL 475, PHRM 475, and NEUR 475.

PHOL 476. Cellular Biophysics. 4 Units.
This course focuses on a quantitative understanding of cellular processes. It is designed for students who feel comfortable with and are interested in analytical and quantitative approaches to cell biology and cell physiology. Selected topics in cellular biophysics will be covered in depth. Topics include theory of electrical and optical signal processing used in cell physiology, thermodynamics and kinetics of enzyme and transport reactions, single ion channel kinetics and excitability, mechanotransduction, and transport across polarized cell layers. The format consists of lectures, problem sets, computer simulations, and discussion of original publications. The relevant biological background of topics will be provided appropriate for non-biology science majors. Offered as BIOC 476, NEUR 477, PHOL 476, PHRM 476.

PHOL 480. Physiology of Organ Systems. 4 Units.
Our intent is to expand the course from the current 3 hours per week (1.5 hour on Monday and Wednesday) to 4 hours per week (1.5 hours on Monday and Wednesday plus 1 hour on Friday). Muscle structure and Function, Myostatin gravis and Sarcopenia; Central Nervous System, (Synaptic Transmission, Sensory System, Autonomic Nervous System, CNS circuits, Motor System, Neurodegenerative Diseases, Paraplegia and Nerve Compression); Cardiovascular Physiology (Regulation of Pressure and flow; Circulation, Cardiac Cycle, Electrophysiology, Cardiac Function, Control of Cardiovascular function, Hypertension); Hemorraghy, Cardio Hypertrophy and Fibrillation; Respiration Physiology (Gas Transport and Exchange, Control of Breathing, Acid/base regulation, Cor Pulmonaris and Cystic Fibrosis, Sleeping apnea and Emphysema); Renal Physiology (Glomerular Filtration, Tubular Function/transport, Glomerulonephritis, Tubulopathies); Gastro-Intestinal Physiology (Gastric motility, gastric function, pancreas and bile function, digestion and absorption, Liver Physiology; Pancreatitis, Liver Disease and cirrhosis); Endocrine Physiology (Thyroid, Adrenal glands, endocrine pancreas, Parathyroid, calcium sensing receptor, Cushing and diabetes, Reproductive hormones, eclampsia); Integrative Physiology (Response to exercise, fasting and feeding, aging). For all the classes, the students will receive a series of learning objectives by the instructor to help the students address and focus their attention to the key aspects of the organ physiology (and physiopathology). The evaluation of the students will continue to be based upon the students’ participation in class (60% of the grade) complemented by a mid-term and a final exam (each one accounting for 20% of the final grade). Offered as BIOL 480 and PHOL 480.
PHOL 481. Medical Physiology I. 6 Units.
Physiology is the dynamic study of life. It describes the vital functions of living organisms and their organs, cells, and molecules. For some, physiology is the function of the whole person. For many practicing clinicians, physiology is the function of an individual organ system. For others, physiology may focus on the cellular principles that are common to the function of all organs and tissues. Medical physiology deals with how the human body functions, which depends on how the individual organ systems function, which depends on how the component cells function, which in turn depends on the interactions among subcellular organelles and countless molecules. Thus, it requires an integrated understanding of events at the level of molecules, cells, and organs. Medical Physiology I is a lecture course (3, 2 hr. lectures/week). It is the first of a two-part, comprehensive survey of physiology that is divided into five blocks: Block 5 covers the physiology of the urinary system; Block 4 covers the respiratory system; Block 3 covers the cardiovascular system, and; Block 2 covers the nervous system; Block 1 covers the physiology of cells and molecules, signal transduction, basic electrophysiology, and muscle physiology; Block 6 covers the gastrointestinal system; Block 7 covers reproduction; and Block 9 covers the physiology of everyday life. Grading in the course will be based on performance on multiple choice/short essay examinations administered at the end of each block with each examination weighted according to the number of lectures contained in that block.

PHOL 482. Medical Physiology II. 6 Units.
Physiology is the dynamic study of life. It describes the vital functions of living organisms and their organs, cells, and molecules. For some, physiology is the function of the whole person. For many practicing clinicians, physiology is the function of an individual organ system. For others, physiology may focus on the cellular principles that are common to the function of all organs and tissues. Medical physiology deals with how the human body functions, which depends on how the individual organ systems function, which depends on how the component cells function, which in turn depends on the interactions among subcellular organelles and countless molecules. Thus, it requires an integrated understanding of events at the level of molecules, cells, and organs. Medical Physiology II is a lecture course (3, 2hr. lectures/week). It is the second of a two-part, comprehensive survey of physiology that is divided into five blocks: Block 5 covers the physiology of the urinary system; Block 6 covers the gastrointestinal system; Block 7 covers the endocrine system; Block 8 covers reproduction; and Block 9 covers the physiology of everyday life. Grading in the course will be based on performance on multiple choice/short essay examinations administered at the end of each block with each examination weighted according to the number of lectures contained in that block.

PHOL 483. Translational Physiology I. 2 Units.
Physiology is the dynamic study of life, describing the vital functions of living organisms and their organs, cells, and molecules. For some, physiology is the function of the whole person. For many practicing clinicians, physiology is the function of an individual organ system. For others, it focuses on the cellular principles that are common to the function of all organs and tissues. Medical physiology deals with how the human body functions, which depends on how the individual organ systems function, which depends on how the component cells function, which in turn depends on the interactions among subcellular organelles and countless molecules. Translational Physiology I will explore examples of how the latest basic research in physiology and biophysics is being applied to the treatment of human disease. For example, while the students are studying the basic principles of cardiovascular physiology, they will also be investigating how these principles are being applied to treat/cure human cardiovascular disorders such as congestive heart failure, coronary artery disease, high blood pressure, etc. Translational Physiology I is a lecture course (1, 2 hr lecture/week) taught primarily by clinical faculty. It is the first of a two-part course that follows the topics being simultaneously covered in the Medical Physiology I course. It is divided into four blocks: Block 1 covers the physiology of cells and molecules, signal transduction, basic electrophysiology, and muscle physiology; Block 2 covers the nervous system; Block 3 covers the cardiovascular system; and Block 4 covers the respiratory system. Grading in the course will be based on performance on multiple choice/short essay examinations administered at the end of each block with each examination weighted according to the number of lectures contained in that block.

PHOL 484. Translational Physiology II. 2 Units.
Physiology is the dynamic study of life, describing the vital functions of living organisms and their organs, cells, and molecules. For some, physiology is the function of the whole person. For many practicing clinicians, physiology is the function of an individual organ system. For others, it focuses on the cellular principles that are common to the function of all organs and tissues. Medical physiology deals with how the human body functions, which depends on how the individual organ systems function, which depends on how the component cells function, which in turn depends on the interactions among subcellular organelles and countless molecules. Translational Physiology II will explore examples of how the latest basic research in physiology and biophysics is being applied to the treatment of human disease. For example, while the students are studying the basic physiology of the urinary system, they will also be investigating how these principles are being applied to treat/cure human kidney disorders such as renal failure, high blood pressure, glomerular disease, polycystic kidney disease, etc. Translational Physiology II is a lecture course (1, 2hr lecture/week) taught primarily by clinical faculty. It is the first of a two-part course that follows the topics being simultaneously covered in the Medical Physiology II course. It is divided into five blocks: Block 5 covers the physiology of the urinary system; Block 6 covers the gastrointestinal system; Block 7 covers the endocrine system; Block 8 covers reproduction; and Block 9 covers the physiology of everyday life. Grading in the course will be based on performance on multiple choice/short essay examinations administered at the end of each block with each examination weighted according to the number of lectures contained in that block. Coreq: PHOL 482.
PHOL 498. Physiology and Biophysics Departmental Seminar. 1 Unit.
Weekly one-hour reviews by invited speakers of their research. Students present literature reviews or summaries of their research.

PHOL 505. Laboratory Research Rotation. 3 Units.
One-semester experience in a selected faculty research laboratory designed to introduce the student to all aspects of modern laboratory research including the design, execution and analysis of original experimental work. Recommended preparation: Consent of instructor and scheduled laboratory.

PHOL 512. Skeletal Biology. 3 Units.
This is an advanced graduate level course for students interested in the morphogenesis, structure, function, and maintenance of the skeletal system taught jointly by faculty from Case Western Reserve University (CWRU), Cleveland Clinic Foundation (CCF), and the Northeastern Ohio Universities College of Medicine (NEOUCOM). It will meet twice per week for 90 minutes per session. The format will include an overview of the topic by the responsible faculty, followed by a discussion of important papers on the topic. The students will be expected to discuss the papers for each session and grading will be based on those discussions. The intent of the course is to enable students to understand the important problems in skeletal biology and both classical and modern approaches for solving them.

PHOL 513. Structural Journal Club. 1 Unit.
Current topics of interest in structural biology, and protein biophysics. Offered as PHOL 513 and PHRM 513.

PHOL 514. Cardiovascular Physiology. 3 Units.
The goal of this course is to provide the student with a solid foundation in cardiovascular physiology and pathophysiology. The course will begin by providing a solid foundation in the structure, phenotype and function of cardiac and vascular muscle. In addition, electrophysiology and metabolism will be addressed. Both basic physiology and more advanced topics, such as pathophysiology, will be covered using a journal club format. (Twice weekly; 1.5hrs/class.) Student participation is required.

PHOL 519. Cardio-Respiratory Physiology. 3 Units.
This course is designed to integrate systemic, cellular and molecular aspects of cardio-respiratory systems in physiological and pathophysiological states. The course requires prior knowledge of basic physiology of the cardiovascular systems. Extensive student participation is required. Instructors provide a brief overview of the topic followed by presentation and critical appraisal of recent scientific literature by students.

PHOL 522. Special Topics in Cardiac Electrophysiology. 3 Units.
Introduction to current topics in cellular cardiac electrophysiology and cardiac ion channel structure, function, and regulation. The format includes informal lectures as well as student presentations and class discussion of current literature.

PHOL 530. Technology in Physiological Sciences. 3 Units.
This lecture/discussion/journal course focuses on techniques in the physiological sciences. Topics include spectroscopy, microscopy, and electrophysiology. The theory and practice are covered with an emphasis on examples taken from the scientific literature.

PHOL 537. Microscopy-Principles and Applications. 3 Units.
This course provides an introduction to various types of light microscopy, digital and video imaging techniques, and their applications to biological and biomedical sciences via lectures and hands-on experience. Topics covered include geometrical and physical optics; brightfield, darkfield, phase contrast, DIC, fluorescence and confocal microscopes; and digital image processing. Offered as GENE 537, MBIO 537, and PHOL 537.

PHOL 601. Research. 1 - 18 Unit.
Cellular physiology laboratory research activities that are based on faculty and student interests.

PHOL 610. Oxygen and Physiological Function. 3 Units.
Lecture/discussion course which explores the significance and consequences of oxygen and oxygen metabolism in living organisms. Topics to be covered include oxygen transport by blood tissues, oxygen toxicity, and mitochondrial metabolism. Emphasis will be placed on mammalian physiology with special reference to brain oxidative metabolism and blood flow as well as whole body energy expenditure and oxidative stress related to disease. Offered as ANAT 610 and PHOL 610.

PHOL 651. Thesis M.S.. 1 - 18 Unit.

Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
Doctor of Medicine (MD)

Programs Leading to MD

Today, applicants can choose from three paths to obtain a medical degree at Case Western Reserve University: the University Track, the College Track (Cleveland Clinic Lerner College of Medicine of Case Western Reserve University), and the Medical Scientist Training Program (p. 793). Students in all three programs:

- are introduced to clinical work and patients almost as soon as they arrive on campus.
- learn medicine using an integrated, organ system-based approach.
- are treated as junior colleagues by faculty members.
- are taught the science of medicine infused with the skills of communication and compassion.
- learn how to learn, a skill they will call on throughout their careers in the quickly changing field of medicine.

Educational Authority

Governance of the educational programs leading to the medical degree resides in the Faculty of Medicine. Each class of students selects representatives who become voting members of the Faculty of Medicine. The faculty of the School of Medicine is responsible for the content, implementation and evaluation of the curriculum. The dean of the School of Medicine serves as its chief academic officer with overall responsibility to the university for the entire academic program. The vice dean for education and academic affairs carries the dean’s academic and administrative authority and has direct supervisory responsibility over the units that lead and support the curriculum.

The faculty’s Committee on Medical Education (CME) evaluates, reviews and makes recommendations concerning overall goals and policies of the School’s medical education program which includes the University and College tracks. Acting for the faculty, the Committee on Medical Education is responsible for 1) the formal approval and adoption of the School’s educational program objectives and ongoing monitoring to ensure that the objectives serve as guides for establishing curriculum and provide the basis for evaluating program effectiveness; 2) the review class cohort performance in each track’s competencies; and 3) the evaluation of the overall content and appropriateness of the educational program and curriculum leading to the MD degree. The faculty elects the majority of the members of the Committee on Medical Education; student representatives also serve on this committee and its curriculum councils.

The operational responsibility for the medical curriculum is invested in curriculum councils that report to the Committee on Medical Education. There are five Curriculum Councils: (a) the Curriculum Monitoring Council (University track), (b) the Medical Science Education Council (University track), (c) the Clinical Curriculum Council (University track), (d) the Curriculum Steering Council (College track), and (e) the Joint Clinical Oversight Group. These councils are responsible for the strategic planning, content, design, selection of teaching leadership, and oversight of the curriculum, student assessment and program evaluation.

Expectations for Personal and Professional Characteristics

Students are evaluated on knowledge base, clinical skills and professional behavior and attitudes. The following characteristics are evaluated throughout the medical curriculum, and students are expected to adhere to these standards in both their academic and personal pursuits:

Interpersonal relationships: Provides supportive, educational and empathetic interactions with patients and families, and is able to interact effectively with “difficult” patients. Demonstrates respect for and complements roles of other professionals, and is cooperative, easy to work with; commanding respect of the health care team.

Initiative: Independently identifies tasks to be performed and makes sure that tasks are completed. Performs duties promptly and efficiently, and is willing to spend additional time, assume new responsibilities, and able to recognize the need for help and ask for guidance when appropriate.

Dependability: Completes tasks promptly and well. Present on time and actively participates in clinical and didactic activities. Always follows through and is exceptionally reliable.

Integrity and honesty: Demonstrates integrity. Is honest in professional encounters. Adheres to professional ethical standards.

Tolerance: Demonstrates exceptional ability to accept people and situations. Acknowledges her or his biases and does not allow them to affect patient care.

Function under stress: Consistently maintains professional composure and exhibits good clinical judgment in stressful situations.

Appearance: Always displays an appropriate professional appearance.

Graduation

A medical student who has satisfactorily met the standards and achievement levels for the core competencies of the medical school track in which he or she is enrolled may be granted the degree of doctor of medicine (MD) by Case Western Reserve University, provided that:

1. He or she has been registered at Case Western Reserve University School of Medicine for at least four academic years, (five years for the College track) or has transferred to the University Track after two years at another accredited medical school.

2. The Committee on Students for the University Track or the Medical Student Promotions and Review Committee for the College Track approves his or her record of performance, and the faculty recommends him or her to the trustees for graduation.

3. He or she has discharged all financial obligations to the university and to the track in which he or she is enrolled.

4. He or she has taken the U.S. Medical Licensing Examination (USMLE) Steps 1 and 2 and the USMLE Step 2 Clinical Skills Examination, and has obtained a minimum passing score on the examinations as determined by the USMLE Composite Committee. There are other academic requirements that must be met which are delineated in another section. The requirements for graduation of any class may be altered by action of the faculty of the School of Medicine.

Licensure

Licensure to practice medicine in the United States and its territories is a privilege granted by the individual licensing boards of the states and territories. Each licensing board of the individual jurisdictions establishes its policies, eligibility and requirements for the practice of medicine within its boundaries pursuant to statutory and regulatory provisions. The degree of doctor of medicine awarded by Case Western Reserve University is an academic degree and does not provide a legal basis for the practice of medicine.
The Electronic Curriculum

The School of Medicine has developed an integrated electronic curriculum for all years of the medical curriculum that contains a list of learning objectives as well as the resources that allow the students to achieve the objectives. These resources include references to traditional textbooks and journal articles, original textual material, PowerPoint files, illustrations, animations, videos, audio files, and links to Internet-based learning resources (including original journal articles in electronic format). These resources are made available on the Internet by an NT/Internet server system.

University track students have access to the Internet and the electronic curriculum from their assigned personal desks via fiber optic Ethernet connection to CWRUnet and via wireless access when away from their desks. College track students have access to the Internet and the College track curriculum via wireless access at the Cleveland Clinic.

Medical Student Organizations

The list of organizations and activities available to medical students continually evolves to reflect the interests of current students. Visit here for the most up-to-date list of student organizations. (http://casemed.case.edu/csr/organizations.html)

Admission

There are three paths to a medical degree at Case Western Reserve University School of Medicine: the University Track, the Cleveland Clinic Lerner College of Medicine of Case Western Reserve University (College Track), and the Medical Scientist Training Program (MSTP). Inquiries about admission and application should be addressed to the appropriate office:

Office of Admissions-University Track
School of Medicine
10900 Euclid Avenue
Cleveland, Ohio 44106-4920
Phone: 216.368.3450 or casemed-admissions@case.edu

Office for Admissions and Student Affairs-College Track
Cleveland Clinic Lerner College of Medicine of Case Western Reserve University
9500 Euclid Avenue NA21
Cleveland, Ohio 44195
Phone: 216.445.7170 or 866.735.1912 or cclcm@ccf.org (http://bulletin.case.edu/schoolofmedicine/md/mailto://cclcm@ccf.org)

Medical Scientist Training Program
School of Medicine
Case Western Reserve University
10900 Euclid Avenue
Cleveland, Ohio 44106-4936
Phone: 216.368.3404 or mstp@case.edu

Getting Started

Students wishing to apply to any MD program at the School of Medicine must initiate the process on the internet through the American Medical Colleges Application Service (AMCAS). Visit AMCAS (https://www.aamc.org/students/applying/amcas) to learn more about the medical school application process.

Admissions Process

After the American Medical College Application Service (https://www.aamc.org/students/applying/amcas) (AMCAS) receives an applicant’s electronic application, he or she receives an e-mail directing him or her to the CWRU School of Medicine online secondary (final) application where the applicant can designate to which MD track(s) they wish to apply. Applicants can apply to both MD tracks and/or the MSTP track. It is possible for an applicant to be interviewed by and receive an admission offer from both the University track and the College track.

Applicants should complete this secondary application as instructed. After the applicant has submitted the secondary application and all supporting materials, the appropriate admissions committee will review the information and decide whether to invite the applicant for an interview. After the interview, the committee will decide whether to extend an offer of admission. Applicants are notified of the committee’s decision no later than May 1.

Admissions Criteria

Although academic credentials are important in the admissions process, high grades and a high score on the MCAT are not the only criteria for admission. Just as important are interpersonal skills, exposure to medicine, well-roundedness and qualities such as professionalism, empathy and leadership ability. The School of Medicine includes a widely diverse student body.

Academic Requirements

In order to understand modern biomedical information, you must have a solid foundation in the basic sciences. At a minimum, the potential applicant should engage in the following coursework:

- **Biology** - Students ordinarily satisfy this requirement if they’ve taken a one-year biology course, including lab, that stresses molecular and quantitative concepts. Courses in taxonomy, botany and ecology will not satisfy this requirement.
- **General/Inorganic and Organic Chemistry** - Students normally meet this requirement if they’ve completed a one-year course in basic chemistry with lab and a one-year course in organic chemistry with lab.
- **Basic Physics** - Students generally satisfy this requirement if they’ve taken a one-year course in physics with lab.
- **Writing skills** - Students typically meet this requirement if they’ve taken one semester of an introductory course in expository writing. The committee will consider other courses that required extensive writing, however.
- **Biochemistry** - A course in biochemistry is required of all students applying to the Cleveland Clinic Lerner College of Medicine Program. It is not required (although highly recommended) for those applying to the University Track and MSTP.
- **Calculus** - One year of college Calculus is required for students applying to the Medical Scientist Training Program.

If these pre-requisites were not fulfilled at an accredited, four-year, degree-granting American or Canadian college or university, the applicant should be prepared to take at least 1 year of challenging, upper-level sciences at one of these institutions prior to application.

If all science pre-requisites were taken at a community college, the committee strongly recommends that the applicant take at least of year of upper-level sciences from an accredited four-year degree granting university within the United States or Canada. If a few science pre-
requisite courses were taken at a community college, the committee will evaluate them on a case-by-case basis.

**AP credits** are acceptable for physics and general chemistry. They are **not acceptable** for organic chemistry or biology. If a student does have AP biology credits, they must complete two upper level biology courses to satisfy the premedical requirements.

As an undergraduate, students should pursue a major in a subject of their own choosing; they should not structure their undergraduate experiences in an attempt to sway the medical school admissions committee. Most applicants to medical school, however, are chemistry or biological science majors.

**Financial Aid**

About 70 percent of the University Track’s medical students receive some financial aid based strictly on financial need. It’s impossible to provide precise figures on financial aid before each specific situation is completely analyzed, but here is a description of the general aspects of the process:

The School of Medicine adheres to the unit loan concept used by most private medical schools. Under this concept, if a student qualifies for financial aid, he or she is expected to obtain a specific portion of his or her support from outside sources such as a Federal Direct Loan, savings and family. Once the student obtains this amount, the remaining aid would be provided through School of Medicine resources, up to the amount determined to be his or her reasonable need. The school’s contribution would be a combination of loan and scholarship, with the exact ratio determined by the student’s particular circumstances.

All students within the College Track receive full scholarship covering tuition and fees. Programs such as the Medical Scientist Training Program, the MD/PhD in health services research program, and others offer financial support for participants. For more information, see other entries in this publication and contact the specific program.

Also, the University Track offers a number of merit scholarships annually to each class though its Dean’s Scholars program and David Satcher, MD, PhD-Rubens Pamies, MD Minority Student Scholarship program. These scholarships, which vary in annual amounts are awarded for up to four years for selected students. Application for the scholarships is by invitation of the admissions committee. Recipients are students with records of exceptional academic and personal achievement.

**To Those Currently in College**

The admissions committee give preference to candidates who will have completed the requirements for a bachelor of arts or bachelor of science degree before entering medical school. Most accepted candidates rank in the top one-third of their classes, and a large proportion of them have outstanding scholastic records.

The committee’s main considerations are the overall quality of college performance and general ability and potential. In most instances, applicants are given priority if they have completed all minimum academic requirements and have taken the MCAT by the time they submit their AMCAS applications. Although no special emphasis is placed on the applicant’s major / field of study, the committee strongly favors the concept of a broad, general college education.

Students who have been out of college a year or more:

Those who have been out of college for a year or more are encouraged to apply. Approximately half of the students at the School of Medicine have a year or more between the time they graduate from college and the time they enter medical school, and about 10 percent of them begin medical school when they are 30 years old or older.

Those two or more years removed from full-time college course work should plan to take challenging, advanced-level (junior-, senior- or graduate-level) courses in the biological sciences to prepare for entry.

**Overview of the University Track**

The University Track curriculum always has reflected the most current educational principles, practices, and knowledge. In the 1950s the School of Medicine was the first to introduce the organ systems approach to teaching the basic sciences. In July 2006, the University Track launched the Western Reserve2 Curriculum (WR2) to develop a learner-centered and self-directed curriculum framework and implement dynamic small group learning teams. Students learn in an environment that fosters scientific inquiry and excitement. The School prepares students for the ongoing practice of evidence-based medicine in the rapidly changing healthcare environment of the 21st century.

The WR2 Curriculum has high expectations for self-directed learning, and seeks to train physician scholars who are prepared to treat disease, promote health and examine the social and behavioral context of illness. It interweaves four themes - 1) research and scholarship, 2) clinical mastery, 3) teamwork and leadership, and 4) civic professionalism and health advocacy to prepare students for the ongoing practice of evidence-based medicine in the rapidly changing healthcare environment of the 21st century.

Scholarship and clinical relevance are the benchmarks for learning, and clinical experiences and biomedical and population sciences education are integrated across the four years of the curriculum. The WR2 Curriculum also creates an independent, educational environment where learning is self-directed and where student education primarily occurs through:

1. facilitated, small-group student-centered discussions
2. large group interactive sessions such as Team-Based Learning or didactic sessions that offer a framework or synthesis
3. interactive anatomy sessions
4. clinical skills training
5. patient-based activities

Clinical experiences begin in the first week of the University Track when students participate in community-based health care field experiences. In the second month of medical school, students begin the Rotating Apprenticeship in Medicine Program (RAMP). This program involves students in several patient care settings. In January of the first year, the Community Patient Care Preceptorship (CPCP) rotations begin. Each student works with a community physician one afternoon a week for 3 months.

Research and Scholarship begin early in the curriculum with special sessions led by faculty engaged in cutting edge research. In the summer following year one, the majority of students engage in summer research opportunities. All students participate in a mentored 16-week experience in research and scholarship and complete an MD thesis prior to graduation.

Electronic resources make the most of classroom time while improving opportunities for self-directed learning and capitalizing on the innovative technology available at Case Western Reserve University.
A key component of the University Track is the unscheduled time on Thursday mornings and weekday afternoons. Students use this time for self-directed learning as well as to pursue a joint degree, take electives, participate in interest groups, shadow a practicing physician, or become active in student organizations.

Each student in the University Track is a member of one of the following advising societies: Emily Blackwell Society, Frederick Robbins Society, David Satcher Society, or Joseph Wearn Society. Each society is headed by an advising dean, who helps the students navigate the curriculum, advises them on residency and career planning, and writes their dean’s letters. The society deans hold regularly scheduled small group and individual meetings with the students. The society deans are all members of the faculty of the School of Medicine and participate actively in the educational programs of the school. Some aspects of the curriculum are coordinated through the societies.

The University Track in Detail
The Western Reserve2 Curriculum (WR2) has high expectations for self-directed learning, and seeks to train physician scholars who are prepared to treat disease, promote health and examine the social and behavioral context of illness. It interweaves four themes of research and scholarship, clinical mastery, teamwork and leadership, and civic professionalism and health advocacy, to prepare students for the ongoing practice of evidence-based medicine in the rapidly changing healthcare environment of the 21st century.

Scholarship and clinical relevance are the benchmarks for learning, and clinical experiences and biomedical and population sciences education are integrated across the curriculum. The WR2 Curriculum also creates an independent, educational environment where learning is self-directed and where student education primarily occurs through:

1. facilitated, student-centered learning teams
2. large group interactive sessions such as Team-Based Learning or didactic sessions that offer a framework or synthesis of a concept area
3. interactive anatomy sessions
4. clinical skills training
5. patient-based activities

Education throughout the Four Years Is Centered on:

1. Fostering experiential and interactive learning in a clinical context;
2. Stimulating educational spiraling by revisiting concepts in progressively more meaningful depth and increasingly sophisticated contexts;
3. Promoting integration of the biomedical and population sciences with clinical experience;
4. Transferring concepts and principles learned in one context to other contexts;
5. Enhancing learning through deliberate practice, or providing learners with direct observation, feedback, and the opportunity to practice in both the clinical environment and in the CWRU School of Medicine’s Mt. Sinai Skills and Simulation Center.

The Western Reserve2 Curriculum has 10 Guiding Principles:

1. The core concepts of health and disease prevention are fully integrated into the curriculum.
2. Medical education is experiential and emphasizes the skills for scholarship, critical thinking, and lifelong learning.
3. Educational methods stimulate an active interchange of ideas among students and faculty.
4. Students and faculty are mutually respectful partners in learning.
5. Students are immersed in a graduate school educational environment characterized by flexibility and high expectations for independent study and self-directed learning.
6. Learning is fostered by weaving the scientific foundations of medicine and health with clinical experiences throughout the curriculum. These scientific foundations include basic science, clinical science, population-based science, and social and behavioral sciences.
7. Every student has an in-depth mentored experience in research and scholarship.
8. Recognizing the obligations of physicians to society, the central themes of public health, civic professionalism and teamwork & leadership are woven through the curriculum.
9. The systems issues of patient safety, quality medical care, and health care delivery are emphasized and integrated throughout the curriculum.
10. Students acquire a core set of competencies in the knowledge, mastery of clinical skills and attitudes that are pre-requisite to graduate medical education. These competencies are defined, learned and assessed and serve as a mechanism of assessment of the school’s success.

Curricular Composition
The four years of the WR2 Curriculum are divided into four major components, each of which focuses on health as well as disease.

Foundations of Medicine and Health
This component is made up of six curricular blocks.

The first block, Becoming a Doctor, is five weeks in duration, and gives students an understanding of population health and the doctor’s role in society. Typically students begin their medical education by studying basic science at the molecular level, and are often not fully aware of the relevance that this knowledge has in their future education as physicians or how it relates to the actual practice of medicine. This curricular block focuses on how physicians can act as advocates for their patients in the health care system; how social and environmental factors impact health; and the importance of population health. Medical students participate in an Extensive Care Unit, an experiential, longitudinal, service learning project intended to introduce them to key population health concepts including epidemiology, biostatistics, community assessment, health risk behavior, and social-environmental determinants of health.

The next five blocks in the Foundations of Medicine and Health are comprised of basic science education complemented by clinical immersion experiences, early contact with patients in clinical preceptorships and simulated clinical experiences. Subject matter is integrated across entire biological systems, which permits faculty in the different disciplines to leverage teaching time to convey content and concepts common to their disciplines. Content is divided into the following blocks:

- **The Human Blueprint**: Comprised of endocrine, reproductive development, genetics, molecular biology, and cancer biology.
- **Food to Fuel**: Encompasses gastro-intestinal system, nutrition, energy, metabolism and biochemistry.
• **Homeostasis:** Includes cardiovascular system, pulmonary system, renal system, cell regulation, and pharmacology.

• **Host Defense and Host Response:** Focuses on host defense, microbiology, blood, skin, and the auto-immune system.

• **Cognition, Sensation and Movement:** Comprising of neurosciences, mind, and the musculoskeletal system.

Several themes stretch longitudinally across these blocks, including anatomy, histopathology and radiology, as well as clinical mastery. Teamwork, interprofessional collaboration and bioethics are likewise incorporated longitudinally.

Blocks 2-6 follow a common pattern. Each block has a Clinical Immersion Week and each has a Reflection and Integration Week. During the Clinical Immersion Week, students leave the classroom and enter the clinical setting to see the relevance of the basic science they have been studying as the concepts are used in the setting of patient care.

The Reflection and Integration week is the final week of blocks 2-6. During this week, no new material is introduced. Learning activities are planned to help students spiral back to concepts introduced earlier in the block by presenting these concepts again, sometimes in new contexts, and now integrated with other concepts previously learned. End of block assessment takes place during the reflection and integration week.

**Research and Scholarship**

The WR2 Curriculum is in concert with CWRU’s emphasis on research and scholarship to encourage student career development in the areas of clinical investigation and population research. The practice of medicine is becoming increasingly evidence and science-based, and research teaches students a way of framing questions and developing an approach to answering them. The focus on research and scholarship provides students with opportunities to pursue individualized areas of interest in great depth. Through this 16-week, mentored experience in research and scholarship (which can be taken at any point from March of the second year onward), students acquire the intellectual tools needed to formulate research questions, critically assess scientific literature and continue the life-long pursuit of learning that is a critical aspect in the careers of all physicians and physician/scientists. The research project culminates in a thesis, which is written in the format of a manuscript of the leading journal in the particular area of interest.

**Clinical Experiences**

The clinical curriculum cuts across all four years of the medical school curriculum, and can be divided into three areas of involvement:

1. **Foundations of Clinical Medicine:** This segment of the clinical curriculum runs longitudinally through the Foundations of Medicine and Health and seeks to develop a broad range of clinical and professional capabilities. FCM develops the necessary skill sets through 4 separate, but integrated, programs:

   • **Tuesday Seminars:** Course continues the theme of “doctoring” begun in Block 1 through the Year 1 and Year 2 curriculum. Topics examined include the relationship between the physician and the patient, the family and the community; professionalism; healthcare disparities; cultural competence, quality improvement; law and medicine; medical error/patient safety, development of mindful practitioners and end of life issues.

   • **Communications in Medicine:** Course is comprised of seven workshops running through Year 1 and Year 2 that focus on the range of skills needed for effectively talking with patients including the basic medical interview, educating patients about a disease, counseling patients for health behavior change, and presenting difficult news and diagnosis.

   • **Physical Diagnosis:** Course runs throughout Year 1 and Year 2 and includes: Physical Diagnosis 1 introducing the basic adult exam to Year 1 students for one session per week for eight weeks, Physical Diagnosis 2 in depth regional exams in various formats during Year 1 and Year 2, and Physical Diagnosis 3 in Year 2 where students spend five session doing complete histories, physicals and write ups on patients they see in an in-patient setting.

   • **Patient-based Programs:** RAMP: Rotating Apprenticeships in Medical Practice is a Year 1 course where students rotate through patient care encounters in multiple settings. This course is designed to expose students to various clinical settings to enhance observational and reflection skills in the context of the doctor/patient relationship and the role of physicians in society. CPCP: Community Patient Care Preceptorship during either Year 1 or Year 2 students spend 11 afternoons in a community physician’s office developing and reinforcing medical interviewing, physical exam and presentation skills (written and oral) with ongoing mentorship from a preceptor and an innovative online curriculum.

2. **Core Clinical Rotations:**

The Core Clinical Rotations are designed to provide students from both the University and College tracks of the Medical School with both breadth and depth in clinical care. Experiences are developmental, with opportunities to reinforce, build upon, and transfer knowledge and skills from all parts of the curriculum. Clinical learning is integrated across disciplines whenever possible through a unique block structure, and important themes related to scholarship, humanism, and science are supported through specially designed weekly small group programs. A unified approach to addressing and assessing a core clinical curriculum is utilized at all teaching sites with the flexibility to take advantage of the unique strengths of each clinical setting.

   • **Core Rotations:** Beginning in March of their second year, students have the opportunity to begin their core clinical rotations. These rotations are organized in blocks of that integrate core specialties in at one site for 8 or 12 weeks. Core 1 combines Internal Medicine, Family Medicine, and Geriatrics for 12 weeks, Core II combines Pediatrics and OB/Gyn for 12 weeks, Core 3 combines Neuroscience and Psychiatry for 8 weeks, and Core 4 combines Surgery and Emergent Care for 8 weeks. Each of these clinical rotations is offered at all of the School of Medicine’s hospital affiliates (including University Hospitals of Cleveland, the Cleveland Clinic Foundation, MetroHealth Medical Center and the Louis Stokes VA Medical Center), and the Basic Core 2 rotation is also offered as a longitudinal integrated clerkship at Kaiser Permanente.

3. **Advanced Clinical and Scientific Studies**

Advanced clinical and scientific studies provide students with flexible learning opportunities that support ongoing professional development and residency preparation and planning:

   • Two Acting Internships are required: one in Internal Medicine, Surgery, Pediatrics, or Inpatient Family Medicine, and one in a area of student choice.

   • One Acting Internship and all electives can potentially be done outside of the CWRU system.
• Students are encouraged to augment their interest in scholarship through rotations and activities that focus on sciences basic to medicine as well as clinical rotations.

Evaluation and Assessment

Student assessment in the WR2 Curriculum is designed to accomplish three goals:

1. drive the types of conceptual learning and scientific inquiry that are goals for the WR2 Curriculum
2. assess whether students have attained the level of mastery set for each phase of the curriculum
3. prepare students for medical licensure

These three goals are accomplished through multiple assessment methods.

Independent study and inquiry are hallmarks of WR2 through assessment strategies that are formative, focus on the synthesis of concepts, and promote student responsibility for the mastery of skills and material. The following assessments are used in Foundations of Medicine and Health:

1. Assessment of students’ participation in weekly Case Inquiry (IQ) groups by faculty facilitators, utilizing observable behavior anchors and focusing on contributions to teamwork and content, critical appraisal skills, and professional behaviors.
2. Synthesis Essay Questions (SEQs). Weekly, formative, open book concept reasoning exercises in which students are given a brief written clinical scenario and asked to explain a clinical phenomenon and its basic science underpinnings. Throughout a teaching block, students complete SEQs at the end of each week. They compare their own answers to an ‘ideal’ answer and receive feedback from their IQ group facilitator.
3. Summative Synthesis Essay Questions (SSEQs), or exercises that measure what students know at specific points in their education, are closed book exercises with approximately 5 clinical vignettes that take an estimated 3-4 hours to complete. These SSEQs are based on the synthesis essays students have been assigned throughout the block. In the final week of the block SSEQs present concepts from previous exercises in new contexts and require concept integration. These summative exercises are scheduled at the end of each large teaching module (every 3-4 months) and are graded by faculty.
4. Structure Practical Exercises. These assessments occur in the final week of blocks 2-6 and assess anatomy, histo-pathology and radiology through clinical scenarios and questions that require anatomic localization and histo-pathologic identification.
5. Self-Assessment Multiple Choice Questions (MCOs). Throughout each 12 week teaching block students are required to complete MCOs. These are drawn from the School of Medicine’s extensive bank of questions which are mapped to learning objectives for the block. Students use these MCOs throughout the block as a study aid and method of self-assessment.
6. Cumulative Achievement Tests (CAT). At the end of each block, students complete a secure formative MCO achievement test, based on content covered in the current teaching block as well as on content from each previous block. These exams are designed utilizing test question resources available through the National Board of Medical Examiners (NBME). Tests will become progressively longer throughout the Foundations of Medicine and Health. The final CAT reflects material across all curriculum blocks. These formative tests enable students to gain perspectives on their overall progress and preparedness for the USMLE Step 1.
7. Student progress in Foundations of Clinical Mastery is measured by small group facilitator assessment in the Seminars of Clinical Practice, direct observation of skills, preceptor evaluation of patient-based activities, and OSCE examinations.
8. Personal Learning Plan. During the Block, students review learning objectives and reflect on their learning, identifying their strengths and areas for further study. A reflective essay is completed that links to pieces of evidence, accumulated throughout the block, to support areas of strength and areas for further growth that have been identified. Students, working with their Society Deans develop a plan for further learning.

The WR2 Curriculum provides students with a focused education that is faculty directed and student centered. Classroom hours are limited. The content of WR2, organized across biological systems, provides students with an integrated view of medicine and health and an understanding of how the basic sciences and clinical practice relate to one another. The flexibility of WR2 permits students to explore in depth an area of interest to them alongside a mentor. The curriculum places great emphasis on the social and behavioral context of health and disease as well as on population medicine which will prepare students to face the emerging challenges of today’s health care system.

Assessment for Promotion and Graduation

The faculty of the School of Medicine is charged with assessing student performance, including knowledge, skills and personal characteristics that are important qualities of a responsible, competent and humane physician. This responsibility is delegated by the faculty to the Committee on Students, a standing committee of the faculty of medicine, with a majority of its members faculty-elected.

The Committee on Students reviews the performance of every medical student in the University Track during each of the four years, determines each student’s continuing status as a student in the school, and recommends candidates for graduation. The committee reviews a medical student’s total performance, which includes the usual indices such as formal grades and assessments, as well as the professional attitudes and behavior manifested by the student. Medical education entails the mastery of didactic, theoretical, and technical matters as well as the demonstration of appropriate professional and interpersonal behavior, sensitivity, sense of responsibility and ethics, and the ability to comport oneself suitably with patients, colleagues and co-workers. To be eligible for promotion and graduation, students must complete the requirements and perform satisfactorily in all components of the curriculum. Medical students in the University Track are graded “satisfactory” or “identified for remediation” in the first two years and as “honors,” “commendable,” “satisfactory,” “unsatisfactory,” or “incomplete” in the clerkships of the third and fourth years. There is no class ranking. Medical students must obtain a passing score on the United States Medical Licensing Examination (USMLE) Step 1, Step 2 Clinical Knowledge (CK) and Step 2 Clinical Skills(CS) to be eligible for graduation.

Overview of the College Track

The Cleveland Clinic Lerner College of Medicine (CCLCM) is a distinct 5-year track within the School of Medicine. In 2002, Cleveland Clinic and CWRU formed a historic partnership to collaborate in education and research through creation of the CCLCM. As stated in the affiliation
agreement between the two institutions, “the principal purpose and educational mission of the College shall be to attract and educate, in specially designed programs, a limited number of highly qualified persons who seek to become physician investigators and scientists who will advance biomedical research and practice.” To achieve this mission, the CCLCM selects students with a desire to pursue careers as physicians and researchers, educates them to be excellent doctors, nurtures their curiosity about science and medicine, provides them with substantive research experience and core research skills, and offers financial support to ensure that excess debt does not preclude their ability to follow careers in research and medicine.

The College Track in Detail

Training the Physician Investigators of Tomorrow: A Synopsis of the Program

Recognizing the critical shortage of physicians engaged in research, the College Track offers an educational program that provides medical students with the necessary skills and knowledge to enter academic residencies and pursue successful careers as basic, translational or clinical investigators and expert doctors – without requiring them to complete an advanced degree in addition to the MD. Graduates are expected to be scientifically inquisitive, to be life-long learners, to be independent thinkers with excellent teamwork skills, to have broad-based research knowledge as well as strong clinical acumen, and to be reflective practitioners of medicine and science who take a critical approach to self-assessment and self-improvement. All three components of the curriculum – basic science, clinical and research – in addition to the advising and assessment processes have been created to support the development of these attributes in our medical students.

The basic science curriculum applies adult learning principles, building on problem-based learning (PBL) to create an early link between clinical problems and basic science learning and to help students develop their skills in hypothesis generation, critical thinking, self-identification of learning objectives, oral presentation and teamwork. Almost all faculty-student contact time involves some form of active learning – graduate school-style seminars and problem sets rather than lectures, case-based anatomy sessions using prostheses and cross-sectional images rather than full cadaver dissections, interactive lab sessions rather than demonstrations, and journal clubs. To support this educational model, curriculum schedules provide extensive time for independent study. The basic science curriculum is organ-system based, with the disciplines of anatomy/embryology, biostatistics/epidemiology, cell biology, histology, imaging, immunology, pathology, pharmacology, physiology, infectious disease, oncology, genetics, evidence based medicine, bioinformatics and ethics designated as curricular threads woven through every organ-based basic science course and extending into the year 3-5 clinical curriculum. Learning objectives for the thread disciplines are used to determine the organ system curriculum structure in the first two years, with the goal of providing a logical, coherent two-year curriculum in each of these topics basic to medicine. Courses in Year 1 focus on normal human structure and function; in Year 2, courses focus on pathophysiology of disease. Later, in Years 3 through 5, students revisit advanced basic science concepts in their core clinical rotations, clinical electives, and College track specific pullout sessions.

The clinical curriculum begins in the fall of the first year contiguous with the first basic science course in Year 1. At its foundation is a continuity teaching and learning experience with a primary care preceptor and his/her patients throughout the first two years. Students spend one half-day every other week in Year 1 and one half-day every week in Year 2 with the same preceptor. During Year 1, students learn core clinical skills in doctor-patient communications and physical diagnosis in sessions linked whenever possible to the basic science courses (e.g., learning the cardiac and lung exams during the Cardiovascular and Respiratory Sciences course and the basic neurological exam during the Neural and Behavioral Sciences course) and then practice those skills with real patients in their preceptors’ offices on alternate weeks. Once they have mastered the basics of the history and physical, they begin to apply their skills to more complete evaluations of ambulatory patients with direct observation and feedback from their preceptors. By the end of Year 2, students are capable of performing a complete history and physical and confidently evaluating adults with common outpatient problems.

In Year 2, students spend a second half-day each week in sessions focused on building advanced clinical skills or clinical activities designed to complement concomitant basic science systems topics (e.g., a session in the Diabetes Clinic during the week devoted to learning about Diabetes). The other key component of the clinical curriculum in Years 1 and 2 is the weekly Foundations of Clinical Medicine Seminar Series. This course focuses on principles of leadership and their application to medical practice, professionalism and ethics, health care systems, population medicine, and provides a setting for students to reflect on their experiences and observations of the health care system. In Years 3 through 5, students in CCLCM participate in the same core clinical experiences as students in CWRU’s University Track. Friday afternoon sessions in Years 3-5 bring CCLCM students together regardless of clinical location and focus on program-specific topics in research and human values.

During all five years there are close mentoring and advising relationships between students and faculty. To ensure this happens, at the beginning of medical school each student is assigned a physician advisor who serves as the student’s partner and guide in navigating and mastering the curriculum throughout all five years. In addition, during the first summer, each student is assigned to an experienced basic or translational research preceptor who integrates the student into all activities in his/her lab and provides guidance and feedback to the student in such areas as working effectively with the lab team, research design, data analysis, and oral and written presentations of research. During the second summer, each student develops a similar relationship with an experienced clinical researcher who includes the student as an active participant in one or more ongoing research projects. Students are exposed to a broad range of basic, translational and clinical researchers during the first two years – during the summer research blocks, during weekly research seminars (Advanced Research in Medicine series), at Deans’ Dinners where they discuss research careers with the speakers over dinner following a formal presentation of the speaker’s research, and in class during basic science and clinical courses. Students then select a research advisor for the master’s level research project on which they will spend 12 to 15 months during the last three years of medical school.

The College uses a unique approach to student assessment designed to enhance student learning and to promote self-directed learning. There are no grades for any course or rotation, and no class ranking. Instead, each student is expected to attain a defined level of achievement in each of 9 competencies. Seven of these defined competencies encompass the 6 core competencies defined for all US graduate medical education programs accredited by the ACGME (Accreditation Council for Graduate Medical Education) as well as research and personal development. Starting on the first day of medical school, students begin collecting evidence from faculty and peers of their progress in achieving the standards in each of the 9 competencies and reflecting on how the evidence demonstrates their development as doctors and researchers – the two interrelated professional roles for which they are preparing.
One of the principles of the College is that assessment drives learning – that a curriculum designed to foster self-directed learning and achievement of competencies is ineffective if assessment focuses on what the "teacher" said in class and factual recall. Therefore the College uses a student-centered, student-driven approach to assessment with strong support from the physician advisors who know the students well and guide them as they develop skills and self-confidence as self-directed learners.

Students gather a broad range of types of evidence over their five years of study and work as partners with their physician advisors to review the evidence and their reflections, to create individual learning plans to address areas of relative weakness, and to tailor the curriculum to build on their areas of particular strength. Evidence of achievement and reflections on progress in their professional development are collected in electronic Student Portfolios and used to document readiness for promotion and graduation from the program. By training students in accurate self-assessment and developing their reflective ability, we intend to send them out of medical school already skilled in the kind of independent, self-directed learning habits that will be required of them as residents and throughout the rest of their professional lives.

CCLCM’s Foundation: A Comprehensive Research Curriculum

The research curriculum begins on the first day of medical school with the basic and translational research block and extends throughout all five years of the College Track. Every student participates actively in a “bench” project in the first summer, prepares an oral presentation describing the project in the format used at most scientific meetings, and develops a mock research proposal that extends the summer research project to the next research question. In addition, students learn the basic principles of research design and data analysis, ethics of the use of animals in research, and critical appraisal and interpretation of the basic science research literature in a journal club. At the end of the summer students formally present their research project and findings to students and preceptors. Linked with the summer research curriculum is a core curriculum in basic biochemistry, cell biology, molecular biology and genetics.

The second summer is devoted to clinical research. Course work focuses on applied medical biostatistics, clinical epidemiology including appropriate design and analysis of various kinds of clinical research protocols, and ethical issues such as human subjects protection including a discussion of an Institutional Review Board (IRB) proposal with members of the IRB. Each student participates actively in an ongoing clinical research project and writes an original clinical research protocol to extend the summer research project to the next research question, prepares an oral presentation describing the proposed research protocol, and formally presents this proposal at the end of the summer.

During the remainder of Years 1 and 2, students participate in Advanced Research in Medicine (ARM), a weekly series of highly interactive research seminars linked to the content of the basic science courses. Molecular Medicine PhD students join to participate in ARM sessions. In Year 1 ARM 1 is designed to provide students opportunities for interaction with a wide range of successful investigators to help them understand the sequence of problem identification, exploring prior work in the area, hypothesis development, experimentation, successes and failures that lead to new research findings. ARM 1 also helps students appreciate the interaction between basic and clinical research – how basic science discoveries translate into changes in the clinical care of patients and how clinical observations or research findings result in new directions in basic science research. In ARM 2, the presentations are linked to the basic science content each week but are more focused on current research projects and development of well-constructed research questions and reinforcement of epidemiology and biostatistics principles learned in the Year 2 summer. The sessions take on the format of a formal research presentation at a scientific meeting. Several times during the year, the students are divided into small groups to develop research hypotheses and design research methods to evaluate the hypotheses.

Deans’ Dinners are held 2 times a year separately for the first and second year classes to provide students the opportunity to attend a formal research seminar by a distinguished physician investigator, followed by dinner and an informal question and answer period to learn how that investigator achieved success in his/her career. This is an opportunity to discuss different career options and pathways, the challenges of balancing research and clinical work, and approaches to balancing career and family or other interests. The goal is to provide role modeling as a supplement to the advising and mentoring systems in CCLCM, helping students gain an early understanding of the various approaches that can lead to successful careers in research for physicians.

By the end of Year 2, each student has experienced basic and clinical research first-hand, has met a large number of investigators with different research interests, has developed essential research skills, and is ready to choose an advisor to supervise and support his/her research project. A Thesis Committee made up of the research advisor and two or more additional faculty supervise and approve the student’s research proposal, progress, and final master’s level thesis that must be completed by February 15 of Year 5.

The last three years of the curriculum are specifically designed to provide flexibility to students in scheduling their research and clinical rotations. Working together, the student, research advisor and physician advisor tailor the curriculum to the student. Students complete their research projects in one 12- to 15-month block of time. Every student regardless of the overall schedule will continue to engage in clinical experiences at least one half-day per week during blocks devoted primarily to research – to ensure that students maintain clinical skills and contact with patients, develop a deeper appreciation of the connection between advances in biomedical research and patient care, and have the opportunity to reflect on their ongoing development as both physicians and researchers.

Throughout all five years of medical school, research topics are integrated with basic science and clinical content. Learning objectives for problem-based learning (PBL) cases in the basic science courses include identifying the latest advances in what is known about the basic science underlying a specific disease, with students encouraged by their facilitators to think about how they could go about finding the answer. Some of the core basic science concepts are learned from studying journal articles rather than textbooks, so students appreciate the research that led to current accepted basic science knowledge. Evidence-based practice is emphasized in the clinical curriculum and students are expected to identify clinical questions for which the evidence is lacking and think about ways to obtain it.

Curriculum Timeline: Years 1 and 2

Students begin Year 1 with a one week Orientation in which they are formally welcomed to the profession of medicine by the Deans and their physician advisors. The week includes individual meetings with the student’s summer research preceptor and physician advisor, an introduction to the unique assessment system and the Student Portfolio, and an introduction to the summer curriculum and its expectations. A White Coat Ceremony that commemorates the entry of all students in both the college and university tracks into the CWRU School of Medicine highlights the week.
The Basic and Translational Research Block occupies the first 10 weeks of Year 1 and includes a course reviewing core concepts in cell biology, molecular biology and biochemistry. Scheduled classes occur 4 days a week for 2 hours, with the remainder of each day devoted to independent study and hands-on experience in the lab of the student’s summer research preceptor. This block sets the stage for active learning in the rest of the curriculum. Throughout the core basic science course and all the basic science courses, each week has a conceptual “theme” within which more detailed learning objectives fall. All assignments and scheduled activities are designed to help students master the core concepts for the week. Mastery is defined as being able to explain the concepts and to apply them to new or different problems or situations, rather than simply “listing” all the factual details. Sessions for the core basic science course are held on Monday, Wednesday and Friday mornings and students are expected to study background material before class and self-assess their understanding of the readings. They then work together in class to solve complex problems related to what they have studied. Tuesday mornings are devoted to focused discussions and presentations related to the science topics discussed that week or introduce students to key concepts in areas such as genetics, oncology, and bioinformatics.

Students meet each Friday for a journal club aimed at enhancing skills in critically assessing the basic science research literature. Each week, two students present an article. The other students are expected to read the articles carefully and come prepared with questions. Each presenter works with a faculty facilitator to review the paper and presentation before journal club. Using feedback from faculty and other students on their presentations and on the questions they ask of others, students begin to hone their communication skills and develop confidence participating as speakers in this setting.

The primary focus of the Year 1 Basic and Translational Research Block is the summer research project. Students are assigned to a summer research preceptor with attention to individual preferences for specific research areas. They are expected to engage fully in all activities in the preceptor’s research group, such as special lab meetings or journal clubs, in addition to working on their defined project. At the end of week 2, they submit a draft plan for their summer research project and review it with their preceptor to set the expectations for the summer. During the summer students also develop a brief “mock” research proposal that extends their research project. At the end of week 5, they submit a draft outline of their brief research proposal. The final document is due in week 9. During week 10, students present their projects orally in the format used at many scientific meetings – a 10-minute presentation with audiovisuals followed by 5 minutes for questions. Thus, in addition to actually working on a “bench” project, students are guided by their preceptors in developing a number of other key skills. Students receive feedback from their preceptors, other members of the lab team, and peers on their contributions in the lab and their written and oral presentations.

At the end of the summer, students schedule their first formal meeting with their physician advisors to review the evidence in their Student Portfolios, to discuss their reflections on their development in their new professional roles, and to review their learning plans to address any specific weaknesses or gaps they have identified. They review feedback on their activities in small group and journal club, lab work, mock grant proposal, oral presentations and scientific writing. This evidence is provided by their summer preceptors, peers, and self-assessments of their mastery of the core basic science concepts. Just as the interactive learning in class sets the stage for research and the rest of the curriculum, the first summer sets the stage for student success in the unique assessment process used in College track.

Each week of the Year 1 and 2 basic science courses is organized around a theme that provides a focus of learning for the students and an opportunity to integrate when possible the basic science, clinical, and research curriculum components. For example, the theme of the last week of the Gastrointestinal System 1 course is “Liver, Gallbladder, and Pancreas”. The Problem-Based Learning (PBL) case focuses on a patient who takes an overdose of acetaminophen and alcohol and subsequently develops liver failure. Students learn normal liver function as they explore this case. (All PBL cases used in the curriculum are based on real cases at the Cleveland Clinic.) The case provides the frame work for the anatomy and other seminar sessions which focus on liver, gallbladder and pancreas anatomy, histology, drug elimination, and genetics. Friday Advanced Research in Medicine session is a meeting of the Liver Transplant Selection Committee attended by all the students where research, bioethics, and clinical care are integrated in the discussion of liver transplant applicants. During Years 1 and 2 the topics of the 3 Dean’s Dinners for each class are also coordinated with the basic science course and weekly theme.

The first basic science course in Year 1, Cardiovascular and Respiratory Sciences 1 (CRS1), is a 7-week course in which students learn basic concepts of the normal structure and function of these systems. There are 14 hours of scheduled curricular time each week in the basic science courses, including 6 hours devoted to PBL cases and 8 hours devoted to other activities such as labs, seminars, and problem sets.

Throughout Year 1, anatomy, imaging, and embryology are integrated into the basic science courses with information presented in two ways – self-directed learning modules that cover basic anatomical information (and are available online), and Case Directed Anatomy Sessions on Monday mornings for which students study clinical cases designed to introduce anatomical concepts and facts before coming to the lab. In the lab, students rotate among a number of stations using cadaver prosections to demonstrate anatomy relevant to the cases and radiological images such as 3-dimensional CT scans. For example, a case of a patient who has suffered a penetrating injury to the chest may be used to focus students on the anatomical structures that might be injured and their relationship to one another.

Histology is also integrated into the basic science courses, with students using a computer based virtual microscopy system rather than a mechanical microscope to look at slides. This allows students not only to scan slides but also to see slide annotations and related gross and radiographic images. Specific learning objectives for histology are included in PBL cases in addition to seminars devoted to histology. The goal is for students to understand the gross and histological structures of each organ system in relation to its function, rather than as isolated anatomical facts. For example, during the week in CRS1 devoted to the theme, “The Heart as a Pump,” students learn the structure and anatomical relationships of the 4 chambers of the heart and heart valves and the histological appearance of myocardial cells while they are studying the physiological concepts of preload, afterload and contractility.

In addition to Anatomy/Embryology, Imaging, and Histology, the other “threads” in Year 1 include cell biology, pharmacology, physiology, bioinformatics, evidence-based medicine, genetics, and ethics, building on the core concepts from the summer in specific relation to each organ system. In CRS1, students learn not only the molecular structures and functions of a- and b-receptors but also the pharmacology of endogenous and exogenous agonists and antagonists of these receptors as they
study myocardial contractility and physiological regulation of blood pressure. They learn the biochemical pathways involved in aerobic and anaerobic production of ATP as they study determinants of oxygen delivery to myocardial cells, concepts they will revisit and build upon during subsequent courses when they study skeletal muscle metabolism during exercise and the role of the liver in maintenance of normal blood glucose levels. They study physiology of the heart, lungs, red blood cells and plasma as an integrated system providing oxygen and removing carbon dioxide, supporting metabolic needs of the entire body. During each course, students return to the core concepts they mastered in previous courses, using those concepts as a framework for building their understanding of the human organism as a whole. The basic science curriculum continues with Gastrointestinal System (4.5 weeks), Endocrinology and Reproductive Biology (4 weeks), Renal Biology (3 weeks), Musculoskeletal Sciences (3 weeks), Neurological and Behavioral Sciences (5 weeks), and Hematology, Immunology and Microbiology (7 weeks). Each basic science course focuses on normal structure and function, relating back to previous courses and preparing students for concepts in future courses.

Starting in the fall of Year 1, the Basic and Translational Research Summer Block’s Friday journal clubs are replaced by Advanced Research in Medicine 1, a weekly series of research seminars in which students are exposed to a wide range of basic and clinical research topics in interactive discussions with accomplished investigators. Presentations are linked closely with the basic science curriculum in order to reinforce core basic science concepts, help students feel confident in questioning the investigators based on what they are learning at the time, and illustrate the process whereby new biomedical discoveries change clinical practice.

Foundations of Medicine (FM) begins at the same time as the first basic science course and continues throughout Years 1 and 2. The guiding principle is that early exposure to patients, with direct observation and feedback by experienced faculty physicians, is optimal for real time assessment and feedback of student clinical skills. FM has 3 interrelated components — clinical skills training, patient care experiences, and Foundation of Clinical Medicine Seminar Series. The FM Seminar Series is a two-year continuum addressing professionalism, ethics, leadership and its application to the care of patients and the practice of medicine, evidence-based medicine, health care systems and patient safety introduced to students primarily through the humanities.

Core clinical skills training occurs every other week from September through January and is coordinated with the organ systems under study. On alternate weeks, students practice the basic skills they just learned with standardized patients in the classroom by conducting histories and physical exams with real patients and writing chart notes on the previous week under the supervision of their longitudinal preceptors. Starting in February, students are exposed to special aspects of the history and physical for geriatric and pediatric patients, while continuing to work on basic skills every other week with their preceptors. They also begin to take on more patient care responsibility in preparation for their weekly clinics with the same preceptor in Year 2. An Objective Structured Clinical Examination (OSCE) with feedback from preceptors is used to help students chart their progress in mastering core skills.

Year 2 begins with the 9-week Clinical Research Block. Students work with a preceptor in an active clinical research environment on an ongoing project, continuing to develop their skills in building relationships with members of a research team. They also write a mock clinical research proposal that extends the research question on which the student is working during the summer. Scheduled coursework occupies 2 hours each weekday and includes a rigorous immersion in Biostatistics with students using statistical software to analyze real data sets and a Clinical Epidemiology course focusing on formulation of scientific questions, study design, clinical trials, and legal and ethical issues in research including human subjects’ protection. The coursework requires significant class preparation for students, thus students must balance their time and effort between the class work and research project in the Year 2 summer. Journal club sessions on Fridays focus on articles from the clinical research literature, with students using knowledge gained from Biostatistics and Epidemiology to help them analyze the papers.

Feedback from peers and faculty facilitators help students enhance their presentation skills and ability to critically read and present scientific papers. Students complete the second summer with a comprehensive range of clinical research skills and knowledge, complementing their basic research experience in the first summer and preparing them to engage in basic, translational or clinically oriented research for their thesis.

For the remainder of Year 2, students return to the same organ-system based basic science curriculum they studied in Year 1, this time focusing on learning the pathophysiology of common diseases. Immunology, Pathology, Oncology, Infectious Disease/Microbiology, and Biostatistics/Epidemiology are now integrated as threads throughout the Year 2 basic science curriculum. The first basic science course is Musculoskeletal Sciences (2 weeks), followed by Neurological and Behavioral Sciences (6 weeks), Endocrinology and Reproductive Biology (4.5 weeks), Cardiovascular and Respiratory Sciences (7 weeks), Hematology (4 weeks), Gastrointestinal System (4 weeks), and Renal Biology (4 weeks). Anatomy and embryology seminars are conducted less often during Year 2, usually 1-3 sessions per course. The clinical curriculum continues to be closely linked to the basic science courses. Students spend one half-day every week in their primary care longitudinal preceptor’s office. An additional clinical half-day is added and students see patients who demonstrate the pathophysiology being studied that week. Some of the additional half-days are devoted to learning advanced clinical skills (the gynecologic and urologic exams, evaluation of geriatric and pediatric patients with common problems) and an exposure near the end of Year 2 to the acute care setting helps to prepare students for Year 3. Foundations of Clinical Medicine Seminar Series begins in September of Year 1 and ends in April of Year 2. Students also participate in two OSCEs, one at the beginning of Year 2 to help students identify skills to address over the year and the second at the end of Year 2 to help students document their skills for their portfolio and to prepare for the USMLE Step 2 CS Examination. After classes end in mid-May, students have 6 weeks available to study for and take the USMLE Step 1 Examination. By the end of Year 2, students have engaged actively in both basic and clinical research, learned and practiced a wide range of research skills. They have extensive experience in self-directed learning both independently and in teams and have mastered core basic science concepts related to human health and disease. They are comfortable “doctoring” adult outpatients and competent in the complete history, physical examination, oral and written presentations, and basic clinical skills such as reading EKGs. Perhaps most important, they have learned to accurately assess their own strengths and weaknesses and create learning plans for themselves — preparing them to succeed in the next three years of the curriculum and a lifetime of professional practice.

Curriculum Timeline: Years 3 through 5

The clinical curriculum for the College Track is the same as the University Track. In all Core Clinical Rotations, students experience both breadth and depth in clinical care, and clinical experiences are developmental, with opportunities to reinforce, build upon, and transfer knowledge
and skills. Clinical learning is also integrated across disciplines whenever possible, and the roles of basic science, civic professionalism, scholarship, and population health in clinical care are evident throughout the clinical curriculum. Students likewise have patient care responsibilities that are progressive in sophistication and increasing in amount as their level of clinical skill and knowledge increases, and all core clinical competencies are addressed and assessed using common methods applied at the clinical sites at which rotations occur.

**Basic Core Rotations:** Beginning in July of their third year, students have the opportunity to begin their core clinical rotations. These rotations are organized in blocks of that integrate core specialties in at one site for 8 or 12 weeks. Basic Core 1 combines Internal Medicine, Family Medicine and Geriatrics for 12 weeks, Basic Core 2 combines Pediatrics and OB/Gyn for 12 weeks, Basic Core 3 combines Neuroscience and Psychiatry for 8 weeks, and Basic Core 4 combines Surgery and Undifferentiated Care for 8 weeks. Each of these clinical rotations is offered at all of the School of Medicine’s hospital affiliates (including University Hospitals of Cleveland, the Cleveland Clinic, MetroHealth Medical Center and the Louis Stokes VA Medical Center), and the Basic Core 2 rotation is also offered at a longitudinal integrated clerkship at Kaiser Permanente.

These Core Clinical Rotations, launched in July 2006 and modified in 2009 and 2012, represent an integrated approach to clinical education that is shared by students from both the University and College tracks of the Medical School. Students engage in clinical learning with basic science correlation through patient-based experiences that are developmental and provide opportunities to acquire, reinforce, build upon, and transfer knowledge and skills. In the Basic Cores, students are based at one of the five affiliated healthcare systems (UH/VA, MetroHealth, CC, and Kaiser for Basic Core 2 only) for an entire 8-12 week experience, facilitating meaningful educational relationships and support.

**Advanced Core Rotations:** In 2012, the topics covered in the Advanced Cores were incorporated into the Basic Cores.

**Advanced Clinical and Scientific Studies**

Advanced clinical and scientific studies provide students with flexible learning opportunities that support ongoing professional development and residency preparation and planning:

- Two Acting Internships are required: one in Internal Medicine, Surgery, Pediatrics, or Inpatient Family Medicine, and one in an area of student choice.
- One Acting Internship and all electives can potentially be done outside of the CWRU system.
- Students are encouraged to augment their interest in scholarship through rotations and activities that focus on sciences basic to medicine as well as clinical rotations.

The last three years are purposely designed as a flexible continuum of core clinical rotations, clinical and other electives, and research – to allow each student to individualize the curriculum to address his/her own career goals, learning needs and research interests. Each student plans the last three years with the advice of his/her physician and research advisors. Required clinical rotations are the same for students in both of CWRU’s MD Tracks and include experiences in medicine, family medicine, pediatrics, surgery, obstetrics and gynecology, psychiatry and neurosciences. Students may elect core rotations at any of CWRU’s affiliated medical centers – the Cleveland Clinic, the Louis Stokes VA Medical Center, MetroHealth Medical Center and Case Medical Center/University Hospitals of Cleveland.

Every CWRU student must pass the CWRU Clinical Skills Examination and USMLE Step 2 CK (Clinical Knowledge) and CS (Clinical Skills) Examinations to graduate from the CWRU School of Medicine. Students take OSCEs similar in format and content to the USMLE Step 2 CS Examination as part of routine assessments of their clinical skills beginning in Year 1 and are well prepared for the CWRU Clinical Skills Examination and USMLE Step 2 CS Examination by the time they have completed the required clinical rotations. These examinations must be completed by the end of Year 4. Students must take the USMLE Step 2 CK Examination by December 31 of their 5th year.

Students spend 12 to 15 months during the last three years on their mentored research project, including preparation and defense of a masters’ level thesis. Students are expected to complete their research in one block of time; however, in unusual circumstances students under the guidance of their Physician and Research Advisors and with permission from the Research Education Committee may divide their research over the final three years, depending on the student’s research project. During time devoted primarily to research, students spend one half-day each week in related clinical activities. Students must complete all required thesis research rotations by December 31 of Year 5 and defend the Research Thesis within 3 months of research completion, but no later than February 15 of Year 5. Within these guidelines, students and their advisors are encouraged to be as creative as possible in designing the final 3-year continuum. Research may be conducted with faculty research advisors at any CWRU campus or in some instances with advisors at other institutions (e.g., the NIH) with approval from the Research Education Committee. Student research may focus on clinical, translational or basic research. Some students may wish to engage in health services research, research in biomedical ethics, or other areas relevant to the advancement of biomedical science and the care of patients in addition to the more “traditional” research areas.

**The Integrated Sciences Concentration (ISC) is** designed to provide medical students with an in-depth exposure to an area of medical interest, with an emphasis on integration of sciences basic to medicine with clinical medicine in a multidisciplinary approach. The ISC program lasts 8-12 weeks (consecutive or non-consecutive) and is designed to partially overlap with ongoing elective clinical rotations. The ISC provides students with exposure to numerous faculty in an area of clinical interest, allows time for the consideration of future directions of the field of interest, and allows for a creative process of “designing your own curriculum”. The culmination of the ISC is a document generated by the student that can take a variety of forms (future directions article, patient materials, artwork) that is relevant to the field and has the potential for distribution.

**The Student Portfolio: Competency-Based Assessment and Reflective Practice**

The College’s approach to student assessment is based on two key educational concepts —“competency-based assessment” and “reflective practice.” Competency-based assessment emphasizes the need for every student to achieve the broad range of required learning outcomes by providing an appropriate curriculum, learning resources, and regular formative assessments. No grades are assigned in the College Track during the 5 year program; when a student achieves the standards for a all competencies, they are assigned a “Meets or Exceeds” (“ME”) for each course on their transcript. Assessment of student performance is criterion-referenced, not norm-referenced; students are not compared to one another but to faculty-defined standards of achievement. A full range of assessment methods are used to profile learning outcomes. Reflective practice emphasizes that learning is dependent upon the integration of reflection and experience. Professionals learn by reflecting
on their experiences both during the experiences ("reflection-in-action") and after the experiences ("reflection-on-action") and by using these reflections to develop new knowledge and skills. We have designed an assessment process that helps our students develop their reflective practice skills – the ability to accurately describe, analyze and evaluate their performance and to identify and follow through on effective learning plans. We are committed to helping every student achieve our competency standards and develop reflective practice skills through frequent formative assessments and close advising.

Evidence of achievement for each of the College Track’s 9 competencies is collected and managed in an electronic portfolio. Students and their advisors share access to the e-Portfolio database of evidence and thus can track and document student progress in meeting our nine competencies. A broad range of types of evidence are collected from the learning experiences in the research, basic science, and clinical curriculum.

During research blocks, research preceptors, journal club facilitators, problem solving session facilitators, and student peers provide written assessments of both individual work and teamwork in the lab, written and oral presentations, and critical thinking and reasoning skills. Written research proposals and reports and the final thesis are also included in the e-Portfolio.

During the basic science courses, students complete weekly online quizzes called Self Assessment Questions (SAQs) that cover the breadth of knowledge for each week’s theme at the level of factual recall and simple application of the facts. Faculty design the SAQs so that students who are actively participating and studying should expect to know at least 80% of the answers; the individual results of the SAQs are available only to the students, but students are encouraged to contact the course director for help with any difficulties they are having. Students have the option of repeating the SAQs to assess their retention of this basic science knowledge. At the end of each week, students complete 1-2 open book Concept Appraisals (CAPPs) designed to determine if they have mastered the concepts for that week well enough to apply them to new or different problems or situations in brief, well-organized, clearly written essay(s). CAPPs are designed to assess depth of knowledge in key concept areas. Other evidence is provided by PBL facilitators and peers who provide assessments of performance in PBL sessions.

Assessments in the clinical curriculum include written feedback on performance from longitudinal preceptors and other faculty physicians and residents, results of OSCEs, patient logs documenting breadth of clinical exposure, patient journals in which students record their reflections on specific patients and their problems, self-assessments of videotaped interviews with patients (both standardized and real), and feedback from patients and other health care providers.

Students are expected to meet regularly their physician advisor to discuss their progress. Several times each year, they are required to review their assessment evidence in relation to expected levels of achievement in the 9 competencies and write Formative Portfolios composed of structured reflective essays on how the evidence demonstrates their development as doctors and researchers. Based on this analysis, they develop learning plans to address areas needing improvement. The essays also include judgments on whether previously established learning goals have been achieved and reflections on the process of achieving these goals. Students discuss these materials with their physician advisors during Formative Assessment meetings. During the last three years, students submit learning plans on a bi-annual basis, and meet with their physician advisor to review their progress. Students are expected to assume more and more responsibility and independence in accurate self-assessment, in developing learning plans and following through on addressing their own learning needs, and in recognizing and building on their own strengths.

At the end of Year 1 and 2 and Year 4, students assemble a Summative Portfolio for review by the Medical Student Promotions and Review Committee that determines if the evidence presented by the student indicates a level of achievement sufficient for promotion to the next year of the program (or graduation). Students are expected to choose not only their best examples of their work, but more importantly evidence demonstrating their growth across the year in specific competencies. We want to graduate students who recognize areas needing improvement, identify an approach to addressing them, and can show that they have now achieved that skill as well as those students who excel in specific areas throughout the year. Graduates of CCLCM will have not only achieved a defined level of achievement of each of the 9 competencies, they will also have developed their reflective ability to accurately assess their own strengths and areas needing improvement. The assessment process is designed to enhance student learning and the student portfolio enables students to document their progress in the achievement of defined competencies.

Graduation Requirements Summary for the College Track

A medical student who has satisfactorily completed all the required work in CCLCM may be granted the degree of Doctor of Medicine (MD) with Special Qualifications in Biomedical Research by Case Western Reserve University, provided that:

1. He/she has been registered at Case Western Reserve University School of Medicine for at least five academic years and not more than 6 years for CCLCM.
2. CCLCM Medical Student Promotions and Review Committee approve his/her record of performance including thesis, and the faculty recommends him/her to the School of Medicine’s Committee on Students for graduation.
3. He/she has discharged all financial obligations to Case Western Reserve University and to the program in which he/she is enrolled.
4. He/she has passed the U.S. Medical Licensing Examination (USMLE) Step 1, USMLE Step 2 Clinical Knowledge (CK) and Step 2 Clinical Skills (CS).
5. He/she has passed the CWRU School of Medicine Clinical Skills Examination.
6. The Research Thesis and Defense have been completed within 3 months after completing research or by February 15th of the 5th year, whichever is earlier.
7. In Years 3-5 every CCLCM student completes a total of 146 weeks in the following activities:
   - 56 weeks of required clinical experience:
   - 40 weeks: Basic Cores I, II, and III
   - 8 weeks: Two Advanced Cores
   - 8 weeks: Two Acting Internships
   - 48 weeks of research
   - 2 weeks of Capstone Course in Year 5
   - 34 weeks of electives (20 weeks minimum for clinical electives)
Dual Degree Programs

Dual Degree Programs with the MD

The degree programs listed in this section may require admission to another school at the university in addition to or instead of the School of Medicine. Each school may have different deadlines and requirements for admissions. Please contact the other schools separately using information provided under that school’s listing in this publication. Additional dual degree programs not including the MD are also offered through the medical school’s departments. Several certificate programs are also offered in General Medical Sciences.

MD/PhD (MSTP)

The Medical Scientist Training Program leading to the MD/PhD in various biomedical programs is listed in above grey tab.

MD/JD

This program, offered in conjunction with Case Western Reserve University School of Law, may be completed in six years. The JD portion requires the completion of 88 credit hours of study. Admission is through the School of Medicine and the School of Law. For more information about the JD portion of the program, visit the Law School section (p. 670), call the law school admissions office at 216.368.3600 or 800.756.0036, or e-mail lawadmissions@case.edu.

MD/MA in Bioethics

The 27-credit-hour Master of Arts in Bioethics program, including a 12-hour foundations course taken during the first year of medical school, emphasizes the interdisciplinary and interprofessional nature of the field. It is designed to provide advance training in bioethics for those who anticipate encountering ethical issues in the course of their primary careers. Medical school students complete the bioethics program while pursuing their medical degrees; no additional time is required. Admission for the master’s degree portion is through the Case Western Reserve University School of Graduate Studies. For more information about the MA requirements, visit the Bioethics section (p. 733), call 216.368.6196, or e-mail bioethics@case.edu.

MD/MS in Applied Anatomy

The core curriculum of this 30-hour, non-thesis master of science master of science in applied anatomy degree program integrates aspects of modern molecular biochemistry, cell biology and physiology with the traditional aspects of anatomical structure and nomenclature of cells, tissues and organs. Electives allow students to pursue individual interests in special areas of research and health care. The program is excellent preparation for those preparing for biomedical careers or those planning to pursue a PhD. Additional details and a sample course of study are described in the Anatomy section of the General Bulletin.

MD/MS Biomedical Investigation

The goal of the joint MD/ Masters of Science in Biomedical Investigation program at Case School of Medicine is to train medical students in basic or clinical research approaches so that the physician graduate may conduct research to advance health. Students will earn a plan B type MS from Graduate Studies, and the name of the joint degree will reflect the particular track pursued by the student (e.g. MD/MS Biochemistry). The tracks proposed in this joint MD/MS program are derived from existing type B MS programs at the School of Medicine into a joint program with the MD, using a common template.

The core activities for this degree include limited credit from the medical core curriculum, 3-6 graduate courses in specific tracks, participation in a common seminar series, scientific integrity training, and a requirement for a special problems project that reflects a full year of research (18 hours of 601 non-graded credits) culminating in a written report and examination. Students are anticipated to complete all graduate courses before entering the research year, allowing full focus on the research experience. Thus, this program will require 5 years overall to complete the requirements for both degrees. Students who wish to join the MD/MS program may apply to the Program after arriving at the University any time prior to Fall of their second year of medical school.

For students to receive graduate credit for medical coursework, they must register for IBIS credit (see below) in advance of the preclinical medical school semester. Students are likely to complete the required two semesters of research 601 after the pre-clinical years in medical school, although the research could occur in other years. Before initiating full time research, the trainee must submit a final Program plan to the Program Oversight Committee that summarizes the courses taken, the proposed thesis topic, and the names and credentials of the MS Thesis Committee. During the research period, the student is expected to participate in track-specific graduate activities including retreats, student talks, journal clubs and other program functions. Only under unusual circumstances will the student be allowed to satisfy the research requirement in non-contiguous semesters.

Each track within the joint MD/MS Program has specific course requirements, described in each graduate department MS section. Available tracks include: Biochemistry (p. 727), Clinical Research (CRSP) (p. 822), Epidemiology (p. 800), Nutrition (p. 754), Pathology (p. 759), Pharmacology (p. 767), Physiology & Biotechnology (p. 774). As a minimum, graduation requires successful completion of 9 graded credits of graduate courses, 6 graded credits of IBIS medical curriculum, 18 non graded credits of research, and additional non graded credits for departmental seminar and the exam and zero credits for scientific integrity training (IBMS 500 On Being a Professional Scientist: The Responsible Conduct of Research or CMED 500 Scientific Integrity in Biomedical Research) in the program. Students are required to pass an examination (IBIS 600 Exam in Biomedical Investigation) established for each student, generally reflecting the preparation and oral defense of a written report on the project.

For more information please contact the College Program Advisor, Dr. Dennis Stacey (http://bulletin.case.edu/schoolofmedicine/dualdegreeprograms/mailto:staceyd@ccf.org) or the University Program Advisor, Dr. William Merrick (http://bulletin.case.edu/schoolofmedicine/dualdegreeprograms/mailto:william.c.merrick@case.edu).

**Total Units in Sequence:** 33-36

Departmental Seminar is also taken for 1 credit hour - timing depends upon the track.

**MD/PhD in Health Policy and Health Services Research**

This program prepares students for careers in academic medicine, health policy, public health, and/or health care management. An important area of focus within this training program is methods and issues in study design that pertain to research examining the health and health care problems of urban and vulnerable populations.

Application to and acceptance in the PhD program in Health Policy/Health Services Research follows admission to the School of Medicine. Dual-degree students are fully integrated with graduate students in other tracks within the Department of Epidemiology and Biostatistics. Dual-degree students typically complete the PhD coursework and the dissertation requirement by their third year after matriculation, with the MD awarded at the end of the seventh year. Support for tuition and stipends is available for a limited number of students each year.

For more information, see Epidemiology and Biostatistics section (p. 803) or contact the departmental coordinator for Graduate Studies, Victor Courtney (http://bulletin.case.edu/schoolofmedicine/dualdegreeprograms/mailto:victor.courtney@case.edu), at 216.368.5957.

**Medical Scientist Training Program (MSTP)**

A combined MD/PhD program in biomedical sciences, the Medical Scientist Training Program (MSTP) is available for students desiring research careers in medicine and related biosciences. This program takes seven to eight years to complete, depending on the time needed to complete the PhD dissertation research. Financial support includes a stipend and full tuition support.

Candidates must meet established prerequisites for admission to both the School of Medicine and the School of Graduate Studies. Criteria include demonstrated capabilities in research and superior undergraduate academic credentials. Applicants must have either U.S. citizenship or permanent residency status to be considered for admission to the MSTP. Information can be obtained by contacting the MSTP program (http://bulletin.case.edu/schoolofmedicine/dualdegreeprograms/mailto:mstp@case.edu) or from the program website (http://bulletin.case.edu/schoolofmedicine/dualdegreeprograms/http://mstp.case.edu). Admissions are coordinated via the School of Medicine admissions program and the AMCAS application.

The first two years of the MSTP are centered on the University Program pre-clinical core medical school curriculum, which occupies five mornings each week. Afternoons include time for graduate courses and/or research rotations, as well as clinical training, thus integrating the medical school and graduate school experiences. The next three to four years are devoted to completion of graduate courses and PhD thesis research in one of the multiple MSTP-affiliated graduate programs. During the PhD phase, MSTP students participate in the MSTP Clinical Tutorial, a program designed to enhance clinical skills and allow students to develop connections between their research and clinical interests (this further addresses the goal of integrating medicine and science). After completion of the PhD program, students return to medical school for two years to complete clinical clerkships and finish the MD curriculum.

The program is administered by the MSTP Steering Committee, which consists of faculty from both basic science and clinical departments. Its functions include selecting candidates for admission, designing and administering the program curriculum, advising students and evaluating student progress.

Please see the Doctor of Medicine (MD) (p. 780) page  for information about the MD curriculum.

**MSTP Program by Year**

**Year 1**
- University Program MD curriculum
- Summer research rotation
- One graduate course or research rotation each semester (fall and spring)

**Year 2**
- University Program MD curriculum
- Summer research rotations (1 or 2)
- Graduate course or research rotation in the fall semester

**Year 3**
- PhD program

**Year 4**
- PhD program
- MSTP Clinical Tutorial

**Year 5**
- PhD program
- Optional MSTP Clinical Tutorial

**Year 6 (If Needed)**
• PhD program
• Optional MSTP Clinical Tutorial
• All PhD work, including dissertation defense and publications, to be completed before starting the 3rd year medical curriculum

Year 7
• Third year MD curriculum (core clinical clerkships)

Year 8
• Fourth year MD curriculum (completion of core clinical clerkships if necessary, clinical and research electives)

The Medical Scientist Training Program in detail

General Description
The Case Medical Scientist Training Program (MSTP) provides training for future physician-scientists by integrating well-developed curricula in science and medicine. Unique aspects of the program include the integration of graduate school and medical school in many phases of the program to optimize dual-degree training, and a high degree of student involvement in running the program.

The MSTP includes three major phases of training.

First phase: During the first two years, each student completes the first two years of the University Program medical school curriculum, including early clinical experiences, completes at least three research rotations, takes graduate courses, and chooses his or her PhD graduate program and thesis lab. During the summers before the first two years of medical school, students complete research rotations. During the fall and spring semesters of year one and the fall semester of year two, students take a graduate course or complete a research rotation.

Second phase: During the PhD phase, students complete all requirements of their PhD program. They also participate in the MSTP Clinical Tutorial for at least one year in a patient-based clinical specialty. A second year of MSTP Clinical Tutorial is optional.

Third phase: In the final phase, students complete years three and four of the University Program medical school curriculum. The focus is clinical training, but research electives can be taken for part of year four.

Although each of these three phases has a different focus, opportunities exist for students to pursue both research and clinical training in each phase. The philosophy of the Case MSTP is to integrate medicine and science throughout the program as much as possible.

The Case MSTP is run by faculty, students and staff. The MSTP Council is a body of students that plans and runs certain aspects of the program. The administrative director, program coordinator, and program assistant have many important roles and run the day-to-day management of the program. The co-director is involved in decisions at all levels of the program and is the primary advisor for students in the first two years of the program. The director is responsible for all aspects of the program and is available to students for advice at any stage. The MSTP Steering Committee makes decisions on MSTP policy, curriculum planning, student admissions, approval of mentors and evaluation of students.

Incoming MSTP students are expected to enter the program on July 1. The MSTP summer retreat, usually held in early July, provides an important orientation to the program and includes sessions and workshops for program and professional development.

Advising System
The program director provides advising to students in all phases of the program. The MSTP co-director advises students in the first two years on research rotations and course work. Students may also meet with an MSTP Steering Committee member representing an area of research interest or with the MSTP director. During the PhD training period, mentoring is provided by the thesis advisor and thesis committee, which includes a member of the MSTP Steering Committee and a member with an MD MSTP students are full members of the medical school class and enter one of the four societies of the University Program when they matriculate in the program. The society dean provides important advice for matters concerning the MD curriculum.

Classes and Research Rotations in Years One and Two
During years one and two of the University Program, MSTP students register for 9 credit hours of graduate course work each semester.

Plan of Study

First Year

| Integrated Biological Sciences I (IBIS 401) | 1 - 9 |
| Clinical Science I (IBIS 411) | 2 |
| Research Rotation in Medical Scientist Training Program (MSTP 400) | 0 - 9 |
| Integrated Biological Sciences II (IBIS 402) | 1 - 9 |
| Clinical Science II (IBIS 412) | 2 |
| Research Rotation in Medical Scientist Training Program (MSTP 400) | 0 - 9 |
| Total Year: | 3-20 |

Second Year

| Integrated Biological Sciences III (IBIS 403) | 1 - 9 |
| Clinical Science III (IBIS 413) | 2 |
| Research Rotation in Medical Scientist Training Program (MSTP 400) | 0 - 9 |
| Graduate School courses | 3-4 |
| IBIS 401 Research (in specific program) | 5-6 |
| Year Total: | 3-20 |

Total Units in Sequence: 17-70

- MSTP 400 Research Rotation in Medical Scientist Training Program or an appropriate graduate school course. If a 4-credit graduate course is taken, registration in IBIS 401 Integrated Biological Sciences I, IBIS 402 Integrated Biological Sciences II or IBIS 403 Integrated Biological Sciences III is reduced to 3 units.

IBIS 401 Integrated Biological Sciences I, IBIS 402 Integrated Biological Sciences II and IBIS 403 Integrated Biological Sciences III are 3-4 credits each. IBIS 411 Clinical Science I, IBIS 412 Clinical Science II, and IBIS 413 Clinical Science III are 2 credit hours each. In contrast to their fellow medical students, MSTP students are graded during years one and two of the medical school curriculum for these graduate courses, which provide graduate school credit for the medical school curriculum. These grades are for graduate school purposes and do not affect standing in the medical school.

In addition to the medical curriculum, students take MSTP 400 Research Rotation in Medical Scientist Training Program or one 3-4 credit graduate school course per semester in the first two years. Graduate courses
are scheduled in the afternoon in the fall and spring semesters to avoid conflict with the medical school curriculum. MSTP students will be registered for MSTP 400 during the summer terms before each of the first two years of medical school. Students also may complete a research rotation instead of a graduate school course during the fall or spring semester.

The PhD Phase

After completion of the second year of medical school, each student chooses a PhD thesis mentor, joins a specific PhD program, and completes any remaining graduate school course work and other requirements for the PhD degree. The following training programs are affiliated with the MSTP. (If the training program is not itself an independent PhD program, the program through which it is offered is indicated in parentheses.)

- Biochemistry
- Biomedical Engineering
- Cancer Biology (Pathology)
- Cell Biology
- Developmental Biology (Genetics and Neurosciences)
- Epidemiology
- Genetic and Molecular Epidemiology (Epidemiology)
- Genetics
- Immunology (Pathology)
- Molecular Biology and Microbiology
- Molecular Virology
- Pathology
- Neurosciences
- Nutrition
- Pharmacology
- Physiology and Biophysics
- Systems Biology and Bioinformatics

All MSTP students are required to take a one-week ethics course (IBMS 500 On Being a Professional Scientist: The Responsible Conduct of Research) during the spring semester of their second year in the program.

Clinical Tutorial, Clinical Refresher Course and Years Three and Four of Medical School

During the PhD thesis phase, MSTP students take the MSTP Clinical Tutorial, which provides a unique longitudinal part-time clinical experience. The MSTP Clinical Tutorial is a year-long course that enhances clinical skills for year three of medical school. It also serves a special career development objective by allowing students to balance medical and scientific interests and explore the connections between these areas. The MSTP Clinical Tutorial, offered during the PhD phase, is an example of the integration of science and medicine in the Case MSTP. An optional MSTP Clinical Refresher course may be taken before the start of year three. After completion of the PhD, MSTP students are enrolled in medical school to complete the requirements for the MD (see description provided for the University Program (p. 782)).

MSTP Activities

The MSTP supports several activities that enhance the scientific and professional development of students. These activities also foster a vibrant and collegial MSTP community with a strong sense of mission in the training of physician scientists.

Summer retreat: The annual MSTP summer retreat is a two-day event focusing on scientific presentations, professional development and program planning for the upcoming academic year.

Winter retreat: This retreat occurs in January or February. Students in their research years present their thesis work through an oral or poster presentation.

MSTP Council coordinates many activities of the Case MSTP. The Council meets once each month to discuss activities that are run by different student committees. The overall goals of the MSTP Council are to identify objectives for the program, to allow students to initiate programs to enhance the MSTP, to encourage increased student involvement in the operation of the MSTP, and to enhance development of leadership skills of MSTP students. The president, vice president and secretary are all elected for a one-year period. Committees are led by 1-3 committee chairs who take charge of committee activities and coordinate the involvement of other students in the committee activities. All students are welcome and encouraged to participate in the various committees and to attend the council meetings. Recent Council committees and other program activities have included the following:

1. Monthly Dinner Meeting Committee

This committee is responsible for planning monthly dinner meetings, selecting topics, speakers, and menus. The series is organized by students and is attended by students, Steering Committee members and research mentors. Invited speakers (students, faculty, alumni and outside speakers) address issues pertinent to research, professional issues, career development or other topics of interest. The informal environment at these gatherings promotes social and professional interactions.

2. Agre Society

The Agre Society at Case Western Reserve University serves to advance understanding of biomedical research by clinical residents, fellows and MSTP students. The society is sponsored and organized by the Department of Medicine, UHCMC, and its activities involve residents and fellows from clinical training programs at Case Western Reserve-affiliated hospitals. MSTP students in all phases of the program, and associated faculty. The main focus of the Agre Society is a series of informal monthly dinner meetings. The design of the Agre Society promotes interactions between MSTP students, residents and fellows with interests in biomedical research, allowing these groups to enrich each other with their different experiences and viewpoints. The program helps clinical residents and fellows to learn about research and identify potential mentors within the wider Case Western Reserve research community. It also helps MSTP students to understand the clinical context of their research and enables them to form contacts with people at more advanced stages of training. The society is named for Peter Agre, MD, a medicine resident in the University Hospitals of Cleveland/VA program in the mid 1970’s who won the Nobel Prize in Chemistry in 2003 for the discovery of aquaporins.

3. Communications and Webpage Committee

This committee organizes communications and the Case MSTP website content.

4. Summer Retreat Committee

This committee plans the summer retreat.

5. Intro to MSTP

This committee organizes events for first year MSTP students, to integrate them into the program and the community.

6. Community Service Committee
Plans events for involvement of MSTP students in community service.

7. Social Committee
This important committee plans fun events throughout the year!

8. Student Representative to Faculty Council
One student is selected to represent the MSTP on Faculty Council.

9. Student Representative to the Committee on Medical Education

10. Representative to the Graduate Student Senate

11. MSTP Women’s Committee
Women in the MSTP organize luncheons or other meetings to discuss issues that face women pursuing careers in science. Students may invite a successful woman scientist who provides a role model as a physician scientist.

Scientific meetings: The program strongly encourages students to present their research at national or international meetings and provides financial support to pay for part of meeting travel expenses (other funding is obtained from the research mentor). In addition to the general meeting support for all students, each year two students are offered the opportunity to attend the annual MD/PhD national student conference in Colorado or the American Physician Scientist Association annual meeting in Chicago, with all expenses paid by the MSTP.

Research symposia: MSTP students are encouraged to present their research at Case student symposia, including the annual graduate student symposium and the Irwin H. Lepow Student Research Day. These symposia feature a nationally recognized keynote speaker, and students have the opportunity to interact extensively with the noted scientist. A committee awards prizes for outstanding student presentations.

Assessment of MSTP Students

Students in the MSTP are assessed for the medical school component of the program in the same manner as students in the University Program, with the exception that grades are awarded for those courses in the MD curriculum in years one and two that receive graduate school credit and are used to satisfy requirements for the PhD degree. Students must satisfactorily complete all requirements for both the MD and the PhD.

IBIS Courses

IBIS 401. Integrated Biological Sciences I. 1 - 9 Unit.
A four-semester sequence encompassing anatomy, biochemistry, physiology, pharmacology, pathology, and microbiology.

IBIS 402. Integrated Biological Sciences II. 1 - 9 Unit.
A continuation of IBIS 401.

IBIS 403. Integrated Biological Sciences III. 1 - 9 Unit.
A continuation of IBIS 402.

IBIS 404. Integrated Biological Sciences IV. 0 - 9 Units.
A continuation of IBIS 403.

IBIS 405. Integrated Biological Sciences I. 1 - 9 Unit.

IBIS 406. Integrated Biological Sciences II. 1 - 9 Unit.

IBIS 407. Integrated Biological Sciences III. 1 - 9 Unit.

IBIS 408. Integrated Biological Sciences IV. 1 - 9 Unit.

IBIS 411. Clinical Science I. 2 Units.

IBIS 412. Clinical Science II. 2 Units.

IBIS 413. Clinical Science III. 2 Units.

IBIS 414. Clinical Science IV. 0 - 2 Units.

IBIS 415. Clinical Science I. 1 - 9 Unit.

IBIS 416. Clinical Science II. 1 - 9 Unit.

IBIS 417. Clinical Science III. 1 - 9 Unit.

IBIS 418. Clinical Science IV. 1 - 9 Unit.

IBIS 424. Integrated Biological Sciences in Medicine. 6 Units.
This course is open only to candidates enrolled in the M.D./M.S. program (University plan). Registration is for the Spring semester of the second year in medical school. The course will cover the areas of cardiology, pulmonary, hematology, renal physiology and gastroenterology. Assessment will be by examination (to include quizzes, multiple choice questions, and essays). Recommended preparation: First three semesters of medical school and currently a medical student in good standing.

IBIS 434. Integrated Biological Sciences in Medicine. 6 Units.
This course is open only to candidates enrolled in the M.D./M.S. program (College plan). Registration is for the Spring semester of the second year in medical school. The course content includes the areas of hematology, gastroenterology and renal physiology. Students will also be required to participate in Process of Discovery. Assessment of performance will be through reaching required levels of competency for the medical areas identified above and by the evaluation of a term paper. Recommended preparation: First three semesters of medical school and currently a medical student in good standing.

IBIS 435. Integrated Biological Science in Medicine-University. 6 Units.
This course is open only to candidates enrolled in the M.D./M.S. program (University Plan). Registration is typically for the Spring semester of the second year in medical school. The course content includes the areas of hematology, gastroenterology and renal physiology. (Students will also be required to participate in Process of Discovery.) Assessment of performance will be through reaching required levels of competency for the medical areas identified above and by the evaluation of a term paper. Recommended preparation: First three semesters of medical school and currently a medical student in good standing.

IBIS 461. Clinical Science (for M.P.H./M.D. Students). 1 - 6 Unit.

IBIS 466. Medical School Electives (for M.P.H./M.D. Students). 1 - 6 Unit.

IBIS 600. Exam in Biomedical Investigation. 0 Units.
Students are required to pass an examination established for each student, generally reflecting the preparation and oral defense of a written report on the project. Prereq: Must be enrolled in MD/MS Biomedical Investigation program.
MSTP Courses

MSTP 400. Research Rotation in Medical Scientist Training Program.  
0 - 9 Units.  
All students must complete research rotations in a minimum of three  
different MSTP-approved laboratories and submit rotation reports and  
rotation evaluations for each to the MSTP office. All three of the rotations  
must be completed before the beginning of each student’s third year of  
the program. The main purpose of research rotations is to aid the student  
in selecting a laboratory for their thesis work.
Environmental Health Sciences

Ariann Richner (http://bulletin.case.edu/schoolofmedicine/environmentalhealthsciences/mailto:ariani.duncan@case.edu), Department Assistant

The Department of Environmental Health Sciences is devoted to the study of the fundamental mechanisms responsible for disease processes initiated or aggravated by environmental agents. Indoor and outdoor environments consist of complex interacting systems. These systems require the development of new approaches to understanding the basis of their action. Current research interests of the faculty include chemical and environmental carcinogenesis, genetic and reproductive toxicology, cytogenetics, radiation biology, and clinical and forensic toxicology.

The Department of Environmental Health Sciences offers the MS degree and an MD/MS program for students who have received formal acceptance to the School of Medicine and are interested in expanding their training in the area of environmental health sciences. This program allows students to complete the requirements for both degrees within a four-year period.

MS Environmental Health Science

The Master of Science degree program is designed to increase the student's knowledge of environmental health science as well as to provide a firm foundation in the life sciences. The program is multidisciplinary and emphasizes cancer biology, environmental toxicology, and nutrition and toxicology. It is based on a core curriculum in the biological sciences, including biochemistry, biostatistics, microbiology, genetics, molecular biology, pharmacology, epidemiology, and toxicology.

Admissions

Applicants must complete a CWRU Graduate Application. Tuition or stipends will not be provided for the master of science program (no additional tuition is required for enrolled medical students).

Degree Requirements

Currently, a student can obtain a MS with a thesis based on an individual research project [Plan A] or may obtain a MS based solely on course work and a comprehensive exam [Plan B]. Both degrees require completion of 27 semester hours of credit. Under Plan A, up to 9 of the 27 semester hours can be obtained through research. Students also prepare a written thesis and complete an oral defense for a Plan A Degree. Completion of a Plan B, MS Degree, requires satisfactory performance on a written comprehensive exam taken after the student has finished their 27 hours of coursework. Also, for Plan B, it's recommended that the student take CBIO 453 Cell Biology I & CBIO 455 Molecular Biology I [8 Credits] or BIO 407 General Biochemistry [4 Credits] & BIO 408 Molecular Biology: Genes and Genetic Engineering [4 Credits].

Of the 27 semester hours of coursework required for the MS degree, 9 hours of credit are fulfilled by the EVHS Core Curriculum. This Core Curriculum is comprised of three 3 credit courses: EVHS 429 Introduction to Environmental Health, EVHS 401 Fundamentals of Environmental Health Sciences: Biochemical Toxicology and EVHS 402 Fundamentals of Environmental Health Sciences: Risk Assessment. Finally, as part of the 12 credits of Core Courses, a student must take a Statistics Course of their choosing (must be approved by the Department). Past examples include: EPBI 441 Theory of Linear Models, with Applications Biostatistics I [3 Credits], EPBI 414 Introduction to Statistical Computing [3 Credits] or EPBI 431 Statistical Methods I [3 credits].

The required course list is as follows:

**Courses**

**EVHS 401. Fundamentals of Environmental Health Sciences: Biochemical Toxicology. 3 Units.**

This course details the fundamentals of biochemical toxicology. Specific topics include oxidation-reduction reactions, Phase I and II xenobiotic metabolism and mechanisms of cellular toxicity. Also, this course focuses on pharmacology. General principles of pharmacology, drug transport and absorption, drug metabolism, neuropharmacology, immunopharmacology and pharmacokinetics are discussed.

**EVHS 402. Fundamentals of Environmental Health Sciences: Risk Assessment. 3 Units.**

This course presents an overview of the scientific approaches used to determine whether environmental agents are potentially dangerous to people. In this course, criteria utilized for establishing exposure limits is presented. A variety of assays which can be employed to assess the impact of environmental exposure on normal and genetically susceptible individuals are studied. These include: numerous animal tests, short term toxicity and mutagenicity tests, functional assays, molecular techniques to delineate mechanisms of action, epidemiology studies and controlled clinical trials. Recommended preparation: EVHS 429.

**EVHS 405. Effects of Exposure to Env Toxins. 3 Units.**

This course provides an introduction to toxic agents found in the environment and presents an overview of chemical and physical agents which have acute toxic and/or genotoxic effects on cells. Toxicity, mutagenicity, carcinogenicity, teratogenicity and the potential for exposure to these agents through environmental, occupational and medicinal routes are discussed. This topic will be covered at both the molecular and the clinical level. Discussion of clinical cases will be included. Prereq: EVHS 401 and EVHS 402.

**EVHS 429. Introduction to Environmental Health. 3 Units.**

This is a survey course of environmental health topics including individual, community, population, and global issues. Introduction to risk management, important biological mechanisms, and age and developmental impacts are covered in an overview fashion. A practical inner city home environment experience is included. Offered as EVHS 429 and MPHP 429.
EVHS 435. Environmental Health Law and Policy. 3 Units.
This course will introduce students to environmental law and policy, with a focus on federal environmental law. The goal of the course is to enable students to understand the distinctive characteristics of a regulatory agency, where scientific insights must be channeled through the paths set out by law. Students will consider how federal statutes are implemented through agency regulations, and the role of courts in overseeing the regulatory process. Substantive statutes we will consider include the Clean Air Act, the Clean Water Act, the Safe Drinking Water Act, the regulation of hazardous wastes and the cleanup of contaminated sites, and a range of federal statutes regulating chemical manufacturing/use and the workplace. The course includes an overview of the common law concepts of torts and nuisance. Prereq: EVHS 429 or permission of instructor.

EVHS 502. Genetic Toxicology II: DNA Damage and Repair. 3 Units.
This course provides an in-depth consideration of agents which alter DNA directly or indirectly through effects on its synthesis and examines the mechanisms and repair processes through which cells respond to this damage. The class consists of formal lectures which introduce each topic, and analysis of up-to-date literature on topics representative of major current areas of interest in this field. Topics covered include fidelity of DNA replication, excision repair, mismatch repair, transcription-linked repair, SOS repair and recombination repair. Other DNA damage responses controlling decision points between DNA repair and apoptosis are also considered. Agent-specific DNA damage, such as that caused by agents leading to bulky adducts, AP sites, base-base mismatches and damage to DNA bases, are considered in the context of specific repair processes responding to these DNA insults in procaryotes and eukaryotes. Recommended preparation: EVHS 401 and 402.

EVHS 506. Independent Study in Environmental Health Sciences. 1 - 6 Unit.

EVHS 510. Molecular Oncology. 3 Units.
This course explores the role of environmental factors in causing alterations in cellular mechanisms which lead to cancer. Emphasis is placed on genetic and other regulatory alterations leading to cell transformation. The possible role of oncogenes and suppressor genes in these processes and the mechanisms through which chemotherapy and immunotherapy manifest toxicity for cancer cells are considered.

EVHS 651. Master’s Thesis Research. 1 - 9 Unit.

EVHS 701. Dissertation Ph.D.. 1 - 9 Unit.
(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
Epidemiology and Biostatistics

The Department of Epidemiology and Biostatistics (http://epbiwww.case.edu) draws on the core disciplines of Epidemiology, Biostatistics, and Public Health to help support students in developing the knowledge, skills and competencies needed to assume positions of leadership with the ultimate goal of advancing the public’s health. Through challenging coursework and both independent and collaborative research opportunities, students will develop a thorough understanding of the multiple determinants of population health outcomes; the individual and structural factors that may lead to disparities in those outcomes; and the way in which specific policies and interventions influence the nature and impacts of population health determinants.

The Department of Epidemiology and Biostatistics offers the following degrees:

- Doctor of Philosophy (PhD)
- Masters (MS)
- Master of Public Health (MPH)

Faculty and Research

Department faculty are nationally recognized and have more than $9.5 million in grants that support projects including HIV/TB research in Uganda, the search for genes that cause disease, cancer prevention and control, studies of interventions to change human behaviors that promote good health, design of clinical trials, studies to change high-risk behaviors related to AIDS, studies of public policies concerning the health of the elderly, and cost/benefit studies of medical interventions. Many research projects are performed in collaboration with the four affiliated hospitals; the University Hospitals, Metro Health, the Cleveland Clinic and the Veteran Administration. The department has offices in two locations at the university, (Wood Building and Wolestein Research Building) and in the Prevention Research Center for Healthy Neighborhoods (PRHCN). The department maintains two scientific computer centers comprised of 14 lab computers and over a dozen servers. Several very large national health care and demographic databases (including Medicare, Medicaid, and Vital Statistics databases) are stored on the servers and are used for faculty and student research and educational projects.

Masters Programs

MS Biostatistics

Statistics is a discipline that provides tools for making decisions under conditions of uncertainty. Biostatistics applies the discipline to medical and biological data, and it is an essential component of most medical research. The study of biostatistics includes design and analysis of experimental studies, such as clinical trials, and non-experimental studies, theory of probability and statistics, mathematical and statistical modeling, and knowledge of methodology used to evaluate the properties of statistical procedures. It also includes a competency in computers, which encompasses programming, statistical software use, and database management. Biostatistics is a dynamic field of study and an integral part of medical and public health research. Those who earn the MS in Biostatistics are equipped for careers in academia, government, and industry, or to enter doctoral programs in biostatistics.

The mission of the Masters Program in Biostatistics is to enroll and train outstanding students in the core discipline of biostatistics. The faculty and students in this program are committed to teaching and learning the theory and application of the essential and modern statistical methods used in the biomedical sciences.

Courses specific to this program include mathematical statistics, generalized linear models, multivariate statistics, survival analysis, categorical data analysis and non-parametric statistics, among others. In addition, the Department of Epidemiology and Biostatistics offers a wide array of courses in population health sciences, including global health epidemiology, genetic epidemiology and bioinformatics, health behavior and preventative science, and healthcare organization, outcomes, and policy. Plentiful research opportunities exist within the department and numerous research centers across the university, and ongoing research is discussed during seminars and frequent informal meetings with faculty.

Concurrently, students will master the rigorous scientific and analytic methods necessary to be at the forefront of efforts to not only describe, but effectively evaluate and improve the population’s health. Student- and faculty-led seminars provide an ongoing mechanism for keeping abreast of current literature and identifying important areas of research and collaborative opportunities. Students are considered junior colleagues of the faculty who will develop the capacity to work independently in a supportive environment. The Department operates within a strong interdisciplinary framework involving faculty within the department, the school of medicine, and across the entire university, as well as leaders in health care institutions and health oriented organizations and agencies throughout the wider community.

Graduates from accredited universities and colleges will be considered for admission to the department. All applicants must satisfy both CWRU and department requirements for graduate admission. The MS program in Biostatistics consists of a 21-credit core curriculum and 15 credits of electives.

General Requirements

Students must satisfy the requirements of the School of Graduate Studies as stated here (p. 656), as well as those outlined by the Biostatistics program. To complete the MS degree program, students must pass a written comprehensive examination (Master’s Plan B). Our MS program does not offer a MS Plan A, Master’s thesis option.

Minimum Program Requirements are as follows:

- Core curriculum (21 credits)
- Electives (15 credits)
- Active participation in Departmental and Biostatistics seminar series
- Written comprehensive exam

Course Requirements

A cumulative grade point average of at least 2.75 is required to obtain a master’s degree. A minimum of 36 credit hours is required and at most 3 credit hours of prerequisites. Where applicable, students are encouraged to design reading electives in their area of interest. To assure the appropriate background for the Biostatistics MS program each student must have completed or take three credit hours in one or more of the following scientific areas: biology, human behavior or social sciences. The advisor must confirm that this requirement is satisfied. No more than 3 credit hours of graduate level course work in these areas may count toward the minimum for the MS degree.

Required Non-Credit Seminar Courses

Attending the non-credit research seminars (EPBI 501 Research Seminar and EPBI 503 Seminar in Biostatistics) is integral to a biostatistics student’s professional development; thus they are required of every enrolled student. They provide an informal forum for students and faculty to discuss and often sharply debate important professional and scientific issues not typically covered in regular coursework.
Comprehensive Exam

The domain of coverage for the written comprehensive exam is the material contained in the core courses excluding the Practicum in Biostatistical Science (EPBI 602 Practicum). The exam is offered once per year and typically involves two days.

info@casemph.org (http://bulletin.case.edu/schoolofmedicine/epidemiologyandbiostatistics/mailto:info@casemph.org)

A Master of Public Health degree is designed to prepare students to address the broad mission of public health, defined as “enhancing health in human populations, through organized community effort;” utilizing education, research and community service. Public health practitioners are prepared to identify and assess the health needs of different populations, and then to plan, implement and evaluate programs to meet those needs. It is the task of the public health practitioner to protect and promote the wellness of humankind. The master of public health program prepares students to enhance health in human populations through organized community effort. Graduates are qualified to work in local and state health departments, universities and colleges, hospitals, ambulatory medical centers, non-profit organizations, and the insurance and pharmaceutical industries. The program seeks to attract a rich mix of students, including those pursuing degrees in medicine, nursing, dentistry, law, social work, bioethics, management and other fields, as well as students holding undergraduate degrees.

The CWRU MPH Program has a two-year curriculum requiring 42 credit hours. Eighteen credits are accumulated in six core required courses, representing the fundamental domains of public health: biostatistics, epidemiology, environmental health sciences, health services administration, public health history and social and behavioral sciences. Students receive nine credits for three courses in the major of their choice, six credits for two elective courses, and nine credits for the “Capstone Experience,” a public health field practicum encompassing one semester of the MPH program. The MPH seminar program, a two-semester sequence, is taken for no credit. Previous experience or education pertaining to public health may increase the student’s flexibility in course selection. Students may also enroll part-time and take courses over a three to five year period.

NOTE: Students who matriculated prior to fall 2007 are still held to the 36 credit hour curriculum.

Requirements:

Core required courses (18 credits):

- MPH 405 Statistical Methods in Public Health | 3
- MPH 406 History and Philosophy of Public Health | 3
- MPH 411 Introduction to Health Behavior | 3
- MPH 429 Introduction to Environmental Health | 3
- MPH 439 Public Health Management and Policy | 3
- MPH 483 Introduction to Epidemiology for Public Health Practice | 3
- Capstone Experience: | 9
  - MPH 652 Public Health Capstone Experience

Major - choose one major and take 9 credits within that major

- Population Health Research Major | 9
- Global Health Major
- Health Policy & Management Major
- Health Promotion & Disease Prevention Major

Electives | 6

- MPH 506 The Future of Public Health
- MPH 507 Building a Public Health Project
Students in the Population Health Research major may take MPH 431 Statistical Methods I in place of MPH 405.

Total Units in Sequence: 42

Majors

Currently, four different majors (a.k.a. tracks) are offered by the CWRU MPH Program: Population Health Research, Global Health, Health Policy & Management, and Health Promotion & Disease Prevention. Each major has a required course or courses (in addition to the core required courses), plus selective offerings to be combined for a total of 9 credit hours in major coursework. Students develop a Capstone project relevant to the major area to expand and apply the knowledge of the subject. Individual emphasis will differ from student to student within each major.

MPH students can also choose to expand the emphasis and depth of their program of study by electing to do a double major plan of study. For the double major, the student chooses two areas (two majors) of equal emphasis and takes 3 courses in each area (this requires the student to take a minimum of 45 credit hours). The student’s Capstone project must embrace and integrate both emphasis., and no double-counting of credits can take place. Students choosing to do the double major plan of study should also work closely with an advisor to ensure optimal course selection and foster the evolution of a successful Capstone project.

Population Health Research Major

Coordinator - Mendel Singer, PhD

Learning Objectives:

- Working knowledge of epidemiologic principles, terminology, and tools
- Working knowledge of the primary analytic methods employed in both prospective and retrospective studies relating to population health
- Understand the most common study designs used in public health and/or clinical research
- Gain familiarity with some of the key advanced concepts in one of the subspecialties of population health (e.g. epidemiology, health services research, outcomes research)

Global Health Major

Coordinator - Daniel Tisch, PhD, MPH

Learning Objectives:

- Develop a global perspective on health and diseases
- Learn to design, execute, analyze, and evaluate global health research or projects
- Acquire skills to understanding and communicate meaningfully with colleagues from distant fields of global health
- Learn to integrate multiple objectives in global health across academic and applied disciplines
- Understand ethical and regulatory issues for global health research

Health Care Policy & Administration Major

Coordinator - Jessica Berg, JD, MPH

Learning Objectives:
To improve population health through leadership by developing knowledge, ability and skills to lead care improvement, including:

- Knowledge of social science through theories and how they can be used to understand the organization of health care (health economics, sociology, organization theory, social psychology)
- To understand the role of the manager, organizational control and design, relationships with professional workers, adaptation to change and public accountability
- To understand and be able to use management techniques including quality improvement, small group leadership, budgeting, cost effectiveness, and decision supports
- Able to analyze a public health problem, recommend solutions, make a public presentation, and carry out improvements

Health Promotion & Disease Prevention Major
Coordinator - Erika Trapl, PhD

Learning Objectives:

- Describe models and theories of health behavior as they relate to health promotion and disease prevention
- Identify multi-factorial causes of health behavior and disease
- Demonstrate knowledge and skills necessary to support behavior change
- Apply principles and practice of effective health communication
- Describe development, implementation, and evaluation of programs that promote healthy lifestyle and behaviors

- MPHP 508 Ethics, Law, and Epidemiology
- ANTH 461 Urban Health

PhD Epidemiology and Biostatistics

The PhD Program in Epidemiology and Biostatistics draws on the core disciplines of biostatistics and epidemiology to support students in developing the knowledge, skills and competencies needed to assume positions of leadership with the ultimate goal of advancing the public’s health. Students accepted into the PhD program will master the rigorous scientific and analytic methods necessary to be at the forefront of efforts to not only describe, but effectively evaluate and improve the public’s health. The Department operates within a strong interdisciplinary framework involving faculty within the department, the school of medicine, and across the entire university, as well as leaders in health care institutions and health oriented organizations and agencies throughout the wider community.

Student- and faculty-led seminars provide an ongoing mechanism for keeping abreast of current literature and identifying important areas of research and collaborative opportunities. Students are considered junior colleagues of the faculty who will develop the capacity to work independently in a supportive environment. The Department operates within a strong interdisciplinary framework involving faculty within the department, the school of medicine, and across the entire university, as well as leaders in health care institutions and health oriented organizations and agencies throughout the wider community.

Graduates from accredited universities and colleges will be considered for admission to the department. All applicants must satisfy both CWRU and department requirements for graduate admission. Upon acceptance into the PhD program, each student will be assigned an academic advisor, who will guide the student through department and graduate school regulations, assist him or her in designing the initial planed program of study, and track the student’s progress toward degree completion.

All incoming PhD students take a required 36-credit core curriculum, which includes a 24-credit common core, 12-credit concentration core, and 6-credits of electives from one of four areas of concentration: Genetic Epidemiology and Bioinformatics, Global Health Epidemiology, Health Behavior and Prevention Science, and Health Care Organizations, Outcomes and Policy (see descriptions below).

On completion of all core requirements, students take a qualifying examination that leads to advancement to candidacy. When ready to embark upon the Doctoral dissertation, the student must choose a research advisor to have the major responsibility for facilitating, guiding, and advising the student in his or her research.

Curriculum

The Doctor of Philosophy degree in the Department of Epidemiology and Biostatistics is comprised of the following components:

- Basic Core Curriculum (24 credits)
- Specialization/Concentration Core Curriculum (12 credits)
- Electives (6 credits)
- Seminar Requirements (501 & 502, 503, 504, 505, or 506)
- Passing the Qualifying Exam
- Portfolio Presentation
- Dissertation (18 credits)

Basic Core Curriculum (24 credits)

The basic core curriculum is designed to provide PhD students with a strong foundation in epidemiology and biostatistics, together with
health service research - the fields that comprise population health sciences - and the methodological and analytic training to conduct a rigorous, high quality dissertation in the student’s selected specialization or concentration.

Specialization/Concentrations (12 credits)

The PhD coursework requirement also consists of concentrated studies within one of four substantive areas offered within the department: Genetic Epidemiology and Bioinformatics, Global Health Epidemiology, Health Behavior and Prevention Science, and Health Care Organizations, Outcomes and Policy.

Most PhD students will specify a concentration when they apply to the program; those who do so will have better chance of acceptance. Students who do not directly specify a concentration when applying for admission to the program, must do so no later than the end of the second semester (for full-time students) or 18 credit hours of core coursework, and meet all the requirements of the chosen concentration. Applying to a concentration after matriculation OR changing concentrations after initial admission does not guarantee acceptance into the concentration. Some concentrations may have additional prerequisites beyond those required for entrance into the PhD program (i.e., at least one course in calculus), or additional non-coursework requirements (i.e., applied research experience).

Electives (6 credits)

Electives are chosen in conjunction with consultation with the student’s academic advisor.

Seminars (0 credits)

Attending research seminars is integral to our graduate program and your professional development. Students are required to attend weekly research seminars. These seminars provide a forum for students to develop skills in scientific presentation, thought and communication, and balance general and concentration-specific speakers and topics. Meeting locations may vary from week to week depending upon the speaker.

Portfolio Presentation

The purpose of the portfolio presentation is to give the doctoral student, faculty and other doctoral students an opportunity to consider the progress, achievements and goals of the presenting student. However, it is neither an examination nor a formal checklist of activity. The presentation is an opportunity for the presenting student to review her/his study and career goals and for the faculty to offer feedback and advice to the student regarding progress toward her/his goals. One way for the student to think about the portfolio presentation is to imagine that (s)he is being interviewed for an academic or research position. In such a circumstance, the student would explain why (s)he has the background and skills that would qualify her/him for the position.

Generally, the Portfolio Presentation is given after Advancement to Candidacy but prior to the dissertation proposal defense.

Dissertation (18 credits)

After passing the qualifying examination and completing all course work, the student should choose a dissertation topic and find a faculty member with an appointment in the Department who is willing to be his/her research advisor.

Year 3 + : Complete remaining hours of elective coursework, Portfolio, and 18 hours of Dissertation Research

Areas of Concentration

Genetic Epidemiology and Bioinformatics

Students enrolled in the Genetic Epidemiology and Bioinformatics Concentration will learn to design and conduct epidemiological studies investigating the genetic and environmental influences on disease. Genetic epidemiology combines genetics, epidemiology, and biostatistics.
Bioinformatics involves the use of sophisticated statistical and data mining tools to analyze genomic, epigenomic, and proteomic data. Special study designs and statistical methods are required to explore genetic influences in epidemiologic studies, and this field continues to evolve as molecular and computational technology evolves. Furthermore, studies have moved beyond associations strictly between trait and DNA sequence, and now incorporate gene-environment interaction, RNA/gene expression, copy number variants, epigenetics, and proteomics. Thus, today’s genetic epidemiologists must be able to take multidisciplinary approaches to the evaluation of genetics in disease pathogenesis.

Researchers in many diverse areas are interested in incorporating genetics into their studies of disease pathogenesis, so this field is in demand. Currently the field is moving towards the development of predictive models incorporating genetic polymorphisms, so this field is central to translational and personalized medicine. After finishing training in this area, students may become collaborators with other basic and clinical scientists who are interested in examining genetic effects on their respective phenotypes, may become methodologists and develop new statistical/bioinformatic approaches appropriate for obtaining genetic information, or may lead their own research related to the genetics of specific complex traits.

Global Health Epidemiology

The World Health Organization (WHO) and the US Institute of Medicine (IOM) defines Global Health as “health problems, issues, and concerns that transcend national boundaries, may be influenced by circumstances or experiences in other countries, and are best addressed by cooperative actions and solutions”. We believe that, at its core, Global Health (and more broadly, population health sciences) is built upon the disciplines of epidemiology and biostatistics. The unifying theme of this concentration is the relatedness of health across diverse geographic areas and communities and the application of epidemiology in the context of related disciplines to define, quantify, and address health determinants, measurements, and trends.

CWRU is a recognized leader in Global Health research and education. Academic opportunities in the field of Global Health are extensive and have been formally organized through the CWRU Framework for Global Health with nine departments, five schools and The Center for Global Health and Diseases at CWRU. Recognizing that Global Health is not limited to international settings or “developing countries”, the concentration also recognizes neglected diseases and vulnerable populations within the USA that transcend cultural boundaries.

The spirit of this concentration is advanced, innovative training to invite and strengthen the brightest new researchers in the field of global health. To accomplish this to the highest degree possible, we take advantage of our own connections within the University, our deep resources in Global Health professionals. Since the focus of this concentration is the development research of impact in a global perspective of health, prior or current experience in cultural settings from which these populations arise is strongly encouraged.

Health Behavior and Prevention Science

Health behavior and prevention research involves the systematic study of factors that modify behaviors related to disease risk and health promotion. This involves the development and testing of intervention programs designed to change behavior and reduce the onset and impact of various diseases and programs designed to improve quality of life. Students enrolled in a concentration in Health Behavior and Prevention Science will train and conduct research on the psychological, social and ecological influences of health-related behaviors linked to the prevention of chronic disease, focusing not only on individual-level health and health behavior change, but more broadly to include multi-level, socio-ecological influences from interpersonal relationships and families, to organizations (school, work, religion), neighborhoods and communities, and policy.

Research opportunities for HBPS students are plentiful across campus, both with EPBI faculty and through established research centers within the university, such as the Prevention Research Center for Healthy Neighborhoods, Center for Reducing Health Disparities, Practice-Based Research Networks, Swetland Center for Environmental Health, Case Comprehensive Cancer Center (Prevention and Control Program), and the Center on Urban Poverty and Community Development.

The Prevention Research Center for Healthy Neighborhoods, through its Training and Mentoring and Research Development Cores, have built-in opportunities for students to become part of research teams, attend seminars, brown-bag discussions and participate in collaborative exchanges with community research partners.

Health Care Organization, Outcomes, and Policy

Students in the Health Care Organization, Outcomes, and Policy concentration will be prepared to design and carry out research in alternative models for the organization and delivery of care; quality, cost-effectiveness and comparative effectiveness of care; disparities in receipt or outcomes of care; translation of evidence-based practice into guidelines and evaluation of their real-world applications; and health policy analysis and implementation. Students in this concentration will acquire a solid grounding in the conduct of rigorous multidisciplinary studies applying quantitative, qualitative and mixed methods, and specialized competencies in key areas, viz., large database analysis; cost-effectiveness and comparative effectiveness analysis; health economics; health policy and management; and other advanced methods such as hierarchical linear modeling; structural equation modeling; instrumental variable analysis; analysis of weighted survey data; and spatial analysis of data.

There is a nationally recognized need for researchers prepared to lead or collaborate on the types of studies students in this concentration would be prepared to conduct. Placements of past graduates of our department who focused their studies in this area indicate that a variety of employment opportunities exist in academia, industry, and government. This concentration is closely related to research in comparative effectiveness, disparities, and health care quality, all three of which reflect national funding priorities. For example, over one billion in federal research dollars has recently been devoted to the funding comparative effectiveness research.

EPBI Courses

EPBI 406. Public Policy and Aging. 3 Units.
Overview of aging and the aged. Concepts in the study of public policy. Policies on aging and conditions that they address. The politics of policies on aging. Emergent trends and issues. Offered as ANTH 498, BETH 496, EPBI 408, GERO 496, HSTY 480, MPHP 408, NURS 479, NURS 579, POSC 480, and SOCI 496.
EPBI 411. Introduction to Health Behavior. 3 Units.
Using a biopsychosocial perspective, an overview of the measurement and modeling of behavioral, social, psychological, and environmental factors related to disease prevention, disease management, and health promotion is provided. Offered as EPBI 411 and MPHP 411. Prereq: Enrollment limited to MPH students (Plan A or Plan B) and EPBI students or consent.

EPBI 414. Introduction to Statistical Computing. 3 Units.
This course introduces the use of computers in epidemiologic investigations and biostatistical applications. Topics covered include the use of the Internet to access and obtain publicly available databases, database and spreadsheet concepts, and developing a sound approach to analysis planning and implementation. The majority of the course will focus on instruction in the use of SAS software for advanced database management and manipulation and basic statistical analyses, with parallel applications in R to exploit its features. Primary emphasis is on developing the knowledge and familiarity required for running these particular programs in connection with data collection, analysis, and presentation of results in clinical studies. Students will be required to complete assignments using personal computers using Windows operating systems and/or computer systems maintained by the department. Students should expect weekly assignments to reinforce lecture concepts. Knowledge of basic statistics in beneficial, as this course does not teach inferential statistical analysis in detail; but it is not vital to learning the material in this course.

EPBI 415. Statistical Programming. 3 Units.
Programming with R and SAS, emphasizing sound practices and covering numerical methods commonly used in statistical science. R is a high-level, open-source platform now vital in statistical computing, especially for creating and sharing applications that implement new and customized methods. SAS is a comprehensive commercial software system that is widely used in biomedical research. Topics include effective programming style and structure, R for customized graphics, Monte Carlo simulation and bootstrapping, numerical optimization and root finding. Previous experience in R and SAS is advised, but students literate in other languages (e.g., Java, C++) are encouraged to enroll. Prereq: EPBI 431.

EPBI 419. Topics in Urban Health in the United States. 3 Units.
This course examines patterns of urban health and disease across the life course among marginalized populations and communities. We will examine the socio-environmental contexts that impact health status (i.e., racism, health disparities, neighborhood context, and environmental stressors). Readings from epidemiology, sociology, and public health literature will provide a foundation for the multiple factors and processes that impact health. Offered as EPBI 419 and MPHP 419.

EPBI 431. Statistical Methods I. 3 Units.
Application of statistical techniques with particular emphasis on problems in the biomedical sciences. Basic probability theory, random variables, and distribution functions. Point and interval estimation, regression, and correlation. Problems whose solution involves using packaged statistical programs. First part of year-long sequence. Offered as ANAT 431, BIOL 431, CRSP 431, EPBI 431, and MPHP 431.

EPBI 432. Statistical Methods II. 3 Units.
Methods of analysis of variance, regression and analysis of quantitative data. Emphasis on computer solution of problems drawn from the biomedical sciences. Design of experiments, power of tests, and adequacy of models. Offered as BIOL 432, CRSP 432, EPBI 432, and MPHP 432. Prereq: EPBI 431 or equivalent.

EPBI 433. Community Interventions and Program Evaluation. 3 Units.
This course prepares students to design, conduct, and assess community-based health interventions and program evaluation. Topics include assessment of need, evaluator/stakeholder relationship, process vs. outcome-based objectives, data collection, assessment of program objective achievement based on process and impact, cost-benefit analyses, and preparing the evaluation report to stakeholders. Recommended preparation: EPBI 490, EPBI 431, or MPHP 405. Offered as EPBI 433 and MPHP 433.

EPBI 434. Community Engaged Research: Principles, Methods and Applications. 3 Units.
Community-engaged research is a partnership approach to research that equitably involves community members, organization representatives, and academic researchers in all aspects of the research process. This course is designed to provide an overview of community-based participatory research (CBPR) and will familiarize students with the core principles, concepts and methods as it applies to health-related outcomes. Using a class format that includes lectures, discussion, case studies, small group exercises and fieldwork projects, we will examine and discuss key methodological considerations in each phase of the research process from partnering with communities to planning for research, data gathering, and dissemination of results. Examples of applications in both public health and clinical settings will be highlighted.

EPBI 435. Survival Data Analysis. 3 Units.
Basic concepts of survival analysis including hazard function, survival function, types of censoring; non-parametric models; extended Cox models: time dependent variables, piece-wise Cox model, etc; sample size requirements for survival studies. Prereq: EPBI 432.

EPBI 436. Essence of Multilevel Statistical Modeling, Including Repeated Measures Analysis. 1 Unit.
A brief introduction to statistical models to handle studies having observational units (cases) at multiple levels (hierarchies). In particular, cases are often nested within groups, such as distinct communities, healthcare centers, or schools. Because the cases are not independent, ordinary statistical models (EPBI 432) are not appropriate. In addition, some research questions suggest case-level analyses; others suggest group-level analyses. Longitudinal and other repeated measures analyses can be formed by taking the measurements to be nested within independent cases. Methods include the basic "summary measure" approach and mixed linear model methods, such as random coefficient regression models. Examples and wise use of software (R and SAS) are stressed in order to develop a strong conceptual understanding of the models. This course joins EPBI 437 and 438 as the three-step "essence" series in advanced statistical methods required for the PhD in Population Health Science. Prereq: EPBI 432 or requisites not met permission.
EPBI 437. Essence of Classical Multivariate Analysis. 1 Unit.
A brief introduction to classical multivariate analysis methods: data visualization, two-group discriminant analysis via Hotelling's test, principal components and exploratory factor analysis, cluster analysis. Examples and wise use of software R are stressed in order to develop a strong conceptual understanding of the methods. This course joins EPBI 436 and 438 as the three-step "essence" series in advanced statistical methods required for the PhD in Population Health Science. Prereq: EPBI 432 or requisites not met permission.

EPBI 438. Essence of Structural Equation Modeling. 1 Unit.
Brief introduction to classic "linear structural relations" (LISREL) formulation of structural equation models: Building them to address specific research aims. Fitting and assessing the goodness of the fit. Prudent interpretations. Examples and wise use of software are stressed in order to develop a strong conceptual understanding. This course joins EPBI 436 and 437 as the three-step "essence" series in advanced statistical methods required for the PhD in Population Health Science. Prereq: EPBI 432 or requisites not met permission.

EPBI 440. Introduction to Population Health. 3 Units.
Introduces graduate students to the multiple determinants of health including the social, economic and physical environment, health services, individual behavior, genetics and their interactions. It aims to provide students with the broad understanding of the research development and design for studying population health, the prevention and intervention strategies for improving population health and the disparities that exist in morbidity, mortality, functional and quality of life. Format is primarily group discussion around current readings in the field; significant reading is required.

EPBI 441. Theory of Linear Models, with Applications. 3 Units.

EPBI 442. Biostatistics II. 3 Units.
This course deals with the basic concepts and applications of nonparametric statistics. Topics will include distribution-free statistics, one sample rank test, the Mann-Whitney and Kruskal Wallis tests, one sample and two sample U-statistics, asymptotic relative efficiency of tests, distribution-free confidence intervals, point estimation and linear rank statistics. Recommended preparation: EPBI 441. Offered as EPBI 442 and MPH 442.

EPBI 443. Multivariate and High Dimensional Data. 3 Units.
Contemporary multivariate analysis, including statistical learning and inference methods when the number of measures far exceeds the number of subjects ("high-dimensional data"). Topics include (but not limited to) classical modeling and inference under multivariate normal theory, principal components, descriptive and confirmatory factor analysis, partial least squares, classification and supervised learning, cluster analysis, unsupervised learning methods, and next generation sequencing data analysis. This course stresses how the core modeling principles, computing tools, and visualization strategies are used to address complex scientific aims powerfully and efficiently, and to communicate those findings effectively to content researchers who may have little or no experience in these methods. Recommended preparation: Advanced graduate students in Biostatistics or other quantitative sciences with background and adequate preparation in graduate-level classical statistical theory and a course experience in regression analysis. Some programming experience. Knowledge in mathematical computing or statistical software package is helpful. We aim to use SAS, R, STATA, and JMP Genomics for analyzing data.

EPBI 444. Communicating in Population Health Science Research. 2 Units.
Doctoral seminar on writing journal articles to report original research, and preparing and making oral and poster presentations. The end products are ready-to-submit manuscripts and related slide and poster presentations for the required first-year research project in the PhD program in the Department of Epidemiology and Biostatistics. While this course provides a nucleus for this endeavor, students work intensively under the supervision of their research mentors, who guide all stages of the work including providing rigorous editorial support. Seminar sessions are devoted to rigorous peer critiques of every stage of the projects and to in-depth discussions of assigned readings. Recommended preparation: PhD students in the Department of Biostatistics and Epidemiology. Non-PhD EPBI students permitted if space available. Fluency in English writing (e.g., in accord with the Harbrace College Handbook). Prereq: EPBI 431 and EPBI 490. Coreq: EPBI 432.

EPBI 445. Research Ethics in Population Health Sciences. 1 Unit.
This one-credit hour course is designed to address key elements in research ethics as they apply to the Population Health Sciences. The course includes readings, lectures, discussions and peer presentations in the following areas: personal, professional and financial conflict of interest; policies regarding human subjects; safe laboratory practices; mentor/mentee responsibilities and relationships; collaborative research; peer review; data acquisition and laboratory tools; management, sharing and ownership of data; research misconduct; responsible authorship and publication; the role of the scientist in society; contemporary ethical issues in biomedical research; and the environmental and societal impacts of scientific research.

EPBI 446. Experimental Design for Biomedical Sciences. 3 Units.
This course deals with basic problems of the design and analysis of experiments with emphasis on experiments conducted in the biomedical sciences. Topics will include completely randomized and balanced incomplete block designs. Latin and Graeco-Latin squares, factorial experiments and response surface and mixture designs. In addition to analysis and interpretation of results from experiments, optimization of design parameters, using second-order models will be covered. The course is intended for graduate students and investigators who are engaged in biomedical research. Prereq: EPBI 432 or MPH 432 or BIOL 432 or consent of instructor.
EPBI 447. Global Health: Outbreak Investigation in Real-Time. 3 Units.
This course provides a trans-cultural, trans-disciplinary, multimedia learning experience by analyzing historical and real-time data from the annual dengue endemics and sporadic epidemics in Puerto Rico and Brazil. A rigorous problem-centered training in the epidemiology, prevention, treatment, and control of infectious diseases using real-time and historical surveillance data of endemic and epidemic Dengue in Bahia, Brazil. This is an advanced epidemiology course in which core material will be primarily taught through reading assignments, class discussion, group projects, and class presentations. The course will utilize the online web-based communication and learning technology to create a single classroom between the CWRU and international partners with unique and complementary skills. In addition to joint classroom lectures across sites, student groups will also perform smaller-scale videoconference meetings for assigned group projects, thus creating strong international connections for the students, faculty, and our institutions. Note: Due to the complexities of time zones for this international course, the course will begin at 8:00a.m. until the U.S.A. adjusts clocks for Daylight Savings Time (unlike Brazil). Therefore, classes after the second week of March will begin at 9:00a.m. Offered as: EPBI 447, INTH 447, and MPH 447. Prereq: EPBI 490.

EPBI 450. Clinical Trials and Intervention Studies. 3 Units.
Issues in the design, organization, and operation of randomized, controlled clinical trials and intervention studies. Emphasis on long-term multicenter trials. Topics include legal and ethical issues in the design; application of concepts of controls, masking, and randomization; steps required for quality data collection; monitoring for evidence of adverse or beneficial treatment effects; elements of organizational structure; sample size calculations and data analysis procedures; and common mistakes. Recommended preparation: EPBI 431 or consent of instructor. Offered as EPBI 450 and MPH 450.

EPBI 451. Principles of Genetic Epidemiology. 3 Units.
A survey of the basic principles, concepts and methods of the discipline of genetic epidemiology, which focuses on the role of genetic factors in human disease and their interaction with environmental and cultural factors. Many important human disorders appear to exhibit a genetic component; hence the integrated approaches of genetic epidemiology bring together epidemiologic and human genetic perspectives in order to answer critical questions about human disease. Methods of inference based upon data from individuals, pairs of relatives, and pedigrees will be considered. The last third of the course (1 credit) is more statistical in nature. Offered as EPBI 451, GENE 451, and MPH 451. Prereq: EPBI/MPH 431 and EPBI/MPH 450 or MPH 450.

EPBI 452. Statistical Methods for Genetic Epidemiology. 3 Units.
Analytic methods for evaluating the role of genetic factors in human disease, and their interactions with environmental factors. Statistical methods for the estimation of genetic parameters and testing of genetic hypotheses, emphasizing maximum likelihood methods. Models to be considered will include such components as genetic loci of major effect, polygenic inheritance, and environmental, cultural and developmental effects. Topics will include familial aggregation, segregation and linkage analysis, ascertainment, linkage disequilibrium, and disease marker association studies. Recommended preparation: EPBI 431 and EPBI 451.

EPBI 453. Categorical Data Analysis. 3 Units.
Descriptive and inferential methods for categorical data with applications: bivariate data; models for binary and multinomial response variables, with emphasis on logit models; loglinear models for multivariate data; model fitting using the maximum likelihood approach; model selection and diagnostics; and sample size and power considerations. Topics in repeated response data as time allows. Recommended preparation: EPBI 441.

EPBI 454. Population Genetics for Genetic Epidemiology. 3 Units.
This course will cover basics of population genetics (mutation, migration, natural selection) as well as topics such as random mating populations and inbred populations. Emphasis will be placed on migration studies and on linkage disequilibrium mapping. Measures on linkage disequilibrium, methods for linkage disequilibrium mapping of disease genes and the use of isolated versus outbred population in linkage of disequilibrium mapping will be discussed. Recommended preparation: EPBI 431.

EPBI 457. Genetic Linkage Analysis. 3 Units.
Methods of analyzing human data to detect genetic linkage between disease traits, discreet and continuous, and polymorphic markers. Both model-based maximum likelihood (lod score) and model-free robust methods will be discussed. Additional topics covered will include measures of informativeness, multipoint analysis, numerical methods and mod score analysis. Prereq: EPBI 432. Coreq: EPBI 451.

EPBI 458. Statistical Methods for Clinical Trials. 3 Units.
This course will focus on special statistical methods and philosophical issues in the design and analysis of clinical trials. The emphasis will be on practically important issues that are typically not covered in standard biostatistics courses. Topics will include: randomization techniques, intent-to-treat analysis, analysis of compliance data, equivalency testing, surrogate endpoints, multiple comparisons, sequential testing, and Bayesian methods. Offered as EPBI 458 and MPH 458. Prereq: EPBI 432 or MPH 432.

EPBI 459. Longitudinal Data Analysis. 3 Units.
This course will cover statistical methods for the analysis of longitudinal data with an emphasis on application in biological and health research. Topics include exploratory data analysis, response feature analysis, growth curve models, mixed-effects models, generalized estimating equations, and missing data. Prereq: EPBI 432.

EPBI 460. Introduction to Health Services Research. 3 Units.
This survey course provides an introduction to the field of Health Services Research and an overview of key health services research concepts and methods, including conceptual frameworks and models; outcomes research; risk adjustment; disparities in health care; policy/health care systems; cost and cost-effectiveness; quality of life, process improvement; patient satisfaction; patient safety; health economics; statistical modeling techniques; and qualitative research methods. Offered as EPBI 460 and MPH 460.
**EPBI 461. Health Services Research Methods. 3 Units.**
This is a course in research methods focusing on practical issues in the conduct of health services research studies. Topics include: an overview of health services research; ethics in health services research; proposal writing and funding; the relationship between theory and research; formulating research questions; specifying study design and study objectives; conceptualizing and defining variables; validity and reliability of measures; scale construction; operationalizing health research relevant variables using observation, self and other report, and secondary analysis; formatting questionnaires; developing analysis plans; choosing data collection methods; sampling techniques and sample size; carrying out studies; preparing data for analysis; and reporting of findings.

**EPBI 464. Obesity and Cancer: Views from Molecules to Health Policy. 3 Units.**
This course will provide an overview of the components of energy balance (diet, physical activity, resting metabolic rate, dietary induced thermogenesis) and obesity, a consequence of long term positive energy balance, and various types of cancer. Following an overview of energy balance and epidemiological evidence for the obesity epidemic, the course will proceed with an introduction to the cellular and molecular biology of energy metabolism. Then, emerging research on biologically plausible connections and epidemiological associations between obesity and various types of cancer (e.g., colon, breast) will be presented. Finally, interventions targeted at decreasing obesity and improving quality of life in cancer patients will be discussed. The course will be cooperatively-taught by a transdisciplinary team of scientists engaged in research in energy balance and/or cancer. Didactic lectures will be combined with classroom discussion of readings. The paper assignment will involve application of course principles, lectures and readings. Offered as EBPI 464, MPHP 464.

**EPBI 465. Design and Measurement in Population Health Sciences. 3 Units.**
This course focuses on common design and measurement approaches used in population health sciences research, building on introductions to these approaches provided in pre-requisite courses. Students will develop in-depth knowledge of these approaches through readings, lectures, discussions, class presentations, and hands-on applications. Applications will focus on primary data collection in multiple settings and across varying populations. Prereq: EPBI 440, EPBI 431, EPBI 490, EPBI 432, EPBI 460, EPBI 444 and EPBI 445.

**EPBI 466. Promoting Health Across Boundaries. 3 Units.**
This course examines the concepts of health and boundary spanning and how the synergy of the two can produce new, effective approaches to promoting health. Students will explore and analyze examples of individuals and organizations boundary spanning for health to identify practice features affecting health; compare and contrast practices and approaches, and evaluate features and context that promote or inhibit boundary spanning and promoting health. Offered as MPH 466, EPBI 466, and BETH 466. Prereq: Graduate student status or instructor consent.

**EPBI 467. Comparative and Cost Effectiveness Research. 1 Unit.**
Comparative effectiveness research is a cornerstone of healthcare reform. It holds the promise of improved health outcomes and cost containment. This course is presented in a convenient 5-day intensive format in June. There are reading assignments due prior to the 1st session. Module A, Days 1-2: Overview of comparative effectiveness research (CER) from a wide array of perspectives: individual provider, institution, insurer, patient, government, and society. Legal, ethical and social issues, as well as implications for population and public health, including health disparities will also be a component. Module B, Day 3: Introduction to the various methods, and their strengths, weaknesses and limitations. How to read and understand CER papers. Module C, Days 4-5: Cost-Effectiveness Analysis. This will cover costing, cost analysis, clinical decision analysis, quality of life and cost-effectiveness analysis for comparing alternative health care strategies. Trial version of TreeAge software will be used to create and analyze a simple cost-effectiveness model. The full 3-credit course is for taking all 3 modules. Modules A or C can be taken alone for 1 credit. Modules A and B or Modules B and C can be taken together for a total of 2 credits. Module B cannot be taken alone. If taking for 2 or 3 credits, some combination of term paper, project and/or exam will be due 30 days later. Offered as EPBI 467 and MPH 467.

**EPBI 468. The Continual Improvement of Healthcare: An Interdisciplinary Course. 3 Units.**
This course prepares students to be members of interprofessional teams to engage in the continual improvement in health care. The focus is on working together for the benefit of patients and communities to enhance quality and safety. Offered as EPBI 468, MPH 468, NURS 468.

**EPBI 471. Statistical Aspects of Data Mining. 3 Units.**

**EPBI 472. Special Topics in Statistical Genetics. 1 - 4 Unit.**
Various topics in statistical genetics will be discussed, depending on student interest and needs. Examples of topics are paternity and zygosity testing, path analysis for genetic epidemiology, the analysis of racial admixture and modeling such phenomena as imprinting and anticipation. The course will consist of four modules. A student may, in consultation with the instructor, elect to take 1 - 4 modules for the corresponding amount of credit. Recommended preparation: EPBI 452.

**EPBI 473. Integrative Cancer Biology. 3 Units.**
Nonlinear mathematical representations of cancer relevant processes will be analyzed and used to interpret data where available. Stochastic processes will be introduced for tumor cell numbers and DNA double strand breaks. SEER, A-bomb, omic and cytometry data will be analyzed.
EPBI 474. Principles of Practice-Based Network Research. 3 Units.
Practice-based research networks (PBRNs) are organizations of community-based healthcare practices that engage in clinical research and practice improvement. In the U.S., there are more than 100 of these dynamic, collaborative organizations that enable the translation of research into practice and practice into research. They also frequently engage in developing and refining methods to improve healthcare quality. This course is designed to provide students with a foundation in PBRN methods and principles, including: introduction to PBRNs, methods for collaborating with community practices, PBRN-building strategies, PBRN data collections methods, statistical issues in network research, community-based participatory research, human subjects' protection issues in PBRNs, quality improvement research in PBRNs, funding for PBRN research, and writing PBRN research findings for publication. Each 2.5 hour class session will feature a lecture followed by a discussion of readings from the literature. Students will develop a PBRN research or quality improvement proposal during the semester. Offered as EPBI 474 and MPH 474.

EPBI 476. Introduction to sequencing data analysis. 3 Units.
This is a 3 credit-hour cross-disciplinary course focusing on the analysis of high throughput sequencing data. In this course, the following will be covered: (1) basic genetics knowledge, (2) advanced next generation sequencing technology, (3) the use of R and perl, and (4) hands-on experience of analyzing different types of large sequencing data (e.g., SNP calling, chip-seq, RNA-seq, and methyl-seq). Upon completion of the course, the students are expected to (1) master basic knowledge and skills in several different disciplines: genetics, programming, and sequencing data analysis, and (2) be able to make significant contributions to collaborative projects by providing meaningful and accurate analysis for sequencing data. Graduate students from the following departments are encouraged to take this course: Department of Epidemiology and Biostatistics, Department of Electronic Engineering and Computer Science, Department of Genetics and Department of Biomedical Engineering. Prereq: EPBI 414 and EPBI 431. Coreq: EPBI 432.

EPBI 477. Internship at Health-Related Government Agencies. 3 Units.
This independent study course will incorporate a one-semester-long internship at health-related government agencies (Ohio Department of Health, Ohio Department of Job and Family Services, or Cleveland City Health Department). The choice of the agency will depend on the student's academic interests and research goals. The objective is to develop a level of familiarity with the organizational and operational aspects of such agencies, and to gain an understanding of agencies' and bureaucracies' interactions with the legislative body, as well as the processes of developing, implementing, managing, and monitoring health initiative. The instructor and the liaison persons at the agencies will be responsible for planning structured encounters of interns with key administrators and policy makers, and to select a research project, based on the intern's research interests and the agencies' research priorities. Interns will be required to submit a draft of the report to the instructor at the end of the semester. The approved, final report will be submitted to the agency. The project will be evaluated for its methodological soundness and rigor. Students will be required to be at the agency one day a week. Recommended preparation: EPBI 515. Offered as EPBI 477 and MPH 474.

EPBI 480. Introduction to Mathematical Statistics. 3 Units.
An introduction to statistical inference at an intermediate mathematical level. The concepts of random variables and distributions, discrete and continuous, are reviewed. Topics covered include: expectations, variance, moments, the moment generating function; Bernoulli, binomial, hypergeometric, Poisson, negative binomial, normal, gamma and beta distribution; the central limit theorem; Bayes estimation, maximum likelihood estimators, unbiased estimators, sufficient statistics; sampling distributions (chi-square, t) confidence intervals, Fisher information; hypothesis testing, uniformly most powerful tests and multi-decision problems. Prereq: MATH 122, MATH 124 or MATH 126.

EPBI 481. Theoretical Statistics I. 3 Units.
Topics provide the background for statistical inference. Random variables; distribution and density functions; transformations, expectation. Common univariate distributions. Multiple random variables; joint, marginal and conditional distributions; hierarchical models, covariance. Distributions of sample quantities, distributions of sums of random variables, distributions of order statistics. Methods of statistical inference. Offered as STAT 345, STAT 445, and EPBI 481. Prereq: MATH 122 or MATH 223 or Coreq: EPBI 431.

EPBI 482. Theoretical Statistics II. 3 Units.
Point estimation: maximum likelihood, moment estimators. Methods of evaluating estimators including mean squared error, consistency, "best" unbiased and sufficiency. Hypothesis testing; likelihood ratio and union-intersection tests. Properties of tests including power function, bias. Interval estimation by inversion of test statistics, use of pivotal quantities. Application to regression. Graduate students are responsible for mathematical derivations, and full proofs of principal theorems. Offered as STAT 346, STAT 446 and EPBI 482. Prereq: STAT 345 or STAT 445 or EPBI 481.

EPBI 483. Causal Inference. 3 Units.
This course covers concepts and methods for causal inference in health research. The ideas and approaches introduced in this course take us beyond standard statistical methods such as regression analysis, and have applications in both observational and randomized studies. Specific topics include potential outcomes, causal diagrams, confounding, propensity scores, instrumental variables, treatment noncompliance, mediation analysis, sensitivity analysis, and structural equations models. Prereq: EPBI/MPHP/BIOL 432 or equivalent.

EPBI 484. Geographic Medicine and Epidemiology. 1 - 3 Unit.
This course focuses on the epidemiology, prevention, treatment, and control of tropical and parasitic diseases. Emphasis will be placed on the triad of agent, host, and environment for infectious disease impacting global health. Three distinct modules will focus on specific examples such as malaria, helminths, bacteria, or viruses. Active class participation is required through discussions, case studies, and group projects. Recommended preparation: EPBI 490, EPBI 491 and a microbiology course or consent of instructor. Offered as EPBI 484, INTH 484, and MPH 484.
EPBI 485. Likelihood Theory & Applications. 3 Units.
This course introduces contemporary likelihood theory and its applications in solving statistical problems. The course will cover maximum likelihood theory; profile-, pseudo-, quasi-likelihood theory, and generalized estimating equations. We will use these likelihood theories in modeling and inference. Although we will rely on statistical theory and mathematics, the course is more about developing statistical thought process in addressing real-world statistical challenges. We will apply computational approaches in understanding estimation and making likelihood based inferences. There will be a midterm project in this course which will allow you to determine independent statistical research working in your own content area. The course is taught at the doctoral level, and much of the theory is illustrated through applications. Prereq: EPBI 482, STAT 446 or equivalent.

EPBI 490. Epidemiology: Introduction to Theory and Methods. 3 Units.
This course provides an introduction to the principles of epidemiology covering the basic methods necessary for population and clinic-based research. Students will be introduced to epidemiologic study designs, measures of disease occurrence, measures of risk estimation, and casual inference (bias, confounding, and interaction) with application of these principles to specific fields of epidemiology. Classes will be a combination of lectures, discussion, and in-class exercises. It is intended for students who have a basic understanding of the principals of human disease and statistics. Offered as EPBI 490 and MPHP 490. Prereq or Coreq: EPBI 431 or requisites not met permission.

EPBI 491. Epidemiology: Case-Control Study Design and Analysis. 3 Units.
This course builds upon EPBI 490 with a comprehensive study of the concepts, principles, and methods of epidemiologic research. The course content specifically focuses on the case-control study design and provides a framework for the design, analysis, and interpretation of case-control studies. Rigorous problem-centered training includes exposure measurement, subject selection, validity, reliability, sample size and power, effect modification, confounding, bias, risk assessment, matching, and logistic regression. Individual and group data projects will be analyzed using SAS statistical software. Offered as EPBI 491 and MPHP 491. Prereq: EPBI/MPHP 490.

EPBI 492. Epidemiology: Cohort Study Design and Analysis. 3 Units.
This course provides a comprehensive introduction to the cohort study. Particular emphasis is placed on cohort study design and cohort data analysis. The course will cover the conceptual framework underlying cohort studies, planning and conducting a cohort study, basic concepts of time, exposure, and outcome, and methods in the analysis of longitudinally collected data. Analytic methods covered in the class include, but are not limited to: analysis of age, period, and cohort effects, analysis of incidence rates, analysis of repeated measures, and analysis of time-to-event data. Students will have the opportunity to conduct analysis of data obtained from an actual cohort study using a statistical package of their choice. Offered as EPBI 492 and MPHP 492. Prereq: EPBI 431 and EPBI 490 or equivalents.

EPBI 494. Infectious Disease Epidemiology. 1 - 3 Unit.
This course is a follow-up to EPBI 484: Geographic Medicine and Epidemiology, and focuses on tuberculosis (TB), HIV, and dengue epidemiology. This is an advanced course, focusing on methods and approaches in epidemiology. It will be taught in three 1-credit modules, and students may take each module separately or all 3 together. Each module will have a separate project and/or exam. Module I: Tuberculosis epidemiology. Module II: HIV epidemiology. Module III: Dengue epidemiology. Offered as EPBI 494, INTH 494, and MPHP 494. Prereq: EPBI 490.

EPBI 497. Cancer Epidemiology. 1 - 3 Unit.
This is a 1-3 credit modular course in cancer epidemiology and is intended for graduate students in epidemiology and biostatistics, environment health, MPH students and MD or MD/PhD students. The course will consist of 3 five-week modules: 1) introduction to cancer epidemiology (study design, etiology and causal inference, cancer statistics and cancer biology); 2) site-specific discussions of various cancers involving natural history of disease and risk factors and etiology and 3) cancer prevention and screening and cancer survivorship. Each of the modules is worth 1 credit hour for a total of 3 credit hours. Offered as: EPBI 497 and MPHP 497.

EPBI 499. Independent Study. 1 - 18 Unit.

EPBI 500. Design and Analysis of Observational Studies. 3 Units.
An observational study investigates treatments, policies or exposures and the effects that they cause, but it differs from an experiment because the investigator cannot control assignment. We introduce appropriate design, data collection and analysis methods for such studies, to help students design and interpret their own studies, and those of others in their field. Technical formalities are minimized, and the presentations will focus on the practical application of the ideas. A course project involves the completion of an observational study, and substantial use of the R statistical software. Topics include randomized experiments and how they differ from observational studies, planning and design for observational studies, adjustments for overt bias, sensitivity analysis, methods for detecting hidden bias, and focus on propensity score methods for selection bias adjustment, including multivariate matching, stratification, weighting and regression adjustments. Recommended preparation: a working knowledge of multiple regression, some familiarity with logistic regression, with some exposure to fitting regression models in R. Offered as CRSP 500 and EPBI 500.

EPBI 501. Research Seminar. 0 Units.
This seminar series includes faculty and guest-lecturer presentations designed to introduce students to on-going research at the University and elsewhere. Seminars will emphasize the application of methods learned in class, as well as the introduction of new methods and tools useful in research.

EPBI 502. Seminar in Genetic Epidemiology and Bioinformatics. 0 Units.
Presentation of original research or recent journal publications by faculty and students.

EPBI 503. Seminar in Biostatistics. 0 Units.
Presentation of original research or recent journal publications by faculty and students in the area of Biostatistics.
EPBI 504. Seminar in Health Care Organization, Outcomes and Policy. 0 Units.
This seminar is designed to enhance the professional development of students in the Health Care Organization, Outcomes and Policy concentration of the Department of Epidemiology and Biostatistics and provide them with practical information, experiences and guidance to foster their academic success. Students will 1) develop the ability to critically appraise the health services research literature; 2) gain experience in organizing and delivering oral presentations based on published literature and their own research endeavors; 3) be exposed to role models and receive coaching on career development through lecture and discussion involving experienced faculty from within and outside the division; 4) receive didactic training and hands-on experience with career-related tasks and skills such as grant writing and proposal evaluation, article review, and effective participation in professional meetings; and hear faculty from within and outside the department describe their research. The specific content of the seminar for any given semester will be determined jointly by HCOOP students and faculty. Enrollment is limited to students in the HCOOP division of the Department of Epidemiology and Biostatistics.

EPBI 505. Seminar in Global Health Epidemiology. 0 Units.
This seminar explores a broad range of topics related to infectious disease research in international settings. Areas of interest are certain to include epidemiology, bioethics, medical anthropology, pathogenesis, drug resistance, vector biology, cell and molecular biology, vaccine development, diagnosis, and socio-cultural factors contributing to or compromising effective health care delivery in endemic countries. Speakers will include a diverse group of regional faculty and post-doctoral trainees, as well as visiting colleagues from around the world. Students will be asked to read a journal article written by the speaker and then discuss this article with the speaker after their seminar.

EPBI 506. Seminar in Health Behavior and Prevention Research. 0 Units.
This seminar is designed to enhance the academic and professional development of students in the Health Behavior & Prevention Research (HB&PR) concentration in the Department of Epidemiology and Biostatistics. The seminar is comprised of a journal club style in which current and classic research literature in health behavior and prevention research is critically evaluated. Also, talks are given by students, faculty, and invited guests. These activities give students the opportunity to improve their ability to: 1) critically evaluate research literature in HB&PR; 2) lead effectively a discussion of a research article; and 3) organize and deliver oral presentations based on published literature and their own research endeavors. Some sessions are devoted to didactic training and hands-on experience with career-related tasks and skills such as grant writing, proposal evaluation, and manuscript review. The specific content of the seminar for any given semester will be determined jointly by the students and faculty in HB&PR. Enrollment is required of all PhD students in the HB&PR concentration of the Department of Epidemiology and Biostatistics; however, it is open to all interested students.

EPBI 508. Ethics, Law, and Epidemiology. 3 Units.
This course is designed to provide epidemiology students with basic knowledge about the ethical and legal principles underlying epidemiological research. This is not a public health law class. Issue papers are assigned on a weekly basis. Each issue paper requires that the student analyze the situation depicted and apply the principles learned. Some issue papers may require that the student draft a proposed rule, a portion of legislation, or a document such as an informed consent form. Other exercises may require that students critique an existing agency rule or legislation. Offered as EPBI 508 and MPH 508. Prereq: EPBI 490 and EPBI 491 or equivalents.

EPBI 510. Health Disparities. 3 Units.
This course aims to provide theoretical and application tools for students from many disciplinary backgrounds to conduct research and develop interventions to reduce health disparities. The course will be situated contextually within the historical record of the United States, reviewing social, political, economic, cultural, legal, and ethical theories related to disparities in general, with a central focus on health disparities. Several frameworks regarding health disparities will be used for investigating and discussing the empirical evidence on disparities among other subgroups (e.g., the poor, women, uninsured, disabled, and non-English speaking populations) will also be included and discussed. Students will be expected to develop a research proposal (observational, clinical, and/or intervention) rooted in their disciplinary background that will incorporate materials from the various perspectives presented throughout the course, with the objective of developing and reinforcing a more comprehensive approach to current practices within their fields. Offered as CRSP 510, EPBI 510, MPH 510, NURS 510, and SASS 510.

EPBI 512. Reproductive and Perinatal Epidemiology. 1 - 3 Unit.
This course provides an overview of the biology, risk factors, and epidemiologic methods related to reproductive and perinatal outcomes. The course will be divided into three one-credit modules: 1) female reproductive health (e.g. puberty, menstrual cycle function, gynecological disorders, menopause); 2) pregnancy (e.g. fecundity, pregnancy complications, birth outcomes, congenital malformations, infant mortality); and 3) male reproductive health (e.g. fecundity, male reproductive malformations, testicular dysgenesis syndrome, erectile dysfunction). The course will be a combination of lectures and class discussions. Recommended preparation: EPBI 490 and EPBI 431 or the equivalent.

EPBI 515. Secondary Analysis of Large Health Care Data Bases. 3 Units.
Development of skills in working with the large-scale secondary data bases generated for research, health care administration/billing, or other purposes. Students will become familiar with the content, strength, and limitations of several data bases; with the logistics of obtaining access to data bases; the strengths and limitations of routinely collected variables; basic techniques for preparing and analyzing secondary data bases and how to apply the techniques to initiate and complete empirical analysis. Recommended preparation: EPBI 414 or equivalent; EPBI 431 or EPBI 460 and EPBI 461 (for HSR students).

EPBI 592. Special Topics in Epidemiology. 1 - 10 Unit.
Short, intensive courses on current research topics, statistical analyses, methodological issues or intervention approaches related to epidemiology, particularly infectious disease, chronic disease, behavioral and social epidemiology. Course hours and requirements vary by topic each semester.

EPBI 601. Master’s Project Research. 1 - 18 Unit.
EPBI 602. Practicum. 1 - 3 Unit.
This course focuses on the skills needed to become an effective statistical consultant. The course objectives are: to learn the role of the consulting statistician and the accompanying responsibilities and ethical considerations, to develop the ability to interact with clients and elicit the information required to provide consulting expertise, to learn general strategies for approaching consulting problems that can be applied to a wide range of problems in medical areas, and to develop expertise in areas needed by the consulting biostatistician. These include database architecture, data quality control, record keeping for potential audits, statistical techniques, and report generation.

EPBI 651. Thesis M.S.. 1 - 18 Unit.

Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

MPHP Courses

MPHP 306. History and Philosophy of Public Health. 3 Units.
The purpose of this course is to introduce students to the science and art of public health through an understanding of the history and philosophies that represent its foundation. Students will learn about the essentials of public health and applications of those precepts throughout history and in the present. The course will examine public health case histories and controversies from the past and present, in order to better understand solutions for the future. Offered as MPHP 306 and MPHP 406. Prereq: Enrollment limited to juniors and seniors only.

MPHP 313. Health Education, Communication, and Advocacy. 3 Units.
Historical, sociological, and philosophical factors that have influenced definitions and the practice of health education and health promotion are studied. Advanced concepts in health communication theory will also be explored. This course is designed to education, motivate, and empower undergraduate and graduate students to become advocates for their own health, the health of their peers, and the health of the community. Offered as MPHP 313 and MPHP 413.

MPHP 405. Statistical Methods in Public Health. 3 Units.
This one-semester survey course for public health students is intended to provide the fundamental concepts and methods of biostatistics as applied predominantly to public health problems. The emphasis is on interpretation and concepts rather than calculations. Topics include descriptive statistics; vital statistics; sampling; estimation and significance testing; sample size and power; correlation and regression; spatial and temporal trends; small area analysis; statistical issues in policy development. Examples of statistical methods will be drawn from public health practice. Use of computer statistical packages will be introduced. Prereq: Enrollment limited to MPH students (Plan A or Plan B) and EPBI students only. All others require instructor consent.

MPHP 406. History and Philosophy of Public Health. 3 Units.
The purpose of this course is to introduce students to the science and art of public health through an understanding of the history and philosophies that represent its foundation. Students will learn about the essentials of public health and applications of those precepts throughout history and in the present. The course will examine public health case histories and controversies from the past and present, in order to better understand solutions for the future. Offered as MPHP 306 and MPHP 406. Prereq: Enrollment limited to MPH students (Plan A or Plan B) and EPBI students or instructor consent.

MPHP 408. Public Policy and Aging. 3 Units.
Overview of aging and the aged. Concepts in the study of public policy. Policies on aging and conditions that they address. The politics of policies on aging. Emergent trends and issues. Offered as ANTH 498, BETH 496, EPBI 408, GERO 496, HSTY 480, MPHP 408, NURS 479, NURS 579, POSC 480, and SOCI 496.

MPHP 411. Introduction to Health Behavior. 3 Units.
Using a biopsychosocial perspective, an overview of the measurement and modeling of behavioral, social, psychological, and environmental factors related to disease prevention, disease management, and health promotion is provided. Offered as EPBI 411 and MPHP 411. Prereq: Enrollment limited to MPH students (Plan A or Plan B) and EPBI students or consent.

MPHP 413. Health Education, Communication, and Advocacy. 3 Units.
Historical, sociological, and philosophical factors that have influenced definitions and the practice of health education and health promotion are studied. Advanced concepts in health communication theory will also be explored. This course is designed to education, motivate, and empower undergraduate and graduate students to become advocates for their own health, the health of their peers, and the health of the community. Offered as MPHP 313 and MPHP 413.

MPHP 419. Topics in Urban Health in the United States. 3 Units.
This course examines patterns of urban health and disease across the life course among marginalized populations and communities. We will examine the socio-environmental contexts that impact health status (i.e., racism, health disparities, neighborhood context, and environmental stressors). Readings from epidemiology, sociology, and public health literature will provide a foundation for the multiple factors and processes that impact health. Offered as EPBI 419 and MPHP 419.

MPHP 421. Health Economics and Strategy. 3 Units.
This course has evolved from a theory-oriented emphasis to a course that utilizes economic principles to explore such issues as health care pricing, anti-trust enforcement and hospital mergers, choices in adoption of managed care contracts by physician groups, and the like. Instruction style and in-class group project focus on making strategic decisions. The course is directed for a general audience, not just for students and concentration in health systems management. Offered as ECON 421, HSMC 421, and MPHP 421.

MPHP 429. Introduction to Environmental Health. 3 Units.
This is a survey course of environmental health topics including individual, community, population, and global issues. Introduction to risk management, important biological mechanisms, and age and developmental impacts are covered in an overview fashion. A practical inner city home environment experience is included. Offered as EVHS 429 and MPHP 429.
MPHP 431. Statistical Methods I. 3 Units.
Application of statistical techniques with particular emphasis on problems in the biomedical sciences. Basic probability theory, random variables, and distribution functions. Point and interval estimation, regression, and correlation. Problems whose solution involves using packaged statistical programs. First part of year-long sequence. Offered as ANAT 431, BIOL 431, CRSP 431, EPBI 431, and MPHP 431.

MPHP 432. Statistical Methods II. 3 Units.
Methods of analysis of variance, regression and analysis of quantitative data. Emphasis on computer solution of problems drawn from the biomedical sciences. Design of experiments, power of tests, and adequacy of models. Offered as BIOL 432, CRSP 432, EPBI 432, and MPHP 432. Prereq: EPBI 431 or equivalent.

MPHP 433. Community Interventions and Program Evaluation. 3 Units.
This course prepares students to design, conduct, and assess community-based health interventions and program evaluation. Topics include assessment of need, evaluator/stakeholder relationship, process vs. outcome-based objectives, data collection, assessment of program objective achievement based on process and impact, cost-benefit analyses, and preparing the evaluation report to stakeholders. Recommended preparation: EPBI 490, EPBI 431, or MPHP 405. Offered as EPBI 433 and MPHP 433.

MPHP 439. Public Health Management and Policy. 3 Units.
This course is designed to introduce students to the basics of health policy-making and includes a background on the basic structure and components of the US Health Care System (such as organization, delivery and financing). It will also cover introductory concepts in public health management, including the role of the manager, organizational design and control, and accountability. We will address relevant legal, political and ethical issues using case examples. At the end of the course, students will understand how health policy is developed and implemented in various contexts, and the challenges facing system-wide efforts at reform. This is a required course for the MPH degree. Grades will be based on a series of assignments. Prereq: Enrollment limited to MPH students (Plan A or Plan B) and EPBI Students or instructor consent.

MPHP 442. Biostatistics II. 3 Units.
This course deals with the basic concepts and applications of nonparametric statistics. Topics will include distribution-free statistics, one sample rank test, the Mann-Whitney and Kruskal Wallis tests, one sample and two sample U-statistics, asymptotic relative efficiency of tests, distribution-free confidence intervals, point estimation and linear rank statistics. Recommended preparation: EPBI 441. Offered as EPBI 442 and MPHP 442.

MPHP 447. Global Health: Outbreak Investigation in Real-Time. 3 Units.
This course provides a trans-cultural, trans-disciplinary, multimedia learning experience by analyzing historical and real-time data from the annual dengue endemics and sporadic epidemics in Puerto Rico and Brazil. A rigorous problem-centered training in the epidemiology, prevention, treatment, and control of infectious diseases using real-time and historical surveillance data of endemic and epidemic Dengue in Bahia, Brazil. This is an advanced epidemiology course in which core material will be primarily taught through reading assignments, class discussion, group projects, and class presentations. The course will utilize the online web-based communication and learning technology to create a single classroom between the CWRU and international partners with unique and complimentary skills. In addition to joint classroom lectures across sites, student groups will also perform smaller-scale videoconference meetings for assigned group projects, thus creating strong international connections for the students, faculty, and our institutions. Note: Due to the complexities of time zones for this international course, the course will begin at 8:00a.m. until the U.S.A. adjusts clocks for Daylight Savings Time (unlike Brazil). Therefore, classes after the second week of March will begin at 9:00a.m. Offered as: EPBI 447, INTH 447, and MPHP 447.

MPHP 450. Clinical Trials and Intervention Studies. 3 Units.
Issues in the design, organization, and operation of randomized, controlled clinical trials and intervention studies. Emphasis on long-term multicenter trials. Topics include legal and ethical issues in the design; application of concepts of controls, masking, and randomization; steps required for quality data collection; monitoring for evidence of adverse or beneficial treatment effects; elements of organizational structure; sample size calculations and data analysis procedures; and common mistakes. Recommended preparation: EPBI 431 or consent of instructor. Offered as EPBI 450 and MPHP 450.

MPHP 451. Principles of Genetic Epidemiology. 3 Units.
A survey of the basic principles, concepts and methods of the discipline of genetic epidemiology, which focuses on the role of genetic factors in human disease and their interaction with environmental and cultural factors. Many important human disorders appear to exhibit a genetic component; hence the integrated approaches of genetic epidemiology bring together epidemiologic and human genetic perspectives in order to answer critical questions about human disease. Methods of inference based upon data from individuals, pairs of relatives, and pedigrees will be considered. The last third of the course (1 credit) is more statistical in nature. Offered as EPBI 451, GENE 451, and MPHP 451.

MPHP 456. Health Policy and Management Decisions. 3 Units.
This seminar course combines broad health care policy issue analysis with study of the implications for specific management decisions in organizations. This course is intended as an applied, practical course where the policy context is made relevant to the individual manager. Offered as HSMC 456 and MPHP 456.

MPHP 458. Statistical Methods for Clinical Trials. 3 Units.
This course will focus on special statistical methods and philosophical issues in the design and analysis of clinical trials. The emphasis will be on practically important issues that are typically not covered in standard biostatistics courses. Topics will include: randomization techniques, intent-to-treat analysis, analysis of compliance data, equivalence testing, surrogate endpoints, multiple comparisons, sequential testing, and Bayesian methods. Offered as EPBI 458 and MPHP 458.
**MPHP 460. Introduction to Health Services Research. 3 Units.**
This survey course provides an introduction to the field of Health Services Research and an overview of key health services research concepts and methods, including conceptual frameworks and models; outcomes research; risk adjustment; disparities in health care; policy/healthcare systems; cost and cost-effectiveness; quality of life, process improvement; patient satisfaction; patient safety; health economics; statistical modeling techniques; and qualitative research methods. Offered as EPBI 460 and MPHP 460.

**MPHP 464. Obesity and Cancer: Views from Molecules to Health Policy. 3 Units.**
This course will provide an overview of the components of energy balance (diet, physical activity, resting metabolic rate, dietary induced thermogenesis) and obesity, a consequence of long term positive energy balance, and various types of cancer. Following an overview of energy balance and epidemiological evidence for the obesity epidemic, the course will proceed with an introduction to the cellular and molecular biology of energy metabolism. Then, emerging research on biologically plausible connections and epidemiological associations between obesity and various types of cancer (e.g., colon, breast) will be presented. Finally, interventions targeted at decreasing obesity and improving quality of life in cancer patients will be discussed. The course will be cooperatively-taught by a transdisciplinary team of scientists engaged in research in energy balance and/or cancer. Didactic lectures will be combined with classroom discussion of readings. The paper assignment will involve application of course principles, lectures and readings. Offered as EBPI 464, MPHP 464.

**MPHP 466. Promoting Health Across Boundaries. 3 Units.**
This course examines the concepts of health and boundary spanning and how the synergy of the two can produce new, effective approaches to promoting health. Students will explore and analyze examples of individuals and organizations boundary spanning for health to identify practice features affecting health, compare and contrast practices and approaches, and evaluate features and context that promote or inhibit boundary spanning and promoting health. Offered as MPHP 466, EPBI 466, and BETH 466. Prereq: Graduate student status or instructor consent.

**MPHP 467. Comparative and Cost Effectiveness Research. 1 Unit.**
Comparative effectiveness research is a cornerstone of healthcare reform. It holds the promise of improved health outcomes and cost containment. This course is presented in a convenient 5-day intensive format in June. There are reading assignments due prior to the 1st session. Module A, Days 1-2: Overview of comparative effectiveness research (CER) from a wide array of perspectives: individual provider, institution, insurer, patient, government, and society. Legal, ethical and social issues, as well as implications for population and public health, including health disparities will also be a component. Module B, Day 3: Introduction to the various methods, and their strengths, weaknesses and limitations. How to read and understand CER papers. Module C, Days 4-5: Cost-Effectiveness Analysis. This will cover costing, cost analysis, clinical decision analysis, quality of life and cost-effectiveness analysis for comparing alternative health care strategies. Trial version of TreeAge software will be used to create and analyze a simple cost-effectiveness model. The full 3-credit course is for taking all 3 modules. Modules A or C can be taken alone for 1 credit. Modules A and B or Modules B and C can be taken together for a total of 2 credits. Module B cannot be taken alone. If taking for 2 or 3 credits, some combination of term paper, project and/or exam will be due 30 days later. Offered as EPBI 467 and MPHP 467.

**MPHP 468. The Continual Improvement of Healthcare: An Interdisciplinary Course. 3 Units.**
This course prepares students to be members of interprofessional teams to engage in the continual improvement in health care. The focus is on working together for the benefit of patients and communities to enhance quality and safety. Offered as EPBI 468, MPHP 468, NURS 468.

**MPHP 474. Principles of Practice-Based Network Research. 3 Units.**
Practice-based research networks (PBRNs) are organizations of community-based healthcare practices that engage in clinical research and practice improvement. In the U.S., there are more than 100 of these dynamic, collaborative organizations that enable the translation of research into practice and practice into research. They also frequently engage in developing and refining methods to improve healthcare quality. This course is designed to provide students with a foundation in PBRN methods and principles, including: introduction to PBRNs, methods for collaborating with community practices, PBRN-building strategies, PBRN data collections methods, statistical issues in network research, community-based participatory research, human subjects’ protection issues in PBRNs, quality improvement research in PBRNs, funding for PBRN research, and writing PBRN research findings for publication. Each 2.5 hour class session will feature a lecture followed by a discussion of readings from the literature. Students will develop a PBRN research or quality improvement proposal during the semester. Offered as EBPI 474 and MPHP 474.
MPHP 475. Management of Disasters Due to Nature, War, or Terror. 3 Units.
The purpose of this course is to make participants aware of the special needs of children and families in disaster situations and understand public health approaches to address these needs. The learning objectives for this course are: 1) Identify the most important problems and priorities for children in disaster situations, 2) Identify the organizations most frequently involved in providing assistance in disaster situations and define their roles and strengths, 3) Describe the reasons why children are among the most vulnerable in disaster events, 4) Conduct emergency nutritional assessments for children, 5) Develop health profiles on displaced children and plan interventions based on results, 6) Define common psychosocial issues of children and the means to address them, 7) List basic points of international law including the Geneva Convention that relate to all persons involved in disaster situations, 8) List important security issues, 9) Appreciate ethical issues involved in disaster situations and employ skills of cross cultural communication, 10) Recognize and respond to special issues for children involved in biological and chemical terrorist attacks.

MPHP 477. Internship at Health-Related Government Agencies. 3 Units.
This independent study course will incorporate a one-semester-long internship at health-related government agencies (Ohio Department of Health, Ohio Department of Job and Family Services, or Cleveland City Health Department). The choice of the agency will depend on the student’s academic interests and research goals. The objective is to develop a level of familiarity with the organizational and operational aspects of such agencies, and to gain an understanding of agencies’ and bureaus’ interactions with the legislative body, as well as the processes of developing, implementing, managing, and monitoring health initiative. The instructor and the liaison persons at the agencies will be responsible for planning structured encounters of interns with key administrators and policy makers, and to select a research project, based on the intern’s research interests and the agencies’ research priorities. Interns will be required to submit a draft of the report to the instructor at the end of the semester. The approved, final report will be submitted to the agency. The project will be evaluated for its methodological soundness and rigor. Students will be required to be at the agency one day a week. Recommended preparation: EPBI 515. Offered as EPBI 477 and MPHP 477.

MPHP 478. Assessment and Application of Health Behavior Principles to Clinical Prevention. 3 Units.
To develop an understanding of the basic principles of health behavior and related theory in an effort to better inform the assessment and delivery of clinical prevention and health promotion to both individuals and populations.

MPHP 479. Teaching Population Health and Community Assessment. 3 Units.
This course allows students to function in a teaching and leadership role in population health education and conduct of a multilevel community assessment of underserved neighborhoods in Cleveland. During the course, students will function as facilitators of small groups (8 to 9 students) of first year medical students during the Population Health block of their medical curriculum. Community assessment, also known as the “Extensive Care Unit” project will include 1) semi-structured interviews with Key Community Contacts; 2) an environmental scan of the assigned neighborhood; 3) analysis of publicly available data; and 4) analysis of youth risk behavior survey data. All data analysis will be mentored by course faculty. In addition, students will be involved with facilitation of a pandemic influenza tabletop exercise. Students will participate in an intensive training prior to facilitation responsibilities; and each week will both debrief the community assessment sessions and plan for the next weekly session.

MPHP 480. Health Systems Management in Primary Care. 1 Unit.
Goal - To develop a deeper understanding of components of the health system that influence and provide shape to the environment in which health care is delivered and about the implementation of systems-based strategies that foster better processes and/or outcomes of health care delivery.

MPHP 481. A Primer of Dental Public Health. 3 Units.
This course introduces students to principles and issues in dental public health. In addition to the principles, students will learn about contemporary issues impacting dental public health, oral epidemiology, dental health care systems, and oral health promotion. To facilitate the understanding of oral health promotion, students will gain a basic understanding of the common oral diseases. Prereq: MPHP 306 or MPHP 406 and MPHP 490 or EPBI 490.

MPHP 482. Qualitative and Mixed Methods in Public Health. 3 Units.
The purpose of this course is three-fold - 1) to provide students with an understanding of the fundamentals of qualitative and mixed methods, including the history and philosophy of these methods, 2) to provide students with an understanding of and skill set associated with the use of qualitative and mixed methods in public health research, and 3) to provide students with an introduction to local professionals engaged in qualitative and mixed methods public health research. Prerequisites include MPHP 405 and 483 (or equivalents) and current status as an MPH student. Prereq: MPHP 405, MPHP 483 and current MPH student.

MPHP 483. Introduction to Epidemiology for Public Health Practice. 3 Units.
This course is designed to introduce the basic principles and methods of epidemiology. Epidemiology has been referred to as the basic science for public health. Application of epidemiologic principles is critical to disease prevention, as well as in the development and evaluation of public policy. The course will emphasize basic methods (study design, measures of disease occurrence, measures of association, and causality) necessary for epidemiologic research. It is intended for students who have a basic understanding of the principals of human disease as well as statistics. Prereq: Must be an MPH Plan A or MPH Plan B, or EPBI student in order to enroll in the course.
**MPHP 484. Geographic Medicine and Epidemiology. 1 - 3 Unit.**

This course focuses on the epidemiology, prevention, treatment, and control of tropical and parasitic diseases. Emphasis will be placed on the triad of agent, host, and environment for infectious disease impacting global health. Three distinct modules will focus on specific examples such as malaria, helminths, bacteria, or viruses. Active class participation is required through discussions, case studies, and group projects. Recommended preparation: EPBI 490, EPBI 491 and a microbiology course or consent of instructor. Offered as EPBI 484, INTH 484, and MPHP 484.

**MPHP 485. Adolescent Development. 3 Units.**

Adolescent Development can be viewed as the overriding framework for approaching disease prevention and health promotion for this age group. This course will review the developmental tasks of adolescence and identify the impact of adolescent development on youth risk behaviors. It will build a conceptual and theoretical framework through which to address and change adolescent behavior to promote health.

**MPHP 490. Epidemiology: Introduction to Theory and Methods. 3 Units.**

This course provides an introduction to the principles of epidemiology covering the basic methods necessary for population and clinic-based research. Students will be introduced to epidemiologic study designs, measures of disease occurrence, measures of risk estimation, and casual inference (bias, confounding, and interaction) with application of these principles to specific fields of epidemiology. Classes will be a combination of lectures, discussion, and in-class exercises. It is intended for students who have a basic understanding of the principals of human disease and statistics. Offered as EPBI 490 and MPHP 490. Prereq or Coreq: EPBI 431 or requisites not met permission.

**MPHP 491. Epidemiology: Case-Control Study Design and Analysis. 3 Units.**

This course builds upon EPBI 490 with a comprehensive study of the concepts, principles, and methods of epidemiologic research. The course content specifically focuses on the case-control study design and provides a framework for the design, analysis, and interpretation of case-control studies. Rigorous problem-centered training includes exposure measurement, subject selection, validity, reliability, sample size and power, effect modification, confounding, bias, risk assessment, matching, and logistic regression. Individual and group data projects will be analyzed using SAS statistical software. Offered as EPBI 491 and MPHP 491. Prereq: EPBI/MPHP 490.

**MPHP 492. Epidemiology: Cohort Study Design and Analysis. 3 Units.**

This course provides a comprehensive introduction to the cohort study. Particular emphasis is placed on cohort study design and cohort data analysis. The course will cover the conceptual framework underlying cohort studies, planning and conducting a cohort study, basic concepts of time, exposure and outcome, and methods in the analysis of longitudinally collected data. Analytic methods covered in the class include, but are not limited to: analysis of age, period, and cohort effects, analysis of incidence rates, analysis of repeated measures, and analysis of time-to-event data. Students will have the opportunity to conduct analysis of data obtained from an actual cohort study using a statistical package of their choice. Offered as EPBI 492 and MPHP 492. Prereq: EPBI 431 and EPBI 490 or equivalent.

**MPHP 494. Infectious Disease Epidemiology. 1 - 3 Unit.**

This course is a follow-up to EPBI 484: Geographic Medicine and Epidemiology, and focuses on tuberculosis (TB), HIV, and dengue epidemiology. This is an advanced course, focusing on methods and approaches in epidemiology. It will be taught in three 1-credit modules, and students may take each module separately or all 3 together. Each module will have a separate project and/or exam. Module I: Tuberculosis epidemiology. Module II: HIV epidemiology. Module III: Dengue epidemiology. Offered as EPBI 494, INTH 494, and MPHP 494. Prereq: EPBI 490.

**MPHP 497. Cancer Epidemiology. 1 - 3 Unit.**

This is a 1-3 credit modular course in cancer epidemiology and is intended for graduate students in epidemiology and biostatistics, environment health, MPH students and MD or MD/PhD students. The course will consist of 3 five-week modules: 1) introduction to cancer epidemiology (study design, etiology and causal inference, cancer statistics and cancer biology); 2) site-specific discussions of various cancers involving natural history of disease and risk factors and etiology and 3) cancer prevention and screening and cancer survivorship. Each of the modules is worth 1 credit hour for a total of 3 credit hours. Offered as: EPBI 497 and MPHP 497.

**MPHP 499. Independent Study. 1 - 18 Unit.**

**MPHP 506. The Future of Public Health. 0 - 3 Units.**

This seminar course is meant to provide an orientation to the Master of Public Health (MPH) Program at Case Western Reserve University's (CWRU) School of Medicine, essential topics related to the future of public health as a professional field, and local public health efforts in the broader campus and Cleveland communities. This seminar is designed for first year MPH students. Prereq: MPH Plan A or Plan B student status.

**MPHP 507. Building a Public Health Project. 0 - 3 Units.**

This course is designed to walk students through the process of creating a Capstone Project, form "idea to field." Specific topics to be covered include: identifying a project, creating a project plan, how to effectively work in the community, program design, evaluation, ethical issues in community research, creating an analytic plan, survey design, and writing results. Major class projects include completing an IRB application or completing a grant application for your own project. The last two weeks of class center around attending and discussing the Capstone Presentations of graduating students. Prereq: MPH Plan A or Plan B student status.

**MPHP 508. Ethics, Law, and Epidemiology. 3 Units.**

This course is designed to provide epidemiology students with basic knowledge about the ethical and legal principles underlying epidemiological research. This is not a public health law class. Issue papers are assigned on a weekly basis. Each issue paper requires that the student analyze the situation depicted and apply the principles learned. Some issue papers may require that the student draft a proposed rule, a portion of legislation, or a document such as an informed consent form. Other exercises may require that students critique an existing agency rule or legislation. Offered as EPBI 508 and MPHP 508. Prereq: EPBI 490 and EPBI 491 or equivalent.
MPHP 510. Health Disparities. 3 Units.
This course aims to provide theoretical and application tools for students from many disciplinary backgrounds to conduct research and develop interventions to reduce health disparities. The course will be situated contextually within the historical record of the United States, reviewing social, political, economic, cultural, legal, and ethical theories related to disparities in general, with a central focus on health disparities. Several frameworks regarding health disparities will be used for investigating and discussing the empirical evidence on disparities among other subgroups (e.g., the poor, women, uninsured, disabled, and non-English speaking populations) will also be included and discussed. Students will be expected to develop a research proposal (observational, clinical, and/or intervention) rooted in their disciplinary background that will incorporate materials from the various perspectives presented throughout the course, with the objective of developing and reinforcing a more comprehensive approach to current practices within their fields. Offered as CRSP 510, EPBI 510, MPHP 510, NURS 510, and SASS 510.

MPHP 532. Health Care Information Systems. 3 Units.
This course covers concepts, techniques and technologies for providing information systems to enhance the effectiveness and efficiency of health care organizations. Offered as HSMC 432, MIDS 432, MPHP 532 and NUNI 432.

Public health field practicum, involving a placement at a community-based field site, and a Master’s essay. The field placement will provide students with the opportunity to apply the knowledge and skills acquired through their Master of Public Health academic program to a problem involving the health of the community. Students will learn to communicate with target groups in an effective manner; to identify ethical, social, and cultural issues relating to public health policies, research, and interventions; to identify the process by which decisions are made within the agency or organization; and to identify and coordinate use of resources at the placement site. The Master’s essay represents the culminating experience required for the degree program and may take the form of a research thesis, an evaluation study, or an intervention study. Each student is required to formally present the experience and research findings. In any semester in which a student is registered for MPHP 652 credit, it is required that the student attend the Community Health Research and Practice (CHRP) group at a minimum of two sessions per 3 credits. CHRP is held once a week for approximately an hour and a half for the duration of fall, spring, and summer semesters. MPHP 652 credit is available only to Master of Public Health students.
General Medical Sciences

The Division of General Medical Sciences was established in 1986 to provide an organizational home for units pursuing interdisciplinary research and education objectives. The division is the equivalent of an academic department, and its constituent units are characterized as Centers. The Dean of the School of Medicine serves as the Chair of the division; each Center is led by a director. The unique nature of each of the General Medical Sciences centers is described in the paragraphs below. (Centers are listed in alphabetical order by full title, and associated academic programs including certificate, MS and PhD programs described in top navigation tabs).

Case Comprehensive Cancer Center

Phone: 216.844.8797
http://cancer.case.edu

Stanton L. Gerson, MD, Director, Case Comprehensive Cancer Center
Anne M. Duli, MPA, Associate Director, Research Administration and Finance

The Case Comprehensive Cancer Center (Case CCC) is one of only 41 National Cancer Institute-designated Comprehensive Cancer Centers in the country. The Case CCC integrates the cancer research activities of the largest biomedical research and health care institutions in Ohio - Case Western Reserve University (CWRU), University Hospitals Case Medical Center and Cleveland Clinic - under a single leadership structure. The Center is internationally recognized for its discoveries in cancer cell signaling; cancer genetics in colon cancer, Barrett’s Esophagitis, leukemias and brain tumors; drug discovery and innovative therapeutics; stem cell research; GU malignancies; and cancer prevention and early detection.

The Case CCC has over 300 collaborating scientists and physicians who have successfully competed for over $119 million in annual funding. These investigators are organized into eight interdisciplinary scientific programs and have access to 14 Scientific Core Facilities. A unified clinical research effort consisting of 11 multidisciplinary clinical disease teams develop and prioritize clinical trials among the partner institutions. A certificate in clinical oncology for K12 participants is available (see Certificates).

Research programs extend to CWRU affiliates MetroHealth Medical Center (the region’s county hospital) and Louis Stokes Veterans Affairs Hospital and to 13 community medical centers operated by University Hospitals and Cleveland Clinic. As a consortium cancer center, the Case CCC has become a powerful example of the potential generated by complementary institutions coming together for the benefit of research and discovery, patient treatments and community impact. Through its partners, Case CCC programs extend throughout northern Ohio to offer residents access to cancer care and a wide range of clinical trials, and participation in community outreach, cancer prevention and cancer survivorship initiatives.

Center for Clinical Investigation

Phone: 216.368.3286
http://cci.case.edu/cci/index.php/Main_Page

Pamela Davis, MD, PhD, Director
James Spilsbury, PhD, Academic Development Core Director
Denise Babineau, PhD, Statistical Sciences Core Director
Guo-Qiang Zhang, PhD, Medical Informatics Division Chief

The Center for Clinical Investigation (CCI) was founded in 2007 and is part of Case Western Reserve University School of Medicine’s Division of General Medical Sciences. The CCI serves as the academic home of Cleveland’s Clinical & Translational Science Collaborative, a partnership of 4 local institutions (Case Western Reserve University, the Cleveland Clinic Foundation, the MetroHealth System, and University Hospitals) and member of a national consortium of approximately 60 institutions funded by the National Institutes of Health to increase the efficiency and speed of clinical and translational research across the country.

The CCI’s mission is to enhance clinical and translational research efforts across the Cleveland area by: (1) spurring advances in knowledge of risk factors, outcomes and treatment effectiveness in the population; (2) facilitating the transfer of scientific advances to the community; and (3) developing a new generation of clinical researchers equipped with the skills needed to efficiently design, implement and interpret novel studies that address important public health questions. To accomplish its mission, the CCI provides computer systems and applications support for basic science and clinical research activities and works closely with basic science and clinical investigators in the CWRU Schools of Medicine, Nursing, and Dental Medicine, as well as the University Hospitals Case Medical Center, Cleveland Clinic Foundation, and MetroHealth System.

The CCI has supported hundreds of clinical research and epidemiology projects, including local and national multicenter, longitudinal studies. The CCI has three cores that work together to provide fully integrated research support to all investigators: Academic Development Core, Division of Medical Informatics, and Statistical Sciences Core.

The Academic Development Core manages the Master’s Degree Program in Clinical Research (Clinical Research Scholars Program - see “Clinical Research MS” tab above) as well as a newly created Certificate Program in Clinical Research. The Academic Development Core also delivers seminars and short courses in clinical research and works to coordinate educational activities in interdisciplinary clinical research across the CTSC’s institutional members. The programs target investigators and other key members of the research team, including data managers and study coordinators. Training efforts in research design, research data management, statistical sciences, statistical software, and scientific communication are emphasized.

The Division of Medical Informatics is primarily charged with developing informatics solutions to many of the barriers clinical investigators face in efficiently processing, storing and sharing research data; and with providing informatics tools and infrastructure for the CCI and the larger research community. In order to meet these goals, the Division of Medical Informatics develops data standards for research database development and data management that aim to maximize the value (accuracy, completeness, availability, security) of research data, develops technological solutions and tools in support of the other CCI cores, develops tools and systems to facilitate understanding of research data (including data dictionaries, data sharing tools, and repositories for biological data) and conducts research in new methodologies for clinical research informatics, clinical and health informatics, comparative effectiveness research, information discovery, data integration, data mining, and translational research. The Division of Medical Informatics staff consists of research programmers and systems analysts with not only a wide range of technical expertise, but with experience using semantic web technology in support of clinical research.

The Statistical Sciences Core provides data management and statistical support on study design and data analysis. Members who provide data management consist of skilled data managers and programmers who consult and collaborate with investigators on data collection instrument development and coding, database development and administration, data cleaning and quality assurance, statistical programming, and dataset preparation. Members providing statistical support collaborate and consult with clinical investigators on proposal development, study
design, study monitoring, and data analysis. The Statistical Sciences Core currently consists of 1 PhD biostatistician, 2 MS biostatisticians, and 1 data manager, each with several years of collaborative experience in an academic medical center. Statistical software packages that are supported by the CCI Statistical Sciences Core include SAS, SPSS, R/S-Plus, JMP, NCSS PASS, MINITAB, and Stata.

**Center for Global Health and Diseases**

Phone: 216.368.6321  
http://www.case.edu/orgs/cghd/index.html  
James W. Kazura, MD, Director

The Center for Global Health and Diseases links the numerous international health resources of the University, its affiliated institutions, and the northern Ohio community in transdisciplinary programs of research and education related to global health. The scope of the Center's activities also includes education and service as these are related to molecular, clinical and population studies of human health and disease.

The Center is currently a national leader in National Institutes of Health-supported studies of the major infectious diseases of developing countries. Cutting-edge approaches are implemented in order to examine the molecular, genetic and immunologic basis of susceptibility to infectious diseases of public health significance - malaria, river blindness, lymphatic filariasis, schistosomiasis, HIV and other viral diseases such as Rift Valley fever. Clinical research in endemic countries is concerned with testing and implementing cost-effective public health interventions that are aimed at the control of malaria and Neglected Tropical Diseases (worm infections of children, elimination of lymphatic filariasis). The Center has ongoing research and educational collaborations with academic and governmental institutions in Papua New Guinea, Brazil, Kenya, Uganda, and several other countries in Sub-Saharan Africa. Educational programs sponsored by the Center include electives in international health, population biology, and genetics of infectious diseases (available to undergraduate, graduate and professional school students), a weekly World Health Interest Group (WHIG) seminar series, overseas rotations for graduate and professional school students, and training programs at the university and abroad for scholars from developing countries (with support from the Fogarty International Center at NIH).

A certificate in Global Health is available (see Certificates).

**Center for Medical Education**

Phone: 216.368.6986  
Terry Wolpaw, MD, MHPE, Interim Director  
Megan McNamara, MD, Director, CAML

The Center for Medical Education, established in 2010, is currently being reorganized to better align with the needs of learners across the educational continuum – from students to residents to graduate students to faculty. The Center for Medical Education (CMEd) provides an organizational home for teaching and learning programs in the School of Medicine and a supportive environment for those who want to develop special skills in medical education.

The Center for the Advancement of Medical Learning ("CAML") operates its programs under the auspices of the CMEd. CAML supports and promotes the development of teaching and lifelong-learning skills among students, faculty, staff, residents, and alumni. CAML pursues research into educational innovations to advance our knowledge of medical learning and teaching. The Center offers workshops to faculty locally, regionally, and nationally to enhance faculty teaching, research and evaluation skills.

The Center also sponsors faculty appointments, both full- and part-time, for some faculty whose roles are predominantly focused on teaching medical students. These include community clinicians who welcome medical students into their clinics and practices.

**Center for Proteomics and Bioinformatics**

Phone: 216.368.1490  
http://proteomics.case.edu/default.aspx  
Biomedical Research Building, Ninth Floor  
Mark R. Chance, PhD, Director

The Case Center for Proteomics and Bioinformatics (CPB) in the School of Medicine was established in 2005. The CPB was created, in part, to strengthen Cleveland’s presence in modern proteomics, bioinformatics, systems biology, structural biology and mass spectrometry research. One of the primary goals of the CPB is to develop an infrastructure of sophisticated equipment that facilitates and maximizes shared equipment usage, as well as to offer a wide array of proteomics services including 2D gel and mass spectrometry analyses.

The CPB has expanded its vision to include education of graduate students in systems biology and bioinformatics. The Center for Proteomics and Bioinformatics developed a graduate program in Systems Biology and Bioinformatics in collaboration with Schools and Departments across the campus. For more information regarding the SYBB graduate program please see "Systems/Bioinformatics" tab above. You may also visit http://bioinformatics.case.edu/.

Proteomics entails the in depth structural analysis of individual proteins in human and animal cells. In studying proteins and their changes, bioinformatics enables researchers to take an integrated -omics approach for discovering networks involved in human disease. The School of Medicine established the Center for Proteomics and Bioinformatics to perform research to better understand the genetic and environmental bases of disease as well as provide new technologies to diagnose diseases such as cancer, heart disease, and diabetes. The CPB has three divisions: Proteomics and Bioinformatics, Bioinformatics, and Macromolecular Structure to enhance the capabilities of the CPB.

The Division of Proteomics and Genomics was established to support research in protein and gene expression analysis, protein and gene modifications, and protein interactions in a wide variety of biological contexts and develop new tools in proteomics and genomics research. The Division of Bioinformatics was established to support interdisciplinary research and training in many areas of bioinformatics including analysis of DNA and protein sequences, protein interaction networks, linkage and association studies for simple and complex traits, and gene and protein expression profiles. The Division of Macromolecular Structure was established to support interdisciplinary research in new methods of structure determination, the combination of computational and experimental structural biology approaches, and developing and maintaining infrastructure for macromolecular structure determination. This Division works closely and coordinates their activities with faculty and Departments across the University who use structural information to understand function as well as other centers that provide leadership in Structural Biology and Biophysics.

The CPB has 9000 sq. feet of laser, spectroscopy, spectrometry, cell culture, and biochemistry laboratory space, residing on the 9th floor of the Biomedical Research Building at CWRU School of Medicine. The CPB has a full complement of mass spectrometry and proteomics facilities including 6 mass spectrometry instruments from Thermo Fisher. The CPB
has a full suite of available computational resources including: Proteus Module Software from Genologics for automated data acquisition and analysis, Rosetta Elucidator, Ingenity and Metacore protein annotation databases, and BioWorks and Mascot MS for mass spectrometry (MS) database searches.

The CPB also offers a wide range of seminars, workshops, and possibilities for individual training. These activities are posted on the CPB Web site. For a list of services and to explore opportunities to collaborate, please visit the Web site: http://proteomics.case.edu/default.aspx or e-mail: proteomics@case.edu.

**Center for Psychoanalytic Child Development**

The Center for Psychoanalytic Child Development is to be led by a child psychoanalyst affiliated with the Hanna Perkins Center for Child Development, located in Shaker Heights, Ohio. The Center’s goals include the development of courses, practica, and supervisory experiences appropriate for medical students, residents, and fellows.

**The Center for RNA Molecular Biology**

Phone: 216.368.1852  
http://www.case.edu/med/rnacenter/home.htm  
Timothy W. Nilsen, PhD, Director

The Center for RNA Molecular Biology is a free standing academic unit in the basic sciences within the School of Medicine at Case Western Reserve University. The RNA Center was established in the mid-nineties as a core entity in recognition of the strong cadre of research laboratories devoted to studying post-transcriptional mechanisms of gene expression focusing on various aspects of RNA Biology. The RNA Center is composed of 11 primary faculty members and 10 secondary members.

The RNA Center contains the largest concentration of RNA molecular biologists in the nation. Collectively, the faculty of the RNA Center cover almost every aspect of RNA research. Current research in the Center focuses on several of these problems ranging from extremely basic questions such as the mechanism of RNA catalysis and how proteins interact with RNA to the roles of RNA processing in disease. Specific research interests include splicing and its regulation, RNA editing, RNA maturation, mechanisms of translation regulation, RNA degradation, RNA trafficking, RNA interference and regulation of gene expression by microRNAs and non-coding RNAs.

Collectively, the RNA Center provides a valuable resource for collaborative efforts within the University and its affiliated institutions the Cleveland Clinic Foundation, and University Hospitals System. In addition, the official journal of the RNA Society “RNA” was founded and continues to be housed in the RNA Center. The RNA Center has also recently launched the “Core Facility for RNA Technology” which provides the CWRU community with the ability to incorporate RNA research into their programs. This includes the technical expertise associated with next-generation sequencing and subsequent bioinformatic analysis.

The members of the RNA Center have an excellent funding record and the research performed is regularly published in highly visible journals such as Science, Nature, Molecular Cell, NSMB, Molecular Cell, etc. In addition, a comprehensive laboratory manual on RNA technology has been co-authored by the Center’s director, Dr. Nilsen.

**Center for Science, Health and Society**

Phone: 216.368.2059  
http://casemed.case.edu/cshs/  
Nathan A. Berger, MD, Director

Recognizing that the successful futures of Case Western Reserve University, the City of Cleveland, and Cuyahoga County are integrally related, the Center for Science, Health and Society (C SHS) was created in 2002 to focus the efforts of the University and the community in a significant new collaboration to impact the areas of health and healthcare delivery systems through community outreach, education, and health policy. The Center, based in the School of Medicine, with university wide associations is engaging the many strengths of the University and the community to improve the health of the community.

The Center has engaged the community at the level of the individual and the neighborhood, in public and private schools, at civic and faith-based organizations, and at the level of governmental agencies and community leadership to identify community problems, perceptions, assets and resources; advise the community of faculty skills, assets and expertise; and, catalyze that community service based scholarship that benefits community interests and promotes mutual enhancement. The Center coordinates the Scientific Enrichment Opportunity outreach program that brings Cleveland high school students on to the medical school campus in the summer to work along with our distinguished faculty in their research labs, to introduce and stimulate the students and help prepare them to enter careers in the health care professions and biomedical workforce. The Center also coordinates the Mini Medical School Program presented every Spring and Fall to educate the community in the latest developments in healthcare, particularly those developed at CWRU. The overall goal of these programs is to educate and empower the community to become better consumers of healthcare and more informed and stronger advocates for healthcare policy and legislation in their own interests.

**Center for the Study of Kidney Biology and Disease**

Phone: 216.778.4993  
John R. Sedor, MD, co-director  
Tyler Miller, MD, co-director  
Donald E. Hricik, MD, co-director  
Walter Boron, MD, PhD, co-director

Kidney disease is the ninth leading cause of death according to the Centers for Disease Control data. Health care costs for approximately 500,000 patients, who are being treated with dialysis [artificial kidney machine] or who received a kidney transplant, consumed almost 1% of the federal budget in 2008. Up to 26 million U.S. residents have evidence of serious kidney disease

The Center’s mission is to accelerate discovery and its translation for treatment and cure of kidney diseases in an interdisciplinary environment within the rich, research environment of the CWRU School of Medicine. The faculty is an accomplished and highly interactive group of investigators, based in the adult or pediatric Divisions of Nephrology in CWRU-affiliated hospitals and the Department of Physiology and other clinical and basic departments. Research interests of the faculty include glomerular development and disease, epithelial cell biology and ion transport, tubular physiology, genetic epidemiology, health services research, renal transplantation, health disparities research and clinical trials. Research faculty applies cellular, molecular biological, genetic, genomic and epidemiological methods to in vitro models, animal models and/or patients. Many projects by Center investigators use health data, culled from robust electronic health records, and biological samples from patients with kidney diseases in order to generate novel hypotheses, which can then tested with animal models and cell lines.
Training opportunities are available for undergraduate, pre- and post-doctoral students.

National Center for Regenerative Medicine
Phone: 216.368.3614
http://stemcellcenter.case.edu
Stanton L. Gerson, MD, Director
Jeremy Rich, MD, PhD, Co-Director
Mariasja Malinowski, Executive Director

The Center for Regenerative Medicine is a multi-institutional center composed of investigators from Case Western Reserve University, University Hospitals Case Medical Center, the Cleveland Clinic, Athersys, Inc., and The Ohio State University. Building on over 30 years of experience in adult stem cell research in northeast Ohio, the Center was created in 2003 with a $19.4 million award from the State of Ohio as a Wright Center of Innovation. An additional $8M award in 2006 from the State of Ohio’s Biomedical Research and Commercialization Program (BRCP) was successfully completed and enabled 3 new clinical trials to enroll patients. In 2009, $5M was awarded by the Ohio Third Frontier (OTF) Research Commercialization Program (RCP) which further validated the Center’s ability to achieve its mission to utilize human stem cell and tissue engineering technologies to treat human disease. In 2010, $1M was awarded to the NCRM by the OTF Biomedical Program (OTFBP) to advance the clinical treatment of spinal cord injury, and a $2.1M OTF Wright Program Project (WPP) award was made to create a consortium of quantitative analysis imaging systems for stem cells.

Clinical Research Scholars Program (CRSP) (http://casemed.case.edu/CRSP)
The Clinical Research program is designed for individuals with an existing degree in medicine, dentistry, nursing, or an allied science such as pharmacy or biomedical engineering. Moreover, a track has also been established for medical students interested in obtaining dual MD/MS degree. The program seeks individuals committed to a career in clinical investigation in an academic or related environment. The program consists of a total of 36 credits: 27 credit hours of coursework, 9 credit hours of mentored research and a formal oral thesis defense. The curriculum offers both focus and flexibility. Focus is provided through a core curriculum (13 credit hours) highlighting clinical research methods, the ethical conduct of research, and a seminar series that introduces the skills necessary for scholarly success. Students typically have special interests in a particular area of clinical research, both clinically and methodologically. This program facilitates pursuit of different methodological interests guided by seasoned CWRU research faculty and addressed partly with choice of appropriate electives (14 credit hours). Requirements for the dual MD/MS degree differ to reflect integration with the medical school curriculum. Most graduates of this program are currently working in academic medical settings, with smaller numbers located in research positions in the private sector or private practice.

CRSP Curriculum
36 credit hours are required for completion of this Master of Science in Clinical Research degree.

Each scholar is encouraged to develop his/her own area of concentration based on personal interests and needs. Typical areas of concentration include: Clinical Research Trials, Health Services Research and Outcomes, and Multidisciplinary/Translational Clinical Research. Please consult with CRSP faculty and your Research Mentor on which electives will best suit your needs.

The choices of electives include but are not limited to:

CRSP 410 Independent Study in Clinical Research 1
- 3
CRSP 501 Working in Interdisciplinary Research Teams 1
CRSP 502 Leadership Development 2
CRSP 503 Innovation and Entrepreneurship 1
CRSP 504 Managing Research Records - A System’s Approach 2
- 3
CRSP 505 Investigating Social Determinants of Health 2

MD/MS Biomedical Investigation-Clinical Research Track

For information about Program Admission and MD requirements, please see MD Dual Degrees section (p. 792). The Clinical Research track includes formal instruction in methods common to all fields of clinical investigation along with mentored research. In addition to medical school credits, students must complete the track-specific courses and electives listed below.

All students in this track must complete the CRSP Core Curriculum or equivalents:

- IBIS 434 Integrated Biological Sciences in Medicine (**or IBIS 401 and 402) 6
- CMED 401 Intro to Clinical Research and Scientific Writing 3
- or CRSP 401 Introduction to Clinical Research Summer Series
- CMED 402 Statistical Science for Medical Research 3
- or CRSP 431 Statistical Methods I
- CMED 403 Introduction to Clinical Epidemiology 3
- or CRSP 402 Study Design and Epidemiologic Methods
- CMED 404 Clinical Research Seminars (*) 1
- or CRSP 412 Communication in Clinical Research (Part 1)
- CMED 405 Clinical Research Seminars (Part 2) 1
- or CRSP 413 Communication in Clinical Research (Part 2)
- CMED 450 Clinical Trials 3
- or EPBI 450 Clinical Trials and Intervention Studies
- CMED 458 Statistical Modeling with Applications in Clinical Research 3
- or EPBI 458 Statistical Methods for Clinical Trials
- CMED 500 Scientific Integrity in Biomedical Research 0
- or IBMS 500 On Being a Professional Scientist: The Responsible Conduct of Research
- CMED 601 Clinical Research Project 18
- IBIS 600 Exam in Biomedical Investigation 0

Program Advisors: Dr. Dennis Stacey (College students) and Dr. William Merrick (University students).

Registration permits for all CMED courses can be obtained from Dr. Ticknor’s office.

Certificate in Global Health

Ronald Blanton, MD  
216.368.4814

The Certificate is the centerpiece of the Framework for Global Health Curricula comprised of faculty from across the Case Western Reserve University campus, whose objective is to promote education in global health issues. Nearly every department at CWRU offers multiple educational activities in global health. Rather than attempt to own all of these activities, the group at CWRU (representing Anthropology, Bioethics, Biology, Biostatistics/Epidemiology, Mathematics, Medicine, Nursing, Engineering) elected to develop a structure within which each department could develop independently while taking advantage of what the others had to offer. The organizing structure for this became the certificate program rather than a separate degree. This approach recognizes that student’s need to graduate within a recognized discipline as well as recognition of a student’s focus, time and effort in training. Each student in the Certificate program will be grounded in global health by a core course (INTH 301 Fundamentals of Global Health/INTH 401 Fundamentals of Global Health) that will allow them to understand concepts and vocabulary across disciplines and that will facilitate meaningful communication with others based in a different discipline. In addition to the Certificate, the Framework for Global Health Curricula had identified and is annotating all global health related courses at CWRU. It has supported the recent revival of Medical Spanish and new courses and electives in Global Health.

Requirements for Certificate in Global Health:

**Anthropology**

**Undergraduate:**

- INTH 301 Fundamentals of Global Health 3
- ANTH 215 Health, Culture, and Disease: An Introduction to Medical Anthropology 3
- ANTH 359 Introduction to International Health 3
- And one elective selected from list of approved electives in the Anthropology Department

**Graduate:**

- INTH 401 Fundamentals of Global Health 3
- ANTH 459 Introduction to International Health 3
- ANTH 511 Seminar in Anthropology and Global Health: Topics 3
- And one elective selected from list of approved electives in the Anthropology Department

Contact: Janet McGrath (http://bulletin.case.edu/schoolofmedicine/generalmedicalsciences/mailto:janet.mcgrath@case.edu), 216.368.2287

**Bioethics**

- INTH 401 Fundamentals of Global Health 3
- BETH 414 International Health Research Ethics 3
- And complete one elective selected from list of approved electives in the Bioethics Department

Contact: Insoo Hyun (http://bulletin.case.edu/schoolofmedicine/generalmedicalsciences/mailto:insoo.hyun@case.edu), 216.368.8658

**Epidemiology/Biostatistics**

- INTH 401 Fundamentals of Global Health 3
- EPBI 484 Geographic Medicine and Epidemiology 1
- EPBI 494 Infectious Disease Epidemiology 1
- And complete an epidemiology research project with global perspective (may be substituted with other course work).

Contact: Daniel Tisch (http://bulletin.case.edu/schoolofmedicine/generalmedicalsciences/mailto:daniel.tisch@case.edu), 216.368.0875

**Math/Applied Math specialization:**

- INTH 301 Fundamentals of Global Health 3
- or INTH 401 Fundamentals of Global Health 3
- EPBI/ANAT/BIOL 431 Statistical Methods I (A basic course in Epidemiology or Biostatistics) 3
- or EPBI 490 Epidemiology: Introduction to Theory and Methods
- or EPBI 491 Epidemiology: Case-Control Study Design and Analysis
- MATH 449 Dynamical Models for Biology and Medicine 3
Case Comprehensive Cancer Center
http://cancer.case.edu/training

The Clinical Oncology Research Career Development Program (CORP) provides interdisciplinary training in clinical and translational oncology research for clinical oncology junior faculty physicians who are interested in pursuing academic research careers as physician scientists. This training addresses the need for clinician investigators to translate fundamental cancer research discoveries into medical care of cancer patients. Eligible candidates are physicians (MD, DO or MD/PhD) with a clinical training background in one of a number of oncology disciplines, including medical, surgical, pediatric, dermatological, gynecological and radiation oncology. Scholars select one of three areas of concentration:

- Mechanism Based Therapeutics and Clinical Trials
- Stem Cell Biology and Hematopoietic Malignancy Clinical Trials
- Prevention, Aging and Cancer Genetics and Clinical Trials

The Scholars' individual training plan consists of a 2-year certificate program which includes a didactic curriculum designed to provide basic background and highly individualized advanced training in both clinical and methodological components of clinical and translational cancer research.

Each Scholar is co-mentored by both a basic or behavioral scientist and a clinical investigator. A mentoring committee comprised of faculty in the Scholar's focus of oncology research provides additional guidance and support. During the period of mentored laboratory training, the Scholars develop original hypothesis-based experiments related to disease mechanisms at a molecular or cellular level. As the Scholars build on their laboratory conclusions to create and implement clinical trials, they are mentored by clinical investigators. Clinical trials are aimed at developing new methods for diagnosis and testing promising ideas for novel therapeutic interventions. These components come together with the Scholar's presentations at a national conference, publications in peer review journals and application for independent funding as a physician scientist.

This two-year certificate program is administered through the Case Comprehensive Cancer Center. The overall goal of the K12 CORP certificate program is to foster interdisciplinary training in clinical and translational oncology research for clinical oncology junior faculty physicians who are interested in pursuing academic research careers as physician scientists. This training addresses the need for clinician investigators to translate fundamental cancer research discoveries into medical care of cancer patients. Eligible candidates are physicians (MD, DO or MD/PhD) with a clinical training background in one of a number of oncology disciplines, including medical, surgical, pediatric, dermatological, gynecological and radiation oncology. Scholars select one of three areas of concentration:

- Mechanism Based Therapeutics and Clinical Trials
- Stem Cell Biology and Hematopoietic Malignancy Clinical Trials
- Prevention, Aging and Cancer Genetics and Clinical Trials

The Scholars' individual training plan consists of a 2-year certificate program which includes a didactic curriculum designed to provide basic background and highly individualized advanced training in both clinical and methodological components of clinical and translational cancer research.

Each Scholar is co-mentored by both a basic or behavioral scientist and a clinical investigator. A mentoring committee comprised of faculty in the Scholar's focus of oncology research provides additional guidance and support. During the period of mentored laboratory training, the Scholars develop original hypothesis-based experiments related to disease mechanisms at a molecular or cellular level. As the Scholars build on their laboratory conclusions to create and implement clinical trials, they are mentored by clinical investigators. Clinical trials are aimed at developing new methods for diagnosis and testing promising ideas for novel therapeutic interventions. These components come together with the Scholar's presentations at a national conference, publications in peer review journals and application for independent funding as a physician scientist.

This two-year certificate program is administered through the Case Comprehensive Cancer Center. The overall goal of the K12 CORP certificate program is to foster interdisciplinary training in clinical and translational oncology research for physicians. Upon completion of this 15-19 hour two year training, scholars will earn the K12 CORP Certificate.

The formal didactic program includes a course in responsible conduct IBMS 500 On Being a Professional Scientist: The Responsible Conduct of Research (0) or CRSP 603 Research Ethics and Regulation (2 hr); CNCR 501 Translational Cancer Research A (Translational Cancer Research Course (1 hr/semester); and one elective (1-3). Additional required activities include Clinical Protocol Tutorials, Intensive Mentored Research Project, Ongoing seminars, Meetings and Presentations; and applications for independent funding.

*Additionally, choose one course from following core courses for credit towards certificate:
Certificate in Clinical Research

James Spilsbury, PhD, Director
Natalie Milone, Education Manager, natalya.cheprakova-milone@case.edu
Center for Clinical Investigation
http://casemed.case.edu/CRSP
216.368.2601

The Clinical Research Certificate program is a four course, 11 credit hour program. Students who successfully complete the required coursework will receive a Certificate in Clinical Research issued by the Center for Clinical Investigation. Coursework includes: Introduction to Clinical and Translational Research; Study Design and Epidemiologic Methods; Advanced Statistics: Linear Models; and a course on Research Ethics and Regulation.

Admissions will be administered by the Center for Clinical Investigation. Individuals who want to participate in the program will complete an application form that includes a brief personal statement describing the reason(s) for seeking clinical research training and a recent CV or resume. Per CWRU School of Graduate Studies requirements, individuals who are not already graduate-degree-seeking students at CWRU must submit to the School of Graduate Studies a completed non-degree application form. Individuals who are not faculty, staff, or employees of CWRU must also submit a transcript or copy of their diploma, documenting completion of a baccalaureate degree. Once accepted into the Certificate program, participants will register for the courses through the Student Information System. The program will have rolling admissions, and students will be able to start taking courses in the summer or fall semester. The coursework for the Certificate will be listed on the official CWRU transcript. However, the Certificate in Clinical Research will be issued by the Center for Clinical Investigation, not the University, and will not appear on the official CWRU transcript.

Performance Standards: A grade of B or higher in each graded course will be required for successful completion of the Certificate program. Enrollees will be responsible for keeping track of the courses they take.

Required Courses:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>CRSP 401</td>
<td>Introduction to Clinical Research Summer Series</td>
<td>3</td>

<td>Advanced Statistics: Linear Models</td>
<td>3</td>
</tr>
<tr>
<td>EPBI 603</td>
<td>Research Ethics and Regulation</td>
<td>2</td>
</tr>
</tbody>
</table>

Exit Standards: Students who complete all required coursework will submit a checklist to the Center for Clinical Investigation notifying the Center for Clinical Investigation’s Education Administrator/Manager that all coursework is completed. This administrator will verify with the registrar’s office that all requirements have been met and will then issue a certificate to the enrollee, documenting completion of the program.
proteins, bioinformatics, and quantitative modeling and analysis. At least 18 semester hours of course work, in addition to thesis hours, must be at the 400-level or higher.

Each student must prepare an individual thesis that must conform to regulations concerning format, quality, and time of submission as established by the dean of graduate studies. For completion of master’s degrees under Plan A, an oral examination (defense) of the master’s thesis is required, where the examination is conducted by a committee of at least three members of the university faculty.

**Masters Degree Plan B Summary**

The minimum requirements for the master’s degree under Plan B are 30 semester hours of course work (with at least 18 semester hours of course work at the 400 level or higher) and a written comprehensive examination or major project with report to be administered and evaluated by the program steering committee. The coursework must include SYBB 459 Bioinformatics for Systems Biology, SYBB 555 Current Proteomics, and SYBB 501 Biomedical Informatics and Systems Biology Journal Club. The curriculum plan must be approved by the program steering committee and include appropriate coverage of the core competencies in genes and proteins, bioinformatics, and quantitative modeling and analysis.

**Sample Plan of Study for MS Degree**

Plan of Study includes required courses as well as electives.

**PhD Program Summary**

The Systems Biology and Bioinformatics program differs from current CWRU programs in the comprehensive requirement for an understanding of biological systems, bioinformatics, and quantitative analysis & modeling. The program includes a set of required core courses including (SYBB 459 Bioinformatics for Systems Biology) and (SYBB 555 Current Proteomics), (SYBB 501 Biomedical Informatics and Systems Biology Journal Club), and an individualized course of study that includes at least six additional courses, a course in the Responsible Conduct of research (IBMS 500 On Being a Professional Scientist: The Responsible Conduct of Research), a qualifier exam, a PhD Thesis, and oral defense consistent with CWRU requirements. The total credits required for the PhD is at least 54 credits (24 grade graduate courses, 12 pre-dissertation research credits, and at least 18 dissertation research credits) and is consistent with a traditional graduate program. Admissions to this program may be obtained through the integrated Biomedical Sciences Training Program, by direct admission to the department or via the Medical Scientist Training Program.

## CMED Courses

### CMED 401. Intro to Clinical Research and Scientific Writing. 3 Units.

This seminar brings in numerous experts to cover a variety of essential issues and concepts in clinical research and scientific writing. The overarching goal is for students to produce a short but well-crafted research proposal. Topics for reading and discussion include general principles of research design and proposal development; key concepts and issues in biostatistical science for study planning, data management, analysis, interpretation, and presentation; modern medical library informatics; ethical issues in clinical research and necessary rigmarole; technical writing emphasizing research proposals; designing studies of diagnostic tests; outcomes research and medical decision making; clinical genomics research.

### CMED 402. Statistical Science for Medical Research. 3 Units.

A rigorous, practical introduction to core concepts and methods in statistical planning, managing, and analyzing data, and interpreting and communicating biostatistical information. Seminar sessions: discuss readings, work through realistic examples using popular commercial software. Project sessions: individuals in small groups discuss their own examples and receive on-the-spot feedback. Topics: types of data and common distributions; database and statistical software; understanding and describing data with simple statistics and effective tables and graphics; statistical transforms (log, logit) and what they imply, basic inference tests, confidence intervals, and related sample-size analyses involving categorical data (analyzing proportions), ordinal data (analyzing ranks), continuous data (analyzing means), and time-to-event data with censoring. A substantial introduction to statistical modeling unifies seemingly diverse methods to induce a cohesive, flexible, and broad understanding of biostatistics. Medical students enrolled in CRSP must complete CCLCM Introduction to Clinical Research, IBIS 431 and IBIS 490 to satisfy the CRSP 401, 402 and 403 series. Prereq: Must be enrolled in School of Medicine.

### CMED 403. Introduction to Clinical Epidemiology. 3 Units.

Using multiple learning modalities, including case-based seminars, computer-based interactive learning, journal club, and readings from texts as well as contemporary clinical literature, students will receive a rigorous introduction to methods of research in clinical epidemiology. Topics to be covered include human subjects protections; legal and ethical components of clinical research; measures of disease frequency; basics of clinical study design; nature of and analysis of risk factors; cohort study design and analysis; case-control study design and analysis; confounding; interaction; bias; survey research; diagnostic tests; disease screening; design, analysis, and reporting of clinical trials; meta-analysis; decision analysis; cost-effectiveness analysis; and a brief introduction to health services research. Medical students enrolled in CRSP must complete CCLCM Introduction to Clinical Research, IBIS 431, and IBIS 490 to satisfy the CRSP 401, 402, and 403 series. Prereq: Must be enrolled in School of Medicine.
CMED 404. Clinical Research Seminars. 1 Unit.
The Clinical Research Seminars series is intended to give students a broad exposure to issues unique to clinical research as well as career development. Students attend seminars on relevant clinical research topics offered either on the Case or CCF campuses, and will write a short summary of each seminar attended. A total of 12-14 one-hour seminars per semester is required for successful completion of the course. Students are expected to take two semesters. Prereq: Must be enrolled in School of Medicine and consent of CCLCM Office.

CMED 405. Clinical Research Seminars. 1 Unit.
The Clinical Research Seminars series is intended to give students a broad exposure to issues unique to clinical research as well as career development. Students attend seminars on relevant clinical research topics offered either on the Case or CCF campuses, and will write a short summary of each seminar attended. A total of 12-14 one-hour seminars per semester is required for successful completion of the course. Students are expected to take two semesters. Prereq: Must be enrolled in School of Medicine and consent of CCLCM Office.

CMED 406. Introduction to Database Programming Base SAS. 0 Units.
Using the SAS Data Step as a programming language. Creating temporary and permanent SAS datasets, exchanging datasets with other software (e.g. Excel, Jmp, R), checking and manipulating data, sorting and merging, producing reports, Effective programming style. This is not a course in statistical analysis. Prereq: Must be enrolled in School of Medicine and consent of CCLCM Office.

CMED 407. Basic Research Ethics. 3 Units.
Examine the ethical issues of clinical research involving human subjects. Topics include research versus clinical practice, informed consent, therapeutic misconception, risk reduction, vulnerability and subject selection, recruitment and inducement.

CMED 408. Clinical Trials. 3 Units.
Design, organization and operation of randomized controlled clinical trials and intervention studies. Topics include legal and ethical issues in design; application of concepts of controls; masking and randomization; steps required for quality data collection; monitoring for evidence of adverse or beneficial treatment effects; elements of organizational structure; sample size calculations and data analysis procedures and mistakes. Prereq: Must be enrolled in School of Medicine.

CMED 409. Statistical Modeling with Applications in Clinical Research. 3 Units.
Statistical modeling methods and strategies for analyzing data in clinical research, including randomized and non-randomized clinical trials. Standard Normal-theory, logistic, and Cox proportional hazard regression methods, emphasizing that these tools provide a unified schema to use linear models for continuous and categorical predictors of outcomes that are continuous, binary, or time-to-event with censoring. Repeated measures analysis using summary measures versus modern mixed models. Spline models for non-linear relationships. Extending the logistic model for ordinal outcomes. Propensity analysis. Software: R. Prereq: Must be enrolled in School of Medicine and consent of CCLCM Office.

CMED 410. Foundations of Clinical Medicine. 3 Units.
Students meet weekly to learn, examine, and discuss issues related to their future societal and professional roles as physicians. Topics covered include population health, medical errors and patient safety, cultural competence, health care disparities, quality improvement, pain management, ethical and legal issues in medicine, leadership, and professionalism. Prereq: Must be enrolled in School of Medicine and consent of CCLCM Office.

CMED 499. Independent Study in Clinical Trials. 3 Units.
A survey of the various aspects of clinical trial investigation to provide the student a first-hand perspective on the day-to-day conduct of clinical investigation from the perspective of investigating physicians, clinical trial coordinators, compliance and regulatory officers, and core laboratory personnel. Students will develop a specific plan with the course directors that will total 40-50 hours of discussion and direct participation. Prereq: CMED 450. Must be enrolled in the School of Medicine and consent of CCLCM Office.

CMED 500. Scientific Integrity in Biomedical Research. 0 Units.
This course covers a wide variety of topics in ethics for biomedical researchers including Institutional Review Boards for human and animal experimentation, requirements of the Health Insurance Portability and Accountability Act (HIPAA), informed consent, and de-identification of patient data in research databases. Issues of data ownership, responsibilities of authorship, and conflicts of interest are also discussed. Prereq: Enrolled in School of Medicine. Must have completed 1.5 years.

CMED 601. Clinical Research Project. 1 - 18 Unit.
Clinical research project leading toward the completion of a type B Masters of Science in Biomedical Investigation - CRSP.

CNCR Courses

CNCR 460. Introduction to Microarrays. 3 Units.
Microarray technology is an exciting new technique that is used to analyze gene expression in a wide variety of organisms. The goal of this course is to give participants a hands-on introduction to this technology. The course is intended for individuals who are preparing to use this technique, including students, fellows, and other investigators. This is a hands-on computer-based course, which will enable participants to conduct meaningful analyses of microarray data. Participants will gain an understanding of the principles underlying microarray technologies, including: theory of sample preparation, sample processing on microarrays, familiarity with the use of Affymetrix Microarray Suite software and generation of data sets. Transferring data among software packages to manipulate data will also be discussed. Importation of data into other software (GeneSpring and DecisionSite) will enable participants to mine the data for higher-order patterns. Participants will learn about the rationale behind the choice of normalization and data filtering strategies, distance metrics, use of appropriate clustering choices such as K-means, Hierarchical, and Self Organizing Maps. Course Offered as BIOC 460, PATH 460, CNCR 460.
CNCR 501. Translational Cancer Research A. 1 Unit.
In this course Case K12 Paul Calabresi Scholars will learn about the steps to receive an IRB approval for their research proposal and clinical trials; how to design and conduct clinical trials by developing a protocol, a research question, the purpose of the LOI, funding and budget issues, working with pharmaceutical companies; essential writing skills for successfully submitting a manuscript for publication in a peer reviewed journal. The class will discuss Social Intelligence and the Biology of Leadership by Goleman and Boyatzis; the scholars will learn about the Case Cancer Center Core Facilities and resources which are available for their research projects. Topics also include the expectations of the K12 CORP program and essential elements for advancing their academic and research career. Recommended preparation: Acceptance to Case K12 Clinical Oncology Career Development Training Program as Paul Calabresi Research Scholar.

CNCR 502. Translational Cancer Research B. 1 Unit.
In this course Case K12 Paul Calabresi Scholars will learn how to manage clinical trials; including staffing, multi or single site, contracting issues, translation and incorporation of laboratory research/correlative science into clinical trials design, getting involved with ECOG. The scholars will learn about mentored and independent funding resources, how to select the appropriate mechanism, and strategies for successful grant submissions and resubmissions. They will learn how to present research and clinical trials progress orally and written to peers/faculty for evaluation my making two PowerPoint presentations: one to the class and their two K12 mentors and a second to the K12 CORP Advisory Committee for written evaluation. Both of these sections will be video taped and a copy of the tape will be reviewed with the scholar. Each scholar will also provide a written summary of their research to date along with their goals for the next 12 months on April 1. Recommended preparation: Acceptance to Case K12 Clinical Oncology Career Development Training Program as Paul Calabresi Research Scholar.

CNCR 503. Translational Cancer Research C. 1 Unit.
In this course each Case K12 Paul Calabresi Scholar will present a summary of their experience from attending either the ASCO/AACR or ASH Clinical Trial Protocol Writing Workshop; two sessions will cover how to write a research proposal-hypothesis, specific aims, methods, and study design. Each scholar will write a sample research proposal which will be critiqued by the other members of the class; two sessions will cover the organization and analysis of biostatistic data used in research. One of these sessions will be a working session based on the scholar’s own data. The scholars will learn about the essential components and issues in developing a successful career in clinical and translational research. Recommended preparation: Acceptance to Case K12 Clinical Oncology Career Development Training Program as Paul Calabresi Research Scholars.

CNCR 504. Translational Cancer Research D. 1 Unit.
In this course Case K12 Paul Calabresi Scholars will discuss an article on essential components of leadership in an academic and clinical setting; how to advance their clinical research career to the level that they can present at the ASCO national conference; learn how to present research and clinical trials progress orally and written to peers/faculty for evaluation by making two PowerPoint presentations: one to the class and their two K12 mentors and a second to the K12 CORP Advisory Committee for written evaluation. Both of these sessions will be video taped and a copy of the tape will be reviewed with the scholar. Each scholar will also provide a written summary of their research and date along with their goals for the next 12 months on April 1. Recommended preparation: Acceptance to Case K12 Clinical Oncology Career Development Training Program as Paul Calabresi Research Scholar.

CRSP Courses

CRSP 401. Introduction to Clinical Research Summer Series. 1 - 3 Unit.
This course is designed to familiarize one with the language and concepts of clinical investigation and statistical computing, as well as provide opportunities for problem-solving, and practical application of the information derived from the lectures. The material is organized along the internal logic of the research process, beginning with mechanisms of choosing a research question and moving into the information needed to design the protocol, implement it, analyze the findings, and draw and disseminate the conclusion(s). Prereq: M.D., R.N., Ph.D., D.D.S., health professionals.

CRSP 402. Study Design and Epidemiologic Methods. 3 Units.
This course will cover the methods used in the conduct of epidemiologic and health services research and considers how epidemiologic studies may be designed to maximize etiologic inferences. Topics include: measures of disease frequency, measures of effect, cross-sectional studies, case-control studies, cohort studies, randomized controlled trials, confounding, bias, effect modification, and select topics. Recommended preparation: CRSP 401 or permission of instructor.

CRSP 406. Introduction to R Programming. 2 Units.
This course will introduce students to programming with R. Major topics will include session management, R data structures, indexing and conditional selection, combining and restructuring data frames, data aggregation, reading and writing data, basic statistical functions, and R traditional graphics. Students will also learn R programming conventions as they relate to preparing data for statistical analysis. Small research datasets will be used in class examples and in homework assignments. Each class will include a demonstration of new concepts followed by a computer lab with exercises designed to reinforce the concepts introduced.
CRSP 407. Logistic Regression and Survival Analysis. 3 Units.
This course introduces two commonly used statistical modeling techniques found in the medical, epidemiologic, and public health research fields; logistic regression and survival analysis. The course emphasizes summarizing and analyzing binary and time-to-event outcomes. The focus is on establishing a foundation for when and how to use these modeling techniques as well as an understanding of interpreting results from analyses. Two course projects will involve problem specification, data collection, analysis, and presentation. Students will use R statistical software extensively. Planned topics include contingency tables, logistic regression models and diagnostic measures, analyzing ordinal outcomes, estimating of the survival curve, Cox proportional hazard regression models and diagnostic measures, and sample size estimation. Software: R version 2.9.1 installed on the student’s lap top. Prereq: CRSP 403 and CRSP 406.

CRSP 410. Independent Study in Clinical Research. 1 - 3 Unit.
Independent Study in Clinical Research enables the student to undertake study of advanced topics in clinical research that are not offered as standing courses at Case Western Reserve University. The student(s) and a member of the Clinical Research Scholars Program faculty, or another faculty member at CWRU, submit a 1-2 page proposal for independent study to the CRSP Program Director. The proposal should include a descriptive title (e.g., research method or clinical topic area) to be studied; a list of up to 5 student-centered objectives of the study; how the subject matter will be learned; and how success in achieving the objectives will be measured (e.g., manuscript, essay, grant proposal, or other written product; examination, etc.). It is expected that there will be at least one contact hour per week for each credit hour requested.

CRSP 412. Communication in Clinical Research (Part 1). 1 Unit.
Sound research only has strong impact when communicated effectively to various types of readers, listeners, and viewers. This requires knowing what receivers need and expect. CRSP 412 focuses on writing. CRSP 413 deals with preparing and delivering oral, poster, and online presentations, mock grant reviewing (to learn what reviewers expect), and modern statistical graphics and tables. Prereq: CRSP 401 or equivalent.

CRSP 413. Communication in Clinical Research (Part 2). 1 Unit.
Sound research only has strong impact when communicated effectively to various types of readers, listeners, and viewers. This requires knowing what receivers need and expect. CRSP 412 focuses on writing. CRSP 413 deals with preparing and delivering oral, poster, and online presentations, mock grant reviewing (to learn what reviewers expect), and modern statistical graphics and tables. Prereq: CRSP 401 or equivalent.

CRSP 431. Statistical Methods I. 3 Units.
Application of statistical techniques with particular emphasis on problems in the biomedical sciences. Basic probability theory, random variables, and distribution functions. Point and interval estimation, regression, and correlation. Problems whose solution involves using packaged statistical programs. First part of year-long sequence. Offered as ANAT 431, BIOL 431, CRSP 431, EPBI 431, and MPHP 431.

CRSP 432. Statistical Methods II. 3 Units.
Methods of analysis of variance, regression and analysis of quantitative data. Emphasis on computer solution of problems drawn from the biomedical sciences. Design of experiments, power of tests, and adequacy of models. Offered as BIOL 432, CRSP 432, EPBI 432, and MPHP 432.

CRSP 500. Design and Analysis of Observational Studies. 3 Units.
An observational study investigates treatments, policies or exposures and the effects that they cause, but it differs from an experiment because the investigator cannot control assignment. We introduce appropriate design, data collection and analysis methods for such studies, to help students design and interpret their own studies, and those of others in their field. Technical formalities are minimized, and the presentations will focus on the practical application of the ideas. A course project involves the completion of an observational study, and substantial use of the R statistical software. Topics include randomized experiments and how they differ from observational studies, planning and design for observational studies, adjustments for overt bias, sensitivity analysis, methods for detecting hidden bias, and focus on propensity score methods for selection bias adjustment, including multivariate matching, stratification, weighting and regression adjustments. Recommended preparation: a working knowledge of multiple regression, some familiarity with logistic regression, with some exposure to fitting regression models in R. Offered as CRSP 500 and EPBI 500.

CRSP 501. Working in Interdisciplinary Research Teams. 1 Unit.
This course will assist learners to understand why and how different professional disciplines, each representing a body of scientific knowledge, must work together to develop and disseminate knowledge. Learners will develop a set of skills specific to being an effective member and leader of an interdisciplinary research team, including working with different value and knowledge sets across disciplines, running effective meetings, managing conflict, giving and receiving feedback, and group decision-making techniques. Using the small group seminar approach and case studies, learners will practice individual and group communication, reflective and self-assessment techniques, and engage in experiential learning activities regarding effective teamwork in interdisciplinary research teams. Techniques to increase group creativity and frame new insights will be discussed. Recommended preparation: K grant Appointment or permission of instructor.

CRSP 502. Leadership Development. 2 Units.
Leadership Assessment and Development is for participants to learn a method for assessing their knowledge, abilities, and values relevant to management; and for developing and implementing plans for acquiring new management related knowledge and abilities. The major goals of this course include generating data through a variety of assessment methods designed to reveal your interests, abilities, values, and knowledge related to leadership effectiveness; learning how to interpret this assessment data and use it to design/plan developmental activities; small group sharing of insights from the various assessments. Recommended preparation: K grant appointment or consent of instructor.
CRSP 503. Innovation and Entrepreneurship. 1 Unit.
The purpose of this module is to acquaint and ultimately engage clinical researchers with the business of innovation and entrepreneurship. Goals include: (1) to provide researchers with many of the skills that they would need to translate academic research into commercial uses; (2) to sensitize clinical researchers to the goals of the business community and facilitate their ability to work with the private sector on technology development; and (3) to make clinical researchers aware of the processes of academic technology development and transfer. Sessions consist of lectures and case discussion facilitated by the instructor. Some sessions include members of the business community as guest lecturers. As an example, students will discuss the financing of new companies with local venture capitalists. Student products include the evaluation of the commercial potential of a university technology in which they apply their new knowledge about commercialization of scientific discoveries.

CRSP 504. Managing Research Records - A System’s Approach. 2 - 3 Units.
This course will provide an approach to managing data for research studies. Major topics include a discussion of a research study system including database design and development, data management, and clinical data management; how to evaluate the data needs of a study including the impact of required regulations; summary of key regulations; the role of the data manager including protocol review, development of a data management plan, CRF design, data cleaning, locking studies and ensuring best practices. Each session will include a lecture, class discussion, and student presentation.

CRSP 505. Investigating Social Determinants of Health. 2 - 3 Units.
The biopsychosocial model highlights the inter-related roles that biological, psychological, and social factors play in health and illness. This course is geared towards clinical research scholars who would like to incorporate aspects of the “social context” in their research. The course will examine the conceptualization, measurement, and effects of several key socio-cultural determinants of health and illness. Sample studies that incorporate social determinants of health will be reviewed. The course will also consider strategies and techniques to conduct clinical research involving social factors in socially and ethnically diverse settings. Students will be encouraged to develop a prototypical study design to incorporate social determinants in their research. To earn an optional third credit hour for this course, students will be required to complete additional assignments tailored to the students’ research needs and interests upon mutual agreement with the instructor at the beginning of the course. Recommended preparation: CRSP 401.

CRSP 510. Health Disparities. 3 Units.
This course aims to provide theoretical and application tools for students from many disciplinary backgrounds to conduct research and develop interventions to reduce health disparities. The course will be situated contextually within the historical record of the United States, reviewing social, political, economic, cultural, legal, and ethical theories related to disparities in general, with a central focus on health disparities. Several frameworks regarding health disparities will be used for investigating and discussing the empirical evidence on disparities among other subgroups (e.g., the poor, women, uninsured, disabled, and non-English speaking populations) will also be included and discussed. Students will be expected to develop a research proposal (observational, clinical, and/or intervention) rooted in their disciplinary background that will incorporate materials from the various perspectives presented throughout the course, with the objective of developing and reinforcing a more comprehensive approach to current practices within their fields. Offered as CRSP 510, EPBI 510, MPHP 510, NURS 510, and SASS 510.

CRSP 603. Research Ethics and Regulation. 2 Units.
This course is designed to introduce students to the ethical, policy, and legal issues raised by research involving human subjects. It is intended for law students, post-doctoral trainees in health-related disciplines and other students in relevant fields. Topics include (among others): regulation and monitoring of research; research in third-world nations; research with special populations; stem cell and genetic research; research to combat bioterrorism; scientific misconduct; conflicts of interest; commercialization and intellectual property; and the use of deception and placebos. Course will meet once per week for 2 hours throughout the semester. Grades will be given based on class participation and a series of group projects and individual short writing assignments. Offered as BETH 503, CRSP 603 and LAWS 603.

CRSP 651. Clinical Research Scholars Thesis. 1 - 18 Unit.
CRSP Thesis M.S.

INTH Courses

INTH 301. Fundamentals of Global Health. 3 Units.
This course seeks to integrate the multiple perspectives and objectives in global health by investigating how the disciplines of Biology, Medicine, Anthropology, Nursing, Mathematics, Engineering analyze and approach the same set of international health problems. Students will develop a shared vocabulary with which to understand these various perspectives from within their own discipline. The focus sites will emphasize issues related to the health consequences of development projects, emergency response to a health care crisis and diseases of development in presence of underdevelopment. Offered as INTH 301 and INTH 401. Prereq: Junior or senior.

INTH 401. Fundamentals of Global Health. 3 Units.
This course seeks to integrate the multiple perspectives and objectives in global health by investigating how the disciplines of Biology, Medicine, Anthropology, Nursing, Mathematics, Engineering analyze and approach the same set of international health problems. Students will develop a shared vocabulary with which to understand these various perspectives from within their own discipline. The focus sites will emphasize issues related to the health consequences of development projects, emergency response to a health care crisis and diseases of development in presence of underdevelopment. Offered as INTH 301 and INTH 401. Prereq: Graduate student.
INTH 447. Global Health: Outbreak Investigation in Real-Time. 3 Units.
This course provides a trans-cultural, trans-disciplinary, multimedia learning experience by analyzing historical and real-time data from the annual dengue endemics and sporadic epidemics in Puerto Rico and Brazil. A rigorous problem-centered training in the epidemiology, prevention, treatment, and control of infectious diseases using real-time and historical surveillance data of endemic and epidemic Dengue in Bahia, Brazil. This is an advanced epidemiology course in which core material will be primarily taught through reading assignments, class discussion, group projects, and class presentations. The course will utilize the online web-based communication and learning technology to create a single classroom between the CWRU and international partners with unique and complementary skills. In addition to joint classroom lectures across sites, student groups will also perform smaller-scale videoconference meetings for assigned group projects, thus creating strong international connections for the students, faculty, and our institutions. Note: Due to the complexities of time zones for this international course, the course will begin at 8:00a.m. until the U.S.A. adjusts clocks for Daylight Savings Time (unlike Brazil). Therefore, classes after the second week of March will begin at 9:00a.m. Offered as: EPBI 447, INTH 447, and MPHP 447.

INTH 484. Geographic Medicine and Epidemiology. 1 - 3 Unit.
This course focuses on the epidemiology, prevention, treatment, and control of tropical and parasitic diseases. Emphasis will be placed on the triad of agent, host, and environment for infectious disease impacting global health. Three distinct modules will focus on specific examples such as malaria, helminths, bacteria, or viruses. Active class participation is required through discussions, case studies, and group projects. Recommended preparation: EPBI 490, EPBI 491 and a microbiology course or consent of instructor. Offered as EPBI 484, INTH 484, and MPHP 484.

INTH 494. Infectious Disease Epidemiology. 1 - 3 Unit.
This course is a follow-up to EPBI 484: Geographic Medicine and Epidemiology, and focuses on tuberculosis (TB), HIV, and dengue epidemiology. This is an advanced course, focusing on methods and approaches in epidemiology. It will be taught in three 1-credit modules, and students may take each module separately or all 3 together. Each module will have a separate project and/or exam. Module I: Tuberculosis epidemiology. Module II: HIV epidemiology. Module III: Dengue epidemiology. Offered as EPBI 494, INTH 494, and MPHP 494. Prereq: EPBI 490.

INTH 551. World Health Seminar. 1 Unit.
This seminar (also called the World Health Interest Group) examines a broad range of topics related to infectious disease research in international settings. Areas of interest are certain to include epidemiology, bioethics, medical anthropology, pathogenesis, drug resistance, vector biology, cell and molecular biology, vaccine development, diagnosis, and socio-cultural factors contributing to or compromising effective health care delivery in endemic countries. Speakers will include a diverse group of local faculty, post-doctoral and graduate student trainees, as well as visiting colleagues from around the world.

SYBB Courses

SYBB 459. Bioinformatics for Systems Biology. 3 Units.

SYBB 501. Biomedical Informatics and Systems Biology Journal Club. 0 Units.
The purpose of this journal club is to provide an opportunity for students to critically discuss a wide variety of informatics and systems biology topics and to present their works in progress. A wide range of informatics and systems theory approaches to conducting biomedical research will be accomplished through the guided selection of articles to be discussed during the club. Potential articles will be chosen from scientific journals including: Nature, Science, BMC Bioinformatics, BMC Systems Biology, the Journal of Bioinformatics and Computational Biology, and the Journal for Biomedical Informatics. During journal presentations, trainees will be expected to lead a discussion of the article that leads to the critical evaluation of the merit of the article and its implication for biomedical informatics and systems biology. The Journal Club will also provide a forum for trainees to present proposed, on-going, and completed research. Trainees will attend and participate in the Journal Club throughout their tenure in the program. The Journal Club will meet twice a month and each trainee will be required to present one journal article and one research in progress presentation yearly. The Journal Club will also include sessions where issues related to the responsible conduct of research are reviewed and extended.

SYBB 555. Current Proteomics. 3 Units.
This course is designed for graduate students across the university who wish to acquire a better understanding of fundamental concepts of proteomics and hands-on experience with techniques used in current proteomics. Lectures will cover protein/peptide separation techniques, protein mass spectrometry, bioinformatics tools, and biological applications which include quantitative proteomics, protein modification proteomics, interaction proteomics, structural genomics and structural proteomics. Laboratory portion will involve practice on the separation of proteins by two-dimensional gel electrophoresis, molecular weight measurement of proteins by mass spectrometry, peptide structural characterization by tandem mass spectrometry and protein identification using computational tools. The instructors’ research topics will also be discussed. Recommended preparation: CBIO 453 and CBIO 455. Offered as PHRM 555 and SYBB 555.

SYBB 600. Special Topics. 1 - 18 Unit.
Offered as EECS 600 and SYBB 600.

SYBB 601. Systems Biology and Bioinformatics Research. 1 - 18 Unit.
(Credit as arranged.)
SYBB 651. Thesis MS. 1 - 18 Unit.
(Credit as arranged.)

SYBB 701. Dissertation PhD. 1 - 18 Unit.
(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
Graduate Programs in the Biomedical Sciences

Malana Bey (http://bulletin.case.edu/schoolofmedicine/graduateprograms/malitno:malana.bey@case.edu), Administrator 216.368.5655

The School of Medicine is proud to administer doctoral, master’s, professional and certificate graduate programs in the biomedical sciences, described fully in this bulletin under their departmental or center affiliations. The Office of Graduate Education provides support and information on the graduate and postdoctoral training programs in the School of Medicine, as well as professional skill development and training grant proposal support. Resources for proposal development as well as current training information are available in Graduate Education (http://casemed.case.edu/gradprog).

Case Western Reserve University School of Medicine has a strong commitment to the importance of diversity in its research and educational programs. The CWRU community celebrates how our individual diversity in race, ethnicity, gender, country of origin, sexual orientation or gender identity enhances our work together. CWRU programs welcome diverse individuals, including those individuals of racial and ethnic groups underrepresented in biomedical science, those with physical disabilities, and those with disadvantaged backgrounds.

Common Academic Requirements

Each graduate program follows the overall regulations established and described in Graduate Studies Academic Requirements pages (http://bulletin.case.edu/schoolofmedicine/graduateprograms/http://schoolofgraduatesudiesacademicrequirements) and documented to the Regents of the State of Ohio. In particular, students and faculty are directed to sections regarding Academic Requirements for Master’s and Doctoral Degrees regarding total and graded course requirements, dissertation advisory committees, maintenance of quality-point average, and other general aspects of graduate study at CWRU. Within those overall expectations, a specific course of study for each graduate program is required and described in each degree plan of study.

Graduate Admissions to School of Medicine Programs

Graduate students are admitted to our programs through several streams, including the Biomedical Sciences Training Program (http://www.case.edu/med/BSTP), the Medical Scientist Training Program (http://mstp.cwru.edu), dual-degree initiatives, and direct admission to specific programs (please see individual program entries under their affiliated department pages).

Student Affinity Groups

Graduate students interact in vibrant groups in the School of Medicine including the Biomedical Graduate Student Organization (http://casemed.case.edu/gradprog/bgso.cfm) and the Minority Graduate Student Organization (http://casemed.case.edu/gradprog/mgso.cfm), as well as university-wide student organizations such as the Graduate Student Senate (http://gss.case.edu). In addition, doctoral students in the School of Medicine organize the annual Biomedical Graduate Student Symposium (http://filer.case.edu/org/bgss/site/Home.html).

Postdoctoral Fellows and Postdoctoral Scholars are appointed through the Office of Postdoctoral Affairs (http://postdoc.case.edu). The Office of Graduate Education provides monthly Professional Skills Programs directed toward trainees.

Biomedical Sciences Training Program (BSTP)

Phone: 216.368.3347
http://www.case.edu/med/BSTP/
Martin Snider, PhD, Director
Debbie Noureddine, Coordinator

The Biomedical Sciences Training Program (BSTP) offers a common admission portal to most biomedical PhD degree programs at CWRU School of Medicine. The BSTP includes eleven doctoral programs in the School of Medicine with more than 200 faculty based in both basic science and clinical departments. Students in the BSTP have the opportunity to study within any research discipline represented in the training programs. This opportunity gives students a tremendous range of research choices. It also provides a distinct advantage over traditional programs, which restrict choices of research area and faculty advisors.

Admissions

Students usually apply in the fall or winter and begin their studies the following summer. The application deadline is January 15th, but applications will be considered by the Admissions Committee as soon as they are complete. In general a year of biology, organic chemistry and mathematics through calculus are required, and biochemistry and molecular biology are strongly recommended. We also seek students with strong quantitative training who may have majored in physics or math who may be interested in our Structural Biology track (p. 774) or Systems Biology and Bioinformatics (p. 825) programs. Depending on preparation, we may suggest additional biology coursework once graduate training begins. This background prepares most students for success in our programs.

Research Experience and Recommendations

Experience performing original research is essential. This might stem from an undergraduate honors thesis, summer research internships, or a technical position after graduation. Letters of recommendation from research mentors that describe creativity, hardwork and promise in science are very important.

Exams

The GRE general test is required. Recent classes have earned an average of 70th percentile in each area. A GRE subject test is desirable, but is not required. The Test of English as a Foreign Language (TOEFL) is required for foreign students unless they are from an English-speaking country or have a degree from University program where the instruction is primarily in English. Students may be eligible to apply for the transfer of some graduate credit from their previous institution. Please go here (http://gradstudies.case.edu) for more information. Transfer credit must be requested prior to beginning coursework at CWRU.

The First Year

Coursework

Students take integrated courses in Cell and Molecular Biology (CBIO 453 Cell Biology 1, CBIO 455 Molecular Biology 1). These two courses offered in the fall semester emphasize the molecular approaches that form the basis of modern biology. We also seek students with strong quantitative training who may have majored in physics or math, and offer alternative courses for these students to acquire foundations in biology. Qualified students also may take more specialized elective courses. All students complete the IBMS 500: On Being a Professional Scientist course introduction to responsible conduct.
Research Rotations
The research rotations allow students to explore research areas and become familiar with faculty members and their laboratories. The main purpose of these rotations is to aid students in selecting a laboratory for their thesis work. Students are encouraged to begin their rotations in July. Doing so gives them the opportunity to complete one rotation during the summer before classes begin at the end of August. A minimum of three rotations must be completed during the year.

Choosing a Thesis Advisor
During the first year, students select an advisor for the dissertation research. Each student also joins the doctoral training program with which the advisor is affiliated. Once a student has chosen a PhD program, the specific requirements of that program are followed to obtain the PhD. The emphasis of the PhD work is on research, culminating in the completion of an original, independent research thesis.

Participating Training Programs
- Biochemistry
- Cell Biology
- Molecular Biology and Microbiology
- Molecular Virology
- Molecular and Cellular Basis of Disease and Immunology
- Molecular, Developmental, and Human Genetics
- Neurosciences
- Nutritional Sciences
- Pharmacological Sciences
- Physiology and Biophysics
- Systems Biology and Bioinformatics

Training faculty, course offerings and individual degree requirements are described in detail in the separate listings for each of these programs.

Once an advisor is selected, the student becomes a member of a PhD Program and fulfills the specific requirements of that program. All PhD programs have similar requirements, including an original thesis, coursework, examinations, publications in scientific journals with lead authorship, seminars and journal clubs and other activities.

BSTP Courses
BSTP 400. Research Rotation in Biomedical Sciences Training Program. 0 - 9 Units.

CBIO Courses
CBIO 453. Cell Biology I. 4 Units.
Part of the first semester curriculum for first year graduate students along with CBIO 455. This course is designed to give students an intensive introduction to prokaryotic and eukaryotic cell structure and function. Topics include membrane structure and function, mechanisms of protein localization in cells, secretion and endocytosis, the cytoskeleton, cell adhesion, cell signaling and the regulation of cell growth. Important methods in cell biology are also presented. This course is suitable for graduate students entering most areas of basic biomedical research. Undergraduate courses in biochemistry, cell and molecular biology are excellent preparation for this course. Recommended preparation: Undergraduate biochemistry or molecular biology.

CBIO 455. Molecular Biology I. 4 Units.
Part of the first semester curriculum for first year graduate students along with CBIO 453. This course is designed to give students an intensive introduction to prokaryotic and eukaryotic molecular biology. Topics include protein structure and function, DNA and chromosome structure, DNA replication, RNA transcription and its regulation, RNA processing, and protein synthesis. Important methods in molecular biology are also presented. This course is suitable for graduate students entering most areas of basic biomedical research. Undergraduate courses in biochemistry, cell and molecular biology are excellent preparation for this course. Recommended preparation: Undergraduate biochemistry or molecular biology.

IBMS Courses
IBMS 500. On Being a Professional Scientist: The Responsible Conduct of Research. 0 Units.
The goal of this course is to provide graduate students with an opportunity to think through their professional ethical commitments before they are tested, on the basis of the scientific community’s accumulated experience with the issues. Students will be brought up to date on the current state of professional policy and federal regulation in this area, and, through case studies, will discuss practical strategies for preventing and resolving ethical problems in their own work. The course is designed to meet the requirements for "instruction about responsible conduct in research" for BSTP and MSTP students supported through NIH/ADAMHA institutional training grant programs at Case. Attendance is required.
Molecular Biology and Microbiology

Ms. Brinn Omabegho (http://bulletin.case.edu/schoolofmedicine/molecularbiologyandmicrobiology@mailto:brinn.omabegho@case.edu), Manager

The Department of Molecular Biology and Microbiology provides a focus within the School of Medicine for the study of the growth and development of microorganisms at the molecular level. The Department is home to three PhD programs: Cell Biology, Molecular Biology and Microbiology, and Molecular Virology.

Faculty have nationally-funded research programs. Many faculty serve on study sections of national agencies, publish in the most prestigious journals, serve as editors of journals, and take leadership positions in throughout Case School of Medicine. The department also enjoys numerous collaborations with faculty in the Departments of Biochemistry, Neuroscience, and Genetics, the Case Comprehensive Cancer Center, the Visual Sciences Research Center, the Center for AIDS Research, and the Center for RNA Molecular Biology, and the Department of Cell Biology at the Lerner Research Center at CCF, because of shared research interests. All these activities create a vibrant scientific environment.

Research areas include the study of normal cell functions, microbial systems, viruses, and infectious diseases. It is only by developing a thorough understanding of the fundamental biology of cells and pathogenic microbes, their host organisms, and how the two interact during infection that improved strategies for prevention and treatment of infectious diseases can be achieved.

PhD in Cell Biology, Molecular Biology and Microbiology, Molecular Virology

The Department of Molecular Biology and Microbiology is home to three PhD programs: Cell Biology, Molecular Biology and Microbiology, and Molecular Virology. Admissions for all three of these programs occurs through the common PhD admissions program, the Biomedical Sciences Training Program (p. 834). In addition, students in the Medical Scientist Training Program (p. 793) (MSTP) can also pursue these three PhD programs.

PhD Requirements

Students entering through BSTP begin the first of three research rotations during the summer and participate in the Core Curriculum in Cell and Molecular Biology (C3MB), two integrated courses which provides formal instruction in modern cell and molecular biology. Some exceptional students with strong backgrounds, such as a previous Master’s Degree, may be eligible to be exempted from part of the Core Curriculum, and instead enroll in one or more advanced courses during the fall semester. Some students may be eligible to apply for the transfer of credit from their previous institution (please visit here (http://gradstudies.case.edu) for more information). Transfer credit must be requested prior to beginning coursework at CWRU.

A student who chooses a thesis advisor from Cell Biology, Molecular Biology Microbiology or Molecular Virology can become a member of one of these three PhD programs. To earn a PhD a student must complete 400-level graduate Core and Elective coursework including responsible conduct of research as described in the course of study.

Students in each program are expected to attend the joint student seminars (MBIO 435 Seminar in Molecular Biology/Microbiology/MVIR 435 Seminar in Molecular Biology/Microbiology/CLBY 435 Seminar in Molecular Biology/Microbiology) for at least 3 semesters (3 credit hours). Continued participation in the seminars after completion of this requirement is encouraged. Up to 4 credit hours can be allocated to the seminar course (one credit per semester).

Molecular Biology and Microbiology/ Molecular Virology and Cell Biology students should take the MBIO 450 Cells and Pathogens/MVIR 450 Cells and Pathogens/CLBY 450 Cells and Pathogens.

In addition, Cell Biology Students entering in 2009 or later must take two of the three following fundamental courses: (CLBY 422 Topics in Cell Biology); (CLBY 526 Cell Biology and Human Disease/MBIO 526 Cell Biology and Human Disease); or (CLBY 488 Yeast Genetics and Cell Biology).

Beyond that, any combination of graduate courses from within or outside the department can be used to fulfill the requirement as long as the planned program of study has the approval of the student’s advisor and committee.

In addition, each PhD student must successfully complete a qualifier examination for advancement to candidacy in the form of a short grant proposal with oral defense. The qualifier is generally completed in the summer after year two. During the dissertation period, students are expected to meet twice a year with the thesis committee, present seminars in the department, and fulfill journal publication requirements. Throughout the doctoral training, students are expected to be enthusiastic participants in seminars, journal clubs, and research meetings in the lab and program.

CLBY 416. Fundamental Immunology. 4 Units.
Introductory immunology providing an overview of the immune system, including activation, effector mechanisms, and regulation. Topics include antigen-antibody reactions, immunologically important cell surface receptors, cell-cell interactions, cell-mediated immunity, innate versus adaptive immunity, cytokines, and basic molecular biology and signal transduction in B and T lymphocytes, and immunopathology. Three weekly lectures emphasize experimental findings leading to the concepts of modern immunology. An additional recitation hour is required to integrate the core material with experimental data and known immune mediated diseases. Five mandatory 90 minute group problem sets per semester will be administered outside of lecture and recitation meeting times. Graduate students will be graded separately from undergraduates, and 22 percent of the grade will be based on a critical analysis of a recently published, landmark scientific article. Offered as BIOL 316, BIOL 416, CLBY 416, and PATH 416. Prereq: Graduate standing.

CLBY 417. Cytokines: Function, Structure, and Signaling. 3 Units.
Regulation of immune responses and differentiation of leukocytes is modulated by proteins (cytokines) secreted and/or expressed by both immune and non-immune cells. Course examines the function, expression, gene organization, structure, receptors, and intracellular signaling of cytokines. Topic include regulatory and inflammatory cytokines, colony stimulating factors, chemokines, cytokine and cytokine receptor gene families, intracellular signaling through STAT proteins and tyrosine phosphorylation, clinical potential, and genetic defects. Lecture format using texts, scientific reviews and research articles. Recommended preparation: PATH 416 or equivalent. Offered as BIOL 417, CLBY 417, and PATH 417.

CLBY 422. Topics in Cell Biology. 3 Units.
This team-taught seminar course focuses on 3-4 distinct areas of contemporary cell biology. Faculty will present context and overview, but most time will be devoted to a close reading of the literature and discussion by students in a round table format. Recommended preparation: CBIO 453 and CBIO 455.

CLBY 435. Seminar in Molecular Biology/Microbiology. 1 Unit.
Graduate students will attend the departmental seminar given by all graduate students in the Department of Molecular Biology and Microbiology, in the Molecular Virology Program, and in the Cell Biology Program, as well as give a seminar on their own thesis research. Students will be evaluated by the faculty member in charge of that student’s seminar with input from the students’ own thesis committee. After each seminar, the student presenter will meet with other graduate students for peer-review of the content, delivery, and style of the seminar. Peer reviewers will also be evaluated for the quality of their input. Offered as CLBY 435 and MBIO 435 and MVIR 435.

CLBY 450. Cells and Pathogens. 3 Units.
Modern molecular cell biology owes a great debt to viral and bacterial pathogens as model systems. In some instances pathogens operate by faithful mimicry of host proteins, and other cases represent the result of extensive molecular tinkering and convergent evolution. This course will also explore numerous mechanisms utilized by pathogens to subvert the host and enhance their own survival. Topics covered include nuclear regulatory mechanisms, protein synthesis and stability, membrane-bound organelles, endocytosis and phagocytosis, and factors that influence cell behavior such as cytoskeleton rearrangements, cell-cell interactions, and cell migration. Additional topics include cell signaling and co-evolution of pathogens and host cell functions. Students are expected to come to class prepared to discuss pre-assigned readings consisting of brief reviews and seminal papers from the literature. Student assessment will be based on effective class participation (approximately 80%) and successful presentation of an independent research topic (approximately 20%). Offered as CLBY 450, MBIO 450, and MVIR 450. Prereq: CBIO 453 and CBIO 455 or permission of instructor.

CLBY 466. Cell Signaling. 3 Units.
This is an advanced lecture/journal/discussion format course that covers cell signaling mechanisms. Included are discussions of neurotransmitter-gated ion channels, growth factor receptor kinases, cytokine receptors, G protein-coupled receptors, steroid receptors, heterotrimeric G proteins, ras family GTPases, second messenger cascades, protein kinase cascades, second messenger regulation of transcription factors, microtubule-based motility, actin/myosin-based motility, signals for regulation of cell cycle, signals for regulation of apoptosis. Offered as CLBY 466 and PHOL 466 and PHRM 466.
CLBY 468. Membrane Physiology. 3 Units.
This student-guided discussion/journal course focuses on biological membranes. Topics discussed include thermodynamics and kinetics of membrane transport, oxidative phosphorylation and bioenergetics, electro-physiology of excitable membranes, and whole and single channel electrophysiology, homeostasis and pH regulation, volume and calcium regulation. Offered as CLBY 468 and PHOL 468.

CLBY 487. Cell Biology of the Nucleus. 3 Units.
Discussion of current cell biology research on the structure and functions of the nuclear envelope, the matrix and chromatin. Recommended preparation: CBIO 453 and CBIO 454 or consent of instructor. Offered as CLBY 487 and PATH 487.

CLBY 488. Yeast Genetics and Cell Biology. 3 Units.
This seminar course provides an introduction to the genetics and molecular biology of the yeasts S. cerevisiae and S. pombe by a discussion of current literature focusing primarily on topics in yeast cell biology. Students are first introduced to the tools of molecular genetics and special features of yeasts that make them important model eukaryotic organisms. Some selected topics include cell polarity, cell cycle, secretory pathways, vesicular and nuclear/cytoplasmic transport, mitochondrial import and biogenesis, chromosome segregation, cytoskeleton, mating response and signal transduction. Offered as CLBY 488, GENE 488, MBIO 488, and PATH 488.

CLBY 511. Cell Biology Seminar. 1 Unit.
The Cell Biology Seminar provides a forum for presentation and discussion of contemporary issues in Cell Biology. Students, fellows, local faculty and guest speakers present both research talks and journal clubs.

CLBY 512. Cell Biology Seminar. 1 Unit.
The Cell Biology Seminar provides a forum for presentation and discussion of contemporary issues in Cell Biology. Students, fellows, local faculty and guest speakers present both research talks and journal clubs.

CLBY 519. Molecular Biology of RNA. 3 Units.
Selected topics regarding editing, enzymatic function, splicing, and structure of RNA. Offered as BIOC 519, CLBY 519, and MBIO 519.

CLBY 525. Transport and Targeting of Macromolecules in Health and Disease. 3 Units.
Each class includes introductory lecture, followed by student participation in interactive discussion of 3 to 5 research publications. At the end of the course, the students are expected to submit a paper or a short research proposal on any of the topics discussed during the course. Recommended preparation: CBIO 453, CBIO 454, CBIO 455, and CBIO 456. Offered as CLBY 525 and PATH 525.

CLBY 526. Cell Biology and Human Disease. 3 Units.
This course is designed to provide broad base of knowledge regarding cell structure and function. The basic structure of the cell will be discussed, as will the various functional systems that are superimposed upon and interact with this structure. The course will discuss organelle biogenesis, materials movement inside cells, cell interaction with the external environment, cell cycle and cell death regulation, cytoskeleton dynamics, quality control mechanisms, and basic signal transduction concepts. The course will also discuss how abnormal cell function may lead to human disease, and how basic cell function may be harnessed by intracellular pathogens to provide favorable intracellular environments for replication. The major goals of this course are to provide students with a working knowledge of the cell to facilitate understanding of the scientific literature, and to familiarize students with modern experimental approaches in cell biology. The course will rely heavily on student participation. Students will be provided with study guides with the expectation they will come to class prepared to lead interactive group discussions with minimal input from instructors. Offered as: CLBY 526, MBIO 526, MVIR 526.

CLBY 599. RNA Structure and Function. 3 Units.
This course will cover fundamental aspects of modern RNA biology with emphasis on the interplay of three dimensional structure of nucleic acids and their function. The main focus of the course is on the recent discoveries that indicate a prominent role of RNA as a major regulator of cellular function. Topics discussed will include an introduction to RNA structure, folding and dynamics, RNA/RNA and RNA-protein interactions, and role of RNA in catalysis of biological reactions in ribosome and the role of other catalytic RNAs in tRNA biogenesis, pre-mRNA splicing, and viral replication. The course also covers the recently discovered RNA regulatory switches, large noncoding regulatory RNAs, and the role of RNA in human diseases and novel, RNA-based therapeutics. Offered as BIOC 599, CLBY 599, and MBIO 599.

CLBY 601. Special Problems. 1 - 18 Unit.
This is the listing for independent research. Students should enroll in this course once they have selected their laboratory for Ph.D. research. The number of credit hours depends on how many didactic courses students are following at the same time. Once they have passed their qualifying examination they should register for CLBY 701.

This is the listing for independent research toward the Ph.D. The number of credit hours depends on how many didactic courses students are following at the same time. Students may register for this course only once they have passed their qualifying examination. Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

MBIO Courses

MBIO 399. Undergraduate Research. 1 - 3 Unit.
Permits qualified undergraduates to work in a faculty member’s laboratory.
MBIO 413. Advanced Topics in Molecular and Biochemical Research Ethics. 0 Units.
This course offers continuing education in responsible conduct of research for advanced graduate students. The course will cover the nine federally defined responsible conduct of research (RCR) areas through a combination of lectures, on-line course material and small group discussions. Six 2-hour meetings per semester are planned. Maximum enrollment of 15 students with preference to graduate students in the Department of Molecular Biology and Microbiology, the Department of Biochemistry, and trainees of the Cell and Molecular Biology Training Grant. Offered as: BIOC 413, MBIO 413.

MBIO 420. Molecular Genetics of Cancer. 3 Units.
Cancer is a genetic disease, not only in the Mendelian sense of inheritance, but also in the sense that it is caused by somatic mutation. The targets of mutation are a set of proto-oncogenes and tumor suppressor genes whose products govern cellular proliferation, death and differentiation. The objectives of this course are to examine the types of genes that are the targets of mutational activation or inactivation and the mechanistic outcome of mutational changes that lead to oncogenesis. The course will also probe viral mechanisms of oncogenesis related to the products of cellular proto-oncogenes or tumor suppressor genes. In the course of these examinations we will explore the genetic and molecular genetic approaches used to identify and study oncogenes and tumor suppressor genes. Students should be prepared to present and discuss experimental design, data and conclusions from assigned publications. There will be no exams or papers but the course will end with a full-day, student-run symposium on topics to be decided jointly by students and instructors. Grades will be based on class participation and symposium presentation. Offered as BIOC 420, MBIO 420, MVIR 420, PATH 422, and PHRM 420. Prereq: CBIO 453 and CBIO 455.

MBIO 434. Mechanisms of Drug Resistance. 3 Units.
Resistance to drugs is an important health concern in the new millennium. Over the past century, modern medicine has developed and prescribed drugs for various ailments and diseases with known therapeutic benefit. Since the discovery of antibiotics by Dr. Fleming, we have struggled with a new complication in infectious diseases, development of drug resistance. This course will focus on and compare the drug resistant mechanisms selected by viruses, bacteria, parasites, fungi, and tumor cells. Topics to be covered include antiretroviral resistance (e.g., AZT and protease inhibitors), antibiotic resistance (e.g., B-lactams), resistance to chemotherapeutic agents, and resistance to anti-malarial drugs (e.g., chloroquine). Offered as MBIO 434, MVIR 434, and PHRM 434.

MBIO 435. Seminar in Molecular Biology/Microbiology. 1 Unit.
Graduate students will attend the departmental seminar given by all graduate students in the Department of Molecular Biology and Microbiology, in the Molecular Virology Program, and in the Cell Biology Program, as well as give a seminar on their own thesis research. Students will be evaluated by the faculty member in charge of that student’s seminar with input from the students’ own thesis committee. After each seminar, the student presenter will meet with other graduate students for peer-review of the content, delivery, and style of the seminar. Peer reviewers will also be evaluated for the quality of their input. Offered as CLBY 435 and MBIO 435 and MVIR 435. Prereq: CBIO 453 and CBIO 455.

MBIO 445. Molecular Biology and Pathogenesis of RNA and DNA Viruses. 3 Units.
Through a combination of lectures by Case faculty and guest lecturers, along with student discussion of current literature, this course emphasizes mechanisms of viral gene expression and pathogenesis. RNA viruses to be discussed include positive, negative, and retroviruses. DNA viruses include SV40, adenovirus, herpes, papilloma, and others. Important aspects of host defense mechanisms, antiviral agents, and viral vectors will also be covered. Students will be evaluated based on their quality of presentation of course papers assigned to them and their overall participation in class discussions. Offered as MBIO 445 and MVIR 445.

MBIO 446. Virus-Host Interactions. 3 Units.
Viruses and their hosts have co-evolved for millions of years and, as a result, viruses have evolved intricate and fascinating mechanisms for evading host defenses. Understanding how viruses interact with the host is fundamental to counteracting or preventing viral infections. For example, viruses that fail to block host defenses are avirulent and candidates for vaccines. Emerging viral infections are a major public health concern and a subject of this course. The course consists of lectures and in-depth analysis of published studies on virus-host interactions. Outstanding local and external lecturers from across the U.S. will participate in teaching this course. In addition, students will deliver one presentation to the class during the course. Offered as MBIO 446 and MVIR 446.

MBIO 450. Cells and Pathogens. 3 Units.
Modern molecular cell biology owes a great debt to viral and bacterial pathogens as model systems. In some instances pathogens operate by faithful mimicry of host proteins, and other cases represent the result of extensive molecular tinkering and convergent evolution. This course will also explore numerous mechanisms utilized by pathogens to subvert the host and enhance their own survival. Topics covered include nuclear regulatory mechanisms, protein synthesis and stability, membrane-bound organelles, endocytosis and phagocytosis, and factors that influence cell behavior such as cytoskeleton rearrangements, cell-cell interactions, and cell migration. Additional topics include cell signaling and co-evolution of pathogens and host cell functions. Students are expected to come to class prepared to discuss pre-assigned readings consisting of brief reviews and seminal papers from the literature. Student assessment will be based on effective class participation (approximately 80%) and successful presentation of an independent research topic (approximately 20%). Offered as CLBY 450, MBIO 450, and MVIR 450. Prereq: CBIO 453 and CBIO 455 or permission of instructor.

MBIO 486. HIV Immunology. 3 Units.
This course will examine the unique immunology of HIV disease. The course content will include the study of HIV pathogenesis, immune control, immune dysfunctions, HIV prevention and immune restoration. Students will be expected to attend lectures and participate in class discussions. A strong emphasis will be placed on reviewing scientific literature. Students will be asked to help organize and to administer an HIV immunology journal club and will be asked to prepare a written proposal in the area of HIV immunology. Offered as PATH 486 and MBIO 486.
MBIO 488. Yeast Genetics and Cell Biology. 3 Units.
This seminar course provides an introduction to the genetics and molecular biology of the yeasts S. cerevisiae and S. pombe by a discussion of current literature focusing primarily on topics in yeast cell biology. Students are first introduced to the tools of molecular genetics and special features of yeasts that make them important model eukaryotic organisms. Some selected topics include cell polarity, cell cycle, secretory pathways, vesicular and nuclear/cytoplasmic transport, mitochondrial import and biogenesis, chromosome segregation, cytoskeleton, mating response and signal transduction. Offered as CLBY 488, GENE 488, MBIO 488, and PATH 488.

MBIO 513. Bacterial Virulence and Host Interactions. 3 Units.
The goal of this seminar course is to familiarize students with bacterial virulence mechanisms and how they interact with the host. The focus will be on current literature pertaining to this field. While the molecular basis of bacterial virulence mechanisms will be the main focus, some time will be spent on the host immune response. Topics covered will include adhesins/pili, secretion mechanisms, AB toxins, bacterial invasion and intracellular survival, regulation of virulence gene expression. Prereq: CBIO 453 and CBIO 455 or equivalent courses.

MBIO 519. Molecular Biology of RNA. 3 Units.
Selected topics regarding editing, enzymatic function, splicing, and structure of RNA. Offered as BIOL 519, CLBY 519, and MBIO 519.

MBIO 520. Principles of Microbiology. 3 Units.
This course provides lectures and small group discussions of the cellular and molecular mechanisms by which certain bacteria, viruses, and parasites execute normal and pathologic conditions in human hosts. The biology, genetics, and physiological properties of these infectious agents are considered in light of the mechanisms by which they induce pathogenic conditions in their human hosts. The course is intended for graduate students advanced beyond the core curriculum of course work in molecular biology and microbiology areas of specialization. Prereq: CBIO 453 and CBIO 455.

MBIO 524. Trends in Prokaryotic Cell and Developmental Biology. 3 Units.
Did you know the (i) all building blocks for the eukaryotic cytoskeleton are also present in prokaryotes, that (ii) bacteria rely on dynamic actin-like structures to segregate chromosomes/plasmids and regulate cell polarity, that (iii) oscillating waves of cyclin-like regulators control progression of the bacterial cell cycle, that (iv) a novel secondary messenger, cyclic di-GMP, has been identified that triggers a physiological and morphological transition in bacteria and (v) that bacterial cell-cell interactions can elicit morphological changes that bear remarkable similarities to organogenesis in flies, worms, and vertebrates? In this advanced graduate course, recent insights on the cell and developmental biology of prokaryotes will be discussed and analogies drawn to those that exist in eukaryotes. Studies on the bacterial model organisms Escherichia coli, Bacillus subtilis, Caulobacter crescentus, Vibrio spp, Myxococcus xanthus and Streptomyces coelicolor have altered our view of the bacterial cell, demonstrating that at the most fundamental level cells operate in a remarkable similar way, regardless of whether they contain a nucleus or not.

MBIO 526. Cell Biology and Human Disease. 3 Units.
This course is designed to provide broad base of knowledge regarding cell structure and function. The basic structure of the cell will be discussed, as will the various functional systems that are superimposed upon and interact with this structure. The course will discuss organogenesis, materials movement inside cells, cell interaction with the external environment, cell cycle and cell death regulation, cytoskeleton dynamics, quality control mechanisms, and basic signal transduction concepts. The course will also discuss how abnormal cell function may lead to human disease, and how basic cell function may be harnessed by intracellular pathogens to provide favorable intracellular environments for replication. The major goals of this course are to provide students with a working knowledge of the cell to facilitate understanding of the scientific literature, and to familiarize students with modern experimental approaches in cell biology. The course will rely heavily on student participation. Students will be provided with study guides with the expectation they will come to class prepared to lead interactive group discussions with minimal input from instructors. Offered as: CLBY 526, MBIO 526, MVIR 526.

MBIO 537. Microscopy-Principles and Applications. 3 Units.
This course provides an introduction to various types of light microscopy, digital and video imaging techniques, and their applications to biological and biomedical sciences via lectures and hands-on experience. Topics covered include geometrical and physical optics; brightfield, darkfield, phase contrast, DIC, fluorescence and confocal microscopes; and digital image processing. Offered as GENE 537, MBIO 537, and PHOL 537.

MBIO 599. RNA Structure and Function. 3 Units.
This course will cover fundamental aspects of modern RNA biology with emphasis on the interplay of three dimensional structure of nucleic acids and their function. The main focus of the course is on the recent discoveries that indicate a prominent role of RNA as a major regulator of cellular function. Topics discussed will include an introduction to RNA structure, folding and dynamics, RNA/RNA and RNA-protein interactions, and role of RNA in catalysis of biological reactions in ribosome and the role of other catalytic RNAs in RNA biogenesis, pre-mRNA splicing, and viral replication. The course also covers the recently discovered RNA regulatory switches, large noncoding regulatory RNAs, and the role of RNA in human diseases and novel, RNA-based therapeutics. Offered as BIOL 599, CLBY 599, and MBIO 599.

MBIO 601. Research in Molecular Biology and Microbiology. 1 - 18 Unit.

MBIO 620. Transcription and Gene Regulation. 3 Units.
This course covers mechanisms of transcription that play critical roles in biological processes. It is designed to develop scientific thinking in designing experiments and evaluating the merits of research papers. Students will be able to present two to three 30-minute talks. Topics include: 1) structure and function of RNA polymerases; 2) accessory factors involved in initiation, elongation, and termination; 3) regulation transcription; 4) transcriptional coactivators and corepressors; 5) regulation of transcription factor activity. A take-home exam will be conducted at the final week. Grades will be based on presentations and take-home exam. Offered as BIOL 620 and MBIO 620. Prereq: CBIO 453 and CBIO 455.

Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
MVIR Courses

MVIR 434. Mechanisms of Drug Resistance. 3 Units.
Resistance to drugs is an important health concern in the new millennium. Over the past century, modern medicine has developed and prescribed drugs for various ailments and diseases with known therapeutic benefit. Since the discovery of antibiotics by Dr. Fleming, we have struggled with a new complication in infectious diseases, development of drug resistance. This course will focus on and compare the drug resistant mechanisms selected by viruses, bacteria, parasites, fungi, and tumor cells. Topics to be covered include antiviral resistance (e.g., AZT and protease inhibitors), antibiotic resistance (e.g., β-lactams), resistance to chemotherapeutic agents, and resistance to anti-malarial drugs (e.g., chloroquine). Offered as MBIO 434, MVIR 434, and PHRM 434.

MVIR 435. Seminar in Molecular Biology/Microbiology. 1 Unit.
Graduate students will attend the departmental seminar given by all graduate students in the Department of Molecular Biology and Microbiology, in the Molecular Virology Program, and in the Cell Biology Program, as well as give a seminar on their own thesis research. Students will be evaluated by the faculty member in charge of that student's seminar with input from the students' own thesis committee. After each seminar, the student presenter will meet with other graduate students for peer-review of the content, delivery, and style of the seminar. Peer reviewers will also be evaluated for the quality of their input. Offered as CLBY 435 and MBIO 435 and MVIR 435.

MVIR 445. Molecular Biology and Pathogenesis of RNA and DNA Viruses. 3 Units.
Through a combination of lectures by Case faculty and guest lecturers, along with student discussion of current literature, this course emphasizes mechanisms of viral gene expression and pathogenesis. RNA viruses to be discussed include positive, negative, and retroviruses. DNA viruses include SV40, adenovirus, herpes, papilloma, and others. Important aspects of host defense mechanisms, antiviral agents, and viral vectors will also be covered. Students will be evaluated based on their quality of presentation of course papers assigned to them and their overall participation in class discussions. Offered as MBIO 445 and MVIR 445. Prereq: CBIO 453 and CBIO 454 and CBIO 455 and CBIO 456.

MVIR 446. Virus-Host Interactions. 3 Units.
Viruses and their hosts have co-evolved for millions of years and, as a result, viruses have evolved intricate and fascinating mechanisms for evading host defenses. Understanding how viruses interact with the host is fundamental to counteracting or preventing viral infections. For example, viruses that fail to block host defenses are avirulent and candidates for vaccines. Emerging viral infections are a major public health concern and a subject of this course. The course consists of lectures and in-depth analysis of published studies on virus-host interactions. Outstanding local and external lecturers from across the U.S. will participate in teaching this course. In addition, students will deliver one presentation to the class during the course. Offered as MBIO 446 and MVIR 446. Prereq: MVIR 445

MVIR 450. Cells and Pathogens. 3 Units.
Modern molecular cell biology owes a great debt to viral and bacterial pathogens as model systems. In some instances pathogens operate by faithful mimicry of host proteins, and other cases represent the result of extensive molecular tinkering and convergent evolution. This course will also explore numerous mechanisms utilized by pathogens to subvert the host and enhance their own survival. Topics covered include nuclear regulatory mechanisms, protein synthesis and stability, membrane-bound organelles, endocytosis and phagocytosis, and factors that influence cell behavior such as cytoskeleton rearrangements, cell-cell interactions, and cell migration. Additional topics include cell signaling and co-evolution of pathogens and host cell functions. Students are expected to come to class prepared to discuss pre-assigned readings consisting of brief reviews and seminal papers from the literature. Student assessment will be based on effective class participation (approximately 80%) and successful presentation of an independent research topic (approximately 20%). Offered as CLBY 450, MBIO 450, and MVIR 450. Prereq: CBIO 453 and CBIO 455 or permission of instructor.

MVIR 481. Immunology of Infectious Diseases. 3 Units.
Lectures and discussion on the immune response to infectious organisms, including bacteria, viruses and parasites. Emphasis on human responses but includes discussions of animal models. Other topics include vaccines and infections in immuno-compromised hosts. Recommended preparation: PATH 416 or consent of instructor. Offered as MVIR 481 and PATH 481.

MVIR 526. Cell Biology and Human Disease. 3 Units.
This course is designed to provide broad base of knowledge regarding cell structure and function. The basic structure of the cell will be discussed, as will the various functional systems that are superimposed upon and interact with this structure. The course will discuss organelle biogenesis, materials movement inside cells, cell interaction with the external environment, cell cycle and cell death regulation, cytoskeleton dynamics, quality control mechanisms, and basic signal transduction concepts. The course will also discuss how abnormal cell function may lead to human disease, and how basic cell function may be harnessed by intracellular pathogens to provide favorable intracellular environments for replication. The major goals of this course are to provide students with a working knowledge of the cell to facilitate understanding of the scientific literature, and to familiarize students with modern experimental approaches in cell biology. The course will rely heavily on student participation. Students will be provided with study guides with the expectation they will come to class prepared to lead interactive group discussions with minimal input from instructors. Offered as: CLBY 526, MBIO 526, MVIR 526.

MVIR 601. Research. 1 - 18 Unit.
Grade of S/U only.

MVIR 701. Dissertation Ph.D.. 1 - 18 Unit.
Grade of S/U only. Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
Molecular Medicine Program

Robin Crotty (http://bulletin.case.edu/schooolofmedicine/molecularmedicine/mailto:crottyr@cfs.org), Recruiting Coordinator

The Molecular Medicine PhD Program is a unique collaborative graduate training opportunity that integrates medical knowledge into graduate training. The goal of this program is to produce scientists trained in translational research: basic or applied research relevant to human health and disease that can lead to new understanding of disease, clinical and diagnostic tools, medications, and therapies.

This program is funded by the Howard Hughes Medical Institute "Med Into Grad" initiative and is consistent with National Institutes of Health Roadmap directives.

Students train rigorously to apply basic science discoveries to human health and to the causes and treatments of human disease. The mastery of competencies necessary to translate scientific observations from the research bench to clinical care is the focus of this PhD program. Graduates will be well prepared to collaborate with physicians and for the challenge of using molecular and cellular biology to advance human health.

PhD in Molecular Medicine

Admission into the Molecular Medicine PhD program is obtained through application directly to the program. Graduate students complete didactic coursework, independent research, and other doctoral requirements to earn the PhD. Students complete three laboratory rotations (starting mid-July) among the laboratories of training faculty, and are exposed to trainer research projects during the Frontiers of Molecular Medicine seminar and journal club series taken the first summer and each semester thereafter.

During subsequent years, students will devote the majority of their time to thesis research, while attending advanced graduate courses, seminars, and journal clubs. Advanced elective courses may be chosen from any department or program on campus, with the approval of the graduate program director and the student’s thesis committee. Students must take a total of 36 semester hours of courses and maintain a B average.

The qualifying exam will be comprised of preparing and defending a grant application in the NIH/NRSA format. The topic of the grant can be in a related area of investigation to the student’s research but cannot resemble projects that are ongoing in the laboratory of the Research Advisor. At least one aim of this proposal will consist of a specific translational or clinical aim.

All efforts should be made to complete the Ph.D. within four years. All students are expected to submit two or more first-authored primary research publications in peer-reviewed scientific journals. At least one manuscript should be accepted for publication prior to the thesis defense.

PhD Program Requirements

Coursework

Students begin in July by first taking MMED 410 Introduction to Human Physiology and Disease. The student will follow a progressive curriculum including Cell Biology; Metabolism and Pharmacology; Nucleic Acids, Gene Expression and Gene Regulation; Infection and Immunity; and Mammalian Genetics. The core series concludes with a course in Principles of Clinical Research for the Ph.D. Investigator, and a mentored Clinical Experience.

Research Rotations

The research rotations allow the student to sample areas of research and become familiar with faculty members and their laboratories. The main purpose of these rotations is to aid the student in selecting a laboratory for the thesis work. Students will begin their rotations in July. A minimum of three rotations must be completed during the year.

Choosing a Thesis Advisor

After the second semester of the first year students select an advisor for the dissertation research. The emphasis of the Ph.D. work is on research, culminating in the completion of an original, independent research thesis.

Plan of Study

Total Units in Sequence: 33-65

* Starts in July
** Credits vary

Third Year: Complete elective coursework so that total graded courses = 24 credits; Research credits switch from 601 to 701 once passed
into candidacy. Minimum of 1 credit of 701 is required each semester thereafter for a total of 18 credits to graduate. Total of 6 graded credits of advanced electives are required to graduate.

Fourth Year and beyond: Full-time Thesis Research (701)

Courses

MMED 400. Research Rotations. 0 Units.
Research rotations are conducted to expose the student to several laboratory environments, a variety of research problems and numerous laboratory techniques as well as to assist them in the selection of their Research Advisor. Rotations will begin immediately upon enrollment and continue through the second semester of the first year. Usually rotations will last 12 weeks, however if a student decides that he/she is not interested in the assigned laboratory a shorter rotation is appropriate. The student is responsible for arranging each rotation with an approved trainer with the consultation of the Graduate Program Director. To assist in this endeavor, the Graduate Program Director will provide a list of approved trainers who have space, time and money to support a graduate student. During the rotation, students are expected to participate in all lab and departmental activities, e.g., lab meetings and seminars. At the completion of a rotation the student is required to submit a written Rotation Report including an outline of the problem being studied, a description of the experimental approaches, a discussion of the results of performed experiments as well as future directions.

MMED 404. Frontiers in Molecular Medicine Seminar. 1 Unit.
In the Frontiers in Molecular Medicine Seminar series, faculty from the department of Molecular Medicine and guest lecturers will discuss ongoing translational research.

MMED 410. Introduction to Human Physiology and Disease. 4 Units.
The purpose of this course is to give an introduction to the physiology of the major human organ systems, as well as selected associated pathophysiologies. The course will provide a physiological basis for subsequent study and research in Molecular Medicine. The integration of clinical faculty into the course will emphasize the importance of bringing scientific knowledge to bear on clinical problems, a theme which will be stressed throughout the Molecular Medicine curriculum. The course will also acquaint students with medical terminology.

MMED 412. Metabolism and Introduction to Principles of Pharmacology. 2 Units.
The course will include a combination of interactive lectures and problem-based interactive seminars. Each week will conclude with at least one clinical correlation where the weekly topic is presented in the context of a clinical problem. Topics to be covered include: carbohydrate metabolism; amino acid and nucleotide metabolism; lipid metabolism and lipoproteins; regulation of metabolism; and principals of pharmacology.

MMED 413. Nucleic Acids, Gene Expression, and Gene Regulation. 3 Units.
The course will include a combination of interactive lectures and problem-based learning. Each week will conclude with at least one clinical correlation where the weekly topic is presented in the context of a clinical problem. Topics to be covered include: DNA structure, chromosome structure, replication and repair; RNA synthesis and RNA processing, the organization of eukaryotic genes and the genetic code and translation; and gene regulation.

MMED 414. Mammalian Genetics. 2 Units.
The course focuses on genetics, genomics, and bioinformatics, and it will include a combination of interactive lectures, problem-based learning and a week-long group project. Topics to be covered include: genetic variation; linkage studies; association studies; complex traits, linkage disequilibrium, the Hap Map, pharmacogenetics; genome-wide expression studies, and mouse models of human disease, and bioinformatics.

MMED 415. Cell Biology. 2 Units.
The course will include a combination of interactive lectures and problem-based learning. Each week will conclude with at least one clinical correlation where the weekly topic is presented in the context of a clinical problem. Topics to be covered include: cell structure and organelles, prokaryotes/eukaryotes; intracellular compartments and protein sorting; receptors/endocytosis/rafts; the nucleus; cell communication; and mechanics of cell division.

MMED 416. Host Defense: Infection and Immunity. 3 Units.
The course will include a reading program, lectures, and weekly problem-based student-led presentations. Weeks 1 and 2 are dedicated to establishing the scope of the field and forming vocabulary. Week 3 and part of Week 4 will cover immune mechanisms. The remainder of the course will deal with clinical aspects of immunobiology. On a regular basis Clinical Correlations, relevant to weekly topics, are integrated into the material. Topics to be covered include: biology and molecular biology of infectious agents; fundamentals of immunology; innate and adaptive responses to infection, immune effector mechanisms; and clinical aspects of immunobiology.

MMED 501. Principles of Clinical and Translational Research. 4 Units.
To give an introduction to the ethical, statistical, methodologic and informatics basis of clinical and translational research. Topics will include the history of clinical and translational research, regulatory aspects of human subjects research, clinical trials study design, conflicts of interest, human subjects recruitment, research and publication ethics, technology transfer, biobank construction and utilization, and clinical and research database construction and utilization. In addition, students will be introduced to principles of biostatistics and clinical epidemiology relevant to clinical and translational research and gain expertise in statistical tool using problem based learning sets.

MMED 504. Seminars in Advanced Research in Medicine. 1 Unit.
The goal of Advanced Research in Medicine 2, Friday Research Seminars (ARM2), is to facilitate student understanding of the bidirectional nature of research and to instill excitement about the way in which novel research results in advances in clinical medicine. A series of 18 accomplished, well-respected researchers will interact with students for 60 minutes per week, challenging the students to think about novel research questions and their relationships to current clinical challenges linked thematically to the theme of the week. The emphases of ARM2 Friday Research Seminar is on the content of the research and how this research may impact and change clinical practice in the future. Each week, a student from the class will be assigned to moderate the session. The student moderator will introduce the speaker and will be responsible for assuring that adequate interactive discussion occurs. In addition, four sets of 2-week sessions each will be devoted to small group sessions. The goal of the 2-week sessions is for the students to develop a research plan directly related to the organ system featured in the presentations.
MMED 521. Molecular aspects of the diagnosis, pathology, and treatment of selected human diseases. 3 Units.
The goal of this course is to integrate medical knowledge into PhD training. This team-taught seminar course focuses on a top-down examination of selected human diseases starting with clinical presentations of the manifestations, diagnoses, and treatment of disease. This is followed by study of the pathology, cell biology, and molecular biology of the disease. This information forms the foundation of a final discussion of current treatment strategies and ongoing research to identify new strategies. Three to four separate disease areas will be discussed during each semester, such as neurodegenerative diseases, cancer, cardiovascular diseases and others. The specific areas of discussion are selected to demonstrate the strength of an integrated team of clinical and basic scientists; and to provide a model for students to follow in future studies in their own area of expertise. Emphasis will be given to the basic scientific observations that formed the basis of successful clinical practice, and how this was utilized by integrated teams of basic and clinical investigators to provide better patient care. Students will prepare for discussions with close reading of the literature. Faculty will present an overview in a discussion format. It is anticipated that each disease area will be presented by an integrated team of clinical and basic scientists. The final weeks of the semester will be devoted to student preparation of a research proposal based upon the information discussed during the course. The specific topic of this proposal will be of the students choosing. Grading will be based both upon preparation for and participation in discussions, and upon the research proposal. Recommended Preparation: Introductory Graduate or Medical School courses in Cell Biology, Molecular Biology, and Physiology

MMED 601. Dissertation Research. 1 - 9 Unit.
Research leading toward the Ph.D. dissertation in Molecular Medicine.

MMED 612. Clinical Experience. 2 Units.
Each student will be assigned a Clinical Mentor who will co-advice the student and serve on both the Qualifying Examination Committee and Thesis Committee. The Clinical Mentor will develop an individualized curriculum for the student in consultation with the Thesis Research Mentor and Program Director. The curriculum will be organized around the integrated, multidisciplinary disease groups at the Clinic. The students will attend and actively participate in the regularly scheduled multidisciplinary clinical conference organized by their disease group (most meet for one hour every week or every other week), usually involving a combination of case presentations and research presentations. At the conclusion of the semester the student will make a presentation to the group focused on a relevant translational research problem. The Clinical Mentor will also organize a series of supervised clinical experiences (with a Mentor) to various locations where students will observe clinician interactions with patients to better understand the disease from the patient perspective and to disease-related diagnostic and research laboratories.

MMED 701. Dissertation Ph.D.. 1 - 9 Unit.
Research leading toward the Ph.D. dissertation in Molecular Medicine. Recommended preparation: Advancement to candidacy in MMED. Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

- a. Available only as a second major.
- b. Includes dietetics.
- c. The Medical Scientist Training Program.
- d. Combined degree by special arrangement for selected students who hold acceptances in the School of Medicine.
- e. Degrees conferred jointly by the Mandel School of Applied Social Sciences and the Weatherhead School of Management in association with the Mandel Center for Nonprofit Organizations.
- f. Available as the undergraduate portion of the Bachelor of Science in Engineering/Master of Science program.
- g. Available as the graduate portion of the Bachelor of Science in Engineering/Master of Science program.
- h. Joint five-year Doctor of Medicine/Master of Science
- i. The Biomedical Investigation Program
- j. Program currently not accepting applications
- k. Masters offered only to current doctoral students or through the Integrated Graduate Studies program (IGS)
University Registrar

Registration
Students register at the time indicated by the University Registrar, (http://www.case.edu/registrar) as shown in the Student Information System (sis.case.edu/psp/saprd/EMPLOYEE/PSFT_HR/c/CW_SR_MENU.CW_CONFID_AGREEMNT.GBL?) (SIS) or as indicated by individual graduate/professional schools. Undergraduate student registration for fall begins in April and continues through the beginning of classes in August; undergraduate student registration for spring begins in November and continues through the beginning of classes in January. Only those students who have no outstanding financial obligations to the university are eligible to register. The Bursar bills those who register early for the next semester, with payment due by the specified deadline before the start of the next semester. At registration just prior to the beginning of classes, students must have paid all previous charges and be able to pay or have financial aid equal to one-half of that semester’s tuition and fees. The schedule of classes (sis.case.edu/psp/saprd/EMPLOYEE/HRMS/c/COMMUNITY_ACCESS.CLASS_SEARCH.GBL & is available electronically and can be accessed through the SIS. (sis.case.edu/psp/saprd/EMPLOYEE/PSFT_HR/c/CW_SR_MENU.CW_CONFID_AGREEMNT.GBL)

The University Registrar’s website includes the academic calendar (http://www.case.edu/registrar/calendar.html) and the dates for late registration and drop/add (http://www.case.edu/registrar/lastday.html). The SIS includes a complete real time listing of courses offered. Students use SIS to register for classes; refer to the listing of registration start dates for each school (http://www.case.edu/registrar/online/when.html) to determine registration eligibility. No zero-credit only registrations (e.g., zero-credit physical education courses) are allowed, unless approved as part of ongoing degree programs.

Registration deadlines will be strictly enforced. Only students officially registered, according to the official SIS class roster, are permitted to attend that class. Instructors may permit students to sit in on occasional classes at their discretion, but students who wish to attend class regularly without receiving credit should register as auditors. Unregistered students are not permitted to take part in laboratory activities.

Courses of Instruction
All courses at the university, except courses in the Medical School, Law School, School of Dental Medicine, and School of Nursing are numbered according to the following plan:

• 100-199 Elementary courses
• 200-299 Intermediate courses
• 300-399 Advanced undergraduate courses
• 400-499 Lower level graduate courses (some are open to undergraduates; consult with the appropriate department)
• 500 and above Advanced graduate courses

Roman numerals (I, II, etc.) after course titles indicate segments of a multicourse sequence. Arabic numerals in parentheses after course titles indicate the semester credit hours for each course.

Veterans’ Coordinator
The Veterans’ Coordinator, housed in the Office of the University Registrar, 110 Yost Hall, administers the regulations governing the educational benefits and opportunities open to veterans under various federal laws. The office maintains close contact with the Veterans Administration and is the only office authorized to verify veterans’ attendance. For information call 216.368.4310 or email registrar@case.edu.

Exceptions to Policies
Requests for exceptions to any academic or administrative policy must be submitted within three months of the end of the semester for which the exception is sought.

Course Audit Program for Senior Citizens
Case Western Reserve University’s Course Audit Program for Senior Citizens (http://www.case.edu/provost/seniorauditprogram) (CAPSC) allows senior citizens (age 65 and older) to take on campus courses at a reduced tuition rate.

Student Records
The Family Educational Rights and Privacy Act of 1974 (FERPA) contains several provisions that are important to students. First, the university may not release personally identifiable student records to a third party, with certain specific exceptions, unless the third party has requested the information in writing and the student has consented, again in writing, to its release. The university may release directory information about a student, however, unless the student submits a written request that any or all such information not be released. Second, a student may request, in writing, an opportunity to inspect and review the student’s official files and records maintained by the university and may, if appropriate, challenge the accuracy of those records. The university is permitted a reasonable time, not to exceed 45 days, to respond to such a request. Third, a student may file with the Family Policy and Regulations Office of the U.S. Department of Education a complaint concerning what he or she believes to be the university’s failure to comply with FERPA. Finally, a student may obtain from the Registrar a copy of this policy, which the university has adopted to meet the requirements of FERPA. The information below is presented in compliance with the provisions of FERPA, which require the university to notify students annually of their rights and the university’s policies and procedures. Specific procedures may vary slightly among the schools and colleges of the university, and each student is encouraged to inquire at his or her own dean’s office if any question arises.

Access to Files
A student may request, in writing, an opportunity to review the contents of the student’s educational file. Certain materials are excluded from review as specified in FERPA. Among these are:

• Records kept in the sole possession of faculty, staff, and other personnel, used only as a personal memory aid, and not accessible to any other person except a temporary substitute for the maker of the record.
• Records created and maintained by law enforcement units solely for law enforcement purposes that are not maintained by persons other than law enforcement officials.
• Records created and maintained by a physician, psychiatrist, psychologist, or other professional or paraprofessional acting in that capacity in connection with the provision of treatment to a student. Such records can, of course, be reviewed by a physician or other appropriate professional of the student’s choice.
FERPA affords students certain rights with respect to their educational records. Students may ask the university to amend a record that the student believes is inaccurate or misleading. The student should write to the university official responsible for the record, clearly identifying the part of the record the student wants changed, and specify why it is inaccurate or misleading. If the university decides not to amend the record as requested by the student, the university will notify the student of the decision and advise the student of his or her right to a hearing regarding the request for amendment. Additional information regarding the hearing procedures will be provided to the student when notified of the right to a hearing.

The student may request copies of those records to which he or she has access under the terms of FERPA. The student will be charged a nominal fee per page for these copies.

Release of Personally Identifiable Records

FERPA affords the student the right to consent to disclosures of personally identifiable information contained in the student’s educational records, except to the extent that FERPA authorizes disclosure without consent. One exception, which permits disclosure without consent, is disclosure to school officials with legitimate educational interests. A school official is defined as a person employed by the university in an administrative, supervisory, academic, or support staff position (including law enforcement unit and health staff); a person or company with whom the university has contracted (such as an attorney, auditor, or collection agent); a person serving on the Board of Trustees; or assisting another school official in performing his or her tasks. A school official has a legitimate educational interest if the official needs to review an education record in order to fulfill his or her professional responsibility.

Upon request, the university discloses education records without consent to officials of another school in which a student seeks or intends to enroll. The university also discloses education records to organizations conducting studies for educational agencies or institutions under certain circumstances.

Directory Information

For the convenience of faculty and fellow students, FERPA provides for a category known as directory information, which may be released without requesting the eligible student’s specific prior consent. Rather, the act requires that students be notified annually of the types of information included in this category and be given an appropriate period in which to express, in writing, any preference that such information about themselves not be released. For this purpose, directory information is defined to include:

- Name (including both maiden name and married name, where applicable)
- Address, telephone listing, and electronic mail address
- Date and place of birth
- Major field of study
- Anticipated graduation date
- Enrollment Status (undergraduate or graduate, full-time or part-time)
- Dates of attendance
- Degrees and awards received
- Participation in officially recognized sports and activities
- Weight and height (members of athletic teams)

Any student who would prefer that the university not release such information about himself or herself should so notify the Office of the University Registrar, in writing, prior to the first week of classes in the fall semester. Students entering the university at midyear may submit such notice during the first week of classes of the spring semester.

Transcripts

A transcript of grades will be released only upon written (or electronically authenticated) request of the student, either in person, by mail or by online request through our transcript servicing partner. A fee is charged for each transcript copy. Neither transcripts nor diplomas will not be issued to, or on behalf of, students who have not discharged delinquent obligations to the university.

Student Right to Know

The Student Right to Know and Campus Security Act requires that universities throughout the country produce statistics and/or information on the following subjects: 1) retention and graduation rates (http://bulletin.case.edu/universityregistrar/www.case.edu/registrar/gradrate.html); 2) financial assistance available to students and requirements and restrictions imposed on Title IV aid; 3) crime statistics on campus (http://www.case.edu/finadmin/security/protserv/protserv.htm); 4) athletic program participation rates and financial support; and 5) other institutional information including: the cost of attendance, accreditation and academic program data, facilities and services available to disabled students, and withdrawal and refund policies.

Data on retention and graduation rates is available in the Office of the Provost in Adelbert Hall (216-368-4389) and from the Office of the Registrar (http://www.case.edu/registrar). Information on financial assistance, including descriptions of application procedures and forms, may be obtained from the Office of University Financial Aid (http://finaid.case.edu). Yost Hall (216.368.4530). Information concerning athletic program participation and financial support may be obtained from the Physical Education and Athletics Department (http://studentaffairs.case.edu/athletics), Veale Center (216.368.2867). Other institutional information, such as that listed in number 5, above, may be obtained from the Office of the Provost and in the various undergraduate, graduate, and professional schools’ registrars’ offices. Case Western Reserve University’s annual security report (available online (http://case.edu/finadmin/security/protserv/protserv.htm)) includes statistics for the previous three years concerning certain reported crimes, including hate crimes, that occurred on campus, in or on campus buildings or property owned or controlled by the university, and on public property within or immediately adjacent to and accessible from campus. The report is available from the Office of the Provost in Adelbert Hall (216-368-4389) and from the Office of the Registrar (http://www.case.edu/registrar). Information on campus security policies and other information concerning the university's efforts to maintain a safe campus environment is available in the Office of the Provost in Adelbert Hall (216-368-4389).
also contains summaries of institutional policies regarding safety and security, reporting of crimes, sexual assault, drug and alcohol use, timely warnings and missing persons investigations. The university maintains a daily crime log that can be accessed here (http://police.case.edu/log.html). The Case Western Reserve University annual security report also includes information on emergency notification, emergency response and evacuation procedures. Emergency procedures for students, faculty, staff and visitors can also be reviewed here (http://case.edu/emergencymanagement).

The annual security report is updated Oct. 1 of every year. A full print copy of the report can be obtained by contacting the crime prevention office at 216.368.1243 (http://bulletin.case.edu/universityregistrar/tel:216-368-1243). Case Western Reserve University also produces an annual fire safety report that includes fire statistics for on-campus housing, summaries of fire policies and evacuation procedures. The report is available online (https://www.case.edu/ehs/FireSafety/2011report.pdf).

**Grading System**

The following grading system is used at Case Western Reserve University:

<table>
<thead>
<tr>
<th>Letter Grade</th>

</tbody>
</table>
In order to receive credit for a course marked Incomplete, the student must complete the work by the date specified by the instructor and in no event later than the end of the next regular semester (fall or spring). If the student fails to remove the Incomplete within the specified time, he or she forfeits the privilege of completing the course for credit, and the grade becomes a permanent Incomplete unless the instructor elects to give a grade of F.

Graduate and Professional Students

Graduate and Professional Students

The grade of S given graduate students in the School of Graduate Studies indicates satisfactory progress in evaluating exclusively thesis and dissertation research. The grade S is not counted in determining quality averages. The alternative to a grade of S is U (Unsatisfactory). The grade of I (Incomplete) may not be used in evaluating thesis and dissertation research. In other graduate/professional schools, the grade of S may indicate passing performance in designated courses and advanced seminars.

Conditional (R)

The grade of R is used for work, such as undergraduate thesis and project laboratories, that extends more than one semester and, upon completion of the thesis or project, will be changed to the letter grade awarded for the completed work. The R grade assigned in ENGL 148 Introduction to Composition indicates that a student must re-enroll in ENGL 148 Introduction to Composition. In the following semester; the R grade in ENGL 148 Introduction to Composition remains on the student’s record and is not subject to replacement by the final grade earned in ENGL 148.

Audit (AD) and Unsuccessful Audit (NG)

The grade of AD (audit) will be given when a student has officially registered to audit a course and has satisfied the requirements specified by the instructor for this grade. The grade of NG (unsuccessful audit, graduate, and professional schools only) will be given when a student has officially registered to audit a course and has not satisfied the requirements specified by the instructor.

Undergraduate Students

A student may audit a course with the dean’s or advisor’s approval and the consent of the instructor of the course. An auditor receives no credit for the course.

Registration in a course cannot be changed from audit to credit or the reverse after the end of the drop/add period. At the beginning of the course, the student and instructor should reach agreement regarding the requirements to be met for a grade of AD. The grade of AD is entered on the student’s transcript if approved by the instructor of the course. If the instructor does not approve the grade AD, the enrollment is not posted on the transcript. A student may take for credit a course he or she audited in an earlier semester.

Graduate/Professional Students

Dental students: Courses toward degree programs in the School of Dental Medicine may not be audited.

The following statements apply to the Schools of Graduate Studies and Management: The instructor may designate that the student has not completed all requirements for auditing the course and that NG (Unsuccessful Audit) be recorded on the student’s transcript. A course
once audited may not be repeated for credit, nor may any course for which credit has been given be repeated for credit toward degree requirements. Students will be permitted to change their registration in a course from credit to audit (AD), or the reverse, with written consent of their advisor and the instructor only if the change is officially made on or before the date specified in the academic calendar for the given term.

Other graduate and professional schools: Please refer to individual school sections of this publication, or to individual school student handbooks.

**Partial Withdrawal (W)**

The grade of W will be given if a student officially withdraws from a course on or before the date specified in the academic calendar for the given term. After this date, the grade as determined by the instructor will be posted.

**Complete Withdrawal (WD)**

The grade WD is assigned by the University Registrar for complete withdrawal from all course work for the semester. All withdrawal requests are to be submitted to the University Registrar prior to the last day of class.

**Grade Point Averages**

Grade-point averages are calculated by multiplying the number equivalent of the letter grade by the number of credit hours for the course. The semester grade-point average is computed by dividing the total number of grade points earned at the university during a given semester by the sum of the credit hours for all courses in which the student received letter grades of A, B, C, D, or F taken at the university during that same semester. (Not all of these grades are given by all schools.)

For the purpose of semester grade calculations, grade points earned when a grade of Incomplete is replaced by the appropriate course grade are credited to the semester in which the incomplete grade was received, but status action (separation, probation, or restoration to good standing) taken at the end of that semester is not affected unless the grade change occurs by the first day of classes of the following semester. Qualification for honors is based on the same terms.

The cumulative grade-point average is computed by dividing the total grade points earned at the university by the sum of the credit hours for all courses included in the grade-point calculation.

**Pass-No Pass**

See specific colleges and schools for information about courses that may be taken on a pass-no pass basis and similar options.

**Definition of a Credit-Hour**

Program Integrity Rules issued by the U.S. Department of Education require institutions to establish a definition of "credit hour." CWRU’s definition was approved by the Faculty Senate on 4/25/12 and applies to all degree programs (undergraduate through graduate/professional):

1. The assignment of credit-hours to a course occurs through a formal review process conducted at the appropriate levels of faculty governance.

2. For courses in lecture format, one credit-hour represents the subject content that can be delivered in one academic hour of contact time each week for the full duration of one academic semester, typically fourteen weeks along with a final examination period. For undergraduate courses, one credit-hour also includes associated work that can be completed by a typical student in 2-3 hours of effort outside the classroom. For graduate and professional courses taught in lecture format, 3-4 hours of outside work is expected for each academic hour of contact time.

3. For courses taught in other than lecture format (e.g., seminars, laboratories, independent study, clinical work, research, etc.), one credit-hour represents an amount of content and/or student effort that in aggregate is no less than that described in (2) above.
Weatherhead School of Management

The Weatherhead School of Management (http://weatherhead.case.edu) is different from other business schools. Weatherhead is bold in its ideas, creative in its approach, and adaptive in its interactions within a changing business environment. Weatherhead has enhanced traditional management education by integrating the fundamentals of business with ideas and practices that change individuals, organizations, and societies. Weatherhead graduates are ready to add immediate value to their organizations, their communities, and the world.

Weatherhead is home to seven academic departments comprising 69 full-time faculty members and 71 full-time members of staff. It offers programs at the undergraduate, master’s, and doctoral levels in the Peter B. Lewis Building and executive programming in the George S. Di-Vely Building on the campus of Case Western Reserve University. Located within University Circle, a square mile of educational, scientific, medical, and cultural institutions, Weatherhead counts among its neighbors the Cleveland Orchestra, the Cleveland Museum of Art, the Cleveland Botanical Garden, the Cleveland Museum of Natural History, the Cleveland Institute of Art, and University Hospitals. Weatherhead is a business school that attracts interest from every corner of the globe while maintaining its roots in the Cleveland community.

Mission Statement
Developing transformational ideas and outstanding leaders for the advancement of business and society.

Values
• Weatherhead believes that management is a noble profession committed to the advancement of human life.
• Weatherhead values its strong ethical foundation and strives to promote a culture rich in ideas and reflection.
• Weatherhead is committed to increasing individual creative and critical capacities, nurturing new and expansive patterns of thought.
• Weatherhead values research of enduring consequence and judges its significance by the impact it has on management thought, management action, and public policy.
• Weatherhead values learning that is active and collaborative. Students, faculty, and staff together engage important management problems with an innovative, knowledge-creating approach.
• Weatherhead is responsive to the needs of its students.
• Weatherhead considers alumni its important partners and strives to add value to their personal and professional lives.
• Weatherhead values partnerships with the business community and other organizations.
• Weatherhead values meaningful service to society and strives for outcomes that influence and positively change the way people and organizations conduct themselves.
• Weatherhead is a cohesive learning organization with an international outlook.
• Weatherhead values diversity, characterized by open dialogue and mutual respect among individuals with different specializations, backgrounds, cultures, and perspectives.
• Weatherhead is results-oriented and judges its contributions by actions taken and outcomes achieved.

Vision
Weatherhead is respected locally and globally for research of enduring consequence. The school is recognized for attracting and educating managers to design novel solutions to the most complex issues facing business and society. Weatherhead’s learning environment is a hub of creative thinking, innovative teaching, and trans-disciplinary research, filled with excitement and a strong sense of community.

Distinguishing Focus
It matters to the Weatherhead School of Management that its education and research efforts help people improve organizations and society. To that end, Weatherhead educates and develops managers of private and public, corporate and nonprofit institutions to combine rigorous analytic skills, design competence, and a bias for execution.

At Weatherhead, students are taught to Manage by Designing and to build the Sustainable Enterprise. These teachings infuse the MBA curriculum; so does the emphasis on responsible commercial practices. Weatherhead confronts today’s most important global issues from a business perspective, and Weatherhead students leave ready to lead that charge, wherever they go.

Specifically, Weatherhead’s work is known for instilling in its students:
• Use of disciplined methods to explore, frame, and resolve complex problems and issues
• Ability to use design techniques to generate alternatives that improve on familiar solutions in surprising and valuable ways
• Awareness of the importance of taking into account entire systems when proposing new ways of doing things

Effective execution requires leadership. Weatherhead’s learning environments are also known for promoting:
• Change management skills that are required to effectively implement novel solutions
• Attention to the value of designing solutions that are sustainable from economic, ecological, and social points of view
• Ability to actively engage all relevant stakeholders in positive change

Weatherhead School of Management’s distinguishing focus on design and sustainability in management integrates and builds upon investments that it has made over the past decade to align with growing interests in organizations and society at large.

Brief History
In 1952, Western Reserve University established the School of Business by combining the Cleveland College Division of Business Administration and the Graduate School Division of Business Administration, and from its founding until 1988, the activities of the School of Business were divided among a number of buildings both in downtown Cleveland and in University Circle. In 1967, the merger of Case Institute of Technology and Western Reserve University created Case Western Reserve University, and the Western Reserve University School of Business absorbed Case’s Division of Organizational Sciences to become the School of Management in 1970. Just six years later, the School of Management launched its Full-Time MBA.

It was in 1980 that the School of Management was renamed in honor of Albert J. Weatherhead III, a Cleveland businessman and industrialist who represented the fourth generation of his family to carry on the Weatherhead name and values, including cultural and educational leadership. By 1999, the Weatherhead School of Management had developed a strong identity, growing out of its space in Nord Hall and requiring new construction. Funded by the philanthropist and
entrepreneur whose name it bears, the Peter B. Lewis building, designed by renowned contemporary architect Frank Gehry and completed in 2002, was the answer. Located across the street from the George S. Dively Building, which houses Weatherhead Executive Education programs, the Lewis Building, featuring Gehry’s unmistakable sculptural profile and gleaming stainless steel roof, both sets the school apart from its surroundings and, quite literally, reflects the prestigious neighborhood of the school. Gehry redefined the way a business school should look, just as Weatherhead redefines the way management education should take place.

Accreditation

The programs of the Weatherhead School of Management have been fully accredited by the Association to Advance Collegiate Schools of Business (AACSB) International since 1958.

Administration

J.B. Silvers, PhD
(Stanford University)
Interim Dean; John R. Mannix Medical Mutual of Ohio Professor in Health Care Finance; Professor, Banking and Finance

Fred Collopy, PhD
(University of Pennsylvania)
Senior Associate Dean; Professor, Information Systems

Laura Desmond, BA
(University of Michigan)
Associate Dean, External Relations

Michael Devlin, MBA
(Case Western Reserve University)
Associate Dean, Executive Education

Jennifer Johnson, MBA
(Case Western Reserve University)
Associate Dean, Undergraduate and Integrated Studies; Associate Professor, Marketing and Policy Studies

Sharon Martin, MBA
(Baldwin-Wallace College)
Associate Dean, Finance and Administration

Department Chairs

Richard J. Boland Jr., PhD
(Case Western Reserve University)
Elizabeth M. and William C. Treuhaft Professor of Management; Chair and Professor, Information Systems

Ronald Fry, PhD
(Massachusetts Institute of Technology)
Chair and Professor, Organizational Behavior

Anurag Gupta, PhD
(New York University)
Chair and Professor, Banking and Finance; Director, International Programs

Kamlesh Mathur, PhD
(Case Western Reserve University)
Chair and Professor, Operations; Faculty Director, Master of Science in Operations Research and Supply Chain; Faculty Director, Executive MBA

Gary J. Previts, PhD, CPA
(University of Florida)
Distinguished University Professor, E. Mandell de Windt Professor in Leadership and Enterprise Development; Chair and Professor, Accountancy

Jagdip Singh, PhD
(Texas Tech University)
ATT Professor; Chair and Professor, Marketing and Policy Studies

Matthew Sobel, PhD
(Stanford University)
Chair, Department of Economics; William E. Umstattd Professor in Industrial Economics; Professor, Operations
Certificate in Nonprofit Management

Certificate in Nonprofit Management (CNM)

This program is not currently accepting new students.

Policies

Satisfactory completion of an approved set of five courses (15 credits) in residence, along with payment of all tuition and fees, is required for graduation. Participants who complete all requirements will be awarded the Mandel Center Certificate in Nonprofit Management.

Retention Requirements

A CNM student who earns a final grade below a B in any course may no longer continue in the program. There is no academic probation period for the CNM, due to the short duration of the program.

Graduation Requirements

A candidate for the CNM program must file an application to graduate not later than two months before the expected graduation date. The filing of this application is the responsibility of the CNM candidate. Contact the Weatherhead School of Management at 216.368.8566 for more information. Eligibility of the candidate to graduate at the time requested will be verified upon receipt of the application.

All requirements for the CNM program must be completed within two years from the date of the student’s initial registration.
Doctoral Programs

Doctor of Management (DM) and PhD in Management: Designing Sustainable Systems

Business leadership is increasingly required to integrate multiple sources of knowledge, understand the perceptions of diverse parties, and put human values into action. Executives are challenged to create social, intellectual, and economic value for their organizations and for society at large based on rigorous and sound evidence. Recognizing these challenges, Weatherhead offers two doctoral degrees in management for working professionals: the DM and the PhD in management: Designing Sustainable Systems.

The DM is based on the expectation that the practitioner-scholar will develop the ability to think intensely and critically about problems confronting an organization, a community, a nation, and the world. Through conceptually modeling these problems, assessing and modifying the assumptions underlying the models, testing assumptions empirically, and applying modes of thought drawn from many disciplines, students draw conclusions and propose solutions based on the results their models produce.

The PhD in management: Designing Sustainable Systems is focused in preparing interdisciplinary scholar-practitioners for successful research and academic careers. Students develop the ability to approach problems rigorously from multiple disciplinary angles and to produce sound evidence and theoretical frames to address those problems.

Curricula and coursework in these programs provide a foundation for conducting rigorous research and practicing evidence-based management. Courses are interrelated theoretically and methodologically and prepare students to bring academic, theoretical, and empirical perspectives to bear on problems that they face in their organizations or in public policy advocacy.

DM

The DM is a 54-credit-hour, three-year lock-step program. DM students' research projects are evaluated by a faculty review committee over the course of the program at critical research milestones.

Year Total: 54

Research Requirements and Deliverables

The DM dissertation consists of the Qualitative Research Paper and Quantitative Research Paper and an Integrative Paper that organizes the research into a coherent thesis.

Research Proposal Paper

The first research requirement is a qualitative research proposal that frames the student’s research problem and question and specifies a design for the fieldwork portion of the qualitative research project. The student develops a written research proposal that synthesizes a substantial body of scholarly literature (theoretical and empirical) in a fashion that creates a conceptual framework and model providing insight into a significant problem of practice reflecting the lived worlds of a specified body of practitioners. The Research Proposal Paper produces a “grand tour” research question to guide the qualitative research project and includes a design for the fieldwork to be carried out in the course of the research project. Students develop individual skills of conceptualizing (including modeling), creating ethnographic/phenomenological interview protocols, conducting phenomenological interviews, and interpretively analyzing qualitative interview data.

Qualitative Research Paper

The Qualitative Research Paper presents findings and explanatory concepts from the student’s qualitative fieldwork project. It identifies and frames a potent “phenomenological practice gap” wherein current practitioner and academic knowledge is lacking in guiding effective practice. The research synthesizes significant scholarly literature into a coherent conceptual framework and an understandable model of relationships among theoretical constructs. Students learn to frame effective questions for practitioner-scholarship research that embodies inquiry and openness, aligning the conceptual framework and research question to the chosen problem of practice, and to write scholarly papers that are clear and present a logical flow of well-supported arguments. By understanding the development of grounded theory and understanding ethnographic observation and field notes, students formally and rigorously analyze qualitative data in an interpretive fashion.

Capstone

The Capstone integrates the analytical approaches the student has learned in EDMP 643 Measuring Business Behaviors and Structures and EDMP 649 Causal Analysis of Business Problems II. The Capstone exercise is intended to allow students to demonstrate their independent competence in quantitative inquiry skills and, based on a satisfactory assessment, to progress toward the completion of the quantitative
inquiry project which is a requirement for both the DM and the PhD in management: Designing Sustainable Systems track.

**Quantitative Research Paper**

The objective of the Quantitative Research Paper is to generate a rigorous and valid quantitative empirical study that is guided by a sound conceptual model of the student’s phenomenon of interest. The study must position itself with respect to the theoretical and research literature of the topic, utilize a robust research design to collect credible data that mitigates biases, reflect systematic and rigorous quantitative analysis indicative of material covered in the quantitative inquiry courses, and meet high scholarly standards to merit publication in top-rated journals and outlets.

**DM Dissertation**

The DM dissertation consists of the Qualitative Research Paper and Quantitative Research Paper and an Integrative Paper that organizes the study into a coherent thesis.

**Integrative Paper**

As a final requirement for the DM dissertation, each student writes an overview statement introducing his or her Qualitative and Quantitative Research Papers, making substantive observations and conclusions about each project, and presenting a personal reflective statement about each project’s significance to the author. The Research Proposal frames the dissertation overview in a preliminary way, but in light of the student’s experience in conducting qualitative and quantitative studies, the synthesis is rewritten, revised, and critically evaluated to become the Integrative Paper. The Integrative Paper and the approved Qualitative Research Paper and Quantitative Research Paper serve as the dissertation requirement of the DM program.

**PhD in Management: Designing Sustainable Systems**

Weatherhead’s PhD in Management: Designing Sustainable Systems is a 72-credit-hour program. The students in this program are selected from first-year DM students who wish to reorient their careers to formally pursue positions as academic researchers and scholars.

**Research Requirements and Deliverables for the PhD in Management: Designing Sustainable Systems Track**

Although trans-disciplinary research is the main focus of the PhD in Management: Designing Sustainable Systems track, candidates must be grounded in a disciplinary field. Therefore, throughout their course of study, candidates will read seminal works and acquire knowledge that leads to a grounding in their chosen discipline(s) (for example marketing, strategy, accounting, information systems, organizational behavior, finance, or economics). Students are required to take a comprehensive exam demonstrating adequate knowledge of the field’s theories, research methods, and results. Upon passing the comprehensive exam, students are advanced to candidacy for the PhD. Candidates defend their PhD thesis proposal and the final thesis during their course of study.

Doctoral candidates in the PhD in Management: Designing Sustainable Systems track will undertake full dissertation research during their fourth year of study to extend their contributions to managerial knowledge. Informed by courses in design thinking, sustainability thinking, and complex systems thinking, candidates incorporate human values and appropriate mixed methods of analysis into their research. An original and significant endeavor, the dissertation includes a detailed review of the chosen topic, relevant research questions, methods of inquiry used, and findings obtained, as well as the implications of these findings.

For more information, contact Sue Nartker (http://bulletin.case.edu/weatherheadschoolofmanagement/doctoralprograms/mailto:sue.nartker@case.edu), Managing Director of the DM program, at 216.368.1943; or Marilyn Chorman (http://bulletin.case.edu/weatherheadschoolofmanagement/doctoralprograms/mailto:marilyn.chorman@case.edu), Associate Director of the program, at 216.368.3638.

**PhD in Management**

A PhD in Management offers students the opportunity to develop theory-driven scholarship that is grounded in practice and explores various dimensions of value creation, and to prepare for a career as university faculty member.

Candidates may specialize in one of five areas:

- Accountancy
- Designing Sustainable Systems
- Information Systems
- Labor and Human Resource Policy
- Marketing

**Accountancy**

The PhD in Accountancy program is structured and a student study plan is developed to support high-quality research and effective teaching based upon knowledge and skill levels appropriate to a student’s goals. Doctoral students work with faculty whose research investigates matters of importance to academics, practitioners, and policy makers, in order to influence practice and standard setting in both the private and public sectors.

**Curriculum**

The first two academic years are directed toward the study of the literature, methods, and recent research appropriate to a student’s identified interests. Summer periods are available for individual reading, development, and writing along project lines to be determined by the student’s chair and program committee. This two-year period is expected to provide the foundation for preparing well-developed research papers that exhibit knowledge and skill levels appropriate to an individual’s goals as he or she approaches candidacy.

The third year is devoted to writing focused individual papers leading to a dissertation proposal under the supervision of a study program committee. Based upon one of these high-quality research papers, a suitable dissertation proposal will be prepared by the end of the third year of study. This research and writing activity will not only help to determine the student’s dissertation topic, but will also be considered equivalent to field examinations. The series of papers leading up to the dissertation
proposal, the proposal itself, and an oral presentation to the student’s study program committee will be taken into account as the committee determines whether to grant doctoral candidate status to the student.

The fourth year is focused upon completion of the dissertation. Throughout the program, the student will develop competencies related to classroom and teaching activities as well.

For more information, visit our website (http://weatherhead.case.edu/degrees/phd-management/accountancy) or contact Elaine Iannicelli (http://bulletin.case.edu/weatherheadschoolofmanagement/doctoralprograms/mailto:elaine.iannicelli@case.edu), Department Administrator, at 216.368.4141.

Designing Sustainable Systems

Please refer to the Doctor of Management (p. 948) section of the Bulletin for more information on the PhD in Management: Designing Sustainable Systems.

Information Systems (IS)

The IS Department is a center for learning about the ways in which information is generated and used in organizations. The department believes that a broad, theoretical study of information that includes human, social, and technical aspects will best enable people in organizations to achieve their operational and strategic missions. Design is a central theme of the work in IS because it connotes the critical evaluation of existing practice, the creation of better alternatives, and the changes needed to make new ideas a reality. Some design issues of special importance to the department include information systems that amplify human and organizational intelligence, that enable new forms of knowledge work, and that expand the capability of teams.

The IS faculty ask fundamental questions about how information shapes our social and economic environment. The faculty cares about the design and use of technology and about information as a uniquely human accomplishment. The faculty believes that information systems are an essential driver in creating a better world, and are committed to making that better world happen.

A management discipline engaged in design- and information-based inquiry, IS is influenced by a broad set of concepts from the humanities, social sciences, and engineering. The department studies and designs information-rich socio-technical systems that satisfy human and social needs. The department seeks intellectually curious students whose research interests intersect with the department’s and who possess a solid background in IS or computer science; industrial, service, or interaction design; or related academic areas. Doctoral study of IS at Weatherhead attracts rigorous lateral thinkers who want to shape their environments and build a strong scholarly track record in the Manage by Designing arena.

The PhD program prepares students for a career in research and teaching, primarily in academic institutions. Students work with faculty from IS and other areas of the school and university to tailor the program to their specific interests and previous study, and develop the skills to become competent researchers in their chosen areas of specialization. IS provides a hands-on education, broad exposure to technique, close association with industry, and intensive workshops with senior faculty. The department unites qualitative and quantitative approaches in order for doctoral candidates to derive better practice from theory and better theory from practice.

Weatherhead approaches IS as a global phenomenon and believe that international collaboration is a necessity. The faculty is well known internationally with substantial experience as visiting scholars or consultants in India, Sweden, the United Kingdom, Canada, Finland, Hong Kong, and Denmark.

The PhD program consists of coursework in three areas and a dissertation. Coursework in the following areas is required: management research and methods, IS research, and a specialized area of study. Following the completion of all required coursework, students take a comprehensive qualifying examination, generally during the second Summer Semester or early in the Fall Semester of the third year.

Upon successful completion of the comprehensive qualifying examination, the student is admitted to candidacy and formally begins the dissertation phase of the program. The dissertation proposal and the dissertation itself are generally completed in one and a half to two years. Students making normal progress should expect to finish all degree requirements within four years. Students must remain in residence throughout the coursework portion of the program, and the faculty strongly discourages any student from relocating prior to completion of the dissertation as doing so dramatically reduces the likelihood of completing the degree.

For more information, contact Gail Stringer (http://bulletin.case.edu/weatherheadschoolofmanagement/doctoralprograms/mailto:gailstringer@case.edu), Department Administrator, at 216.368.5326.

Labor and Human Resource Policy

A specialization in labor and human resource policy involves inquiry into the employment relationship and effective use of human assists at the level of work groups, organizations, markets, and societies.

For more information, contact Radhika Easwaran (http://bulletin.case.edu/weatherheadschoolofmanagement/doctoralprograms/mailto:radhika.easwaran@case.edu), Department Administrator, at 216.368.2144.

Marketing

Marketing is fundamentally an organizing logic for creating, communicating, and delivering value to customers. The marketing faculty’s research is primarily around themes of value creation and customer relationship management that address managerially relevant problems in a socially networked service economy. Working closely with faculty, PhD students in marketing develop a plan of study that is tailored to their goals within a structured program. Students build skills for high quality, theory-driven scholarship including rigorous empirical work that influences academics, practitioners, and policy makers. The program emphasizes outcomes and expects doctoral students to develop research papers of publishable quality during each year of the program.

Curriculum

The coursework usually spans five semesters. Students normally carry three courses per semester. Except in extraordinary circumstances, students will only be permitted to commence their programs in the Fall Semester. Following completion of all required course work, students will take a comprehensive qualifying examination. Students in good standing will usually sit for the qualifying exam by the end of the second year or early in the third year of their program, thereby completing all course requirements, except the dissertation proposal and dissertation, in about three years.

Upon successful completion of the comprehensive qualifying examination, the PhD student is admitted to candidacy and formally begins the dissertation phase of the program. Students are required to enroll in a minimum of 18 credit hours of dissertation research while the
dissertation is in progress. The minimum number of total credit hours (dissertation and course credits) is 57. Students are required to complete both their course work and dissertation at the Case Western Reserve campus.

Student Profile
Typical doctoral students have strong quantitative skills, a master’s degree with more than two years’ work experience, and a GMAT score over 650. Student dissertation topics include market-driven innovations, relationship marketing, sales management, service marketing, marketing strategy, frontline marketing, and marketing value chains, among others.

Interested students are encouraged to visit our website (http://weatherhead.case.edu/departments/marketing) and to contact individual faculty to explore mutual interests.

For more information, contact Tedda Nathan (http://bulletin.case.edu/weatherheadschooolofmanagement/doctoralprograms/mailto:tedda.nathan@case.edu), Department Administrator, at 216.368.2144.

PhD in Operations
The intrinsic complexity of supply chain organizations and the coordination of operational and financial decisions throughout the supply chain are at the heart of the PhD in operations research. Weatherhead’s Operations Department has a rich history as a center of education and scholarship—it was here that the world’s first doctorate in operations research was granted. Candidates learn a unique combination of mathematics, statistics, and computer modeling to assist in decision-making for complex organizational problems.

Please note that the Operations Department is not accepting new PhD candidates for academic year 2012-2013. For more information, contact Radhika Easwaran (http://bulletin.case.edu/weatherheadschooolofmanagement/doctoralprograms/mailto:radhika.easwaran@case.edu), Department Administrator, at 216.368.2144.

PhD in Organizational Behavior
Weatherhead’s doctoral program in organizational behavior was the first of its kind. Created in 1964, it continues to set the standard for universities worldwide in this discipline. United by a passion for generating new knowledge of enduring consequence through scholarly inquiry, writing, and research, and deeply reflective practice, doctoral candidates study in a department that the Financial Times ranked among the three best in the world.

Recipients of the PhD in organizational behavior have taken positions throughout the globe in leading business schools, think tanks, and research-oriented nongovernmental organizations, including such prestigious organizations as the London School of Business, Columbia University, Stanford University, the Naval Postgraduate School, Notre Dame University, the World Bank, and the White House.

Organizational behavior is a vital and growing field of knowledge that is concerned with relational and developmental processes across levels of analysis, ranging from individuals and groups, through organizations and inter-organizational systems, to societal change and development. The academic roots of the field span the disciplines of individual and social psychology, sociology, anthropology, political science, and social philosophy. Organizational behavior situates the knowledge and tools of those disciplines in the context of the human dimensions of organizational life.

We approach the study of organizational behavior from the perspectives of human diversity and possibility, with a special concern for the dynamics and processes of adult development and for creating new knowledge and methods for individual, group, and organizational processes of learning, innovation, performance, and transformation.

Educational Goals
• Obtain a doctoral-level foundation in academic areas pertinent to organizational behavior, from the micro to the macro. This interdisciplinary course of study covers key social science domains including developmental psychology, sociology, learning theory, group dynamics, organization theory, living systems theory, and the organizational dimensions of global change.
• Master and blend qualitative, quantitative, and action-research methodologies in the quest for comprehensive and penetrating understanding
• Develop a high level of professional creativity, interpersonal competence, and a foundation of professional values enabling the pursuit of research and action in the field, including the facilitation and design of contexts for human development and self-reflective learning, organization development, and larger-system transformative change

Curriculum
The doctoral program is structured to align with the department’s mission of developing world-class researchers interested in doing high-quality work of enduring consequence. Hence, course requirements encourage continual development of reading, writing, relational, and research skills to help students effectively explore and seamlessly communicate their ideas.

Total Units in Sequence: 48

The program is designed for full-time, year-round engagement for four years. Although some students choose not to maintain local residence in
latter stages of the dissertation and to complete it more slowly, the PhD in organizational behavior is designed and supported as a four-and-a-half to five-year journey.

For the first two years, in addition to the methods courses and departmental "modules" (worth one credit hour each), there is a weekly Organizational Behavior Department Seminar designed to create and sustain an appreciative, intellectually nourishing learning space for the organizational behavior community. The Organizational Behavior Department Seminar is organized and managed by the first- and second-year PhD students in close relationship with the course instructors, and is required for both the first- and second-year cohort groups. Seminar sessions alternate between first- and second-year student meetings and gatherings of the organizational behavior community of students and faculty from within and outside the department. The seminar provides a forum for sharing the ongoing research and scholarship of the department through preparation and presentation of Integrative Scholarship Papers, Qualifying Papers, dissertation proposals, and dissertation defenses. It is also a platform for developing productive and collaborative research relationships and for increasing collective knowledge of the current state of the art in organizational behavior and related fields.

Research Requirements and Deliverables
The first two years of the PhD are devoted to coursework. This provides a strong theoretical foundation for conducting research throughout the remainder of the program.

Integrative Scholarship Paper
At the end of the first year, each doctoral student is required to have completed an Integrative Scholarship Paper. This is a critical review and integration of the literature about a topic or problem of interest. It can be thought of as a report on the current state of the scholarly conversation about the topic, encompassing historical perspectives on the evolution of the scholarly conversation to date, an examination of how the topic is approached by different disciplines or schools of thought, theoretical propositions, and suggestions for future research. Students are expected to work with a faculty advisor with support from other faculty and doctoral students to submit their Integrative Scholarship Papers for journal publication during the second year of the doctoral program.

Qualifying Paper
By the conclusion of their second year or the beginning of their third year in the doctoral program, students complete a Qualifying Paper. Generally, this is an initial empirical investigation or meta-analysis of a topic of choice. The student is expected to form a committee, headed by a faculty advisor of the student’s own choosing, and two other departmental faculty members who guide the research. Often understood as a "mini-thesis," the student is expected to produce an in-depth analysis of the research question explored through a relevant method of inquiry. Students are expected to submit their Qualifying Papers for journal publication during the third year of the doctoral program.

Dissertation
Doctoral students undertake dissertation research during their third and fourth years in the program. Each student forms a committee consisting of three departmental faculty members (one of whom will be the committee chair) and one faculty member from outside the department, but within the university, to guide the research conducted. An original and significant endeavor, the dissertation includes a detailed review of the chosen topic, relevant research questions, methods of inquiry used, findings obtained, and an analysis of their implications.

Though all three deliverables (the Integrative Scholarship Paper, Qualifying Paper, and dissertation) may optimally flow within a single stream of inquiry, the student is free to choose a different topic of interest for each.

For more information, contact Lila Robinson (http://bulletin.case.edu/weatherheadschoolofmanagement/doctoralprograms/mailto:lila.robinson@case.edu), Department Administrator, at 216.368.2055.
Dual Degree Programs

MBA/Juris Doctor (JD) Dual-Degree Program

Weatherhead has a formal full-time dual-degree program with the School of Law. Students enrolled in the program who fulfill the requirements set for graduation by both schools will receive both a JD and an MBA degree. The MBA/JD dual-degree program is designed for individuals who want to specialize in the legal, contractual, and governmental aspects of management. After completion of both degree programs, two separate diplomas are awarded. Coursework for both programs must be completed within six years of the date of initial enrollment in either program.

To learn more, contact Weatherhead at 216.368.2030 or bizadmission@case.edu, or the School of Law at 216.368.3600 or msadmit@case.edu.

MBA/MD Dual-Degree Program

The School of Medicine and Weatherhead collaborate to offer the dual MBA/MD degree program. The MBA/MD provides physicians with the management knowledge and skills necessary to deal with rapid changes in the healthcare industry and the economy. Students are expected to take one full year of study in one program followed by one full year of study in the other. The completion of the remaining MBA credit requirements will be determined in partnership with the student’s society dean and the Full-Time MBA Program Director. Throughout the dual-degree program, MBA/MD students continue to register in the first school they attended. After completion of both degree programs, two separate diplomas are awarded. Coursework for both programs must be completed within six years of the date of initial enrollment in either program.

To learn more, contact Weatherhead at 216.368.2030 or bizadmission@case.edu, or the School of Medicine at 216.368.3450 or msadmit@case.edu.

MBA/Master of Global Management (MGM) Dual-Degree Program

Weatherhead and the American Graduate School of International Management (the Thunderbird School) jointly offer a graduate-level program in both management and international studies. Prospective students who are interested in applying to the dual MBA/MGM program offered by Weatherhead and the Thunderbird School should apply separately to each school. (Applicants to Weatherhead should indicate their interest in the MBA/MGM in the appropriate area under “Intended Program” at the bottom of the first page of the Weatherhead MBA application.) The admissions committees of each institution will maintain independent control over their admissions criteria and procedures. Students must be admitted separately to each of the programs. Admission to one school does not guarantee admission to the other.

To learn more, contact Weatherhead at 216.368.2030 or bizadmission@case.edu, and contact Thunderbird at 602.978.7131 or admissions@t-bird.edu (http://bulletin.case.edu/weatherheadschoolofmanagement/dualequals/mailto:admissions@t-bird.edu).

Master of Science in Social Administration (MSSA)/MBA Dual-Degree Program

The MSSA/MBA joint program is offered in partnership with the Mandel School of Applied Social Sciences (MSASS) and Weatherhead. The MSSA/MBA is designed for candidates who wish to prepare for advanced social work practice in a variety of direct practice and community and social development settings, while developing the skills to assume management responsibility within those settings. Candidates must apply separately to each program.

To learn more, contact Weatherhead at 216.368.2030 or bizadmission@case.edu, or MSASS at 216.368.2280 or msassadmit@case.edu.

MBA/Master in Public Health (MPH) Dual-Degree Program

The dual MBA/MPH degree was developed by the School of Medicine, the School of Graduate Studies and Weatherhead to provide the skills and knowledge necessary for those who wish to attain the following goals:

- A career working with communities to improve the health of their members by identifying and assessing the health needs of the population and planning and implementing programs to meet those needs
- Management and leadership ability to ensure continued economic viability, human development, and effective communication for the public health organization and community in which they practice

MBA/MPH candidates must complete separate applications, participate in the required admission tests, and be admitted separately to each program. Students will continue to register throughout the program in the school where they first registered.

To learn more, contact Weatherhead at 216.368.2030 or bizadmission@case.edu, or the School of Medicine at 216.368.3725 or info@casemph.org (http://bulletin.case.edu/weatherheadschoolofmanagement/dualequals/mailto:info@casemph.org).

Weatherhead MSM-Finance and Tongji University MBA Double-Degree Program

Weatherhead and the School of Economics and Management at Tongji University (SEM-Tongji) have jointly developed a double-degree program. This is the first master’s degree in finance offered by a world-class U.S. university in mainland China. This innovative program, taught in Shanghai and Cleveland, provides students with both broad general management skills and depth of knowledge in finance. Graduates come away with a global way of thinking and the latest insights on the Asian financial market.

Upon graduation from the program, students will obtain both the MSM-Finance degree from Weatherhead and the MBA degree from SEM-Tongji. Students take 10 SEM-Tongji MBA courses and 13 Weatherhead MSM-Finance courses.

Program Features

- Obtain the first MSM-Finance degree offered from a highly ranked U.S. university in mainland China
- Gain cutting-edge knowledge and skills in global finance
- Take advantage of the opportunity to prepare for CFA, FRM, and other certifications
- Specialize in corporate finance, risk management, and capital markets
- Network with financial sector players in the U.S.; intern in Shanghai’s Lujiazui/Pudong international finance and trade area
To learn more, contact Yuan Wu (http://bulletin.case.edu/weatherheadschoolormanagement/dualdegrees/mailto:yuan.wu@case.edu) at 216.368.2077.
Honors and Awards

Graduate Student Leadership Awards

All Weatherhead graduate students, faculty, and staff may nominate graduating students for the student awards. Finalists are chosen from among the nominees, and recipients are elected by graduating students.

The **Rita Kicher Award** is presented to a graduating part-time student at Weatherhead. The award recipient is recognized as an outstanding colleague in Cleveland’s professional community by his or her peers and supervisors, is an active member of community nonprofit organizations, contributes to one or more professional societies or organizations, demonstrates leadership qualities, and promotes Weatherhead in a positive way.

The **Scott S. Cowen Student Leadership Award** is presented to a Weatherhead graduate student who serves as a leader and role model for all students. The recipient promotes the Weatherhead image in a positive way, contributes to the total community, and stimulates the classroom experience.

The **Student Life Award** is presented to a Weatherhead graduate student who actively participates in and supports Weatherhead student activities and events; encourages and supports student participation in student life activities; and creates, revitalizes, or provides added value to Weatherhead student organizations, activities, or programs.

The **Theodore M. Alfred Distinguished Service Award** is presented to a Weatherhead graduate student who participates in community service inside and outside of Weatherhead, brings community service opportunities to Weatherhead, and promotes external service opportunities.

Awards presented independent of nominations are:

- The Dean’s Academic Achievement Award to those students attaining the highest GPA in their respective programs

- Beta Gamma Sigma - Master’s students graduating in the Spring, who are in the top 20 percent of their graduating class (Summer, Fall and Spring graduates), are invited to join the semester they complete their program. Master’s students graduating in the Summer and Fall, who are in the top 20 percent of their graduating class (Summer, Fall and Spring graduates), are invited to join the Spring semester following completion of their program. Doctoral students graduating in the Spring are invited to join the semester they complete their program. Doctoral students graduating in the Summer and Fall are invited to join the Spring semester following completion of their program.
Master of Business Administration (MBA)

Full-Time MBA

The Full-Time MBA is a four-semester, 69-credit program. The Weatherhead experience starts where many MBA programs end up: in conversation with top executives. Weatherhead’s first-year Management Perspectives and Dialogues course brings business leaders into the classroom, where they work on real management issues with the help of students. Students also complete a leadership development course that puts them in touch with their strengths and identifies areas that can be improved through a personal learning and career plan. And during their second year, candidates are immersed in studio-based design or sustainability courses; the MBA Institute in Sustainable Value was touted in Forbes as one of the 10 most innovative business school courses, while Businessweek named the Weatherhead School of Management MBA as one of the 30 best design programs in the world.

Electives

The second year of the program allows students to customize their academic program by selecting eight electives.

Independent Study

MBA students are limited to six credit hours of elective credit as independent study. Any student wishing to take more than six credit hours of independent study must petition the Faculty Director of the Full-Time MBA.

Other courses at the university may be eligible for MBA elective credit. Contact the Faculty Director of the Full-Time MBA for additional information.

Curriculum

All of the core courses in the following tables are required.

<table>

Total Units in Sequence: 69

Either the year-long course Design in Management: Concept & Practices or the year-long course MBA Institute in Sustainable Value and Social Entrepreneurship is required. Students must take both semesters of either Design in Management: Concept & Practices or MBA Institute in Sustainable Value and Social Entrepreneurship. Students may take both semesters of both courses, but they may not change courses mid-year, taking Design in Management: Concept & Practices in the fall followed by MBA Institute in Sustainable Value and Social Entrepreneurship in the spring, for example.

Cleveland Clinic Health Management Scholars Program

Cleveland Clinic has joined forces with Weatherhead to create the Health Management Scholars Program. This innovative partnership gives four students the unique opportunity to participate in Weatherhead’s Full-Time MBA program and in a specialized Experiential Learning assignment at the Cleveland Clinic. Qualifying scholars will also receive the following benefits:

• Partial tuition scholarship
• Prestigious paid summer internships at Cleveland Clinic

For additional information about this program, contact Deborah Bibb (http://bulletin.case.edu/weatherheadschoolofmanagement/mbaprograms/mailto:deborah.bibb@case.edu), Senior Director of Admissions, at 216.368.6702.

Part-Time MBA

The Weatherhead Part-Time MBA is a 48-credit-hour, three-year cohort-based program that combines a core of fundamental business classes with elective options to create an integrated experience focused on honing general management skills. Students develop a personalized learning plan through the MBAP 401 Leadership Assessment and Development (LEAD) course.

A Leadership Speaker Series provides an opportunity to hear from a variety of executives who bring current business experience to the classroom. Classes meet one evening a week and one Saturday a month in the Fall and Spring Semesters. Summer Semesters may include more intensive formats.

The Part-Time MBA program also features cutting-edge classes in applying design ideas to management issues and in understanding sustainable business practices. These classes will help students break from the norm of viewing every challenge through the standard spreadsheet-based prisms common to so many MBA programs.

The first Summer Semester begins with the intensive offering of LEAD and moves through the rest of the core offerings within the first two years of the program. The majority of the third year is devoted to electives.

Curriculum

Students attracted to the Weatherhead EMBA aspire to senior leadership roles within organizations. The curriculum opens horizons, fusing that aspiration with Weatherhead’s expertise in turning good leaders into great ones. At every stage in the program, students build their knowledge of how business works while strengthening their personal leadership capacity. Each course is taught in the format that best facilitates learning its content. For instance, each of the four levels of leadership (individual, team, organization, and society) is explored in a one-week immersive format, while some quantitative courses extend over two semesters.

requiring only 12 total residencies on campus, the 57-credit-hour Weatherhead EMBA program is designed to be manageable for busy executives, allowing students from around the world to participate in a one-of-a-kind leadership program. The curriculum is delivered over five semesters, or 21 months. Both Fall and Spring Semesters are comprised of a one-week immersion and two 3-day residencies. The Summer Semester is delivered abroad through the EMBA 475 International Tour. The EMBA requires a serious time commitment from each participant. Although individual study habits vary, students should anticipate devoting a minimum of 20 hours per week to study outside of classes.

The Weatherhead EMBA is a lock-step cohort program. Participants self-select learning teams which represent essential study partnerships over the course of the program as well as invaluable resources for networking and organizational support. Learning teams meet weekly outside of the classroom, either face-to-face or remotely, to achieve course objectives and enhance the learning experience. In addition, faculty often host optional study and review sessions, which are also recorded for virtual access.

Executive MBA (EMBA)

For candidates with 10 years of experience and the endorsement of their organization, the Executive MBA (EMBA) is tailored to those poised to move into a more prominent leadership role. Indeed, the Organizational Behavior Department (which the Financial Times named as one of the three best worldwide) structured the EMBA around an exploration of the four levels of leadership, amplifying students’ ability to effect change at the personal, team, organization, and societal levels. The program is based around periodic residencies in the company of intimate cohort groups.

Open Electives

Students in the Part-Time MBA program have the opportunity to choose four electives. Students determine their own focus areas and, with the help of our Career Management Office, learn how to best position themselves for post-MBA career advancement.

Non-cohort Students

Non-cohort part-time students are those who entered the Part-Time MBA program in Fall Semester 2009 or prior, transferred in during Summer Semester 2010 or prior, or transitioned from non-degree to degree-seeking status prior to Fall Semester 2010. Non-cohort students must complete 48 credit hours, consisting of 10 core required courses and 6 electives. The 48 hours must be completed within six years of starting the program.

For additional information about this program, contact Tony Lingham (http://bulletin.case.edu/weatherheadschoolofmanagement/mbaprograms/mailto:tony.lingham@case.edu), Faculty Director of the Part-Time MBA, at 216.368.2138.

Wealth climate EMBA program is designed to be manageable for busy executives, allowing students from around the world to participate in a one-of-a-kind leadership program. Master's Programs

Master of Accountancy (MAcc)
The MAcc program at Weatherhead is designed for individuals who seek to obtain an advanced degree which builds upon the skills and knowledge acquired in an undergraduate degree in accountancy. The program is fully accredited and provides professional education by very highly qualified faculty members. In an increasingly competitive business environment, the MAcc program provides students with an important foundation for long-term success and sets graduates apart from their colleagues.

Undergraduate accounting students at Case Western Reserve are strongly advised to enter and complete the MAcc program in their fifth year. University policies permit such students an opportunity to complete their master's degree in 30 credit hours, rather than 36, if course selection is properly planned. Also, certain highly qualified students in accounting may be eligible to accelerate their completion of the Bachelor of Science (BS) in Accounting and the MAcc through an Integrated Study (p. 970) program. This program allows such students to enroll as both an undergraduate and a graduate student during the senior year. Because of the necessity for proper planning of course work and programs, undergraduate students are strongly encouraged to begin planning early and apply for the MAcc in the junior year.

Most candidates for the MAcc program have an academic background in accountancy, but this is not required for admission. If not completed during a candidate's undergraduate coursework, an admitted student must complete specific accounting and general business coursework before or during the MAcc program.

Prerequisites
Because the program builds upon skills and knowledge developed in an undergraduate accountancy program, all admitted candidates must complete certain prerequisite courses in accounting and business before or during the MAcc program. Prerequisites include:

- An undergraduate degree from an accredited institution or the equivalent. Please note that an undergraduate degree in accountancy is not required.
- A grade of B or better in prerequisite business and accounting courses completed at an accredited four-year educational institution or the equivalent. Prerequisites may be completed before or during the MAcc program.

General Business Prerequisites
- Corporate Finance
- U.S. Business Law
- Operations Management
- Marketing
- Principles of Economics (Micro and Macro)
- Statistics

Accountancy Prerequisites
- Principles I and II (must include a semester of managerial accounting)
- Intermediate Financial Reporting I and II
- Advanced Financial Reporting
- Auditing
- U.S. Taxation

Curriculum
The 36-credit-hour MAcc program offers the flexibility of beginning in the Fall or Spring Semester. Upon completion of the program, graduates will have satisfied all educational requirements to sit for the CPA examination in the state of Ohio.

Core Courses
These courses build a foundation for the program.

Supporting Electives
In consultation with the graduate program advisor, MAcc students select four electives (12 credit hours) in areas that complement a professional accountancy career. As an option to fulfill a portion of the supporting elective courses, students are encouraged to consider completing a second accounting concentration. Supporting elective courses must be selected from graduate management courses other than MBA core courses and prerequisite-level courses.

Total: 36 credit hours

For more information about the MAcc, contact Tiffany Welch (http://bulletin.case.edu/weatherheadschoolofmanagement/masterprograms/mailto:tiffany.welch@case.edu), Assistant Dean of Curriculum and Administration, at 216.368.2058.

Master of Science in Management-Finance (MSM-Finance)
The Master of Science in Management-Finance (MSM-Finance) degree is an intensive program designed to equip students to meet the needs of financial-sector companies in today’s intense and competitive business climate. Upon completion of the program, students will be prepared to pursue a number of exciting career opportunities in the fields of investment banking, private equity, corporate finance, risk management, commercial banking, investment management, corporate development, and financial advising.

Weatherhead’s distinctive program prepares students to make immediate and skilled contributions to corporate finance, financial modeling, valuation, derivatives, risk management, and financial econometrics. Candidates learn from and work directly with A-list
faculty whose hands-on involvement with students is a point of pride at Weatherhead; meanwhile, Weatherhead’s Cleveland location is home to the Federal Reserve Bank of Cleveland and to a number of corporate headquarters. The program can be completed in 15 months, and internship opportunities are available on a competitive basis.

Upon completion of the MSM-Finance program, students will:

- Be prepared to add expected and immediate industry value
- Speak and understand the languages of business
- Have a working knowledge of focused financial theory
- Have a network of regional, national, and international business contacts

Curriculum

The 39-credit-hour MSM-Finance program is a three-semester, full-time curriculum beginning in the Fall Semester.

The curriculum is comprised of the following four components:

Finance Core

The Finance Core provides students with advanced tools and techniques to serve as a strong foundation for a career in finance.

<table>
<thead>
<tr>
<th>Course</th>
<th>Units</th>
</tr>

Total for degree: 39 credit hours

For more information, contact CNV Krishnan (http://bulletin.case.edu/weatherheadschoolofmanagement/masterprograms/mailto:cnk2@case.edu), PhD, Deborah and David Daberko Faculty Fellow, Associate Professor of Banking and Finance, and Faculty Director of the MSM-Finance program, at 216.368.2116.

Master of Science in Management in Operations Research and Supply Chain Management (MSM-OR/SC)

The MSM-OR/SC degree is designed for individuals with quantitative training who seek to obtain a position in operations management or a management position in manufacturing, service, or consulting firms that are part of sophisticated national or global supply chains. The MSM-OR/SC curriculum provides students with the fundamentals of business as well as depth and focus in the principles and concepts of operations and supply chain management. This unique program produces highly knowledgeable professionals well prepared to make organizations more efficient and competitive.

The MSM-OR/SC degree attracts individuals with a quantitative undergraduate degree who have an interest in gaining expertise in the field of operations research or supply chain management. Typical undergraduate majors include:

- Engineering
- Statistics
- Computer science
- Economics
• Mathematics
• Business

Students beginning this program must have a working knowledge of undergraduate calculus, including differentiation and integration, and one semester of undergraduate linear algebra. Work experience is beneficial but not required for admission; many students pursue the MSM-OR/SC immediately following the completion of their undergraduate degree.

Outcomes

Upon completion of the MSM-OR/SC program, students will:

• Be equipped with analytical and supply chain skills to become an agent of positive change at their organization within the first few years of work
• Speak and understand the languages of business
• Have a working knowledge of all functional areas of an organization and the ability to communicate effectively with colleagues in these areas
• Have a network of regional, national, and international business contacts

Curriculum

The 39-credit-hour MSM-OR/SC is a three-semester, full-time program beginning in the Fall Semester of each year. The curriculum comprises the following three components:

Business Core (9 credit hours)

The Business Core introduces students to business fundamentals and includes a professional development course, a unique feature of the Weatherhead MSM-OR/SC not found in most competitors’ programs.

For more information, contact Kamlesh Mathur (http://bulletin.case.edu/weatherheadschoolofmanagement/masterprograms/mailto:kamlesh.mathur@case.edu), PhD, Chair and Professor of Operations and Faculty Director of the MSM-OR/SC, at 216.368.3857.

Master of Science in Positive Organization Development and Change (MPOD)

The Master of Science in Positive Organization Development and Change (MPOD) is a relatively new program created and offered by the Department of Organizational Behavior at the Weatherhead School of Management. It is specifically geared toward the needs of managers and change agents from a wide variety of organizations that face a torrent of continual change, increasing complexity, and growing interconnectedness in multi-cultural contexts, and must respond in ways that will yield economic value while being environmentally sustainable and socially responsible.

Toward these ends, the MPOD program emphasizes strength-based and positive approaches to managing change, designing sustainable institutions, formulating effective strategy, creating high engagement work cultures, leading through Emotional Intelligence, coaching for high performance, and deep personal and professional development. It will be of value to organizations with aspiring managers who wish to:

• Build new capabilities in strategic-level change management for value creation with customers and communities
• Broaden their knowledge of leading-edge theory and practice in Appreciative Inquiry, strength-based human resource development, and positive organizational change research
• Develop the competencies and the Emotional Intelligence to coach and foster leadership skills and personal character in oneself and others
• Form extraordinary teams and Sustainable Enterprises—ones that enable human flourishing, are economically prosperous and ecologically advanced, and unite strengths with aspirations
• Engage in lifelong Experiential Learning to realize, develop, and model themselves as agents for positive change

The MPOD program is grounded in the basic belief that a person can be a powerful instrument for change, and that personal and professional development go hand in hand. The learning experience will involve experiential opportunities for participants to become more self-aware, to practice and experiment with new skills, and to give and receive coaching that can be life-changing.

Curriculum:

The MPOD program is conducted in five 7-day residencies and one 10-day international tour spread over 18 months. The modules are conveniently spaced 10-12 weeks apart—thereby making the program flexible enough to accommodate the busy schedules of leaders, managers, and staff professionals. This design will enable students to attend school without leaving their employment. The intervening periods...
(between program residencies) will involve project and group work, self-study, assignments, reading, and on-line guidance done in collaboration with the faculty at CWRU.

One of the uniquely rewarding aspects of the MPOD program is the 10-day international study tour. Students will travel as a cohort to Katholieke University in Leuven, Belgium, to learn with students from their Certificate of Continuing Education program in Consultancy in Groups and Organizations (CIGO), and to Ashridge University Business School, Berkhamsted, U.K., to study alongside peers in the Ashridge Masters in Organisation Consulting (AMOC) program.

**Major Course Topics:**
- Foundations of Positive Organization Development and Change
- Organization Design for a Knowledge World
- Leadership and Executive Assessment and Development
- Sustainability for Strategic Advantage
- Building the Sustainable Enterprise
- Experiential Learning for Individuals, Teams, and Organizations
- Practicum in Appreciative Inquiry and Positive OD
- Individual Field Project
- Foundations of Strategic Thinking
- The Dynamics of Effective Consulting and Implementation
- Global Citizenship and Multi-Cultural OD: International Study Tour

**International Study Tour**

For more information, please contact Patricia Petty (http://bulletin.case.edu/weatherheadschoolofmanagement/masterprograms/mailto:patricia.petty@case.edu), Program Manager of the MPOD, at 216.368.4642.

**Master of Nonprofit Organizations (MNO)**

This program is not currently accepting new students.

**Master of Engineering and Management (MEM)**

In industry, the work of engineering and business management cannot be done independently. That is why the Case School of Engineering and the Weatherhead School of Management have pooled resources via The Institute for Management and Engineering (TiME) to offer a fully integrated master’s degree that can be completed in three semesters. Graduates of the MEM program possess skills critical to success in a leadership role, require less management training, and contribute effectively to engineering organizations within their first year on the job.

Additional information regarding the MEM program (p. 9) is available in the Case School of Engineering section of the Bulletin.
Policies

Registration and Academic Standards for Graduate Students

Class Attendance

Students are expected to attend all scheduled class meetings for the courses in which they are registered. Students should notify faculty when they are forced to miss a class because of extenuating circumstances. Faculty should report excessive absences to the program's faculty director. Students who are not on the class roster for a course are not permitted to attend the course.

Course Loads

The university requires students to be registered for a minimum of 9 credit hours to maintain full-time student status. Weatherhead requires students to register for and complete courses as specified in their cohort program curriculum plan to continue in their program and maintain any scholarship granted. Failure to adhere to the program curriculum plan may result in separation from the program.

Part-Time MBA cohort students register for between 3 and 7.5 credit hours per semester. Non-cohort part-time students are those who entered the Part-Time MBA program in the 2009 Fall Semester or prior, transferred in during the 2010 Summer Semester or prior, or transitioned from non-degree to degree-seeking status prior to the 2010 Fall Semester. Non-cohort students must complete 48 credit hours, consisting of 10 required courses and 6 electives. The 48 hours must be completed within six years of starting the program.

MNO students are required to follow the completion plan as signed with the program director. All requirements for the MNO degree must be completed within six years from the day of the student’s initial registration.

Course Registration

A student may enroll during each registration period through the last day of late registration, as set by the official university calendar (http://www.case.edu/provost/registrar/calendars/5year.html). Exceptions will be granted only upon the recommendation of the dean of Weatherhead. A fee of $25 is charged during the late registration period.

To register, students must have a clear balance unless they are participating in the Bridge Loan Program. In this case, a company tuition reimbursement letter must be submitted. Students register online using the Student Information System (SIS). Students who wish to apply for federal loans should visit the FAFSA website (http://www.fafsa.ed.gov).

During any semester, a student may not register in more than one career in SIS, unless the student is in a dual-degree program.

If at any time a student fails to register in two consecutive semesters, excluding the summer session, the student must reapply for admission to Weatherhead, unless prior approval was granted by the Weatherhead Registrar.

Degrees Conferred

Case Western Reserve grants degrees to qualified candidates three times per year: in August, for students who complete their programs during the Summer Semester; in January, for students who complete their programs during the Fall Semester; and in May, for students who complete their programs during the Spring Semester.

There is only one diploma (http://case.edu/commencement) exercise each year, in May, and all candidates are invited to march at this ceremony, regardless of the month in which their degree was awarded. May degree candidates receive their diplomas the day of the ceremony. May degree candidates who do not participate in the ceremony can choose to have their diploma mailed to them or collect it at the Weatherhead registrar’s office. January and August degree recipients can have diplomas mailed or held for pick up. Students may not receive diplomas prior to the date on which the degree is to be granted.

Extra Assignments

No student is permitted to do extra assignments beyond the work assigned to all students in a course, in order to obtain a higher grade. This policy applies to changing an I grade to a regular grade, or to changing one regular grade to another. However, faculty may replace or substitute assignments for individual students in a course, based on extenuating circumstances.

</tr>
</tbody>
</table>

Grade of Incomplete (I)

The grade I is assigned at the discretion of an instructor, provided that two criteria are met:

- There are extenuating circumstances, explained to the instructor before the assignment of the grade, which clearly justify an extension of time beyond the requirements established for other students in the class. It is the student’s responsibility to notify the instructor of the circumstances which prevent completion of the course.
• The student has been passing the course and only a small segment of the course, such as a term paper, remains to be completed, for which the extenuating circumstances justify a special exception.

In order to receive credit for an I, the student must complete the work by the date specified by the instructor, and no later than the end of the next regular semester (Fall or Spring Semester).

In the absence of notification or adequate justification, the I will automatically change to F or NP (depending on the grading basis for the course) on the stated deadline.

If the student wishes to petition to extend a grade of I beyond the stated deadline, the student must obtain approval from the faculty member who assigned the I, and from the program’s faculty director, before the deadline. A request must be made in writing, preferably via email, and convey (a) the extenuating circumstances justifying the extension and (b) the expected date of completion of the work. If approved, the request should be initiated by the faculty member and delivered by the student to the faculty director for approval and then to the Weatherhead registrar. Failure to complete course requirements by the extended date will result in a grade of F or NP, depending on the grading basis for the course.

Graduation Requirements

A cumulative GPA of 2.5 in all graduate courses taken for credit in the MBA, EMBA, MSM-Finance, MPOD, MSM-OR/SC, or MAcc degree programs is required for graduation. Candidates must submit an application for graduation in SIS no later than two months before the graduation date at which their degree is expected to be awarded. The candidate is responsible for filing the application. Upon receipt of the student’s application, the Weatherhead registrar will verify the student’s eligibility for graduation at the anticipated date. Students are advised to contact the Weatherhead Registrar’s Office (mailto:wsomregistrar@case.edu) if they have any questions regarding requirements for graduation.

Leave of Absence

If a student will not be taking classes for more than one semester, the student should request a one-year leave of absence. Approval for any leave of absence from a degree program must be requested in writing by the student. This request for approval should be submitted to the faculty director of the program and the Weatherhead registrar. Unapproved interruption in the program sequence constitutes separation from the program.

Retroactive leaves of absence are not permitted. Students who fail to return upon completion of a leave of absence need to re-apply to the degree program. Students must graduate within six years from the start of their first semester at Weatherhead. A leave of absence does not extend the maximum time permitted for the completion of degree requirements. A leave of absence cannot be taken if students are on an approved extension of the time limit to complete their degree.

Registration

Students generally register for classes and make changes to their schedule using SIS. Step by step information on registering for classes is available online (http://www.case.edu/registrar/sisuserguides/SIS_SC_Enroll.pdf). For assistance with this process, students must contact the Weatherhead Registrar (http://bulletin.case.edu/weatherheadschoolofmanagement/policies/mailto:wsomregistrar@case.edu) at 216.368.5900 before the last day of the drop/add period.

Residency

For the EMBA program:

In-person presence at each residency is critical for success in the EMBA program. Students are expected to attend each residency and each class. If unavoidable absences arise, these should be approved in advance, and accommodation should be reached with the faculty member(s) in question to make up the content. In addition to regularly-scheduled classes, students can expect to attend frequent meetings with small groups formed at the outset of the program.

For the MPOD program:

In-person presence at each residency is critical for success in the MPOD program. Students are expected to attend each residency and each class, and to participate throughout the program with classmates in small groups, team projects, and practicums. If unavoidable absences arise, these should be approved in advance, and accommodation should be reached with the faculty member(s) in question to make up the content.

Retention Requirements

All students are required to follow their curriculum plan and graduate with their cohort. If at any time a student fails to register in two consecutive semesters, excluding the summer session, the student must reapply for admission to Weatherhead, unless prior approval was granted by the Weatherhead Registrar.

For the MBA, EMBA, MSM-Finance, and MSM-OR/SC degree programs:

• A cumulative GPA of 2.5 is needed to maintain good standing.
• A cumulative GPA below 2.5 will result in probation.
• A cumulative GPA below 2.5 in two different semesters will result in separation from the program.
• An earned F received in any class will result in separation from the program.
• If a student receives a grade of D in a required class, the student must pass a proficiency exam in order to continue and graduate. The student must take and pass the proficiency exam before the start of the next semester. If the student passes the proficiency exam, a grade of C will appear on the transcript. Failure to obtain a C will lead to separation from the program. If the GPA of a student on probation is low enough to remain below 2.5 regardless of a C grade earned in a proficiency exam, the student will not be allowed to take the exam and will be separated from the program.

For MAcc and MPOD degree programs:

• A cumulative GPA of 2.5 is needed to maintain good standing.
• A cumulative GPA below 2.5 will result in probation.
• A cumulative GPA below 2.5 in two different semesters will result in separation from the program.
• An earned F received in any class will result in separation from the program.

For the MEM program:

• Students must maintain an overall GPA of 2.75 to remain in the program.
• Any student admitted to the program on a conditional basis must demonstrate a minimum GPA of 2.75 in the first semester (the Summer Semester) to continue.
A student will be placed on academic probation after any semester in which the minimum GPA is not attained. A student who is on academic probation in a particular semester will be allowed one additional semester to attain the minimum GPA in order to continue in the MNO program.

Transcripts
Case Western Reserve considers grades and other information about a student’s performance at the university to be a private matter and will release such information to the student only upon written request. Transcripts will not be issued to or on behalf of a student who has not discharged all financial obligations to the university. Transcripts are issued by the University Registrar’s Office. Requests can be made online (http://www.case.edu/registrar/transcripts.html) or in person or by mail using this form (http://www.case.edu/registrar/forms/transreq.pdf).

Transcripts of work completed at other institutions will not be released to the student or other third parties.

Transfers and Waivers
No transfers, waivers, or substitutions are accepted for Full-Time MBA, EMBA, MPOD or MAcc. For the MSM-Finance and MSM-OR/SC:

Upon approval of the Faculty Program Director, MSM-Finance and MSM-OR/SC students may substitute up to 9 credit hours of coursework if comparable CWRU courses have been completed.

For the Part-Time MBA:

Students who entered the program in Fall 2011 and after may transfer 6 credit hours of prior course work from an AACSB-accredited university to replace elective classes only with approval from the faculty director and the Weatherhead Registrar. No course in which the student received a grade lower than a B will be accepted.

Non-cohort part-time students who entered the Part-Time MBA program in the 2009 Fall Semester or prior, transferred in during the 2010 Summer Semester or prior, or transitioned from non-degree to degree-seeking status prior to the 2010 Fall Semester must complete the Petition for Transfer Credit Form and required accompanying documents (a current course description and the course syllabus). Core courses are not eligible for transfer credit. Transfer course approval is required from the Weatherhead Registrar, the Faculty Program Director, the Department Chair and the Dean’s Office. Contact the Weatherhead Registrar’s Office for the Petition for Transfer Credit Form. (Online courses are not eligible for transfer credit to Weatherhead.) If a transfer credit request is approved, upon completion of the course, it is the student’s responsibility to provide the Weatherhead Registrar’s Office with an official transfer transcript. Official transcripts are transcripts received in a sealed envelope directly from the transfer institution. Only courses with a “B” or higher are transferred to Weatherhead. Weatherhead does not transfer in courses from non-AACSB accredited schools. Quarter hours convert to semester hours with a conversion of 0.67 semester hours for every 1.0 quarter hours.

For the MNO program:

A total of 6 credit hours are eligible for a waiver, subject to the following requirements:

• Courses must have been taken at an accredited institution within five years of the date of application to the MNO program
• A grade of at least a B must have been earned
• A Mandel Center faculty member must make written approval of the waived course
• Courses will not be waived based upon work experience
• A student must register for and complete at least 54 credits toward the MNO degree in residence at the university in addition to courses waived. A waived course may reduce degree requirements

Transfer Credit
Courses granted transfer credit must be approved as applicable to the MNO program. Courses must have been taken at an accredited institution and must be approved prior to enrollment. A grade of at least a B must have been earned. Grades in transfer credit courses are not counted in the cumulative grade point average. Transfer credit is limited to 6 credits.

Substitution
An additional 9 credits may be approved for substitute credit. Substitute courses replace required MNO courses but do not reduce the total number of credits required to complete the program. Substitute courses must be selected and approved in accordance with a clearly defined written proposal consistent with student interests and needs and the MNO program mission.

Withdrawals
To withdraw from courses during a semester, the student may either initiate a request to withdraw in SIS or contact the Weatherhead Registrar (http://bulletin.case.edu/weatherheadschoolofmanagement/policies/mailto:wsomregistrar@case.edu) before the last day of classes. All withdrawals after the official drop/add periods will result in a grade of W (WD if withdrawing from all classes) on the student’s transcript. A student withdrawing after the last day of classes will receive the grade of F unless, in the judgment of the program’s faculty director, there are valid reasons for recording the grade of W.

Failure to attend class, giving notice to the instructor, or nonpayment of fees will not be regarded as official notice of withdrawal. A grade of F will be assigned in each course from which the student has not officially withdrawn.

Note: A student is not entitled to any tuition adjustment for a single course dropped after the drop/add deadline. However, if a student is forced to withdraw from all coursework for the semester due to unavoidable and unforeseen circumstances, he or she may petition (in writing to the Weatherhead registrar) for a partial tuition refund. Tuition charges for withdrawals after the drop/add deadline are prorated based upon the week of withdrawal and according to the schedule (http://www.case.edu/finadmin/controller/pdf/bill_sch12-13.pdf) published in the semester registration materials.

Academic Integrity Policy
This Policy comprises the standards of academic integrity in the graduate programs of the Weatherhead School of Management at Case Western Reserve University and sets forth the procedures to be followed by the
Dean, Faculty, and Staff in cases in which students are alleged to have violated the Academic Integrity Policy. This policy does not address alleged violations and disciplinary actions in the undergraduate programs. Such matters are addressed at the university level.

Academic integrity is vital to the Weatherhead School of Management’s (WSOM) graduate programs learner-centered approach to management education. Learning flourishes where the free flow of ideas is unimpeded by concerns over the origins of those ideas and the process by which they are created. Thus, a deep commitment to learning and honesty on the part of every student is crucial. Every student is expected to respect the learning process, to enhance it, to strenuously avoid any activity that might corrupt it, and to report observed violations of the WSOM code of academic conduct. Faculty, the Dean and Administration also have a crucial role in upholding Academic Integrity in WSOM and ensuring adherence to general principles of academic integrity and this policy.

To foster a well-informed commitment to academic integrity, the following policies govern the WSOM learning environment:

1. All forms of dishonesty including cheating, plagiarism, or knowingly furnishing false information to WSOM faculty or administrators are prohibited. This standard is to be interpreted strictly. Examples of violations of the code of academic conduct include, but are not limited to:
   - Communication or use of aids not specifically authorized by the instructor during examinations. Such instances include giving or receiving unauthorized assistance in any form (including the use of unauthorized aids, copying from another student’s work, giving, soliciting or receiving unauthorized aid).
   - Submission of work prepared for another class, by another section of the same class in the same or prior years, or by other students without the prior authorization of the course instructor.
   - Submission of texts or partial texts prepared by anyone other than the student (plagiarism), including material from the internet, without proper attribution, including whether the true author is aware of, or condones, the act. Plagiarism can occur inadvertently due to the omission of proper credit and includes failure to properly footnote sources, to indicate quoted or paraphrased material, or to credit others for their ideas, words, or work.
   - Misrepresentation of oneself on a resume.

2. Computer software is private intellectual property; therefore, copying university owned or licensed software or data, or loading such software on to another computer system for personal or external non-CWRU use without prior written approval is prohibited. The modification of university owned licensed software or data without prior written approval is prohibited.

3. Information technology, including computers, data transmission and storage technology are essential to knowledge production and learning. Damage or disruption to the operation of computer equipment, data communications equipment or data communications lines is prohibited. The use of University owned or licensed computers for non-educational purposes or for purposes for which they were not intended is prohibited.

To maintain and consolidate information on prior Academic Integrity violations and associated consequences, prior to each academic year, Council will designate one Academic Integrity Officer (AIO) and one Associate Academic Integrity Officer (AAIO) from the full-time faculty to serve a term of one year of service during the coming academic year, renewable up to five years based upon the respective individuals’ willingness and capability to fulfill the respective roles. Council will carefully consider the fit between the workload demands of the AIO and AAIO and the characteristics of the individuals including such things as the individuals’ tenure, rank and previous involvement in other WSOM committees related to WSOM curriculum. To fulfill the responsibilities of the AIO, the individual will be provided with the appropriate administrative support.

The AIO is the first contact for allegations of violations of the code of academic conduct as explained below. The AAIO is appointed for two purposes. First, the AAIO serves as a backup for the AIO in the event that conflicts of interest or other obligations prevent the AIO from fulfilling AIO duties in a given case. Second, Council selects the AAIO with the idea that the AAIO may become the succeeding AIO when the AIO’s term is concluded whereupon Council will designate a replacement AAIO.

If a student witnesses an activity that appears to violate the code of academic conduct, that student’s academic integrity demands that he or she take proper action to address or curtail the activity. Proper action may include confronting the individuals involved, requesting that the instructor clarify the guidelines for appropriate conduct, and/or reporting the activity to the instructor or the AIO. Provision will be made for an anonymous reporting channel as necessary.

In the event that a faculty member has reasonable grounds to suspect that a student has violated the WSOM Code of Academic Conduct, the faculty member should consult the AIO. The purpose of the consultation is fourfold: (1) to provide the faculty member with an awareness of precedents for the violation in question, (2) to maintain consistency across departments in the WSOM, (3) to determine whether the student has prior violations, and (4) to allow the faculty member and the AIO to determine whether additional information should be gathered about the alleged incident and by whom.

A faculty member may resolve the violation without a hearing if the following four conditions are met: (1) the incident and sanction have been reported to the AIO, (2) the student admits to the violation, (3) based on the best information available, it is the student’s first violation, and (4) the student accepts the sanction proposed by the faculty member. The minimum sanction in such cases is failure in the work in question; the maximum sanction is failure in the course. In addition, any student guilty of an academic integrity violation shall not be permitted to participate in the evaluation process for either the faculty member(s) who brought the allegation or the course in which the violation occurred.

If any one of the four conditions noted above is not met, or if the faculty member concludes that the seriousness of the offense warrants a hearing, a hearing must be convened in accordance with the procedures outlines below. In addition Any student guilty of an academic integrity violation shall not be permitted to participate in the evaluation process for either the faculty member who brought the allegation or the course in which the violation occurred.

Procedures for Conducting Academic Integrity Disciplinary Hearings

INITIAL STEPS

1. The faculty member or other individual alleging the academic integrity violation shall prepare a written, signed statement containing a description of the acts constituting the alleged violation of the Code of Academic Conduct, including dates, times, locations and names of individuals involved. The written statement shall include all supporting evidence that is pertinent to the alleged violation.

2. The individual shall submit the statement to the WSOM AIO. The AIO will review the statement to determine whether the written statement
contains sufficient information to warrant further investigation. The AIO shall also notify the University’s Office of Student Affairs of the matter. The AIO and University’s Office of Student Affairs will collaborate to the extent appropriate to resolve the matter.

3. If the AIO determines that further investigation is warranted, the AIO may request that other parties prepare written statements describing their knowledge of the alleged violation of the Code of Academic Conduct.

4. The AIO shall notify the student of the allegations and that a hearing will be scheduled, which will provide the student with the opportunity to prepare a defense against the allegations and to have an advisor present at the hearing.

HEARING PROCESS

1. After receiving all written statements and any other pertinent information, the AIO shall convene an ad hoc Hearing Committee comprised of the following individuals: (a) two individuals typically from the body of elected student officers; (b) three full-time regular faculty members; and (c) one non-voting administrative staff member. The members of the committee will elect one member to serve as Chair with the staff member recording the minutes. The two individuals from the body of elected student officers should be comparable “peers” to the student alleged to have violated the Academic Integrity Policy. Cases may arise in which comparable peers may not exist in the body of elected student officers in which case the AIO may select a comparable peer from among the general student body.

2. Prior to the hearing, the ad hoc Hearing Committee members will be provided with the written documents concerning the alleged incident and any other pertinent information.

3. The ad hoc Hearing Committee will establish a hearing date and communicate the date to all parties involved. Prior to the hearing date, the student in question shall have access to all written documents and any other information the ad hoc Hearing Committee has reviewed, subject to situations in which the Committee foresees that privacy concerns or related legal issues may prevent the sharing of certain information with the student. For example, cases may arise in which the sharing for certain information may violate the Family Education Rights and Privacy Act (FERPA). In such cases, the Committee will consult with the University’s Legal Counsel.

4. All members of the ad hoc Hearing Committee must be present at the hearing.

5. The student may be accompanied and assisted by an advisor. The advisor shall not be permitted to participate in the hearing except to advise the student.

6. If the faculty member or other individual alleging the violation chooses not to attend the hearing, the AIO will appoint an individual, selected from among the faculty, to represent the faculty member or other individual.

7. Minutes of the hearing will be recorded by the staff member referenced in item 1 of this section.

8. The student shall have the opportunity to argue his/her defense and to present supporting evidence and witnesses. The student shall have the opportunity to hear and question witnesses against him/her by directing all such inquiry through the person chairing the meeting.

9. The Hearing Committee shall have the authority to reasonably limit the time for testimony for each witness, including the testimony of the student in question.

10. After the hearing, the Committee shall convene to discuss the information presented and to make a written recommendation. The recommendation shall be made to the Dean within a reasonable period of time after the hearing. The Dean will make the final decision regarding the outcome of the hearing.

11. The recommendation may include discipline up to and including suspension and expulsion. The student will receive a copy of the Committee’s recommendation.

SANCTIONS AND APPEAL PROCESS

1. The Dean shall have the authority to accept, reject or modify the Hearing Committee’s recommendation, after consultation with the AIO and, if possible, the AAIO. The student shall have the right to present in writing, his/her basis for requesting acceptance, rejection or modification. The Dean shall communicate his/her decision in writing to the student and the Committee.

2. In no event will a student be suspended from classes or expelled prior to a final resolution of the charges, except in cases where the Dean or the AIO believes the student’s presence on campus presents a risk of danger to the University community.

3. The procedures set forth herein do not preempt the jurisdiction and disciplinary processes of other University bodies that retain their own concurrent jurisdiction to investigate and enforce their own rules and impose their own disciplinary measures. In circumstances in which different disciplinary findings and/or measures may be imposed by different bodies, the more severe shall have precedent.

4. A student found in violation has the right to appeal the original decision to the Provost’s Office at according to the following procedures. An appeal of a decision must be submitted in writing and postmarked or hand delivered to the Provost or the Provost’s designee, within ten (10) calendar days after the date on which written notice of the decision is sent to the student. Each student shall be limited to one appeal. The decision of the appeal officer is final.

5. An appeal may be based only upon one or more of the following grounds: a. Procedural error; b. Misapplication or misinterpretation of the rule alleged to have been violated; c. Findings of facts not supported by a preponderance of evidence; d. Discovery of substantial new facts that were unavailable at the time of the hearing; or e. That the disciplinary sanction imposed is grossly disproportionate to the violation committed.

6. The appeal officer shall dismiss the appeal if the appeal is not based upon one or more of the grounds set forth in Section (B) above. The appeal officer may decide the appeal based upon a review of the record. The appeal officer may request additional written information or an oral presentation from any relevant person(s) and then decide the appeal based upon the enhanced record.

7. The appeal officer may, after a review of the record, uphold the original sanction, dismiss the original sanction, or impose a lesser sanction. An appeal officer may also remand the case to the original hearing body or refer the case to a new hearing officer or panel to be reheard. If possible, the new hearing officer or panel should be different from the one that originally decided the case. If a case is reheard by a hearing officer or panel, the sanction imposed can be greater than that imposed at the original hearing.

8. A student and hearing officer may agree in advance to minor deviations from procedure. Such deviations are not then subject to appeal. Other minor deviations are acceptable as long as such deviations are not found upon appeal to be unreasonably harmful to the student.
Standards of Conduct Beyond Academic Integrity

In addition to the standards set forth in the Academic Integrity Policy (p. 965), Weatherhead students are subject to the university’s Standards of Conduct (http://studentaffairs.case.edu/handbook/policy/standards.html) which specifically prohibit the following activities:

1. Interference with freedom of speech or movement, or intentional disruption or obstruction of teaching, research, administration, or other functions on university property
2. Any actual or threatened physical harm or mental abuse of any person on university premises or at functions sponsored or supervised by the university
3. Failure to comply with the directions of university officials, instructional or administrative, acting in performance of their duties
4. Theft or vandalism of university property or that of a member of the university community or campus visitor
5. All forms of dishonesty, including cheating, plagiarism, knowingly furnishing false information to the university, forgery, and the alteration or misuse of university documents, records, or instruments of identification
6. Falsification, distortion, or misinterpretation of information before a hearing body
7. Unauthorized carrying or possession on university premises of firearms or of any weapon with which injury, death, or destruction may be inflicted
8. Violation of law on university premises or in connection with university functions
9. Violation of published university rules and regulations

A student accused of any of the above prohibited activities will be referred to the disciplinary conduct procedures described below.

Disciplinary Conduct Procedures

Initial Steps

1. The student, faculty member, or member of staff making the allegation shall prepare a written and signed statement containing a complete description of the acts constituting the violation of the university Standards of Conduct, including dates, times, locations, and names of individuals involved.
2. The written statement must be directed to the dean of Weatherhead who may choose a designee to administer the disciplinary proceedings. The dean or designee shall review the statement to determine whether the written statement contains enough information to warrant further investigation. The dean or designee shall also notify the university’s Office of Student Affairs of the matter. The dean or designee and university Office of Student Affairs will work collaboratively on this matter to the extent appropriate.
3. If the dean or designee determines that further investigation is warranted, he or she may require that other parties involved make a written statement describing their knowledge of the incident. The student in question will be notified in writing of the nature of the charges against him or her.
4. The student will be notified that a hearing will be scheduled and that he or she will have the opportunity to defend himself or herself against the allegations, and to have an adviser present, at the hearing.

Hearing Process

1. After receiving all written statements and any other pertinent information, the dean or designee shall convene an ad hoc hearing committee consisting of two elected student officers, two full-time faculty members, and one administrative staff member. The members of the committee shall elect one member to serve as chair.
2. Prior to the hearing, the hearing committee will be provided with the written documents concerning the alleged incident and any other pertinent information.
3. A hearing date will be decided upon and communicated to all parties involved. Prior to the hearing date, the student in question shall have access to all written documents and any other information the hearing committee has reviewed, unless the committee decides that it would be inappropriate to provide certain information to the student.
4. On the hearing date, all members of the hearing committee must be present.
5. The student may be accompanied and assisted at the hearing by an adviser. The adviser shall not be permitted to participate in the hearing except to advise the student.
6. Minutes of the hearing will be recorded.
7. The student shall have the opportunity to argue his or her defense and to present supporting witnesses. The student shall have the opportunity to hear and cross-examine witnesses against him or her by directing all such inquiry through the meeting chair, unless the committee deems that it would be inappropriate to permit cross-examination for certain witnesses.
8. The hearing committee shall have the authority to limit the time for testimony for each witness, including the testimony of the student in question.
9. After the hearing, the committee shall convene to discuss the evidence presented and to make a written recommendation. The recommendation will be made to the dean or designee within a reasonable period of time after the hearing.
10. The recommendation may include discipline up to and including suspension and expulsion. The student shall receive a copy of the committee’s recommendation.

Sanctions and Appeal Process

1. The dean or designee shall have the authority to accept, reject, or modify the hearing committee’s recommendation. The student shall have the right to present, in writing, a request for acceptance, rejection, or modification. The dean or designee shall communicate his or her decision in writing to the student and the committee.
2. In no event will a student be suspended from classes or expelled prior to a final resolution of the charges, except in cases where the dean or designee believes that the student’s presence on campus presents a risk to the university community.

The procedures set forth herein do not preempt the jurisdiction and disciplinary processes of other university bodies, which retain their own concurrent jurisdiction to investigate and enforce their own rules and impose their own disciplinary measures. In circumstances where different disciplinary findings and/or measures may be imposed by different bodies, the more severe sanction shall take precedence.
Grievance Procedures
Staff and faculty members have an important role to play in supporting the best possible learning environment. In the event that a student feels unjustly affected by a non-disciplinary academic or administrative action, he or she may grieve the action or decision in the following manner:

1. The student should bring his or her complaint directly to the person responsible for the action in question. The student should make an effort to resolve the problem informally.

2. If efforts at informal resolution of the problem are not successful, the student shall prepare a written statement within a reasonable period of time after the action or decision that gives rise to the grievance. The statement shall contain the following:
   - Date of the grievance
   - Brief description of the alleged unjust academic or administrative action or decision
   - Names of individual(s) involved
   - Explanation of previous attempts to resolve the problem(s)
   - Action(s) that the student believes should be taken to resolve the problem

3. The written statement shall be directed to the Director of Student Affairs, Shannon Greybar Milliken.

4. The Dean or Dean’s designee may request that the individual(s) named in the grievant’s written statement prepare a written statement responding to the grievant.

5. Upon receiving the written statements, the Dean or designee shall convene an ad hoc committee consisting of one student and two full-time faculty members.

6. The committee shall consider the written statements of the individuals involved and any other information they deem relevant. The committee may interview the individuals involved, including the grievant.

7. The committee shall make a written recommendation to the Dean or designee and furnish a copy to the grievant.

8. The Dean or designee may accept, reject, or modify any or all of the committee’s recommendations. The Dean or designee shall make the final decision as to the grievance and shall communicate the decision to the grievant in writing.

All grievances will be held in strictest confidence by all involved. The grievance process cannot be used to circumvent the disciplinary process and procedures set forth elsewhere in this document.
Undergraduate Programs

Bachelor of Science (BS) in Accounting

Accountancy demands a high degree of technical training, similar to the professions of architecture, law, engineering, and medicine. The accounting profession requires a broad knowledge of the fundamentals of economics and business and a commitment to public well-being. Career opportunities in accounting include the public, corporate, government, nonprofit, and healthcare sectors. The undergraduate program in accounting is designed to prepare students for entrance into these careers and to provide a foundation for the examination to become a CPA or to achieve other professional certifications.

As part of the sequence of courses leading to the BS in Accounting offered through Weatherhead, the student takes required and elective courses in related fields of banking and finance, economics, marketing, organizational behavior, information systems, management policy, and operations.

BS in Accounting

General Education Requirements

SAGES (13-16)
First Seminar 4
Two University Seminars 6
Departmental Seminars - taken as MGMT 395, see below* 6
Senior Capstone ** 6

Breadth Requirements (26-30)
MATH 125  Math and Calculus Applications for Life, Managerial, and Social Science 4
or MATH 121  Calculus for Science and Engineering I 4
MATH 126  Math and Calculus Applications for Life, Managerial, and Social Science II 4
or MATH 122  Calculus for Science and Engineering II 4
Two Natural Science Courses  6
Two Arts & Humanities Courses  6
Two Social Science Courses - one of which is COSI 200 or COSI 280 6

Major Requirements

Principles Requirements (15)
ECON 102  Principles of Microeconomics 3
ECON 103  Principles of Macroeconomics 3
ACCT 101  Introduction to Financial Accounting 3
ACCT 102  Management Accounting 3
OPRE 207  Statistics for Business and Management Science I 3

Core Requirements (24)
BAFI 355  Corporate Finance 3
MGMT 250  Managing Organizations and People I 3
MGMT 251  Managing Organizations and People II 3
MIDS 301  Introduction to Information: A Systems and Design Approach 3
MKRI 201  Marketing Management 3
OPRE 301  Operations Research and Supply Chain Management 3
PLCY 399  Business Policy 3
Advanced Seminars - *MGMT 395 - one credit hour, each student must complete three. 3

Accounting Requirements (18)
ACCT 300  Corporate Reporting I 3
ACCT 301  Corporate Reporting II 3
ACCT 304  Advanced Financial Reporting 3
ACCT 305  Income Tax: Concepts, Skills, Planning 3
ACCT 314  Attestation and Assurance Services 3

Total Credit Hours for Degree: 122

- Students must complete one university-approved SAGES Senior Capstone. It is not required that students complete a Weatherhead-specific capstone. Most students choose to take MGMT 398 Action Learning, although a second option within Weatherhead is MGMT 397 Undergraduate Research Project.

Students pursuing the BS in Accounting are advised to take the two introductory classes, ACCT 101 Introduction to Financial Accounting and ACCT 102 Management Accounting, as early as possible. Students are advised to take the required MGMT 250 Managing Organizations and People I and MGMT 251 Managing Organizations and People II sequence in the Fall and Spring Semesters, respectively, of the second year.

Accounting majors may not use the P/NP option for Weatherhead courses. Twelve credit hours of accounting coursework taken at another accredited institution may be considered for transfer toward the BS in Accounting, although transfer credit for courses beyond introductory accounting must be approved by the Accountancy Department. Each student is required to consult with an advisor in the Office of Undergraduate and Integrated Study Programs at Weatherhead.

Integrated Study Programs in Accountancy

Integrated study programs enable attainment of a BS in Accounting and a Master of Accountancy (MAcc) degree in five years or less. These programs are strongly recommended for those individuals planning to obtain professional certification. CPA candidates must have completed 150 semester hours of study at the university level in order to qualify to sit for the CPA examination. There are two programs that integrate graduate and undergraduate course work in accountancy: the joint BS in Accounting/MAcc and the accelerated BS in Accounting/MAcc.

Application to either integrated study program should be made during the junior year directly to the MAcc program. The Graduate Management Admission Test (GMAT) is required for admission to the MAcc program and should also be completed during the junior year. Once admitted, students in an integrated study program are required to design a comprehensive study plan with both the Weatherhead adviser and the director of the MAcc program.

Joint BS in Accounting/MAcc

Undergraduate accounting majors accepted to the joint BS in Accounting/MAcc program are permitted to double count six credit hours of coursework towards both the BS in Accounting and the MAcc. Hence, the two programs require 152 credit hours of study rather than 158 credit hours (122 credit hours for the BS and 36 credit hours for the MAcc). For the first eight semesters of study, students register as undergraduates at Case Western Reserve; thereafter, students register in the graduate professional degree program at Weatherhead. Students complete and are awarded the BS in Accounting prior to completing the master’s degree program.

Accelerated BS in Accounting/MAcc

The accelerated BS in Accounting/MAcc program allows motivated students to complete both the BS in Accounting and the MAcc degrees in four years of study. These students are able to double count six credit hours of coursework, reducing the total credit hour requirement from 158
credit hours to 152 credit hours. To enroll in this program, students must have:

- Completed 90 hours of undergraduate coursework
- Completed all of the undergraduate Seminar Approach to General Education and Scholarship (SAGES) General Education Requirements at Weatherhead
- Completed 36 hours of the Weatherhead major requirements (including 15 hours of the required accountancy coursework)
- Achieved at least a 3.0 overall GPA

For all eight semesters of study, the student will register as an undergraduate at Case Western Reserve and never as a graduate student in the graduate professional degree program at Weatherhead. Students in this program will receive both the BS and the master’s degree at the end of the program.

Professional Practicum

A practicum is a planned, structured, supervised workplace experience at an approved "site" organization. The practicum is an Experiential Learning arrangement between the student, the employer, and the practicum adviser in conjunction with the University Career Center. Employers provide appropriate supervision and work-related learning, while the practicum adviser guides and evaluates the student’s experience.

The primary goal of this active learning experience is the intellectual, personal, and professional growth of the student in an area related to the student’s academic goals. The practicum should provide the student with new skills, insights, and experiences that are transferable to the academic setting.

Students apply to the University Career Center in the semester preceding the work assignment. A student may participate in up to two practica, but must spend at least one intervening semester on campus.

To be eligible, a student must have:

- Completed 21 credit hours of coursework at Case Western Reserve (prior to the start of the work assignment)
- A minimum GPA of 2.5 and good academic standing
- Completed ACCT 101 Introduction to Financial Accounting and ECON 102 Principles of Microeconomics or ECON 103 Principles of Macroeconomics
- Registered for MGMT 1 Supervised Professional Practicum - Semester 1 or MGMT 2 Supervised Professional Practicum - Semester 2, a non-credit practicum course
- Completed pre-practicum assignments with the University Career Center
- Secured a Weatherhead faculty member as a practicum advisor*
- Developed an approved Learning Agreement with the practicum advisor

* An advisor from the Office of Undergraduate and Integrated Study Programs at Weatherhead can serve as a practicum adviser during the summer.

All practica developed through the University Career Center must be taken for transcript notation, and students must have a faculty member serve as a practicum advisor. If a student elects to work in an internship/practicum without enrolling in the course for academic notation, he or she will not have the benefits of full-time student status. Additionally, he or she will not represent the practicum program in any official capacity.

Bachelor of Science (BS) in Management

Graduates of the BS in Management program obtain a broad education within a scientific framework that enables them to bring an unusual degree of analytical capability to the problems of management and business. Each management student is required to complete a concentration in finance, marketing, or an approved, individualized program of study (see below in the section titled Dean’s Approved Concentration). In addition, each student must consult with an adviser in the Office of Undergraduate and Integrated Study Programs at Weatherhead.

BS in Management

General Education Requirements

Students must complete a 15 credit hour concentration in Banking & Finance, Marketing, or a Dean’s Approved Concentration.

Additional Requirement (16-23)

Electives - to include 12 credit hours outside of WSOM

Total Credit Hours for Degree: 122

** Students must complete one university-approved SAGES Senior Capstone. It is not required that students complete a Weatherhead-specific capstone. Most students choose to take MGMT 398 Action Learning, although a second option within Weatherhead is MGMT 397 Undergraduate Research Project.

For more information, contact Teresa Kabat (http://bulletin.case.edu/weatherheadschoolofmanagement/undergradprograms/mailto:teresa.kabat@case.edu), Department Administrator, at 216.368.4110.
Organizations and People II sequence in the second year. Management majors may not use the P/NP option for any Weatherhead courses.

- MKMR 310 Marketing Analytics 3
- MKMR 311 Consumer Relationship Management 3
- MKMR 312 Selling and Sales Management 3

Total Units 15

Dean’s Approved Concentrations

A student may construct a 15-credit sequence of courses in an area of individual interest, subject to approval by the Weatherhead Undergraduate Executive Committee.

For more information, contact Jim Hurley (http://bulletin.case.edu/weatherheadschoolofmanagement/undergradpgrams/mailto:james.hurley@case.edu), Assistant Dean of Undergraduate and Integrated Study Programs, at 216.368.3856.

Minors

Minor in Accounting

- ACCT 101 Introduction to Financial Accounting 3
- ACCT 102 Management Accounting 3
- ACCT 300 Corporate Reporting I 3
- Two additional 300-level accounting courses 6

Total Units 15

Minor in Banking and Finance

- ACCT 101 Introduction to Financial Accounting 3
  or ACCT 203 Survey of Accounting 3
- BAFI 355 Corporate Finance 3
- BAFI 356 Investments 3
- Two of the following three courses: 6
  - BAFI 357 Financial Modeling, Analysis and Decision Making 3
  - BAFI 359 Intermediate Corporate Finance 3
  - BAFI 341 Money and Banking 3

Weatherhead Center

Fowler Center for Sustainable Value

The Fowler Center (http://weatherhead.case.edu/centers/fowler) leverages interdisciplinary scholarship and practice to help leaders capitalize on new profitable business opportunities to solve the world's growing social and environmental problems. The Center works directly with all kinds of institutions to embed sustainability into their core strategy, applying cutting-edge competencies in design, innovation, whole systems, and Appreciative Inquiry. The Fowler Center is led by Executive Director Roger Saillant, PhD. The Fowler Center focuses on two primary areas: scholarship and outreach.

Sustainable Value is defined as a dynamic state that occurs when a company creates ongoing value for its shareholders and stakeholders. By "doing good" for society and the environment, the company does even better for its customers and shareholders than it otherwise would.

To learn more or to find out how you or your organization can get involved with the Fowler Center, visit our website (http://weatherhead.case.edu/centers/fowler) or contact Beau Daane (http://bulletin.case.edu/weatherheadschoolofmanagement/centers/mailto:beau.daane@case.edu), Fowler Center Manager, at 216.368.4795.
Weatherhead School of Management Courses

ACCT Courses

ACCT 101. Introduction to Financial Accounting. 3 Units.
Financial reports are the most significant means for an organization to communicate its management results to stockholders, creditors, and regulators. This course covers concepts, principles, and practices, including preparation and interpretation, of financial reports. The financial reporting system and basic internal controls for the balance sheet, income statement, and cash flow statements are discussed. A student may not receive credit for both ACCT 101 and ACCT 203.

ACCT 203. Survey of Accounting. 3 Units.
The course covers the principle of financial and managerial accounting for non-management students, including the framework that underlies financial and management accounting and how accounting information should be used by: (1) parties external to the firm, i.e., stockholders, creditors and government, to evaluate the financial performance of an organization; and (2) internal management to fulfill the planning, control and performance evaluation functions. Enrollment is limited to students who are neither management nor accounting majors nor enrolled in the Weatherhead School of Management. This course may be substituted for ACCT 101. A student may not receive credit for both ACCT 101 and ACCT 203. This course cannot be substituted for ACCT 102 without a waiver from the chairman. Offered as ACCT 203 and ACCT 403.

ACCT 300. Corporate Reporting I. 3 Units.
This course covers financial accounting theory, generally accepted accounting principles and reporting practices, including evaluation of current issues and practices related to asset valuation, including receivables, inventory and fixed assets. It also covers the users and uses of financial statements, the difference between cash-basis and accrual accounting, the determination of income, the financial statements, financial statement analysis, revenue recognition, and the role of financial information in valuation decisions and contracting. Prereq: ACCT 101 and ACCT 202 or requisite not met permission.

ACCT 301. Corporate Reporting II. 3 Units.
This course covers financial accounting theory, generally accepted accounting principles and reporting practices. Areas of focus include: liability determination, long-term debt, derivatives, leases, pensions and other postretirement benefits, accounting for income taxes, earnings per share, stock options, and investments. International aspects also are considered. Prereq: ACCT 300.

ACCT 304. Advanced Financial Reporting. 3 Units.
This course covers partnerships, consolidations, foreign exchange, international aspects of accounting, accounting for state and local governments and not-for-profit organizations, segment reporting and interim reporting. Prereq: ACCT 301.

ACCT 305. Income Tax: Concepts, Skills, Planning. 3 Units.
This course addresses U.S. Federal Income Taxation concepts and applications. The subject matter includes topics applicable to individuals, partnerships and corporations and various other entities required to file income tax returns. In addition the subject matter addressed includes a variety of business, legal and taxation concepts and practices related to effective tax planning. The purpose of the course is to provide the student with the appropriate knowledge and skill levels to "speak the language of U.S. tax." Prereq: ACCT 202 or ACCT 401 or requisite not met permission.

ACCT 314. Attestation and Assurance Services. 3 Units.
This course covers the role of the auditor, the audit process, the public accounting profession, audit risk and materiality, fraud, audit methods and techniques, audit planning, internal control, the effects of information technology on the audit, auditing revenue, receivables and inventories, professional ethics, legal responsibilities, emerging assurance services, and recent developments in the auditing profession. Prereq: ACCT 301.

ACCT 360. Independent Study. 1 - 18 Unit.

ACCT 403. Survey of Accounting. 3 Units.
The course covers the principle of financial and managerial accounting for non-management students, including the framework that underlies financial and management accounting and how accounting information should be used by: (1) parties external to the firm, i.e., stockholders, creditors and government, to evaluate the financial performance of an organization; and (2) internal management to fulfill the planning, control and performance evaluation functions. Enrollment is limited to students who are neither management nor accounting majors nor enrolled in the Weatherhead School of Management. This course may be substituted for ACCT 101. A student may not receive credit for both ACCT 101 and ACCT 203. This course cannot be substituted for ACCT 102 without a waiver from the chairman. Offered as ACCT 203 and ACCT 403.

ACCT 405. Advanced Federal Taxes. 3 Units.
Corporate income taxes, estate and gift tax, fiduciary income taxes, partnerships, and hybrid forms of organization are covered. Prereq: MAcc students only and ACCT 305.

ACCT 406. Accounting Information Systems. 3 Units.
This course is designed to explore and understand accounting as an information system. We will examine the use, development, evaluation, and management of both the information itself and the technology applied to it. The course assumes background in principles of accounting at the fundamental level or consent of instructor.

ACCT 413. Advanced Management Accounting and Control. 3 Units.
Managerial accounting is concerned with providing information and analysis to assist managers in the planning, directing, and controlling of company operations. This course covers advanced techniques for dealing with contemporary issues requiring accounting information and analysis. Writing communication and support for sustainable outcomes are emphasized. Prereq: ACCT 401 or MBAC 503 or equivalent.
ACCT 414. Corporate Reporting and Analysis. 3 Units.
This course provides a basis for evaluation of traditional and proposed uses of report and information for decision making in investment, credit and internal planning and control. Students are introduced to concepts and analytical techniques that can be used to critique and interpret the financial health of the organization. At a practical and theoretical level, the course integrates research in the areas of accounting, quantitative methods and finance which has proved useful in the financial analysis of organizations. Prereq: (ACCT 401 or MBAP 402 or MBAC 502) and (BAFI 402 or MBAP 405 or MBAC 504).

ACCT 418. Fraud, Governance and Reporting. 3 Units.
This course examines managerial fraud, primarily made possible by the manipulation of accounting. This includes treatments of the motives for fraudulent behavior but focuses primarily upon the techniques of earnings management and the processes of its detection. Governance of organizations in the post-Enron, WorldCom and Tyco environment will also be studied. Regulation and the duties of those responsible for proper governance will be among the topics in this portion of the course. Guest speakers from the forensic industry and materials from practice institutes will be employed. Prereq: ACCT 401 and BAFI 402 or equivalent.

ACCT 430. Taxes and Management Decisions. 3 Units.
This course is designed to sensitize students to the importance of tax planning opportunities and pitfalls inherent in management decisions. The course will focus on helping students recognize potential tax opportunities and problems by examining a variety of practical managerial decision contexts. The course is specifically designed for students preparing for careers in management, not necessarily in accounting or tax. Prereq: ACCT 401 or MAND 425 and MAND 426.

ACCT 431. Tax Practice: Analysis, Planning and Communications. 3 Units.
This course concentrates on teaching the identification of key U.S. tax issues, the analysis of fundamental tax concepts and the underlying interpretation and application of tax law through the use of appropriate authoritative sources. Both oral and written communication will be utilized to present tax planning research results. Actual court cases will be used as the basis for simulating practical client scenarios. Prereq: ACCT 305.

ACCT 437. Principles of Personal Financial Planning and Taxation. 3 Units.
This course focuses on financial planning for individuals. It is designed to be an overview course that touches on the basic concepts of each area of financial planning including general principles of financial planning, insurance planning, investment planning, income tax planning, retirement planning, estate planning, and planning for college education funding. Upon completion of this course, the student should be able to identify major issues in these areas and prepare a basic comprehensive financial plan for a hypothetical client. This course should provide the student with an appreciation for the amount of additional education necessary in order to become qualified as a Certified Financial Planner. Prereq: ACCT 305.

ACCT 439. Regulation of Accountancy. 3 Units.
This course examines the role and structure of government standard-setting agencies, including the U.S. Securities and Exchange Commission (SEC) and the Public Company Accounting Oversight Board (PCAOB) and related legislative and regulatory aspects as found in the Sarbanes-Oxley Act of 2002, and in studies by the General Accounting Office (GAO) and other regulatory agencies. The 1993 and 1994 securities acts, the notions of full and fair disclosure and auditor independence are addressed as important aspects of securities regulation. Research papers and assignments address technical and disclosure requirements of operating companies and mutual funds. Extensive use is made of web-based information including company and mutual fund sites and databases. Prereq: ACCT 301.

ACCT 444. Advanced Auditing Theory and Practice. 3 Units.
This course examines auditing concepts and issues in depth. A special focus exists on audit evidence and how auditors make decisions. Some topic areas include ethics, analytical review, fraud, and the role of technology. Prereq: MAcc students only; ACCT 314 or consent.

ACCT 480. International Tax. 3 Units.
A student will achieve a practical command of the tax issues, from an accountant's perspective, which are raised by international transactions and how the U.S. tax laws resolve those issues. Subject matter includes an overview of the U.S. tax system for international transactions, sourcing rules, foreign activities of U.S. persons, foreign tax credit, U.S. taxation of foreign persons, foreign-owned U.S. businesses, transfer pricing and tax treaties. In addition, examples of VAT (value-added taxation) and of the tax regime of a non-U.S. country will be studied. Prereq: ACCT 305.

ACCT 495. Advanced Accounting Seminar. 1 Unit.
This one semester credit hour seminar is designed to permit focus and attention upon specialized technical accounting and reporting topics which are individually insufficient to warrant larger credit offerings. It is expected that the topics of individual ACCT 495 seminars will vary based upon faculty availability and interest and the rapidly changing environment of professional circumstances. Individual seminar topics will be proposed, reviewed and approved by the accounting faculty at appropriate times and thereafter added to the ACCT 495 offering list. Possible seminar topics include: International Financial Accounting Standards; Securities and Exchange Commission Accounting; Federal Financial Accounting and Reporting; Mutual Fund Reporting; Financial Controls and Board Governance; Research Methods and Topics; and Triple-Bottom Line/Accountability topics.

ACCT 501. Special Problems and Topics. 1 - 18 Unit.
This course is offered, with permission, to students undertaking reading in a field of special interest.

ACCT 520. Advanced Accounting Theory. 3 Units.
This seminar studies contemporary issues in financial accounting theory and business reporting. Topics are considered from their historical development to contemporary circumstances. Academic and professional literatures are employed to gain a variety of perspectives on current matters. The development of communication skills, written and verbal, and use of support technology for presentations is emphasized throughout. Students are required to make several individual and team presentations, to conduct database and periodical research and to provide frequent written and oral research reports. Prereq: MAcc students only; ACCT 304 or consent.
ACCT 540. Contemporary Accountancy Policy. 3 Units.
This is a seminar on subjects of contemporary concern to the profession of accountancy which are currently being analyzed and debated by professional bodies and the academic community. These subjects involve the role of the profession in society, and the appropriate execution of that role. Some of the potential topics are government oversight in the profession, competitive pressures, independence, scope of services, and education/competency issues. The seminar provides a participative understanding of the press of society on the accountancy profession. Prereq: MAcc students only and ACCT 304 and ACCT 314, or requisites not met permission.

ACCT 601. Special Problems and Topics. 1 - 18 Unit.
This course is offered, with permission, to Ph.D. candidates undertaking reading in a field of special interest.

Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

BAFI Courses

BAFI 341. Money and Banking. 3 Units.
This course emphasizes the importance of financial markets, the nature and role of the financial system, and the linkages between these—money and banking—and the economy. Emphasis is placed on both theoretical and practical constructs, on major innovations and contemporary changes, and the closely intertwined condition of financial and economic systems with monetary and fiscal policy. Offered as BAFI 341 and ECON 341. Prereq: ECON 102 and ECON 103.

BAFI 342. Public Finance. 3 Units.
Government intervention is a pervasive feature of every modern economy. The goal of this course is to develop the economic tools for understanding and evaluating a wide range of government behaviors such as taxation and redistribution policy, the public provision of goods and services, and the regulation of private markets. ECON 342 begins by considering "market failures" that justify government intervention in a market economy. To respond to such failures, governments must raise revenues through taxation. Using the tools of microeconomic theory, we will develop a framework for thinking about the positive and normative effects of alternative forms of taxation. Particular attention will be paid to the individual income tax in the U.S., allowing students to understand the efficiency, distributional and behavioral implications of recent changes in the tax code. We will then turn to the expenditure side of the public sector. The economic principles used to evaluate public expenditures will be discussed and exemplified through the analysis of significant public programs. Of particular interest will be the effect of public programs on the incentives faced by workers and families. Offered as BAFI 342 and ECON 342. Prereq: ECON 102.

BAFI 355. Corporate Finance. 3 Units.
The basic goals of this course are to familiarize students with the concepts and tools used in financial management at both the corporate and personal levels. They include the notion of present value, securities valuation, risk and return analysis, and other financial analysis techniques. The concepts and techniques are, in turn, used to evaluate and make decisions regarding the firm’s investments (capital budgeting) and the cost of capital. Prereq: Minimum sophomore standing; ACCT 101 or ACCT 303.

BAFI 356. Investments. 3 Units.
This course is about investing in securities. It provides a comprehensive introduction to security analysis and portfolio management. Investing is a rational decision-making process in which the investor seeks to select a package or portfolio of securities that meets a predetermined set of objectives. Descriptive, institutional and quantitative decision-making methods are arranged in a cohesive framework of analysis of interest to the informed investor. Topics include modern portfolio theory, the relation between risk and return, efficient markets, bonds, and options, among others. Prereq: BAFI 355.

BAFI 357. Financial Modeling, Analysis and Decision Making. 3 Units.
Firms try to create value. In their day-to-day operations, they are faced with numerous challenges: Should we accept trade credit or borrow? Will an acquisition create or destroy value? Should we introduce a new product line even if it cannibalizes an existing one? In each of these situations they try to quantify the impact on the value of their firm. The goal of this course is to develop your skills in financial modeling and valuation, so you can tackle issues like the ones described above. The course is designed to be “hands-on”: You will learn to apply the theory and develop spreadsheet modeling skills through homework, case studies and a group project. By the end of the course you will have a good understanding of both the theory and practice of valuation, and possess a set of cutting-edge financial modeling skills. This course is designed for students who aspire to work in a regular company, a bank or a consulting firm in (i) corporate finance (including mergers and acquisitions); (ii) strategy; or (iii) equity and analysis. Prereq: BAFI 355.

BAFI 359. Intermediate Corporate Finance. 3 Units.
This second course in corporate finance is designed to lay the analytic foundation for careers in business. The objective of the course is to strengthen students’ conceptual understanding and problem-solving skills. Topics covered include economic cash flows and valuation, long term financial planning and ratios analysis, growth and external financing, short term financial planning, working capital management, capital budgeting and managerial options, capital structure, payout policy, financial strategy, initial public equity offerings, and mergers and acquisitions. Topics covered may vary from semester to semester. The course envisages use of spreadsheets and case studies. Prereq: BAFI 355.

BAFI 360. Independent Study. 1 - 18 Unit.
This course is offered for candidates undertaking reading in a field of special interest. Permission of department chair required.

BAFI 361. Applied Financial Analytics. 3 Units.
This course is developed based on the feedback received from employers who have hired BS Management (finance) graduates in the past and will likely do so in future. The goal is to enable students to use financial econometrics to effectively analyze financial data, and hone skills in financial modeling and valuation with the objective of understanding the value created or destroyed by the activities or proposed activities of a firm. The course will draw on theoretical aspects of BAFI 355 but focus on developing financial analytic skills. SAS statistical package use and modeling skills will be developed. By the end of the course, students will appreciate what drives valuation, and be comfortable in financial data analytics using SAS. Prereq: BAFI 355. Coreq: BAFI 357.
BAFI 372. International Finance. 3 Units.
This course deals with open-economy macroeconomics and international financial markets, covering open-economy national income analysis, international macroeconomic policy coordination, exchange rate determination, foreign portfolio investment, and global financial crises. Offered as BAFI 372 and ECON 372. Prereq: ECON 102 and ECON 103.

BAFI 402. Financial Management I. 3 Units.
In this course, students are introduced to the basics of corporate finance, including the objectives, tasks, and decisions made by corporate financial managers. The course covers discounted cash flows, bond and stock valuation, cost of capital, capital budgeting, asset risk and return, and short-term and long-term financial management. Coreq: ACCT 401 or MBAC 502 or MBAP 402.

BAFI 402A. Financial Management 1. 2 Units.
This module reviews knowledge and refreshes core skills in managerial finance, especially those related to financial statement analysis, discounted cash flow valuation, and risk and return in the capital markets. Teaching methods include lectures, discussions, cases, and extensive exercises. Prereq: Open to ACL-MBA students.

BAFI 403. Financial Management. 3 Units.
The purpose of this course is to familiarize the student with the theory and application of additional models used in financial decision-making by corporations. Issues relating to efficient markets, dividend policy, capital structure, financing decisions, option pricing, leasing, and risk management are among the topics considered. In addition, special topics may include mergers and acquisitions, pension funds, and international financial management. Prereq: ACCT 401 or MBAC 502 or MBAP 402.

BAFI 404. Financial Modeling. 3 Units.
Firms try to create value. In their day-to-day operations, they are faced with numerous challenges; should we accept trade credit or borrow? Will an acquisition create or destroy value? Should we introduce a new product line even if it cannibalizes an existing one? In each of these situations they try to quantify the impact on the value of their firm. The goal of this course is to develop your skills in financial modeling and valuation, so you can tackle issues like the ones described above. The course is designed to be "hands-on": you will learn to apply the theory and develop spreadsheet modeling skills through homework, case studies and a group project. By the end of the course you will have a good understanding of both the theory and practice of valuation, and possess a set of cutting-edge financial modeling skills. This course is designed for students who aspire to work in a regular company, a bank or a consulting firm in (i) corporate finance (including mergers and acquisitions); (ii) strategy; or (iii) equity analysis. Prereq: BAFI 402 or MBAC 504 or MBAP 405.

BAFI 420. Health Finance. 3 Units.
Exploration of economic, medical, financial and payment factors in the U.S. healthcare system sets the framework for the study of decisions by providers, insurers, and purchasers in this course. The mix of students from various programs and professions allows wide discussion from multiple viewpoints. Offered as BAFI 420 and HSMC 420.

BAFI 427. Green Finance. 3 Units.
Natural systems and resources are being depleted, degraded, and impaired at a rapidly increasing pace. Yet there are very few businesses that are paying adequate attention to the adverse impact of such changes on their future as well as on their survival. How do these changes affect corporate risks? What financial challenges do they create? How can policy changes help move firms in the right direction? What innovative products and strategies can companies use to deal with these challenges? How can companies assess sustainability risk? How can these strategies add sustainable value to firms? These are just a sample of the questions that we will address in this course. This course on Green Finance will provide you with a unique opportunity to understand and explore such questions, especially as they pertain to the role of senior financial managers as well as other members of the senior management team of companies across different industries. It will expose you to cutting edge practices in the area of green finance, providing you with the thought leadership that is essential for success in today’s competitive world.

BAFI 428. Financial Strategy and Value Creation. 3 Units.
The intersection between the theory of perfect markets and the reality of market imperfections provides the basis for the exploration of value creation in this course. Opportunities in both product and financial markets are explored using case studies to develop a framework for strategic financial decisions. Prereq or Coreq: BAFI 403.

BAFI 429. Investment Management. 3 Units.
This course explores the characteristics of financial investments and markets and develops modern techniques of investment analysis and management. The goal is to help students develop a level of analytical skill and institutional knowledge sufficient to make sensible investment decisions. Topics include: an overview of stock, debt and derivative asset markets, practical applications of modern portfolio theory, equilibrium and arbitrage-based approaches to capital market pricing, the debate over market efficiency, the term structure of interest rates, bond portfolio management, and uses of derivative assets in investment portfolios. Prereq or Coreq: BAFI 403.

BAFI 430. Derivatives and Risk Management. 3 Units.
This course is intended to give students an understanding of options and futures markets both in theory and practice. The emphasis is on arbitrage and hedging. The course concentrates on listed common stock and index contracts as well as commodity markets. Various theories for trading strategies are studied. Prereq or Coreq: BAFI 403.

BAFI 431. Fixed Income Markets and Their Derivatives. 3 Units.
This class is concerned with fixed income securities, interest rate risk management, and credit risk. Fixed income securities account for about two thirds of the market value of all outstanding securities, and hence this topic is important. The course covers the basic products of fixed income markets including treasury and LIBOR products, such as interest rate swaps. Risk management and hedging strategies are covered as well as selected topics in credit risk models and mortgage-backed securities. Prereq: BAFI 430.
BAFI 432. Corporate Risk Management. 3 Units.
This is a unique strategic risk management course aimed at participants who wish to enhance their understanding of the risks faced by corporate firms, both financial and non-financial. Learn techniques to identify and measure these risks, and understand how derivatives and risk management solutions can be used to manage these risks, create value, and advance the strategic goals of the firm. The course is designed in a manner such that it would be of use to executives of all corporations, financial and nonfinancial, across all functional areas. Prereq or Coreq: BAFI 403.

BAFI 440. Advanced Corporate Finance. 3 Units.
This course exposes the students to a more in-depth treatment of some of the topics covered in BAFI 403 and introduces them to new topics. Topics include investment decisions, financing decisions, payout decisions, contracting decisions and performance metrics, internal control systems, risk management, real options, diversification and valuation. Topics covered may vary from semester to semester. Prereq: BAFI 403.

BAFI 444. Entrepreneurial Finance. 3 Units.
The objective of this course is to introduce students to the issues of financial management and capital formation in new ventures. The course will address issues of estimation of cash requirements, development of pro forma financial plans, firm valuation and the process and tools used in raising debt and equity financing. Bootstrapping, angel investing, venture capital, strategic alliances and initial public offerings will be covered. The emphasis is on the entrepreneur and how he/she can assess financial needs and develop a sensible plan for acquiring financial resources in a manner that is consistent with their financial needs and other strategic goals. Offered as BAFI 444 and ENTP 444. Prereq: BAFI 402.

BAFI 450. Mergers and Acquisitions. 3 Units.
This course examines the economic rationale and motivation for the different merger and acquisition and recapitalization activities undertaken by firms and individuals in the U.S. market. Emphasis is on the comparable publicly traded proxy company, comparable "change of control" transaction, and discounted cash flow methods of valuing a firm. The class will also review the different types of debt and equity capital employed to fund mergers and acquisitions and recapitalizations, how senior lenders and equity investors structure their loans and/or investments, and how investors realize the gains through different exit strategies. The legal and tax ramifications of various forms of M&A activity are also discussed. The course gives the student an excellent understanding of the role that senior commercial banks, insurance companies, pension funds, LBO funds, investment banking firms, and venture/growth capital investors play in mergers and acquisitions and will strengthen the students' ability to value a business enterprise. Prereq: BAFI 403.

BAFI 460. Investment Banking. 3 Units.
This course covers the role of the investment banker as a strategic financial advisor, primarily to corporate clients. The course is divided into three sections, roughly equal in length: (1) industry structure, key players, services and strategies, (2) the capital acquisition process, with a particular focus on initial public equity offerings, and (3) mergers and acquisitions, with a focus on advising financial and strategic buyers and financing these transactions. Students will gain extensive experience in applying financial models that support valuations in various markets. Prereq: BAFI 403.

BAFI 480. International Financial Management. 3 Units.
This course introduces students to international finance and foreign exchange risk management by corporations. Topics include foreign exchange markets and international financial institutions; fx contracts; exchange rate risk and corporate risk management; and international aspects of long-term financing. Prereq: BAFI 403.

BAFI 501. Special Problems and Topics. 1 - 18 Unit.
This course is offered, with permission, to students undertaking reading in a field of special interest.

BIOS Courses

BIOS 447. Regulatory Affairs for the Biosciences. 1.5 Unit.
This mini-course introduces students to the Food and Drug Administration (FDA) and the laws and regulations it enforces. A scientific regulatory agency with far-reaching enforcement authority, FDA is the most powerful consumer protection agency in the world. This course will familiarize students with FDA’s mission, philosophy and organizational structure, as well as policy and procedure it uses to ensure the safety and effectiveness of the food, drugs, biologics, cosmetics, medical devices and radiation-emitting products it regulates. Recommended preparation: Enrollment in the MEM Biomedical Entrepreneurship Track. Offered as BIOS 447, HSMC 447, and IIME 447.

BIOS 448. Engineering Statistics for Biosciences. 3 Units.
This course provides an introduction to biostatistics, emphasizing experimental design, analysis of data, and special emphasis on statistical and financial aspects of randomized clinical trials for biomedical applications. There will be a final project involving development of a clinical trial protocol including the experimental design, recruitment and retention strategy, analysis plan and budget. Offered as BIOS 448, HSMC 448, and IIME 445.

BLAW Courses

BLAW 331. Legal Environment of Management. 3 Units.
This course is designed as a survey course in the area of basic business law. It covers the fundamental legal principles and laws that underlie any business decision. The major topics include: contracts, the Uniform Commercial Code (sales), torts, real and intellectual property, business organizations, Securities Regulation and Agency.

BLAW 417. Legal Environment for Managers - M.B.A.. 3 Units.
This course will provide an overview of the legal environment in which business transactions take place. Through coverage of a number of topical areas, the student will be given a broad understanding of how the law impacts upon the daily decisions of managers. More specifically, the student will be better able to identify and understand how the legal issues facilitate or hinder the conduct of business. Topics covered will include contracts, property, products' liability, employment law, and corporate law. Special emphasis is placed on those regulatory areas of greatest interest to modern business.
ECON Courses

ECON 102. Principles of Microeconomics. 3 Units.
This course is an introduction to microeconomic theory, providing a foundation for future study in economics. In particular, it addresses how individuals and businesses make choices concerning the use of scarce resources, how prices and incomes are determined in competitive markets, and how market power affects the prices and quantities of goods available to society. We will also examine the impact of government intervention in the economy.

ECON 103. Principles of Macroeconomics. 3 Units.
While Microeconomics looks at individual consumers and firms, Macroeconomics looks at the economy as a whole. The focus of this class will be on the business cycle. Unemployment, inflation and national production all change with the business cycle. We will look at how these are measured, their past behavior and at theoretical models that attempt to explain this behavior. We will also look at the role of the Federal Government and the Federal Reserve Bank of the United States in managing the business cycle.

ECON 120. Life After Graduation. 1 Unit.
This is a one-credit seminar intended for freshmen, sophomores and juniors. The purpose of the class is to help students understand what career choices they will have with an economics major. During this course, students will assess their strengths and weaknesses, learn networking tools, and explore the options available to them. The class will meet once a week for an hour. Graduating seniors need to obtain permission to enroll. Students may not earn credit for ECON 120 if they have completed MGMT 250.

ECON 255. Economic History of the United States. 3 Units.
The growth of the American economy from the colonial period to the present. Competing explanations of economic growth; significant attention to the political and legal environment in which the U.S. economy developed; "lessons" of past experience for contemporary policy; some attention to inequality and the changing distribution of wealth and income. Offered as ECON 255 and HSTY 255.

ECON 301. Entrepreneurial Strategy. 3 Units.
This course is designed to show students how to identify potential business opportunities, determine what constitutes a good business model, and to strategically implement a business proposal. Topics of focus include an overview of the entrepreneurial process, determinants of venture success in high tech and other business environments, and strategies for industry entry and venture growth. Offered as ECON 301 and ENTP 301. Prereq: ACCT 101 or ACCT 203. Coreq: At least sophomore standing.

ECON 307. Intermediate Macro Theory. 3 Units.
Macroeconomics studies aggregate indicators of the performance of an economy, most commonly measured in terms of GDP, unemployment rate and inflation rate. An important goal of macroeconomic researchers is to develop a model of an economy that is simple, yet powerful enough to explain the historical trends of these aggregate economic indicators. Needless to say, coming up with a good model has remained a very difficult task. So far, there is no single model that is good enough to coherently explain even the most prominent historical trends of aggregate economic indicators. But several models have been built, each offering insight into a certain aspect of the economy. Throughout the course model building is motivated by real world cases from the American economy. Prereq: ECON 102 and ECON 103.

ECON 308. Intermediate Micro Theory. 3 Units.
This class will give you an overview of microeconomic theory, which forms a basis for much of economic analysis. The main focus of the class will be theoretical, in order to give you a solid foundation for future study in virtually any other field of economics. This includes the theory of how consumers decide what to consume and how firms decide when to stay in business, and how much to produce at what price. Note: a student cannot receive degree credit for both ECON 308 and ECON 309. Prereq: ECON 102.

ECON 309. Intermediate Micro Theory: Math Based. 3 Units.
This course will cover the same topics covered in Economics 102: theory of the consumer, theory of the firm, markets and government intervention in the market. However, we will cover these topics in more detail and we will use calculus in our analysis. You should come away from this course with a greater understanding of how consumers and firms make their decisions and how they interact in the market place. Note: a student cannot receive degree credit for both ECON 308 and ECON 309. Prereq: ECON 102, MATH 121 or MATH 125.

ECON 311. Entrepreneurship and Wealth Creation. 3 Units.
This course teaches students how to find, value, and finance the acquisition of a business, culminating in the class negotiation with a business owner to buy his/her business in a live simulation. Students will be exposed to the concepts and tools needed to successfully acquire a company. Negotiation strategies will be explored. Entrepreneurial Leadership approaches on how to grow and manage the business, once it is owned will also be presented, including how to create a strategic plan. The course also features a real-start up of a business. Student teams will each be given $1000 of seed capital. Learnings include how to select a product, and how to develop and execute a marketing plan. Students will meet top merger-acquisition experts and be exposed to some of Cleveland’s most respected entrepreneurs. Offered as ECON 311 and ENTP 311.

ECON 326. Econometrics. 3 Units.
Econometrics is the application of statistics to empirical economic analysis. One way of testing the validity of economic theories is to gather data and apply statistical tests to see if the data support the theory. These data are usually gathered by observing actual economies, firms and consumers, rather than by performing experiments in a laboratory. Because economic analysts lack the precision and control of the laboratory, they must compensate by adjusting their statistical procedures. In this class, we will concentrate on regression analysis, which is the basic tool of the economic researcher. We will study the assumptions commonly made in the application of this technique, the consequences of violating these assumptions, and the corrections that can be made. Students will have a chance to formulate and test their own hypotheses using econometric software available for personal computers. Recommended preparation: One semester of statistics or consent of instructor. Prereq: ECON 102 and ECON 103 and (STAT 207 or OPRE 207).

ECON 327. Advanced Econometrics. 3 Units.
This class builds on the foundations of applied regression analysis developed in ECON 326. The goal of the class is to equip students with the tools to conduct a causal analysis of a hypothesis in a variety of settings. Topics will include causality, panel and time series data, instrumental variables and quasi-experiments, semi- and non-parametric methods, and treatment evaluation. Prereq: ECON 326.
ECON 328. Experimental Economics. 3 Units.
This course introduces students to the use of experiments by economists to study individual choice behavior, policy, and markets. Students learn methods through exploring the recent experimental literature in fields such as charitable giving, discrimination, incentives, cooperation, self-control, and education. Topics include causality, experimental design, internal and external validity, biases, and inference problems. Prereq: ECON 102.

ECON 329. Game Theory: The Economics of Thinking Strategically. 3 Units.
The term "game theory" refers to the set of tools economists use to think about strategic interactions among small groups of individuals and firms. The primary purpose of this course is to introduce students to the basic concepts of game theory and its applications. The class will stress the use of game theory as a tool for building models of important economic phenomena. The class will also include a number of experiments designed to illustrate the game theoretic results, and to highlight how reality may depart from the theory. The course will stress the value of thinking strategically and provide students with a framework for thinking strategically in their everyday lives. Rather than approaching each strategic situation they encounter as a unique problem, students will be taught to recognize patterns in the situations they face and to generalize from specific experiences. Prereq: ECON 102.

ECON 330. Economic Behavior and Psychology. 3 Units.
This course will cover the relatively new field of Behavioral Economics, also sometimes called "Psychology and Economics." Behavioral economics involves incorporating insights into economics from other disciplines that enrich the understanding of how people make economic decisions. Most of the crossovers come from the field of psychology, but there is also a growing interest in ideas from sociology and neuroscience. We will cover fundamental concepts related to decision-making, such as how people respond to risk, how people make decisions over time, and the ways in which people really aren’t as selfish as economists sometimes make it seem. We will also discuss empirical work that shows how these concepts affect how economists think about real-world issues. Examples include examining how to set the default options for 401k programs, understanding why people pay for costly gym memberships they do not use, and looking at whether sellers on Ebay use the best possible ending times for their auctions. Prereq: ECON 102.

ECON 331. Money and Banking. 3 Units.
This course emphasizes the importance of financial markets, the nature and role of the financial system, and the linkages between these--money and banking--and the economy. Emphasis is placed on both theoretical and practical constructs, on major innovations and contemporary changes, and the closely intertwined condition of financial and economic systems with monetary and fiscal policy. Offered as BAFI 341 and ECON 341.

ECON 332. Economic Analysis of Labor Markets. 3 Units.
This course is about the economics of work and pay. We will take a comprehensive look at labor markets in the U.S. and other advanced countries and examine related social policy issues. This will include the effect of unions on wages, the underpinnings of the income distribution of the U.S., issues of poverty and welfare, discrimination and wage differential by gender and race, the relationship between work and family, education as a determinant of wages, and the way firms use wage and employment practices to motivate their employees to work productively. What makes labor economics special is that the commodity we examine is human labor, something that is central to the organization of our lives and the functioning of the economy. Labor economics thus applies the standard neoclassical model of demand, supply, and equilibrium to many areas that also have a profound human dimension. Prereq: ECON 102.

ECON 333. The Economics of Organizations and Employment Relationships. 3 Units.
Organizational Economics is the study of effective organizational design and management. It applies the powerful tools of modern economics to such questions as: what are the practices and structures that make for successful firms? Why are successful firms able to excel at some things (think Microsoft and word processors and spreadsheets) but not at other things (think Microsoft and web-based search)? Fundamentally organizations are human enterprises and their performance is driven by the people they employ. For this reason a good deal of organizational economics is concerned with how firms structure relationships with their employees. One of the important benefits students gain from studying organizational economics is a rigorous and logical framework for thinking about their jobs and careers. By applying this framework to many different real world settings, students become adept at translating general insights to their specific concerns. Organizational economics is built upon a hybrid approach to human behavior that draws from economics and social psychology. From economics, we take the idea that individuals can skillfully use the resources and information at their disposal to achieve their goals. From social psychology we take the idea that individual pursuit of their interests is complicated by the emotions, impulses, and cognitive biases built into human brains. The economic emphasis on goals implies that successful organizations must structure incentives and design jobs in ways that are consistent with the interests of employees. The psychological approach implies that successful organizations must also adopt motivational strategies that appeal to both the rational and non-rational drivers of human behavior. Prereq: ECON 102.

ECON 341. Money and Banking. 3 Units.
This course emphasizes the importance of financial markets, the nature and role of the financial system, and the linkages between these--money and banking--and the economy. Emphasis is placed on both theoretical and practical constructs, on major innovations and contemporary changes, and the closely intertwined condition of financial and economic systems with monetary and fiscal policy. Offered as BAFI 341 and ECON 341.

ECON 342. Public Finance. 3 Units.
Government intervention is a pervasive feature of every modern economy. The goal of this course is to develop the economic tools for understanding and evaluating a wide range of government behaviors such as taxation and redistribution policy, the public provision of goods and services, and the regulation of private markets. ECON 342 begins by considering "market failures" that justify government intervention in a market economy. To respond to such failures, governments must raise revenues through taxation. Using the tools of microeconomic theory, we will develop a framework for thinking about the positive and normative effects of alternative forms of taxation. Particular attention will be paid to the individual income tax in the U.S., allowing students to understand the efficiency, distributional and behavioral implications of recent changes in the tax code. We will then turn to the expenditure side of the public sector. The economic principles used to evaluate public expenditures will be discussed and exemplified through the analysis of significant public programs. Of particular interest will be the effect of public programs on the incentives faced by workers and families. Offered as BAFI 342 and ECON 342. Prereq: ECON 102.
ECON 343. Economics of State and Local Governments. 3 Units.
This course uses economic analysis to gain insight in the U.S. system of state and local governments. In the case of local governments, unlike the familiar case of the U.S. government, people often display their displeasure with the government’s actions by leaving rather than by voting against the incumbents. A careful consideration of the circumstances under which people will choose "exit" (moving out) over "voice" (voting) is central to the course. We’ll also examine economic theories of why people vote and how people vote. We consider a broad range of policy issues. Among them are school finance, zoning, local government economic development policies, lotteries, and affordable housing policy. Of course, we also analyze the full range of state and local government taxes, including the property tax, personal income tax, corporate income tax, and sales tax. Prereq: ECON 102 or consent of instructor.

ECON 346. Economic Perspectives. 3 Units.
This course examines important contemporary and historical issues from an economic perspective. It enables students to think about the world "like an economist." Possible topics of current interest include the transformation of Eastern Europe, ethnic and racial strife, environmental policy and sustainable development, and professional sports.

ECON 350. World Economic History: From Poverty to Prosperity. 3 Units.
The average person living in the industrialized world today has 10-20 times the annual income of his or her forbearers in 1800 and a much longer lifespan. What explains the massive increases in living standards for residents of the industrialized world? The average person living in Africa today has roughly the same if not less annual income than in 1800. Why haven’t all the world’s people seen a similar increase in living standards since 1800? These questions are the central themes of this course on the evolution of the world economy over the past millennium. Highlights of the class will include the pre-1800 Malthusian economy, the industrial revolution and its spread, 19th and 20th century globalization booms, and the development successes and failures of the 20th century. Prereq: ECON 102.

ECON 364. Economic Analysis of Business Strategies. 3 Units.
This course examines how companies compete against each other and interact with customers in an effort to increase profits. Topics include: pricing strategies, product differentiation, advertising, R&D strategies, bundling and tie-ins, entry barriers, mergers and acquisitions, collusion and cartels, the dynamics of network industries (e.g. information technology), and technology adoption and diffusion. The course will take two complementary perspectives. First, we will consider the point of view of companies, and ask how different business strategies can affect competitive success. Second, we will consider the perspective of consumers and policymakers: we will ask whether different firm strategies enhance or reduce social welfare, and will explore different policy options to increase welfare (e.g. antitrust policies, patent systems). The first part of the course will utilize a range of basic economic tools. In the second part of the course, we will apply what was learned in the first part to real examples of firms and industries, including both business and legal cases. Prereq: ECON 102.

ECON 367. Energy Economics and Engineering Solutions. 3 Units.
This course examines the economics of markets for various energy sources, and the potential of emerging technologies to alter the market outcomes. We will look at why energy markets have historically been subject to extensive government intervention. We will analyze the effects of traditional policy measures such as price controls and regulation; and we will examine current policy issues arising from the relationships among energy use, economic growth, and the environment. Prereq: ECON 102.

ECON 368. Environmental Economics. 3 Units.
This course will use economic theory as an aid to understanding environmental problems and their solutions. We will start with a study of the firm. Once we have developed an understanding of firms' incentives to pollute and overexploit natural resources, we will learn how various economic policies can change these incentives and thus prevent environmental degradation. Thereafter, we will evaluate the efficiency of these economic policies. Finally, we will apply our theoretical analysis to specific environmental problems. Prereq: ECON 102.

ECON 369. Economics of Technological Innovation and Entrepreneurship. 3 Units.
This course is designed to help students identify, evaluate, and obtain control over technological opportunities so they may successfully understand the challenges of starting new companies. The course focuses on four themes: 1) the source, discovery and evaluation of technological opportunities; 2) the process of organizing a new firm to produce new technology that satisfies the needs of customers; 3) the acquisition of financial and human resources necessary to exploit technological opportunities; and 4) the development of mechanism to appreciate the returns from exploitation of technological opportunities. Prereq: ECON 102.

ECON 372. International Finance. 3 Units.
This course deals with open-economy macroeconomics and international financial markets, covering open-economy national income analysis, international macroeconomic policy coordination, exchange rate determination, foreign portfolio investment, and global financial crises. Offered as BAFI 372 and ECON 372. Prereq: ECON 102 and ECON 103.

ECON 373. International Trade. 3 Units.
This course deals with international trade theories and policies, covering gains from and patterns of trade, immigration, foreign direct investment, protectionism, multilateral trade liberalization, regionalism and the costs and benefits of globalization within as well as among nations. Prereq: ECON 102 and ECON 103.
ECON 375. Economics of Developing Countries. 3 Units.
This course focuses on international aspects of economic development. The term "developing country" is often defined as a country that exhibits low per capita income, high poverty level, low level of industrialization, or low life expectancy. In terms of size, the developing countries make up at least three-fourth of the world population. Why do we study those countries' economies separately from the industrialized economies? In fact, low economic growth, high unemployment, or high poverty rates also exist in many developed countries. The differences lie not in the types of problems but in the causes of these problems. In addition, differences in the kind of institutions that prevail in developing countries also lead to different policy prescriptions. Among developing countries, differences in historical experience, cultural practices, political institutions and economic conditions are also enormous. Illustrations and explanations of those differences are provided from a wide range of developing countries. Prereq: ECON 102 and ECON 103.

ECON 376. Inside the Financial Crisis. 3 Units.
This is a case study in the events surrounding the 2007 global financial crisis. The course will build from fundamental economic concepts into a comprehensive analysis of the elements which led to the collapse and the contemporary policy debates about the recovery. The background for debate will come from an analysis of: Housing and housing finance, bank runs and Bear Sterns, mortgage backed securities and toxic asset purchases. The course will then examine major components of the Dodd-Frank Act and enable students to assess whether the act will address the causes of the 2007 crisis and more importantly establish the conditions to prevent a future crisis. Prereq: ECON 102 and ECON 103.

ECON 378. Health Care Economics. 3 Units.
The health care industry is the fastest growing sector of the U.S. economy, with expenditures on health care now accounting for over 14% of total GDP. Because of its complexity and sheer size, the health care industry affects virtually every facet of the economy including labor productivity, income distribution and international competitiveness. The goal of ECON 378 is to apply the tools of economic analysis to develop students' understanding of health care markets and related public policy issues. The course begins with an overview of the health care system in the U.S. with attention to disturbing statistics that have inspired calls for reform. The remainder of the course is approximately divided between analysis of the consumer side of the health care market and analysis of the provider side. Throughout the course, proposals for reforming the health care system will be described and discussed. Prereq: ECON 102.

ECON 386. Urban Economics. 3 Units.
Microeconomic theory as taught in principles (and even intermediate) does not usually take into account the fact that goods, people, and information must travel in order to interact. Rather, markets are implicitly modeled as if everyone and everything is at a single point in space. In the first part of the course, we will examine the implications of spatial location for economic analysis. In the second part of the class, we will use microeconomic tools to understand urban problems. Topics that we will cover include urban growth, suburbanization, land use, poverty, housing, local government, transportation, education, and crime. Prereq: ECON 102.

ECON 391. Advanced Topics and Writing in Economics. 3 Units.
This course is characterized by intensive yet open-ended intellectual inquiry, guided by reading from primary and secondary sources, and will include extensive practice in written and oral communication. The focus will be on contemporary economic issues and scholarship, and assumes a high level of ability in undergraduate economics training. Specifically, this course provides an avenue for an intellectual discourse on some of the most challenging present day economic issues, and we will rigorously think and write about how economic concepts can be applied to virtually any topic, issue and event in the social world. Students will be challenged throughout the course to think and write like an economist and see the world through the economist's lens. Prereq: ECON 308 or ECON 309 and ECON 326 and junior or senior standing.

ECON 395. The Economy in the American Century. 3 Units.
This class provides an approved SAGES capstone experience for economics majors. It uses American economic history as an arena for a culminating application of the diverse knowledge and skills students have acquired during their undergraduate careers. The twentieth century American economy was shaped by a series of transformations that make our lives profoundly different from those lived by Americans in 1900. Attempting to understand these transformations has shaped the discipline of economics. Events and processes such as mass migration, the Great Depression, the growth of women's participation in the workforce, and suburbanization generated questions that economists developed theories and bodies of empirical evidence to answer. Students will synthesize knowledge accumulated in their prior undergraduate study to tackle big questions posed by the history of the American economy during the 20th century. These questions cover the spectrum of economic life and scholarship, from finance and technology to human capital and gender. Students form teams to tackle an important question developed in consultation with the instructor. Each team will be responsible for educating the class on their research findings through researching and delivering a class-length presentation and preparing readings and exam questions. Students will produce an individual final paper related to their team's topic that expresses their own scholarly perspective and interest. Prereq: Junior or Senior standing.

ECON 397. Honors Research I. 3 Units.
All students admitted to the Honors Program will undertake an independent research project (Senior Thesis) under the guidance of a faculty member (Thesis Advisor). ECON 397 is used to define the topic, review relevant literature, formulate hypotheses, and collect appropriate data toward completing their research project. Students will have the responsibility of providing regular progress reports to their thesis advisor highlighting the work accomplished to date, the immediate challenges confronting them, and a plan to complete the project in the time remaining. Prereq: ECON 102, ECON 103, ECON 326 and ECON 308 or ECON 309; Junior standing and minimum GPA of 3.3 in ECON major and 3.0 overall.

ECON 398. Honors Research II. 1 - 3 Unit.
This is the second course in a two course sequence to complete the Honors Research Program in Economics. Prereq: A grade of B or higher in ECON 397.

ECON 399. Individual Readings and Research. 1 - 6 Unit.
Intensive examination of a topic selected by the student.
ECON 403. Economics for Management. 3 Units.
This course surveys the basic principles of micro and macroeconomics. Topics covered in microeconomics include supply and demand, the theory of production and costs, market structures and factor markets. Macroeconomics topics are the national incomes accounts, the determination of national income, employment and inflation, fiscal and monetary policies and international trade.

ECON 403A. Economics. 1 Unit.
This course serves as a review of economic principles and an introduction to the use of economics in the management setting. Basic economic concepts will be demonstrated by analyzing economic issues and policies relating to the environment in which organizations function. Economic analysis will be demonstrated with reference to particular decisions confronted by firms, including game theory. Prereq: Open to ACL-MBA students.

ECON 421. Health Economics and Strategy. 3 Units.
This course has evolved from a theory-oriented emphasis to a course that utilizes economic principles to explore such issues as health care pricing, anti-trust enforcement and hospital mergers, choices in adoption of managed care contracts by physician groups, and the like. Instruction style and in-class group project focus on making strategic decisions. The course is directed for a general audience, not just for students and concentration in health systems management. Offered as ECON 421, HSMC 421, and MPH 421. Prereq: ECON 403 or MBAC 512 or MBAP 406.

ECON 431. Economics of Negotiation and Conflict Resolution. 3 Units.
Students frequently enroll in a negotiation class with one thought in mind--negotiating a better job offer from an employer. They soon learn, however, that negotiation skills can do far more than improve a pay check. Negotiations occur everywhere: in marriages, in divorces, in small work teams, in large organizations, in getting a job, in losing a job, in deal making, in decision making, in board rooms, and in court rooms. The remarkable thing about negotiations is that, wherever they occur, they are governed by similar principles. The current wave of corporate restructuring makes the study of negotiations especially important for M.B.A.s. Mergers, acquisitions, downsizing and joint ventures call into question well established business and employment relationships. Navigating these choppy waters by building new relationships requires negotiation skills. The increased stress on quality and other hard-to-measure aspects of relationships with customers and suppliers makes the process of negotiation even more complex and subtle. For these reasons, negotiation classes have taken center stage in the study of management. Every major business school now offers classes in negotiation and these classes are overflowing with students. Offered as ECON 431 and LHRP 413.

ECON 464. Technology Entrepreneurship. 3 Units.
This course is designed to help students to identify, evaluate, and obtain control over technology opportunities that they can successfully exploit by starting new companies. The course focuses on four themes: (1) the source, discovery, and evaluation of technological opportunities, (2) the process of organizing innovation to produce new technology that satisfies the needs of customers, (3) the different mechanisms available to appropriate the returns from the exploitation of technological opportunities, and (4) the differences between opportunities and approaches that are valuable and sustainable for independent entrepreneurs and large firms. Students taking this course may not receive credit for both ECON 464 and ENTP 441. Offered as ECON 464 and ENTP 464.

ECON 474. International Trade. 3 Units.
This course deals with the causes and effects of international trade and investment. Its coverage includes the global and regional commercial agreements and institutions that affect the international business environment. The European Union, the North American Free Trade Agreement, and the World Trade Organization are treated extensively. Prereq: ECON 403.

ECON 486. Value Creation Through Real Estate. 3 Units.
Introduction to economic analysis of real estate markets, with focus on development of urban land. Introduction to financial instruments used in development, and to the role of government in facilitating and constraining the use of real property. Prereq: ECON 403.

ECON 501. Special Problems and Topics. 1 - 18 Unit.
This course is offered, with permission, to students undertaking reading in a field of special interest.

ECON 526. Advanced Econometrics. 3 Units.
This course focuses on the theoretical underpinning of multivariate regression analysis. The course also develops practical applications of econometric analysis. The course also introduces students to more advanced topics including discrete choice analysis, instrumental variables, and time-series methods.

ECON 601. Special Problems and Readings. 1 - 18 Unit.
This course is offered, with permission, to Ph.D. candidates undertaking reading in a field of special interest.

ECON 701. Dissertation Ph.D.. 1 - 18 Unit.
Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

EDMP Courses

EDMP 610. Culture and World Politics. 3 Units.
Religion, ethnicity, and nationalism have assumed major political significance in the post Cold-War and post-9/11 eras. The course examines ideas of political democracy and economic liberalism in relation to different cultural and religious ideas and explores relationships among social values, political structures, and economics. Prereq: Must be enrolled in the DM Program.
EDMP 611. Theory and Practice of Collective Action. 3 Units.
The ability of autonomous and interdependent parties to coordinate actions, or to act cooperatively, affects a wide range of organizational and social problems. This course addresses the theory and practice of collective action in local, national and global contexts. Case studies of collective action problems, such as environmental protection, community revitalization, and the mobilization of interest groups will be discussed.

EDMP 613. Leading Change. 3 Units.
Change is an enigma and yet sustained, desirable change (SDC) drives adaptation, growth and life itself. In this course, we will continuously attempt to answer two questions: What is the process of sustained, desirable change? and What is the role of a leader? Concepts from complexity theory will be used, including understanding the multilevel nature of SDC at the individual, dyad, team, organization, community, country, and global levels. Intentional Change Theory (ICT) will be used as the organizing concept for the changes studied. Leadership and its development will be examined by studying a number of topics and applying them to three major case studies: (1) yourself; (2) practice coaching with compassion; and (3) a major change project. This course will explore questions, such as: Who are effective leaders? How do they think and act? What makes us want to follow them? How are leaders developed? What is the role of emotional and social intelligence? How does a leader’s mind, body, heart, and spirit affect their performance?

EDMP 614. Business as an Evolving Complex System. 3 Units.
The goal of this course is to provide a foundation for understanding how business systems evolve, why the business systems in the major advanced countries have evolved differently over the last 100 years or so, and what the underlying driving forces are. The focus is on transformation rather than economic growth. The course examines the evolution of business systems as a result of technological and organizational change. It deals with the role of history, culture and finance in generating business organizations in various countries. The course also studies the emergence of regional innovation systems and industry clusters, as well as how digitization and globalization are changing the "industrial logic."

EDMP 616. Global Economic Systems and Issues. 3 Units.
This course provides a framework and analytical tools for understanding globalization and international economic relations in the context of the global political system. It analyzes the economic and political forces that are shaping global cooperation on economic matters, the role and impact of international economic institutions such as the World Bank, the International Monetary Fund, and the World Trade Organization, and evolving forms of regional governance, such as the European Union. It covers national and international policies and development and the causes and cures of international financial crises. The course revolves around concepts of efficiency, equality, power, and institutions in the making of public policy towards globalization of communications and transportation. Prereq: EDMP 665.

EDMP 617. Technology and Social System Design. 3 Units.
Managers are designers who shape the social and technical world we inhabit. This course explores the process of design and asks how managers can become better designers and interventionists who anticipate and evaluate the social, economic, and political consequences of existing and emerging products, processes, and organizational forms.

EDMP 627. Applied Research IV. 3 - 9 Units.
(See EDMP 621.)

EDMP 638. Qualitative Inquiry I. 3 Units.
This course explores ways to conceptualize an object of study and facilitates formulation of students’ conceptual work and production of research reports at the end of the first year of the program. The course conveys how to generate research ideas by critically reviewing literature and developing ideas that contribute to a problem or issue of interest by working with theory and extending previous research. The practicality of conducting certain kinds of research is evaluated and length, intensity and ethical constraints of different research efforts are examined. Each student produces a report communicating and supporting a conceptualization of the phenomenon of interest involving independent, mediating and dependent variables. The paper defines a problem of practice, presents, both visually and in narrative form, concepts shaped by field experience and prior writing that promote understanding of the problem, and includes a research proposal describing sample, data collection and data analysis. Prereq: EDMP 665.

EDMP 640. Social Ethics: Contemporary Issues. 3 Units.
The course draws upon intellectual ancestors and current thinkers in moral philosophy and ethics to assist each student in identifying, analyzing, and discussing social and ethical questions pertaining to the definition and purpose of contemporary life, the need for moral coherence, and the meaning of life in a global society. The unifying theme of the course is Tolstoy’s question, “How then shall we live?” The course does not seek to provide answers to the great questions of life. Rather, it tries to expand each student’s capacity to grapple with such questions. Prereq: Must be enrolled in the DM Program.

EDMP 641. Qualitative Inquiry II. 3 Units.
This course guides the student in conducting the qualitative research project that was proposed in EDMP 638. Fieldwork and initial analysis is conducted during the summer when data based on semi-structure interviews is collected and analysis begins using inductive coding techniques. A summer residency is held in mid-June to assess progress as final data collection and analysis continues. The aim of the fall semester is to prepare a formal research report on that project, which will be submitted to an academic research conference. The final report includes a revision of one’s conceptual model, integrating new understandings and literature arising from the data collection and analysis. Prereq: EDMP 638.

EDMP 642. Directed Studies Seminar. 1 - 9 Unit.
At different times during the Program, EDM students register for Directed Studies courses. The purpose of these courses is to recognize the work the students are doing to conduct and present their individualized research at a high quality level. Activities conducted under the Directed Studies courses are dedicated to the collection of qualitative or quantitative data and the preparation of research reports.

EDMP 643. Measuring Business Behaviors and Structures. 3 Units.
This course aims to develop the basic foundations and skills for designing and executing generalizable studies. It focuses on building competence in model building, construct measurement, research design, data collection methodologies, and application of analytical software commonly involved in quantitative inquiry. Covered topics include framing research questions, reliability and validity of measurement, quasi-experimental research design, and fieldwork for data collection. Classes are designed to balance between the theory and practice of quantitative research design, and will be linked to the participant’s own research projects. Prereq: EDMP 641.
EDMP 644. Multivariate Data Analysis. 2 Units.
Building on instruction in univariate statistics, this course covers the fundamental assumptions, principles, and applications of multiple regression and structural equation modeling methodologies for analyzing quantitative data. It focuses on building competence in analytical skills for testing hypotheses guided by a conceptually sound and pragmatically useful model of some real world phenomenon. Analytical software used include SPSS and AMOS. Prereq: EDMP 641.

EDMP 645. Integration of Qualitative and Quantitative Inquiry. 3 Units.
Using the mixed method research toolkit developed in previous courses, this course focuses on critically analyzing selected pieces of published applied and policy research to develop a critical appreciation of issues and debates that have wide applicability and relevance. In particular, it offers students ways to integrate and triangulate using a mixed method approach, different forms of evidence, and related evidence. In addition, this course addresses common method choice and justification issues and related challenges of validity and theory formulation that typically arise during the students’ execution of a series of individual research projects. Application of critical analysis and appreciation approach in justifying mixed methods designs to the student’s own research work is encouraged and supported by sharing and discussing common research and methodology themes and problems. Prereq: Must be enrolled in the DM Program.

EDMP 646. Advanced Analytical Methods for Generalizing Research. 3 Units.
This course addresses advanced topics in regression and structural equation modeling such as latent growth curve models, partial least squares, logit models, tests for various types of invariance, multiple-group analysis, multilevel analysis, and analyzing qualitative/categorical data. These analytical methods are intended to enhance the student’s toolkit as to facilitate a strong bridge to the academic literature and the application to specific data based problems that arise in applied managerial research.

EDMP 647. Introduction to Statistics. 1 Unit.
This course introduces basic statistical concepts and their application in social research building, elementary statistical methods and applications, descriptive statistics, random variables, sampling distribution, estimation, hypothesis tests. The course also provides an introduction to data analysis using SPSS computer software.

EDMP 648. Causal Analysis of Business Problems I. 3 Units.
Model Building & Validation I introduces fundamental concepts in theory-based model building and validation. In this course students will develop, explore, refine and validate a range of models appropriate for addressing their problem of practice including classification models, process models, variance models, and articulating nomological networks. In particular, the course will focus on effective conceptualizations of causation, control, mediation, and moderation. Further, foundational statistical techniques such as tests of assumptions of the data, exploratory factor analysis, and regression and path analysis will be introduced. Prereq: Must be enrolled in the DM Program.

EDMP 649. Causal Analysis of Business Problems II. 3 Units.
Building upon the first course in Model Building & Validation, this course will guide students through the theoretically-grounded variance models that are required for testing through structural equation modeling (SEM) in the quantitative portion of their research. Fundamental concepts in model testing will be reinforced using path analysis, and will include a deeper exploration of moderation by addressing topics such as moderated mediation and interaction effects. Beyond the analysis the course will emphasize precise and accurate formulation of theoretical models and associated reasoning, as well as careful interpretation of findings. The class will also delve into testing of data assumptions and prepare students for the model testing portion of their capstone assignments. Prereq: Must be enrolled in the DM Program.

EDMP 660. Directed Studies: Qualitative Fieldwork. 1 - 3 Unit.
This course is part of the qualitative research sequence which began with EDMP 638, Qualitative Research Methods I. In this qualitative fieldwork course, students will conduct a series of interviews based on the research proposal and interview guide which they developed in EDMP 638. Students are expected to complete their interviews and work with faculty to begin initial analysis of the interview data.

EDMP 661. Directed Studies: Qualitative Research Report Preparation. 1 - 3 Unit.
This course is dedicated to individualized student research. Student research objectives and plans are implemented through qualitative and quantitative fieldwork, report preparation, and manuscript development and submission.

EDMP 662. Directed Studies: Quantitative Fieldwork. 1 - 3 Unit.
This course is dedicated to the design, development and execution of the student’s individualized research work. Each student will be expected to develop a proposal for research work that aims to empirically test a conceptual model to address a significant substantive problem. Following faculty approval and feedback, each student will be expected to conduct field work for data collection in accord with a research design that yields high quality data. Completion of the course requirements will rest on the satisfactory completion the fieldwork as per guidelines provided in the course.

This course is dedicated to the execution and completion of student’s individualized research work. Each student will be expected to execute a research study to provide reliable and valid conclusions using rigorous quantitative methodologies and write a publishable quality paper for submission to faculty for approval. It is highly desired that student papers be submitted for presentation and publication at appropriate academic and/or practitioner outlets. Completion of the course requirements will rest on the satisfactory completion and submission of the research paper as per guidelines provided in the course.
EDMP 664. Knowledge Dissemination to Influence Managerial Practice. 3 Units.
The aim of this course is twofold. First, it supports students organizing and writing their DM thesis overview or their PhD thesis proposal. Also discussed are ways to organize and communicate in scientific genres, their aims and their generic properties. Secondly, students become acquainted with scientific communication and publishing. Effective reviewing, criteria for judging articles and theses, management of review processes, and how to communicate and respond to reviews are topics discussed. The course also addresses publication strategies and ways of managing and communicating scientific and managerial knowledge to different stakeholders. Prereq: Must be enrolled in the DM Program.

EDMP 665. Introduction to Research Inquiry. 3 Units.
This course begins participants’ three-year research experience. Energized by one’s personal passion and commitment to the topic, we seek for the work to be accomplished at a level that makes it worthy of widespread dissemination and influence as engaged scholars. The goal in this course is to prepare students to develop their minds as scholars by understanding the world of research; develop a research identity by identifying one’s research domain; learn to read academic literature and write in a scholarly style; work with academic literature to identify and digest concepts and theories that inform research on that problem; begin to develop a conceptual model that abstracts how the world may be functioning in that problem domain and points to a research question that can guide the next stage of the research. The final deliverable for this course is to present the research topic with substantiation for its significance, relevance and timeliness in the management field. This would include the research question(s); the literature review; and proposed qualitative methodology and analytical approach(es).

EDMP 671. Design and Sustainable Systems. 3 Units.
The goal of this course is to introduce doctoral students to the nature and practice of design as a strategy of inquiry as well as a mode of action in addressing the problems of creating and managing sustainable human systems. The objectives are (1) to introduce the conceptual framework of design, (2) the nature of human interaction as seen from the perspective of design, (3) the intellectual and practical strategies of design, (4) the methods and techniques of design that are relevant to the study and design of sustainable human systems, and (5) the nature of “wicked problems” and the ethical issues of design, with special attention to the place of human dignity in the design of sustainable systems. The course will employ key elements of the literature of design, close reading and discussion, and exercises that explore the concepts and methods of design. Prereq: Must be enrolled in the DM Program.

EDMP 672. Sustainability and Social Value Creation. 3 Units.
This course is designed to galvanize new visions of business and society, as well as organizational leadership. The course is born of a conviction that the future of human society and the natural world is intimately linked to the future of the world economy, business enterprises, and management education. The course presentations, books, dialogues, and interview projects are organized around three themes: (1) the state of the world and the economics possibilities of our time, (2) the business case for understanding business as an agent of world benefit—how business performance can profit from current and future advances in sustainable design and social entrepreneurship; and (3) tools for becoming a change leader—including the methods of Appreciative Inquiry and new insights about “strength-based” change emerging from the science of human strengths. The overarching aim is to provide a powerful introduction to the many facets of sustainable value creation as a complete managerial approach. Prereq: Must be enrolled in the DM Program.

EDMP 673. Understanding, Designing, Managing Complex Systems. 3 Units.
The purpose of this course is to provide a perspective on systems thinking and complex systems and aid PhD students in expanding the ideas in their research on systems, systems models, and complex systems. The work of the course will develop with increasingly difficult books on the subject of complex systems, a major case study in health care, and individual applications of the concepts to their potential research model and methods. Prereq: Must be enrolled in the DM Program.

EDMP 674. Effectiveness of Institutional, Individual and Organizational Decision Making. 3 Units.
This course introduces students to research on individual judgment and decision making. Drawing insights from research in economics, political science, psychology, management, and sociology, behavioral decision making and judgment is the study of how-why-when people make decisions. Sessions introduce and explore the discipline. Along with a historical review of the literature, the general topics of emotion, experience, self control, and motivation are introduced. Behavioral finance is a topic specifically used as the lens through which individual, group, and firm decision making and judgment are analyzed. Designed to expose the student to a number of academic theories which may be incorporated into their second year paper, this course will also allow the student to experience a deeper dive into the particulars of academic literature including research design, literature reviews, discussion and dissemination, etc. This course will employ an integrated learning format. Lectures, group projects, written assignments, etc. will be used throughout this semester. Prereq: Must be enrolled in the DM Program.

EDMP 676. Conflict & Cooperation in the Global Arena. 3 Units.
The global arena is described by some as a realm of perpetual conflict. Others argue that given the right institutions and incentives, international actors can find ways to achieve cooperation, peace and increased global prosperity. Still others suggest that the international political and economic arena is “what you make of it”—emphasizing the role of norms, identities and ideas in shaping international outcomes. This course will examine both theoretical and policy perspectives regarding the question of international conflict and cooperation, with a specific emphasis on drawing on insights from collective action theory and international relations scholarship. Prereq: Must be enrolled in the DM Program.
Program participants who have not successfully completed their Applied Research Projects before the start of the fall semester following their third year of enrollment in the E.D.M. Program will have seven years from the date of their initial matriculation into the Program to complete degree requirements. If their work continues beyond the normal 54 credit hours of designed courses, they will register for Applied Research Project Continuation. Continuation credits may also be used for students enrolling in the Program after August 2000, who have not completed their required course work and research requirements within the Program’s required 54 semester credit hours. Prereq: EDMP 665.

EMBA Courses

EMBA 417. TEAMS. 1 Unit.
This course enables the formation of E.M.B.A. study groups and classroom learning environment by introducing participants to their adult learning styles, models of group decision-making, theories of team development and rules of engagement for effective learning teams. Prereq: E.M.B.A. students only.

EMBA 436. Accounting for Business Executives. 3 Units.
This course is an introduction to financial and managerial accounting, rather than a course in introductory accounting. This course is designed for the business professional and is intended to prepare the student to use the information prepared by accountants. It will not dwell in detail on the technical aspects of accounting or bookkeeping. In addition, this course is designed to help the student become an effective user of cost information, from the perspective of parties internal to the firm. This aspect of accounting is a compilation of techniques rather than a set of rules. Since the information is for private use, the goal is to create the most meaningful and useful data for use by managers. Assignments will be designed to develop the student’s ability to analyze and interpret accounting data and to more effectively utilize accounting data in day to day business decisions. Finally, this course is intended to strengthen abilities to identify problems and opportunities, to search out and analyze desired information leading to a well-reasoned conclusion, and to perform sensitivity analysis around that conclusion, using financial information. Prereq: E.M.B.A. candidates only.

EMBA 437. Economic Analysis for Managers. 3 Units.
This course, which is limited to students in the Executive M.B.A. program, explores the basic elements of the economic system which the executive needs to know in order to understand how the firm interacts with the system and how economic factors affect decision making. Prereq: E.M.B.A. candidates only.

EMBA 437B. Economic Analysis for Managers. 1.5 Unit.
This course, which is limited to students in the Executive M.B.A. program, explores the basic elements of the economic system which the executive needs to know in order to understand how the firm interacts with the system and how economic factors affect decision making. Prereq: EMBA 437A

EMBA 438A. Business Statistics and Quantitative Analysis. 1.5 Unit.
In this course, students study the use of modern quantitative and business statistics to support the executive decision-making process. With the help of computer software, the models examined assist in describing and analyzing problems and suggesting possible managerial actions. The techniques discussed include tools for decision making under uncertainty including regression analysis. This course is part of a two (2) course sequence. Prereq: E.M.B.A. candidates only.

EMBA 438B. Business Statistics and Quantitative Analysis. 1.5 Unit.
In this course, students study the use of modern quantitative and business statistics to support the executive decision-making process. With the help of computer software, the models examined assist in describing and analyzing problems and suggesting possible managerial actions. The techniques discussed include tools for decision making under uncertainty including regression analysis. This course is part of a two (2) course sequence. Prereq: EMBA 438A

EMBA 439. Corporate Finance. 3 Units.
The central organizing principle of this course is to familiarize the class with the basics of valuation. This first course in finance introduces the tools and methods employed in valuation of projects and corporate securities. Valuation involves the determination of (i) cash flows of the firm, project or financial assets and (ii) the discount rates that are used to compute the present values of the cash flows. Asset pricing models provide the underpinnings for the development of the discount rates. The material is synthesized in capital budgeting exercises which are cost-benefit analyses of capital project cash flows to evaluate whether they are value enhancing. Prereq: E.M.B.A. candidates only.

EMBA 439B. Corporate Finance. 1.5 Unit.
The central organizing principle of this course is to familiarize the class with the basic of valuation. The first course in finance introduces the tools and methods employed in valuation of projects and corporate securities. Valuation involves the determination of (i) cash flows of the firm, project or financial assets for (ii) the discount rates that are used to compute the present values of the cash flows. Asset pricing models provide underpinnings for the development of the discount rate. The material is synthesized in capital budgeting exercises which are cost-benefit analyses of capital project cash flows to evaluate whether they are value enhancing. Prereq: EMBA 439A

EMBA 441A. Leading Change: Self. 2 Units.
The primary objective of Leading Change: Self is to learn a method for assessing your knowledge, abilities, values, and interests relevant to leadership and executive management so that you will be able to develop and implement a plan for enhancing your leadership and executive capability throughout your career and life. The enabling objectives are: (a) To systematically identify your current and desired capability (i.e., knowledge, abilities, values, and interests); (b) To develop an individualized learning agenda and plan for the next 3-5 years; and (c) To explore techniques to assist others in doing the same. This course will explore questions, such as: Who are effective leaders? How are they different than managers? How do they think and act? What makes us want to follow them? How are leaders developed? How can people help others become effective leaders? What type of leader do I want to be? And, what can I do to become that type of leader? This course is part of a two (2) course sequence. Prereq: E.M.B.A. candidates only.
EMBA 441B. Leading Change: Self. 1 Unit.
The primary objective of Leading Change: Self is to learn a method for assessing your knowledge, abilities, values, and interests relevant to leadership and executive management so that you will be able to develop and implement a plan for enhancing your leadership and executive capability throughout your career and life. The enabling objectives are: (a) To systematically identify your current and desired capability (i.e., knowledge, abilities, values, and interests); (b) To develop an individualized learning agenda and plan for the next 3-5 years; and (c) To explore techniques to assist others in doing the same. This course will explore questions, such as: Who are effective leaders? How are they different than managers? How do they think and act? What makes us want to follow them? How are leaders developed? How can people help others become effective leaders? What type of leader do I want to be? And, what can I do to become that type of leader? The course will take place over two semesters. This course is part of a two (2) course sequence. Prereq: EMBA 441A.

EMBA 442. Innovation. 3 Units.
Organizations are under continuous pressure to be efficient and productive in order to generate (often short-term) profit. At the same time they must innovate to remain competitive in the long-term. Innovation involves the generation, development, and delivery of new products, processes, or businesses. Intrapreneurs are those who can successfully bring new ideas to fruition in established organizations. Innovation in the context of an established organization requires that intrapreneurs fundamentally understand the dynamics of innovation and innovation management. This course introduces fundamental concepts associated with innovation in the context of an established organization. Prereq: E.M.B.A. candidates only.

EMBA 443. Supply Chain Management. 3 Units.
Operations managers, ranging from supervisors to vice presidents, are concerned with the production of goods and services. More specifically, they are responsible for designing, running, controlling and improving the systems that accomplish production. This course is a broad-spectrum course with emphasis on techniques and information that are helpful to the practice of management in general and at any level. We will discuss commonly occurring application problems such as process analysis, inventory control, quality management, just-in-time concepts, etc. The field of operations management was originally concerned with manufacturing systems. But many of the same ideas apply, and the same trade-offs are present, in service organizations like health care, insurance, hotel-management, airlines and government related operations. Several manufacturing and non-manufacturing environments will be discussed explicitly, and the emphasis will be on the fundamentals of the operations function in an organization. Also we will explore the interface of operations management with other functional areas such as marketing, finance, accounting, etc. Prereq: E.M.B.A. candidates only.

EMBA 443B. Supply Chain Management and International Experience. 1.5 Unit.
Operations managers, ranging from supervisors to vice presidents, are concerned with the production of goods and services. More specifically, they are responsible for designing, running, controlling and improving the systems that accomplish production. This course is a broad-spectrum course with emphasis on techniques and information that are helpful to the practice of management in general and at any level. We will discuss commonly occurring application problems such as process analysis, inventory control, quality management, just-in-time concepts, etc. The field of operations management was originally concerned with manufacturing systems. But many of the same ideas apply, and the same trade-offs are present, in service organizations like health care, insurance, hotel-management, airlines and government related operations. Several manufacturing and non-manufacturing environments will be discussed explicitly, and the emphasis will be on the fundamentals of the operations function in an organization. Also we will explore the interface of operations management with other functional areas such as marketing, finance, accounting, etc. Prereq: E.M.B.A. candidates only.
EMBA 446. Managing Risk and Real Options. 3 Units.
The course seeks to help corporate managers understand how financial design can be used to advance the goals and strategies of the firm. In the Finance course, you concentrated almost exclusively on the firm's capital expenditure decision. You studied in great detail the discounted cash flow model, NPV, how you get your cash flows, and how you discount according to risk. Now we move to the other side of the balance sheet to look at how the firm can finance these expenditures. The first part of this class provides the basic building blocks of financial engineering which begins with call and put options. The course focuses on using derivatives (calls and puts) to change a firm's risk profile with respect to equity, interest rate, foreign exchange, credit, and commodity risks. We look at capital structure decisions and securitization issues and discuss what it means to create optimal structures. Almost immediately we will tie this to our financial crisis and obtain an appreciation for financial designs that could be setup so as to enhance firm value, mitigate systemic risks, or accomplish specific sustainable goals in a global economy. The second part of the class is geared towards real options and its relationship to strategic planning. In competitive markets, no one expects to formulate a detailed long-term plan and follow it mindlessly. As soon as we start down the path, we begin learning about business conditions, competitors' actions, and so forth and we need to respond flexibly to what we learn. Unfortunately, the financial tool most widely relied on to estimate the value of strategy, DCF, assumes that we follow a predetermined plan, regardless of how events unfold. A better approach to valuation would incorporate both the uncertainty inherent in business and the active decision making required for strategy to succeed. Prereq: E.M.B.A. candidates only.

EMBA 449. Contemporary Issues in Management. 3 Units.
This course is intended to address the contemporary issues in management to be decided by faculty and student interest. With the current global economic crisis, this year the course will focus on International Finance and Economics. In subsequent years, the topics will evolve as the global business climate changes. Prereq: E.M.B.A. candidates only.

EMBA 450. Managerial Marketing. 3 Units.
This course is designed with three overarching objectives. The first is an emphasis on decision making in a broad range of market contexts. The second objective builds on the notion that decision making is dynamic; that is, market situations demand not just one good decision but a series of them as a situation unfolds (providing new and varied information for each subsequent decision). Integrating concepts from a number of the courses that you are taking concurrently into decision-making about markets is a final objective. Prereq: E.M.B.A. candidates only.

EMBA 451. Business Model Design. 3 Units.
In most companies the process of designing business models is an ad hoc process and in my opinion an inefficient process. In this course you will learn a systematic but iterative process to do this. We will expose you to some broad categories of business models and internalize the basic logic of how to make money in each of these categories. The first step is to recognize which of these categories is most applicable to your business. The second step is to customize these broad patterns to the specifics of the business at hand. This seems easy because everything is in English and there are no hard formulas to figure out. However, unless you discipline yourself to systematically go through a structured process (there are other equally valid processes than the ones you'll be exposed to) it is very easy to fall into the ad hoc trap. You will internalize this process by applying it over a wide range of business situations that will give you confidence in its applicability to any business opportunity. After the completion of this course you should be quickly able to draw the outline of a business model for any business opportunity that you're considering. Prereq: E.M.B.A. candidates only.

EMBA 457. International Trade and Finance. 2.5 Units.
This course consists of two parts. The first part deals with the global trade and direct investment environment. It covers the theories as well as the political economy of international trade and foreign direct investment. Its aim is twofold: (i) to enable an understanding of such technical issues as to how the effects of tariffs and quotas differ or how free trade areas and customs unions differ; and (ii) to provide a systemic view of how government policies and corporate strategies interact in changing the global trade and investment environment of business. The second part of the course deals with regional economic integration and the global monetary system. Its aim is twofold (i) to enable an understanding of such technical issues as to how different stages of economic integration such as free trade areas and customs union differ; how the foreign exchange market functions in terms of different hedging instruments in the context of the international monetary system; and (ii) to provide a systemic view of how government policies and corporate strategies interact in changing the global trade and financial environment of business. Prereq: E.M.B.A. candidates only.

EMBA 464. Legal Environment. 3 Units.
This course provides a brief overview of the legal system that managers face, with an emphasis on contracts, corporate law, property rights and the modern regulatory apparatus of government. Contracts include full coverage of the Uniform Commercial Code. Corporate law is the capstone of the consideration of other forms of business organizations such as partnerships. Regulatory areas include employment law and environmental law. Property coverage includes modern struggles over intellectual ownership claims (patents, copyrights, etc.). Prereq: E.M.B.A. candidates only.

EMBA 472. Leading Change: The Organization. 3 Units.
Participants in this course will be challenged to enhance their leadership capacity by assessing and analyzing the knowledge, abilities, values and interests relevant to executives. The course will also explore the art of reading and understanding organizations in ways that help us imagine, design, and develop organization excellence. Prereq: E.M.B.A. candidates only.
EMBA 473. Leading Change: Teams. 3 Units.
Sustainability of effective leadership is necessary for adaptive, resilient organizations and for the health and functioning of the leader. Chronic stress results in diminished cognitive functioning, as well as poor health and a contagion of negative mood in organizations. The latest advances in social neuroscience and endocrinology will be used to develop an understanding how someone in a leadership position can renew themselves and mitigate the ravages of chronic stress. The short course will focus on how to coach others toward renewal and sustainability. Prereq: E.M.B.A. candidates only.

EMBA 473A. Leading Change in Dyads and Teams and Beyond. 1.5 Unit.
Sustainability of effective leadership is necessary for adaptive, resilient organizations and for the health and functioning of the leader. Chronic stress results in diminished cognitive functioning, as well as poor health and a contagion of negative mood in organizations. The latest advances in social neuroscience and endocrinology will be used to develop an understanding how someone in a leadership position can renew themselves and mitigate the ravages of chronic stress. Examining leadership in dyads, the course will focus on how to coach others toward renewal, sustainability, and effective leadership. In the context of an International Change Theory and complexity concepts, the course will also examine in detail how to lead and develop teams to be effective. This course is part of a two (2) course sequence. Students will receive a grade of "R" at the end of the Fall Semester; the "R" will then be changed to the appropriate grade at the end of the Spring Semester. Prereq: E.M.B.A. candidates only.

EMBA 473B. Leading Change in Dyads and Teams and Beyond. 1.5 Unit.
Sustainability of effective leadership is necessary for adaptive, resilient organizations and for the health and functioning of the leader. Chronic stress results in diminished cognitive functioning, as well as poor health and a contagion of negative mood in organizations. The latest advances in social neuroscience and endocrinology will be used to develop an understanding how someone in a leadership position can renew themselves and mitigate the ravages of chronic stress. Examining leadership in dyads, the course will focus on how to coach others toward renewal, sustainability, and effective leadership. In the context of a International Change Theory and complexity concepts, the course will also examine in detail how to lead and develop teams to be effective. Prereq: EMBA 473A.

EMBA 475. International Tour. 3 Units.
This course is designed to present first-hand issues in international management. It accomplishes this by means of readings, a written assignment and, most importantly, an international trip designed to witness different management cultures, styles and environments for business in the international community. Faculty responsibility rests with the Faculty Director of the E.M.B.A. Program as well as a "Resident Faculty" specific to each field trip. Such faculty are drawn from the Weatherhead community and vary by the design and destination of the trip. In addition, the course is staffed by an administrative assistant from the complement of Dively CMDR staff. Occasionally and where appropriate, there is also "in-tourist" assistance in some of our foreign locations. Prereq: E.M.B.A. candidates only.

EMBA 476. Corporate Governance. 3 Units.
The course structure is grounded in the following themes: - The role of the board of directors; - The CEO relationship to the firm's principal stakeholders (shareholders, board of directors, employees, customers) and the CEO's responsibility to give back (time and money) to the community; - CEO role in developing and maintaining the organization's vision, values and corporate culture. Prereq: E.M.B.A. candidates only.

EMBA 477. Behavioral Economics. 1.5 Unit.
This class develops practical, actionable insights into how people make economic decisions in the real world. Standard economics proposes that decisions are motivated by a rational response to financial incentives and information. Behavioral economics expands the standard approach by incorporating and understanding the systematic biases and errors we make in interpreting information and making decisions. This expanded toolbox will help the student to improve their own decisions and to understand and motivate behavior in employees, customers, and others. Prereq: E.M.B.A. candidates only.

EMBA 478A. Leading Design in Organization. 1.5 Unit.
This course explores the ideas and methods of design as a new approach to management practices that is well suited to the changing environment that organizations face in contemporary culture and the emerging economic environment in the United States and abroad. It is a studio course as well as a seminar, because it is designed around a project that each student brings to the EMBA program, a project that is grounded in the issues and operations of the student's organization or in the kind of organization that the student wishes to explore. In addition to the yearlong project, the course will also include important readings in management and organizational literature that are relevant to the new direction of strategic thinking. Finally, the course will draw on the expertise of other faculty at the Weatherhead School of Management who will be called upon to share their practical expertise and theoretical knowledge in the development and execution of the student's management design project, whether in the area of vision and strategy, new product development of goods and services, operations, organizational design and configuration, or related topics. This is the first part of a two semester course. Prereq: E.M.B.A. candidates only.

EMBA 478B. Leading Design in Organizations. 1.5 Unit.
This course explores the ideas and methods of design as a new approach to management practices that is well suited to the changing environment that organizations face in contemporary culture and the emerging economic environment in the United States and abroad. It is a studio course as well as a seminar, because it is designed around a project that each student brings to the EMBA program, a project that is grounded in the issues and operations of the student's organization or in the kind of organization that the student wishes to explore. In addition to the yearlong project, the course will also include important readings in management and organizational literature that are relevant to the new direction of strategic thinking. Finally, the course will draw on the expertise of other faculty at the Weatherhead School of Management who will be called upon to share their practical expertise and theoretical knowledge in the development and execution of the student's management design project, whether in the area of vision and strategy, new product development of goods and services, operations, organizational design and configuration, or related topics. This is the second part of a two semester course. Prereq: E.M.B.A. candidates only.
ENTP Courses

ENTP 301. Entrepreneurial Strategy. 3 Units.
This course is designed to show students how to identify potential business opportunities, determine what constitutes a good business model, and to strategically implement a business proposal. Topics of focus include an overview of the entrepreneurial process, determinants of venture success in high tech and other business environments, and strategies for industry entry and venture growth. Offered as ECON 301 and ENTP 301. Prereq: ACCT 101 or ACCT 203. Coreq: At least sophomore standing.

ENTP 310. Entrepreneurial Finance - Undergraduate. 3 Units.
This course explores the financing and financial management of entrepreneurial new ventures. The course will focus on issues of financial management of new ventures (forecasting cash flows, cash flow management, capital budgeting, valuation, capital structure) and the various financial methods and mechanisms available to entrepreneurs (bootstrapping, angel investors, venture capitalists, IPOs). Prereq or Coreq: ACCT 101 or ACCT 303 or consent of instructor.

ENTP 311. Entrepreneurship and Wealth Creation. 3 Units.
This course teaches students how to find, value, and finance the acquisition of a business, culminating in the class negotiation with a business owner to buy his/her business in a live simulation. Students will be exposed to the concepts and tools needed to successfully acquire a company. Negotiation strategies will be explored. Entrepreneurial Leadership approaches on how to grow and manage the business, once it is owned will also be presented, including how to create a strategic plan. The course also features a real-start up of a business. Student teams will each be given $1000 of seed capital. Learnings include how to select a product, and how to develop and execute a marketing plan. Students will meet top merger-acquisition experts and be exposed to some of Cleveland’s most respected entrepreneurs. Offered as ECON 311 and ENTP 311.

ENTP 312. Senior Seminar in Entrepreneurship. 3 Units.
The main objective of this course is to meet the advanced needs of our students in honing their entrepreneurial skills. This objective will be achieved through readings and case instruction, presentations by entrepreneurs who are actively engaged in starting new ventures and the commercialization of new technologies, and the successful completion of a research project for an entrepreneurial venture. These projects will be graded by the professor and presented to the class and to the client entrepreneur. Prereq: ENTP 310 and ENTP 311.

ENTP 418. Enterprise Development. 3 Units.
-course features new product launch by students and new business idea competition judged by actual venture capitalists. Students will also learn how to acquire control of an existing company, including valuation methods, sources of funding, tactics for finding companies to buy, and how to negotiate the purchase of a business. Also includes actual student negotiation with sellers of a company. Course is designed to accelerate career success through bold entrepreneurial strategies. Offered as ENTP 418 and PLCY 418.

ENTP 419. Entrepreneurship and Personal Wealth Creation. 3 Units.
Course explores the accumulation of personal wealth utilizing entrepreneurial strategies. The underlying competencies of successful entrepreneurs are identified and applied to individual lives of students. Active entrepreneurs will be studied, and original case studies of start-ups and acquisitions provide the basis for class exercises. Offered as ENTP 419 and PLCY 419.

ENTP 425. Managing Human Resource Issues in Entrepreneurial Firms. 3 Units.
This course examines how entrepreneurial firms can develop human resource practices and strategies to sustain their vision, grow their businesses, and create value for customers, shareholders, and employees. The first half of the course will be devoted to exploring the distinctive challenges entrepreneurial firms encounter in aligning organizational goals and human resource strategy and practices. Among those practices are staffing, recruitment and selection, compensation, and employee motivation. The second half of the course will explore these issues further in the context of key organizational phases ranging from firm foundings, the transition from entrepreneurial to professional management, the development of “entrepreneurship” in existing organizations, and the spin-off of the new corporate ventures. Offered as ENTP 425 and LHRP 425.

ENTP 428. Entrepreneurship and Innovation. 3 Units.
In all companies, new and old, large and small, innovation and entrepreneurship are important ways economic value is created. Whether a person wants to found their own company or work in an existing one, and whether one wants to run a business or simply work in one, it is difficult to go through one’s career without needing to engage in innovation or entrepreneurship. The purpose of this course is to equip students to think about how to manage innovation and entrepreneurship. The course will provide frameworks and tools for understanding four important dimensions of innovation and entrepreneurship: (1) identifying and evaluating opportunities for the new products, processes, ways of organizing, materials, and markets; (2) assessing the needs of customers for new products and services and developing products and services that fulfill those needs; (3) creating strategies to financially benefit from investing in innovation and entrepreneurship; and (4) designing groups and organizations to be innovative and entrepreneurial. Prereq: MBAC 502, MBAC 503, MBAC 504, MBAC 505, MBAC 508B or ACCT 401, BAFI 402, MGMT 499, or ACCT 401A, BAFI 402A, MGMT 499 or MBAP 402, MBAP 405, MBAP 410.
ENTP 444. Entrepreneurial Finance. 3 Units.
The objective of this course is to introduce students to the issues of financial management and capital formation in new ventures. The course will address issues of estimation of cash requirements, development of pro forma financial plans, firm valuation and the process and tools used in raising debt and equity financing. Bootstrapping, angel investing, venture capital, strategic alliances and initial public offerings will be covered. The emphasis is on the entrepreneur and how he/she can assess financial needs and develop a sensible plan for acquiring financial resources in a manner that is consistent with their financial needs and other strategic goals. Offered as BAFI 444 and ENTP 444. Prereq: BAFI 402.

ENTP 450. Entrepreneurial Marketing-M.B.A.. 3 Units.
This course addresses the entrepreneurial/intrapreneurial process of commercializing an idea for a market opportunity. Students select an opportunity and develop a deployable, one-year market entry program and a five-year strategic marketing program. Emphasis is on the entrepreneurial marketing decision process, including defining the business, defining the market, specifying customer perceived value, assessing competitive capability and advantage, identifying and properly using secondary and primary information, and deploying marketing programs throughout the organization and the supply chain. Offered as ENTP 450 and MKMR 450B.

ENTP 464. Technology Entrepreneurship. 3 Units.
This course is designed to help students to identify, evaluate, and obtain control over technology opportunities that they can successfully exploit by starting new companies. The course focuses on four themes: (1) the source, discovery, and evaluation of technological opportunities, (2) the process of organizing innovation to produce new technology that satisfies the needs of customers, (3) the different mechanisms available to appropriate the returns from the exploitation of technological opportunities, and (4) the differences between opportunities and approaches that are valuable and sustainable for independent entrepreneurs and large firms. Students taking this course may not receive credit for both ECON 464 and ENTP 441. Offered as ECON 464 and ENTP 464.

ENTP 501. Special Problems and Topics. 1 - 18 Unit.

HSMC Courses

HSMC 420. Health Finance. 3 Units.
Exploration of economic, medical, financial and payment factors in the U.S. healthcare system sets the framework for the study of decisions by providers, insurers, and purchasers in this course. The mix of students from various programs and professions allows wide discussion from multiple viewpoints. Offered as BAFI 420 and HSMC 420. Prereq: ACCT 401.

HSMC 421. Health Economics and Strategy. 3 Units.
This course has evolved from a theory-oriented emphasis to a course that utilizes economic principles to explore such issues as health care pricing, anti-trust enforcement and hospital mergers, choices in adoption of managed care contracts by physician groups, and the like. Instruction style and in-class group project focus on making strategic decisions. The course is directed for a general audience, not just for students and concentration in health systems management. Offered as ECON 421, HSMC 421, and MPHP 421.

HSMC 427. Health Law. 3 Units.
The course examines the nature and structure of the health care system; the relationship between patient, provider, and payer; private legal controls on health care delivery such as malpractice and informed consent law; and public controls in the form of government regulatory and payment programs. Offered as HSMC 427 and LAWS 227.

HSMC 432. Health Care Information Systems. 3 Units.
This course covers concepts, techniques and technologies for providing information systems to enhance the effectiveness and efficiency of health care organizations. Offered as HSMC 432, MIDS 432, MPHP 532 and NUNI 432.

HSMC 444. Models of Health Care Systems. 1.5 Unit.
This course is for professionals who will pursue their careers in, or associated with, the health care industry; and therefore, need to understand the structure, operations and decision influences in the health care delivery system. The course is intended to develop competence and confidence in the participant’s ability to understand and operate in the industry. It is applicable to the private and public, profit and not-for-profit sectors. In this course students are introduced to: the different systems of care delivery; their organization and operations; their markets and the nature of the demand for their services; and the dynamics of their interoperation among themselves and with other entities in the industry (e.g., payors/insurers, regulators and accreditors, technology and pharmaceuticals suppliers). Offered as HSMC 446 and IIME 446.

HSMC 447. Regulatory Affairs for the Biosciences. 1.5 Unit.
This mini-course introduces students to the Food and Drug Administration (FDA) and the laws and regulations it enforces. A scientific regulatory agency with far reaching enforcement authority, FDA is the most powerful consumer protection agency in the world. This course will familiarize students with FDA’s mission, philosophy and organizational structure, as well as policy and procedure it uses to ensure the safety and effectiveness of the food, drugs, biologics, cosmetics, medical devices and radiation-emitting products it regulates. Recommended preparation: Enrollment in the MEM Biomedical Entrepreneurship Track. Offered as BIOS 447, HSMC 447, and IIME 447.

HSMC 448. Engineering Statistics for Biosciences. 3 Units.
This course provides an introduction to biostatistics, emphasizing experimental design, analysis of data, and special emphasis on statistical and financial aspects of randomized clinical trials for biomedical applications. There will be a final project involving development of a clinical trial protocol including the experimental design, recruitment and retention strategy, analysis plan and budget. Offered as BIOS 448, HSMC 448, and IIME 445.

HSMC 456. Health Policy and Management Decisions. 1.5 Unit.
This seminar course combines broad health care policy issue analysis with study of the implications for specific management decisions in organizations. This course is intended as an applied, practical course where the policy context is made relevant to the individual manager. Offered as HSMC 456 and MPHP 456.

HSMC 501. Special Problems and Topics. 1 - 18 Unit.
This course is offered, with permission, to students undertaking reading in a field of special interest.
LHRP Courses

LHRP 360. Independent Study. 1 - 18 Unit.
This course is offered for candidates undertaking reading or independent research in a field of special interest.

LHRP 413. Economics of Negotiation and Conflict Resolution. 3 Units.
Students frequently enroll in a negotiation class with one thought in mind--negotiating a better job offer from an employer. They soon learn, however, that negotiation skills can do far more than improve a pay check. Negotiations occur everywhere: in marriages, in divorces, in small work teams, in large organizations, in getting a job, in losing a job, in deal making, in decision making, in board rooms, and in court rooms. The remarkable thing about negotiations is that, wherever they occur, they are governed by similar principles. The current wave of corporate restructuring makes the study of negotiations especially important for M.B.A.s. Mergers, acquisitions, downsizing and joint ventures call into question well established business and employment relationships. Navigating these choppy waters by building new relationships requires negotiation skills. The increased stress on quality and other hard-to-measure aspects of relationships with customers and suppliers makes the process of negotiation even more complex and subtle. For these reasons, negotiation classes have taken center stage in the study of management. Every major business school now offers classes in negotiation and these classes are overflowing with students. Offered as ECON 431 and LHRP 413.

LHRP 421. Strategic Human Resource Management. 3 Units.
The effective motivation and management of human resources within the enterprise is treated in this course with special emphasis on the integration of Human Resources strategy into the overall competitive strategy of the enterprise. Implications of the inevitable conflict of goals and interests among organization members are considered, covering such areas as hiring, performance appraisal, labor-management relations, employee rights, pay systems, grievance systems, and worker participation.

LHRP 425. Managing Human Resource Issues in Entrepreneurial Firms. 3 Units.
This course examines how entrepreneurial firms can develop human resource practices and strategies to sustain their vision, grow their businesses, and create value for customers, shareholders, and employees. The first half of the course will be devoted to exploring the distinctive challenges entrepreneurial firms encounter in aligning organizational goals and human resource strategy and practices. Among those practices are staffing, recruitment and selection, compensation, and employee motivation. The second half of the course will explore these issues further in the context of key organizational phases ranging from firm foundings, the transition from entrepreneurial to professional management, the development of "entrepreneurship" in existing organizations, and the spin-off of the new corporate ventures. Offered as ENTP 425 and LHRP 425.

LHRP 431. Negotiations for Managers. 3 Units.
The aim of this course is to enhance individual as well as organizational performance and competitive advantage through "principled negotiation", "win-win bargaining", and collaborative as opposed to competitive approaches to team problem solving. The context crosses all types of business, government and non-governmental organizations. Concepts, strategies, and models of negotiation are drawn from social psychology, economics, labor relations, and legal literature. Students will also be introduced to mediation (both as mediators and negotiators); to the complex art of advocacy and to the latest alternative dispute resolution (ADR) techniques. There is heavy reliance on simulations and role play to enhance student understanding of key course concepts. Although immediate skill enhancement through practice is a goal, students understanding of key concepts will enable them to continuously improve their insights and skills long after the course is concluded. There is no prerequisite for the course.

LHRP 451. Alternative Dispute Resolution. 2 Units.
Students will examine the processes of alternative dispute resolution (ADR) through reading materials, videotapes, guest lectures, and simulation exercises. Particular emphasis will be given to the interaction of lawyers and clients in business negotiations and in litigation. Negotiation, arbitration, mediation, the summary jury trial, and the mini-trial will be examined. The class will also cover impediments to ADR, such as lack of understanding or hostility on the part of clients or lawyers. Offered as LAWS 351 and LHRP 451.

LHRP 501. Special Problems and Topics. 0.5 - 18 Units.
This course is offered, with permission, to students undertaking individual reading or research projects in a field of special interest.

LHRP 601. Special Problems and Topics. 1 - 18 Unit.
This course is offered, with permission, to Ph.D. candidates undertaking reading in a field of special interest.

Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
MBAC Courses

MBAC 502. Financial Accounting. 3 Units.
This course examines the key terminology, frameworks, concepts and principles for financial reporting to stockholders, creditors and government agencies. Foundations of the financial reporting systems including the balance sheet, income statement and cash flow statements are explained.

MBAC 503. Managerial Accounting. 3 Units.
Managerial accounting provides information to managers that helps them make effective business decisions, control operations, plan for the future, and evaluate performance. This course examines some of the important managerial accounting systems and analytical tools used in business today. Prereq: ACCT 401 or MBAC 502 or equivalent.

MBAC 504. Corporate Finance I. 3 Units.
This is the first part of a 2-semester-long MBA core course. In this semester, students are introduced to the basics of corporate finance, including the objectives of and the decisions made by corporate financial managers. Topics covered include time value of money, stock and bond valuation, cost of capital and risk and return, investment decision rules, cash flows and free cash flows, and capital budgeting. The course envisions extensive use of spreadsheets as well as an intensive workshop involving data analysis.

MBAC 505. Corporate Finance II. 3 Units.
This is the second part of a 2-semester-long MBA core course. In this semester, topics covered include cash flow projections and planning, working capital management and short-term financing, capital structure, dividend policy, efficient markets, and macroeconomic/industry analysis and valuation. The course envisions extensive use of spreadsheets, case studies, data analysis, and an intensive workshop.

MBAC 506. Marketing and Supply Chain Management. 3 Units.
MBAC 506 (Marketing and Supply Chain Management) and MBAC 507 (Operations and Supply Chain Management) are an integrated presentation of the process of marketing, operations and supply chain management. Thus, they must be taken in numerical sequence or concurrently. Through lecture, discussion, cases and/or simulations you will learn theory and practice of how firms develop processes to understand, create and deliver "triple bottom line" value (i.e., economic, social and environmental) to business and/or consumer markets. In systems theory these continual-input-transformation-output stages comprise value chains. Specifically, in this course, we will introduce you to, and help you to practice, the ways managers forecast demand, establish production processes for the product or service, manage inbound resource flows, and manage outbound distribution so the customer can get the product or service the way he or she wants (i.e., place, form, time and "experience" utility). Throughout both courses (see MBAC 506 for its specific content) we will address the integrated process of managing ongoing long-term relationships with customers, distribution partners and suppliers to assure long-term customer satisfaction and achievement of the organization’s economic, social and environmental goals. Prereq: MBAC 506.

MBAC 507. Operations and Supply Chain Management. 3 Units.
MBAC 506 (Marketing and Supply Chain Management) and MBAC 507 (Operations and Supply Chain Management) are an integrated presentation of the process of marketing, operations and supply chain management. Thus, they must be taken in numerical sequence or concurrently. Through lecture, discussion, cases and/or simulations you will learn theory and practice of how firms develop processes to understand, create and deliver "triple bottom line" value (i.e., economic, social and environmental) to business and/or consumer markets. In systems theory these continual-input-transformation-output stages comprise value chains. Specifically, in this course, we will introduce you to, and help you to practice, the ways managers forecast demand, establish production processes for the product or service, manage inbound resource flows, and manage outbound distribution so the customer can get the product or service the way he or she wants (i.e., place, form, time and "experience" utility). Throughout both courses (see MBAC 506 for its specific content) we will address the integrated process of managing ongoing long-term relationships with customers, distribution partners and suppliers to assure long-term customer satisfaction and achievement of the organization’s economic, social and environmental goals.

MBAC 508. Strategic Issues and Applications. 3 Units.
Strategic management deals fundamentally with the ways firms build and sustain superior competitive positions and profitability. Successful strategy design and implementation requires an understanding of a firm’s external environment, its internal resources and capabilities. It also requires an integrative view of the firm that spans functional areas such as operations, marketing and finance. Strategic analysis draws on a number of academic disciplines including economics, psychology, political and management science.

MBAC 509. Leadership Assessment and Development. 3 Units.
This course focuses on developing the student. In this course the student will get to know themselves better by completing assessments and making sense of them, having group discussions, presenting to a group, engaging in various experiential activities, participating in a coaching session, working with a team, and expanding your knowledge of leadership skills and abilities. We encourage students to take every opportunity to reflect on their experiences during this course.

MBAC 510. Managing People and Organizations. 3 Units.
Using the behavioral and social sciences as a basis, this course examines concepts relevant to the effective management of people and organizations. Topics related to HR and organizational behavior are covered and include: organizational and team structure; organizational culture; conflict and decision-making; reward systems and motivation; recruiting and selection; management practices; group and team dynamics; and managing differences. A variety of methods, including experiential and interactive learning methods, are used to study these topics.
MBAC 511. Statistics and Decision Modeling. 3 Units.
This course provides the foundations of statistical and operations research methodologies for managerial decision-making. Topics covered include making inferences for populations from sample data via (a) estimation with confidence intervals, (b) hypothesis tests, and (c) forecasting with simple and multiple regression. Decision modeling of organizational systems uses mathematical and computer models to provide a quantitative approach to analyzing and solving complex decision problems. This course includes an introduction to linear programming models and applications, queuing models, and simulation models.

MBAC 512. Economics. 3 Units.
In this short class you will be introduced to the basics of modern microeconomic and macroeconomic thinking. Topics include consumers, firms, markets, the role of the government, information and public choice. This class will also focus on the economy as a whole: business cycle, statistics used to measure the economy, fiscal and monetary policy, international trade and development.

MBAC 517A. Management Perspectives and Dialogues. 3 Units.
This course serves as a vehicle to exercise critical thinking and integration skills. While much is learned by attending to the various functions of a business, effective management requires that you be able to integrate these to better understand the whole (organization, supply chain, market, industry, etc.). The course addresses that objective in three ways. First, we will bring in teams of senior managers for you to engage in dialogue about issues they have recently addressed, expect to address in the near future and how they function as leaders of their organizations. Next, are several modules that explore a couple of particular perspectives on management—that managers are designers and that businesses play a critical role in shaping a sustainable world. These are viewed as lenses for integrating the skills you are developing in the functional courses. Finally, we will have sessions in which you will practice thinking on your feet about how to approach business problems and situations. These are structured to help you in job interviews and to help you stand out in your early days in new work environment. The goal of this course is pragmatic. You can help by actively engaging with us in a dialogue about which elements work in helping you achieve these objectives and which do not. Prereq: MBAC 517A.

MBAP Courses

MBAP 401. Leadership Assessment and Development. 3 Units.
This course is designed to increase competitive attractiveness in the marketplace and maximize the added value of the M.B.A. program. The objective of the course is to have students learn a method for assessing and developing in themselves the knowledge and abilities relevant to management throughout their careers. This is accomplished by helping students develop an individualized learning plan to enhance their level of knowledge in 11 fields and 22 abilities. Students engage in a number of assessment activities, then receive feedback and interpret it. This occurs in the context of an Executive Action Team (i.e., students and a facilitator) in which students help each other assess their current capability and future development needs. This course is limited to students in the Part-time Cohort M.B.A. program. Prereq: This course is for students in the Part-time Cohort MBA Program only.

MBAP 402. Accounting for Decision Making. 3 Units.
This course will cover the use and application of basic financial statements, the basic cost structures in a firm, and decision making using accounting information. We will discuss usage and analysis of information from the annual report, focusing on the balance sheet, income statement, cash flow statement and related notes. The course will also cover internally generated accounting information about the cost structure of the firm. We will discuss use of this information in decision making. You are expected to be comfortable with definitions of basic accounting terms, and you should be familiar with the accounting structure and the financial statements. Prereq: This course is for students in the Part-time Cohort MBA Program only.

MBAP 403. Statistics and Decision Modeling. 3 Units.
This course provides the foundations of statistical and operations research methodologies for managerial decision-making. Business statistics focuses on statistical thinking as one of the fundamentals of effective management. Topics covered include sampling and the normal distribution, making inferences from data via confidence intervals and hypothesis tests, and analyzing relationships between samples. Decision modeling of organizational systems uses mathematical and computer models to provide a quantitative perspective on identifying, analyzing and solving complex decision problems. This course includes an introduction to linear programming models and applications, simulation techniques in decision-making, and project management. Prereq: This course is for students in the Part-time Cohort MBA Program only.

MBAP 404. Managing People in Organizations. 3 Units.
Examines the behavioral sciences relevant to the effective management of people and the effective design of human resources system, structure and policies. Topics include leadership, change management, motivation and pay systems, team dynamics, staffing, decision making, organizational communications, employee participation, performance appraisal, conflict management, negotiation, work design, organizational design, and organizations culture. A variety of methods, including experiential and interactive learning methods, are used to study these topics. Prereq: This course is for students in the Part-time Cohort MBA Program only.
MBAP 405. Financial Management I. 3 Units.
This is a Corporate Finance course that deals with investment theory and financial value. The course materials cover discounted cash flows, bond and stock valuation, capital budgeting, applications of real options in investment analysis, asset's risk and return, cost of capital, market efficiency and capital structure. The tools, problem solving techniques, and ways of thinking that you develop in this course have broad applicability to all areas of business. They also form the basis for sensible personal decisions in the areas of investments, borrowing, and financial planning. Prereq: This course is for students in the Part-time Cohort MBA Program only.

MBAP 406. Economics for Managers. 3 Units.
This course surveys the basic principles of micro and macroeconomics. Topics covered in microeconomics include supply and demand, the theory of production and costs, market structures and factor markets. Macroeconomics topics are the national incomes accounts, the determination of national income, employment and inflation, fiscal and monetary policies and international trade. Prereq: This course is for students in the Part-time Cohort MBA Program only.

MBAP 407. Managerial Marketing. 3 Units.
This course focuses on managing marketing as a process of creating value and mutually desirable exchanges of values. That is the foundation of a customer orientation and a central theme of market-driven management. Methods for strategic marketing planning, understanding buyer behavior, market analysis, segmentation and devising integrated marketing programs are introduced. Creating customer value and competitive advantage in worldwide markets is the central theme. Prereq: This course is for students in the Part-time Cohort MBA Program only.

MBAP 408. Operations Management. 3 Units.
Operations management deals with the design of products and processes, the acquisition of resources, the conversion of inputs to outputs, and the distribution of goods and services. It is central to a firm's ability to compete effectively. As global competition in both goods and services increases, the management of operations is becoming more and more important. This course provides a broad overview of the managerial issues associated with production and delivery of goods and services. It includes the use of quantitative modeling using computers as a central methodology. Prereq: This course is for students in the Part-time Cohort MBA Program only.

MBAP 409. Sustainability and Social Entrepreneurship. 3 Units.
This course creates a foundational platform featuring key models and managerial tools for building sustainable value and "turning the social and global issues of our day into business opportunities." Case studies of leading mainstream companies are used to analyze how business value is created for a range of social and environmental initiatives. Students will look at sustainability business strategies that reduce risks, drive down costs, create new revenue streams, serve new markets, and position companies to take advantage of changing societal expectations. Environmental issues such as climate change are covered along with social issues such as global poverty. Students acquire the competencies required to make effective business decisions based on integrating sustainability into the core of a company’s value added activities. Prereq: This course is for students in the Part-time Cohort MBA Program only.

MBAP 410. Strategic Issues and Applications. 3 Units.
This course wraps the M.B.A. core by providing an integrative experience of applying the full range of managerial skills addressed throughout the core in a comprehensive case exercise. Students develop, document, and present comprehensive, implementable strategic and tactical actions programs in groups. Prereq: This course is for students in the Part-time Cohort MBA Program only.

MBAP 411. Identifying Design Opportunities. 3 Units.
Designing is giving form to an idea for a more desirable product, service, process or organization, and refining the idea into something that can be delivered reliably and efficiently. Good design integrates these evolving ideas with the day-to-day realities of a firm's operations, systems, marketing, economics, finance and human resources. Designing is thus a unique managerial activity that brings together changing technologies, capabilities, relationships, activities and materials to shape an organization's plans and strategies. It combines analysis and synthesis to create opportunities for improvement and means of attaining them. Viewed this way, designing is a core competence of a successful entrepreneur or innovative leader. Design analysis is the systematic review of the four orders of design found in every firm--namely, the firm's communications, products, interactions and environments--and the creation of opportunities to increase firm value by improving each. Students will identify ill-defined, ill-structured problems within organizations. Such problems are ones for which there are no definitive formulations and for which the formulation chosen affects the solutions available. For such problems, there is no explicit way of knowing when you have reached a solution, and solutions cannot necessarily be considered correct or incorrect. But finding innovative solutions to such problems can provide unique opportunities to create exceptional value. A major outcome of the semester's inquiry is a presentation of the design problem and proposed design solution. Prereq: This course is for students in the Part-time Cohort MBA Program only.

MBAP 412A. Dialogues in Leadership. 1.5 Unit.
This course is a three credit hour two-semester course sequence that seeks to educate students of management in the intricacies of issues management through a process of facilitated dialogs with practicing management professionals who possess deep and highly contextualized knowledge and experiences in addressing a varied range of management issues in contemporary real life settings. The goal of the course is to help students bring their in-class theoretical learning into a safe laboratory setting for active testing. Real life managerial contexts will be introduced as faithfully as possible wherein theory and practice are brought into constructive juxtaposition, each providing a complementary and not necessarily a counter perspective to the other. Prereq: This course is for students in the Part-time Cohort MBA Program only.

MBAP 412B. Dialogues in Leadership. 1.5 Unit.
This course is a three credit hour two-semester course sequence that seeks to educate students of management in the intricacies of issues management through a process of facilitated dialogs with practicing management professionals who possess deep and highly contextualized knowledge and experiences in addressing a varied range of management issues in contemporary real life settings. The goal of the course is to help students bring their in-class theoretical learning into a safe laboratory setting for active testing. Real life managerial contexts will be introduced as faithfully as possible wherein theory and practice are brought into constructive juxtaposition, each providing a complementary and not necessarily a counter perspective to the other. Prereq: This course is for students in the Part-time Cohort MBA Program only.
MGAB Courses

MGAB 501. Study Abroad. 1 - 15 Unit.
Place holder for students studying abroad, to be replaced with actual course work taken at Exchange location once course work is completed and a transcript is sent to CWRU.

MGMT Courses

MGMT 1. Supervised Professional Practicum - Semester 1. 0 Units.
A professional practicum is a workplace experience, the primary goal of which is the intellectual, personal and professional growth of the student. It occurs under the sponsorship or supervision of a mentor in the workplace who is committed to seeing that it is an educational as well as a work venture. It requires skills appropriate to the student’s year in college and provides students with new skills, insights and experiences that are transferable back to the academic setting and/or to a future position in the workplace. (Only available to declared Weatherhead Accounting or Management majors.) Prereq: Junior standing or higher.

MGMT 2. Supervised Professional Practicum - Semester 2. 0 Units.
A professional practicum is a workplace experience, the primary goal of which is the intellectual, personal and professional growth of the student. It occurs under the sponsorship or supervision of a mentor in the workplace who is committed to seeing that it is an educational as well as a work venture. It requires skills appropriate to the student’s year in college and provides students with new skills, insights and experiences that are transferable back to the academic setting and/or to a future position in the workplace. (Only available to declared Weatherhead Accounting or Management majors.) Prereq: Junior standing.

MGMT 201. Contemporary Business: Connecting Principles to Performance. 3 Units.
This course is designed to survey business topics, issues, and practices. Students will be introduced to each of the functional areas of business, including accounting, finance, marketing, operations, business intelligence, and human resources management. The course is designed to help students appreciate the interrelationship of these business functions and, more generally, the role and context of business in society. Other topics considered include: the economic and legal environment of business, the globalization of markets, workforce diversity, leadership and entrepreneurship. To convey course content, lectures, in-class discussions, exercises, simulations, and guest speakers are used. Weekly discussions and a high level of student interaction amplify on class materials and concepts by focusing on contemporary issues of actual businesses.

MGMT 250. Managing Organizations and People I. 3 Units.
The principal goals of this course are to help students understand: 1) The context in which they, as managers, will function; the options they have for careers in management based on their own aptitudes and orientations; and how they can develop the skills they need for success in their chosen fields; and 2) How the effective strategic management of people contributes to organizational performance and the production of value, and that for many organizations, the effective management of people has been the driver of competitive advantage. This is the first course in a two course sequence. Prereq: At least sophomore standing.

MGMT 251. Managing Organizations and People II. 3 Units.
The principal goals of this course are to help students understand: 1) The context in which they, as managers, will function; the options they have for careers in management based on their own aptitudes and orientations; and how they can develop the skills they need for success in their chosen fields; and 2) How the effective strategic management of people contributes to organizational performance and the production of value, and that for many organizations, the effective management of people has been the driver of competitive advantage. This is the second course in a two course sequence. Prereq: MGMT 250 and at least sophomore standing.

MGMT 315. International Management Institute. 3 Units.
The course provides undergraduate students with a unique overseas visitation, language orientation, and management subject experiences during periods such as Spring Break, or during interims immediately following the end of the semester. Opportunities for diverse cultural and language experiences which result from the institute are added benefits of these programs. Prereq: ECON 102, ECON 103, ACCT 101 and BAFI 355.

MGMT 360. Special Topics and Issues in Management. 1 - 9 Unit.
This course option is available to qualified students who are undertaking special projects in a management related field.

MGMT 395. Advanced Seminar. 1 Unit.
This seminar, for undergraduate students with junior class standing or above, provides an opportunity to consider topics of importance in the community of ideas and activities related to the professional and managerial world. The development of writing and communication skills and in-depth discussion are expected attributes of seminar activity. The topic and scope of the coverage will be defined by the course instructor as consistent with the seminar approach to learning of the University. Prereq: Declared ACCT or MGMT Major and At Least Junior Standing.

MGMT 397. Undergraduate Research Project. 3 - 6 Units.
This course provides a supervisory structure for students completing a capstone research project in the Weatherhead School of Management. Arrangements should be made by consultation with a faculty member selected and the Senior Capstone Committee of the School of Management. Open to all management and accounting majors and other qualified students with instructor approval. A written report, presentation to the faculty department most closely related to the student’s topic, and an approved public presentation are required.

MGMT 398. Action Learning. 6 Units.
This is an experiential course built around a live project in a local organization. The project-based course is focused on improving business process. Students will work in teams to analyze the current situation and diagnose its problems or opportunities, creatively envision new possibilities, evaluate potential improvements and recommend appropriate solutions. Students will be evaluated by the professor and the project managers at the client organizations. Prereq: ACCT 202, BAFI 355 and MKMR 301, Senior Standing, and Declared ACCT or MGMT major.
MGMT 403. Leadership Assessment and Development. 3 Units.
This course is designed to increase competitive attractiveness in the marketplace and maximize the added value of the M.B.A. program. The objective of the course is to have students learn a method for assessing and developing in themselves the knowledge and abilities relevant to management throughout their careers. This is accomplished by helping students develop an individualized learning plan to enhance their level of knowledge in 11 fields and 22 abilities. Students engage in a number of assessment activities, then receive feedback and interpret it. This occurs in the context of an Executive Action Team (i.e., students and a facilitator) in which students help each other assess their current capability and future development needs. This course is limited to students in the M.B.A. program.

MGMT 405-1. Challenges of Globalization: Field Studies of Problems and Opportunities Facing Business. 0 Units.
This course is an exploration of current and emergent impacts of globalization on businesses, governments and non-profit organizations in Northeastern Ohio. Students will be organized into teams exploring aspects of these impacts, with each team developing archival and interview (and sometimes observational) data on the global challenges facing organizations in the region. Each team will be guided by mentors with extensive international experience. Throughout the course students will read and engage in on-going face-to-face and on-line discussions of relevant international news and analysis from such publications as Economist and Financial Times. At the conclusion of the course each team will present its findings to the community and contribute a chapter to a professional-quality report that will be circulated throughout the region.

MGMT 405-2. The Challenges of Globalization: Field Studies of Problems and Opportunities Facing Business. 6 Units.
This course is an exploration of current and emergent impacts of globalization on businesses, governments and non-profit organizations in Northeastern Ohio. Students will be organized into teams exploring aspects of these impacts, with each team developing archival and interview (and sometimes observational) data on the global challenges facing organizations in the region. Each team will be guided by mentors with extensive international experience. Throughout the course students will read and engage in on-going face-to-face and on-line discussions of relevant international news and analysis from such publications as Economist and Financial Times. At the conclusion of the course each team will present its findings to the community and contribute a chapter to a professional-quality report that will be circulated throughout the region.

MGMT 413. Human Value in Organizations. 3 Units.
Examines the behavioral sciences relevant to the effective management of people and the effective design of human resources system, structure and policies. Topics include leadership, change management, motivation and pay systems, team dynamics, staffing, decision making, organizational communications, employee participation, performance appraisal, conflict management, negotiation, work design, organizational design, and organizations culture. A variety of methods, including experiential and interactive learning methods, are used to study these topics.

MGMT 413A. Human Values in Organizations. 1 Unit.
Classes will explore research in the fields of organizational behavior and human resource management and apply this knowledge in actual situations and cases. They will learn about how to learn from experiences they have in class and in their EATs. Students will be able to directly apply skills learned in class to leadership, project management, task force management, team development, staff meetings, decision making, problem solving, interpersonal relations, environmental analysis, job redesign, organizational change, and labor and human resource policy. Prereq: Open to ACL-MBA students.

MGMT 418. Curricular Practical Training. 0 Units.
This course is intended for graduate business students who wish to gain curricular practical training in support of career goals. The experience developed in an internship will complement academic experience gained in Weatherhead classes.

MGMT 419. Corporate Field Research. 1 - 3 Unit.
This course is intended for the graduate business student who wishes to gain applied/practical business experience based on his/her intended career path and/or with an organization. This course will assist building required skills and bridge the gap between the classroom and real world application.

MGMT 420A. Dialogues in Top Management I. 1.5 Unit.
MGMT 420A and MGMT 420B Dialogues in Top Management I and II. Students must take the two courses in sequence. The courses comprise a series of dialogues with teams of top-echelon managers of pre- and post-dialogue student groups; analytic papers based on the content of the dialogues, class discussions, and readings. Readings and class discussions address both the character and dynamics of complex, enterprise-wide management problems and processes of effectively managing them. In open dialogues with practicing top-echelon managers students explore the practice and theory of effective top-echelon/general management. That is management that involves applying concepts and skill across all functional areas of management. Student groups' analytical essays after each dialogue stimulate in-depth discussion both of possible conceptual models of the management process and of the relationships to it of the course materials in the graduate programs

MGMT 420B. Dialogues in Top Management II. 1.5 Unit.
MGMT 420A and MGMT 420B Dialogues in Top Management I and II. Students must take the two courses in sequence. The courses comprise a series of dialogues with teams of top-echelon managers of pre- and post-dialogue student groups; analytic papers based on the content of the dialogues, class discussions, and readings. Readings and class discussions address both the character and dynamics of complex, enterprise-wide management problems and processes of effectively managing them. In open dialogues with practicing top-echelon managers students explore the practice and theory of effective top-echelon/general management. That is management that involves applying concepts and skill across all functional areas of management. Student groups' analytical essays after each dialogue stimulate in-depth discussion both of possible conceptual models of the management process and of the relationships to it of the course materials in the graduate programs
MGMT 440. Leadership Assessment and Development II. 0 Units.
The exit assessment course (MGMT 440) is aimed at assessing how students’ career goals, values and abilities may have changed since the program began. The course meets for one mandatory half day seminar in the Spring Semester and carries 0 units of credit. In the MGMT 403 course, students were provided the tools and opportunities for self-assessment and career planning. In the very first semester, they completed several assessment instruments (LSI, POQ, 360-Feedback (ECI-U), ASI, My Values, Career Anchors and others). They had to identify their top values, set a career vision and create an individualized learning plan. The ultimate goal was to assure that their personal development and preparation was relevant to, and in alignment with, the emergent requirements of today’s business management careers. This course is specifically designed to identify if a student’s prior learning plan (completed in the MGMT 403 course) still fits with his/her current career reality and to also identify what has changed for him/her. The activities in the course will include: Viewing the current reality of today’s business environment; Revisiting their experience in the MBA program including any internships/jobs; Determining if a student’s values, vision and learning plan still fit; Retaking the 360-Feedback (Emotional Intelligence Competencies) to identify development of competencies; Identifying relevant areas of personal development; Committing to a refined learning plan and goals. Through a highly interactive and team based process, students will be able to reflect on their current reality, get feedback on your personal growth and discover what changes would enhance their professional career journey.

MGMT 458. International Institute. 3 Units.
The International Institute involves semester-long study of a particular region, followed by a class trip to an area within that region. The preparatory coursework varies depending on the region selected for that particular semester; however, it typically consists of research about cultural, financial, political, and economic topics. The trip consists of daily research meetings with organizations within the region being studied. Upon return, a summary exercise is required to complete the coursework. The class trip is a mandatory component of the course.

MGMT 460. Managing in a Global Economy. 3 Units.
Managers need new skills to enable them to manage effectively in what is increasingly a global economy. They need a deeper understanding of cultural differences and how these differences may influence communications with foreign employers, employees, customers, suppliers or partners. They need a better understanding of the economic and political mechanics of the world business system. They need to learn how to find out more about potential opportunities and threats that lie outside the United States. This course is designed to address these needs.

MGMT 464. Business Ethics. 3 Units.
This course is built around two core learning tracks. The first is extended analyses of case studies, which identifies ethical problems, diagnoses import, and develops strategic programs to address them. The second learning track uses short pieces of fiction to explore issues of ethical character, leadership, and organizational responsibility. Each student keeps an ethics journal over the course of the semester to reflect on ethical issues, both inside and outside the classroom. In addition, small student groups are formed to write case studies focusing on a business ethics problem.

MGMT 467-1. Commercialization and Intellectual Property Management. 3 Units.
This interdisciplinary course covers a variety of topics, including principles of intellectual property and intellectual property management, business strategies and modeling relevant to the creation of start-up companies and exploitation of IP rights as they relate to biomedical-related inventions. The goal of this two-semester course is to address issues relating to the commercialization of biomedical-related inventions by exposing law students, MBA students, and Ph.D. candidates (in genetics and proteomics) to the challenges and opportunities encountered when attempting to develop biomedical intellectual property from the point of early discovery to the clinic and market. Specifically, this course seeks to provide students with the ability to value a given technological advance or invention holistically, focusing on issues that extend beyond scientific efficacy and include patient and practitioner value propositions, legal and intellectual property protection, business modeling, potential market impacts, market competition, and ethical, social, and healthcare practitioner acceptance. The course will meet over two consecutive semesters--fall and spring--and is six credit hours (three credits each semester). During these two semesters, law students, MBA students, and Ph.D. candidates in genomics and proteomics will work in teams of five (two law students, two MBA students and one Ph.D. candidate), focusing on issues of commercialization and IP management of biomedical-related inventions. The instructors will be drawn from the law school, business school, and technology-transfer office. To be eligible for this course, law students must also have a B.S or equivalent in the life sciences, such as biology, biochemistry, genomics, molecular biology, etc. Offered as LAWS 367, MGMT 467, GENE 367 and GENE 467.

MGMT 467-2. Commercialization and Intellectual Property Management. 3 Units.
This interdisciplinary course covers a variety of topics, including principles of intellectual property and intellectual property management, business strategies and modeling relevant to the creation of start-up companies and exploitation of IP rights as they relate to biomedical-related inventions. The goal of this two-semester course is to address issues relating to the commercialization of biomedical-related inventions by exposing law students, MBA students, and Ph.D. candidates (in genetics and proteomics) to the challenges and opportunities encountered when attempting to develop biomedical intellectual property from the point of early discovery to the clinic and market. Specifically, this course seeks to provide students with the ability to value a given technological advance or invention holistically, focusing on issues that extend beyond scientific efficacy and include patient and practitioner value propositions, legal and intellectual property protection, business modeling, potential market impacts, market competition, and ethical, social, and healthcare practitioner acceptance. The course will meet over two consecutive semesters--fall and spring--and is six credit hours (three credits each semester). During these two semesters, law students, MBA students, and Ph.D. candidates in genomics and proteomics will work in teams of five (two law students, two MBA students and one Ph.D. candidate), focusing on issues of commercialization and IP management of biomedical-related inventions. The instructors will be drawn from the law school, business school, and technology-transfer office. To be eligible for this course, law students must also have a B.S or equivalent in the life sciences, such as biology, biochemistry, genomics, molecular biology, etc. Offered as MGMT 467, LAWS 367, GENE 367 and GENE 467.
MGMT 495A. Ames Advanced Business Plan Seminar. 3 Units.
This two semester 6 credit hour course teaches students to write a strategic business plan. Working in teams, students study a Cleveland area business through meetings with company executives, including the CEO, under the supervision of a faculty member and outside planning expert. In Semester One, multiple leading faculty members will conduct classes which focus on key components of a business plan, including marketing, strategy, finance, supply chain and leadership. Semester One will culminate with a case study of an assigned company written by each team. Semester Two is a practicum experience during which student teams write a strategic business plan for their assigned company, once again under the supervision of faculty and outside mentors. Plans will be presented by teams to a Business Plan Competition jury composed of leading private equity executives, investment bankers and/or corporate CEOs.

MGMT 495B. Ames Advanced Business Plan Seminar. 3 Units.
This two semester 6 credit hour course teaches students to write a strategic business plan. Working in teams, students study a Cleveland area business through meetings with company executives, including the CEO, under the supervision of a faculty member and outside planning expert. In Semester One, multiple leading faculty members will conduct classes which focus on key components of a business plan, including marketing, strategy, finance, supply chain and leadership. Semester One will culminate with a case study of an assigned company written by each team. Semester Two is a practicum experience during which student teams write a strategic business plan for their assigned company, once again under the supervision of faculty and outside mentors. Plans will be presented by teams to a Business Plan Competition jury composed of leading private equity executives, investment bankers and/or corporate CEOs.

MGMT 498. Action Learning. 3 Units.
This course allows teams of students to integrate functional core knowledge from the first year of the M.B.A. program and apply analysis and strategic management skills in a real-world setting. Students will be evaluated by the instructor and the project managers at the client organizations. Recommended preparation: Second year full-time M.B.A. status.

MGMT 499. Strategic Issues and Applications. 3 Units.
This course wraps up the M.B.A. core by providing an integrative experience of applying the full range of managerial skills addressed throughout the core in a comprehensive case exercise. Students develop, document, and present comprehensive, implementable strategic and tactical actions programs in groups. Prereq: ACCT 401 and BAFI 402.

MGMT 501. Special Problems and Topics. 1 - 18 Unit.
This course is offered, with permission, to students undertaking reading in a field of special interest.

MGMT 502. Advanced Topics. 1 - 18 Unit.
This is a course of flexible design to meet advanced theoretical and/or methodological needs of doctoral students. Approval is needed from the instructor, and it requires a letter grade.

MGMT 575. Doctoral Research Project. 3 Units.
The objective of the course is to produce a stand-alone piece of scholarship in the academic discipline pursued by the student. The paper or project should be of publishable quality as judged by the instructor. The work of the student is to be accomplished on the independent study basis under the direction of a faculty member. Although there are no specific course prerequisites, the understanding is that all other coursework should have been completed to be admitted into the class. Prereq: Ph.D. standing.

MGMT 601. Special Topics. 1 - 18 Unit.
This course is offered, with permission, to Ph.D. candidates undertaking reading in a field of special interest.

MGMT 602. Advanced Topics. 1 - 18 Unit.
This is a course of flexible design to meet advanced theoretical and/or methodological needs of doctoral students. Approval is needed from the instructor, and it requires a letter grade.

MGMT 610. Culture and World Politics. 3 Units.
Religion, ethnicity, and nationalism have assumed major political significance in the post Cold-War and post-9/11 eras. The course examines ideas of political democracy and economic liberalism in relation to different cultural and religious ideas and explores relationships among social values, political structures, and economics. Prereq: Only for students in PhD in Management: Designing Sustainable Systems, or by permission of the Program Director.

MGMT 614. Business as an Evolving Complex System. 3 Units.
The goal of this course is to provide a foundation for understanding how business systems evolve, why the business systems in the major advanced countries have evolved differently over the last 100 years or so, and what the underlying driving forces are. The focus is on transformation rather than economic growth. The course examines the evolution of business systems as a result of technological and organizational change. It deals with the role of history, culture and finance in generating business organizations in various countries. The course also studies the emergence of regional innovation systems and industry clusters, as well as how digitization and globalization are changing the industrial logic. Prereq: Must be enrolled in PhD in Mgt: Designing Sustainable Systems.

MGMT 616. Global Economic Systems and Issues. 3 Units.
This course provides a framework and analytical tools for understanding globalization and international economic relations in the context of the global political system. It analyzes the economic and political forces that are shaping global cooperation on economic matters, the role and impact of international economic institutions such as the World Bank, the International Monetary Fund, and the World Trade Organization, and evolving forms of regional governance, such as the European Union. It covers national and international policies and development and the causes and cures of international financial crises. The course revolves around concepts of efficiency, equality, power and institutions in the making of public policy towards globalization of communications and transportation. Prereq: Must be enrolled in Ph.D in Management: Designing Systems track.
MGMT 617. Technology and Social System Design. 3 Units.
Managers are designers who shape the social and technical world we inhabit. This course explores the process of design and asks how managers can become better designers and interventionists who anticipate and evaluate the social, economic, and political consequences of existing and emerging products, processes, and organizational forms. Prereq: Students in PhD Management program or requisites not met permission.

MGMT 640. Social Ethics: Contemporary Issues. 3 Units.
The course draws upon intellectual ancestors and current thinkers in moral philosophy and ethics to assist each student in identifying, analyzing, and discussing social and ethical questions pertaining to the definition and purpose of contemporary life, the need for moral coherence, and the meaning of life in a global society. The unifying theme of the course is Tolstoy’s question, “How then shall we live?” The course does not seek to provide answers to the great questions of life. Rather, it tries to expand each student’s capacity to grapple with such questions. Prereq: Students in PhD Management program or requisites not met permission.

MGMT 641. Qualitative Res Methods II. 3 Units.
This course guides the student in conducting the qualitative research project that was proposed in EDMP 638. Fieldwork and initial analysis is conducted during the summer when data based on semi-structure interviews is collected and analysis begins using inductive coding techniques. A summer residency is held in mid-June to assess progress as final data collection and analysis continues. The aim of the fall semester is to prepare a formal research report on that project, which will be submitted to an academic research conference. The final report includes a revision of one’s conceptual model, integrating new understandings and literature arising from the data collection and analysis. Prereq: Only for students in PhD in Management: Designing Sustainable Systems, or by permission of the Program Director.

MGMT 643. Measuring Bus Behav & Struc. 3 Units.
This course aims to develop the basic foundations and skills for designing and executing generalizable studies that measure business behaviors and structures. It focuses on building the student's capacity to grapple with such questions. Prereq: Students in PhD Management program or requisites not met permission.

MGMT 644. Causal Analy of Bus Prob II. 3 Units.
Causal Analysis of Business Problems II introduces fundamental concepts in theory-based model building and validation. In this course students will develop, explore, refine a range of models appropriate for addressing their problem of practice including classification models, process models, variance models, and articulating nomological networks. In particular, the course will focus on effective conceptualizations of causation, control, mediation, and moderation. Further, foundational statistical techniques such as tests of assumptions of the data, exploratory factor analysis, and regression and path analysis will be introduced to analyze concepts of causation, control, mediation and moderation. Prereq: Only for students in PhD in Management: Designing Sustainable Systems, or by permission of the Program Director.

MGMT 645. Integration of Qualitative and Quantitative Inquiry. 3 Units.
Using the mixed method research toolkit developed in previous courses, this course focuses on critically analyzing selected pieces of published applied and policy research to develop a critical appreciation of issues and debates that have wide applicability and relevance. In particular, it offers students ways to integrate and triangulate using a mixed method approach, different forms of evidence, and related evidence. In addition, this course addresses common method choice and justification issues and related challenges of validity and theory formulation that typically arise during the students’ execution of a series of individual research projects. Application of critical analysis and appreciation approach in justifying mixed methods designs to the student’s own research work is encouraged and supported by sharing and discussing common research and methodology themes and problems. Prereq: Students in PhD Management program or requisites not met permission.

MGMT 646. Advanced Analytical Methods for Generalizing Research. 3 Units.
This course addresses advanced topics in regression and structural equation modeling such as latent growth curve models, partial least squares, logit models, tests for various types of invariance, multiple-group analysis, multilevel analysis, and analyzing qualitative/categorical data. These analytical methods are intended to enhance the student's toolkit as to facilitate a strong bridge to the academic literature and the application to specific data based problems that arise in applied managerial research. Prereq: Students in PhD Management program or requisites not met permission.

MGMT 648. Advanced Analytical Methods for Generalizing Research. 3 Units.
This course addresses advanced topics in regression and structural equation modeling such as latent growth curve models, partial least squares, logit models, tests for various types of invariance, multiple-group analysis, multilevel analysis, and analyzing qualitative/categorical data. These analytical methods are intended to enhance the student's toolkit as to facilitate a strong bridge to the academic literature and the application to specific data based problems that arise in applied managerial research. Prereq: Students in PhD Management program or requisites not met permission.

MGMT 649. Integration of Qualitative and Quantitative Inquiry. 3 Units.
Using the mixed method research toolkit developed in previous courses, this course focuses on critically analyzing selected pieces of published applied and policy research to develop a critical appreciation of issues and debates that have wide applicability and relevance. In particular, it offers students ways to integrate and triangulate using a mixed method approach, different forms of evidence, and related evidence. In addition, this course addresses common method choice and justification issues and related challenges of validity and theory formulation that typically arise during the students’ execution of a series of individual research projects. Application of critical analysis and appreciation approach in justifying mixed methods designs to the student’s own research work is encouraged and supported by sharing and discussing common research and methodology themes and problems. Prereq: Students in PhD Management program or requisites not met permission.

MGMT 645. Integration of Qualitative and Quantitative Inquiry. 3 Units.
This course addresses advanced topics in regression and structural equation modeling such as latent growth curve models, partial least squares, logit models, tests for various types of invariance, multiple-group analysis, multilevel analysis, and analyzing qualitative/categorical data. These analytical methods are intended to enhance the student's toolkit as to facilitate a strong bridge to the academic literature and the application to specific data based problems that arise in applied managerial research. Prereq: Students in PhD Management program or requisites not met permission.

MGMT 646. Advanced Analytical Methods for Generalizing Research. 3 Units.
This course addresses advanced topics in regression and structural equation modeling such as latent growth curve models, partial least squares, logit models, tests for various types of invariance, multiple-group analysis, multilevel analysis, and analyzing qualitative/categorical data. These analytical methods are intended to enhance the student's toolkit as to facilitate a strong bridge to the academic literature and the application to specific data based problems that arise in applied managerial research. Prereq: Students in PhD Management program or requisites not met permission.

MGMT 648. Advanced Analytical Methods for Generalizing Research. 3 Units.
This course addresses advanced topics in regression and structural equation modeling such as latent growth curve models, partial least squares, logit models, tests for various types of invariance, multiple-group analysis, multilevel analysis, and analyzing qualitative/categorical data. These analytical methods are intended to enhance the student's toolkit as to facilitate a strong bridge to the academic literature and the application to specific data based problems that arise in applied managerial research. Prereq: Students in PhD Management program or requisites not met permission.

MGMT 649. Integration of Qualitative and Quantitative Inquiry. 3 Units.
Using the mixed method research toolkit developed in previous courses, this course focuses on critically analyzing selected pieces of published applied and policy research to develop a critical appreciation of issues and debates that have wide applicability and relevance. In particular, it offers students ways to integrate and triangulate using a mixed method approach, different forms of evidence, and related evidence. In addition, this course addresses common method choice and justification issues and related challenges of validity and theory formulation that typically arise during the students’ execution of a series of individual research projects. Application of critical analysis and appreciation approach in justifying mixed methods designs to the student’s own research work is encouraged and supported by sharing and discussing common research and methodology themes and problems. Prereq: Students in PhD Management program or requisites not met permission.

MGMT 645. Integration of Qualitative and Quantitative Inquiry. 3 Units.

Application of critical analysis and appreciation approach in justifying mixed methods designs to the student’s own research work is encouraged and supported by sharing and discussing common research and methodology themes and problems. Prereq: Students in PhD Management program or requisites not met permission.
MGMT 664. Knowledge Dissemination to Influence Managerial Practice. 3 Units.
The aim of this course is twofold. First, it supports students organizing and writing their DM thesis overview or their PhD thesis proposal. Also discussed are ways to organize and communicate in scientific genres, their aims and their generic properties. Secondly, students become acquainted with scientific communication and publishing. Effective reviewing, criteria for judging articles and theses, management of review processes, and how to communicate and respond to reviews are topics discussed. The course also addresses publication strategies and ways of managing and communicating scientific and managerial knowledge to different stakeholders. Prereq: Students in PhD Management program or requisites not met permission.

MGMT 671. Design and Sustainable Systems. 3 Units.
The goal of this course is to introduce doctoral students to the nature and practice of design as a strategy of inquiry as well as a mode of action in addressing the problems of creating and managing sustainable human systems. The objectives are (1) to introduce the conceptual framework of design, (2) the nature of human interaction as seen from the perspective of design, (3) the intellectual and practical strategies of design, (4) the methods and techniques of design that are relevant to the study and design of sustainable human systems, and (5) the nature of "wicked problems" and the ethical issues of design, with special attention to the place of human dignity in the design of sustainable systems. The course will employ key elements of the literature of design, close reading and discussion, and exercises that explore the concepts and methods of design. Prereq: Students in PhD Management program or requisites not met permission.

MGMT 672. Sustainability and Social Value Creation. 3 Units.
This course is designed to galvanize new visions of business and society, as well as organizational leadership. The course is born of a conviction that the future of human society and the natural world is intimately linked to the future of the world economy, business enterprises, and management education. The course presentations, books, dialogues, and interview projects are organized around three themes: (1) the state of the world and the economics possibilities of our time, (2) the business case for understanding business as an agent of world benefit--how business performance can profit from current and future advances in sustainable design and social entrepreneurship; and (3) tools for becoming a change leader--including the methods of Appreciative Inquiry and new insights about "strength-based" change emerging from the science of human strengths. The overarching aim is to provide a powerful introduction to the many facets of sustainable value creation as a complete managerial approach. Prereq: Students in PhD Management program or requisites not met permission.

MGMT 673. Understanding, Designing, Managing Complex Systems. 3 Units.
The purpose of this course is to provide a perspective on systems thinking and complex systems to aid PhD students in expanding the ideas in their research on systems, systems models, and complex systems. The work of the course will develop with increasingly difficult books on the subject of complex systems, a major case study in health care, and individual applications of the concepts to their potential research model and methods. Prereq: Students in PhD Management program or requisites not met permission.

Prereq: Must be enrolled in Ph.D. in Management: Designing Sustainable Systems and have predoctoral research consent or advanced to Ph.D. candidacy milestone.

MIDS Courses

MIDS 301. Introduction to Information: A Systems and Design Approach. 3 Units.
Managers must design business systems and flows of information that enable an organization to operate successfully in changing environments. This course will explore what "design," "systems," "information" and "environment" really mean in this context. You will develop a systems and design perspective on information and organizations that will inform your future work as a manager and leader. You will learn how to model organizations and their environments to reveal how they reflect foundational concepts of information theory, cybernetic control and complexity. You will also learn to evaluate multiple levels of information design, including communication design, product design, experience design and organization design, as an integral part of your management skills. In addition, you will study the strategic use of contemporary information technologies (e.g., enterprise systems, cloud computing, crowd sourcing, viral marketing, distributed innovation, and social media) to understand how they have changed the competitive landscape of business. Throughout the course, you will be challenged to develop new skills for analyzing organizations, environments and systems, and for using design concepts and methods to create information environments that will enable successful organizations.

MIDS 315. Multimedia Systems. 3 Units.
Current practices and future directions of multimedia systems are discussed. Special attention is given to management issues involved in specifying, designing, developing, and assessing multimedia systems and to design principles that can be used to improve the quality of multimedia. This is a project-based course in which students gain experience in developing web sites, CD-ROMs, and films. Description for MIDS 415: As information becomes more abstract and therefore more difficult to perceive directly with one’s sense, sonic and visual presentation become more important than ever. Designing systems that take advantage of people’s aesthetic sensibilities is an area wide open to the enterprising and inventive entrepreneur. This course will interest those who think that artists have a say about how sound and graphics and words might be put together. The course examines aesthetic issues that arise in the development of multimedia. It focuses on creative integration of video, audio, and graphics particularly for the web, interactive CDs, and virtual reality. Offered as MIDS 315 and MIDS 415. Prereq: Not open to first-year students.

MIDS 326. Systems Analysis and Design. 3 Units.
This course investigates concepts and techniques for analyzing organizational systems in order to identify opportunities for redesigning the organization, its work practices and/or its information systems. It emphasizes creativity in diagnosing organizational problems and opportunities. You will learn consultation and intervention strategies for moving to a consensus on problem definition and a vision of desired changes. You will learn both soft and structured object-oriented methods for performing systems analysis. In addition you will learn the process of documenting new organizational and information system requirements in a form suitable for detailed system design and implementation.

MIDS 360. Independent Study. 1 - 18 Unit.
MIDS 385. Web Systems Integration. 3 Units.
Standards-based technology is used to help solve complex information system problems in modern organizations. This course brings together component-based development approaches in the context of doing business on the global Internet and on corporate intranets. Enabling technologies are based on published and de facto Internet standards including HTTP and HTML, CGI/API and Perl, CSS, JavaScript, ActiveX, XML, CORBA/DCOM, and SSL/SET. Students are encouraged to contribute to a team effort to design, implement, and integrate an appropriate solution to a selected business problem in electronic commerce or distance learning. They will also develop competency in the foundation technologies. Offered as MIDS 385 and MIDS 485.

MIDS 409. System and Design Thinking. 3 Units.
For over a half-century, the field of information systems has been learning about the design, development, testing, and use of complex systems. Computers are just the start. The networks that connect them to create a massive communications grid, the software that runs on them, and the impact of these artifacts on organizations have all generated large bodies of knowledge. Two modes of thinking have proven particularly valuable in making sense of these developments—system thinking and design thinking. While this course applies concepts from system thinking and design thinking to problems related to using information in organizations, the techniques are widely applicable to managing.

MIDS 409A. System and Design Thinking. 1 Unit.
For over a half-century, the field of information systems has been learning about the design, development, testing, and use of complex systems. Computers are just the start. The networks that connect them to create a massive communications grid, the software that runs on them, and the impact of these artifacts on organizations have all generated large bodies of knowledge. Two modes of thinking have proven particularly valuable in making sense of these developments—system thinking and design thinking. While this course applies concepts from system thinking and design thinking to problems related to using information in organizations, the techniques are widely applicable to managing. Prereq: Open to ACL-MBA students.

MIDS 413. Managing Large Systems. 3 Units.
This course will help you understand the complex nature of the selection, implementation and management of large enterprise business systems (such as Enterprise Resource System, Customer Relationship Management systems and Supply Chain Management systems). It is no secret that many companies have publicly, and privately, struggled with large enterprise business systems projects which ended up millions of dollars over budget, many years behind schedule, or worse, crippling the companies’ operations by failing to meet the day-to-day demands of the business. During this course, we will examine case studies of successful, and unsuccessful, projects and organize the common themes into a framework applicable to the successful navigation of the life cycle of large enterprise business systems. Prereq: MIDS 409.

MIDS 415. Multimedia Systems. 3 Units.
Current practices and future directions of multimedia systems are discussed. Special attention is given to management issues involved in specifying, designing, developing, and assessing multimedia systems and to design principles that can be used to improve the quality of multimedia. This is a project-based course in which students gain experience in developing web sites, CD-ROMs, and films. Description for MIDS 415: As information becomes more abstract and therefore more difficult to perceive directly with one’s sense, sonic and visual presentation become more important than ever. Designing systems that take advantage of people’s aesthetic sensibilities is an area wide open to the enterprising and inventive entrepreneur. This course will interest those who think that artists have a say about how sound and graphics and words might be put together. The course examines aesthetic issues that arise in the development of multimedia. It focuses on creative integration of video, audio, and graphics particularly for the web, interactive CDs, and virtual reality. Offered as MIDS 315 and MIDS 415.

MIDS 420A. Design in Management: Concept and Practices. 3 Units.
Designing is giving form to an idea to conceive of a more desirable product, service, process or organization and refining the idea into something that can be delivered reliably and efficiently. Good design integrates these evolving ideas with the day-to-day realities of a firm’s operations, systems, marketing, economics, finance and human resources. Designing is thus a unique managerial activity that brings together changing technologies, capabilities, relationships, activities and materials to shape an organization’s plans and strategies. It combines analysis and synthesis in ways that are integrative and inventive, and through it managers create opportunities and means of attaining them. Viewed this way, designing is a core competence of a successful entrepreneur or innovative leader. This course is the first in a two-semester sequence. Design analysis is the systematic review of the four orders of design found in every firm—namely, the firm’s communications, products, interactions and environments—and the creation of opportunities to increase firm value by improving each. Students will identify ill-defined, ill-structured problems within organizations. Such problems are ones for which there are no definitive formulations and for which the formulation chosen affects the solutions available. For such problems, there is no explicit way of knowing when you have reached a solution, and solutions cannot necessarily be considered correct or incorrect. But finding innovative solutions to such problems can provide unique opportunities to distinguish organizations and to create exceptional value. A major outcome of the semester’s inquiry is a presentation of the challenges and opportunities discovered during the design analysis of the client organization. The presentation will include a conceptualization of the client’s current situation and opportunities, along with a statement of their design requirements. It is successful to the extent that it demonstrates learning by creating unexpected value to the client.
MIDS 420B. Design in Management: Concept and Practices. 3 Units.
Designing is giving form to an idea to conceive of a more desirable product, service, process or organization and refining the idea into something that can be delivered reliably and efficiently. Good design integrates these evolving ideas with the day-to-day realities of a firm’s operations, systems, marketing, economics, finance and human resources. Designing is thus a unique managerial activity that brings together changing technologies, capabilities, relationships, activities and materials to shape an organization’s plans and strategies. It combines analysis and synthesis in ways that are integrative and inventive, and through it manages to create opportunities and means of attaining them. Viewed this way, designing is a core competence of a successful entrepreneur or innovative leader. This course is the first in a two-semester sequence. Design analysis is the systematic review of the four orders of design found in every firm—namely, the firm’s communications, products, interactions and environments—and the creation of opportunities to increase firm value by improving each. Students will identify ill-defined, ill-structured problems within organizations. Such problems are ones for which there are no definitive formulations and for which the formulation chosen affects the solutions available. For such problems, there is no explicit way of knowing when you have reached a solution, and solutions cannot necessarily be considered correct or incorrect. But finding innovative solutions to such problems can provide unique opportunities to distinguish organizations and to create exceptional value. A major outcome of the semester’s inquiry is a presentation of the challenges and opportunities discovered during the design analysis of the client organization. The presentation will include a conceptualization of the client’s current situation and opportunities, along with a statement of their design requirements. It is successful to the extent that it demonstrates learning by creating unexpected value to the client. Prereq: MIDS 420A.

MIDS 432. Health Care Information Systems. 3 Units.
This course covers concepts, techniques and technologies for providing information systems to enhance the effectiveness and efficiency of health care organizations. Offered as HSMC 432, MIDS 432, MPH 532 and NUNI 432.

MIDS 461. Change Management. 3 Units.
Change is an inherent dimension of organizational life—new policies, regulations, technologies, people, products, competitors, markets, processes, physical facilities...the list goes on. Consequently, the abilities to adapt to and manage technical and organizational changes are critical managerial competencies. This course aims to provide a framework for planning, analyzing, and managing those changes over which you as a manager will have some control. Though our discussions will focus on technology-enabled and technology-related change, the intention is to equip you with a process model, tools, and guiding principles that can be applied more generally to other change processes.

MIDS 485. Web Systems Integration. 3 Units.
Standards-based technology is used to help solve complex information system problems in modern organizations. This course brings together component-based development approaches in the context of doing business on the global Internet and on corporate intranets. Enabling technologies are based on published and defacto Internet standards including HTTP and HTML, CGI/API and Perl, CSS, JavaScript, ActiveX, XML, CORBA/DCOM, and SSL/SET. Students are encouraged to contribute to a team effort to design, implement, and integrate an appropriate solution to a selected business problem in electronic commerce or distance learning. They will also develop competency in the foundation technologies. Offered as MIDS 385 and MIDS 485.

MIDS 501. Special Problems and Topics. 1 - 18 Unit.
This course is offered, with permission, to students undertaking reading in a field of special interest.

MIDS 527. Seminar in MIDS. 3 Units.
This seminar addresses topics of current interest with a strong emphasis on research. It is intended primarily for the faculty and doctoral students of the MIDS Department.

MIDS 601. Special Topics in MIDS. 1 - 18 Unit.
This course is offered, with permission, to Ph.D. candidates undertaking reading in a field of special interest.

Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

MKMR Courses

MKMR 201. Marketing Management. 3 Units.
This is an introductory marketing course designed to provide students with the concepts and theories necessary for understanding the fundamental principles of marketing and its role in any organization. Students will learn concepts such as marketing orientation, marketing-mix, relationship marketing and service logic, as well as behavioral theories of customer response and strategic frameworks of customer brand management. Students develop capabilities for understanding marketing issues in real world situations and to create and implement basic marketing plans. Prereq: At least Sophomore standing.

MKMR 304. Brand Management. 3 Units.
Successful innovation and management of brands and products creates customer, firm and societal value. This course is designed to help students understand the principles of product and brand development and management such as understanding evolving customer needs; creating and delivering the right products, services, and experiences; and managing the process to enhance brand equity and customer satisfaction. Through text, cases, and simulation this engaging class will cover the branding process from new brand and product development; brand communication and promotion, and brand equity measurement. The course will also discuss specific topics such as global brands, brand extensions, brand revitalization, and social responsibility. Prereq: ACCT 102, ECON 102 and MKMR 201.
MKMR 307. Marketing Value Chain Management. 3 Units.
This course views the supply chain (including the distribution channels) as a multi-organization business system that enables customers at all points in the system to acquire the benefits/value they want in the way they want to acquire them. It is a collaborative human network creating customer and shareholder value throughout the system. Strategic and tactical management topics include specifying customer desired value, assessing network members’ (suppliers, producers, distributors, and customers) abilities to create it, and consequently allocating decisions, tasks, and rewards to members. Emphasis is on structure, communication, motivation, and control/discipline to encourage effective implementation throughout the supply chain system. Offered as MKMR 307, MKMR 407 and OPMT 407. Prereq: ACCT 102 and MKMR 201.

MKMR 308. Measuring Marketing Performance. 3 Units.
Evaluation and control are important strategic marketing processes and without effective and consistent measurement, these processes cannot be performed adequately. In recent years, marketing budgets have been challenged by top managers as the value of these expenditures to an organization’s financial well being is not often clear. Marketing activities such as advertising, sales promotions, sales force allocation, new product development and pricing all involve upfront investments and making these investments now require increasing scrutiny. This course will be about knowing and understanding what to measure, how to measure and how to report it so the link between marketing tactics and financial outcomes is clearer. The course will include lecture by the instructor, readings, cases, computer based data exercises and guest lectures. There will also be a team project requirement. Prereq: ACCT 102, ECON 102 and MKMR 201.

MKMR 310. Marketing Analytics. 3 Units.
To appreciate, design, and implement data-based marketing studies for extracting valid and useful insights for managerial action that yield attractive ROI, five essential processes are emphasized: (a) making observations about customers, competitors, and markets, (b) recognizing, formulating, and refining meaningful problems as opportunities for managerial action, (c) developing and specifying testable models of marketing phenomenon, (d) designing and implementing research designs for valid data, and (e) rigorous analysis for uncovering and testing patterns and mechanisms from marketing data. Prereq: MKMR 201.

MKMR 311. Consumer Relationship Management. 3 Units.
Customer Relationship Management (CRM) is the strategic process of building and maintaining profitable, sustainable customer relationships through co-creation of value with customers in both business-to-business (B2B) and business-to-consumer (B2C) markets. This course starts with understanding the relationship between an organization’s strategic goals and the structure and dynamics of organization-customer relationships. Topics include assessing CRM system design, implementation and management; the fundamentals of customer profitability analysis; customer portfolio management; B2B relationship management; sales force management and automation; and designing services programs to optimize customer experiences; and expanding customer relationships through services. Additionally, students will explore how one-to-one marketing and social networks enhance customer relationships. Learning will be accomplished through lecture and discussion, critical discussion of case studies and contemporary marketing issues, and interaction with experienced CRM marketing professionals. Prereq: MKMR 201.

MKMR 312. Selling and Sales Management. 3 Units.
Selling and sales management are keys to implementing an organization’s marketing program and customer relationships. This course emphasizes developing an understanding of basic marketing concepts, selling principles, interrelationships among sales force management and other business functions, appropriate strategy for managing a sales force and measurement of sales force productivity. We will use theories of work motivation and explore how individual difference variables influence the choices of sales managers. This course uses a synthesis of sales research and leading practices to focuses on both a strategic and a tactical perspective. Strategic issues include: entrepreneurial strategy, the sales force’s role in company strategy, customer relationship and strategic account management, sales force size and organization and career paths to sales management. Tactical issues include: effective approaches to selling, finding and retaining top sales talent, motivating and compensating the field force, evaluating performance, and aligning sales territories. Prereq: MKMR 301 or consent of instructor.

MKMR 350. Entrepreneurial Marketing. 3 Units.
You have a great idea. This course helps you achieve your goals for it - whether they are commercial, societal, environmental, public policy/ political or a combination of the four. The course addresses the conceptually creative and data-driven entrepreneurial/intrapreneurial process of conceiving and implementing an operational program for realizing the goals of a market opportunity. Students select an opportunity and develop a deployable, one-year market entry program and five-year strategic marketing program. Emphasis is on the entrepreneurial marketing decision process, including defining the business model, selecting performance objectives and measures, specifying customer perceived value, assessing competitive capability and advantage, defining and analyzing the value chain and evaluating market space structure and dynamics, and complementing the players in the value chain. Identifying and properly using both secondary and primary information in management decision making is a major focus of the course. Offered as MKMR 350 and MKMR 450. Prereq: Sophomore standing.

MKMR 355. Communications Management in a Digital Marketplace. 3 Units.
In a marketplace where consumer touchpoints have gone digital and new digital methods of connecting with the consumers are emerging, this course provides a sound understanding of management of an organization’s total marketing communications. The focus is on identifying appropriate strategy and tactics for effectively communicating with end consumers and other stakeholders/public in both conventional ways and also in new and emerging ways. Students examine the roles of advertising, sales promotion and public relations, along with below the line methods like direct response advertising, and Internet based methods including display and search advertising, affiliate marketing and viral campaigns. They work with developing and managing these elements as part of an overall, synergistic communications strategy. Perspectives and metrics for evaluation of the effectiveness of marketing communications are also introduced and discussed. Prereq: MKMR 301.

MKMR 360. Independent Study. 1 - 3 Unit.
This course is offered, with permission, to students undertaking reading and research in an area of their special interest.
MKMR 403. Managerial Marketing. 3 Units.
This course focuses on managing marketing as a process of creating value and mutually desirable exchanges of values. That is the foundation of a customer orientation and a central theme of market-driven management. Methods for strategic marketing planning, understanding buyer behavior, market analysis, segmentation and devising integrated marketing programs are introduced. Creating customer value and competitive advantage in worldwide markets is the central theme. Prereq: ACCT 401.

MKMR 403A. Marketing. 1 Unit.
This course is designed to refresh and enhance student familiarity with fundamental concepts in marketing management, and with how those concepts are applied to solve realistic business problems. The course exposes students to basic marketing theory in the areas of consumer behavior and decision making (both individual consumers and organizational buyers), pricing strategies, channel management and its importance to marketing strategy, new product development and management and its importance to marketing strategy, new product development and management, and promotion management. Equal emphasis is given to analyzing business cases that deal with realistic situations where the theories described above can be applied. Considerable emphasis is also given to learning analysis techniques and back-of-the-envelope calculations that can be applied to case data (financial, market research results, industry reports, etc.) to gain further insights. Prereq: Open to ACL-MBA students.

MKMR 407. Marketing Value Chain Management. 3 Units.
This course views the supply chain (including the distribution channels) as a multi-organization business system that enables customers at all points in the system to acquire the benefits/value they want in the way they want to acquire them. It is a collaborative human network creating customer and shareholder value throughout the system. Strategic and tactical management topics include specifying customer desired value, assessing network members’ (suppliers, producers, distributors, and customers) abilities to create it, and consequently allocating decisions, tasks, and rewards to members. Emphasis is on structure, communication, motivation, and control/discipline to encourage effective implementation throughout the supply chain system. Offered as MKMR 307, MKMR 407 and OPMT 407.

MKMR 408. Marketing Metrics. 3 Units.
Evaluation and control are important strategic marketing processes and without effective and consistent measurement, these processes cannot be performed adequately. In recent years, marketing budgets have been challenged by top managers as the value of these expenditures to an organization’s financial well being is not often clear. Marketing activities such as advertising, sales promotions, sales force allocation, new product development and pricing all involve up-front investments and making these investments now require increasing scrutiny. This course will be about knowing and understanding what to measure, how to measure and how to report it so the link between marketing tactics and financial outcomes is clearer. The course will include lecture by the instructor, readings (no textbook), cases, computer based data exercises and guest lectures. There will also be a team project requirement. Prereq: MBAC 506 or MKMR 403 or MBAP 407.

MKMR 410. Marketing Insight Management. 3 Units.
To appreciate, design, and implement data-based marketing studies for extracting valid and useful insights for managerial action that yield attractive ROI. Five essential processes are emphasized: (a) making observations about customers, competitors, and markets, (b) recognizing, formulating, and refining meaningful problems as opportunities for managerial action, (c) developing and specifying testable models of marketing phenomenon, (d) designing and implementing research designs for valid data, and (e) rigorous analysis for uncovering and testing patterns and mechanisms from marketing data. Prereq: MKMR 403 or MBAC 506 or MBAP 407.

MKMR 411. Customer Relationship Management. 3 Units.
Customer Relationship Management (CRM) is the strategic process of building and maintaining profitable customer relationships through co-creation of value with customers. This course starts with understanding the relationship between an organization’s strategic goals and customer relationships, including assessing CRM systems, management and implementation, in both B2B and B2C markets. Students will learn the fundamentals of customer profitability analysis, customer portfolio management, B2B relationship/sales force management and automation, designing services to optimize customer experiences, as well as expanding customer relationships through services. Additionally, students will explore how one-to-one marketing and social networks enhance customer relationships. Learning will be accomplished through critical discussion of case studies and contemporary marketing issues, and hands-on group project and presentation, and interaction with experienced CRM marketing professionals. Prereq: MKMR 403 or MBAC 506 or MBAP 407.

MKMR 419. Market Space Management. 3 Units.
This course will introduce you to the fundamental marketing ideas, tools and skills that enable managers to pursue high growth, high return business models in today’s complex and severely competitive markets. Kim and Mauborgne (1999) broke new marketing ground by emphasizing the idea of discovering fundamentally new (unoccupied) market spaces (i.e., where there are no direct competitors). Innovators look across, rather than within, traditional competitive market boundaries to create real value innovation. The reward is a rapid growth, high return business model. Chakravorti (2004) addressed methods of managing those models. Today’s market space networks are so complex that one’s customer’s adoption of an innovation usually depends on its systematic adoption by many other members of the value chain. So, innovators must develop multiple partnerships by changing the behaviors of numerous players, while concurrently dealing with competitive threats. In the course you will learn and practice the seven major tasks of market space discovery and management: 1. Identifying unoccupied market space(s) in which the product or service offers network partners and end users long-term, demonstrable value, 2. determining those parties’ perceptions of the product’s unique benefits to them, 3. mapping the structure and dynamics of the Inter-organizational networks—including both potential partners and competitors, 4. determining the members’ perception of the costs to them of partnering, 5. developing and costing a program to develop relationships with the partners and end users, 6. estimating profitability and ROI, and 7. executing the management program. Course materials include text, readings and cases as a basis for lectures and discussions. Guest speakers address managerial perspectives. Student individual and team deliverables can include active class participation, position papers, case analyses, tests, and a Market Space Audit project. Offered as MKMR 419 and MSOR 419.
MKMR 421. Marketing Value Creation. 3 Units.
Marketing value creation is the process of creating and managing successful brands through continuous innovation. Successful brand innovation and management requires understanding evolving customer needs; creating and delivering the right products, services, and experiences; and managing the process to enhance brand equity and customer satisfaction. Through text, readings, cases, high-profile guest lectures and team projects, this engaging class will cover the innovation and branding process from discovery of unmet needs, brand and product development, to brand promotion and advertising and brand equity measurement. A sustainability thread will weave through the course, covering topics such as brand's ecological footprint, product safety, eco-friendly branding, the ethics of advertising, the impact of pricing on consumers and corporate social responsibility. The result of proper sensitivity to customer needs, social concerns and the environment is integral to the process of value creation for customers, companies and society. Prereq: MKMR 403 or MBAC 506 or MBAP 407.

MKMR 450. Entrepreneurial Marketing. 3 Units.
You have a great idea. This courses helps you achieve your goals for it - whether they are commercial, societal, environmental, public policy/ political or a combination of the four. The course addresses the conceptually creative and data-driven entrepreneurial/intrapreneurial process of conceiving and implementing an operational program for realizing the goals of a market opportunity. Students select an opportunity and develop a deployable, one-year market entry program and five-year strategic marketing program. Emphasis is on the entrepreneurial marketing decision process, including defining the business model, selecting performance objectives and measures, specifying customer perceived value, assessing competitive capability and advantage, defining and analyzing the value chain and evaluating market space structure and dynamics, and complementing the players in the value chain. Identifying and properly using both secondary and primary information in management decision making is a major focus of the course. Offered as MKMR 350 and MKMR 450.

MKMR 450B. Entrepreneurial Marketing-M.B.A.. 3 Units.
This course addresses the entrepreneurial/intrapreneurial process of commercializing an idea for a market opportunity. Students select an opportunity and develop a deployable, one-year market entry program and a five-year strategic marketing program. Emphasis is on the entrepreneurial marketing decision process, including defining the business, defining the market, specifying customer perceived value, assessing competitive capability and advantage, identifying and properly using secondary and primary information, and deploying marketing programs throughout the organization and the supply chain. Offered as ENTP 450 and MKMR 450B. Prereq: MKMR 403.

MKMR 460. Marketing Communications Management. 3 Units.
This course provides a sound understanding of management of an organization’s total marketing communications. The focus is on identifying appropriate strategies and tactics for effectively communicating with end consumers and other stakeholders/publics, in order to manage the firm’s brand equity and its market, industry and societal positioning. Students examine the roles of advertising, sales promotion, point-of-purchase efforts, and public relations, and emerging direct marketing technologies. They work with developing and managing these elements as part of an overall, synergistic communications strategy. Marketing communications for ongoing as well as crisis situations are developed. Multiple perspectives on evaluation of the effectiveness of marketing communications are introduced. Topics addressed include: integrated marketing communications, brand equity management, corporate communications strategies, public relations management, and crisis management. Prereq: MKMR 403.

MKMR 475. Supply Chain Logistics. 3 Units.
The focus of this course is on the effective management of a firm’s downstream processes in the supply chain that deliver goods and services to customers. Concepts, methods, and strategies are presented that can lower supply chain costs while maintaining or improving customer service. In addition, ideas for using the supply chain for competitive advantage leading to revenue enhancement are discussed. Adding value for customers is the objective. Key topics include transportation planning, inventory management, network design, and customer service goal setting. Offered as MKMR 475 and OPMT 475.

MKMR 476. Strategic Sourcing. 3 Units.
The primary purpose of the course is to provide a comprehensive introduction to supply issues in manufacturing and service organizations. Procurement and supply management has evolved as a strategic function across various industries. Recent volatility in commodity process has further enhanced the challenges in procurement. This course explores sourcing strategies in global supply chains to reduce cost and enhance the competitiveness of the firm. This course will provide you with a framework for thinking about strategic sourcing and tools to procure commodities and services efficiently. Offered as MKMR 476 and OPMT 476.

MKMR 501. Special Problems and Topics. 1 - 18 Unit.
This course is offered, with permission, to students undertaking reading or a project in a field of special interest.

MKMR 601. Special Problems and Topics. 1 - 18 Unit.
This course is offered, with permission, to Ph.D. candidates undertaking reading or a project in a field of special interest.

Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
MPOD Courses

MPOD 413. Foundations of Positive Organization Development and Change. 4 Units.
This course explores and develops the art of reading and understanding social systems in ways that help us imagine, design and develop organization excellence. First it seeks to show how many of our conventional ideas about organizations are based on discourse and metaphors that lead us to see and understand organizations in partial and often limiting ways. Growing research from the domains of Positive Psychology and Positive Organization Scholarship and the theory and practice of Appreciative Inquiry will be explored to show how we can create new and more positive, strength-based ways of designing and developing social systems. Includes presentations, guest lectures and panel discussions on current topics of interest for the Masters in Positive Organization Development and Change (MPOD) candidates. Led by a faculty member of the Department of Organization Behavior, these dialogues and seminars will be presented in several of the six main residencies of the MPOD program. Reflective essays and integrative papers will enable participants to explore their practice of OD, leadership capacity, application of learnings from the program and deeply held values related to current issues and opportunities in the domain of human systems change and development. Prereq: Open to MPOD candidates only.

MPOD 414. Organization Design for a Knowledge World. 3 Units.
The objective of this course is to familiarize participants with the theory and technique of organization design and corporate change with particular emphasis on helping leaders understand and implement the latest forms of organizing in a customer-focused, electronically mediated and knowledge-driven world. Frameworks presented will be used to explore the impact of the information revolution on organization design and change, and the evolution of traditional vertically integrated and multi-divisional enterprises toward spider web structures, trans-organizational networks and communities of practice. Prereq: Open to MPOD candidates only.

MPOD 416A. Leadership, Executive Assessment and Development. 1 Unit.
Leadership with emotional intelligence will be examined by studying a number of topics and applying them to two major case studies: 1) a CEO; and 2) yourself. In this context, coaching the development of leadership will be a major topic throughout the course. This course will explore questions such as: Who are effective leaders? Are they different from effective managers? How do they think and act? What makes us want to follow them? How are leaders developed? What and how can people (you) help/coach others develop their competencies to become more effective leaders? (Part one of a three-section course.) Prereq: Open to MPOD candidates only.

MPOD 416B. Leadership and Executive Assessment and Development. 1 Unit.
Leadership with emotional intelligence will be examined by studying a number of topics and applying them to two major case studies: 1) a CEO; and 2) yourself. In this context, coaching the development of leadership will be a major topic throughout the course. This course will explore questions such as: Who are effective leaders? Are they different from effective managers? How do they think and act? What makes us want to follow them? How are leaders developed? What and how can people (you) help/coach others develop their competencies to become more effective leaders? (Part two of three) Prereq: MPOD 416A.

MPOD 416C. Leadership, Executive Assessment and Development. 1 Unit.
Leadership with emotional intelligence will be examined by studying a number of topics and applying them to two major case studies: 1) a CEO; and 2) yourself. In this context, coaching the development of leadership will be a major topic throughout the course. This course will explore questions such as: Who are effective leaders? Are they different from effective managers? How do they think and act? What makes us want to follow them? How are leaders developed? What and how can people (you) help/coach others develop their competencies to become more effective leaders? (Part three of a three-section course.) Prereq: MPOD 416B.

MPOD 418. Sustainability for Strategic Advantage. 2 Units.
Sustainability is introduced as a movement in business to create value by responding to social and environmental problems in ways that meet current needs without reducing future capacity. Students are introduced to systems thinking skills, such as whole system mapping, causal loop modeling, emergent hypotheses, stakeholder analysis and engaging productive dialogues. Emphasis is placed on use of these skills as methods for working with clients to create actionable knowledge, thereby integrating reflection with action to leave the client system stronger. Prereq: Open to MPOD candidates only.

MPOD 419. Building the Sustainable Enterprise. 4 Units.
In this course, participants will build on skill developed in MPOD 418 by working in the field with a client system to build a sustainable enterprise. Emphasis is on clarifying what sustainability means for a successful enterprise, the advantages to stakeholders of working as action researchers and the use of systems tools to foster generative dialogue. Professional presentations and papers are developed to advance a collaborative learning network among participants and clients. Prereq: Open to MPOD candidates only.

MPOD 431. Experiential Learning for Individuals, Teams, and Organizations. 3 Units.
This course focuses on the theory of experiential learning and its application at the individual, team, and organizational levels of analyses. This course offers the chance for students to gain insight into their individual learning and adaptive styles, and how such styles impact the way they interact and have consequence for team. The course also explores how teams and organizations learn, and the effect that cultural determinants have on learning and adaptability. In addition, the course examines how learning theory can be applied to focused institutional development projects and educational processes. The course uses presentations, lectures, research findings, interactive activities, and class discussion. The current topics of interest are for the Masters in Positive Organization and Change (MPOD) candidates. It is led by a faculty member of the Department of Organization Behavior. Reflective essays and integrative papers will enable participants to explore their learning styles and that of their organizations and teams to strengthen the practice of OD and human systems change and development. Prereq: MPOD students only.
MPOD 435. Practicum in Appreciative Inquiry and Positive OD. 4 Units.
This course develops participants' consultative skills. Competence in role entry and development, data collection, intervention and evaluation is gained through class exercises and field projects. The focus is on developing a problem-centered approach to intervening in organizations that minimizes reliance on programmed techniques and maximizes collaborative innovation and learning between client and consultant. Prereq: Open to MPOD candidates only.

MPOD 439A. Individual Field Project. 2 Units.
The objective of this course is to plan and execute a significant organization development, change and/or analysis project with an ongoing client or employer. Emphasis is placed on the craft of developing projects that are consistent with one's current skills, career plans and developmental needs, combined with the needs, opportunities, readiness, and resources of the client organization. This course is limited to candidates for the MPOD program. (Part one of a two section course.) Prereq: Open to MPOD candidates only.

MPOD 439B. Individual Field Project. 2 Units.
The objective of this course is to plan and execute a significant organization development, change and/or analysis project with an ongoing client or employer. Emphasis is placed on the craft of developing projects that are consistent with one's current skills, career plans and developmental needs, combined with the needs, opportunities, readiness, and resources of the client organization. This course is limited to candidates for the MPOD program. (Part two of a two-section course.) Prereq: MPOD 439A.

MPOD 470A. Leading Change from a Complexity Perspective. 1 Unit.
In this course, we will continuously attempt to answer two questions: (1) What is the process of sustained, desirable change? and (2) What is the role of a leader? Concepts form complexity theory will be used, including understanding the multilevel nature of SDC at the individual, dyad, team, organization, community, country, and global levels. Intentional Change Theory (ICT) will be used as the organizing concept for the changes studied. In this context, coaching the development of leadership will be a major topic throughout the course. Prereq: MPOD candidates only.

MPOD 470B. Leading Change from a Complexity Perspective. 2 Units.
In this course, we will continuously attempt to answer two questions: (1) What is the process of sustained, desirable change? and (2) What is the role of a leader? Concepts form complexity theory will be used, including understanding the multilevel nature of SDC at the individual, dyad, team, organization, community, country, and global levels. Intentional Change Theory (ICT) will be used as the organizing concept for the changes studied. In this context, coaching the development of leadership will be a major topic throughout the course. Prereq: MPOD candidates only.

MPOD 479. Foundations of Strategic Thinking. 3 Units.
This course will define what constitutes strategic change and what does not. Students will be introduced to a variety of strategic interventions and models from which to interpret, understand and achieve positive organizational change. Opportunity will be provided to apply selected models to the student's organization and other cases in order to gain insight and appreciation for financial and non-financial factors that influence fundamental organizational growth and development. Prereq: Open to MPOD candidates only.

MPOD 480A. Dynamics of Effective Consulting and Implementation. 2 Units.
This course will: 1) highlight the major current trends and changes that affect the nature of managerial work; 2) describe how OD practitioners and consultants need to factor such trends into their consulting strategies; 3) differentiate between types of interventions, the circumstances in which they apply and their unique strengths; 4) provide background theories that explain the challenges inherent in mobilizing positive change; 5) describe ways to bridge the gap between knowing and doing in order to build organization resilience; and 6) introduce a variety of consulting techniques and skills that the students can add to their repertoire. (Part one of two) Prereq: Open to MPOD candidates only.

MPOD 480B. Dynamics of Effective Consulting and Implementation. 1 Unit.
Additional models and consulting skills will be introduced and the class will be given the chance to practice these consultative/facilitative techniques. In addition, the course will integrate the learning from the first and second sessions. Toward this end, the course will develop a framework that considers the purpose of a consulting strategy (why); the process that one might employ (how); and the principles that form the foundations for action and intervention (what). (Part two of two) Prereq: Open to MPOD candidates only.

MPOD 498. Global Citizenship and Multi-Cultural OD: International Study Tour. 4 Units.
This course will broaden perspectives and knowledge of how OD principles and technologies are generated and applied in contexts and cultures outside of North America. Selected literature representing global perspectives on the practice of OD and field experiences will provide support and background for personal experience and reflection on cross-cultural issues in organizing. The primary learning context will be an intense, 10-day study tour to some country outside of North America to provide the participants with opportunities for: 1) comparative studies of OD practices in different cultural settings; 2) in-depth experiences with OD practitioners and students in a different national, regional and cultural context; 3) co-inquiry with non-North American students also involved in developing OD knowledge and skills; and 4) on-site organization visits outside of North America to observe and learn about on-going dynamic change efforts. Prereq: Open to MPOD candidates only.

MSFI Courses

MSFI 403. Corporate Finance. 3 Units.
The purpose of this course is to familiarize the student with the theory and application of additional models used in financial decision-making by corporations. Issues relating to efficient markets, dividend policy, capital structure, financing decisions, option pricing, leasing, and risk management are among the topics considered. In addition, special topics may include mergers and acquisitions, pension funds, and international financial management. Prereq: For MSF-MSM and ACL-MSF students only.
MSFI 404. Financial Modeling. 3 Units.
Firms try to create value. In their day-to-day operations, they are faced with numerous challenges: Should we accept trade credit or borrow? Will an acquisition create or destroy value? Should we introduce a new product line even if it cannibalizes an existing one? In each of these situations they try to quantify the impact on the value of their firm. The goal of this course is to develop your skills in financial modeling and valuation, so you can tackle issues like the ones described above. The course is designed to be "hands-on": You will learn to apply the theory and develop spreadsheet modeling skills through the homework, case studies and a group project. By the end of the course you will have a good understanding of both the theory and practice of valuation, and possess a set of cutting-edge financial modeling skills. This course is designed for students who aspire to work in a regular company, a bank or a consulting firm in (I) corporate finance (including mergers and acquisitions); (II) strategy; or (III) equity analysis. This course is for MSF-MSM and ACL-MSF students only. Prereq: For MSF-MSM and ACL-MSF students only.

MSFI 421. Fundamental Analysis of Companies and Industries. 3 Units.
The goal of this course is twofold--to revisit important concepts in financial and managerial accounting, marketing, strategy and operations, and to see how they can be applied through the filter of finance. Put a little differently, what should students think about above and beyond analyzing accounting and financial information in assessing how value gets created within the firm? While students may have been exposed to some of these subjects in their undergraduate studies, this course will ensure they all have a common background and language. We will rely heavily on working with financial information from a broad range of companies and industries. Emphasis will be placed on understanding the key drivers behind financial results--what choices about business model and business strategy lead to the reported financial results. Prereq: For MSF-MSM and ACL-MSF students only.

MSFI 428. Financial Strategy and Value Creation. 3 Units.
The intersection between the theory of perfect markets and the reality of market imperfections provides the basis for the exploration of value creation in this course. Opportunities in both product and financial markets are explored using case studies to develop a framework for strategic financial decisions. Prereq: For MSF-MSM and ACL-MSF students only.

MSFI 429. Investment Management. 3 Units.
This course explores the characteristics of financial investments and markets and develops modern techniques of investment analysis and management. The goal is to help students develop a level of analytical skill and institutional knowledge sufficient to make sensible investment decisions. Topics include: an overview of stock, debt and derivative asset markets, practical applications of modern portfolio theory, equilibrium and arbitrage-based approaches to capital market pricing, the debate over market efficiency, the term structure of interest rates, bond portfolio management, and uses of derivative assets in investment portfolios. Prereq: For MSF-MSM and ACL-MSF students only.

MSFI 430. Derivatives and Risk Management. 3 Units.
This course is intended to give students an understanding of options and futures markets both in theory and practice. The emphasis is on arbitrage and hedging. The course concentrates on listed common stock and index contracts as well as commodity markets. Various theories for trading strategies are studied. This course is for MSF-MSM and ACL-MSF students only. Prereq: For MSF-MSM and ACL-MSF students only.

MSFI 431. Fixed Income Markets and Their Derivatives. 3 Units.
This class is concerned with fixed income securities, interest rate risk management, and credit risk. Fixed income securities account for about two thirds of the market value of all outstanding securities, and hence this topic is important. The course covers the basic products of fixed income markets including treasury and LIBOR products, such as interest rate swaps. Risk management and hedging strategies are covered as well as selected topics in credit risk models and mortgage-backed securities. Prereq: For MSF-MSM and ACL-MSF students only.

MSFI 432. Corporate Risk Management. 3 Units.
This is a risk management course aimed at developing an understanding of the risks faced by financial and nonfinancial firms, learning techniques to identify and measure these risks, and understanding how financial engineering (especially derivatives) can be used to manage these risks and advance the strategic goals of the firm. Main topics include Value-at-Risk (VaR) techniques and implementation of VaR systems (RiskMetrics, Delta-normal, Historical Simulation, Structured Monte-Carlo); financial risk measurement and management using forwards, futures, options, swaps, and exotics; and credit risk management, including implementing various credit risk and credit VaR models, estimating capital at risk, and using credit derivatives for managing credit risk. Several classes are devoted to discussing recent risk management debacles and relating them to theory. Prereq: For MSF-MSM and ACL-MSF students only.

MSFI 434. Financial Econometrics. 3 Units.
MSFI 434 represents a rigorous study of the latest developments in the area of financial econometrics. The class assumes no prior knowledge of econometrics. It assumes that you have had a basic statistics class and that you have had regression analysis. It is taught using economic motivations and examples from the financial world. The course concerns modern econometric topics like time-series forecasting, volatility modeling, and panel data analysis. Various concepts and approaches in the course will be subjected to real world data. Students are expected to have basic knowledge of the fundamentals of corporate finance and statistics. The course aims at providing a lasting conceptual framework for model building using modern applied econometric techniques commonly employed in finance. Prereq: For MSF-MSM and ACL-MSF students only.

MSFI 435. Empirical Finance. 3 Units.
MSFI 435 provides an introduction to empirical analysis and research in finance. This involves the management of empirical datasets and the aspects of quantitative applications of finance theory. The goal is to enable the student to deal with the need to analyze complex and large financial and economic datasets that is present in many fields of the financial profession. The scope of the data as well as the quantitative methods used in such analysis often requires familiarity with robust computational environments and statistical packages. As such, another goal of the course is to familiarize the student with at least one such environment. Applications are conducted using real financial and economic data. The course draws on the theoretical aspects of the subjects covered, but mainly focuses on the practical matters required to undertake an empirical analysis of financial topics--e.g., the definition of the research question, the datasets required, the computational needs, and, then, the implementation. The course enables the student to evaluate outstanding financial research as well as to conduct his or her own research. Prereq: For MSF-MSM and ACL-MSF students only.
MSFI 436A. Individual, Team and Career Development. 1.5 Unit.
This course is designed to focus on three areas of development critical to students’ personal and professional success: 1) Individual; 2) Team; and 3) Career. The individual and team aspects include developing self and other awareness through exploration of learning styles, process skills, and building communication and presentation competencies. Career development includes a focus on strategies for success such as networking, resume building, and learning from executives through intensive and interactive seminars. The course involves use of assessments, group discussions, presentations and experiential activities. Prereq: For MSF-MSM and ACL-MSF students only.

MSFI 436B. Individual, Team and Career Development. 1.5 Unit.
This course is designed to focus on three areas of development critical to students’ personal and professional success: 1) Individual; 2) Team; and 3) Career. The individual and team aspects include developing self and other awareness through exploration of learning styles, process skills, and building communication and presentation competencies. Career development includes a focus on strategies for success such as networking, resume building, and learning from executives through intensive and interactive seminars. The course involves use of assessments, group discussions, presentations and experiential activities. Prereq: For MSF-MSM and ACL-MSF students only.

MSFI 440. Advanced Corporate Finance. 3 Units.
This course exposes the students to a more in-depth treatment of some of the topics covered in BAFI 403 and introduces them to new topics. Topics include investment decisions, financing decisions, payout decisions, contracting decisions and performance metrics, internal control systems, risk management, real options, diversification and valuation. Topics covered may vary from semester to semester. Prereq: For MSF-MSM and ACL-MSF students only.

MSFI 450. Mergers and Acquisitions. 3 Units.
This course examines the economic rationale and motivation for the different merger and acquisition and recapitalization activity undertaken by firms and individuals in the U.S. market. Emphasis is on the different three (3) methods of valuing a firm, the various forms of debt and equity capital employed to fund mergers and acquisitions and recapitalizations, how lenders and investors structure their loans and/or investments, and how investors realize the gains through different exit strategies. The course gives the student an excellent understanding of the role that senior commercial banks, insurance companies, pensions funds, LBO funds, investment banking firms, and venture/growth capital investors play in mergers and acquisitions. Prereq: For MSF-MSM and ACL-MSF students only.

MSFI 490. Projects in Corporate Finance. 3 Units.
This course is focused on engaging groups of students in identifying, analyzing and making decisions on real-world corporate financial problems. Teams of students will be assigned to a specific client situation drawn from one of three general areas: (i) mergers and acquisitions (involving corporations and/or leveraged buyout firms), (ii) public equities (IPOs and/or equity research) and (iii) corporate financial policies and transactions. This course is structured to be a capstone experience that allows students to leverage the broad range of skills, tools and approaches introduced throughout the program. It is intended to provide an important bridge from work in the classroom to the unstructured, chaotic nature of real world business. Prereq: For MSF-MSM and ACL-MSF students only.

MSFI 491. Projects in Risk Management. 3 Units.
This course is focused on engaging groups of students in identifying, analyzing and making decisions on real-world risk management financial problems. Teams of students will be assigned to a specific client situation drawn from one of two general areas: (i) investments and hedge funds, equity and portfolio management, fixed income and foreign exchange and (ii) risk management with derivatives, credit risk management, risk analytics, regulatory capital, asset liability bank management. This course is structured to be a capstone experience that allows students to leverage the broad range of skills, tools and approaches introduced throughout the program. It is intended to provide an important bridge from work in the classroom to the unstructured, chaotic nature of real world business. Prereq: For MSF-MSM and ACL-MSF students only.

MSOR Courses
MSOR 406. Operations Management for MSM OR. 3 Units.
Operations managers, ranging from supervisors to vice presidents, are concerned with the production of goods and services. More specifically, they are responsible for designing, running, controlling and improving the systems that accomplish production. This course is a broad-spectrum course with emphasis on techniques helpful to the practice of management at the analyst level. Its goal is to introduce you to the environments, to help you appreciate the problems that operations managers are confronted with, and provide you with the tools to address these problems. Operations Management spans all value-adding activities of an organization including product and process design, production, service delivery, distribution network and customer order management. As global competition in both goods and services increases, a firm’s survival depends upon how well it structures its operations to respond quickly to changing consumer needs. Thus, it is essential for all business managers to acquire an understanding of operations management to maintain their competitive advantage. This course provides students with the basic tools needed to become an analyst in Supply Chain and Operations Management. This course provides an overview of Process analysis, Capacity management, Queuing system, analysis, Forecasting, Quality management, Material Requirements planning, Inventory management, and Supply Chain management. The emphasis of the course is on both real world applications and technical problem solving. Several manufacturing and non-manufacturing environments will be discussed explicitly, like health care, insurance, hotel-management, airlines and government related operations. Also we will explore the interface of operations management with other functional areas such as marketing, finance, accounting, etc. This coursework includes individual and group assignments, case analyses and experiential learning through simulations and educational games. Prereq: Course limited to students in Program=OPRMS, Plan=ORSC-MSM.
MSOR 410. Financial Management for Supply Chain. 3 Units.
This course focuses on learning the language of business, how basic accounting information is reported and analyzed, and how basic financial principles can be applied to understanding how value is created within an enterprise. This course is intended for individuals who have a limited background in accounting, finance and business. Most of the exercises will involve evaluating and building models in Excel. Teaching objectives are fairly straightforward: 1. Provide you with a basic understanding of the key principles of accounting and finance. We will quickly cover material that is typically covered in a three-course sequence (Introductory Accounting and Finance I and II). We will fly at a fairly high level, but we want to make sure you understand the basic concepts. 2. Apply these concepts to real (but straightforward) business situations, to gain a better understanding of how companies utilize accounting and financial information. 3. Time permitting, explore how these concepts can be applied to securities, mergers and acquisitions and leveraged buyout transactions, with a specific emphasis on how these concepts are likely to surface in your role in such transactions. Prereq: Course limited to students in Program=OPRMS, Plan=ORSC-MSM.

MSOR 419. Market Space Management. 3 Units.
This course will introduce you to the fundamental marketing ideas, tools and skills that enable managers to pursue high growth, high return business models in today’s complex and severely competitive markets. Kim and Mauborgne (1999) broke new marketing ground by emphasizing the idea of discovering fundamentally new (unoccupied) market spaces (i.e., where there are no direct competitors). Innovators look across, rather than within, traditional competitive market boundaries to create real value innovation. The reward is a rapid growth, high return business model. Chakravorti (2004) addressed methods of managing those models. Today’s market space networks are so complex that one customer’s adoption of an innovation usually depends on its systematic adoption by many other members of the value chain. So, innovators must develop multiple partnerships by changing the behaviors of numerous players, while concurrently dealing with competitive threats. In the course you will learn and practice the seven major tasks of market space discovery and management: 1. Identifying unoccupied market space(s) in which the product or service offers network partners and end users long-term, demonstrable value, 2. determining those parties’ perceptions of the product’s unique benefits to them, 3. mapping the structure and dynamics of the Inter-organizational networks—including both potential partners and competitors, 4. determining the members’ perception of the costs to them of partnering, 5. developing and costing a program to develop relationships with the partners and end users, 6. estimating profitability and ROI, and 7. executing the management program. Course materials include text, readings and cases as a basis for lectures and discussions. Guest speakers address managerial perspectives. Student individual and team deliverables can include active class participation, discussions. Guest speakers address managerial perspectives. They are also expected to engage with projects external to the university (similar to an action learning project). Prereq: For ORSC-MSM students only.

MSOR 485A. Individual Development. 1.5 Unit.
This course is unique in the sense that its primary focus is on the student as an individual. In this course the student will get to know themselves better by completing assessments and making sense of them, having group discussions, presenting to a group as individuals, engaging in various experiential activities, conducting career interviews, attending various individual development programs and participating in two individual coaching sessions. Prereq: For ORSC-MSM students only.

MSOR 485B. Team Development. 1.5 Unit.
This course is unique in the sense that its primary focus is on the student working in teams. In this course the student will assess their team interaction based on team assignments simulated and action learning type projects, presenting to the class as a team, engaging in various experiential activities, participating one team coaching session, working with a team, and expanding their knowledge of team leadership and membership skills and abilities. They are also expected to engage with projects external to the university (similar to an action learning project). Prereq: For ORSC-MSM students only.

OPMT Courses

OPMT 405. Operations Management. 3 Units.
Operations management deals with the design of products and processes, the acquisition of resources, the conversion of inputs to outputs, and the distribution of goods and services. It is central to a firm’s ability to compete effectively. As global competition in both goods and services increases, the management of operations is becoming more and more important. This course provides a broad overview of the managerial issues associated with production and delivery of goods and services. It includes the use of quantitative modeling using computers as a central methodology. Prereq: QUMM 414.

OPMT 405A. Operations Management. 1 Unit.
In recent years, a changing competitive landscape has highlighted the critical role of the operations function in ensuring business success. In this course, we treat business as a value-added chain of processes that supply and convert disparate inputs into products and services and distribute these outputs. We examine how to best design, run and improve these processes. A variety of manufacturing and service sector settings will be used as examples to illustrate the concepts. It is assumed that the student is familiar with the material covered in a basic undergraduate course in operations management. Specifically, a vocabulary of operations management terminology and proficiency in basic tools and techniques of operations management are expected. Prereq: Open to ACL-MBA students.

OPMT 407. Marketing Value Chain Management. 3 Units.
This course views the supply chain (including the distribution channels) as a multi-organization business system that enables customers at all points in the system to acquire the benefits/value they want in the way they want to acquire them. It is a collaborative human network creating customer and shareholder value throughout the system. Strategic and tactical management topics include specifying customer desired value, assessing network members’ (suppliers, producers, distributors, and customers) abilities to create it, and consequently allocating decisions, tasks, and rewards to members. Emphasis is on structure, communication, motivation, and control/discipline to encourage effective implementation throughout the supply chain system. Offered as MKMR 307, MKMR 407 and OPMT 407.
OPMT 420. Six Sigma and Quality Management. 3 Units.
The Six Sigma process is the standard for quality improvement in organizations around the globe. In this course, we study the details of the five steps in the Six Sigma process: DEFINE, MEASURE, ANALYZE, IMPROVE, and CONTROL (DMAIC). We introduce the concept of sustainability into the criteria to use to evaluate proposed solutions during the Six Sigma process. Many tools, concepts, and processes that are often an integral part of Six Sigma projects in companies are included in the course content. They range from the very basic tools of quality (such as cause-and-effect diagrams for brainstorming) to complete processes (such as benchmarking, quality function deployment, failure mode and effects analysis-FMEA). Statistical concepts that are central to Six Sigma including statistical process control and introduction design of experiments are also included. Once the Six Sigma process and its various components are understood, we study quality management including quality control, quality planning, quality improvement, strategic quality management, and quality strategy. Students meeting the required standards of performance will earn a Green Belt Certification in Six Sigma and Quality Management from the Weatherhead School of Management.

OPMT 430. Sustainable Operations. 3 Units.
This course takes a business approach to environmental and social issues to answer "what do I need to know about environmental and social issues to make my company more successful, and how can I act on that knowledge profitably?" We summarize important environmental and social issues facing business (and all of society), such as global climate change, pollution, economic development, hunger, and social unrest. Drawing on most areas of the MBA program, we examine environmental and social issues associated with product design and component commonality, recycling materials, product packaging, process design and remanufacturing, facility location and design (including green building), reverse logistics and closed-loop supply chains, and global supply chains.

OPMT 450. Project Management. 3 Units.
Project management is concerned with the management and control of a group of interrelated tasks required to be completed in an efficient and timely manner for the successful accomplishment of the objectives of the project. Since each project is usually unique in terms of task structure, risk characteristics and objectives, the management of projects is significantly different from the management of repetitive processes designed to produce a series of similar products or outputs. Large-scale projects are characterized by a significant commitment of organizational and economic resources coupled with a high degree of uncertainty. The objective of this course is to enhance the ability of participants to respond to the challenges of large-scale projects so that they can be more effective as project managers. We study in detail up-to-date concepts, models, and techniques useful for the evaluation, analysis, management, and control of projects. Prereq: QUMM 414 or MBAC 511 or MBAP 403 or OPRE 433.

OPMT 475. Supply Chain Logistics. 3 Units.
The focus of this course is on the effective management of a firm's downstream processes in the supply chain that deliver goods and services to customers. Concepts, methods, and strategies are presented that can lower supply chain costs while maintaining or improving customer service. In addition, ideas for using the supply chain for competitive advantage leading to revenue enhancement are discussed. Adding value for customers is the objective. Key topics include transportation planning, inventory management, network design, and customer service goal setting. Offered as MKMR 475 and OPMT 475.

OPMT 476. Strategic Sourcing. 3 Units.
The primary purpose of the course is to provide a comprehensive introduction to supply issues in manufacturing and service organizations. Procurement and supply management has evolved as a strategic function across various industries. Recent volatility in commodity processes has further enhanced the challenges in procurement. This course explores sourcing strategies in global supply chains to reduce cost and enhance the competitive firm. This course will provide you with a framework for thinking about sourcing and tools to procure commodities and services efficiently. Offered as MKMR 476 and OPMT 476.

OPMT 477. Enterprise Resource Planning in the Supply Chain. 3 Units.
Enterprise resource planning is the dominant system by which companies translate the needs from their customers into the detailed plans that the company must perform to meet the customer needs, and the resulting support the company will need from its suppliers. As such, it is a central player in the process of supply chain management. In this course, we study both the quantitative and qualitative concepts and techniques to help manage a company's operations to perform these important translation and planning tasks in order to help the company be successful. The quantitative analysis will be supported by microcomputer software available in the Weatherhead computer lab. Student teams complete a series of integrated case studies from the same company to vividly see the relationships between various planning and control activities. A major emphasis during the course is the design of processes and procedures (algorithms) for solving very complex (wicked) problems as a part of both class discussions and while working on case studies, as well as critiquing the designs so as to clearly understand their limitations.

OPMT 490. Independent Study in Operations Management. 1 - 15 Unit.
This course is offered, with permission, to students undertaking reading in a field of special interest.

OPMT 501. Special Problems and Topics. 1 - 18 Unit.
This course is offered, with permission, to students undertaking reading in a field of special interest.

OPRE Courses

OPRE 207. Statistics for Business and Management Science I. 3 Units.
OPRE 301. Operations Research and Supply Chain Management. 3 Units.
Operations research (OR) or management science, is the discipline of applying advanced quantitative methods to make better decisions. Techniques covered include linear programming, queuing models and simulation. The second part of the course focuses on how OR tools are used in managing various aspects of Supply Chain. Topics covered include demand forecasting, design of distribution systems, capacity planning, and inventory management. Recommended preparation: one semester of statistics or consent of instructor. Prereq: STAT 207 or OPRE 207.

OPRE 345. Decision Theory. 3 Units.
This course provides an understanding of the principles, basic concepts, and methodology of engineering economics. It develops proficiency with these methods and with the process for making rational decisions regarding situations likely to be encountered in professional practice.

OPRE 402. Stochastic Models with Applications. 1.5 Unit.
This course surveys fundamental methods and models in operations research and operations management that incorporate random elements. Topics discussed will include basic results from the theory of stochastic processes, especially Markov chains; an introduction to stochastic dynamic programming; and models in the control of queues and inventories. Prereq: OPRE 433 or OPRE 433A and OPRE 433B.

OPRE 411. Optimization Modeling. 3 Units.
The first half of the course provides a practical coverage of linear programming, a special type of mathematical model. The art of formulating linear programs is taught through the use of systematic model-building techniques. The simplex algorithm for solving these models is developed from several points of view: geometric, conceptual, algebraic, and economic. The role and uses of duality theory are also presented. Students learn to obtain and interpret a solution from a computer package and how to use the associated output to answer “What-happens-if...” questions that arise in post-optimality analysis. Specific topics include: problem formulation, geometric and conceptual solution procedures, the simplex algorithm (phase 1 and phase 2), obtaining and interpreting computer output, duality theory, and sensitivity analysis. The second half of this course provide a practical approach to formulating and solving combinatorial optimization problems in the areas of networks, dynamic programming, project management (CPM), integer programming, and nonlinear programming. The art of formulating problems, understanding what is involved in solving them, and obtained and interpreting the solution from a computer package are shown. A comparison with formulating and solving linear programming problems is provided as a way to understand the advantages and disadvantages of some of these problems and solutions procedures. Recommended preparation: Knowledge of Excel, one semester each of undergraduate linear algebra and undergraduate calculus (derivatives); or consent of instructor.

OPRE 427. Convexity and Optimization. 3 Units.
Introduction to the theory of convex sets and functions and to the extremes in problems in areas of mathematics where convexity plays a role. Among the topics discussed are basic properties of convex sets (extreme points, facial structure of polytopes), separation theorems, duality and polars, properties of convex functions, minima and maxima of convex functions over convex set, various optimization problems. Offered as MATH 327, MATH 427, and OPRE 427. Prereq: MATH 223 or consent of instructor.

OPRE 432. Computer Simulation. 3 Units.
Computer simulation is a process of designing and creating a computerized model that mimics an existing or proposed system so as to better understand the behavior of the system. Many studies have shown that in industry, simulation is most frequently used Operations Research tool due to its ability to deal with complex systems. The first half of this course is designed to give students a basic idea of simulation methodology with the aid of population simulation software. The emphasis of the course is in simulating business processes, however, the versatility of the technique will be demonstrated with applications from finance, health care, etc. The second half of the course covers the statistical design and analysis of simulation models. The topics include random number generation, input data analysis, statistical analysis of simulation outputs, variance reduction techniques, and design of simulation experiments. Prereq: OPRE 433 or OPRE 433A and OPRE 433B or requisites not met permission.

OPRE 433. Probability, Statistics, and Forecasting. 3 Units.
Data of many kinds are typically available in practice, but the challenge is to use those data to make effective professional decisions. This software-intensive course begins with useful descriptions of data and the probability theory foundation on which statistics rests. It continues to statistics, including the central limit theorem, which explains why data often appear to be normally distributed, and the Palm-Khintchine theorem which explains why data often appear to have a Poisson distribution. The remainder of the course focuses on regression and forecasting, including detecting and overcoming some of the deadly sins of regression, and the surpassing flexibility of regression models. Recommended preparation: One semester of undergraduate calculus or consent of instructor.

OPRE 434. Regression and Forecasting. 1.5 Unit.
The first part of this course covers the fundamentals of multiple linear-regression analysis and logistic regression models emphasizing understanding and forecasting relationships between variables in a variety of data settings. The second part includes time series analysis and forecasting. Using case studies and commonly used state-of-the-art statistical software (e.g., SPSS, SAS, etc.) students learn to summarize relationships and measure how well these relationships fit data, and how to make meaningful statistical inferences and forecasts. Prereq or coreq: OPRE 433B or QUMM 414.

OPRE 435B. Integrated Problem Solving in OR and OM. 1.5 Unit.
This project-oriented course uses a variety of software to involve the student in the complete problem-solving process in OR and OM. This process includes problem definition and formulation, data collection, and storage in a database, connecting the database to the solution algorithm, designing and implementing an appropriate user interface, and presenting the final solution. Prereq or Coreq: OPRE 411 or OPRE 411B.

OPRE 435C. Data Structures. 1.5 Unit.
The objective of this course is to provide the student with the data structures (arrays, files, linked lists, trees, and so on) and the numerical methods (differentiation, integration, and solving linear equations) needed for implementing algorithms that solve operations research and operations management problems. These topics are illustrated with C++ and object-oriented programming. Emphasis is given to ensuring that the programs are robust and usable by nontechnical people.
OPRE 454. Analysis of Algorithms. 3 Units.
This course presents and analyzes a number of efficient algorithms. Problems are selected from such problem domains as sorting, searching, set manipulation, graph algorithms, matrix operations, polynomial manipulation, and fast Fourier transforms. Through specific examples and general techniques, the course covers the design of efficient algorithms as well as the analysis of the efficiency of particular algorithms. Certain important problems for which no efficient algorithms are known (NP-complete problems) are discussed in order to illustrate the intrinsic difficulty which can sometimes preclude efficient algorithmic solutions. Recommended preparation for EECS 454: MATH 304 and (EECS 340 or EECS 405). Offered as EECS 454 and OPRE 454. Prereq: OPRE 435A and OPRE 435C.

This course is offered, with permission, to students undertaking reading in a field of special interest.

OPRE 501. Special Problems and Topics. 1 - 36 Unit.
This course is offered, with permission, to students undertaking reading in a field of special interest.

This course is limited to candidates for the Ph.D. degree who are preparing dissertations in some field of operations research. Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

ORBH Courses
ORBH 303. Leadership and Personal Development. 3 Units.
This is an experience-based course designed for increased integration of cognitive and emotional processes, greater awareness of one’s behavior and impact on others, and greater opportunity for behavioral choice in interpersonal relations. Several Saturday classes.

ORBH 370. Women in Organizations. 3 Units.
The purpose of this course is to explore the unique challenges of life for women in their twenties as they increase understanding of the issues surrounding women, ambition, and success in a variety of organizations and professions. At this stage of life there are many choices women can make regarding careers and relationships. This course will broaden understanding of the context of work in women’s lives and help women and men understand the leadership and managerial issues that will surround them in organizations. Offering more complex understandings of issues women face in the workplace related to race and gender, the course will help increase self knowledge about personal identity and direction, values, and abilities including the enhancement of leadership capabilities. It will also facilitate career development, improving the ability of individual women to be choiceful about the quality of integration of both a personal and professional life. Offered as ORBH 370 and WGST 370.

ORBH 403. Developing Interpersonal Skills for Managers. 3 Units.
This course is intended to sharpen students’ skills in the art of relating successfully to other individuals and groups. The course uses an intensive group experience to make students more aware of how their actions affect others, more capable of giving and receiving interpersonal feedback, and more cognizant of processes through which groups work. Several Saturday classes.

ORBH 412. Appreciative Inquiry. 3 Units.
This course studies organizational analysis through appreciative inquiry. It explores multiple framework for understanding the complexity of organizational life. Students form teams and conduct appreciative studies across industries. This course also addresses questions of organizational change (how to move from theory/ideal to practice). Learning is experiential in nature.

ORBH 425. Developing Emotional Intelligence. 3 Units.
Although helping or stimulating individuals to change, learn, and develop is considered a responsibility of the human resource function in an organization, every professor, manager, consultant, and helping professional spends most of their time trying to provoke, evoke, or catalyze a change in others. This course will examine the processes by which individuals change and the methods often used to facilitate this change. How and what a person chooses to change (i.e., select their change goals) will be explored, as well as factors affecting the extent to which he/she changes. The efficacy and ethics of various approaches to individual change as part of human resource and organization development efforts will be discussed. Prereq: MGMT 403.

ORBH 430A. MBA Institute In Sustainable Value and Social Entrepreneurship I. 3 Units.
The MBA Institute in Sustainability and Social Entrepreneurship involves 6 credits divided up into two "courses." The first course --- phase one ---- creates a foundational platform featuring key models and managerial tools for the building sustainable value and “turning the social and global issues of our day into business opportunities.” The second course in an applied sustainability field experience where teams work with companies and communities or real-life sustainability and social entrepreneurship opportunities. The foundations course is a prerequisite to the applied field project phase.

ORBH 430B. MBA Practicum in Sustainable Value and Social Entrepreneurship II. 3 Units.
The MBA Institute in Sustainability and Social Entrepreneurship involves 6 credits divided up into two “courses.” The first course--phase one--creates a foundational platform featuring key models and managerial tools for the building sustainable value and “turning the social and global issues of our day into business opportunities.” The second course is an applied sustainability field experience where teams work with companies and communities or real-life sustainability and social entrepreneurship opportunities. The foundations course is a pre-requisite to the applied field project phase. Prereq: ORBH 430A.

ORBH 450. Executive Leadership. 3 Units.
This course explores answers to questions such as: Who are leaders? Are they different than managers, heroes and heroines? How do the effective ones think and act? What situations create leaders, foster their emergence or provide opportunities? What makes us want to follow them? What are the personal pits of being a leader (i.e., sex, drugs, alcohol, insomnia, ulcers, etc.)? How are leaders developed? Case studies, self-study and at-work projects will be the primary methods used in the course.
ORBH 460. Women in Organizations. 3 Units.
This course addresses important leadership and management issues concerning women in organizations. The course provides complex understandings of issues pertinent to professional women and work such as sex role typing, sex-based discrimination, equal pay, sexual harassment, work-family balance, women’s leadership and women’s career issues and development. The course helps students increase self-knowledge about their own values and practices as well as enhance their capabilities as leaders and managers. We will examine the opportunities, challenges, trade-offs, and organizational dynamics experienced by women in work settings, as well as the interpersonal, organizational, and societal structures and processes impacting women in organizations. Through a variety of course methods, students gain greater awareness of the gendered nature of work and organizations and learn effective strategies for women's career progress and effective participation in organizations.

ORBH 470A. Leading Change from a Complexity Perspective. 1 Unit.
In this course, we will continuously attempt to answer two questions: (1) What is the process of sustained, desirable change? and (2) What is the role of a leader? Concepts from complexity theory will be used, including understanding the multilevel nature of SDC at the individual, dyad, team, organization, community, country, and global levels. Intentional Change Theory (ICT) will be used as the organizing concept for the changes studied. In this context, coaching the development of leadership will be a major topic throughout the course. Prereq: Open to MPOD candidates only.

ORBH 470B. Leading Change from a Complexity Perspective. 2 Units.
In this course, we will continuously attempt to answer two questions: (1) What is the process of sustained, desirable change? and (2) What is the role of a leader? Concepts from complexity theory will be used, including understanding the multilevel nature of SDC at the individual, dyad, team, organization, community, country, and global levels. Intentional Change Theory (ICT) will be used as the organizing concept for the changes studied. In this context, coaching the development of leadership will be a major topic throughout the course. Prereq: Open to MPOD candidates only.

ORBH 479B. Foundations of Strategic Thinking. 2 Units.
This course will define what constitutes strategic change and what does not. Students will be introduced to a variety of strategic interventions and models from which to interpret, understand and achieve positive organizational change. Opportunity will be provided to apply selected models to the student's organization and other cases in order to gain insight and appreciation for financial and non-financial factors that influence fundamental organizational growth and development. (Part two of a two-section course.) Prereq: ORBH 479A.

ORBH 488. Leadership and the Global Agenda. 3 Units.
This course will attempt to develop leadership values and competencies in Organization (OD) within the global arena. Objectives for the course include: (1) developing an executive view of the state of the world; (2) building skills in appreciative inquiry for researching best practices of organizations to maintain sustainable economic development; (3) learning how to build organizational capacities for responding to the global agenda for change; and (4) developing a global consciousness to a larger set of global values to provide a vision for a better world and the potentials of our organizations to assist in realizing such a vision.

ORBH 490. Special Topics. 1 - 18 Unit.
This is a seminar course led by a member of the faculty of the Department of Organizational Behavior. Specific topics are announced at the start of each semester. This course is intended also for independent study.

ORBH 491. Managing Diversity and Inclusion. 3 Units.
This course addresses workforce diversity issues from individual, group, and organizational perspectives. The focus is on innovative ways of utilizing today's culturally expanding workforce. Emphasis is on the "what and how" for managers in developing a corporate culture that embraces diversity, helping them in learning to work with, supervise and tap the talent of diverse employees within their organizations. Included are methods for modifying systems to attract, retain, develop, and capitalize on benefits of the new workforce demographics. A retreat experience is part of this course and is required of all participants.

ORBH 501. Special Problems and Topics. 1 - 18 Unit.
This course is offered, with permission, to students undertaking reading in a field of special interest.

ORBH 510. Organizational Behavior Department Seminar. 3 Units.
The OB Department Seminar is organized and managed by the first year PhD students. Seminar sessions will alternate between first year meetings and gatherings of the ORBH community of students, faculty and friends. Community sessions will be organized around research presentations of PhD Qualifying Papers, Dissertation Proposals and Dissertation Defense. Seminar Objectives: 1. To create and sustain an appreciative, intellectually nourishing learning space for the ORBH community that will support, inspire and empower us to explore the frontiers of scholarship in our field; 2. To provide a forum for sharing the ongoing research and scholarship of the department; 3. To develop productive collaborative research relationships; 4. To increase our collective knowledge of the current state of the art in OB and to develop productive collaborative research relationships; 4. To increase our collective knowledge of the current state of the art in OB and related fields.

ORBH 511. Micro Organizational Behavior. 1 Unit.
Examines the field of micro-organizational behavior. Specifically, the study of individuals and groups within an organizational context and the study of internal processes and practices as they affect individuals and groups. Major topics include individual characteristics such as beliefs, values and personality. Individual processes such as motivation, emotions, commitment, group and team processes, such as decision-making; organizational processes and practices such as goal setting, performance appraisal and rewards, and the influence of all of these on such individual, group and organizational outcomes as performance, job satisfaction, citizenship behaviors, turnover, justice, absenteeism and employee engagement.

ORBH 513. Appreciative Inquiry and Strength-Based Change. 1 Unit.
This course explores and develops the art of understanding social systems in ways that help us imagine, design and develop organization excellence. It seeks to show how many of our conventional ideas about organizations are based on discourse and metaphors that lead us to see and understand organizations in partial and often limiting ways. Growing research from the domains of Positive Psychology and Positive Organization Scholarship and the theory and practice of Appreciative Inquiry will be explored to show how we can create new and more positive, strength-based ways of designing and developing social systems.
ORBH 520. Group and Interpersonal Analysis. 1 Unit.
This course is a review of major concepts and research in group dynamics and interpersonal relations. Topics concern face-to-face social interaction such as communication patterns, power, hierarchy, leadership, norms, goals, productivity, social theories of personality, and personal change through group methods. The course combines cognitive emphasis and personal experience-based learning.

ORBH 523. Business as an Agent of World Benefit: The Discovery and Design of Positive Institutions. 1 Unit.
The relationship between business and society--and the search for mutually beneficial advances between industry and the world's most pressing global issues--has become one of the defining issues of the 21st century. Throughout the world, immense entrepreneurial energy is finding expression, energy whose converging force is in direct proportion to the turbulence, crises, and the call of our times. Factories and buildings are being designed in ways that, surprisingly, give back more clean energy to the world than they use. Bottom-of-the-pyramid strategies and micro-enterprise models are demonstrating how business can eradicate poverty through profitability. Companies are designing products that leave behind no waste--only "food" that becomes input into their biological or technological cycles. And macrowikinomics--everything from telepresence to megacommunity--is rebooting our capacity for human cooperation and global action. Prereq: Limited to ORBH PhD students only.

ORBH 525. Leading Change from a Complexity Perspective. 1 Unit.
Change is an enigma and yet sustained, desirable change (SDC) drivers adaptation, growth and life itself. In this course, we will continuously attempt to answer two questions: (1) What is the process of sustained, desirable change? and (2) What is the role of a leader, including their emotional and social intelligence? Concepts from complexity theory will be used, as well as case studies and longitudinal studies including understanding the multilevel nature of SDC at the individual, dyad, team, organization (including family business), community, country, and global levels. Intentional Change Theory (ICT) will be used as the organizing concept for the changes studied. Prereq: Limited to ORBH PhD students only.

ORBH 528. The Dynamics of Managing Effective Change. 1 Unit.
This course explores and develops an understanding of how individuals actually effect positive change and outcomes within an organization without the requisite authority or decision making power to do so. It seeks to show how managing a change process appears to follow a path of cumulative activities that in time produce a punctuated equilibrium—one that triggers a step up in performance. Such activities seem to be small episodes or learning cycles geared at converting inert knowledge into action; increasing awareness; reinforcing accountability, and/or attaining results. These findings will be compared and contrasted to existing change models and theories. Prereq: Limited to ORBH PhD students only.

ORBH 535. Organization Development and Change. 1 Unit.
This seminar addresses the applications of Organizational Behavior concepts and theories to the creation, development and change of organized systems; the domain of Organization Development. We will examine literature and research on organization and large systems change from modernist and post-modernist perspectives. Specific attention will be given to normative—re-educative models (Organization Development) and recent movements in strength-based models of change informed by positive psychology and positive organization scholarship. Intervention theory and method related to large groups and system-wide change will also be addressed.

ORBH 538. Research and Theory on Dynamical Behavior in Groups. 1 Unit.
This seminar exposes student to a variety of conversations in the study of group dynamics. Major topics include work on commons dilemmas, communal and exchange relationships, social facilitation, social loafing, social combination, and social creativity drawing deeply on our historical roots. It will also focus on current topical issues such as demographic faultlines, transactional memory, and issues of time and transition. Prereq: Limited to ORBH PhD students only.

ORBH 540. Social Exchange, Social Networks, and Social Capital in Organizations. 1 Unit.
In this course we will examine the nature of social exchange relationships in organizations. We will explore how individual perceptions regarding the quality of the relationship they have with their immediate supervisor, their work group, and the organization as an entity can impact their workplace attitudes and behaviors. Additionally, we will learn how the examination of networks of relationships can enhance our understanding of how individuals experience organizational life. The course will also provide a brief introduction to the theory, methods and procedures of social network analysis with an emphasis on applications to individual and organizational social capital.

ORBH 541. Organizational Systems. 1 Unit.
This course covers the use of general systems theory as a conceptual base for examining organizations from the macro-perspective. The course examines organizational structure and technology, organizations and interorganizational networks in interaction with their societal environments, and large-scale problems of organizational and social power, conflict and change. It is designed to present a large-scale perspective on organization theory and behavior that is complementary to the micro-perspective of organizational behavior.

ORBH 550. Team and Small Group Research. 1 Unit.
This seminar is designed to focus primary on understanding the state of team research from 1950s to the present. The seminar will include in-depth reviews and critical analysis on the philosophical and methodological perspectives of team researchers. The seminar will also include topics, research design and methods (including analytical approaches) used in team research. Students will be expected to develop a research design and analysis proposal for a team research project using both qualitative and quantitative approaches.
ORBH 560. Research Methods I. 3 Units.
This course concerns itself with issues associated with the conduct of social research. The primary focus is on learning the "craft" of research and its associated technologies. Among the topics that are addressed are: scientific method; research terminology and definitions; search design; laboratory experiments; simulations; field experiments; field studies; measurement, reliability and validity; and sampling. This course is intended to help students acquire the skills necessary in undertaking dissertation-related research.

ORBH 565. Research in Gender and Diversity in Organizations. 1 Unit.
This course will provide a full range of feminist research methods exploring relationships between feminism and methodology involving a plurality of perspectives for conducting research and creating knowledge with an emphasis on collecting and interpreting qualitative materials. Particular attention is paid to understanding gender and diversity related phenomenon that occurs in the workplace. Classic feminist research from a variety of historical, societal, economic, interpersonal and organizational paradigms are incorporated. Coreq: ORBH doctoral students only.

ORBH 570. Learning and Development. 1 Unit.
This course provides an exploration of the learning and development paradigm underlying the human potential development approach to human resource development. The origins of this approach in the naturalist epistemologies John Dewey's pragmatism, Kurt Lewin's gestalt psychology, the work of James, Follett, Emerson, Piaget, Maslow, Rogers, and others and current research in adult development, biology and brain/mind research, artificial intelligence, epistemology, moral philosophy and adult learning will be considered. The course will focus on applications of theses ideas to current issues in human resource development such as adult learning in higher education, advanced professional development, and large system learning and development. Coreq: ORBH doctoral students only.

ORBH 572. Thematic Analysis. 1 Unit.
This course will help students develop the ability to sense themes, or patterns, the ability to apply coding systems in a reliable manner, the ability to develop a coding system, and the ability to design research studies for developing or using codes. Participants will develop and practice these abilities on four types of data which are: conscious and unconscious thought; an individual's behavior; interaction among people; and historical documents such as speeches, myths, ballads, etc. Assignments will involve reading, practice coding material provided, developing preliminary codes from material selected, and a research project in which development and/or use of a code is required. Appropriate for doctoral students in behavioral or social sciences (Mini-Course, Occasional Offering). Prereq: Doctorate students only.

ORBH 601. Special Problems and Topics. 1 - 18 Unit.
This course is offered, with permission, to candidates undertaking reading in a field of special interest.

Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

PLCY Courses

PLCY 360. Independent Study. 1 - 18 Unit.

PLCY 399. Business Policy. 3 Units.
This course uses case analysis to develop perspective and judgment on business problems through the integration of functional areas. Formulation, development, and implementation of organization goals and policies, the development of strategy in relation to the competitive environment, and applications of quantitative and behavioral decision-making techniques are examined. Prereq: Senior standing.

PLCY 418. Enterprise Development. 3 Units.
Course features new product launch by students and new business idea competition judged by actual venture capitalists. Students will also learn how to acquire control of an existing company, including valuation methods, sources of funding, tactics for finding companies to buy, and how to negotiate the purchase of a business. Also includes actual student negotiation with sellers of a company. Course is designed to accelerate career success through bold entrepreneurial strategies. Offered as ENTP 418 and PLCY 418.

PLCY 419. Entrepreneurship and Personal Wealth Creation. 3 Units.
Course explores the accumulation of personal wealth utilizing entrepreneurial strategies. The underlying competencies of successful entrepreneurs are identified and applied to individual lives of students. Active entrepreneurs will be studied, and original case studies of start-ups and acquisitions provide the basis for class exercises. Offered as ENTP 419 and PLCY 419.

PLCY 425. Chief Executive Officer. 3 Units.
This course is designed for students who aspire to become a chief executive officer. The unique role, responsibilities, and requirements of the CEO will be explored. Students will benchmark CEO best practices through exposure to leading chief officers, study the paths to and preparation for the top job, and develop a personal career strategy to increase their chances of becoming a CEO.

PLCY 474. Innovation for Competitive Advantage. 3 Units.
In this course, we will develop frameworks to identify new value propositions for the customer. We will then apply these frameworks to three types of innovations that we see in practice--incremental, disruptive and white space--and more importantly understand business model innovations that go beyond just a product or process innovation. The course will also explore techniques of focused brainstorming and creative problem solving techniques. Prereq or Coreq: MGMT 499.
PLCY 490. Corporate Strategy. 3 Units.
This course is an advanced strategy course that explores the determinants of successful corporate strategy. In Strategy Issues and Applications you were exposed to the basic frameworks for developing successful competitive or business unit level strategy. Corporate strategy takes you to the next level and provides the frameworks you need to be able to be successful in multiple businesses. At its core corporate strategy constitutes any and all decisions that change the core business model of a firm. Examples are vertical integration, new but related product lines, entering new markets with existing products and entering new or existing markets with unrelated products. The fundamental premise of the course is that successful corporate strategy is rooted in competitive advantage arising from capabilities residing at the business unit level. Starting from analyzing business level strategies of very simple firms, the course successively builds frameworks towards more complicated business level strategies. Next, the course develops frameworks to discuss corporate strategy based around the concept of core competencies and market entry strategies. Finally, the course develops the concepts that are useful in greenfield entries, alliances and acquisitions as part of an overall corporate strategy. Prereq: MGMT 499 or MBAC 508 or MBAP 410.

PLCY 494. Managerial Consultancy. 3 Units.
Students will learn to match consulting methodologies with client needs and employ a step by step strategy development process applied to actual companies which are semester-long clients of the class. Accelerated career strategies in the consultancy business are featured as well as tactics for getting hired in the first place. The course views consultancy as a role rather than career and conceptualizes consultancy as a process of optimizing an organization’s value creation potential and competitive advantage. Students should be able to apply the concepts regardless of career choice. Exposure to senior practicing consultants is featured.

PLCY 495. Industry and Competitive Analysis for Strategic Planning. 3 Units.
This course introduces methods of industry and competitive analysis. Industry structure and firm competitive behavior are studied with a view to develop business strategies for securing and preserving competitive advantage. Emphasis is placed on understanding industry dynamics and the processes by which industries undergo change and evolution. Emphasis is also placed on firms’ capabilities and core competencies and their capacity to implement major strategic changes in their industries. Readings and cases are the principal pedagogical tools utilized in this course. Students are required to analyze an industry of their choice in small project teams and present their analyses in class.

PLCY 496. Strategic Planning and Control Systems for Strategy Implementation. 3 Units.
This course introduces the principal tools of strategy implementation, namely the design of organization structures, the use of formal planning and control systems, and the design of measurement and reward systems. The importance of organizational context (small vs. large, for profit vs. not-for-profit, manufacturing vs. service, etc.) and the need to tailor systems to the context of the organization are emphasized. New and emerging organizational forms and their role in strategy development and implementation are reviewed. Cases and readings are the principal pedagogical methods utilized. Students work in small project teams, study the operation and effectiveness of systems for strategic control in organizations, and present the results of their analysis in class presentations.

PLCY 501. Special Problems and Topics. 1 - 18 Unit.
This course is offered, with permission, to students undertaking reading in a field of special interest.

PLCY 601. Special Problems and Topics. 1 - 18 Unit.
This course is offered, with permission, to Ph.D. candidates undertaking reading in a field of special interest.

Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

QUMM Courses
QUMM 414. Statistics and Decision Modeling. 3 Units.
This course provides the foundations of statistical and operations research methodologies for managerial decision-making. Business statistics focuses on statistical thinking as one of the fundamentals of effective management. Topics covered include sampling and the normal distribution, making inferences from data via confidence intervals and hypothesis tests, and analyzing relationships between samples. Decision modeling of organizational systems uses mathematical and computer models to provide a quantitative perspective on identifying, analyzing and solving complex decision problems. This course includes an introduction to linear programming models and applications, simulation techniques in decision-making, and project management.

QUMM 414A. Statistics and Decision Modeling. 1 Unit.
This class provides a brief look at management science and selected key tools and applications. Topics include modeling, linear programming, simulation and linear regression. Students should have a background in statistics and college-level algebra. Just-in-time statistics review workshops will be available at the beginning of the semester. Prereq: Open to ACL-MBA students.

QUMM 501. Special Problems and Topics. 1 - 18 Unit.
This course is offered, with permission, to students undertaking reading in a field of special interest.
Weatherhead School of Management Faculty

Accountancy Faculty
Leon W. Blazey Jr., CPA
(Weather Reseved University)
Professor, Accountancy
Karen Braun, PhD, CPA
(University of Connecticut)
Associate Professor, Accountancy
Timothy J. Fogarty, PhD, CPA, JD
(Pennsylvania State University, State University of New York at Buffalo)
Professor, Accountancy
Gregory Jonas, PhD, CMA
(Virginia Commonwealth University)
Assistant Professor, Accountancy
Michele Meckfessel, PhD, CPA
(Virginia Polytechnic Institute and State University)
Assistant Professor, Accountancy
Larry M. Parker, PhD, CPA
(University of Houston)
Professor, Accountancy; Faculty Director, MAcc
Gary J. Previs, PhD, CPA
(University of Florida)
Distinguished University Professor; E. Mandell de Windt Professor in Leadership and Enterprise Development; Chair and Professor, Accountancy
Mark H. Taylor, PhD, CPA
(University of Arizona)

Richard J. Boland Jr., PhD
(Case Western Reserve University)
Elizabeth M. and William C. Treuhaft Professor of Management; Chair and Professor, Information Systems

Richard Buchanan, PhD
(University of Chicago)
Professor, Information Systems

Fred Collopy, PhD
(University of Pennsylvania)
Senior Associate Dean; Professor, Information Systems

Kalle J. Lyytinen, PhD
(University of Jyväskylä)
Iris S. Wolstein Professor in Management Design; Professor, Information Systems; Faculty Director, Doctor of Management Program

Richard L. Osborne, MS
(Case Western Reserve University)
Theodore M. and Catherine C. Alfred Professor of Management; Professor, Marketing and Policy Studies

Vasudevan Ramanujam, PhD
(University of Pittsburgh)
Associate Professor, Marketing and Policy Studies

N. Mohan Reddy, PhD
(Case Western Reserve University)
Professor, Marketing and Policy Studies

Jagdip Singh, PhD
(Texas Tech University)
AT&T Professor; Chair and Professor, Marketing and Policy Studies

Operations Faculty

Ankur Goel, PhD
(University of Texas-Austin)
Assistant Professor, Operations

Kamlesh Mathur, PhD
(Case Western Reserve University)
Chair and Professor, Operations; Faculty Director, MSM-OR/SC, EMBA

Matthew J. Sobel, PhD
(Stanford University)
Chair, Department of Economics; William E. Umstattd Professor in Industrial Economics; Professor, Operations

George Vairaktarakis, PhD
(University of Florida)
Professor, Operations

Marketing and Policy Studies Faculty

Sayan Chatterjee, PhD
(University of Michigan)
Professor, Marketing and Policy Studies

Steven P. Feldman, PhD
(University of Pennsylvania)
Professor, Marketing and Policy Studies

Gary K. Hunter, PhD
(University of North Carolina)
Assistant Professor, Marketing and Policy Studies

Jennifer L. Johnson, MBA
(Case Western Reserve University)
Associate Dean, Undergraduate and Integrated Studies; Associate Professor, Marketing and Policy Studies

Casey E. Newmeyer, PhD
(University of Pittsburgh)
Assistant Professor, Marketing and Policy Studies

Rakesh Niraj, PhD
(Washington University)
Associate Professor, Marketing and Policy Studies

Richard L. Osborne, MS
(Case Western Reserve University)
Theodore M. and Catherine C. Alfred Professor of Management; Professor, Marketing and Policy Studies

Simon Peck, PhD
(University of Leeds)
Associate Professor, Marketing and Policy Studies; Faculty Director, Full-Time MBA

Vasudevan Ramanujam, PhD
(University of Pittsburgh)
Associate Professor, Marketing and Policy Studies

N. Mohan Reddy, PhD
(Case Western Reserve University)
Professor, Marketing and Policy Studies

Jagdip Singh, PhD
(Texas Tech University)
AT&T Professor; Chair and Professor, Marketing and Policy Studies

Diane Bergeron, PhD
(Columbia University)
Lewis-Progressive Fellow; Assistant Professor, Organizational Behavior

Diana Bilimoria, PhD
(University of Michigan)
KeyBank Professor, Organizational Behavior

Harlow Cohen, PhD
(New York University at Buffalo)
Associate Professor, Organizational Behavior

Ronald Fry, PhD
(Massachusetts Institute of Technology)
Chair and Professor, Organizational Behavior

Organizational Behavior Faculty

Diane Bergeron, PhD
(Columbia University)
Lewis-Progressive Fellow; Assistant Professor, Organizational Behavior

Diana Bilimoria, PhD
(University of Michigan)
KeyBank Professor, Organizational Behavior

Richard E. Boyatzis, PhD
(Harvard University)
Distinguished University Professor; H.R. Horvitz Professor in Family Business; Professor, Organizational Behavior; Faculty Director, MNO

Susan S. Case, PhD
(New York University at Buffalo)
Associate Professor, Organizational Behavior

Corinne A. Coen, PhD
(University of Michigan)
Assistant Professor, Organizational Behavior

Harlow Cohen, PhD
(Case Western Reserve University)
Professor, Organizational Behavior; Faculty Director, MPOD

David L. Cooperrider, PhD
(Case Western Reserve University)
Fairmount Minerals Professor in Social Entrepreneurship; Professor, Organizational Behavior

Peter Drucker, PhD
(University of Virginia)
Professor, Organizational Behavior

Paul F. Gerhart, PhD
(University of Chicago)
Professor, Organizational Behavior

Chris Laszlo, PhD
(University of Paris)
Associate Professor, Organizational Behavior

Tony Lingham, PhD
(Case Western Reserve University)
Associate Professor, Organizational Behavior; Faculty Director, Part-Time MBA

Bonnie Ann Richley, PhD
(Case Western Reserve University)
Assistant Professor, Organizational Behavior

Melvin L. Smith, PhD
(University of Pittsburgh)

Associate Professor, Organizational Behavior; Faculty Director, Executive Education

John Paul Stephens, PhD
(University of Michigan)

Assistant Professor, Organizational Behavior
## Index

### A
- Academic Regulations ................................................. 502
- Advanced Education in General Dentistry (AEGD) ........... 625
- American Studies Program ........................................... 136
- Anesthesiology and Perioperative Medicine ..................... 718
- Asian Studies Program .................................................. 137

### B
- Bachelor of Science in Nursing (BSN) .............................. 458
- Biochemistry ................................................................... 140
- Case School of Engineering ............................................ 9
  - Case School of Engineering Undergraduate Degree Requirements ... 539
- Case Western Reserve University .................................... 4
- Certificate in Nonprofit Management ............................... 947
- Childhood Studies Program .......................................... 495
- College of Arts and Sciences ......................................... 141
- College of Arts and Sciences Undergraduate Degree Requirements ... 541
- Computer Science .......................................................... 143
- Craniofacial, Surgical, and Special Care Orthodontics Fellowship Program ................................. 627

### C
- Case School of Engineering ............................................ 9
- Certificate in Nonprofit Management ............................... 947
- Childhood Studies Program .......................................... 495
- College of Arts and Sciences ......................................... 141
- College of Arts and Sciences Undergraduate Degree Requirements ... 541
- Computer Science .......................................................... 143
- Craniofacial, Surgical, and Special Care Orthodontics Fellowship Program ................................. 627

### D
- Degree Program in Engineering - Undesignated ................. 21
- Department of Anatomy ................................................. 719
- Department of Anthropology ......................................... 144
- Department of Art History and Art ................................. 160
- Department of Astronomy .............................................. 178
- Department of Biochemistry .......................................... 724
- Department of Bioethics ............................................... 733
- Department of Biology ................................................... 183
- Department of Biomedical Engineering ........................... 23
- Department of Chemical Engineering ............................. 41
- Department of Chemistry .............................................. 207
- Department of Civil Engineering .................................... 51
- Department of Classics .................................................. 216
- Department of Cognitive Science .................................... 225
- Department of Dance ..................................................... 234
- Department of Economics .............................................. 238
- Department of Electrical Engineering and Computer Science ................................. 60
- Department of English ................................................... 239
- Department of Genetics ................................................. 742
- Department of Geological Sciences ............................... 250
- Department of History .................................................. 256
- Department of Macromolecular Science and Engineering ... 87
- Department of Materials Science and Engineering ........... 100
- Department of Mathematics .......................................... 275
- Department of Mechanical and Aerospace Engineering ...... 114
- Department of Modern Languages and Literatures ............ 289
- Department of Music ..................................................... 305
- Department of Neurosciences ........................................ 748
- Department of Nutrition ............................................... 751
- Department of Pathology .............................................. 759
- Department of Pharmacology ........................................ 767
- Department of Philosophy .............................................. 322
- Department of Physics ................................................... 330
- Department of Physiology and Biophysics ...................... 774
- Department of Political Science ...................................... 347
- Department of Psychological Sciences ............................. 361
- Department of Religious Studies .................................... 375
- Department of Sociology ............................................... 384
- Department of Statistics ............................................... 393
- Department of Theater ................................................ 400
- Division of Education and Student Programs ................. 129
- DMD Special Programs for Undergraduates ................... 628
- DMD/MPH DMD and Master of Public Health .................. 629
- DMD/MS Clinical Research Training ............................... 630
- Doctor of Dental Medicine (DMD) ................................. 631
- Doctor of Medicine (MD) ............................................... 780
- Doctor of Nursing Practice ............................................ 460
- Doctoral Program .......................................................... 504
- Doctoral Programs ......................................................... 948
- Dual Degree Programs .................................................. 670
- Dual Degree Programs .................................................. 792
- Dual Degree Programs .................................................. 506
- Dual Degree Programs .................................................. 953
- Dual Degree Programs .................................................. 496

### E
- Endodontics ................................................................. 633
- Engineering Physics ..................................................... 130
- Environmental Health Sciences .................................... 798
- Environmental Studies Program .................................... 408
