This course prepares students to critically assess and reflect on evidence-based practice theory, principles, and practice issues as they relate to social work. Students will integrate knowledge of assessment and clinical treatment theories with the growing research and science base of evidence-based practice. The course will focus on multiple levels of evidence-based practice promotion including the individual level, the programmatic and agency level, and the broader market place contexts. In the beginning of the course, students will be introduced to the history and background of the evidence-based practice movement, including definitions and terms. Students will also examine how to incorporate strategies optimizing client needs and circumstances into the EBP decision-making process, and to think critically about how to ensure that their practice adheres to social work values and ethics. Students will learn issues and strategies for locating, selecting, and evaluating EBP practice research, including the selection of EBPs tailored to a specific client or population. On the programmatic and agency levels, students will examine core implementation components and challenges (e.g., planning, educating, financing, restructuring, managing quality, attending to policy) commonly faced in agency practice by clinicians, supervisors and administrators. As students are exposed to the implementation science literature and research, they will appreciate how key multilevel implementation approaches can be designed and applied to promote health and behavioral health innovation on both the prevention and intervention levels. Finally, students will review that EBP landscape from a broader perspectives including prevention science, and the diffusion of innovations, examining important controversies and market trends that influence and impact contemporary evidence-based practice in social work. Prereq: SASS 477 and SASS 478.

SASS 539. Early Intervention: Theories and Practice. 1 - 3 Units.
This course both describes the characteristics of young children with disabilities and examines the intervention models and practices that are used to address the developmental and social-emotional needs of these children. The course describes the legislative and philosophical foundations for contemporary early intervention practice. It discusses the meaning of evidence based practice and examines contemporary early intervention practices from this perspective. The readings and assignments for this course have been designed to reflect the course objectives.

SASS 539A. Early Intervention Practicum. 0 Unit.
This practicum course is zero academic credit hour for students who have been selected for the Early Intervention Traineeship program. Students will work with the practicum instructor to complete 60 hours of experience in early intervention.

SASS 542. Evaluating Programs and Practice. 3 Units.
This course prepares social work students in all specializations to critically evaluate the practice and programs that are involved in. It builds upon the evidence informed practice course in the generalist curriculum and deepens and expands this content as applicable at the advanced practice level. Students learn to use evidence-based research methodology and findings to inform their social work practice. Students will learn to evaluate their practice within their field setting. Students will learn to use single system design methods to evaluate social work interventions with individuals, families, and groups, learning about specifying the intended outcome of worker intervention, systematically collecting and analyzing client system outcome data throughout service delivery, and using this information to guide clinical and ethical decision making.
SASS 545. Program Design. 3 Units.
Program design and development are of critical importance in nonprofit organizations. In this course students will gain a practical, hands-on understanding of strategies for designing programs. The course focuses on program development approaches that attempt to maximize a program's relevance to the need being addressed and increase the likelihood that the program will attain its identified outcomes. Emphasis is placed on learning to understand a community's need/problem, reviewing evidence on potential strategies and identifying promising practices, anticipating potential implementation challenges and addressing them, and identifying potential funders. The link between program design and the development of effective program proposals is stressed. Through this course students will have the opportunity to design a program using a specific analytic framework. Students will learn: (1) to address the demands of multiple constituencies and competing values in program development process, (2) skills for developing and implementing programs in the nonprofit sector, and (3) to examine issues of diversity as they affect organizations and community efforts and explore personal values and ethics as these influence programs and interventions.

SASS 546. Poverty Strategies for Social Workers. 3 Units.
This course provides an understanding of poverty. It examines poverty through an exploration of its causes, theory, policy strategies for its amelioration and practice implications. The course investigates the impact of poverty on single individuals, families with children, minorities, and vulnerable populations. The course will examine welfare reform and its impact in bringing people out of poverty. Students, in teams, will examine one facet of poverty--its theories, policies, impacts on individuals and families, potential solutions, and our approaches to the issues as social workers. In addition to assigned texts and readings, the course will be supplemented by practitioners, organizers, and low-income persons addressing the issues of poverty. Prereq: SASS 440 or SASS 400-TR.

SASS 547. Problem Identification, Screening and Assessment/Diagnosis. 3 Units.
This course will provide a bio-psycho-social approach to identification, screening, assessment and diagnoses of common psychosocial problems/dysfunctions experienced clients. This course introduces the student to the etiology, recognition and diagnoses of these problems in the context of social work practice. Through use of a competency-based model, students will be introduced to techniques used to screen, assess and diagnose problems such as serious mental illness, suicidality, depression and anxiety, substance abuse, child abuse, elder abuse, and exposure trauma. Students will also become familiar with the use of the DSM IV TR in providing axis I diagnostic formulations. A skills-based approach will be used in presenting students with specific screening, assessment and diagnostic protocols. This course is designed to incorporate a range of issues associated with stages across the lifespan from childhood to late life. Prereq: SASS 477 or SASS 400-TR.

SASS 548. International Social Work. 3 Units.
This is an advanced seminar designed for students interested in the international dimensions of the social work profession and social work practice. The seminar focuses on commonalities and differences in the roles and functions of social workers in different nations. It also gives attention to social work as a global profession and social work practice on an international level. Prereq: SASS 477 or SASS 400-TR.

SASS 549. Theory/Practice Approaches in Direct Practice Social Work. 3 Units.
This required, three credit course introduces selected theories and practice approaches commonly used in social work with individuals, families and groups. The course is designed to provide students with knowledge of theoretical explanations and practice frameworks commonly used in direct social work practice. The course also encourages students to apply critical thinking skills to theory and its practical applications. Case presentations, class discussions and assignments will require students to apply various theoretical perspectives to common problems and issues in social work practice. The course will highlight the use of professional social work values and attention to human development issues, diversity and cultural perspectives as they apply in each theory or framework. Prereq: SASS 477 or SASS 400-TR.

SASS 550. Trauma Informed Social Work Practice with Children & Families. 3 Units.
This course builds on foundation direct practice courses and focuses specifically on children, adolescents and families affected by trauma. It uses both a developmental and an ecological systems perspective recognizing that in order to successfully treat trauma, it is important to not only focus on the individual but also on the family and the larger community environment of which the child or adolescent is a part. It is designed to foster an understanding of the neurobiology of trauma as well as to develop specific skills in interviewing children, child assessment including case formulation, selection of appropriate interventions, and using specific intervention strategies at different levels of the trauma system. Rather than teaching one specific intervention model, students will develop an understanding the importance of using the empirical literature, critical thinking skills, and clinical judgment to determine how to best intervene. The issues of ethically and culturally competent practice are emphasized throughout the course in each content area. Finally, the impact of secondary trauma on the practitioner is acknowledged and students develop plans for self-care.

SASS 554. Trauma Informed Social Work Practice with Adults. 3 Units.
The purpose of this course is to provide students with an in-depth understanding of both trauma theory and the neurobiology of trauma, expanding practice knowledge to include the assessment and treatment of adult survivors of multiple forms of trauma. Different types of traumatic exposure will be explored to understand the impact of trauma symptoms and disorders, providing appropriate trauma informed evidence-based and evidence-supported intervention strategies. An emphasis will be placed on the emotional/behavioral manifestations of trauma as well as the physiological effects of trauma within the body. The course will begin with an overview of different types of trauma and will make a distinction between posttraumatic reactions and the development of posttraumatic stress disorders, with a focus on complex traumatic stress as opposed to "classic" PTSD. Prereq: SASS 477 or SASS 400-TR.

SASS 555. Women's Issues. 3 Units.
This course examines theories that are relevant to the development and socialization of women, and discusses issues that are relevant to women's lives within the context of oppression based on sexism, racism, ageism, homophobia, and other forms of discrimination. Emphasis is placed on assisting students in becoming more aware of the issues that are specifically relevant to their own development and socialization, and preparing for effective and sensitive professional practice by increasing knowledge about the issues facing women. Prereq: SASS 440 or SASS 400-TR.
SASS 561. Community Practice Policy: Analyzing and Changing Social Policy. 3 Units.
This course teaches knowledge, values and skills for analyzing and changing social policy. The course uses a policy practice framework to examine the development and implementation of community and social policy and to prepare students to participate in policy change. A Policy Practice Project provides an opportunity for students to develop skills in planning, advocacy, and policy development. Students work in groups to develop and implement a change strategy targeted at the agency or community level. Course content includes policy analysis, logic models, and advocacy methods. The course will also cover essential social policies relevant to community practice including place based and population based policies for improving communities such as community development, employment and housing policies.

SASS 562. Social Work Intervent in Co-occurring Mental and Substance Abuse Disor. 3 Units.
This advanced methods course provides a basic orientation to substance use disorders in persons with mental illness (SAMI). A biopsychosocial framework will be used to explore the etiology, the maintenance and the recovery of both mental and substance abuse disorders. The historical background of practitioner, programmatic, and institutional barriers that impede the development and application of clinical skills to dually diagnosed individuals will be explored. Emphasis will be placed on strategies for the implementation of services to deal with individuals with co-occurring problems and their families using the evidence-based New Hampshire-Dartmouth Psychiatric Research Center Integrated Treatment (IT) Model. Current assessment techniques and treatment of special populations including, but not limited to: women, minorities, and adolescents will be discussed. Prereq: SASS 477 or SASS 400-TR.

SASS 564. Social Work Practice in Alcohol and Other Drug Abuse. 3 Units.
SASS 564 is an advanced direct practice concentration course focused upon knowledge, skills and values important for social work practice with people who abuse and/or are dependent on alcohol and other drugs. The content of SASS 564 directly builds upon the foundation direct practice course (SASS 477) and the required advanced course in screening and assessment (SASS 576). SASS 564 takes a bio-psycho-social approach to prevention, assessment and treatment of alcohol and other drug abuse and dependency (AODA) problems. This course introduces the student to the etiology and treatment of alcohol and other drug use disorders in the context of social work practice. The historical background and the development of the evidence base of alcohol and other drug treatment interventions, self-help groups, and conceptual models of addiction will be presented. Students will explore their own attitudes and values toward AODA problems and how these affect treatment outcome as well as commonly used prevention and treatment approaches in social work with people who abuse and/or are dependent upon alcohol and other drugs. The course will use case materials to illustrate similarities and differences among various populations including minority/ethnic identity groups. Prereq: SASS 477 or SASS 400-TR.

SASS 566. Assessing and Engaging Community for Community Change. 3 Units.
This course enables the student to become a change agent in their organization and community. This course advances multiple theories (critical social theory, community capitals theory, conflict theory) and methods of community practice for social workers as agents of social change. This course builds on foundational theories and research methods, instructing students on applied community facilitation, planning, and organizing models and skills. We will examine strategies of community building and organizing, focusing on communities and organizations as a means of fostering social change and improving the quality of life for individuals and families, especially in historically marginalized communities. Students will learn frameworks and models of community building and community organizing, focusing on the role of the change agent and the change process in the context of structural racism, privilege, and inequity.

SASS 567. Strategic Power Building with Communities. 3 Units.
This course will prepare students to design an organizing campaign to build grassroots power among those who have been historically marginalized and among constituents within a community and to effectively use that power to leverage social change. Students will explore and share learnings from several traditions of organizing including those for civil rights, labor, neighborhood work, anti-colonial struggles, and consciousness raising. The course will explore a variety of different approaches including organizing institutions, social movements, and organizing campaigns around specific issues or in conjunction with other approaches for social change. It will also examine the opportunities and ethical considerations of organizing within a variety of important contexts including various community geographies, online/offline, and working with social service participants and agencies.

SASS 569. Planning & Implementing Social Change. 3 Units.
This course builds skills for the design, planning and implementation of social change. The focus of this course is on promoting social change through more strategic and impactful planning, positioning and partnerships. The premise of this course is that the impact and sustainability of programs, initiatives and other change efforts can be strengthened through more effective planning, better strategic positioning and organizational adaptation to external circumstances and trends, and stronger collaborations and partnerships. Students will strengthen their ability to work effectively within organizations, in collaborations and coalitions, and within communities and systems. Course content includes the development of theories of change and action, logic, models, strategic planning, organizational assessment, strategic positioning, collaboration and coalition building, systems reform, and effective working relationships with funders and local intermediaries. A service learning assignment with a community partner. Prereq: SASS 567.

SASS 574. Legal Issues in Social Work. 3 Units.
This course explores the legal issues that permeate the social work profession. Starting with a historical examination of our legal systems, the course will illustrate how social work is influenced and shaped by constitutional, statutory, and legal policy constructs. Students will learn about the skills necessary to provide testimony and to conduct forensic interviews, and we will discuss the legal foundation of ethical considerations and social work values. Students will also learn basic skills in how to utilize the law and legal processes to best advocate for clients and address larger social justice issues. By the end of the course, students will understand how social workers can competently navigate the choppy waters of the law in an interdisciplinary professional environment.
SASS 575. Travel and Study Seminar. 3 Units.
This course acquaints the student with the socio-political factors that influence the development of social welfare systems in a selected country and the impact of these systems on the development and functioning of individuals, families, groups, or communities. The role of the emerging social work profession in social change is explored via the social welfare system. Topics focus on the health care, mental health, aging, child, and/or educational systems and are oriented towards direct practice, management, or community development.

SASS 576. Integrative Seminar in Alcohol and Other Drug Abuse Treatment. 3 Units.
This course is an advanced level course in the Alcohol and Other Drug Abuse Specialization that provides opportunities for students to increase their knowledge of topics in the areas of assessment, diagnosis and treatment of alcohol and other drug disorders. The seminar builds upon course material in Foundation Methods (477) and in the advanced methods course (SASS 549 and SASS 564). The seminar is intended to help students understand the evidence base for the treatment of substance use disorders and to explore selected areas of social work practice in intervention in the context of that evidence. Community applications of theory and techniques are stressed. The integrative Seminar in AODA Treatment uses a seminar format and provides students the opportunity to interact with treatment professionals from various treatment and practice settings. The seminar format also facilitates individual learning: each student selects his or her own topic to pursue in depth. Each student is responsible for leading a minimum of one seminar presentation. Each student will select the topic for the seminar in consultation with the instructor. Coreq: SASS 477 and SSWM 564 or SASS 564.

SASS 579. Cognitive Behavioral Interventions. 3 Units.
This course acquaints students with the theoretical, conceptual, and skill bases of several cognitive-behavioral approaches to practice. Topics include assessment, use of tasks and homework, coping skills, cognitive restructuring, and problem solving approaches to practice. The course draws upon students' field and work experiences to illustrate the application of the concepts and skills under discussion. Prereq: SASS 477 or SASS 400-TR

SASS 580. Social Work Practice in Mental Health: Children and Adolescents. 3 Units.
This advanced methods course builds on the content from required foundation social work methods, policy and human development courses including Direct Practice Methods and Skills, Mental Health Policy and Service Delivery. This course complements the content of advanced methods courses including Social Work with People Who Have Chronic Mental Illness, Social Work in Child Abuse and Family Violence, and Interventions in Alcohol and Other Drug Abuse. This course develops biopsychosocial knowledge and intervention techniques related to professional settings specializing in child and adolescent mental health: hospitals, child guidance agencies, family service agencies, mental health centers, and residential treatment centers. Students learn to use development and clinical theory to guide interventions while, maximizing individual strengths, social work treatment centers. Students learn to use development and clinical theory to guide interventions while, maximizing individual strengths, social work values and ethics, and empowerment. Social and economic risk factors, such as poverty, discrimination, and oppression, are considered in the intervention process and in the utilization of mental health services. In addition, students learn to think critically about the myriad ways cultural diversity influences parenting, child and adolescent norms and expectations. Students utilize assessment skills, coupled with knowledge of development and clinical theory to explore clinical case studies. Prereq: SASS 440 and SASS 477 or SASS 400-TR.

SASS 581. Social Work Practice with Older Adults. 3 Units.
This course is an advanced methods course that builds on the knowledge gained in Foundation Methods. The content of SASS 581 directly builds upon the foundation direct practice course (SASS 477) and the required advanced course in screening and assessment (SASS 547). It is also a required course in the Aging Specialization for the MSSA. The course will focus on the persistent principles and emerging emphases in direct practice with older adults and their families. Students will be asked to develop a model of practice based on knowledge of this unique population, social work values, and practice concepts. The course includes special issues in assessment, strengths-base case management, and intervention approaches known to be effective with emotional disorders in older adults. Prereq: SASS 477 or SASS 400-TR.

SASS 582. Social Work in Child Abuse and Family Violence. 3 Units.
This course addresses the etiology, investigation, and treatment of child abuse including sexual abuse and the roles of child welfare, health, and mental health agencies. Particular attention is given to direct work with children and adults who have experienced abuse, and to interventions in instances of family violence. Prereq: SASS 440 and SASS 477 or SASS 400-TR.
SASS 583. Social Work Practice in Mental Health Adults. 3 Units.
This advanced methods course builds on the content from required foundation social work methods, policy, and advanced sociobehavioral theory courses including Direct Practice Methods and Skills, Mental Health Policy and Service Delivery, Advanced Child and Adolescent Development and Dysfunction, and Adult Psychopathology. This course complements the content of advanced methods courses including Social Work with People Who Have Chronic Mental Illness, Social Work in Child Abuse and Family Violence, and Interventions in Alcohol and Other Drug Abuse. This course develops biopsychosocial knowledge and intervention techniques related to professional settings specializing in child and adolescent mental health: hospitals, child guidance agencies, family service agencies, mental health centers, and residential treatment centers. Students learn to use development and clinical theory to guide interventions while, maximizing individual strengths, social work values and ethics, and empowerment. Social and economic risk factors, such as poverty, discrimination, and oppression, are considered in the intervention process and in the utilization of mental health services. In addition, students learn to think critically about the myriad ways cultural diversity influences parenting, child and adolescent norms and expectations. Students utilize assessment skills, coupled with knowledge of development and clinical theory to explore clinical case studies. Prereq: SASS 477 or SASS 400-TR.

SASS 584. Integrative Seminar in Mental Health: Children and Adolescents. 3 Units.
Integrative Seminar in Mental Health: Children and Adolescents is an advanced level course, a capstone course in the Mental Health Child and Adolescent Specialization, that provides opportunities for students to increase their knowledge of assessment, diagnosis and treatment. This course builds on the course material in SASS 580, SASS 477, SASS 549, and SASS 576. The seminar is intended to help students integrate theory and practice, especially in the context of public mental health and community-based, social service practice. The integrative seminar in Social Work Practice with Children and Adolescents uses a seminar format facilitates individual learning and promotes a learning-to-practice, reflective approach. The seminar assumes there are numerous evidenced-based models and practices and focuses student learning on the role of the professional use of self in the implementation of theory, technique, model, or intervention.

SASS 585. Social Work with Groups. 3 Units.
A theoretical formulation of the social group work method as a problem solving process is addressed. Exercises are presented in the use of diagnostic skills to determine individual needs and problems for which groups may be helpful, the worker's role in facilitating group functioning through his/her use of various program media. Attention is given to the significance of goals, agency environment, and policy for direct work with groups. Prereq: SASS 477 or SASS 400-TR.

SASS 586. Social Work with Couples. 3 Units.
This course provides an overview of assessment and intervention methods for working with couples around issues of marriage, divorce, and remarriage. Alternate couple forms are discussed. The course emphasizes systems and social learning approaches, communication and negotiation in problem solving and its relevance to assessment, treatment structure, and techniques. Special attention will be given to problem areas such as commitment, sexual dysfunction, chemical dependency, and destructive communication patterns. Prereq: SASS 477 or SASS 400-TR.

SASS 587. Integrative Seminar in Mental Health: Adults. 3 Units.
The integrative seminar in Social Work Practice with Adults is an advanced level course, a capstone course in the Mental Health Adult Specialization, that provides opportunities for students to increase their knowledge of assessment, diagnosis and treatment. This course builds on course material in SASS 583, SASS 477, and SASS 576. The seminar is intended to help students integrate theory and practice, especially in the context of public mental health and community-based, social service practice. The integrative seminar in Social Work Practice with Adults uses a seminar format and provides students the opportunity to interact with professionals, from various treatment and practice settings. The seminar format facilitates individual learning and promotes a learning-to-practice, reflective approach. The seminar assumes there are numerous evidenced-based models and practices and focuses student learning on the role of the professional use of self in the implementation of theory, technique, model, or intervention. Prereq: SASS 583 or SASS 400-TR.

SASS 589. Advanced Social Work Practice In Integrated Healthcare. 3 Units.
The objective of this course is to introduce social work students to the direct practice of integrated behavioral health in primary care settings. Students will become knowledgeable of the roles of behavioral health providers working in healthcare settings, theories and models of care, and cross-cultural issues. They will develop skills in engagement, assessment, intervention, planning and implementation, and practice evaluation. Because the populations served in primary care settings span the continuum of severity in both the physical and behavioral health dimensions, students will develop competencies in engaging and supporting diverse patients across a range of health conditions. Prereq: SASS 477 or SASS 400-TR.

SASS 590. Field Practice. 1 - 12 Units.
SASS 594. Independent Study Abroad. 0 - 12 Units.
(Credit as arranged.)
SASS 598. Individual Reading. 1 - 12 Units.
Special written permission needed. See MSASS registrar.
SASS 601. Field Education I. 2 Units.
The overall goal of this course is to provide graduate level social work students with field related opportunities to develop foundation level competencies in the eight abilities by helping students apply knowledge of social work theory, skills, values and ethics acquired in the classroom in an agency setting. These collective experiences provide students with a forum to develop social work skills, integrate and operationalize the values and ethics inherent in professional practice, and confront social injustice as self-reflective, competent developing practitioners. The field instructor is based at the social service setting and provides the direct instruction of the student. The faculty advisor, who is based at the School, serves as a link between all parties, interprets the requirements and standards of the School, and participates and consults in the design of the student's learning experience. The field instructor assigns tasks to the student according to the requirements of the School and the educational and experiential level of the student. Student, field instructor, and faculty field advisor all participate in various ways in the evaluation of the student's work; the faculty advisor is responsible for assigning the grade.
SASS 602. Field Education II. 3 Units.
This course is designed to be taken by entering Advanced Standing students in the first semester of their master’s program and by Foundation level social work students in the second semester of their master’s program. It consists of a field practicum and participation in professional development opportunities. For students entering the program with advanced standing, there is an additional requirement of four logs and an integrative assignment, and periodic meetings with a field faculty advisor in addition to the field conference. The overall goal of this course is to provide graduate level social work students with field related opportunities to continue to develop foundation level competencies in the eight abilities by helping students apply knowledge of social work theory, skills, values, and ethics acquired in the classroom in an agency setting. The periodic meetings with the field faculty advisor are designed to provide students with an opportunity to integrate classroom and field learning. These collective experiences provide students with a forum to develop social work skills, integrate and operationalize the values and ethics inherent in professional practice, and confront social injustice as self-reflective, competent, developing practitioners. Students spend 300 hours in field and professional development in SASS 602. Prereq: SASS 601 or SASS 400-TR.

SASS 603. Field Education III. 3 Units.
The overall goal of this course is to provide graduate level social work students with field related opportunities to continue to develop advanced level competencies in their area of concentration in the eight abilities by helping students apply knowledge of social work theory, skills, values, and ethics acquired in the classroom in an agency setting. The periodic meetings with the field faculty advisor are designed to provide students with an opportunity to integrate classroom and field learning. These collective experiences provide students with a forum to develop social work skills, integrate and operationalize the values and ethics inherent in professional practice, and confront social injustice as self-reflective, competent, developing practitioners. Students spend 300 hours in field and professional development in SASS 603. Prereq: SASS 602 or equivalent.

SASS 604. Field Education IV. 3 Units.
This course is designed to be taken by students in their advanced course of study. It consists of a field practicum and participation in professional development opportunities. The overall goal of this course is to provide graduate level social work students with field related opportunities to continue to develop advanced level competencies in their area of concentration in the eight abilities by helping students apply knowledge of social work theory, skills, values and ethics acquired in the classroom in an agency setting. The periodic meetings with the field faculty advisor are designed to provide students with an opportunity to integrate classroom and field learning. These collective experiences provide students with a forum to develop social work skills, integrate and operationalize the values and ethics inherent in professional practice, and confront social injustice as self-reflective, competent, developing practitioners. Student, field instructor, and field faculty advisor all participate in the evaluation of the student’s work; the faculty advisor is responsible for assigning the grade. Students spend 300 hours in field and professional development in SASS 604. Prereq: SASS 603 or equivalent.

SASS 608. Philosophy of Science and Theory Building. 3 Units.
This is a required foundation course. The nature of theory is examined. Inductive and deductive methods for knowledge building are reviewed. Course content draws from philosophy of science as well as empirical and phenomenological research.

SASS 609. Theories of Social Welfare and Social Justice. 3 Units.
This is a foundation course required for all students. Theories of social welfare and social justice are examined. Course content draws from moral philosophy, economics, political science, cultural anthropology, sociology, history, psychology, and social welfare theory and provides students with a broad orientation to the field of theoretical social welfare.

SASS 610. Theories of Human Behavior: Macro and Micro Dimensions. 3 Units.
This is a required, foundation course and is designed to help students acquire a critical and reflective approach to theory in social work research and practice. The course provides a broad overview of theoretical perspectives at the individual, group, community, organizational and/ or societal levels and addresses major theoretical perspectives used in social work and social welfare research.

SASS 613. Advanced Research Design. 3 Units.
This foundation course in research methods is required of all students. It is a prerequisite to the quantitative and qualitative courses. Topics covered include operationalization of variables, threats to validity, and experimental, quasi-experimental and non-experimental research design.

SASS 614. Models of Qualitative Research. 3 Units.
This required course introduces students to the principles, approaches, methods, and analytical techniques utilized when conducting qualitative research in the social sciences. Five models of qualitative research design and methodology are studied, including narrative analysis, case study, ethnography, and grounded theory and phenomenology. This course is designed to provide students with the tools to critically evaluate as well as to enhance the academic rigor or “quality” of qualitative data. Prereq: SASS 608 and SASS 613.

SASS 615. Social Statistics and Data Analysis. 3 Units.
This foundation course (or its equivalent) is required of all students. Content includes univariate, bivariate and inferential statistics, and the use of electronic data processing technology to manage and analyze data.
SASS 616. Applied Regression and the Linear Model. 3 Units.
This is a required course in the research methods sequence for MSASS doctoral students. At the end of this course, students will be able to apply ordinary least squares regression and logistic regression in the analysis of social science data. They will learn to formulate research questions and hypotheses, specify statistical models, carry out the appropriate analyses, interpret their findings, and communicate their results clearly and effectively. Prereq: SASS 613 and SASS 615.

SASS 618. Measurement Issues in Quantitative Research. 3 Units.
This required course covers the operationalization of social science concepts and development of methods for their measurement. Issues covered include index and scale construction, validity, reliability, questionnaire design, factor analysis, measurement error, and missing data. Prereq: SASS 613 and SASS 615.

SASS 619. Structural Equation Modeling. 3 Units.
This advanced-level, elective statistics course focuses on the family of analytical techniques referred to as structural equation modeling (SEM). SEM covers both measurement models (e.g., confirmatory factor analysis) and structural models. The course covers theoretical and methodological considerations and preliminary data screening necessary to ascertain whether SEM would be an appropriate technique; terminology and notation specific to SEM; statistical assumptions and strategies for assessing and remedying possible violations; use of SEM to conduct confirmatory factor analysis; use of SEM to test structural models, including mediation models; advanced models (e.g., multiple-group, longitudinal, dyadic, to be determined by student interests); how to critique SEM analyses and identify common problems; statistical power; and best practices for reporting SEM analyses and results. AMOS will be used to conduct the SEM analyses and SPSS to conduct preliminary analyses. The course uses a combination of readings, class discussion, lecture, written assignments, and hands-on computer labs. Prereq: SASS 613, SASS 615, SASS 616 and SASS 618.

SASS 623. Research Synthesis & Systematic Review Methodology. 3 Units.
This course will provide advanced skill development of systematic review methodology and will combine didactic sessions with in-class laboratory sessions where students will be taught how to perform each step in a review. Students will conduct their own systematic review resulting in a final product of a systematic literature review manuscript that is ready for submission to a peer-reviewed journal. The purpose of this course is to (1) develop student’s methodological skills in how to conduct a systematic literature review and (2) train students on how to analyze, integrate, and synthesize a body of literature. By the end of the course, students should have achieved the following objectives: (1) Identify a suitable research topic for the preparation of a systematic review -Systematically search and identify literature -Code and collect data from identified studies -Analyze and interpret patterns of evidence across studies -Write about the body of literature in an integrated and synthesized manner -Present systematic literature review findings in a manuscript format ready for submission to a peer-reviewed journal Students who wish to take this course as a Fellowship Course must follow the School of Graduate Studies policy and submit an application (http://case.edu/gradstudies/currentstudents/forms/). This application requires permission of the instructor, the student’s faculty advisor, and the School of Graduate Studies. Students taking the course as a Fellowship Course are expected to meet all course requirements and prerequisites. Prereq: SASS 613.

SASS 630. Seminar on Social Work Education. 3 Units.
This required seminar examines the structure and content of social work education within the context of higher education in American society. Emphasis is placed on curriculum design and course development. The course also is designed to help students develop a strategic approach to teaching based on learning theory. Finally, attention is given to current issues and future directions for social work education.

SASS 631. Job Seekers Seminar. 3 Units.
This dynamically dated seminar is designed to prepare doctoral students for a successful academic job search. The course objectives include: Obtaining knowledge about where to find academic job postings and how to determine appropriate fit; understanding the job search process; developing application materials; practicing mock interviews and mock job talks; and, developing a strategy for a successful first year as a professor. Prereq: Advanced to Candidacy.

SASS 632. Research Project. 3 Units.
This elective course provides students with the opportunity to work with specific faculty engaged in research studies either on an individual or group basis. Prereq: 614 and SASS 615.

SASS 637. Individual Reading. 1 - 9 Units.
This is an elective individual reading course permitting students to select areas of interest and pursue these interests with specific faculty.

SASS 638. Integrative Seminar: Research Development for Social Welfare Scholars. 1 Unit.
Social work is, historically, an inclusive and diverse discipline that draws from multiple traditions to focus scholarship and research to address social justice and social change. The field of social work is in a period of critical self-reflection, strategy-setting (e.g. the Grand Challenges), and transformation. Developing scholars of social welfare will enter into an increasingly transdisciplinary research landscape that requires training opportunities that align with trends in the field, including capacity and readiness to engage in team science, interdisciplinary and transdisciplinary teams, translations of research evidence to policy, and partnerships with multiple stakeholders. The purpose of this year-long integrative seminar is to provide a forum for developing social welfare scholars to engage in an active learning community across cohorts. The community is designed to actively engage in developing dimensions of social welfare researchers that are common to all of us, although we have varied research aims, populations, change goals, and disciplinary and/or system/community partners. The seminar uses a range of formats (e.g. invited speakers, discussion panels, and student working sessions) and is designed to offer flexible responsiveness to challenges that doctoral students are experiencing, and beyond the normative bounds of standing courses or project activities. This course is purposefully cross-cohort, from first year students through dissertation active students. The aim is to foster a sense of collegiality, peer mentorship, and doctoral student community.
Throughout the course, emphasis is placed on critical thinking, collegial developments in a social welfare research domain of personal interest. This provides students with the opportunity for in-depth study of theoretical practice and social welfare policy. To this end, the major assignment ‘explanatory’ theory) to the applied, i.e. contemporary social work theory (i.e. metatheoretical assumptions; grand theory; and mid-level to these tasks. Also central to this process if the linking of ‘levels of central commitment to social justice and multiculturalism. It provides foundations in the socially constructed nature of theory and social ‘problems’ and in historical changes in conceptual and theoretical perspectives on human society, interactions, and policy in the social realm. Domains of interest encompass a range of theoretical perspectives and provide the opportunity for exploring the theoretical and meta-theoretical assumptions and models that frame social welfare and social science scholarship, research, and policy. The overarching goal of this course is to help you develop a working knowledge of how theory, including metatheoretical assumptions and mid-level ‘explanatory’ theories shape social welfare and social science scholarship, research, and policy. Reviewing, critiquing, refining, and integrating theories is central to this process and thus we will devote much of the course to these tasks. Also central to this process if the linking of ‘levels of theory’ (i.e. metatheoretical assumptions; grand theory; and mid-level ‘explanatory’ theory) to the applied, i.e. contemporary social work practice and social welfare policy. To this end, the major assignment provides students with the opportunity for in-depth study of theoretical developments in a social welfare research domain of personal interest. Throughout the course, emphasis is placed on critical thinking, collegial engagement, and the conventions of formal scholarly practice.

SASS 639. Independent Study for Early Teaching Support. 1 Unit.
Doctoral candidates are required to complete SASS 630: Seminar on Social Work Education in Fall semester of the second year, and during that semester or immediately following, to complete a non-credit teaching mentorship with a full time faculty. Following the mentorship and with judged readiness to teach independently, the student will request that the Associate Dean for Academic Affairs of the MSSA and MNO Programs, assign the student an undergraduate or graduate course to teach independently. SASS 639: Independent Study for Early Teaching Support is required concurrent with the candidate’s first independent teaching experience. The course is offered in fall and spring and does not count toward the 54 credits required for graduation. The course may be repeated during the candidate’s first three teaching experiences and is required for each of the first three teaching experiences for students entering Fall, 2016, or later.

SASS 644. Critical Theories in Social Welfare. 3 Units.
This doctoral seminar focuses on the nature and role of theory in contemporary social welfare research and policy, informed by a central commitment to social justice and multiculturalism. It provides foundations in the socially constructed nature of theory and social ‘problems’ and in historical changes in conceptual and theoretical perspectives on human society, interactions, and policy in the social realm. Domains of interest encompass a range of theoretical perspectives and provide the opportunity for exploring the theoretical and meta-theoretical assumptions and models that frame social welfare and social science scholarship, research, and policy. The overarching goal of this course is to help you develop a working knowledge of how theory, including metatheoretical assumptions and mid-level ‘explanatory’ theories shape social welfare and social science scholarship, research, and policy. Reviewing, critiquing, refining, and integrating theories is central to this process and thus we will devote much of the course to these tasks. Also central to this process if the linking of ‘levels of theory’ (i.e. metatheoretical assumptions; grand theory; and mid-level ‘explanatory’ theory) to the applied, i.e. contemporary social work practice and social welfare policy. To this end, the major assignment provides students with the opportunity for in-depth study of theoretical developments in a social welfare research domain of personal interest. Throughout the course, emphasis is placed on critical thinking, collegial engagement, and the conventions of formal scholarly practice.

SASS 651. Field Education I. 2 Units.
This course is designed to be taken by generalist level social work students without Advanced Standing in the second semester of their master’s program. Students enrolled in SASS 651 take SASS 495V, Field Education Seminar concurrently. The overall goal of this course is to provide graduate level social work students with field related opportunities to develop the required generalist level competencies by helping students apply and integrate knowledge of social work theory, skills, knowledge, values, ethics and cognitive & affective processes acquired in the classroom within an agency setting. These collective experiences provide students with a forum to develop social work skills, integrate and operationalize the values and ethics inherent in professional practice, and confront social injustice as self-reflective, competent developing practitioners. The Field Instructor is based at the field site and provides direct instruction and supervision to the student. The Field Faculty Advisor based at the Mandel School is the liaison between all parties, interprets the requirements and standards of the School, and participates and consults in the design of the student’s learning experience. The Field Instructor assigns tasks to the student according to the requirements of the School and the educational and experiential level of the student. Student, Field Instructor, and Field Faculty Advisor participate in the assessment and evaluation of the student’s work. The Field Faculty Advisor is the course instructor and assigns all grades. Students complete a total of 147 field hours and 3 hours of professional development in this course.

SASS 651AV. Field Education I-AV. 1 Unit.
This course is designed to be taken by entering Non-Advanced Standing or foundation social work students after the successful completion of SASS495V of their master’s program. The SASS 651AV course is 8 weeks in duration. The overall goal of this course is to provide graduate level social work students with field related opportunities to develop foundation level competencies in the eight abilities by helping students apply knowledge of social work theory, skills, values and ethics acquired in the classroom in an agency setting. These collective experiences provide students with a forum to develop social work skills, integrate and operationalize the values and ethics inherent in professional practice, and confront social injustice as self-reflective, competent developing practitioners. The field instructor is based at the social service setting and provides the direct instruction of the student. The faculty advisor, who is based at the School, serves as a link between all parties, interprets the requirements and standards of the School, and participates and consults in the design of the student’s learning experience. The field instructor assigns tasks to the student according to the requirements of the School and the educational and experiential level of the student. Student, field instructor, and faculty field advisor all participate in various ways in the evaluation if student’s work; the faculty advisor is responsible for assigning the grade. Students spend 75 hours in field and professional development in SASS 651AV. Prereq: SASS 495V.
SASS 651BV. Field Education I-BV. 1 Unit.
This course is designed to be taken by entering Non-Advanced Standing social work students in the first semester of their master's program. The SASS 651BV course is 8 weeks in duration. The overall goal of this course is to provide graduate level social work students with field related opportunities to develop foundation level competencies in the eight abilities by helping students apply knowledge of social work theory, skills, values and ethics acquired in the classroom in an agency setting. These collective experiences provide students with a forum to develop social work skills, integrate and operationalize the values and ethics inherent in professional practice, and confront social injustice as self-reflective, competent, developing practitioners. The field instructor is based at the social service setting and provides the direct instruction of the student. The faculty advisor, who is based at the School, services as a link between all parties, interprets the requirements and standards of the School, and participates and consults in the design of the student's learning experiences. The field instructor assigns tasks to the student according to the requirement of the School and the educational and experiential level of the student. Student, field instructor, and faculty field advisor all participate in various ways in the evaluation of student’s work; the faculty advisor is responsible for assigning the grade. Students spend 75 hours in field and professional development in SASS 651BV. Prereq: SASS 651AV.

SASS 652A. Field Education II-A. 1.5 Unit.
This course is designed to be taken by entering Advanced Standing students in the first semester of their master's program and by Non-Advanced Standing social work students in the second semester of their master's program. The SASS 652A course is 16 weeks in duration. It consists of a field practicum and participation in professional development opportunities. For students entering the program with advanced standing, there is an additional requirement of four logs and an integrative assignment, and periodic meetings with a field faculty advisor in addition to the field conference. The overall goal of this course is to provide graduate level social work students with field related opportunities to continue to develop foundation level competencies in the eight abilities by helping students apply knowledge of social work theory, skills, values, and ethics acquired in the classroom in an agency setting. The periodic meetings with the field faculty advisor are designed to provide students with an opportunity to integrate classroom and field learning. These collective experiences provide students with a forum to develop social work skills, integrate and operationalize the values and ethics inherent in professional practice as self-reflective, competent, developing practitioners. Students spend 150 hours in field and professional development in SASS 652A. Prereq: SASS 651A and SASS 651B or SASS 400-TR.

SASS 652B. Field Education II-B. 1.5 Unit.
This course is designed to be taken by entering Advanced Standing students in the second semesters of their master's program and by Non-Advanced Standing social work students in the fourth semester of their master's program. The SASS 652B course is 16 weeks in duration. It consists of a field practicum and participation in professional development opportunities. For students entering the program with advanced standing, there is an additional requirement of four logs and an integrative assignment, and periodic meetings with a field faculty advisor in addition to the field conference. The overall goal of this course is to provide graduate level social work students with field related opportunities to continue to develop foundation level competencies in the eight abilities by helping students apply knowledge of social work theory, skills, values, and ethics acquired in the classroom in an agency setting. The periodic meetings with the field faculty advisor are designed to provide students with an opportunity to integrate classroom and field learning. These collective experiences provide students with a forum to develop social work skills, integrate and operationalize the values and ethics inherent in professional practice and confront social injustice as self-reflective, competent, developing practitioners. Students spend 150 hours in field and professional development in SASS 652B. Prereq: SASS 652A.

SASS 653A. Field Education III-A. 1.5 Unit.
This course is designed to be taken by students in their advanced course of study. Advanced Standing social work students take this course in the third semester of their master's program. Non-Advanced Standing social work students take it in the fifth semester of their master's program. The SASS 653A course is 16 weeks in duration. It consists of a field practicum and participation in professional development opportunities. The overall goal of this course is to provide graduate level social work students with field related opportunities to continue to develop advanced level competencies in their area of concentration in the eight abilities by helping students apply knowledge of social work theory, skills, values and ethics acquired in the classroom in an agency setting. The periodic meetings with the field faculty advisor are designed to provide students with a forum to develop social work skills, opportunity to integrate classroom and field learning. These collective experiences provide students with a forum to develop social work skills, integrate and operationalize the values and ethics inherent in professional practice, and confront social injustice as self-reflective, competent, developing practitioners. Students spend 150 hours in field and professional development in SASS 653A. Prereq: SASS 652A and SASS 652B.
SASS 653B. Field Education III-B. 1.5 Unit.
This course is designed to be taken by students in their advanced course of study. Advanced Standing social work students take this course in the fourth semester of their master’s program. Non-Advanced Standing social work students take it in the sixth semester of their master’s program. The SASS 653B course is 16 weeks in duration. It consists of a field practicum and participation in professional development opportunities. The overall goal of this course is to provide graduate level social work students with field related opportunities to continue to develop advanced level competencies in their area of concentration in the eight abilities by helping students apply knowledge of social work theory, skills, values and ethics acquired in the classroom in an agency setting. The periodic meetings with the field faculty advisor are designed to provide students with a forum to develop social work skills, opportunity to integrate classroom and field learning. These collective experiences provide students with a forum to develop social work skills, integrate and operationalize the values and ethics inherent in professional practice, and confront social injustice as self-reflective, competent, developing practitioners. Students spend 150 hours in field and professional development in SASS 653B. Prereq: SASS 653A.

SASS 654A. Field Education IV-A. 1.5 Unit.
This course is designed to be taken by students in their advanced course of study. Advanced Standing social work students take this course in the fifth semester of their master’s program. Non-Advanced Standing social work students take it in the seventh semester of their master’s program. The SASS 654A course is 16 weeks in duration. It consists of a field practicum and participation in professional development opportunities. The overall goal of this course is to provide graduate level social work students with field related opportunities to continue to develop their advanced level competencies in their area of concentration in the eight abilities by helping students apply ethics acquired in the classroom in an agency setting. The periodic meetings with the field faculty advisor are designed to provide students with an opportunity to integrate classroom and field learning. These collective experiences provide students with a forum to develop social work skills, integrate and operationalize the values and ethics inherent in professional practice, and confront social injustice as self-reflective, competent, developing practitioners. Students spend 150 hours in field and professional development in SASS 654A. Prereq: SASS 653A and SASS 653B.

SASS 654B. Field Education IV-B. 1.5 Unit.
This course is designed to be taken by students in their advanced course of study. Advanced Standing social work students take this course in the sixth semester of their master’s program. Non-Advanced Standing social work students take it in the eighth semester of their master’s program. The SASS 654B course is 16 weeks in duration. It consists of a field practicum and participation in professional development opportunities. The overall goal of this course is to provide graduate level social work students with field related opportunities to continue to develop their advanced level competencies in their area of concentration in the eight abilities by helping students apply ethics acquired in the classroom in an agency setting. The periodic meetings with the field faculty advisor are designed to provide students with an opportunity to integrate classroom and field learning. These collective experiences provide students with a forum to develop social work skills, integrate and operationalize the values and ethics inherent in professional practice, and confront social injustice as self-reflective, competent, developing practitioners. Student, field instructor, and field faculty advisor all participate in the evaluation of the student’s work; the faculty advisor is responsible for assigning the grade. Students spend 150 hours in field and professional development in SASS 654B. Prereq: SASS 654A.

SASS 655. Dual Degree Field Practicum II. 3 Units.
This course is designed to be taken by MSSA/MPH joint degree students as the second field period of their master’s program. It consists of a field practicum and participation in professional development opportunities. The Field Practicum is an integral component of the MSASS and MPH curriculums, allowing students to apply, develop, and refine their conceptual knowledge and skills as part of a planned, supervised, and evaluated community-based experience. The Practicum is designed to move students beyond the walls of academia, to understand the political, economic, social, and organizational contexts within which social work and public health activities are conducted. These collective experiences provide students with a forum to develop skills, integrate and operationalize the values and ethics inherent in professional practice, and confront social injustice as self-reflective, competent developing practitioners. (EPAAS Program Objective M6 and EPAAS Content Area 4.7) The overall goal of this course is to provide graduate level MSSA/MPH joint degree students with field related opportunities to continue to develop foundation level competencies in the eight MSSAS abilities by helping students apply knowledge of social work and public health theory, skills, values and ethics acquired in the classroom in an agency setting. Offered as MPHP 655 and SASS 655. Prereq: SASS 601.
SASS 656. Dual Degree Field Capstone III. 3 Units.
The Public Health Capstone Project is an integral component of the MPH curriculum, allowing students to apply, develop, and refine their conceptual knowledge and skills as part of a planned, mentored, and evaluated public health scholarly project. This course is designed to be taken by advanced level students. It consists of a 288 hour field based Capstone experience and participation in 12 hours of professional development opportunities. The overall goal of this course is designed to move students beyond the walls and constraints of the classroom, to understand the political, economic, social, and organizational contexts within which public health and social work activities are conducted. It is also designed to provide graduate level dual degree students with field related opportunities to begin to develop advanced level competencies in the eight abilities by helping students apply knowledge of social work theory, skills, values and ethics acquired in the classroom in an agency setting. These collective experiences provide students with a forum to continue to develop and hone social work skills, integrate and operationalize the values and ethics inherent in professional practice, and confront social injustice as self-reflective, competent developing practitioners. (EPAS Program Objective M6 and EPAS Content Area 4.7) Offered as SASS 656 and MPHP 656. Prereq: SASS 655.

SASS 657. Dual Degree Field Capstone IV. 3 Units.
The Public Health Capstone Project is an integral component of the MPH curriculum, allowing students to apply, develop, and refine their conceptual knowledge and skills as part of a planned, mentored, and evaluated public health scholarly project. This course is designed to be taken by advanced level students. It consists of a 288 hour field based Capstone experience and participation in 12 hours of professional development opportunities. The overall goal of this course is designed to move students beyond the walls and constraints of the classroom, to understand the political, economic, social, and organizational contexts within which public health and social work activities are conducted. It is also designed to provide graduate level dual degree students with field related opportunities to begin to develop advanced level competencies in the eight abilities by helping students apply knowledge of social work theory, skills, values and ethics acquired in the classroom in an agency setting. Offered as MPHP 657 and SASS 657. Prereq: SASS 656 or MPHP656.

SASS 701. Dissertation Ph.D.. 1 - 9 Units.
This course is intended for students who have passed the qualifying examination and are actively working on their dissertation. Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
SCHOOL OF DENTAL MEDICINE

The Case Western Reserve University School of Dental Medicine (https://case.edu/dental/) is a professional school offering a curriculum leading to the Doctor of Dental Medicine degree (DMD). Advanced education programs in the dental specialties are also available.

The School of Dental Medicine was organized June 21, 1892, as the Dental Department of Western Reserve University. For the first 25 years of its existence, the school was located in downtown Cleveland. In 1917, the School of Dental Medicine became an integral part of the university, with a building on Adelbert Road. In 2003, the name of the school officially changed from the School of Dental Surgery to the School of Dental Medicine, and the degree offered changed from Doctor of Dental Surgery to Doctor of Dental Medicine.

In 2019, the School moved to the Sheila and Eric Samson Pavilion and the Dental Clinic Building at the Health Education Campus of Case Western Reserve University and Cleveland Clinic. The 477,000-square-foot Samson Pavilion is home to dental, nursing, medical, and physician assistant students. Being under one roof, and having some classes that they’ll all take together, encourages the communication and collaboration that’s required in the fast-paced field of health care.

The Profession of Dentistry

The mission of dentistry is the protection and improvement of the health of individuals and society with a concentration on oral health. Professional activities encompass a wide variety of endeavors including the clinical care of individuals, the prevention of disease, the discovery of new knowledge, and the development of procedures and policies that protect and improve health, especially for those populations at risk for disease.

Because oral health is an important concern of society, the role of the dentist continues to be essential and rewarding. Men and women who are interested in scientific studies directly related to the welfare of people should find a strong appeal in dentistry as a life work. It offers an unusual opportunity for public service, community respect, and the use of originality, compassion, and substantial skill and independent judgment on a daily basis.

Mission Statement

The mission of the Case Western Reserve University School of Dental Medicine is to provide outstanding programs in oral health education, patient care, focused research and scholarship, and service that are of value to our constituents. We will accomplish this in an environment which fosters collegiality and professionalism, and that enables a diverse group of students to become competent oral health care providers and contribute to the health and well-being of individuals and communities.

The School of Dental Medicine’s core values are: collegiality, a culture of inquiry, diversity, innovation, integrity, and responsible stewardship.

Dental Education Program

The students who enter the School of Dental Medicine are very carefully selected and have already had many opportunities for intellectual and social development. The years in dental school should permit the continued maturation of the individual and should emphasize the basic knowledge and skills which are common to all dentists. Graduates should continue their dental education during their professional careers and add to the basic concepts taught in dental school by studying the scientific literature and by attending continuing education courses. While in dental school, the student develops an attitude of professionalism and a sense of responsibility toward the patient’s welfare, which will provide optimal dental care.

License to Practice Dentistry in Ohio

Specific information about licensure in Ohio and other states should be obtained from the individual state boards of dentistry.

Accreditation

The School of Dental Medicine is accredited by the Commission on Dental Accreditation (CODA) on a seven year cycle. The School’s most recent site visit was November 1-3, 2016.

Administration

Kenneth B. Chance, Sr., DDS
Dean of the School of Dental Medicine

Dale A. Baur, DDS
Vice Dean; Professor and Chair of Oral and Maxillofacial Surgery

Nabil F. Bissada, DDS, MSD, BDS
Associate Dean for Global Relations; Professor of Periodontics

Fady F. Faddoul, DDS, MSD
Professor and Chair of Comprehensive Care

T. Roma Jasinevicius, DDS, MEd
Interim Chair of Periodontics; Associate Professor of Comprehensive Care

Suchitra S. Nelson, PhD
Assistant Dean, Clinical and Translational Research; Professor and Interim Chair of Community Dentistry

Ronald L. Occhionero, DDS
Associate Dean for Administration; Professor of Comprehensive Care

Andres Pinto, DDS, DMS, MPH
Assistant Dean of Graduate Studies; Professor and Chair of Oral and Maxillofacial Medicine and Diagnostic Sciences

Patricia Mehosky Ribeiro, BA, MBA, CRA
Assistant Dean for Research Administration

David D. Rolf II, DMD, MS
Associate Dean of Academic Affairs; Professor of Periodontics

John W. Smolik, MBA, CPA
Assistant Dean of Finance and Operations
Community Health Clinics
Dental students participate in clinical care at several community health clinics in and around the greater Cleveland area. As part of the curriculum, dental students spend two weeks at one of the community clinics and additionally may volunteer their services in their free time.

Doctor of Dental Medicine (DMD)
The program will accomplish its goals through academic work in four themes and two threads, which are woven throughout the four years of the program. The program includes a variety of educational formats to deliver the curricula, including problem-based learning sessions, team-based learning, independent study, seminars, experiential learning opportunities, traditional lectures, laboratories, standardized patient experiences, and patient-based comprehensive care. An important goal of the curriculum is to help students become better prepared in independent learning, interprofessional practice, critical thinking skills, and the use of evidence. The curriculum includes the following themes and threads:

Themes
Health and Well-Being
This theme contains all curricula -- both didactic and clinical -- that apply to health and the normal structure and functioning of the body and of the oral complex. The traditional content areas of physiology, biochemistry, anatomy, histology, among other dental science classes, are integrated through cases to form a better bridge between the basic sciences and the clinical sciences.

Disease Processes
The Disease Processes theme includes content related to general and oral diseases. These topics are often melded with healthy structure and function content to provide students with a global perspective of the implications of disease on usual functioning.

Restoration of Health
This theme contains content related to therapies necessary for treatment of medical disease and dental disease. A focus on restoring oral health is accomplished through virtual reality clinical skills training, training on models and progression to comprehensive dental care in conjunction with didactic knowledge.

Maintenance of Health
The Maintenance of Health theme focuses on a curriculum which explores strategies for preserving health through general and oral health therapies, patient education, disease risk assessment, and disease prevention. This theme provides a viewpoint from which students can develop life-long care plans for their patients.

Threads
Inquiry
This thread that runs throughout the four-year program supports student growth in skills in clinical decision making. Students develop an understanding of what scientific evidence is, how to make clinical decisions and to value scientific discovery in all aspects of dentistry.

Leadership
This thread contains curriculum for the development of students as ethical, sensitive, caring practitioners who are stewards of oral health of...
the individual patient, the community, and society. An important focus in Leadership curriculum is content that helps students advance in their role as a professional. It also supports the integration of all students into the practice management curriculum centered within their clinical preceptor groups.

Years

Year 1
This year includes curriculum describing normal healthy functioning and disease processes. Basic science content is taught in the context of clinical cases. Foundational work in understanding human structure and function is paired with learning about disease. Dental clinical sciences study the foundational elements of oral health.

Year 2
This year continues with an integrated approach to curricula in health and disease with an emphasis on the development of dental clinical skills. Further development of students as clinicians proceeds with their involvement in the clinical preceptor groups. Students will make a transition to increasing patient-centered clinical care as they demonstrate competency in clinical skills and didactic knowledge.

Year 3
This year includes didactic work related to advancing levels of knowledge and clinical experience. Students spend time in didactic classes that are directly related to clinical practice and in rotations to specialty clinical areas while accomplishing comprehensive patient care.

Year 4
Students gain clinical experience in the Comprehensive Care Clinics and finish didactic work which may include enrichment courses. They participate in practice management activities of their preceptor group, developing critical skills for general practice dentistry.

Doctor of Dental Medicine (DMD)

First Year Courses

First Term
- DSPR 136 Cariology 1
- DSPR 139 Neoplasia and Genetics 1
- HEWB 121 Foundations of Life Science 4.5
- HEWB 130 Oral Histology 1.5
- HWDP 131 Heart and Lungs in Health and Disease 4.5
- LDRS 101 Collaborative Practice I A 1.5
- LDRS 111 Epidemiology for Public Health and Clinical Practice 2.5
- MAHE 141 Preventive Periodontics 1
- MAHE 144 Preventive Periodontics Clinic (graded in the spring) 1
- MAHE 145 ACE: Outreach Preventive Dentistry 2
- REHE 151 Dental Anatomy 3
- REHE 153 Dental Anatomy Laboratory 1

Second Term
- HEWB 123 Facial Growth 1.5
- HEWB 124 Masticatory Dynamics 2
- HEWB 126 Masticatory Dynamics Lab 1.5
- HEWB 128 Body as Host 4

Second Year Courses

First Term
- HWDP 232 Renal and Hematologic Systems in Health and Disease 2
- HWDP 243 Endocrine and Reproductive Systems in Health and Disease 1.5
- HWDP 245 Musculoskeletal System in Health and Disease 1.5
- HWDP 246 Neuroscience in Health and Disease 2
- MAHE 242 Periodontics (graded in the spring) 1
- REHE 257 Prosthodontic Technology 2
- REHE 259 Basic Procedures in Fixed Prosthodontics II 1
- REHE 262 Basic Procedures in Restorative Dentistry II 1
- REHE 264 Endodontics .5
- REHE 272 Basic Procedures in Restorative Dentistry II Lab 1
- REHE 267 Basic Procedure Fixed Prosthodontics II Lab 1.5
- REHE 269 Basic Procedure Fixed Prosthodontics Lab 1
- REHE 274 Endodontics Lab 1
- REMA 261 Preclinical Orthodontics 1

Second Term
- DSPR 232 Periodontics 1
- DSPR 234 Oral and Maxillofacial Pathology 3
- INQU 202 Introduction to Medicine: Patient Assessment 1.5
- MAHE 214 ACE: Family First 1
- MAHE 242 Periodontics 1
- REHE 252 Pain Control 1
- REHE 253 Basic Procedures in Esthetics 1
- REHE 254 Pharmacology 4
- REHE 256 Radiologic Interpretation 1
- REHE 258 Principles of Treatment Planning I 1

DMD/MPH DMD and Master of Public Health

Purpose

One of the primary goals of the American Dental Association (ADA) is to, “promote the oral health of the public.” Dental public health is one of the nine recognized specialties of the ADA, and is defined as, “the art and science of preventing oral diseases and promoting oral health through organized community efforts”. The DMD/MPH program seeks to impart knowledge and skills necessary to expand the practice of dentistry into the community in a proactive way that fosters positive oral health, and as a direct result, yields improved overall health of the populations involved. It is necessary to address populations to improve the health of individuals and to work with individuals to improve the health of populations. Thus, dentistry and public health are inter-dependent and reliant on each other in order to achieve their mutual goals.

Description of the Curriculum

The length of the DMD/MPH dual degree curriculum is five years, one of which is dedicated to MPH courses. This year can be completed:

- before the 1st DMD year
- between the 1st and 2nd DMD years
- between the 2nd and 3rd DMD years

Other requests/options will be considered on a case-by-case basis.

DMD Curriculum: The DMD degree includes 141.5 credit hours of didactic, laboratory, and clinical work. The DMD curriculum will not entail/incure any change because of enrollment in this dual degree program. A total of up to 9 credits from the DMD curriculum (Epidemiology for Clinical Practice, ACE Preventive Dentistry, and Interprofessional Collaborative Practice I) will be counted as electives towards the MPH degree.

MPH Curriculum: The MPH degree requires 42 credit hours:

- 18 hours of Core Courses
- 15 hours of Electives, of which 9 are covered by DMD courses
- 9 hours of Culminating Project (3 credit Practicum & 6 credit Capstone)
- Participation in a seminar series

Students must successfully complete both the DMD curriculum and the MPH curriculum to complete the dual degree. Students must complete the Capstone project and are also expected to present their project at a national meeting, the School of Dental Medicine Professionals Day, and the CWRU MPH Population Health Innovations Conference.

The Culminating Experience is the centerpiece of the CWRU MPH Program. A Public Health field practicum and capstone project required of all MPH students, this two course sequence places students in health related settings to work on projects of mutual interest to the agency or organization and the student. The experience gives students the opportunity to apply the knowledge and skills they have acquired through their academic course work to a problem involving the health of the community. Students learn to communicate with target groups in an effective manner, to order priorities for major projects according to definable criteria, to use computers for specific applications relevant to public health, to identify ethical, social, and cultural issues relating to public health policies, research, and interventions, to identify the process by which decisions are made within the organization or agency, and to identify and coordinate the use of resources at the site.

Admissions to the Program

Students interested in the DMD/MPH program, please contact Dr. Sena Narendran, director of the program, by phone at 216.368.1311 or by email at DentalPH@case.edu.

Total Units 30

DMD Special Programs for Undergraduates

The School of Dental Medicine offers a pre-dental track for outstanding high school seniors who plan to pursue careers in dentistry.

Pre-Professional Scholars in Dentistry

The Pre-Professional Scholars Program in Dentistry offers exceptionally well-qualified high school students a seven-year program where students join the CWRU School of Dental Medicine after completing
three years of undergraduate coursework. For more information about the program, see Pre-Professional Scholars Program (p. 1241) in the Office of Undergraduate Studies section of this bulletin. For more information about admission to the Pre-Professional Scholars Program, see the Office of Undergraduate Admission website (http://case.edu/admissions/).

### Senior Year in Professional Studies

The Senior Year in Professional Studies offers Case Western Reserve undergraduate students, who are candidates for the Bachelor of Arts (BA) degree and who are admitted to Case Western Reserve University School of Dental Medicine by the end of the junior year, the opportunity to shorten their entire course of studies by one year. For more information about the program and admission, see Acceleration Toward Professional Degrees (p. 1239) in the Office of Undergraduate Studies section of this bulletin.

### Graduate Studies at School of Dental Medicine

#### Academic Regulations

##### Registration

Graduate studies programs operate on a twelve-month basis, from July 1 to June 30. The year is divided into two six-month semesters. The fall semester is from July 1 to December 31; spring semester is from January 1 to June 30. The act of registration includes submission of a course schedule approved by the department, the payment of semester tuition, and the dental school registrar registering the student. Each semester, registration must be completed as scheduled. Students enrolled in fall and spring semesters may arrange to pay bills for tuition and fees in two installments. At least half of the total bill must be paid at registration; the remainder must be paid in accordance with university policy. Fees may be charged for late registration or late payment. Students who fail to be registered within 30 days after the published dates will be considered to have withdrawn from the program. In the School of Dental Medicine, students who are not registered are not considered students of record, lose the protection of the university in matters of liability, and therefore, may not treat patients. They can no longer attend class or receive grades and will have to formally reestablish their matriculation. In any circumstance, all lost course and/or clinical time will be added to the end of the program’s original completion date.

Under unusual circumstances, special arrangements for registration may be made with permission of the department chair and the associate dean for graduate studies. Social security numbers are used for all records and documents and must be provided at the time of registration. Foreign students will be issued a number for this purpose if they have not obtained a social security number prior to registration. New students and new residents who are not registered as specified and who have failed to provide satisfactory reasons for the delay in advance will forfeit their right to admission. Vacancies which arise from such circumstances are filled from a list of alternate candidates at the discretion of the department.

##### Grading

The responsibility for assigning grades rests exclusively with the course director, who must announce the general method of grading at the beginning of the course. Course grades are reported to the registrar of the School of Dental Medicine at the end of the course or when a final grade has been determined, if prior to the scheduled completion time for the course. Incomplete or conditional grades can be changed only by the course director as described in the University Registrar (p. 1284) section of this bulletin. Grading in the School of Dental Medicine Graduate Programs is A, B, C, or F, pass/no pass and Satisfactory/Unsatisfactory.

### Transfer Credit

Transfer of credit from another university is limited to six semester hours of graduate-level courses. Such transfer requires approval from the student’s advisor, the department chair, and the Office of Graduate Studies. Courses must have been taken within five years prior or subsequent to matriculation in the graduate program at Case Western Reserve University, and only those with grades of “B” or better are transferable. No credit for a thesis may be transferred from another university.

Graduate credit is not awarded for 100- or 200-level courses or their equivalents.

#### Thesis Advisory Committee

Each master’s degree candidate is advised to consult with their Program Director as to when and how to form a thesis committee. The Graduate department chair, in consultation with the Program Director, chooses a faculty member to serve as the primary thesis advisor. The primary thesis advisor will help identify other members of the faculty (at least two) to serve as secondary advisors and as members of the thesis committee. At least two members of the thesis committee must be from the department in which the student is enrolled, and one must be from another department. Additional membership is not restricted and may include persons from outside the university who have qualifications acceptable to the department chair. Members of the thesis committee continue in their capacity until the student graduates or leaves the program of study. The thesis committee will be responsible for guiding the student in the development of a thesis protocol. Once a protocol is acceptable, the thesis committee members advise the student on the conduct of the research and writing of the thesis document. Ultimately, the committee members will evaluate the student’s oral defense and final thesis document.

##### Research Project

For master’s degree programs, each student must carry out an original and meaningful research project acceptable to the department chair and the advisory committee. A written thesis, similarly acceptable, is to be prepared and must conform to the standard format determined by the Office of Graduate Studies of the School of Dental Medicine. The thesis must be submitted before the prescribed deadline. An oral examination (defense) of the thesis is required. This examination is administered by the student’s advisory committee before a standard date set by the Office of Graduate Studies of the School of Dental Medicine. The Advisor and all committee members must be present for the defense. Unanimous agreement of the committee is required to pass the thesis examination. A student must be registered for thesis credit or continuing graduate work during the semester in which the thesis examination is conducted. The thesis defense is ordinarily open to all members of the university faculty, student body, and guests.

### Extra Courses

Individual students enrolled in an advanced education program, whether or not a master’s degree is involved, may be required to take courses beyond the general requirements set forth by the department in order to complete the program. In such instances, the student must be notified in writing by the department chair, with a copy filed in the Office of Graduate Studies of the School of Dental Medicine.
Time Limits
Each student is expected to maintain continuous registration and all requirements must be completed within five consecutive calendar years immediately following matriculation as an advanced education student, including approved periods of leave of absence. A student who fails to complete the requirements within five years must be formally readmitted with full standing in order to continue study, subject to terms of readmission, future time limits, and revised requirements for the award of the degree. Prior status in the program is no guarantee of readmission and should not be assumed.

Leave of Absence
A student may request a leave of absence for personal reasons or reasons of health when anticipated or actual absence is in excess of three weeks. A written request for a leave of absence must include the reason for the request and the length of time requested. A leave of absence cannot exceed one calendar year. It must be submitted to the program director and to the associate dean of graduate studies of the School of Dental Medicine. The program director will forward the request with his/her response to the Committee on Graduate Studies. In order to be eligible for such requests, the student must be currently enrolled and in regular attendance prior to the time or circumstances that necessitated the request. At the expiration of the leave, the student must resume registration unless formally granted an extension. A leave of absence does not extend the maximum time permitted for the completion of degree requirements. A student who fails to obtain an approved leave, or who fails to resume registration at the time expected, may be separated from the program. During the period of leave, it is expected that the student will not avail himself or herself of the teaching and research resources of the School of Dental Medicine or the university. At the end of an approved leave, reentry into the program is reviewed by the program director in concert with the Committee on Graduate Studies, and may not be at the same level attained at the time the leave was granted. Programs with a high patient case component may require that the clinical portion of the program be repeated in its entirety. Finally, the committee also reserves the right to place a student on leave of absence where it has been determined that the circumstances warrant, even in the absence of a formal request.

Maintenance of Good Standing
A minimum cumulative grade point average of 2.75 is required for good standing in a graduate program for all courses taken for graduate credit (excluding those graded Satisfactory/Unsatisfactory or Pass/No Pass).

The associate dean for graduate studies reviews student performance and may recommend a course of action to the Committee on Graduate Studies. The committee may require remedial work, place a student on academic review or probation, set conditions for continuation in the student’s course of study or program, and may require withdrawal for failure to meet the academic standards set by the department or school. A student who receives a grade deemed unsatisfactory in any course is placed on probation and must remove himself or herself from probation within a time period specified by the committee. It is expected that removal from probation will ordinarily require repetition of the course with an acceptable grade or the successful completion of work deemed equivalent by the student’s advisory committee and the departmental chair.

In this regard, a student may be separated from the university for any one of the following reasons:

1. Failure to correct probationary status within the specified time period.
2. Failure to achieve a minimum grade point average of 2.50 or above upon completion of 12 semester hours or a grade point average of 2.75 or higher upon completion of 21 semester hours of graduate study.
3. Failure to complete all requirements for the master’s degree within five consecutive calendar years from the term of matriculation, unless granted an extension of a maximum of one year upon recommendation of the advisor and chair and approved by the associate dean for graduate studies.

In calculating the grade point average, all courses for which quality points are given are counted, including courses which may be required to be repeated. In addition, on the recommendation of the student’s department, and with due process, the School of Dental Medicine may suspend or separate a student from the university for failure to maintain appropriate standards of conduct and integrity in discharging their responsibilities. Academic failure, moral delinquency, gross misconduct, or failure to meet the specific conditions of probation or academic review is sufficient reason for requiring withdrawal from the school.

Graduation
The minimum requirements for the master’s degree in the School of Dental Medicine are 36 semester hours of course work, including six or more semester hours of thesis/equivalent registration, and the submission of an accepted thesis. Individual departments may require additional semester hours of specific course work and/or thesis. Not less than 24 semester hours may be at the 500 level or higher.

A candidate for a Master of Science in Dentistry degree must make application for the degree to the Office of Graduate Studies of the School of Dental Medicine no later than three months before the commencement at which the degree is expected.

The awarding of the degree is dependent upon the satisfactory completion of all requirements, and the recommendations of department chair, Committee on Graduate Studies, and faculty of the School of Dental Medicine. The student must complete all requirements for both the master’s degree and certificate in order to receive either.

Degrees will not be awarded to candidates with delinquent financial accounts that include, but are not limited to, tuition payments, fees, and library fines.

Delayed Graduation
A candidate who has successfully defended his or her thesis, but who fails to meet the deadline for thesis submission for graduation in one semester, will be permitted to receive his or her degree at the next scheduled graduation, without further registration or payment of tuition if the completed thesis is submitted within fourteen days of the date originally scheduled for graduation. If all requirements are not met within this grace period, the candidate must register for the subsequent semester.

Advanced Education in General Dentistry (AEGD)

The AEGD program is a one-year experience with a major emphasis in clinical general dentistry designed to provide the resident with training beyond that received in the pre-doctoral curriculum.
Formal courses, seminars, and literature review, as well as one week of “on call” per month, enhance the resident’s ability to handle dental and medical emergencies encountered in everyday practice.

The AEGD program provides the resident the opportunity to deliver the highest quality of comprehensive dental care to the broadest range of the population with a knowledge, comfort, and ease in treating the high-risk patient and underserved segment of the population including: HIV/AIDS, medically compromised, physically handicapped and geriatric populations with considerable experience in implantology and full mouth rehabilitation.

The AEGD program enables the resident to become proficient in diagnosis and treatment planning for the more challenging and complex cases to identify and treat many medical and/or dental emergencies encountered in everyday dental practice. The AEGD program introduces the resident to the basic concepts of hospital dentistry and helps them interact with their medical colleagues and other health care providers.

Goals and Objectives

• To provide the residents with the didactic knowledge and clinical experience to deliver multidisciplinary comprehensive oral health care to a wide range of the population beyond the level of predoctoral education. (This includes providing community services through the management of the medically and/or immunocompromised patient, the physically handicapped patient, as well as the geriatric and the underserved segment of the population.)

• Enable the residents to identify and treat the most common medical and/or dental emergencies encountered in everyday dental practice.

• To develop in the residents the values of professional ethics, and acceptance of cultural diversity in the practice of dentistry.

• To develop the skills of self-evaluation and critical thinking.

• To provide the residents with experience to improve their ability to interact, function and communicate effectively with other healthcare professionals in the delivery of comprehensive treatment.

• To encourage the resident to continue the process of lifelong learning through continuing education, professional meetings, and review of literature.

• To provide the residents with training in inpatient care, practice and risk management in order to manage a private dental practice.

Admission

Information about the program can be found on the School of Dental Medicine website.

https://case.edu/dental/departments-programs/advanced-education-in-general-dentistry-aegd/aegd-residency-program

The didactic component of the AEGD program is conducted in both the formal courses as well as the departmental seminars.

Formal Courses

• Management of Medical Emergencies

• Pharmacology

• Orthodontic

• Interdisciplinary Seminars

• Occlusion

• Correlative Medical Sciences

Seminars

• Literature review

• Case Presentation

• Endodontics

• Periodontics

• Oral Surgery

• Implantology

• Oral Diagnosis and Treatment Planning

• Preventive Dentistry

• Pain and Anxiety Control in the Conscious Patient

• Special Care Patients including the Medically Compromised

• Asperis and Infection Control

• Pediatric Dentistry

• Operative Dentistry

• Fixed and Removable Prostodontics

• Oral Medicine

• Practice Management

Pediatric Rotation

• Length of Rotation or Experience (in weeks): 2

• Number of Hours per week: 10

Objectives:

1. To provide residents with both clinical and didactic training in pediatric dentistry beyond that received in the pre-doctoral curriculum.

2. To improve the resident’s ability in diagnosis, treatment planning, oral examination, and physical evaluation of the pediatric patient.

3. To improve the resident’s ability to use non-pharmacologic management techniques to appropriately manage and guide the behavior of the child patient to accept needed treatment and to provide advice or guidance to the parent to enhance the child’s acceptance.

4. To assist the resident in developing a working knowledge of preventive and corrective dental procedures relating to the growth and development of the stomatognathic system.

5. To increase both the confidence and competence of residents in meeting the general oral health needs of the pediatric patient.

Total Units in Sequence: 2-21
Craniofacial, Surgical, and Special Care Orthodontics Fellowship Program

Phone: 216.368.0673  
Manish Valiathan, DDS, MSD, Program Director  
manish.valiathan@case.edu

Fellows accepted into the Craniofacial, Surgical and Special Care Orthodontics Fellowship Program will be provided with advanced clinical, didactic, and research training during the 1-year program of study in the management of children with craniofacial abnormalities. We anticipate most fellows to go through a 1-year program of study. However, individuals who intend to devote the majority of their careers in this area may be provided with the opportunity to enroll in a second year of study.

Graduates of the program will be exposed to the diagnoses, treatment planning, and clinical execution of orthodontic and dentofacial orthopedic services to a large clinical volume of pediatric, adolescent, and adult patients who have congenital and acquired craniofacial abnormalities. The goal of the Fellowship Program is to train the fellow to attain a level of competency that enables him or her to recognize, diagnose and treat patients with craniofacial anomalies and special needs in a hospital-based, team care setting.

Fellows participate in the craniofacial and cleft conferences, review treatment plans and progress notes, and provide clinical care to the patients under direct supervision. All complex treatments are discussed with the attending on a case-by-case basis. New patient exams are done on a regular basis and the fellows work up cases (clinical exam, study models analysis, CBCT evaluations) and review the treatment plans with the faculty. The fellows will perform all the surgical treatment plans, cephalometric prediction tracings, model surgery, and splint construction. The fellow will also scrub in and participate in the OR activities/surgical procedures.

Rotations with other services will form an integral part of the Fellowship Program. The principal rotations will be with the departments of plastic surgery, oral and maxillofacial surgery, and pediatric dentistry. In addition, the fellow will be exposed to speech pathology, pediatric otolaryngology, genetics, and occupational therapy.

The format of the program allows for constant one-on-one supervision that will allow for subjective assessments of the fellow’s understanding of the subject matter, clinical skills, and patient management skills. This will be supplemented by weekly sessions with the faculty, where the fellow’s understanding will be further tested. At the end of each semester, a written examination will form part of the assessment of the fellow’s progress.

Admission

More information about admission to the program can be obtained by contacting the following:

Manish Valiathan (manish.valiathan@case.edu), DDS, MSD, Program Director, at 216.368.0673; Deb Tomrick (debra.tomrick@case.edu), Craniofacial Clinic Assistant, at 216.368.4331; or Colleen Friday (colleen.friday@case.edu), Graduate Studies Administrator, at 216.368.1168

Residency Program in Dental Public Health

The advanced education program in Dental Public Health is fully accredited by the Commission on Dental Accreditation and offers three tracks: 1) one-year full-time for dentists with a master’s degree in public health or equivalent; 2) two-year part-time for dentists with a master’s degree in public health or equivalent; or 3) two-year full-time for dentists WITHOUT a master’s in public health. While residents in the first two tracks earn a certificate, residents in the third track will earn a residency certificate from the School of Dental Medicine as well as an accredited MPH degree through Case Western Reserve University (CWRU) School of Medicine.

The primary training site is the CWRU School of Dental Medicine, with extramural sites in other parts of Ohio. The didactic instruction for the residency program encompasses the new competencies of the American Board for Dental Public Health and concepts such as population health, cultural competency, epidemiology, social determinants, health literacy, among others. Residents in the first two tracks should complete at least one research project and those in the third track are required to complete two projects. The field experience sites have been carefully chosen to increase residents’ cultural sensitivity and understanding, particularly about underserved groups. Trainees have opportunities to work with vulnerable populations.

Additional program information about the residency program can be found at:

Applications to the program must be submitted through:

http://www.adea.org/PASSapp/applicants (http://www.adea.org/PASSapp/applicants/)

Endodontics

The graduate endodontics program is a continuous 24-month master’s degree (Master of Science in Dentistry) and certificate program commencing the beginning of July each year. It has two full-time faculty (one full-time director) and 5 part-time clinical faculty members. The program is concerned with developing competent, skilled clinicians with teaching and research abilities.

To achieve these objectives, the program provides an extensive background in both scientific and clinical knowledge. The curriculum is designed to fulfill the requirements of the American Board of Endodontics and promote Diplomates.

The program will prepare specialists in the fields of diagnosis, all phases of treatment, and prevention of pulpal and periapical dental disease. It will provide training in research design and methodology as it relates to pulpal, dentinal, periodontal, and related clinical areas, preparing the resident for teaching responsibilities in undergraduate, postgraduate, and graduate levels.

A top of the line surgical microscope is required by the program for teaching a variety of microscopic surgery techniques.
The curriculum includes bone grafting, guided tissue regeneration, and IV sedation.

The presentation of multiple table clinics is required.

**Admission**

Information about admission to the Endodontic program can be found on the School of Dental Medicine website.

https://case.edu/dental/departments-programs/endodontics/endodontic-residency-program

### Oral and Facial Maxillofacial Surgery

The residency program at Case Western Reserve University in Oral and Maxillofacial Surgery is a joint program with the School of Medicine leading to an MD degree and certificate in oral and maxillofacial surgery. Case Western Reserve University is the only program in the country that enables residents to obtain their medical degree and certificate in five years.

Residents rotate through several institutions: the Department of Oral & Maxillofacial Surgery at University Hospitals of Cleveland, Cleveland’s Veterans Administration Hospital, the School of Dental Medicine at Case Western Reserve University, the section of Oral and Maxillofacial Surgery at the Cleveland Clinic and the Cleveland Clinic Hospital and other affiliated facilities. This diversity of institutions ensures that residents gain experience in the essential areas of clinical surgery in preparation for all types of practices.

**Admission**

More information about application and the Oral and Maxillofacial Surgery program can be found on the School of Dental Medicine website.

- University Hospitals/OMFS - 7 months
- Veteran’s Admin/OMFS - 3 months
- University Hospitals/Anesthesia - 2 months

### PGY 2

- CWRU School of Medicine - 12 months
- Surgery/Internal Medicine - 4 months
- Pediatrics/Family Medicine/Ob Gyn - 4 months
- Psychiatry/Neurology - 2 months
- Emergency Medicine/Geriatrics - 2 months

**PGY 3**
- University Hospitals/OMFS - 5 months
- The Cleveland Clinic/OMFS - 1 month
- Veteran’s Admin/OMFS - 1 month
- University Hospitals/Anesthesia - 3 months

**PGY 4**
- General Surgery Internship:
  - University Hospitals/OMFS - 2 months
  - The Cleveland Clinic/OMFS - 1 month
  - University Hospitals and MetroHealth/Surgery Rotations - 9 months
    - Plastic Surgery - 3 months
    - ENT - 2 months
    - Neurosurgery - 1 month
    - SICU/Trauma - 2 months
    - General Surgery/Pediatric Surgery - 1 month

**PGY 5**
- University Hospitals/OMFS Chief Resident - 6 months
- University Hospitals/OMFS - 6 months

**Orthodontics**
The graduate program in orthodontics is a master’s (Master of Science in Dentistry) and certificate program dedicated to advancing the art and science of orthodontics through research, teaching, and service.

The clinical training of orthodontic residents encompasses all aspects of current orthodontic practice including, full treatment cases with fixed appliances and clear thermoplastic aligners, early treatment, adult treatment, craniofacial anomalies, orthognathic surgery, oral appliances for sleep apnea, the use of temporary anchorage devices (TADS) soft tissue lasers, and electrosurgery. The length of the orthodontic program is 30 months. Given this time frame, the clinical teaching of orthodontics will be divided according to the importance of the above topics to the private practice of orthodontics. In a program of 30 months it is not possible to produce a seasoned and skilled orthodontist, therefore our program strives to produce a competent beginner. Accordingly, the clinical load of patients is chosen to match the teaching goals of the department.

There is an option to extend the program to 36 months to satisfy European specialty training standards (ERASMUS).

**Admission**
More information about the admission process can be found at https://case.edu/dental/departments-programs/orthodontics/graduate-programs/how-to-apply-to-graduate-programs/)

**Pediatric Dentistry**
The graduate program in pediatric dentistry is a master’s (Master of Science in Dentistry) and certificate program based at Case Western Reserve University School of Dental Medicine and Rainbow Babies and Children’s Hospital.
The two-year postdoctoral residency program follows the principles and policies outlined in the Guidelines for Advanced Education in Pediatric Dentistry prepared by the American Academy of Pediatric Dentistry and the American Board of Pediatric Dentistry. It is fully accredited by the Commission on Dental Accreditation. Successful completion results in a certificate of specialty education in pediatric dentistry which qualifies the resident for examination by the American Board of Pediatric Dentistry.

Students who elect to complete the master’s program pay full tuition. The MSD program is open to non-US citizens and foreign-trained dentists. Foreign-trained dentists must complete a US GPR or AEGD before applying to the program.

Our purpose is to train the specialist as a qualified practitioner, consultant, and advocate for complete dental treatment of healthy and special needs children.

The acquired skills prepare the pediatric dental resident to prevent, diagnose and treat common and unusual oral problems that might arise during the physical, psychological and emotional development of the child and adolescent. In addition to the oral aspects of childcare, the resident becomes cognizant of the general health problems related to children.

Our program offers a balanced clinical and didactic curriculum in advanced infant, child, and adolescent dental care.

The pediatric dentistry curriculum is designed to have the resident play an integral role in the health care of children, side by side with his/her medical colleagues, and to prepare the resident for successful entry into the contemporary practice setting while providing the foundation for future growth in the field.

Admission

More information about admission can be found at the School of Dental Medicine website.

The following courses are required for the postdoctoral student:

- Behavioral Management
- Anatomy
- Epidemiology & Biostatistics
- Microbiology
- Facial Growth and Development
- Craniofacial Anomalies
- Hospital Dentistry
- Conscious Sedation
- Conferences
- Pediatric Dentistry Literature Review
- Preventive and Interceptive Orthodontics
- Genetics
- Pharmacology
- Hospital Rotations in the departments of Anesthesia, Pediatric, and Emergency Medicine

A research requirement must be fulfilled for certification in pediatric dentistry. Students enrolled in the MSD program must complete a formal thesis.

### Periodontics

The graduate program in periodontics is a thirty-six month, continuous course of study, leading to both a certificate in Periodontics and a Master of Science in Dentistry degree. It is a fully accredited program by
the Commission on Dental Accreditation and meets all the clinical and didactic requirements of the American Board of Periodontology.

The general goals of the program are to train expert clinicians in this specialty, and/or to prepare individuals for an academic (research-teaching) career in Periodontics.

This postdoctoral program offers broad clinical experience and research training.

Completion and defense of a research thesis is one of the requirements of this program. Limited teaching experience is offered to the graduate student so that his/her exposure to clinical, research and teaching facets of periodontics is complete. All of the faculty of the Department of Periodontics involved in teaching graduate students in this program are educationally or board certified periodontists. Additional instruction within this program is by faculty members of the School of Dental Medicine and the School of Medicine. Because of the multiplicity of training programs our professors have completed, the student is exposed to diverse views on diagnosis, prevention, and treatment of periodontal diseases. A brief initial review of basic aspects of periodontology introduces the new graduate student to specialty training during the summer session. Extensive contact with practicing periodontists, sufficient exposure to hospital periodontal practice, and clinical training in dental implants and conscious sedation are additional features of this program.

Admission

More information about admission to the periodontics program (http://dental.case.edu/periodontics/residency/howtoapply/) can be found on the School of Dental Medicine website.

The following courses are required for the postdoctoral student:

- Advanced Periodontal Seminar - ongoing for 3 years
- Literature Review in Periodontology - ongoing for 3 years
- Periodontal Conferences - ongoing for 3 years
- Clinical Periodontics - ongoing for 3 year
- Advanced Principles of Occlusion - 1 semester
- Conscious Sedation - 1 semester (didactic, 2nd year), ongoing for 2 years (clinical)
- Implant Dentistry - 1 semester (didactic, 2nd year), ongoing for 2 years (clinical)
- Research Thesis - ongoing for 2 year
- Periodontal Prosthesis - one semester
- Microbiology, Immunology and the Immune Response - 1 semester
- Management of Medical Emergencies - 1 summer session
- Anatomy of the Head and Neck - 1 summer session
- Limited Tooth Movement - 1 summer session
- Biological Aspects of the Stomatological System - 1 semester
- Correlative Medical Science - 1 semester
- Introduction to Research Methods - one semester
- Advanced Oral Pathology - one semester
- Epidemiology and Biostatistics - 1 semester
- Interdisciplinary Seminar - one semester
- Clinical Pharmacology - one semester
- Creative Thinking in Research Development - 1 semester
- 2-week hospital rotation

Year Total: 7-28
Expanded Function Dental Auxiliary (EFDA)

The School of Dental Medicine offers a non-degree certificate course in expanded dental functions to dental auxiliaries with requisite training and experience. This continuing education program prepares the student to take an examination administered by the Ohio Commission on Dental Testing or the Commission on Dental Competency Assessments, for Expanded Function Dental Auxiliaries.

The Expanded Function Dental Auxiliary course is less than a part-time program and includes didactic, pre-clinical laboratory, and clinical training. It is affiliated with several hospitals and health agencies in the Cleveland metropolitan area, where a portion of the clinical training takes place. The majority of clinical experience occurs in the student's place of employment. Students are selected for admission on the basis of their performance on an entrance examination administered by the program faculty.

Upon successful completion of this accredited program, an auxiliary is eligible to sit for the state certifying examination provided by the Commission on Dental Testing in Ohio or the Commission on Dental Competency Assessments.

Admission

Information about admission to the EFDA program (http://dental.case.edu/efda/) can be found on the School of Dental Medicine website.

Students begin the program learning tooth anatomy, contour, and contact using wax. Then students gradually advance through one, two, three, and complex surface restorations of amalgam and composite on the typodont. Rubber dam placement, gingival retraction cord placement, and sealant placement are also learned.

Part of the responsibility for being in the program will be for the employer dentist to allow the EFDA trainee to perform intra-oral procedures (restorations) in the office once the student has successfully passed semester one amalgam, composite, and sealant competencies.

Clinical/patient experience occurs during the second semester at MetroHealth Hospital/clinics, Case School of Dental Medicine Clinic, Rainbow Hospital Tapper Pedodontic Clinic, or St. Elizabeth Hospital Dental Clinic in Youngstown, Ohio, and the office in which the student is employed.

Mock board exams are given during the second semester, simulating the testing atmosphere of the actual state examination.

After successful completion of the course, the student will be eligible to sit for the state board examination administered by the Commission on Dental Testing in Ohio (http://cotdinohio.org/) or by the Commission on Dental Competency Assessments (http://www.cdcaexams.org/). Examination candidates will be expected to bring their own instruments and materials (not school-owned) for the exam.

According to various sections of the Ohio Law and Regulations for Certification and Licensure Boards, persons convicted of any felony or misdemeanor may not be able to take the licensure or certification examinations; may have restrictions placed on their ability to practice. For more information, contact the Dean of Student Services and the applicable licensure/certification board.

Lecture and lab during the first semester

- All day lab/clinic second semester
- An optional state board review course is offered at the end of the second semester, after completion of the EFDA Program in May for an additional fee

Lectures and labs

- Nomenclature
- Caries classification
- Cavity preparation
- Oral anatomy
- Dental morphology
- Periodontium
- Histology
- Basics of occlusion
- Ergonomics
- Instrumentation
- Pulp protection
- Dental materials
- Matrix and wedge techniques
- Temporization
- Amalgam placement and carving
- Polishing amalgams
- Composite placement
- Composite finishing and polishing
- Posterior composites
- Pit and fissure sealant placement
- Rubber dam placement

School of Dental Medicine Faculty

Full-time Faculty

Mario Alemagno, DDS
Senior Instructor of Comprehensive Care

Moshin Ali, MSc, BDS, PhD
Associate Professor of Comprehensive Care
COMP Courses

COMP 200. Directed Clinical Experience. .5 - 6 Units.
Directed clinical experience under faculty supervision and with special permission of the Associate Dean for Education.

COMP 300. Directed Clinical Studies. .5 - 8 Units.
Independent study during the period prior to daily clinic sessions, with emphasis on clinical didactic material and review of clinical procedures to support student's clinical learning and progress. Meeting with clinical preceptors to review progress, to be initiated by the student as needed.

COMP 310. Summer Clinic. .5 - 6 Units.
Attendance is mandatory in the summer dental clinic of the third year. Students become acquainted with all aspects of clinical practice and begin providing clinical care for patients.

COMP 322. Surgical Periodontics. 1 Unit.
The course consists of didactic and clinical instruction that provides the student with knowledge of the various types of surgical therapy performed for periodontitis & peri-implantitis. Includes discussion on types of surgery, points of periodontal intervention and when to refer patients to periodontal surgery.

COMP 358. Clinical Oral Surgery I. 1 Unit.
This clinical course introduces the student to patient management in clinical oral surgery, which includes infection control, patient evaluation, diagnosis, treatment planning, informed consent, local anesthetic procedures, and routine oral surgery procedures employed in a general dental practice.

COMP 378. Pediatric Dentistry Clinic. 1.5 Unit.
This clinical experience in dental care for children and adolescents provides the predoctoral student with patient-parent contact and the opportunity to perform comprehensive pediatric dental care such as preventive dentistry, restorative dentistry, pulp therapy, primary teeth extractions and space maintenance with pharmacological and non-pharmacological behavior management methods, for the pediatric dental patient.

COMP 384. General Dentistry Clinical Qualifying. 1 Unit.
This is a clinic course where the students are given the opportunity to demonstrate knowledge in comprehensive treatment planning, health promotion and disease prevention, and the management of a recall system.

COMP 386. Quality Assurance. 1 Unit.
This course requires student dentists to evaluate their dental records against widely accepted written standards for dental record keeping. This is known as a comprehensive record audit. Records are broken down to their component parts, including but not limited to medical history, progress notes, treatment plans, and chartings. Emphasis is placed on making sure the required components are present, and adequate information is filled in for each component. Because records are partially electronic and partially written, it is essential that all entries that appear in both records are identical.
COMP 387. General Practice Dentistry A. 2.5 Units.
This course provides each third year student with basic clinical training and experience in the following disciplines of dentistry: Oral Diagnosis, Oral and Maxillofacial Surgery, Endodontics, Periodontics, Operative Dentistry, Fixed Prosthodontics, Removable Prosthodontics, Pediatrics, Orthodontics, Geriatrics, Hospital Dentistry. Each third year student is assigned to a preceptor group which is managed by two master clinician dentists. These preceptors provide their students with training in diagnosis, treatment planning, sequencing, and the actual treatment of their assigned patients. Consultations in the various specialties of dentistry occur as required. The preceptors direct and coordinate the total dental health care of the patients of each of their students. Monthly seminars are provided by the preceptors of each group to discuss student cases, to review dental techniques and journal articles. Individual student meetings are scheduled to discuss clinical performance.

COMP 389. General Practice Dentistry B. 2.5 Units.
This course provides each third year student with basic clinical training and experience in the following disciplines of dentistry: Oral Diagnosis, Oral and Maxillofacial Surgery, Endodontics, Periodontics, Operative Dentistry, Fixed Prosthodontics, Removable Prosthodontics, Pediatrics, Orthodontics, Geriatrics, Hospital Dentistry. Each third year student is assigned to a preceptor group which is managed by two master clinician dentists. These preceptors provide their students with training in diagnosis, treatment planning, sequencing, and the actual treatment of their assigned patients. Consultations in the various specialties of dentistry occur as required. The preceptors direct and coordinate the total dental health care of the patients of each of their students. Monthly seminars are provided by the preceptors of each group to discuss student cases, to review dental techniques and journal articles. Individual student meetings are scheduled to discuss clinical performance.

COMP 390. General Practice Dentistry A. 2.5 Units.
This course provides each third year student with basic clinical training and experience in the following disciplines of dentistry: Oral Diagnosis, Oral and Maxillofacial Surgery, Endodontics, Prosthodontics, Operative Dentistry, Fixed Prosthodontics, Removable Prosthodontics, Pediatrics, Orthodontics, Geriatrics, Hospital Dentistry. Each third year student is assigned to a preceptor group which is managed by two master clinician dentists. These preceptors provide their students with training in diagnosis, treatment planning, sequencing, and the actual treatment of their assigned patients. Consultations in the various specialties of dentistry occur as required. The preceptors direct and coordinate the total dental health care of the patients of each of their students. Monthly seminars are provided by the preceptors of each group to discuss student cases, to review dental techniques and journal articles. Individual student meetings are scheduled to discuss clinical performance.

COMP 394. General Practice Dentistry B. 2.5 Units.
This course provides each third year student with basic clinical training and experience in the following disciplines of dentistry: Oral Diagnosis, Oral and Maxillofacial Surgery, Endodontics, Periodontics, Operative Dentistry, Fixed Prosthodontics, Removable Prosthodontics, Pediatrics, Orthodontics, Geriatrics, Hospital Dentistry. Each third year student is assigned to a preceptor group which is managed by two master clinician dentists. These preceptors provide their students with training in diagnosis, treatment planning, sequencing, and the actual treatment of their assigned patients. Consultations in the various specialties of dentistry occur as required. The preceptors direct and coordinate the total dental health care of the patients of each of their students. Monthly seminars are provided by the preceptors of each group to discuss student cases, to review dental techniques and journal articles. Individual student meetings are scheduled to discuss clinical performance.

COMP 417. Community Oral Health Capstone Experience. 1.5 Unit.
The course exposes students to a healthcare facility different from the dental school clinic with a different patient population and work force.

COMP 422. Periodontics. .5 Unit.
Lecture and clinic together in this course enable the student to further apply the knowledge and skills learned in prior periodontal courses while incorporating the impact of systemic conditions and multidisciplinary interactions on periodontic endpoints. It focuses on how selective periodontal treatment can be integrated into a treatment plan considering the parameters presented by a special situation and introduces students to case specific consideration. Some examples are treatment related to specific medical problems, pharmacologic interactions, endodontics, prosthodontics, geriatrics, esthetics, orthodontics and implantology.

COMP 427. Oral Diagnosis and Treatment Planning. 1 Unit.
Diagnosis and treatment planning based on the correlation of the fundamentals taught in oral diagnosis, oral radiology, physical evaluation, preventive dentistry, and restorative dentistry. Clinical experience in the application of didactic training consists of the following components: 1. assignment in the admitting and radiology clinic where students carry out examinations of newly admitted patients and evaluate their problems and needs; 2. radiology, oral medicine, and medicine interpretation findings by the students is discussed with a faculty member.

COMP 428. Oral Diagnosis and Radiology. .5 Unit.
The primary goals of this course are to enable the student to become competent in the collection and interpretation of clinical data, enable the student to become competent in determining the differential and/or definitive diagnosis of oral disease based upon the interpretation of the clinical/laboratory data acquired and enable the student to interact with other health care providers in the medical risk assessment of patients admitted to the School of Dental Medicine.

COMP 447. Clinical Oral Surgery II. 1 Unit.
This clinical course involves the hands on application of oral surgery principles including evaluation of the patient's medical status, clinical examination, local anesthesia delivery, extractions, pre-prosthetic procedures, patient management, and infection control.

COMP 448. Endodontics. 2 Units.
The clinical curriculum provides the major endodontic treatment information for this program. Specific subjects covered are diagnosis, pulp and periapical pathosis, radiology, pharmacology, anesthesia, pain management, emergency treatment, pulp treatment, trauma, mechanical innovations, apexification, bleaching, endodontic-periodontic complexities, preparation of endodontically treated teeth, and endodontic surgery. The above information is designed to provide the student with a basic understanding of the field of endodontics.

COMP 458. Clinical Oral Surgery II. 1 Unit.
This clinical course involves the hands on application of oral surgery principles including evaluation of the patient's medical status, clinical examination, local anesthesia delivery, extractions, pre-prosthetic procedures, patient management, and infection control.

COMP 464. Operative Dentistry. 2.5 Units.
Basic and advanced principles of operative dentistry are used to perform dental restorations on patients diagnosed for dental procedures related to operative dentistry.

COMP 468. Removable Prosthodontics. 1.5 Unit.
The Removable Prosthodontics course is a third - fourth year clinical course which applies principles of removable Prosthodontics.

COMP 474. Fixed Prosthodontics. 2.5 Units.
The principles of fixed prosthodontics are applied to patient situations that require a fixed restoration to develop function and esthetics that will satisfy the criteria for an acceptable end result for restoring a tooth or for replacing a missing tooth with a fixed restoration.
COMP 478. Pediatric Dentistry. 1.5 Unit.
This clinical experience in dental care for children and adolescents provides the predoctoral student with patient-parent contact and the opportunity to perform comprehensive pediatric dental care such as preventive dentistry, restorative dentistry, pulp therapy, primary teeth extractions and space maintenance with non-pharmacological behavior management methods, for the pediatric dental patient.

COMP 480. Clinical Geriatric Dentistry. .5 Unit.
The course exposes students to providing comprehensive care to a broad range of older adults in a variety of settings. Senior students will attend interdisciplinary team meetings to present dental findings, recommendations and to gain exposure to the impact of physiological aging, systemic conditions, functional disabilities, and pharmacological interactions on delivering comprehensive care to this vulnerable population.

COMP 482. Clinical Orthodontics. 1 Unit.
Clinical orthodontics provides the student with the opportunity to apply the knowledge that he/she has obtained in facial growth, dentofacial morphology, sophomore orthodontics, and senior orthodontics to assist in and sometimes treat comprehensive, preventive, interceptive and limited corrective tooth movement patients.

COMP 487. General Practice Dentistry A. 2.5 Units.
Comprehensive dental care. Each student is assigned for clinical training to a preceptor group led by a practicing general dentist. The preceptor guides the students in diagnosis, treatment planning, and actual patient treatment with consultation in various specialties as required. Experiences in the provision of emergency dental care. The preceptor directs the total dental health care of the patients of each of his students. Biweekly seminars are provided for each preceptor group. Special topics, students cases, techniques, and journal articles are discussed. Recommended preparation: Concurrent enrollment in COMP 489.

COMP 489. General Practice Dentistry B. 2.5 Units.
Comprehensive dental care. Each student is assigned for clinical training to a preceptor group led by a practicing general dentist. The preceptor guides the students in diagnosis, treatment planning, and actual patient treatment with consultation in various specialties as required. Experiences in the provision of emergency dental care. The preceptor directs the total dental health care of the patients of each of his students. Biweekly seminars are provided for each preceptor group. Special topics, students cases, techniques, and journal articles are discussed. Recommended preparation: Concurrent enrollment in COMP 487.

COMP 490. General Practice Dentistry A. 2.5 Units.
Clinical application of the principles of general practice dentistry. Recommended preparation: Concurrent enrollment in COMP 494.

COMP 492. General Dentistry Clinical Competency. .5 Unit.
This course consists of the successful completion of the recall, emergency, diagnosis and treatment planning, and patient outcomes clinical competencies. It is also necessary for the student to successfully fulfill the recall needs of their assigned clinic patients in order to pass this course. Recommended preparation: Completion of Basic Core Program.

COMP 494. General Practice Dentistry B. 2.5 Units.
Clinical application of the principles of general practice dentistry. Recommended preparation: Concurrent enrollment in COMP 490.

COMP 495. Directed Clinical Studies. .5 - 8 Units.
This course is intended to provide students with the opportunity to advance their dental clinical patient skills in the comprehensive care clinics of the School while also providing advanced opportunity for students who are so inclined to focus in individual areas of clinical skills development.

COMP 498. Quality Assurance. 1 Unit.
This course reinforces quality assurance skills and knowledge provided in the prerequisite course including, but not limited to: providing students with the working knowledge of dental record keeping, as it relates to diagnosis and treatment of pathology; recognition and management of medical illness and disabilities; treatment planning; documentation of pre-existing conditions, current and past treatment; established laboratory protocols; evaluation of reasons for remakes and re-dos; post-treatment evaluation of care. Recommended preparation: COMP 394.

DENF Courses

DENF 422. Comprehensive Periodontics. 3 Units.
This course is available only to dental school faculty who have earned dental degrees from foreign institutions and who have approval of their Chairperson and the Dean to register. Successful completion of the course is accomplished by fulfilling the unit requirements, competency exams and any other written or practical requirements set forward by the Dental Education Committee and approved by the general faculty of the School of Dental Medicine in order to assure competency in the periodontic procedures associated with general dentistry.

DENF 428. Comprehensive Oral Medicine. 3 Units.
This course is available only to dental school faculty who have earned dental degrees from foreign institutions and who have the approval of their Chairperson and the Dean to register. Successful completion of the course is accomplished by fulfilling the unit requirements, competency exams and any other written or practical requirements set forward by the Dental Education Committee and approved by the general faculty of the School of Dental Medicine in order to assure competency in the radiologic and oral diagnostic procedures associated with general dentistry.

DENF 448. Comprehensive Endodontology. 3 Units.
This course is available only to dental school faculty who have earned dental degrees from foreign institutions and who have the approval of their Chairperson and the Dean to register. Successful completion of the course is accomplished by fulfilling the unit requirements, competency exams and any other written or practical requirements set forward by the Dental Education Committee and approved by the general faculty of the School of Dental Medicine in order to assure competency in the endodontic procedures associated with general dentistry.

DENF 455. Comprehensive Oral Surgery. 3 Units.
This course is available only to dental school faculty who have earned dental degrees from foreign institutions and who have the approval of their Chairperson and the Dean to register. Successful completion of the course is accomplished by fulfilling the unit requirements, competency exams and any other written or practical requirements set forward by the Dental Education Committee and approved by the general faculty of the School of Dental Medicine in order to assure competency in the oral surgery procedures associated with general dentistry.
DENF 464. Comprehensive Operative Dentistry. 3 Units.
This course is available only to dental school faculty who have earned
dental degrees from foreign institutions and who have the approval of
t heir Chairperson and the Dean to register. Successful completion of the
course is accomplished by fulfilling the unit requirements, competency
exams and any other written or practical requirements set forward by the
Dental Education Committee and approved by the general faculty of the
School of Dental Medicine in order to assure competency in the operative
procedures associated with general dentistry.

DENF 474. Comprehensive Fixed Prosthodontics. 3 Units.
This course is available only to dental school faculty who have earned
dental degrees from foreign institutions and who have the approval of
their Chairperson and the Dean to register. Successful completion of the
course is accomplished by fulfilling the unit requirements, competency
exams and any other written or practical requirements set forward by the
Dental Education Committee and approved by the general faculty of the
School of Dental Medicine in order to assure competency in the fixed
prosthodontic procedures associated with general dentistry.

DENT Courses

DENT 501. Biological Aspects of the Stomatological System. 0 - 2 Units.
This course is a review of biochemistry, molecular and cellular biology,
histology, and oral anatomy and an expansion of oral biological topics
that underlie the disciplines of endodontics, orthodontics, periodontics,
and pediatric dentistry.

DENT 502. Correlative Medical Science. 0 - 2 Units.
Case-based discussion of selected systemic disease commonly
encountered by the dentist.

DENT 503. Facial Growth and Development. 0 - 1 Units.
Emphasis on the qualitative, quantitative, and integrative changes during
postnatal craniofacial growth and development.

DENT 504. Advanced Facial Growth. 1 Unit.
Student participation in seminar evaluation series dealing with problems
and controversies apparent in the literature in regard to theories of
growth, development, and aging. Emphasis on the craniofacial literature,
but not exclusively.

DENT 505. Dentofacial Anomalies. 0 - 1 Units.
This course is designed to provide the student with the practical
experience regarding the multidisciplinary aspects of diagnosis and
treatment of patients with craniofacial anomalies. Observation of team
sessions and active participation in patient examinations, diagnosis, and
treatment planning.

DENT 507. Dental Ethics for the Graduate. 0 - 1 Units.
This 8 week course is given in group discussion format. Topics of ethical
dilemmas, informed consent, professional (both national and local) codes
of ethics, IRB introduction, patient autonomy, contractual obligations and
puerisy are discussed using case scenarios and student presentations.

DENT 509. Temporomandibular Disorders, Orofacial Pain and Sleep
Disorders. 0 - 3 Units.
This course will enable first year dental residents to learn the principles
of pain mechanisms, types of OFP and Sleep Disorders, differential
diagnosis and management of these conditions in adults and children.
By the end of this course the residents should be able to identify the
most common types of OFP and sleep disorders, be able to make the
differential diagnosis, and manage simple OFP case and / or refer the
most complex OFP cases. Recommended preparation: DMD, DDS or
equivalent degree.

DENT 510. Epidemiology and Biostatistics. 0 - 3 Units.
A detailed presentation of epidemiological and biostatistical techniques
designed to acquaint the student with a broad spectrum of scientific
approaches and to prepare for a research project. Topics include design
of observational and experimental studies, common biostatistical
techniques encountered in the dental literature such as t-test, ANOVA,
chi-square, correlation and regression, and assessing the validity of
diagnostic tests. Instruction includes lectures, critique of selected
literature and computer analysis of data.

DENT 512. Advanced Oral Pathology. 0 - 3 Units.
Lectures and seminars on the clinical and histopathologic characteristics
of many of the common oral diseases. Special emphasis on developing a
logical approach to clinical and histopathologic diagnosis. Participation
expected for in-class discussion of the clinical and histopathologic
material presented.

DENT 513. Anatomy of the Head and Neck. 0 - 3 Units.
This course deals with the structural, functional, and clinical relationships
of the many organs and organ systems which comprise the head, neck,
and pharyngeal regions of the human body.

DENT 514. Research Methods: Preparation. 0 - 1 Units.
The goal of this course is to facilitate a formal statement of the student's
research idea as preparation for working with a thesis committee or
undertaking independent research.

DENT 516. Microbiology, Immunology, and Immune Systems. 0 - 1 Units.
This course reviews bacterial structure and classification, provides
insight into oral bacterial pathogenesis. Principles of antibiotic use
and mechanisms of resistance are reviewed. Microbial diagnostic
methodologies are discussed. Integration of periodontics, endodontics,
and pediatric dentistry is stressed as it relates to the inflammatory
process in the human host.

DENT 518. Behavioral Considerations in Oral Health Care. 0 - 1 Units.
This course focuses on the behavioral knowledge and skills the oral
health practitioner must possess in order to deliver effective, patient-
centered care. Specifically, the course is designed to enhance graduate
students' existing knowledge and skills in relation to dentist-patient
communication, management of diverse patient populations, and patient
education and facilitation of health behavior change.

DENT 520. Skeletal Anchorage. .5 Unit.
This course provides 1st year orthodontic residents with the theoretical
knowledge and practical skills necessary to successfully treat
orthodontic patients in need of absolute anchorage with orthodontic
mini-implants. In addition, the most current articles in the orthodontic
literature pertaining to this topic are read and discussed. The theory will
be supplemented by practical exercises as necessary.
DENT 521. Manot Cave Dig, Israel. 0 - 1 Units.
This project is an ongoing collaboration between the CWRU School of Dental Medicine and Tel Aviv University. The newly discovered excavations have produced thousands of butchered deer bones, hundreds of stone tools, an one partial human skull. Traditionally CWRU faculty and students will be going in July to continue their work. Interested students are given the opportunity to learn basic archeological techniques while working in a newly discovered cave in Northern Israel. The Manot cave was discovered in 2008 and after 6 field seasons has yielded thousands of artifacts shedding light on what life was like for our early ancestors. Each participant will rotate through several stations including wet and dry sieving, excavation, and how to pick through the processed remains. They will learn how to identify stone and bone tools, faunal and floral remains. In addition to the hands-on experience they also get to attend field lectures by some of the world's most famous researchers in human prehistory. Lodging is in comfortable cabins within easy walking distance from the cave site. This two-week field and lab experience is not only educational but also presents the opportunity to travel around the beautiful country of Israel.

DENT 522. Orthodontic Biomechanics. 1 Unit.
This course provides first year orthodontic residents with the theoretical biomechanical knowledge necessary to successfully treat a wide range of orthodontic malocclusions using the preadjusted straight wire appliance, the segmented arch technique, treatment auxiliaries, and orthodontic mini-implants. In addition, the most current articles in the orthodontic literature pertaining to this topic are read and discussed. The theory will be supplemented by practical exercises as necessary.

DENT 550. Clinical Pharmacology. 0 - 1 Units.
This course is designed to enable residents to obtain an understanding of the pharmacology of the most commonly prescribed medications; pharmacotherapeutic concepts in relationship to disease pathophysiology; rational drug therapy in the treatment of disease; drug-drug interactions and drug-disease interactions; adverse drug events. Residents will be expected to apply information on disease pathophysiology and pharmacotherapy to clinical cases. The ultimate goal is to provide relevant information to assist clinicians in practice.

DENT 555. Management of Medical Emergencies. 0 - 1 Units.
This course covers the diagnosis and management of common medical emergencies, with special emphasis on patient evaluation and history taking to prevent such emergencies in the dental office. Venipuncture technique and the use of emergency equipment are demonstrated. Also included is a basic course in cardiopulmonary resuscitation, with practical demonstrations and examinations that lead to certification in basic CPR.

DENT 561. Orthodontics for Pediatric Dentists I. 0 - 3 Units.
The course is designed to familiarize the pediatric dentistry residents with (1) the clinical evaluation of patients to determine appropriateness of orthodontic intervention, (2) record taking, (3) diagnosis, (4) treatment planning of cases in the mixed and permanent dentition, (5) treatment administration and (6) retention strategies. The primary focus will be on interceptive orthodontics including growth modification and corrective orthodontics in the permanent dentition. First in a series of four courses.

DENT 564. Advanced Principles of Occlusion. 1 Unit.
This course is designed to provide in-depth knowledge of the structure and function of all anatomic components involved in occlusion, biomechanics of articulation and mastication; recording of mastication patterns; diagnosis of occlusal dysfunction; relationship to neuromuscular and temporomandibular joint anatomy and pathology; evidence based therapy used in the management of occlusal and temporomandibular disorders and its significance to inflammatory periodontal disease.

DENT 565. Practice Management I (Ortho). 0 - 1 Units.
Seminar and demonstration course designed to prepare the student for all phases of the "business" of orthodontics as well as the responsibility of being a "professional." Management of the department clinic, private practice management, office visitations, and the business community, and ethics through the use of guest speakers on jurisprudence, personal and professional insurance, accounting, estate planning, risk management, informed consent, banking, office design, organized dentistry and investments. First in a series of four courses.

DENT 569. Orthodontic Literature Review I. 1 Unit.
The course will focus on contemporary and classic literature selected to cover a wide range of orthodontic topics. The selected literature includes the reading list suggested by the American Board of Orthodontics in preparation for the Part II of the ABO examination. Students will be required to discuss the articles and answer questions pertaining to the reviewed material.

DENT 572. Pre-Clinical Principles in Orthodontics. 0 - 1 Units.
This course is comprised of a series of seminars presented by orthodontic faculty covering topics that will prepare the first orthodontic resident for the initial phases of clinical training.

DENT 573. Advanced Specialty Principles: Clinical I. 2 Units.
Full fixed orthodontic appliance treatment of patients in an educational setting. First in a series of four courses.

DENT 580. Orthodontics-Oral Surgery Conference. 0 - 1 Units.
A seminar series involving a multidisciplinary approach to the treatment of patients with severe craniofacial deformities. Begins in the fall of each year (continuing for four semesters) with a series of lectures, followed by assignment of patients supervised jointly by the departments of orthodontics and oral surgery. Meetings held bimonthly to review patient progress, plan treatment, and present cases for discussion. Each student involved in all phases of treatment: presurgical orthodontics, the surgical procedure, finishing orthodontics, and retention.

DENT 583. Orthodontic Diagnostic Seminar I. 1 Unit.
Series of lectures and seminars covering the science of orthodontic diagnosis. Course consists of lectures on techniques of diagnosis, treatment planning, and critique of cases from the department or from faculty private practices. Content also includes long-term follow-up of post retention cases. First in a series of three courses.

DENT 585. Orthodontic Diagnostic Seminar III. 1 Unit.
Third in a series of three courses. (See DENT 583.)

DENT 586. Limited Tooth Movement for the Dental Specialist. 0 - 1 Units.
A review of the rationale for orthodontic treatment in periodontally diseased patients and in pre-restorative dentitions. Lectures, audio-visual programs, and technique sessions. Diagnosis, treatment planning, and various methods of tooth movement.
DENT 587. Periodontal Prosthesis. 1 Unit.
This course examines and defines the periodontal prosthetic interrelationships beginning with treatment planning and continuing with discussing the utilization of the combined treatment modalities. It focuses on provisionalization, furcation treatment, occlusion, aesthetics, removable appliances, and special advanced treatment problems.

DENT 589. Orthodontic Diagnostic Seminar IV. 1 Unit.
The fourth course in a series which consists of weekly lectures and seminars covering the science of orthodontic diagnosis. Consists of lectures on the techniques of diagnosis, various diagnostic aids, and case planning. Also consists of seminars where the students perform diagnosis, plan treatment and critique cases from the department. This course is used for long-term follow-up clinic.

DENT 651. Thesis M.S.D.. 1 - 9 Units.
Subsections for each program area of study: endodontics, orthodontics, periodontics, or pediatric dentistry.

DENT 661. Conscious IV Sedation I. 2 Units.
Didactic portion covers physical evaluation, physiology, pharmacology, emergencies, and techniques. Cardiac monitoring, basic life support, and advanced cardiac life support.

DENT 662. Conscious IV Sedation II. 1 Unit.
(See DENT 661.) Supervised clinical experience in conscious IV sedation.

DENT 663. Implant Dentistry I Periodontics. 1 Unit.
Designed to enhance the understanding of current concepts and their role in the multidisciplinary treatment of the patient.

DENT 664. Implant Dentistry II Periodontics. 0 - 6 Units.
(See DENT 663.) Clinical demonstration, participation, and case presentation in implant dentistry.

DENT 682. Cephalometrics. 0 - 1 Units.
A lecture and laboratory course in cephalometric roentgenography leading to a thorough understanding of craniofacial radiographic techniques. Use of x-rays and radiation hygiene, and technical and interpretive proficiency.

DENT 683. Imaging and IT. 1 Unit.
This course is designed to give some basic computer knowledge and prepare the resident for the use of computers in the orthodontic office.

DENT 684. Radiology and Cephalometrics. 1 Unit.
Fundamentally related to cephalometric radiography, skeletal morphology, and cephalogram interpretations of historic analyses via the Krogman-Sassouni Syllabus. Also, clinical evaluations of hard and soft tissue relationships of the airway and skeletal maturation are presented. The use of Bolton Standards in craniofacial analysis is stressed.

DENT 692. Restorative Fellowship. 6 Units.
Provides for 12 months of clinical and didactic training in all phases of general dentistry beyond the scope of predoctoral dental education. Areas of emphasis include advanced restorative techniques, proper selection of restorative materials, restoration of implants, fixed and removable prosthodontics, and aesthetic dentistry. At the discretion of the course director, students may register for an additional 12 months, during which time the student will build on knowledge attained during the first year, continue with advanced didactic instruction, expand their clinical experience through continued patient care, participate in clinical research, and have teaching opportunities.

DENT 693. Fellowship of Advanced Clinical Education - Advanced Dental Studies. 1 - 9 Units.
Fellowship of Advanced Clinical Education (or F.A.C.E.) - Advanced Dental Studies is a special course per agreement in collaboration with Qassim University in Saudi Arabia.

DENT 694. Fellowship in Dentistry. 6 Units.
The Fellowship in Dentistry provides for advanced clinical, didactic and research training beyond the scope of the pre-doctoral dental education.

DENT 695. Oral Surgery Residency. 1 - 10 Units.
Allows registration for non-degree-seeking students in graduate level courses at the direction of the department.

DENT 696. Advanced Dental Training. 0 - 6 Units.
This course is a one year advanced training in dental medicine at Case Western Reserve University School of Dental Medicine. Responsibilities may include clinical and didactic responsibilities. The course is designed to give students clinical experience in a defined focus area.

DENT 697. Advanced Dental Training II. 1 Unit.
Continuation of Advanced Dental Training I. Prereq: D.D.S. or equivalent.

DENT 698. Multidisciplinary Seminar. 0 - .5 Units.
This seminar meets monthly to discuss multidisciplinary cases to develop treatment recommendations for the patients presented. Each graduate department selects a clinical case that requires the services of at least three dental specialties. Ideally, patients should be in the beginning stage of treatment planning so the input from the various specialties can be used to develop a comprehensive plan to establish a healthy oral environment. It is expected that several alternative treatments will be discussed and the relative merits of each approach evaluated. To maximize the benefit of this seminar to the student learning process, an attending faculty member should be present from each of the dental specialty programs. In addition, all seminars have a Prosthodontist to provide input on the restorative treatment options.

DENT 699. AEGD Residency Training. 1 - 8 Units.
This is a multidisciplinary course that encompasses didactic and clinical training in general dentistry.

DNDO Courses

DNDO 529. Endodontology. 3 Units.
Scientific rationale for endodontic practice. Endodontic anatomy, physiology, pathology, and microbiology. All treatments and techniques studied and substantiated by current and classical research.

DNDO 539. Endodontic Literature Review. 3 Units.
Provides scientific basis for present and future treatment. Instructs students in critically evaluating literature. Provides format for lifelong self-education. Specific journal assignments summarized, evaluated, and presented for group discussion weekly.

DNDO 551. Clinical Endodontic Specialty. 3 Units.
Students present case histories as they encounter them in clinic. Cases discussed in detail and critically evaluated by colleagues and graduate endodontic faculty. Past endodontic literature discussed in detail as each student presents a topic assigned by faculty. Problems in clinic discussed. Several guest endodontists present various techniques and perform them.
DNDO 651. Sedation in Endodontic Practice. 1 - 3 Units.
5 modules designed to provide in-depth knowledge of minimal and moderate sedation to graduate endodontic students with the goal of becoming proficient in providing safe and effective minimal or moderate sedation to patients undergoing endodontic therapies. Recommended preparation: Current American Heart Association certification in BLS or Red Cross certification in Professional rescuer CPR.

DORL Courses

DORL 529. Oral Diagnosis / Med Seminar. 1 Unit.
Principles of diagnosis of oral mucosal disorders, clinical pathology and systemic pathology will be discussed in an interactive, case based format.

DORL 531. Clinical Oral Diagnosis and Oral Medicine. 1 Unit.
Clinical rotation in oral medicine and orofacial pain service.

DORL 532. Medical Specialty Services. 1 - 3 Units.
This course provides exposure to the graduate student to medical primary and specialty services and applications to the practice of oral medicine.

DORL 541. Clinical Oral and Maxillofacial Radiology. 1 Unit.
Learn the principles of CBCT, MRI, and other advanced imaging Assist in oral and maxillofacial reading service Recognize radiologic appearance of abnormal findings in the maxillofacial complex

DORL 542. Advanced Oral Radiology. 1 Unit.
Seminar format review of advanced imaging techniques and interpretation on a one to one basis with faculty.

DORL 554. Current Concepts in Medicine. 1 Unit.
Students will review contemporary internal medicine topics of relevance to the oral medicine clinician.

DPED Courses

DPED 533. Pediatric Dentistry Literature Review. 0 - 2 Units.
Review of the literature in preparation for the specialty board examination in pediatric dentistry. Includes articles on various topics including growth and development, special needs patients, oral pathology and oral medicine, and clinical and hospital practice.

DPED 535. Fundamentals in Pediatric Dentistry. 0 - 3 Units.
Students present selected chapters from major pediatric dentistry review books for critique and discussion. Major strengths and weaknesses are emphasized. The course director then presents the most current information on the subject.

DPED 537. Advanced Clinical Pediatric Dentistry. 0 - 3 Units.
Students develop skills in diagnosis, radiographic technique, treatment planning, preventive and restorative dentistry, space management, trauma management, and nonpharmacologic behavior management. There is an opportunity to attend hospital grand rounds and physician conferences.

DPED 639. Advanced Seminar in Pediatric Dentistry. 0 - 3 Units.
Students present patient cases for in-depth discussion of specific clinical problems.

DPED 690. Pediatric Dental Residency. 0 - 10 Units.
Allows registration for non-degree-seeking students in graduate level courses at the direction of the department.

DPER Courses

DPER 519. Introduction to the Graduate Periodontology Program. 0 - 1 Units.
Introduction to the Graduate Periodontology Program. Introduce first year residents to the Graduate Periodontal Clinic and Program. The course consists of a series of seminars to discuss a variety of topics regarding patient care in the Graduate Periodontics clinic.

DPER 557. Periodontal Conference. 0 - 3 Units.
Presentation of treated patients with advanced periodontal disease. Discussion of the clinical findings, etiology, diagnosis, and treatment plan. Critical review of the different surgical procedures used in therapy and evaluation of postoperative results. First in a series of four courses.

DPER 577. Clinical Periodontics. 0 - 6 Units.
Clinical practice of periodontics supplemented by case evaluation and treatment planning. A comprehensive study of normal and diseased periodontal tissues including etiology and diagnosis. Current modes of therapy-rationale technique, and prognosis. First in a series of four courses.

DPER 595. Advanced Periodontal Seminar. 1 - 3 Units.
Series of seminars covering clinical, histological, and physiological aspects of the periodontium in health and disease, etiology, diagnosis, prognosis, prevention, and treatment of periodontal disease, as well as the relationship of periodontics to other phases of dentistry.

DPER 665. Implant Literature Review 1. 1 Unit.
This course will consist of presentation/discussion of pertinent topics related to the practice of implantology. Discussion of most relevant articles of each topic.

DPER 666. Implant Literature Review 2. 1 Unit.
This course will consist of presentation/discussion of pertinent topics related to practice of implantology and the most relevant articles of each topic.

DPER 667. Implant Literature Review 3. 0 Unit.
This course will consist of presentation/discussion of pertinent topics related to practice of implantology and relevant articles on each topic.

DPER 685. Literature Review in Periodontics. 0 - 3 Units.
Comprehensive discussion of selected articles related to clinical periodontology and basic sciences of significance to periodontal research and therapy.

DPHC Courses

DPHC 501. Principals of Oral Epidemiology and Research Methods. 2 Units.
This course will address the distribution and determinants of oral and dental diseases at the local, state, national and international levels. Students will be instructed on the application of various dental indexes. Survey research methodology including questionnaire, development, and different forms of validity are also some of the topics taught. The course will enable residents to identify and formulate a research question that will be developed into a research proposal, to fulfill their residency requirement.
DPHC 505. Communication Methods in Dental Public Health. 2 Units.
This course will prepare students to be adept in searching scientific literature and gain/augment their skills in communicating as public health professionals. This skill set includes preparing literature reviews, manuscripts, developing research proposal and for this purpose students will gain proficiency in relevant software such as Reference Manager/EndNote/Adobe Connect. Students will be familiar with the different elements of a research proposal and gain skills in writing these components.

DPHC 507. Data Analysis and Reporting. 2 Units.
Data Analysis and report writing will prepare residents to be proficient in analyzing public health/epidemiological by instructing them on the appropriate use of univariate, bivariate, and multivariate statistical test. Students will use either primary or secondary data sets for such applications. Bases on their previously approved research proposal and the results of the data analysis residents will write a scientific report to fulfill one of the requirements of the residency program.

DPHC 508. Dental Public Health Administration. 2 Units.
This course describes the history of dental public health, its principles, and the discipline as a recognized dental specialty. Understanding the discipline/profession and administration at local, state, national, and international levels will enable the graduates to be effective public health administrators.

DPHC 530. Graduate Preventive Dentistry. 2 Units.
This course will address primary, secondary, and tertiary prevention methods to prevent oral and dental diseases with the particular focus on groups of people rather than individual patients. Instruction on cost-effectiveness of different preventive modalities will enable students to choose the applicable program for specific populations.

DPHC 532. Oral Health Care Systems. 2 Units.
The course on oral health care systems will provide an insight into the dental care systems in the U.S. including different forms of financing, private, public, etc. Knowledge of the system will enable future dental public health professionals to recognize the oral health workforce models and their appropriateness to public health settings to provide dental care to various groups.

DPHC 551. Research in Dental Public Health I. 1.5 Unit.
One of the core aspects of dental public health training at CWRU is to augment residents’ research skills; each resident will be required to develop, implement, and complete at least one research project during the training. The project may involve primary data collection or the use of secondary data for analysis. The program director, members of the residency committee, and experts working in the area of each resident’s interest will assist with the selection of an appropriate research topic and getting IRB approval. Following the data analysis, each resident will submit and defend a written report of the project. Acquisition of research skills will be facilitated by didactic courses and periodical meetings with the residency director and members of the residency committee.

DPHC 552. Research in Dental Public Health II. 1.5 Unit.
One of the core aspects of dental public health training at CWRU is to augment residents’ research skills; each resident will be required to develop, implement, and complete at least one research project during the training. The project may involve primary data collection or the use of secondary data for analysis. The program director, members of the residency committee, and experts working in the area of each resident’s interest will assist with the selection of an appropriate research topic and getting IRB approval. Following the data analysis, each resident will submit and defend a written report of the project. Acquisition of research skills will be facilitated by didactic courses and periodical meetings with the residency director and members of the residency committee.

DRTH Courses
DRTH 510. Humans: An Evolutionary Biology. 0 - 2 Units.
DRTH 523. Clinical Specialty Seminar. 2 Units.
This course is a companion to clinical training in orthodontics and involves faculty and student evaluation of past and present literature. Sessions are used to evaluate current timely literature, and lectures and seminars complement the clinical experiences with topics including patient management, treatment of various aged populations and malocclusions, orthopedic appliances, treatment of patients with special needs, and various aspects of fixed and removable mechanotherapy.
DSPR Courses

DSPR 136. Cariology. 1 Unit.
This course in cariology includes development, distribution and determinants, role of fluorides, clinical features, risk assessment, and prevention of caries. The course will enable students to understand the etiology, patho-physiology, and clinical aspects of caries, which will complement the Problem-Based-Learning module, Epidemiology for Clinical Dentistry. In addition, this course will prepare the first-year students for their sealant rotation where they will be observing clinical features of caries in children before placing sealants on appropriate teeth.

DSPR 139. Neoplasia and Genetics. 1 Unit.
Neoplasia and its sequelae are a major healthcare problem in the United States and across the world. I would like dental practitioners and students to have a thorough understanding of and to be articulate in describing the aspects of neoplastic disease, ranging from theory to clinical impact. This understanding rests on familiarity with basic principles of genetics which increasingly is recognized to be implicated in the pathophysiology, diagnosis, prognosis, and treatment of a variety of diseases not limited to neoplasia. Such knowledge is essential in being able to: confidently and compassionately manage patients; speak comfortably with colleagues in other medical specialties; entertain the possibility of neoplastic disease in the appropriate clinical scenario.

DSPR 232. Periodontics. 1 Unit.
The second-year course in periodontology focuses on the application of basic principles of periodontology in diagnosis and treatment of periodontal disease. Emphasis is placed on development of clinical skills and diagnosis of periodontal disease in the first half of the course, ending with informal discussion of actual cases. Pre-surgical treatment planning is introduced in the second half of the course to prepare for the third year.

DSPR 234. Oral and Maxillofacial Pathology. 3 Units.
The practice of dentistry includes a routine 90-second head and neck exam on all new patients as well as the proper identification and management any and all abnormalities of the oral cavity, salivary glands and jaw bones. In order to confidently and compassionately provide comprehensive care to the dental patient, the dentist must be aware of and qualified in managing diseases native to the oral and maxillofacial regions and systemic or dermatologic diseases with oral and maxillofacial manifestations. Many systemic conditions with oral and maxillofacial manifestations have been taught in your general pathology lectures and will at most be mentioned in passing due to time constraints. You will be introduced to approximately 300 diseases in this course. I want all of you to succeed in this challenging course. Success entails recognizing that oral and maxillofacial pathology is best thought of as a foreign language, and must be learned, practiced and rehearsed as such to achieve mastery and confidence.

DSPR 239. Neoplasia. 1 Unit.
Topics covered in this educational module include tumor nomenclature, features of benign versus malignant tumors, cytologic characteristics of cancer cells, pathogenesis and prognosis

DSPR 333. Management of Medical Emergencies. .5 Unit.
The purpose of this course is to comprehensively review the recognition and management of common medical emergency situations that a dentist is likely to encounter in the dental office.

DSPR 341. Oral Diagnosis and Radiology. 2 Units.
The didactic curriculum is aimed at helping the beginning clinician (student) to develop and understand the diagnostic process. It is designed to present to the student a method, a process, by which the common oral problems facing the dental practitioner can be recognized, diagnosed, evaluated and managed.

DSPR 342. Oral Cancer Diagnosis. 1 Unit.
Cancer is a major health problem in the United States and accounts for a significant utilization of health care and research resources. Dentists have professional, ethical and legal responsibilities to recognize the signs and symptoms of oral cancer and render a prompt and accurate diagnosis. Patients with oral cancer have complex treatment needs and the dentist can have a positive impact on the quality of life of such patients. Students of dental medicine should understand the many facets of oral cancer so that they might be able to make a positive contribution to the well being of their patients, especially for those who will develop oral cancer.

DSPR 344. Principles of Medicine. .5 Unit.
The didactic curriculum provides a general background and discussion of the risk assessment of medical conditions in an ever-increasing aging population. Within the setting of out-patient care, as well as those that are hospitalized, patients often present for dental procedures with co-existing medical systemic illness that provide an added challenge to the dental provider. Management of these medical problems within the context of dentistry and medicine will be covered.

DSRE Courses

DSRE 335. Clinical Pharmacology. 1.5 Unit.
This course is designed to review general principles of pharmacology, provide evidence-based information on the therapeutic application of agents prescribed by oral healthcare providers and discuss the rationale for and clinical implications of other therapeutic agents prescribed to patients by other healthcare providers. Emphasis is placed on critical thinking in discussing the reciprocal influences of drug, patient, and procedure-related variable.

This course is structured to help the student acquire a basic understanding of the advanced aspects of the specialty of oral and maxillofacial surgery and includes the process of diagnosis, surgical and adjunctive management of diseases, deformities and malformations of the oral cavity, jaws and associated structures.

DSRE 374. Fixed Prosthodontics. 1 Unit.
The didactic portion of the course describes further development of principles and clinical applications introduced in REHE 259/260, Basic Procedures in Fixed Prosthodontics, with emphasis on diagnosis, treatment planning, clinical and laboratory procedures in fixed prosthodontics. Discussion and comprehensive overview of fundamentals and advanced methods of restoring function and esthetics for partially edentulous patients with fixed prostheses.

DSRE 391. Endodontics. 1 Unit.
The didactic curriculum provides the major endodontic treatment information for this program. Specific subjects covered are diagnosis, pulp and periapical pathosis, radiology, pharmacology, anesthesia, pain management, emergency treatment, pulp treatment, trauma, mechanical innovations, apexification, bleaching, endodontic-periodontal complexities, preparation of endodontically treated teeth, and endodontic surgery, tooth-difficulty assessment and evidence based endodontics. The above information is designed to provide the student with a basic understanding of the field of endodontics.
DSRE 392. Nitrous Oxide and Conscious Sedation. .5 Unit.
This course consists of lectures and inter-student nitrous oxide administration for the undergraduate dental student to become informed and trained in the safe and effective use of nitrous oxide-oxygen inhalation light conscious sedation. The student will also learn the pharmacology and clinical application of agents used for intravenous light and moderate conscious sedation in the control of pain and anxiety in dentistry.

DSRE 393. Principles of Oral and Maxillofacial Surgery I. 1 Unit.
This didactic curriculum introduces the basic concepts of minor oral surgery relevant to the general dentist and also provides discussion on the following topics; medications used in oral surgery, management of the hospitalized patient, management of simple and complex odontogenic infections, management of complications in oral surgery, principles of diagnosis and treatment of facial trauma, and biopsy techniques in oral surgery.

DSRE 395. Introduction to Oral and Maxillofacial Surgery. .5 Unit.
This didactic course is designed to prepare the student for oral surgery clinical rotations and is comprised of the following topics, review of local anesthesia, review of applied anatomy, infection control, patient assessment and case presentation, informed consent, oral surgical armamentarium, and principles of exodontia.

DSRE 396. Temporomandibular Disorders and Occlusion. 2 Units.
The didactic portion of the course describes anatomy, biomechanics, and the maintenance of, the pathology associated with and the restoration of the masticatory or stomatognathic system. It includes Temporomandibular Disorder and other types of Orofacial Pains such as Primary Headache Disorders, Neuropathic Orofacial Pain, Psychogenic Pain, and Dental Sleep Medicine.

EFDA Courses

EFDA 111. Tooth Morphology for the EFDA. 1 Unit.
Instructional laboratory sessions provide experience with viewing models of teeth as well as reproducing teeth in wax. Mastery of terminology and basic facts of dental anatomy and tooth positions of permanent and primary teeth. Introduction of proper instrument begins.

EFDA 113. Dental Materials for the EFDA. 1 Unit.
Instructional laboratory sessions cover the physical and chemical properties and uses and manipulation of materials used in protection of the pulp and intracoronal temporization. Composition, properties and manipulation of dental amalgam, composite and pit and fissure sealant materials are also introduced. Isolation techniques and rubber dam placement lab.

EFDA 115. Restorative Dentistry for the EFDA I. 3 Units.
Skill development in the placement and carving of Class I, II, V and complex amalgam restorations on the typodont. Skill development in the placement and finishing and polishing of Class I, II, III, IV, and V composite restoration and amalgam restoration finishing and polishing on the typodont. Continued skill development in instrumentation, body positioning and ergonomics. Skill development in the use of low and high speed handpieces for rotary instrument use in finishing and polishing restorations. Skill development in self-evaluation using specific criteria. Pit and fissure sealant applications. **Student must show competency of skills acquired to be able to progress in Clinical Practicum for the EFDA**.

EFDA 116. Restorative Dentistry for the EFDA II. 2 Units.
Students begin preparation for the state board examination by demonstrating successful completion of amalgam and composite restorations with increasingly difficult grading evaluation, mastery of self evaluation skills, decreasing registration placement time and by completing 3 mock board examinations. Students must pass a final clinical and didactic examination to pass the course. Emphasis on understanding Ohio EFDA Registration protocol.

EFDA 120. Clinical Practicum for the EFDA. 2 Units.
Students fulfill the Ohio State Dental Board requirement of having clinical experience on patients in CWRU approved dental clinics. Clinic sessions include a variety of restorative experiences on many patients. One 8 hour session is required for 4 weeks. Students will restore patients’ teeth under the supervision of a licensed dentist and a clinical supervisor in clinics affiliated with CWRU. Emphasis is placed on restoring metallic and non-metallic restorations.

EFDA 122. Clinical Board Review. .5 Unit.
Review of Restorative Expanded Functions for the Dental Auxiliary. This two day course is designed to prepare the Registered Dental Hygienist or Certified Dental Assistant for the EFDA certification examination administered by the Commission on Dental Testing in Ohio. Successful completion of an approved EFDA course is a prerequisite for attendance. This course meets the requirements as remediation for auxiliaries who have not passed the certifying examination after two attempts. The course will involve both laboratory reviews and practice, preparing the participant for the clinical examination.

HEWB Courses

HEWB 121. Foundations of Life Science. 4.5 Units.
This course includes an introduction to basic elements of cell structure and function. This includes the characteristics and role of different types of cells, the cell cycle, mechanisms for cell damage, repair and death, cell signaling, differentiation and gene expression. This course serves as a foundation for the modules in Health and Wellbeing and Disease Processes.

HEWB 123. Facial Growth. 1.5 Unit.
Introduction to the normal growth and development of the human face from embryology to adult.

HEWB 124. Masticatory Dynamics. 2 Units.
The didactic portion of the course describes the function of the masticatory structures with an emphasis on the path of teeth and temporomandibular joint structures during function.

HEWB 126. Masticatory Dynamics Lab. 1.5 Unit.
In the laboratory, students will continue developing the psychomotor skills necessary to reproduce the functional morphology of permanent teeth, and perform basic laboratory procedures.

HEWB 128. Body as Host. 4 Units.
This educational module focuses on the role of immune function in preserving and maintaining health; the role of bacteria, viruses, and fungi in health and infectious disease; and the host changes that occur during oral and systemic disease processes.

HEWB 130. Oral Histology. 1.5 Unit.
This course provides students with a basic understanding of the biological and histological processes involved in the development of the human oral region, particularly the calcified tissues.
HEWB 134. Head and Neck Structure and Function. 4.5 Units.
Head and neck anatomy is one of the core courses of dental education. It provides the foundation for dental education and the practice of dentistry. This course uses a mix of lecture, prosection laboratory and problem-based learning to provide the student with the anatomical content necessary for them to carry into their practices.

HEWB 200. Directed Studies. 1 - 6 Units.
Directed study under faculty supervision and with special permission of the Associate Dean for Education.

HEWB 349. Dentofacial Morphology. 1 Unit.
This course provides the dental student with an introduction to the assessment of dynamic faces and the relatively static dentition. The course details the etiologies and characteristics of various malocclusions including developmental disharmonies observed during the growth and development of a child. Primary emphasis is laid on empowering the student in the diagnoses of malocclusions employing study casts, intra and extra-oral photographs and, CBCTs or cephalograms and panoramic radiographs.

HWDP Courses

HWDP 131. Heart and Lungs in Health and Disease. 4.5 Units.
Dentists need to have a general understanding of their patients overall systemic health. Health issues involving the cardiovascular organs and the respiratory organs affect many of the patients they see, and can effect treatment and treatment outcomes. A comprehensive understanding of the anatomy (developmental, histologic and gross anatomical), physiology and pathology of the Thorax & Cardiorespiratory System is essential for this purpose.

HWDP 142. Gastrointestinal System in Health and Disease. 2 Units.
The practice of dentistry focuses on the mouth, the beginning of the gastrointestinal tract. Therefore, an understanding of processes like swallowing and salivation are central to the practice of dentistry, while a basic understanding of digestive function is central to the continued well-being of the patient because it is the portal for entry of nutrients to the body. Disorders associated with the digestive tract, or which impact the function of the digestive tract (for instance, bulimia) can have profound effects on oral health, while some pharmacological agents used in the treatment of those disorders have potential adverse effects on oral health. Therefore, a firm understanding of the gastrointestinal tract in health and disease is a necessity for modern dental care.

HWDP 232. Renal and Hematologic Systems in Health and Disease. 2 Units.
One of the major connective tissues of the human body is blood. The kidneys play a role in the filtration of the plasma and assist in the maintenance of blood pressure and acid-base balance. The cellular entities of the blood (red cells, white cells and platelets) are needed to provide flow of oxygen and other metabolic substrates to and from all the tissues of the body and play a significant role in the defense of the body and repair of these tissues. It is therefore necessary for the dental practitioner to understand the histology, anatomy, physiology and pathologic processes that affect these systems.

HWDP 243. Endocrine and Reproductive Systems in Health and Disease. 1.5 Unit.
Dentists need to have a general understanding of their patients overall systemic health. Health issues involving the endocrine and reproductive tracts can affect treatment and treatment outcomes. A comprehensive understanding of the anatomy (developmental, histologic and gross anatomical) physiology and pathology of these systems is essential for this purpose.
**Interprofessional Education (IPE)** occurs "when students or members of two or more professions learn with, from and about each other to improve collaboration and the quality of care" (CAIPE 1997, revised 2013). Through IPE, students develop the knowledge, skills and attitudes needed to prepare them for interprofessional collaboration, defined by the WHO as "when multiple health workers from different professional backgrounds work together with patients, families, carers (caregivers), and communities to deliver the highest quality of care." Over the last decade there has been a growing emphasis on developing the ability of all professionals to more effectively communicate and collaborate in the care of individuals, families, communities, and populations. Interprofessional Education (IPE) occurs "when students or members of two or more professions learn with, from and about each other to improve collaboration and the quality of care" (CAIPE 1997, revised 2013). Through IPE, students develop the knowledge, skills and attitudes needed to prepare them for interprofessional collaboration, defined by the WHO as "when multiple health workers from different professional backgrounds work together with patients, families, carers (caregivers), and communities to deliver the highest quality of care." Over the last decade there has been a growing emphasis on developing the ability of all professionals to more effectively communicate and collaborate in the care of individuals, families, communities and populations in order to achieve the triple aim: enhancement of the patient or client experience, improvement in population health outcomes, and delivering more cost-effective care. Collaborative Practice I focuses on the domain of interprofessional collaboration. In addition to serving individuals, in this domain healthcare and partner professionals collaborate using population health and community engagement approaches in order to improve the health and well-being of individuals, families, communities, and populations. Therefore, students in this interprofessional service learning experience will learn teamwork skills through active participation in an authentic and meaningful community-based project that is focused on health and well-being for individuals, families, communities, or populations. Collaborative Practice I serves as an introductory IPE experience for dental, genetic counseling, medical, nursing, nutrition, physician assistant, psychology, social work and speech-language pathology students at CWRU. Depending on the School and program, the Collaborative Practice I experience is a free-standing course or integrated into one or more courses, blocks, rotations, etc. By the end of the experience, students will have acquired basic readiness to participate in subsequent interprofessional collaborative experiences.

**LDRS Courses**

**LDRS 101. Collaborative Practice I A.** 1.5 Unit.
Interprofessional Education (IPE) occurs "when students or members of two or more professions learn with, from and about each other to improve collaboration and the quality of care" (CAIPE 1997, revised 2013). Through IPE, students develop the knowledge, skills and attitudes needed to prepare them for interprofessional collaboration, defined by the WHO as "when multiple health workers from different professional backgrounds work together with patients, families, carers (caregivers), and communities to deliver the highest quality of care." Over the last decade there has been a growing emphasis on developing the ability of all professionals to more effectively communicate and collaborate in the care of individuals, families, communities, or populations. Collaborative Practice I serves as an introductory IPE experience for dental, genetic counseling, medical, nursing, nutrition, physician assistant, psychology, social work and speech-language pathology students at CWRU. Depending on the School and program, the Collaborative Practice I experience is a free-standing course or integrated into one or more courses, blocks, rotations, etc. By the end of the experience, students will have acquired basic readiness to participate in subsequent interprofessional collaborative experiences.

**LDRS 102. Collaborative Practice I B.** 1.5 Unit.
Interprofessional Education (IPE) occurs "when students or members of two or more professions learn with, from and about each other to improve collaboration and the quality of care" (CAIPE 1997, revised 2013). Through IPE, students develop the knowledge, skills and attitudes needed to prepare them for interprofessional collaboration, defined by the WHO as "when multiple health workers from different professional backgrounds work together with patients, families, carers (caregivers), and communities to deliver the highest quality of care." Over the last decade there has been a growing emphasis on developing the ability of all professionals to more effectively communicate and collaborate in the care of individuals, families, communities and populations in order to achieve the triple aim: enhancement of the patient or client experience, improvement in population health outcomes, and delivering more cost-effective care. With the triple aim in mind, Collaborative Practice I focuses on the domain of interprofessional collaboration. In addition to serving individuals, in this domain healthcare and partner professionals collaborate using population health and community engagement approaches in order to improve the health and well-being of individuals, families, communities, and populations. Therefore, students in this interprofessional service learning experience will learn teamwork skills through active participation in an authentic and meaningful community-based project that is focused on health and well-being for individuals, families, communities, or populations. Collaborative Practice I serves as an introductory IPE experience for dental, genetic counseling, medical, nursing, nutrition, physician assistant, psychology, social work and speech-language pathology students at CWRU. Depending on the School and program, the Collaborative Practice I experience is a free-standing course or integrated into one or more courses, blocks, rotations, etc. By the end of the experience, students will have acquired basic readiness to participate in subsequent interprofessional collaborative experiences.

**LDRS 111. Epidemiology for Public Health and Clinical Practice.** 2.5 Units.
This 3-week intensive sequence provides the first experience with the problem-based learning format and focuses on foundational knowledge in epidemiology for evidence-based practice in dentistry. Problem-based cases will use oral health topics to demonstrate the skills for critical appraisal of the health literature. Large-group lectures will present the foundational knowledge; small-group settings will permit students to gain experience in applying these skills to relevant dental literature.

**LDRS 116. Promoting Evidence-based Dentistry I.** .5 Unit.
The course will present advanced topics in oral health epidemiology and research to enhance skills for critical appraisal of the oral health literature and facilitate the use of evidence-based decision making skills and critical thinking during D1 in preparation for use in clinical training. The course will build on topics in LDRS 111. Using diverse formats, students will enhance their skills to be efficient and effective in acquiring, appraising and applying scientific evidence. The course topics will address concomitant coursework to enhance relevance. A large-group lecture will present the foundational knowledge; faculty facilitated small-group discussions will permit students to gain experience in applying these skills to relevant dental literature. Student assignments can be included in a portfolio to demonstrate progress towards competency.

**LDRS 118. Ergonomics.** .5 Unit.
This course introduces students to the principles and implementation of ergonomics in dentistry.
LDRS 310. Professional Development. 1 Unit.
This course focuses on behavioral knowledge, skills, and attitudes the student-dentist will require to be effective in the delivery of patient-centered oral health care. Concepts introduced in the course INQU 102: Knowing the Patient are extended and built upon in the areas of communication skills, health promotion and health behavior change, ethics, and management of a diverse patient population. Instruction in the assessment and management of dental fear and anxiety is also included. This course will utilize a blended learning format, with a combination of on-line instructional videos and readings, in-class sessions, assignments and a simulated patient exercise.

LDRS 313. Dental Patient Management/Risk Management. 1 Unit.
Principles of patient management and risk management are reviewed. The primary focus is directed toward the skills associated with communication. A variety of examples of malpractice are reviewed and discussed. Other areas of risk are discussed such as infection and occupational hazards related to EPA and OSHA standards.

LDRS 316. Practice Management I. 1 Unit.
This course is designed to develop practical knowledge and skills in dental practice management. As the student prepares for clinical practice, topics surrounding negotiation of working contracts, insurance contract evaluation, policies, compliance, and marketing are among some of the most important issues to be familiar with. The course will take a third year dental through the starting process of running a dental office and preparing them to write a business plan.

LDRS 317. Dental Auxiliary Management. .5 Unit.
This course introduces students to each type of auxiliary personnel in the dental office and describes their training, testing, duties delegated legally and how their utilization in the office setting can be optimized. Basic management considerations and theories of leadership are presented and various leadership styles are recommended for situations presented. This course provides an understanding of interacting with auxiliary personnel and the process of delegation. The course defines state dental board rules and regulations that guide dentists in the utilization of auxiliary personnel. Such items as overhead costs are explored in relation to each auxiliary category. Information is presented on the implementation of the resultant delivery systems including ergonomics and scheduling initiatives.

LDRS 415. Practice Management II. 1.5 Unit.
Practice Management II is entirely focused on each student producing his or her business plan by researching a potential area where they intend to practice. The business plan is constructed from the results of research done to complete homework for each session. Student findings serve as the basis for discussion and sharing of ideas to aid each student in improving their business plan.

LDRS 416. Practice Management III. 1.5 Unit.
This course is designed to develop practical knowledge and skills in dental practice management. As the student prepares for clinical practice, topics surrounding negotiation of working contracts, insurance contract evaluation, policies, compliance, and marketing are among some of the most important issues to be familiar with. The course will take a fourth year dental student from start to finish of owning and running a successful dental practice.

LDRS 420. Jurisprudence and Professional Ethical Responsibility. .5 Unit.
The didactic curriculum provides historical background as well as current tools needed to be able to make sound ethical and legal decisions for clinical practice.

MAHE Courses

MAHE 141. Preventive Periodontics. 1 Unit.
This course enables the student to recognize periodontal health and the changes that occur in the transition from health to disease. The didactic component focuses on the scientific basis for prevention of inflammatory periodontal diseases presented in lecture format. The clinical component consists of laboratory and clinical exercises in preventive Periodontics. The course provides practical instruction in how to implement preventive periodontal therapy under direct supervision by faculty.

MAHE 144. Preventive Periodontics Clinic. 1 Unit.
This course enables the student to recognize periodontal health and the changes that occur in the transition from health to disease. The didactic component focuses on the scientific basis for prevention of inflammatory periodontal diseases presented in lecture format. The clinical component consists of laboratory and clinical exercises in preventive Periodontics. The course provides practical instruction in how to implement preventive periodontal therapy under direct supervision by faculty.

MAHE 145. ACE: Outreach Preventive Dentistry. 2 Units.
The didactic portion of the course provides generalized background of dental sealant placement and other preventive procedures. In addition the student will develop the knowledge of ethical dental practice and cultural awareness in preparing to provide care for an underserved population. The lab and clinical portion of the course will establish the student’s ability to provide dental sealants with the culminating experience of providing care for children in the Cleveland Metropolitan School District (CMSD) as part of the MAHE 147 clinical course.

MAHE 147. ACE Clinical Outreach Preventive Dentistry. 2 Units.
The student will have the opportunity to practice their knowledge of ethical dental practice and cultural awareness while providing care for an under-served population by providing screening and dental sealants for children in the Cleveland Metropolitan School District (CMSD).

MAHE 214. ACE: Family First. 1 Unit.
The overarching goal of the clinical experience (ACE) is to incorporate the concepts of risk assessment and the importance of the family unit to oral health. The Family First ACE will allow students to explore the interaction between genetic and environmental factors in oral diseases and certain systemic conditions (diabetes, hypertension, and asthma). At the end of the "Family First" rotation the students would have achieved certain didactic and clinical objectives and the experience is linked to the second year didactic courses: Cariology, Periodontology, and Oral Pathology. This experiential learning includes clinical experience, didactic lectures, and small group discussions. Risk assessment for common oral diseases such as caries and periodontal diseases as well as for oral cancer is part of the clinical activities. Students will review the risk assessment and systemic health to delineate genetic and environmental factors through small group discussions.

MAHE 242. Periodontics. 1 Unit.
The course consists of clinical instruction that provides the student with knowledge of clinical data collection and therapy performed in the management of healthy patients who may have risks for periodontal diseases. Includes discussion on types of risks for progressing periodontal diseases, disease etiology and points of periodontal intervention and diagnosis.
MAHE 340. Nutrition for Dentistry. 1 Unit.
This course offers instruction in nutrition concepts relevant to the dental professional. Content includes the function of nutrients, their digestion and absorption, and intake recommendations; nutritional status assessment; role of nutrition in the growth and development of oral structures; nutrition and the periodontium; nutrition in immune-compromising conditions and oral lesions; nutrition concerns for the dentally compromised patient; nutrition needs throughout the life cycle; and the role of the dental professional in the nutrition care of patients.

OMFS Courses

OMFS 694. Program Year 1. 1 - 3 Units.
Interns are expected to take calls at UH and, where applicable, the Veteran’s Administration (VA). After the initial two months at UH, one of the interns will begin a three-month rotation at the VA as the principal OMFS resident. Both rotations will give the intern experience in diagnosis, information-gathering, dentoalveolar surgery, and major surgery within the scope of OMFS. The last two months of the first year are spent on the UH Anesthesia service. The resident will be paired with an anesthesiology resident or attending, improving upon and learning procedures involving management of the medically-compromised patient, airway management, pharmacologic management, intravenous sedation and general anesthesia. Formal conferences are held to advance the residents in oral and maxillofacial pathology, contemporary issues in OMFS, orthognathics, implantology and anesthetic principles, case presentation, and OMFS knowledge updates. As well, interns are second year medical students and take part in a full-year course in physical diagnosis.

OMFS 695. Program Year 2. 1 - 3 Units.
Students must complete 40 weeks of basic core clerkships through the academic year: Family Medicine, Internal medicine, Aging, OB-GYN, Pediatrics, Neurosciences, Psychiatry, surgery, and emergency medicine. They must complete 8 additional weeks of clinical electives, this may include a OMFS rotation.

OMFS 696. Program Year 3. 1 - 3 Units.
Interns are expected to take calls at UH and, where applicable, the Veteran’s Administration (VA). After the initial two months at UH, one of the interns will begin a three-month rotation at the VA as the principal OMFS resident. Both rotations will give the intern experience in diagnosis, information-gathering, dentoalveolar surgery, and major surgery within the scope of OMFS. The last two months of the first year are spent on the UH Anesthesia service. The resident will be paired with an anesthesiology resident or attending, improving upon and learning procedures involving management of the medically-compromised patient, airway management, pharmacologic management, intravenous sedation and general anesthesia. Formal conferences are held to advance the residents in oral and maxillofacial pathology, contemporary issues in OMFS, orthognathics, implantology and anesthetic principles, case presentation, and OMFS knowledge updates. As well, interns are second year medical students and take part in a full-year course in physical diagnosis.

OMFS 697. Program Year 4. 1 - 3 Units.
Fourth-year residents are primarily off-service as general surgery interns. Residents rotate through plastic surgery, ENT surgery, general surgery, dermatological surgery, and trauma surgery at UH and MetroHealth hospital.

OMFS 698. Program Year 5. 1 - 3 Units.
During this senior year, the resident returns to the OMFS service as chief for six months. The chief resident is responsible for the resident service, working-up surgical cases and is typically the first assistant in major surgical cases. During this time, the chief works closely with the AEGD residents to plan and perform surgery on simple and advanced implant cases.

REHE Courses

REHE 120. Introduction to Radiography. 1.5 Unit.
Foundation course consisting of lectures and laboratory covering basic principles of radiography. Included are: instructions on taking intraoral radiographs, radiation physics involved in x-ray generation and the parts and function of the x-ray unit, radiation biology of x-ray interaction with tissue, head and neck anatomy and pathology with regards to radiographic interpretation. Each student will have clinic rotations.

REHE 151. Dental Anatomy. 3 Units.
The didactic portion of the course describes the anatomy of the masticatory structures with an emphasis on teeth, deciduous and permanent.

REHE 152. Basic Procedures in Fixed Prosthodontics. 1 Unit.
This course will develop and build core elements vital to Fixed Prosthodontics, specifically related to single unit restoration. The course will place an emphasis on the following topics: clinical indications and application of the single unit restoration, principles of engineering of abutment preparations, preparation designs, soft tissue management, provisional and definitive restorative materials, clinical progression and treatment sequence for the cementation of provisional and definitive fixed partial denture.

REHE 153. Dental Anatomy Laboratory. 1 Unit.
In the laboratory, students will develop the psychomotor skills necessary to reproduce the functional morphology of permanent teeth.

REHE 154. Basic Procedures in Fixed Prosthodontics Lab. 1 Unit.
Laboratory component of REHE 152.

REHE 156. DentSim Laboratory. 1 Unit.
This course covers the criteria, techniques and practice of preparing ‘ideal/standard’ operative preparations. The restorative procedures will be performed on typodont teeth mounted in a computer assisted simulator (DentSim).

REHE 158. Dental Materials I .5 Unit.
This is a didactic course that defines and describes properties, composition, indications and contraindications of used of different dental materials.

REHE 162. Basic Procedures in Restorative Dentistry I . 5 Unit.
This course introduces students to the criteria, the techniques for, and practice of preparing ‘ideal/standard’ Class I and V (and possibly Class II) operative preparations. In this course, the emphasis will be on the more traditional posterior amalgam Class I and V preparations. Students will be introduced to basic concepts of preparation design and amalgam restorations. In addition, the composition and properties of amalgam will be mentioned (however, the Dental Materials I Course will provide the basic information regard this material.) The restorative procedures will be performed on typodont teeth mounted in a simulator. The emphasis will be on traditional preparation design and execution.

REHE 172. Basic Procedures in Restorative Dentistry I Lab. 1 Unit.
Laboratory component of REHE 162.
REHE 252. Pain Control. 1 Unit.
This course consists of lectures, demonstrations and clinical participation for the undergraduate dental student to become informed and trained in the safe and effective use of local anesthetics in dentistry. The students will also learn the pharmacology and clinical application of these agents in the control of pain and anxiety.

REHE 253. Basic Procedures in Esthetics. 1 Unit.
This course provides formal lecture presentations and laboratory exercises to introduce the students to basic operative procedures for direct composite resin restorations.

REHE 254. Pharmacology. 4 Units.
This course is a basic introduction to the principles of pharmacology and to drug classes of particular relevance to dentistry. Drugs used in other medical areas will also be reviewed. Information concerning drug doses is NOT included. Information concerning calculations used in determining doses WILL BE included.

REHE 256. Radiologic Interpretation. 1 Unit.
Follow-up course to Introduction to Radiography, with a primary focus on Radiographic Interpretation, consisting of lecture and laboratory covering basic principles of radiography, interpretation and diagnosis. Each student will have a clinic rotation.

REHE 257. Prosthodontic Technology. 2 Units.
The didactic portion of the course relates not only the theory of complete denture construction, but also the human elements that are involved. This includes the physical dental examination, evaluation of the patient’s needs and descriptions of the various procedures needed to successfully rehabilitate an edentulous patient.

REHE 258. Principles of Treatment Planning I. 1 Unit.
This course provides an advanced teaching concept called Flipped Classroom. The flipped classroom is a teaching module model in which the typical lecture and homework elements of a course are reversed. Short video lectures are viewed by students at home before class sessions, while in-class time is devoted to exercises, projects, or discussions (we refer to these as LEARNING MODULES). The video lecture is often seen as the key ingredient in the flipped approach. Such lectures are created by the instructor and posted online.

REHE 259. Basic Procedures in Fixed Prosthodontics I. 1 Unit.
This course builds upon those core elements covered in REHE 152/154. Emphasis on principles of engineering for fixed partial dentures, preparation and design of fixed partial dentures, considerations for the restoration of endodontically involved teeth, and definitive and provisional fixed partial denture restorations. Introduces dental material topics related to fabrication of a fixed partial denture restoration, including: chemicomechanical soft tissue retraction, die spacers, investments, casting and casting alloys, ceramics, soldering, provisional materials, prefabricated and custom post and core systems. Emphasis on principles of engineering for fixed partial dentures, preparation and design of fixed partial dentures, considerations for the restoration of endodontically involved teeth, and definitive and provisional fixed partial denture restorations. Introduces dental material topics related to fabrication of a fixed partial denture restoration, including: chemicomechanical soft tissue retraction, die spacers, investments, casting and casting alloys, ceramics, soldering, provisional materials, prefabricated and custom post and core systems.

REHE 260. Basic Procedures in Fixed Prosthodontics III. .5 Unit.
This course builds upon those core elements covered in REHE 152/154 and REHE 259/269. Emphasis on principles of engineering for fixed partial dentures, preparation and design of fixed partial dentures, considerations for the restoration of endodontically involved teeth, and definitive and provisional fixed partial denture restorations. Introduces dental material topics related to fabrication of a fixed partial denture restoration, including: chemicomechanical soft tissue retraction, die spacers, investments, casting and casting alloys, ceramics, soldering, provisional materials, prefabricated and custom post and core systems. Emphasis on principles of engineering for fixed partial dentures, preparation and design of fixed partial dentures, considerations for the restoration of endodontically involved teeth, and definitive and provisional fixed partial denture restorations. Introduces dental material topics related to fabrication of a fixed partial denture restoration, including: chemicomechanical soft tissue retraction, die spacers, investments, casting and casting alloys, ceramics, soldering, provisional materials, prefabricated and custom post and core systems.

REHE 262. Basic Procedures in Restorative Dentistry II. 1 Unit.
This course, together with the first year Intro to BP Operative Dentistry and the BP Esthetic Dentistry Course covers the criteria, the techniques for, and practice of preparing ‘ideal/standard’ operative preparations and placement of operative restorations. In this portion of the course, the emphasis will be on posterior Class II amalgam preparations and restorations, as well as an introduction to cast gold inlay and onlays, and an introduction to CEREC (Ceramic REConstruction) Onlays. Students will be introduced to basic cariology and radiology as it relates to operative dentistry. In addition, the composition and properties of the following materials will be reviewed: amalgam, liners and bases, and gold. The Dental Materials Course will provide the basic information regarding these materials. The restorative procedures will be performed primarily on typodont teeth mounted in a simulator. Extracted teeth with caries will also help students appreciate the different tactile responses of caries, dentin and enamel. There will be an emphasis on the following: the rationale for types of preparations and materials, indications and contraindications for different materials and types of restorations, and clinical problem solving related to operative dentistry in total treatment care.

REHE 263. Basic Procedure in Esthetics Lab. .5 Unit.

REHE 264. Endodontics. .5 Unit.
The didactic and preclinical curriculum covered in endodontics in REHE 264 and followed in DSRE 391 provides the major endodontic treatment information for this program. Specific subjects covered are diagnosis, pulp and periapical pathosis, radiology, pharmacology, anesthesia, pain management, emergency treatment, pulp treatment, trauma, mechanical innovations, apexification, bleaching, endodontic-periodontal complexities, preparation of endodontically treated teeth, and endodontic surgery. The above information is designed to provide the student with a basic understanding of the field of endodontics.
REHE 266. Partial Denture Design. 3 Units.
This course covers the second subcategory of removable dentures with the Complete Dentures course REHE 257/267. The title "Removable Partial Denture Technology" in fact covers a very vast field of skills and knowledge required for the fabrication of a removable partial denture in collaboration with the dental laboratory and the dentist. Its preliminary assessment and diagnostic requirements make it very close to oral diagnostic sciences; preprosthetic radiographic, surgical, periodontal and endodontic considerations make it very close to these disciplines as much as it is a restorative/rehabilitative procedure. As the design and construction of a metal framework is quite a hard topic to fully understand and master, while a must for being a successful general dentist, the course will mainly emphasize removable partial denture design. The skills and competencies obtained from the previous removable dentures course will help students to understand some of the components of removable partial dentures so that the course will be focused on other components peculiar to removable partial dentures.

REHE 267. Prosthodontic Technology Lab. 2 Units.
The laboratory phase is the hands-on course where the student will go through the technique of construction of a complete maxillary and mandibular denture. This will include both a traditional and implant supported overdenture project.

REHE 268. Basic Procedures Competency. 2 Units.
This course will build on the basic techniques learned in the previous basic procedure courses and aims to prepare the students for their clinical experience.

REHE 269. Basic Procedure Fixed Prosthodontics II Lab. 1.5 Unit.
Laboratory component of REHE 259-1.

REHE 270. Basic Procedure Fixed Prosthodontics III Lab. 1 Unit.
Laboratory component of REHE 259.

REHE 272. Basic Procedures in Restorative Dentistry II Lab. 1 Unit.
Laboratory component of REHE 262.

REHE 274. Endodontics Lab. 1 Unit.
Laboratory component of REHE 264

REHE 276. Partial Denture Design Lab. 2 Units.
Laboratory component of REHE 266.

REHE 351. Surgical Periodontics. 1 Unit.
The course consists of didactic and clinical instruction that provides the student with knowledge of the various types of surgical therapy performed by periodontitis in the management of patients with various periodontal disease conditions. Includes discussion on types of surgery, points of periodontal intervention and when to refer patients to periodontal surgery.

REHE 352. Principles of Treatment Planning II. 1 Unit.
This course provides lecture presentations to help prepare the student to deal with their patients from the standpoint of patient management and treatment planning. The lectures will guide the students through the thought processes necessary in the development of workable treatment plans. The emphasis will be on exposing the students to principles of treatment planning, integrating evidence based dentistry. The lectures will emphasize the steps and sequencing approach to treatment planning and will include the concept of decisional analysis. This course utilizes knowledge the students have acquired from previous classes.

REHE 355. Esthetic Dentistry. 1 Unit.
This course provides formal lecture presentations and laboratory exercises to familiarize the students to various esthetic dental materials and techniques to achieve optimal esthetic results.

REHE 358. Dental Materials II. .5 Unit.
This is a didactic course that defines and describes properties, composition, indications and contraindications of uses of different dental materials.

REHE 360. Implant Dentistry. 1 Unit.
The course is designed to introduce the third year dental students to the concepts of dental implantology. Students will be introduced to computer guided dental implant treatment planning program Nobel Clinician. This course will provide didactic and laboratory instructions for the students to be able diagnose, treatment plan and restore a patient who needs a single implant.

REHE 362. Clinical Application of CAD/CAM Technologies. .5 Unit.
This course covers the criteria, techniques and practice of using CAD/CAM technologies in the clinical environment. In this course, emphasis will be on ceramic restorations made by Cerec (Sirona), as well as an introduction to different options of CAD/CAM machines available in the market. Students will be introduced to an advanced level of expertise in using the latest Cerec software in a variety of clinical applications. There will be also emphasis on the rationale for types of preparations and material selection based on the correct clinical indication.

REHE 400. Regional Board Preparation. .5 Unit.
The purpose of this course is to prepare the dental student to challenge a clinical licencing board examination. The students will be examined on the appropriate licensing board materials, and patient clinical activities. Students will be given formative feedback on typodont exercises as needed for their licensing examination.

REHE 413. Advanced Implant Dentistry I. 1 Unit.
This course is designed to expose the student to advance implant therapies for the dentate and edentulous patient. Through lectures and discussions the students will be demonstrated the multitude of variations of care available for these patients and the restorative processes necessary to delivery that care. Limitations of each of these modalities will be thought. Guidelines of dental implant therapy allowing them to provide most appropriate treatments will be given.

REHE 414. Advanced Implant Dentistry II. 1 Unit.
This course is designed to expose students to advanced implant treatment options that are available for the partially and fully edentulous patients. Through lecture, discussions and treatment planning sessions students will be exposed to the multitude of treatment options available for the patients and the restorative processes necessary to successful treatment completion. They also will understand the limitations of each of these modalities within the scope of dental implant therapy allowing them to provide the most appropriate treatment direction for their patients.

REHE 421. Periodontal Medicine and Cases. 1 Unit.
The 4th year course in periodontology focuses on the application of evidence and principles to complex and multidisciplinary cases. A second component of this course is synthesizing 4 years of content using sample board exam questions as a guide.

REHE 453. Principles of Treatment Planning III. 1 Unit.
Treatment Planning III is designed to permit participation by the student doctor in the steps in developing a treatment plan. The initial sessions will review data gathering, data interpretation, creating diagnoses and developing both a definitive and alternate treatment plans. Students will be provided with case studies which will be the basis for discussion. Utilizing the preceptor groups, we will stress the analysis of data and the use of the results to develop both diagnoses and treatment plans.
REHE 455. General Anesthesia, Oral Surgery. .5 Unit.
The didactic curriculum provides a general background in the pharmacologic, physiologic and clinical aspects of moderate and deep conscious sedation and general anesthesia as may be applicable for oral and general surgery.

REHE 482. Orthodontics. 1 Unit.
Senior orthodontics provide instruction enabling the dental student to gain judgment, knowledge and skills to select and treat uncomplicated tooth irregularities in children and adults. The student is also versed in the technique of intra-professional communication and referral. In addition, advanced topics in comprehensive orthodontics, e.g. ortho-surgical problems, orthodontic management, and orthopedic treatment, mixed dentition treatment and functional appliance therapy are discussed.

REHE 488. Case Presentations I. 1 Unit.
First Semester of Case Presentation is dedicated to the review example of comprehensive treatment planning material in preparation for the written Western Regional Board, Northeast Regional Board Dental Simulated Clinical Examination and the Case Based Examination (CBE) and case based questions from the National Boards Part II, by discipline. Selected case studies will be presented by the faculty that demonstrates comprehensive care and evidence based dentistry. These cases will be presented in lecture format utilizing Online questions relating to the case will be asked during each presentation. Clinical techniques germane to the various case reports will be presented as needed.

REHE 489. Case Presentations II. 1 Unit.
First Semester of Case Presentation is dedicated to the review example of comprehensive treatment planning material in preparation for the written Western Regional Board, Northeast Regional Board Dental Simulated Clinical Examination and the Case Based Examination (CBE) and case based questions from the National Boards Part II, by discipline. Selected case studies will be presented by the faculty that demonstrates comprehensive care and evidence based dentistry. These cases will be presented in lecture format utilizing Online questions relating to the case will be asked during each presentation. Clinical techniques germane to the various case reports will be presented as needed.

REMA Courses

REMA 261. Preclinical Orthodontics. 1 Unit.
Sophomore orthodontics includes relevant areas of applied growth and development, diagnostic methods and treatment planning. Topics included are: Histology and Physiology of Tooth movement and Laboratory Techniques related to the fabrication and use of suitable orthodontic appliances including material and biologic background necessary for proper clinical management of these appliances.

REMA 270. Introduction to Pediatrics. 1 Unit.
Students will learn principles and practices of modern dental care for children including diagnostic, preventive, and treatment procedures applied to dental caries, periodontal disease, malocclusion, growth and development in children. In caring for the child patient, this course emphasizes current concepts of behavior guidance of children in the dental treatment setting.

REMA 380. Introduction to Geriatric Dentistry. 1 Unit.
This course focuses on the study of aging in the population and its effects on treatment planning and actual dental treatment of geriatric patients from well to frail. Didactic instruction and case presentations would cover a wide variety of medically compromising conditions, physical disabilities and sensory impairments. The effects of these conditions as they pertain to dentistry will be discussed together with economic, social and community variables that need to be addressed to achieve rational dental care.
SCHOOL OF LAW

George Gund Hall
http://law.case.edu (http://law.case.edu/)
Phone 216.368.3600

Founded in 1892, the Case Western Reserve University School of Law (http://law.case.edu) is a charter member of the Association of American Law Schools and of the national law honorary society, the Order of the Coif. It was among the first law schools accredited by the American Bar Association.

The school has a student body of about 500 and a full-time faculty of about fifty. In the school’s early years, most students came from Ohio and remained in Ohio after graduation. Today, students come from all parts of the country, and there are CWRU law graduates in virtually every state (and in several foreign countries), and certainly in every major U.S. city. An active and aggressive Career Services Office works with students, graduates, and prospective employers from all over the nation to maximize job opportunities.

The Judge Ben C. Green Law Library

The law library’s holdings include more than 410,000 books and volume-equivalents, complete collections of federal and state law, law reviews, current law services, an extensive British and Commonwealth collection, and special collections in taxation, labor law, foreign investments, international law, and environmental law. The law library is building strong collections in law and medicine, intellectual property, and law of the European Union. It is a selective depository for both U.S. and Canadian government documents. There are computer facilities on every floor of the library, providing access to more than 700 electronic services and library catalogs, and a wide range of software services. The university boasts a fast and powerful computing network and wireless access, and the university network links the law school to the vast resources of the Internet. The law library is a member of OhioLINK, which is a consortium of Ohio’s college and university libraries and the State Library of Ohio. OhioLINK offers access to more than 31 million library items from 79 institutions. These materials include items from law, medical, and special collections.

The law library offers its users access to an ever-expanding list of electronic research databases as well as e-books. Electronic resources are accessible through the library catalog and the Law Library Services page on our website. Web-based databases offered include Lexis/Nexis and Westlaw as well as over 100 OhioLINK databases (including Index to Legal Periodicals and Medline). Many of these OhioLINK databases contain the full text of journal articles. Housed within the law library are a computer laboratory and a computer training classroom.

Special Programs

Litigation Program
Since the mid-1970s, the School of Law has invested heavily in its litigation program. Students practice the basic skills of trial advocacy in such courses as LAWS 6110 Trial Tactics, LAWS 6111 Appellate Practice, and in the co-curricular moot court and mock trial programs.

Study Abroad
The JD program in the School of Law offers a number of opportunities for students to engage in comparative legal study. The law school has cooperative agreements with over 20 schools in Africa, Asia, Europe, Latin America, and North America, allowing students to study at the host school for a semester and transfer the completed credits to the CWRU JD program. In addition to traditional semester-long exchange programs, the law school offers concurrent degree programs with prestigious universities in England, France, and Spain. Through these programs, students can earn two degrees - a JD from our law school and an LLM from the partner school - in just three years, for the same price as those earning just the JD. Students spend their 1L and 2L years at our law school, and then their third year at the foreign partner school. The law school also offers the Case Abroad at Home program, which brings foreign scholars to campus to offer special one-week intensive courses immediately prior to the start of the fall term each year.

Student Activities

Publications
The School of Law publishes three scholarly journals, all student-edited. The oldest is the Case Western Reserve Law Review. The Journal of International Law is an academic journal specializing in research in the areas of international and comparative law. Health Matrix: Journal of Law-Medicine began as a joint undertaking of all six of the university’s professional schools but since 1990, has been sponsored solely by the law school and its Law-Medicine Center.

Competitions

Moot Court
A student board administers the Dean Dunmore Moot Court Competition, a year long program in which second-year students participate after completing the Appellate Practice course. It culminates in a round-robin tournament involving 16 finalists. From those finalists, the executive board and faculty advisors select teams that will compete the following year in external moot-court competitions (currently the National Moot Court Competition and the ABA’s National Appellate Advocacy Competition.) Case Western Reserve also enters the Jessup International Competition, the International Criminal Court Competition, and the Vis International Arbitration Competition; those teams are selected by the faculty coaches in a joint intramural try-out competition in the fall.

Mock Trial
The Jonathan M. Ault Mock Trial Board sponsors the Case Classic, an invitational competition involving law schools from places as diverse as Ohio, Kentucky, West Virginia, Michigan, Indiana, and Alabama. The Case Classic provides a competitive and collegial environment for multiple teams to tune up for the Spring competition season. Currently, the law school sends a team to the National Trial Competition, the National Student Trial Competition of the Association of Trial Lawyers of America, and a competition sponsored by the Academy of Trial Lawyers of Allegheny County, Pennsylvania.

Regulations and Rules of Conduct

The Academic Regulations of the School of Law are provided to each student upon matriculation through the law school’s website.

In addition to the university’s rules of conduct, law students are expected to comply with the American Bar Association’s Model Code of Professional Responsibility and Model Rules of Professional Conduct, to the extent that these are applicable, and with the law school’s own Code of Conduct. The Model Code and Model Rules are available in the law library. The school’s Code of Conduct, like the Academic Regulations, is provided to each student upon matriculation through the law school’s Intranet website.
Regular class attendance, a high degree of preparation for class, a high degree of participation in class discussions, and diligent execution of class exercises or assignments are required of every student. At the option of the instructor and after notification to the student, one who violates this regulation shall be withdrawn from the course, and the grade WF shall be entered on the student’s transcript.

### Administration

Jessica Willen Berg, JD (Cornell University), MPH (Case Western Reserve University)
Co-Dean

Michael P. Scharf, JD (Duke University)
Co-Dean

Bryan L. Adamson, JD (Case Western Reserve University), MA (Purdue University)
Associate Dean for Diversity and Inclusion

Alyson Suter Alber, JD (University of Virginia)
Associate Dean for Enrollment Planning and Strategic Initiatives

Juscelino F. Colares, JD (Cornell University), PhD (University of Tennessee)
Associate Dean for Global Legal Studies

Avidan Y. Cover, JD (Cornell University)
Associate Dean for Academic Affairs

Kelli C. Curtis, JD (Ohio State University)
Associate Dean for Admissions

Jessie Hill, JD (Harvard University)
Associate Dean for Research and Faculty Development

Sarah McFarlane Polly, JD (Ohio State University)
Senior Associate Dean for Student Services and Career Development

Laura E. McNally-Levine, JD (Syracuse University)
Associate Dean for Experiential Education

Joseph A. Custer, JD (University of Arkansas), MLIS (University of Missouri - Kansas City)
Director, The Judge Ben C. Green Law Library

Michael T. McCarthy, JD (Washington and Lee University)
Assistant Dean for Student Services

Mary Beth Moore, JD (Cleveland State University)
Assistant Dean for Career Development

Melanie Walker, MBA (Cleveland State University)
Assistant Dean for Finance and Administration

### Academic Centers

#### Coleman P. Burke Center for Environmental Law

Nearly a decade after endowing a professorship in honor of his law school mentor Leon Gabinet, alumnus Coleman P. Burke (LAW ’70) has committed $10 million to establish a center at the Case Western Reserve University School of Law that combines two of the driving passions of his life: the environment and the law.

The gift — the largest in the law school’s 126-year history — creates the Coleman P. Burke Center for Environmental Law. The Burke Center will dramatically expand students’ learning opportunities in environmental law, while also establishing the school as a leading intellectual hub of interdisciplinary research and thought leadership in this rapidly growing field.

#### Milton A. Kramer Law Clinic Center

The Supreme Court of Ohio authorizes student practice under attorney supervision in the final year of law school. Through the clinic, students provide legal representation to indigent clients and community groups and receive academic credit. The supervising attorneys are full-time members of the law faculty. The clinical program is the capstone of the skills curriculum and offers specialized practice experiences in Criminal Justice, Community Development, Civil Litigation Practice, focused on consumer matters, predatory lending, social security disability, and other public benefit issues, Immigration, Health Law, and Family Law.

#### Center for Business Law and Regulation

To better prepare its students and future leaders with a thorough understanding of the business issues facing entrepreneurs, entities, and other clients, the School of Law created the Center for Business Law and Regulation. The center focuses on expanding curricular offerings and programs as well as engaging in opportunities for legal, empirical, and interdisciplinary research, assessing the role and impact of government in the regulation of business. The center will also host special lectures and symposia to highlight topics in business law and foster public debate and inquiry regarding business regulation.

#### Spangenberg Center for Law, Technology, and the Arts

The Spangenberg Center for Law, Technology, and the Arts was established as an internationally recognized forum for the interdisciplinary study of law, technology, and the arts. The Center focuses on teaching, research, and programs pertaining to intellectual property, technological innovation and technology transfer, the intersection of science, economics, philosophy, and the law, legal issues concerning biotechnology and computer technologies, and laws and cultural issues relating to the creative arts. Through the Center, the law school is able to offer students opportunities to address important, topical issues relating to law and technology and law and the arts through a variety of courses, lectures, events, and symposia.

#### Frederick K. Cox International Law Center

The Cox International Law Center serves as the stimulus for enhancing programs in international, comparative, and transnational law at the law school. It supports visiting scholars and visiting faculty at the law school to enrich the curriculum and research capacity of the resident faculty. It also supports the development of international information resources. Through a series of sister law school relationships, it seeks to attract foreign students to the law school and provide opportunities for Case Western Reserve law students to study abroad; it also provides opportunities for faculty to study and teach abroad.
Institute for Global Security Law and Policy

The events and aftermath of 9/11 have made security and counter-terrorism fundamental, if not defining, concerns for the world community, nations, companies, the legal system, and individuals. The Institute for Global Security Law and Policy was created in 2005 to provide a uniquely comprehensive hub for addressing the legal, financial, political, social, religious and cultural ramifications of counterterrorism, using an innovative multifaceted approach that integrates theory with practical application. The Institute develops and integrates the best learning from the academic and the real world and draws on numerous disciplines and experiences to provide innovative and world class programs, research, teaching, and service on the issues of security and counter-terrorism. The work of the Institute serves as an invaluable resource to governments, businesses, organizations, the legal profession, and the general community.

Financial Integrity Institute

The mission of the Financial Integrity Institute is to advance financial integrity globally by conducting and promoting at the highest standards research, education, and professional excellence in anti-money laundering and countering the financing of terrorism, targeted sanctions, anti-corruption, and international tax evasion policies and practices. The Institute has also recently launched a Master of Arts in Financial Integrity program at the School of Law.

Law-Medicine Center

The Law-Medicine Center at Case Western Reserve University has been in operation for over 50 years. It began with a focus on forensic medicine, but has broadened to include the whole range of legal, social, economic, scientific, and ethical issues in which law and medicine are interrelated. Besides the regular course offerings, the center frequently presents lectures, symposia, and workshops, and sponsors major conferences. It publishes a student-edited journal, Health Matrix: Journal of Law-Medicine. Participants in the center’s activities include not only university personnel, but also professionals from such institutions as University Hospitals of Cleveland and the Cleveland Clinic.

Center for Cyberspace Law and Policy

The Center for Cyberspace Law and Policy is devoted to studying the creation, dissemination, and acquisition of human thought, creativity and information in the digital age. Through scholarship, teaching, and bringing together leading thinkers, the Center evaluates the laws, policies, and social forces that govern issues once limited to the Internet, but that are now commonplace in a world networked and mediated by digital technology.

Center for Professional Ethics

The center’s mission is to explore moral choices across professional lines in a variety of disciplines. It brings together practicing professionals, faculty and students to exchange ideas on such topics as confidentiality, decision-making, lying and conflict of interest. The Center for Professional Ethics was founded in 1978 by Robert P. Lawry, who retired from the law faculty in 2007, and Robert W. Clarke, retired Director of Case Western Reserve University’s Christian Movement. The center is supported by the David and Katherine Ragone Endowment Fund. The center plans to continue to draw upon its founding principles to expand its inter-disciplinary approach and put academic work into practice.

Social Justice Law Center

From our efforts to improve the county’s bail/bond system to our involvement in municipal police reform, from our international war crimes prosecution assistance to our research in Innocence Project cases, from our efforts to address human trafficking to our work to remedy the lead crisis in our city, Case Western Reserve University School of Law has been a leader in social justice. The Social Justice Law Center continues the tradition of exploring, teaching, and debating these critical issues in our contemporary society.

Juris Doctor (JD)

Juris Doctor

The School of Law offers the Juris Doctor (JD) degree as well as several dual-degree programs. The JD degree requires successful completion of 88 credit hours, of which 44 hours are in specified required courses, at least 2 credits in the writing of a substantial research paper, at least 12 hours of experiential learning experiences (including a required capstone experience completed during the 3L year) and at least 34 elective credits. The first year program for the JD degree consists of the required basic courses, along with two one-credit ‘mini-course’ electives taken in the spring term.

Elective courses

In addition to the required courses and the optional curricular concentrations, all students must take open elective courses in order to earn a minimum of 88 credits of law school coursework to qualify for the Juris Doctor degree. All students must enroll for a full-time course load each semester (10 - 18 credits), and must complete at least six regular semesters of full-time coursework. Optional summer courses may be used to reduce the credit load during a regular semester, but the student...
must still complete at least six regular full-time semesters (summer does not count as a regular semester.)

**General Education Requirement**

All candidates for the Juris Doctor must satisfy a General Education Requirement in order to qualify for graduation. This requirement consists of upper-level doctrinal courses that are tested on the Bar Exam. To satisfy this requirement, a student must enroll in and earn credit for at least four of the following nine courses: Business Associations, Conflict of Laws, Constitutional Law 2, Criminal Procedure 1, Evidence, Family Law, Sales, Secured Transactions, Wills & Trusts.

**Graduate School Option**

Students in the School of Law who are not enrolled in a dual-degree program may take up to nine hours of approved courses in the other graduate and professional schools of Case Western Reserve University and have such courses counted as elective credit toward the JD degree. Such coursework must be graduate-level coursework, and must be closely related to the study of law and the student's educational/career objectives.

**Academic Regulations**

All coursework counting towards requirements of the JD degree must be completed within five years of initial matriculation into law school. Courses completed more than five years prior must be retaken, and the older courses will not be counted towards the degree requirement. A complete list of Academic Regulations for the Juris Doctor program are contained in the Law Student Handbook. Questions can be directed to the law school's Academic Services Office.

**Class Attendance Policy**

JD students are required to attend all class sessions for which they are registered. Instructors will provide details of their procedures and policies regarding class absence at the beginning of the course. Students who fail to meet responsibilities for class attendance and preparation are subject to dismissal from a course by the Instructor. Students dismissed from a course will receive a grade of WF for the course and will not be eligible to take the exam or complete the work in the class.

JD students have an option to earn a curricular concentration by focusing their course selections within a particular area of legal study. Requirements for each particular concentration are listed below. In order to receive the concentration, students must earn at least 15-18 credits (varies by the specific concentration) in courses within the concentration. Each concentration has a number of prescribed required courses, along with a menu of courses that can counted as elective hours. Specific courses applicable to each concentration are subject to change by faculty review. Students should contact the law school's Academic Services Office for the applicable concentration requirements.

Dual Degree Programs

For students in dual degree programs, 12 hours of elective credits in the JD program are waived in consideration of completion of the dual degree. Students must be separately admitted to both degree programs in order to pursue a dual degree, the qualitative requirements of both degrees must be fully met, and the two degrees must be earned simultaneously. Students must begin coursework in the second degree program prior to beginning the fifth semester of law school work. Also, no coursework completed prior to official matriculation in the law school may be counted towards the law school degree.

JD/MBA (Master of Business Administration)

Students may complete the three-year JD program and the two-year MBA program in four academic years by completing 133 credit hours (including a 7-credit-hour overload which can be taken during the academic year or during the summer semester).

The School of Law allows dual degree students to use 12 credit hours from the MBA to fulfill both JD and MBA requirements. The Weatherhead School of Management allows dual degree students to use 12 credit hours from the School of Law to fulfill both MBA and JD requirements. Students must achieve a grade of C or better to receive double credit for the courses. This reduces the total number of hours required for the two degrees by 24 credit hours.

JD/MBA students may enroll only on a full-time basis, except during summer sessions. Dual degree students must receive both the JD and the MBA degrees simultaneously upon completion of degree requirements at both schools in order to receive the 24 hours of cross-credits described above.

Throughout the dual degree program, JD/MBA students continue to register in the first school they attended. After completion of both degree programs, two separate diplomas are awarded. Course work for both programs must be completed within six years of the date of initial enrollment in either program.

JD/MA or JD/MS (Master of Arts or Master of Science)

Enrolling in both the School of Law and the School of Graduate Studies, a student complete a Juris Doctor (JD) and a Master of Arts (MA) or Master of Science (MS) degree and earn the two degrees in seven semesters or six semesters plus two summers. Law students enrolled in a dual JD/MA degree program may earn up to 12 credits toward the JD in graduate level courses. Current options for this dual degree are:

- MA – Art History and Museum Studies
- MA - Bioethics
- MA - History (Legal History)
- MA - Political Science
- MS – Biochemistry
JD/MSSA (Master of Science in Social Administration)

A dual degree program established by the Mandel School of Applied Social Sciences and the School of Law makes it possible for selected full-time students to pursue an integrated program of studies and receive the MSSA and JD degrees within four years rather than the normal five years that would be required to earn the two degrees separately. Law students enrolled in the dual JD/MSSA program may earn up to 12 credits toward the JD in graduate level MSSA courses. Applicants for the dual degree program must apply to and meet the admission requirements of both professional schools and are encouraged to apply for admission to both programs simultaneously.

Dual degree students must receive the MSSA and JD degrees simultaneously to be granted credit for specific courses taken in the other program.

JD/MD (Doctor of Medicine)

The School of Law and the School of Medicine offer a specialized dual degree program that allows a student to complete both degrees in six years. Law students enrolled in the dual JD/MD degree program may earn up to 12 credits toward the JD in graduate level MD courses. A student who begins at the law school spends two years studying law, then four years studying medicine. Alternatively, a student may spend the first two years and the last two years at the medical school, and the two middle years at the law school.

JD/MPH (Master of Public Health)

The MPH degree will generally add a year of additional course work to the JD degree, creating a four-year program. Law students enrolled in the dual JD/MPH degree program may earn up to 12 credits toward the JD in graduate level MPH courses. The law school offers several health law courses that meet the MPH elective requirements.

Graduate Law Programs

Programs for foreign-educated lawyers

Three different Master of Laws (LLM) programs are offered to students who have completed legal training outside of the United States. These programs allow students to spend one year in an intensive study program to gain exposure and immersion into the legal theory and practices of the U.S., and to engage in comparative study of the U.S. and other international legal systems. Building on a base of required courses specific to the International LLM programs, each student will develop a individual plan of study leading to a Master of Laws degree in general United States and Global Legal Studies, or the more focused fields of Intellectual Property Law or International Business Law. Students in the general United States and Global Legal Studies, or the more focused fields of International LLM programs will have the opportunity to participate in one of our International Criminal Tribunal Externships during one of their semesters in the program.

Ancillary Programs

In addition to the legal training programs, the School of Law offers three programs that are are targeted to other professionals who seek advanced training in areas of law and policy making. Students will spend at least two semesters in advanced coursework, as determined by the student's graduate program adviser. The student will then undertake significant research resulting in the writing of a doctoral dissertation under the supervision of a selected faculty member. Students must spend at least one full year in full-time residence at the law school. Completion of the SJD program typically will require two to three years of full-time effort. Further information and admission materials may be requested from the Foreign Graduate Studies Program office (http://law.case.edu/Academics/Degrees/LLM/).

Doctor of Juridical Science

The Doctor of Juridical Science (SJD) offers advanced academic study of law for students who hold either a JD degree or an equivalent professional law degree from a country outside of the USA, and some promise for advanced academic study. The SJD program is highly individualized and tailored to the student's aspirations. The program will train graduates for positions of leadership in academia, research or policy making. Students will spend at least two semesters in advanced coursework, as determined by the student’s graduate program adviser. The student will then undertake significant research resulting in the writing of a doctoral dissertation under the supervision of a selected faculty member. Students must spend at least one full year in full-time residence at the law school. Completion of the SJD program typically will require two to three years of full-time effort. Further information and admission materials may be requested from the Foreign Graduate Studies Program office (http://law.case.edu/Academics/Degrees/LLM/).

International Criminal Law

The Master of Laws (LLM) program in International Criminal Law is a one-year advanced study program to students who hold the JD degree from a U.S. law school, or equivalent training from a school outside of the USA. It provides students with an in-depth knowledge of international criminal law and procedure, international humanitarian law, and national security law, and will equip them to practice international criminal law before international tribunals or national courts. Students will plan their course of study by working closely with the Program Director. Selected students will also have the opportunity to participate in one of our International Criminal Tribunal Externships during one of their semesters in the program.

Master of Legal Studies

This is a customizable program of 30 credit hours of study for those without a prior law degree who wish to have training in legal studies to advance careers that do not require a legal license. This degree is appropriate for students planning to work in related fields but who do not need a full JD degree, students who are looking for relevant legal training as part of a dual graduate degree but do not plan to practice law, and those who are looking to bolster their credentials before applying to JD programs. Options for study in this program are varied; students may pursue the ML degree on either a full-time (two semesters total) or part-time basis. Students are required to meet with an academic advisor to develop a curricular plan prior to matriculation and periodically throughout the program.

More details on the program are available on the program website. (https://case.edu/law/academics/masters-programs/master-law-programs/)
Master of Arts in Financial Integrity
This program is intended for professionals who design and implement anti-money laundering, counter-terrorism, counter-proliferation financing policies and related integrity initiatives. Taught by leading academics and practitioners from around the world, the MAFI program is the first of its kind offered by a major research university. The program is offered on a part-time, year-round basis over 16 months through a series of intensive, three day weekend session meeting once every month. The program is 30 credits, consisting of 6 required courses, one elective, and a required capstone research project.

More details on the program are available on the program website (https://law.case.edu/Academics/Degrees/Master-of-Arts-in-Financial-Integrity/).

Master of Arts in Patent Practice
The Masters in Patent Practice is designed to prepare students for careers as patent agents. Students must be eligible to sit for the patent bar exam, which requires an undergraduate degree in engineering, computer science, or a physical or biological degree. This degree is a viable alternative for students who want to pursue a career in patent practice without having to take the full 3-year JD.

More details of the program may be found on the program website (https://law.case.edu/Academics/Degrees/Masters-in-Patent-Practice/).

LAWS 4300 Intellectual Property Survey 3
LAWS 4302 Patent Law 3
LAWS 4315 Patent Agent Lab 3
LAWS 4820 Patent Bar Review 4
LAWS 5341 Commercialization and Intellectual Property Management 3
LAWS 4311 Patent Preparation and Prosecution 3
LAWS 4312 Patent Preparation and Prosecution 2
Electives 9
Total Units 30

School of Law Faculty
Bryan L. Adamson, JD (Case Western Reserve University), MA (Purdue University)
David L. Brennan Professor of Law

Jonathan H. Adler, JD
(George Mason University)
Johan Verheij Memorial Professor of Law; Director of the Coleman P. Burke Center for Environmental Law

Anat Alon-Beck, JSD, LL.M
(Cornell University)
Assistant Professor of Law

Michael J. Benza, JD
(Case Western Reserve University)
Senior Instructor in Law

Jessica Wilen Berg, JD, MPH
(Cornell University; Case Western Reserve University)
Dean; Tom J.E. and Bette Lou Walker Professor of Law; Professor of Bioethics, Professor of Population and Quantitative Health Sciences

Jaime Bouvier, JD
(Case Western Reserve University)
Assistant Professor of Lawyering Skills

David J. Carney, JD
(University of Michigan)
Professor of Lawyering Skills

Jaclyn Celebrezze, JD
(Ohio State University)
Instructor

Juscelino F. Colares, JD, PhD
(Cornell University; University of Tennessee)
Schott-van den Eynden Professor of Business Law; Professor of Political Science

Avidan Y. Cover, JD
(Cornell University)
Professor of Law; Director of the Institute for Global Security Law & Policy, Frederick K. Cox International Law Center

Jennifer I. Cupar, JD
(Case Western Reserve University)
Professor of Lawyering Skills

Joseph A. Custer, JD, MLIS
(University of Arkansas; University of Missouri-Kansas City)
Associate Professor of Law; Director, Judge Ben C. Green Law Library

Liam Dunn, JD, MS, MA
(Case Western Reserve University)
Instructor of Law; Director of Academic Support

Peter M. Gerhart, JD
(Columbia University)
John Homer Kapp Professor of Law

Melanie R. GiaMaria, JD, MSSA
(Case Western Reserve University)
Lecturer in Law

Jonathan C. Gordon, JD
(Columbia University)
Professor of Lawyering Skills; Director, SJD Program

K. Gordon, JD
(Harvard University)
Professor of Law; Director of the Financial Integrity Institute; Associate Director of the Frederick K. Cox International Law Center

Ayesha Bell Hardaway, JD
(Case Western Reserve University)
Assistant Professor of Law; Director of the Social Justice Law Center

B. Jessie Hill, JD
(Harvard University)
Judge Ben C. Green Professor of Law
Secondary Faculty

Shannon E. French, PhD
(Brown University)

*Inamori Professor of Ethics; Associate Professor of Philosophy; Associate Professor of Law; Director of the Inamori International Center for Ethics and Excellence*

Brian K. Gran, JD, PhD
(Indiana University; Northwestern University)

*Professor of Sociology and Law*

Kenneth F. Ledford, JD, PhD
(University of North Carolina; Johns Hopkins University)

*Associate Professor of History and Law*

Ted Steinberg, PhD
(Brandeis University)

*Adeline Barry Davee Distinguished Professor of History and Professor of Law*

Martha A. Woodmansee, PhD
(Stanford University)

*Professor of English and Law*
School of Law Courses

Courses

LAWS 1101. Contracts. 4 Units.
The formation of a contract; problems of offer and acceptance; consideration; the question of contract breach; damages and remedies for a breach. Required.

LAWS 1102. Criminal Law. 3 Units.
A basic course in substantive criminal law, dealing with the standards to be used in defining and punishing criminal behavior. The course includes discussion of crimes and criminality; culpable mental states; causation; insanity; attempt and complicity; homicide; and rape. Required.

LAWS 1103. Torts. 4 Units.
This course covers compensation of an injured party for harm resulting from intentional or unintentional acts and omissions of others. Consideration is given to the rules, rationale, and policy underlying tort liability. The course includes analysis of assault and battery, false imprisonment, negligence, standard of care, duty, risk, causation, liabilities and rights of landowners and land users, liability relating to dangerous activities and defective products, liabilities arising from special relationships or specially recognized legal interests, and defenses. Required.

LAWS 1201. Civil Procedure. 4 Units.
A broad survey of the procedural development of a lawsuit is undertaken, tracing the various steps from pleading and discovery to trials and judgments. Modern procedural issues involved in jurisdiction of the courts, venue, choice of law, and former adjudications are discussed. Throughout the course principal attention is given to the Federal Rules of Civil Procedure. Required.

LAWS 1202. Property. 4 Units.
The nature of property interests; estates in land and future interests; concurrent ownership; landlord-tenant; transfer of property interests; easements, covenants, and equitable servitudes; nuisance; and zoning. Required.

LAWS 1204. Law, Legislation and Regulation. 3 Units.
Law, Legislation and Regulation is a required first-year course designed to introduce students to the structure of US government, the legislative process, principles of statutory interpretation, the operation of administrative agencies and regulatory process.

LAWS 1801. Legal Writing, Leadership, Experiential Learning, Advocacy, and Professionalism 1. 3 Units.
Students will study the fundamental lawyering skills of researching, analyzing, and writing about the law in LLEAP 1 (Fall semester of first year) and LLEAP 2 (Spring semester of first year). Skills include objective analysis and writing, complex factual and legal analysis and persuasive writing. In the simulation portion of the course students will begin to develop the basic skills of client counseling and oral advocacy.

LAWS 1802. Legal Writing, Leadership, Experiential Learning, Advocacy, and Professionalism 2. 3 Units.
Students will study the fundamental lawyering skills of researching, analyzing, and writing about the law in LLEAP 1 (Fall semester of first year) and LLEAP 2 (Spring semester of first year). Skills include objective analysis and writing, complex factual and legal analysis and persuasive writing. In the simulation portion of the course students will begin to develop the basic skills of client counseling and oral advocacy. The LLEAP 2 course particularly focuses on legal transactions. Students will learn the basic principles of reading, analyzing and drafting a contract, including identifying and developing substantive deal terms and contractual processes that should be added to the contract, although not identified by the client. By means of a simulated negotiation, the students will conduct a mock client interview and a business negotiation. Prereq: LAWS 1801.

LAWS 1901. International Law: Fundamentals. 1 Unit.
This course will examine the sources and nature of international law, as well as the processes by which international law is created, interpreted, and enforced. It will also cover substantive areas of international law such as use of force, international criminal law, law of the sea, international environmental law, and human rights law. The course utilizes simulations and role play exercises. This foundational course will be required for any students undertaking a Cox Center funded international law internship during the summer after 1L year. The course will also provide a suitable foundation for taking any advanced international law course and is a required course for the International Law Concentration.

LAWS 1903. Contemporary Issues in Criminal Law Practice. 1 Unit.
The practice of criminal law at the federal level involves many of the most difficult issues practitioners face: how do you best navigate the structure of the federal court system in a way that is advantageous to your client? What is a trial exactly, and how does it work? If someone is convicted of a crime, what happens next? Are we incarcerating too many people in America? Why is there such a stark racial and socio-economic disparity between criminal defendants and other courtroom actors? This seminar introduces those issues, and provides a window into the lives of Assistant United States Attorneys, Assistant Federal Defenders, Magistrate Judges, and other federal practitioners.

LAWS 1905. Legal Analysis and Problem Solving. 1 Unit.
This course provides students with an opportunity to enhance their legal analysis and exam-writing skills. The course also focuses on key components of law school success, such as maximizing the classroom experience, effective reading and briefing of case law, and exam preparation.

LAWS 1906. Professionalism: Essential Competencies and Characteristics of a Successful Lawyer. 1 Unit.
This course involves exploration of professional competencies and characteristics that are essential eligibility requirements for bar admission and that employers have identified as critical to success in the legal profession. These include: honoring commitments, integrity and trustworthiness, diligence, listening, good judgment, compliance with deadlines, and civility. Students will evaluate how their own strengths and weaknesses fit with these competencies and characteristics, and consider how to develop them throughout law school and also communicate them to potential employers and colleagues.

LAWS 1912. Bioethics and Law I. 1 Unit.
This course will provide an introduction to Bioethics and Law. Bioethics and Law I will focus on end-of-life care and cover topics such as informed consent, medical decision making, capacity, definitions of death, and medically-assisted dying.
LAWS 1913. Pandemic Law and Ethics. 1 Unit.
Introduction to basic legal and ethical issues raised during the current Covid-19 pandemic. Topics include: defining pandemics; understanding the roles of local, state and federal government; identifying the general range of public health powers; and exploring some of the ethical issues which arise in the current environment.

LAWS 1914. Courts, Public Policy, and Social Change. 1 Unit.
Courts, Public Policy, and Social Change will focus on the NAACP's litigation campaign against racial segregation that culminated in the landmark Supreme Court decision in Brown vs. Board of Education and also will examine the real-world impact of that decision. Among the principal topics to be considered are strategies for reforming legal doctrine, the relationship between lawyers and their clients, the use of empirical evidence in the legal process, and methods of implementing judicial rulings.

LAWS 1915. Civil Litigation Practicum I. 1 Unit.
This course will provide first-year students with a "hands-on" opportunity to participate in civil litigation by assisting the instructor with civil litigation matters handled through the Milton A. Kramer Law Clinic Center. While first-year students (unlike third-year students) are not permitted to practice law under Ohio's legal-intern rule, see generally Ohio R. Gov. Bar II, they are permitted to assist by interviewing clients, conducting fact and legal research, drafting court filings, and assisting in live litigation-related appearances (depositions, trials, appellate arguments). In this course, students will observe and, to the extent permissible, engage in a wide variety of civil-litigation activities. The class sessions will focus on the applicable substantive and procedural law and related issues of case strategy, ethics, and professionalism.

LAWS 1916. Artifact Law. 1 Unit.
This course provides an introduction to art law by addressing the law governing who is entitled to possession of archeological and historical artifacts. It considers the relative rights of finders and other persons, the rights of persons who take possession of such artifacts by way good faith purchase or who simply have possession for a long time. The problem of international movement of artifacts and resulting conflict of laws is introduced. The impact of governmental assertions of ownership over "cultural" property is examined, as are international treaties relating to artifacts. The course complements the basic Property course, emphasizing doctrines applicable to personal property.

LAWS 1917. Energy and Climate Law and Policy. 1 Unit.
For well over three decades the scientific community has warned us of the economic and environmental risks posed by continued burning of fossil fuels to the earth's climate. We are now experiencing the extreme weather events we were warned of decades ago. The clock is ticking. This class will explore state and federal energy and climate laws and policies that have been adopted, as well as other legal mechanisms to address climate. Students will then be asked to design and craft laws and policies they believe should be advanced to address the climate crisis.

LAWS 1924. Courts, Public Policy, and Social Change II. 1 Unit.
Courts, Public Policy, and Social Change is designed to offer students a perspective on the social impact of law and legal institutions. The course will focus on civil challenges to discrimination based on race and sex. Among the principal topics to be considered are strategies for reforming legal doctrine, the relationship between lawyers and their clients, the use of empirical evidence in the legal process, and methods of implementing judicial rulings. Part II will examine the litigation campaign against gender discrimination.

LAWS 2001. Professional Responsibility. 3 Units.
This course deals with questions underlying the responsibilities of the lawyer, as a professional, to self, society, client, and the profession. Premises concerning the lawyer's role or roles within the context of the adversary system are examined in some detail, as is the idea of professionalism. The Model Code of Professional Responsibility and the Model Rules of Professional Conduct are analyzed as generalized statements of the aspirations and obligations of lawyers, and as applied to concrete problems. Required.

The constitutional system of the United States; judicial function in constitutional cases; the division of powers between the nation and the states and within the national government; the powers of the president; national and state citizenship; and constitutional limitations on the powers of the states and nation for the protection of individual liberties. Required.

LAWS 2803. Legal Writing, Leadership, Experiential Learning, Advocacy, and Professionalism 3: Advanced Skills. 3 Units.
This course continues to develop the legal skills introduced in LEAP 1 and 2 courses. Students will continue their study of legal research, analysis, and advocacy in this advanced writing course. Two sections will be offered each semester providing students with the choice of focusing on Litigation or Transactional work. Students will engage in simulated counseling with clients such as, negotiations, case management conferences, and firm meetings. In the Transactional section, students will work through an entire transaction starting with a letter of intent, continuing on to contract drafting and due diligence, and ending with the closing. In the Litigation section, students will be exposed to the entire spectrum of litigation a case, including pleadings, discovery, dispositive motions, pretrial filings, trial, and appeal.
LAWS 3501. Introduction to Financial Integrity. 4 Units.
This course will introduce students to laws, policies, and practices in combatting money laundering, terrorism financing, and evasion of targeted sanctions. It focuses on the Financial Action Task Force’s 40 Recommendations and Methodologies for Assessing Compliance, and cites examples of compliance assessments from jurisdictions from around the globe.

LAWS 3502. Preventive Measures. 4 Units.
This course examines in detail measures that banks and other financial institutions are required to implement as financial integrity preventive measures. Focuses on risk assessment, customer on boarding and acceptance, record keeping, customer activity monitoring, suspicious activity report preparation, internal controls, and the supervisory process. Risk assessment techniques will be emphasized. Also, the course reviews the FATF preventive measures standards and methods of compliance assessments. A sampling of key national laws and regulations, including those of the United States, is included.

LAWS 3503. Operational & Law Enforcement. 4 Units.
This course will examine the operations of national financial intelligence units in analyzing suspicious activity reports and other data and information and in creating actionable intelligence from that information. It will then review the investigation and prosecution of both criminal and civil prosecution of financial integrity crimes. The course will also review the FATF operational and law enforcement standards and methods of compliance assessments. A sampling of key national laws and regulations, including those of the United States, will be included. Prereq: Must be enrolled in the Executive Master of Arts-Financial Integrity program.

LAWS 3504. International Cooperation in Civil and Criminal Matters. 4 Units.
This course will examine in detail how financial intelligence units, investigators, prosecutors, and investigative judges/magistrates cooperate with officials of other jurisdictions in identifying possible financial integrity crimes, investigating and prosecuting those cases, and recovering assets that are candidates for freezing or confiscation. The course will also review the FATF standards for cooperation in civil and criminal matters and methods of compliance assessments, relevant U.N. conventions, model laws and regulations, and a sampling of key national laws and regulations, including those of the United States. Prereq: Must be enrolled in the Executive Master of Arts-Financial Integrity program.

LAWS 3505. Building and Implementing an Effective Preventive Measures Compliance Program. 4 Units.
The course will examine specific problems that arise in building an effective preventive measures program. In addition to an in-depth examination of selected problems in designing and implementing preventive measures, the course will cover audits, inspections, on-site examinations, and sanctions. It will rely primarily on the presentation and discussion of case studies in each critical area of an effective compliance program, with a focus on the banking sector. Prereq: Must be enrolled in the Executive Master of Arts-Financial Integrity program.

LAWS 3506. Building and Prosecuting Criminal and Civil Financial Integrity Cases. 4 Units.
The course will examine specific problems that arise in building and prosecuting financial integrity cases. In addition to an in-depth examination of selected problems in building and prosecuting cases, we will cover problems in asset tracing and recovery, and will rely primarily on the presentation and discussion of case studies in each critical area of investigation and prosecution. Prereq: Must be enrolled in the Executive Master of Arts-Financial Integrity program.

LAWS 3551. Customer Acceptance & Transaction Monitoring Systems. 2 Units.
This course will consider the use of automated customer acceptance and transaction monitoring systems, as well as follow-up investigations by internal FIUs. It will examine key issues in data base formation, including web-based text recognition and analysis, link analysis, and different forms of statistical discriminant and regression analysis, and forms of data presentation. The course will make use of case studies and will examine current vendor products. Prereq: Must be enrolled in the Executive Master of Arts-Financial Integrity program.

LAWS 3552. National Financial Intelligence Units. 2 Units.
This course will consider the use of automated systems for analyzing suspicious transaction reports and other data to develop actionable intelligence, as well as follow-up investigations by national FIUs. It will examine key issues in data base formation, including web-based text recognition and analysis, link analysis, and different forms of statistical discriminant and regression analysis, and forms of intelligence presentation. The course will examine current vendor products and make use of case studies. Prereq: Must be enrolled in the Executive Master of Arts-Financial Integrity program.

LAWS 3553. Mutual Evaluations. 2 Units.
The course will cover the process of assessment compliance with the Financial Action Task Force’s 40 Recommendations by use of the FATF’s Methodology of Assessment. It will cover all aspects of compliance assessment, from initial self-assessment questionnaire preparation to final discussion of the draft assessment at the FATF/FSRB Plenary. Prereq: Must be enrolled in the Executive Master of Arts-Financial Integrity program.

LAWS 3554. Global Justice: Anti-money laundering and financing of terrorism. 2 Units.
The course will focus on practical and theoretical issues of global justice as they pertain to anti-money laundering and combating the financing of terrorism. What are our obligations to international justice? How do they influence financial integrity law law? The course will consider the normative basis of jurisprudence, comparing legal positivism to natural law theory. Next, the course will look at theories of global justice suitable to answer normative questions on what law should aim at. The remainder of the course will consider practical issues that come into play with financial integrity law, such as corruption, poverty, distributive justice, human rights, violence, and war. Prereq: Must be enrolled in the Executive Master of Arts-Financial Integrity program.

LAWS 3555. Blockchain and Artificial Intelligence in Compliance. 2 Units.
This course will cover the rise of technology use in compliance and risk disciplines impacting financial crimes industry. The focus will be on use of artificial intelligence and introduction of new products such as cryptocurrency, initial coin offerings and crypto asset backed offerings lend to increase complexity in the role of compliance when dealing with products and technology without an established roadmap. Content and discussions will examine the changing demands on compliance officers and growing reliance of technology in operational execution of the AML/CFT program. It will review the disparate guidance globally which make the operational implementation and compliance advisory challenging in a fast-paced financial services industry. Prereq: Must be enrolled in the Executive Master of Arts-Financial Integrity program.

LAWS 4101. International Law. 3 Units.
An introduction to basic comparative, transnational, and international law disciplines. Using areas of substantive and procedural law familiar to first-year students, the course examines issues arising from cross-national activity. Students are exposed to choice of law, comparative law, international law, and international institutions.
LAWS 4201. Health Law. 3 Units.
This course provides a broad survey of the fundamental legal issues surrounding the delivery of health care in the United States. It is an introduction to the complex and wide-ranging field of health law. Topics include: health insurance; the regulation of medical professionals and institutions; the clinician-patient relationship; liability of health care professionals and institutions; discrimination in health care; and professional relationships in health care. Students will learn to identify and analyze major legal issues in health care contexts and to understand the interplay among cost, quality, and access to care.

LAWS 4300. Intellectual Property Survey. 3 Units.
This course is designed to provide students with an overview of several areas of law traditionally associated with intellectual property or IP, including copyright law, which pertains to the protection of literary, musical, and artistic creations and has issues replete with First Amendment implications; patent law and trade secret law, which focus on the protection of technological works ranging from chemical formulae, to software, to biotechnology; and trademark law, which relates to the goodwill associated with corporate identity and product recognition. We will also devote time to the study of the philosophy and economics of intellectual property keeping in mind, throughout the course, the need to strike an optimal balance between incentives to create and commercialize intellectual creations on the one hand and public access to these creations on the other hand.

LAWS 4301. Copyright Law. 3 Units.
Copyright law is the in-depth study of the legal doctrine and policy relating to the protection of one's artistic, literary, musical, and computer-related expression. We will focus primarily on the 1976 Copyright Act and amendments thereto, such as the Digital Millennium Copyright Act of 1998.

LAWS 4302. Patent Law. 2 - 3 Units.
Basic concepts of patent law as property considered primarily in its substantive aspects, including the relationship to other forms of protection and intellectual property, infringement, and statutory requirements for patents.

LAWS 4303. Trademark Law. 3 Units.
Trademark Law is the study of how commercial entities use words and designs to identify the source their products and services in the minds of consumers and competitors. This course focuses on domestic and international trademark acquisition, retention, transfer, registration, and infringement. In addition to the common law of trademarks and unfair competition, much of this course will be devoted to studying the statutory scheme of federal trademark law.

LAWS 4311. Patent Preparation and Prosecution 1. 3 Units.
Patent preparation, drafting, and filing of a patent application are the fundamental aspects of patent practice. Students will learn how to conduct a client-inventor interview, what questions to ask the client-inventor and what information is most important to obtain prior to commencing the patent drafting process. Technical aspects of patentability searching will also be explored. In addition, the student will learn the various parts of the patent application and best practices associated with drafting each part. Before the drafting takes place, the class will cover relevant case law. Also, nonlegal, practical aspects such as organization, various grammatical concerns, and other concepts related to patent drafting will be covered. Ultimately, students will take the information provided in the class and draft an actual patent application based upon a simple hypothetical invention. Emphasis will be placed on specification drafting and claim drafting, and how to claim around prior art. Prereq or coreq: LAWS 4302.

LAWS 4312. Patent Preparation and Prosecution 2. 2 Units.
The course builds on Patent Preparation and Prosecution 1 (LAWS 4311) and will focus on aspects of patent prosecution post-filing. In particular, students will learn how to respond to an Office Action rejecting the patent application as is typically encountered during the practice before the US Patent and Trademark Office. The student’s response will take the form of an Amendment that will reflect changes made to the claims and arguments relating to patentability. The course will also cover the appeals process. Prereq: LAWS 4311.

LAWS 4315. Patent Agent Lab. 3 Units.
The patent claim is the most important part of the patent application, because it is the claim that represents the metes and bounds of inventor’s property right. This Lab is devoted to drafting claims, understanding the different types of claims, and how claims differ depending on the nature of the technology.

LAWS 4401. Business Associations. 4 Units.
This course is an introduction to the law of business associations, including general and limited partnerships, limited liability companies, and corporations. The functions and relationships of enterprise participants, primarily promoters, equity owners, creditors, and managers are investigated. The course covers pre-organizational problems and then canvases the roles of ownership and management, with emphasis on the special duties (fiduciary and other) imposed on certain participants in publicly and closely-held entities. The regulation of securities fraud, proxy voting and solicitations, and the issuance of securities under the federal securities laws is explored. Fundamental concepts of business financing, including valuation of the concern and claim structure, are investigated. Organic changes, including dissolutions, mergers, and tender offers, are discussed.

LAWS 4402. Nonprofit Organizations Law. 2 Units.
Explores the rationales for the existence of the nonprofit sector and the allocation of certain functions to it. The focus is on the legal framework for the structure and operation of nonprofit organizations under state nonprofit corporation statutes and the policy and practice of preferred tax treatment for selected organizations and gifts to them under the Internal Revenue Code.

LAWS 4404. Sales. 3 Units.
One of the basic courses in commercial law. It serves equally as an introduction to the general organization, structure, and appropriate application of the Uniform Commercial Code. Primarily we study the law of Sale of Goods under Article 2 of the U.C.C. Necessarily this includes a study of products liability law, which is explored under both sales warranty and strict tort liability theories. The interrelationship between these competing theories of products liability law are also investigated. Other specific topics studied are the legal rules applicable to 1) the formation of sale contract, including the battle of the forms, statute of frauds, and parol evidence rule, 2) performance of and excuse of performance from the sales contract, 3) title warranties and title transfers, and 4) remedies for breach of the sales contract. Students may not take both LAWS 381 and LAWS 266 (Sales and Secured Financing).

LAWS 4405. Federal Income Tax. 3 - 4 Units.
An introductory course in federal income taxation of the individual taxpayer, including a consideration of the nature of income, specific statutory exclusions, business and nonbusiness deductions, the treatment of capital gains and losses, and elementary tax accounting.
LAWS 4406. Franchise Law. 1 Unit.
The course will provide an overview of federal and state regulation of franchise sales and will touch on other legal issues (types of business entities, trademark law) encountered when a business proposes to sell franchises. We will address sample franchise agreement clauses, requirements for completing the mandatory franchise disclosure document, and typical franchise related litigation scenarios.

LAWS 4561. Governance, Risk Management, and Compliance. 3 Units.
This course deals with the institutional dynamics that allow compliance officers to interact with business owners and regulators in order to properly risk-manage compliance requirements while creating and enforcing a code of conduct that champions an ethical corporate culture. The students are introduced to the Code of Ethics and corporate governance, including the role of the board of directors and executives in managing firms and overseeing risk management and regulatory compliance. The course covers the detection and handling of potential compliance lapses, including the conduct of investigations and the role of whistleblowers and attorney advisors. Students will explore the broader compliance functions of social responsibility, sustainability, and human rights. This course will be useful as a foundation for any student studying any highly regulated field where risk management is required, such as in the health care or finance settings.

LAWS 4705. Legal Methods: Privacy Torts. 2 Units.
This course examines the concept of privacy in the law, starting with Samuel Warren and Louis Brandeis’s famous article, “The Right to Privacy,” and moving through the how stated have adopted and implemented the tort rights that Warren and Brandeis identified in that article. The course will cover the historical bases for privacy torts and explore emerging issues such as how technological advances, like the internet and smart phones, have raised new challenges to the concept of privacy in tort law.

LAWS 4711. Technology in Law Practice. 1 Unit.
One of the biggest hurdles for lawyers seeking to adapt to—and adopt—technology affecting their practices is to sort through questions about how that technology relates to traditional ethics rules. In 2009 the ABA Commission on Ethics 20/20 was created to review the impact of technology and globalization on the ABA Model Rules of Professional Conduct. By the time it completed its work in 2013, the commission had developed a number of recommendations, the most significant was the implications of the need to keep up with the changing technology environment as set forth in Model Rule 1.1, which requires a lawyer to provide competent representation to a client. This one credit course (held in an intensive one-week meeting format) will provide law students with the knowledge and practice skills needed to comply with the added language to the comments to Rule 1.1, stating that competence encompasses knowledge about “the benefits and risks associated with relevant technology.”

LAWS 4714. Essential Legal Theory. 3 Units.
This course is designed to explore the most fundamental legal concepts. The primary focus is on the characteristics of rules, what rules must be like and how they can ‘go wrong.’ Other legal norms, such as standards, will also will explored, and the question will be posed: when ought the law to use rules, and when standards? The centrality of such norms to the enterprise we call law will be examined, as well as the question of whether such norms are binding upon the citizen. We consider the nature of justice and how it relates to law, as well as how legal entitlements are structured in terms of rights and privileges. We also examine how these ideas shed light on the nature of legal reasoning. Along the way, we will discuss one of the most common problems generated by misunderstanding the nature of rules and standards: the many confusions surrounding the notion of a stereotype. We pose the question: when and why is decision-making by use of a stereotype improper? In this context, we will examine a number of issues of age, gender, and racial discrimination, among others.

LAWS 4806. Administrative Law. 3 Units.
This course examines the legal and institutional framework within which agencies administer regulatory statutes, with emphasis on procedural and constitutional issues. Major themes include limiting arbitrary action, controlling agency discretion, and promoting governmental accountability. Examples and problems are drawn from a wide range of substantive areas, including business, communications, consumer protection, education, environmental, health and safety, intellectual property, labor and employment law, and real estate law.

LAWS 4807. Criminal Procedure I. 3 Units.
The investigatory stage of the criminal process. Constitutional limitations on searches and seizures, interrogation practices, and pretrial identification procedures are examined. In addition, the exclusionary rule, the principal method for enforcing Fourth, Fifth, and Sixth Amendment rights, is considered.

LAWS 4808. Evidence. 4 Units.
A comprehensive course in the law of evidence as applied in civil and criminal cases. Subjects include relevance, hearsay, judicial notice, privileges, examination of witnesses, expert and lay opinion testimony, and real, demonstrative, and scientific evidence. This course deals with both the practical applications and theoretical underpinnings of the Federal Rules of Evidence and common law precedents. Students may not take both LAWS 207 and LAWS 212.

LAWS 4809. Wills, Trusts, and Future Interests. 3 - 4 Units.
A survey of the law of intestate and testate succession, will substitutes, private and charitable trusts, fiduciary administration, and future interests (including the Rule Against Perpetuities).

LAWS 4810. Entering the Profession. 2 Units.
This course provides an introduction to the testing formats and required skills common to bar exams in United States jurisdictions, including the Multistate Bar Exam (MBE, multiple-choice format); the Multistate Performance Test (MPT, task-oriented essay); and essay questions in various substantive areas (which generally incorporate some state-specific content). Substantive content will be presented to provide raw material for practice testing. Students will earn the course credit by attending at least 80% of class sessions and completing 100% of written assignments with at least 65% success rate. Rewrites and retests will be allowed on request. The course does not comprise complete preparation for any bar exam. Rather, it provides familiarity, study strategies, and test-taking instruction along with limited substantive content.
LAWS 4820. Patent Bar Review. 4 Units.
Passing the patent bar is a requirement for practicing before the U.S. Patent & Trademark Office (USPTO). This course will introduce students to 35 U.S.C. (the United States "patent laws") and 37 C.F.R. (Code of Federal Regulations encompassing the patent rules), followed by an in-depth study of the M.P.E.P. (Manual of Patent Examining Procedure), which is the Patent Office’s rule book that covers all the patent laws and rules as interpreted by the USPTO. In addition, the course will cover the particulars of the patent bar exam, including questions from prior exams; essential materials the students need to master to pass the exam, and provide students with several opportunities to hone their bar taking skills. Prereq: LAWS 4302 and LAWS 4311 and enrolled in the Master of Patent Practice program.

LAWS 4901. Foreign Graduate Seminar. 2 Units.
This seminar is the required introductory course for foreign students enrolled in the Graduate Program in U.S. Legal Studies. It begins with a series of lectures introducing students to American legal education, American government, courts, and culture; various common law subjects; and professional responsibility. Throughout the year seminar sessions are held with legal practitioners from law firms and corporations in the Cleveland area who are involved in an international practice. Limited to the foreign LL.M. students.

LAWS 4903. U.S. Contract Law. 3 Units.
The subject matter and coverage of this course is approximately the same as the subject matter and coverage of first-year Contracts (LAWS 1101) as abbreviated and modified to reflect that it (a) is limited to foreign students who are candidates for the LL.M. in U.S. Legal Studies and (b) consists of 3 (not 5) credit hours.

LAWS 4904. Doing Business in the United States. 3 Units.
The course is designed to introduce foreign students to many areas of U.S. domestic law through consideration of a transnational business transaction. Examples of areas of law covered: restrictions on foreign investment, regulatory agencies, banking and finance, importing and exporting, business entities, litigation and alternative dispute resolution, labor relations, immigration law, taxation. Limited to candidates for the LL.M. in the U.S. Legal Studies.

LAWS 4910. Language and Law. 0 Unit.
This course introduces students to the study of law in the U.S. and provides students with a practical introduction to U.S. legal writing and analysis. The class emphasizes reading, analysis, research, writing, and comprehension skills necessary for students to participate in legal discourse in a law school setting. The course allows international students and professionals to develop language skills in a law-related context. No credit is awarded toward the degree requirements, but completion of this course may a condition of admission to the law school's foreign graduate programs.

LAWS 4911. SJD Seminar. 0 - 2 Units.
This year-long seminar is required of all SJD program students. The purpose of the class is to improve the academic writing skills of SJD students, introduce students to thesis writing, and to improve the English writing skills of those students whose native language is not English.

LAWS 4912. U.S. Legal Research, Writing, and Analysis. 2 Units.
This is a required course for students in any of the Foreign Graduate LL.M. programs. The course is designed to teach English compositional skills and grammar for legal studies. With an English-as-a-second-language focus, this course will seek to teach students the various steps of the writing process, English grammar, and certain aspects of legal composition. The main goal of this course is to enable students to write clearly and correctly within U.S. legal studies and the U.S. legal work place.

LAWS 4922. U.S. Legal Scholarly Writing. 1 Unit.
This is the second of a two-course sequence for students in the Foreign Graduate LL.M. programs. This course focuses on advanced writing schools, with special attention to legal research skills. The course is required for students seeking a degree in the specialty LL.M. programs, and is an elective for other LL.M. students.

LAWS 4930. Intensive English Language Study. 0 Unit.
The course is designed for LL.M. students who have already studied English and are below (but close to) the proficiency level for full-time LL.M. studies. The course seeks student proficiency in spoken and written English. The course provides intensive English speaking and writing course designed specifically for foreign graduate legal studies students needing English language skills to succeed in their legal studies.

LAWS 5110. Contemporary Issues in International and Comparative Law. 1 Unit.
The objectives of the course will revolve around initiating students to the basic concepts and principles of comparative law reasoning and helping students make sense of the increasing dialogue between jurisdictions practicing constitutionalism in a global context with a focus on human rights issues. The coverage of the proposed course will select from the following themes depending on student interest and availability of materials: (a) Freedom of religion, secularism and culture; (b) Freedom of expression and hate propaganda; (c) Freedom of expression and sexual representation; (d) Equality and same sex unions; (e) Assisted suicide; (f) Death penalty, (g) Implementation of human rights in federal or quasi-federal politics; (h) Socio-economic rights; and/or (i) Cultural rights.

LAWS 5111. Admiralty Law. 2 Units.
The general principles of admiralty law including jurisdiction, practice, maritime liens, collisions, salvage, limitation of liability, and the rights of injured maritime workers.

LAWS 5113. Counterterrorism Law. 3 Units.
This course will take an in-depth look at counter-terrorism in the United States, Israel, and other countries. The course will examine the competing conceptions and definitions of terrorism at the national and international level and the institutions and processes designed to execute the "war on terrorism." This will include study of the balance between security and liberty policies in the U.S. Patriot Act, the use of military tribunals or civil courts, the use of assassination or targeted killings, and the emerging law on enemy combatants and their detention, and the arguable need for new self-defense doctrines at the global level.
LAWS 5115. International Arbitration. 2 Units.
An advanced course covering the current status of arbitration as a dispute settlement mechanism in international affairs. This course will cover the use of arbitration as a means of resolving international disputes: a) between private parties; b) between private and governmental parties; and c) between governments. It will cover possible forums and rules of arbitral dispute resolution and the problems of the enforcement of foreign arbitral awards. Special aspects of dispute resolution in certain geographical and subject areas will be covered as will be the problem of sovereign immunity. Disputes arising from multinational business transactions will be focused on as will be maritime, environmental, and border disputes.

LAWS 5116. International Human Rights. 3 Units.
This course will cover a variety of issues in the area of international human rights. Issues covered will include the law of treaties and treaty interpretation; international organizations' and non-governmental organizations' roles in protecting human rights; the rights of women and minorities; critiques of the idea of "universal" human rights; and the Alien Tort Claims Act. In addition to covering the procedure and substance of the international system for protection of human rights, we will also discuss human rights under various domestic legal systems from a comparative perspective.

LAWS 5118. International Law Research Lab. 3 Units.
Students in this unusual course undertake legal research projects designed at the request of various international law enforcement organizations. Recent clients include the International Criminal Court, the UN-affiliated tribunals in Cambodia and Sierra Leone, Interpol, U.S. Military Commissions, and the U.S. Coast Guard, among others. Course sessions explore the development and practice of international criminal law as well as developing jurisprudence relevant to the current students' projects. Substantial time is devoted to in-class discussion of target issues, writing workshops, and individual presentation of findings. Completed projects are forwarded to the requesting clients and posted in the school's international war crimes portal. Grades are based on the quality of students' participation and the final written product.

LAWS 5120. International Business Transactions. 3 Units.
This course examines various types of international business activities from a transactional perspective. It focuses on international sales, international payments, and international licensing transactions and examines the different legal systems (state, federal, international) that may impact on these transactions. It also considers commercial aspects of the interpretation of cross-border contracts, dispute resolution concerning cross-border contracts, and the role of lawyers. Some basic issues relating to private international law/conflicts of law are also addressed. There is also some introductory coverage of international electronic commerce transactions and related legal issues.

LAWS 5121. International Criminal Law and Procedure. 3 Units.
This course surveys selected issues and current problems involving the criminal aspects of international law and the international aspects of criminal law. The course begins with an introduction to the origins and purposes of international criminal law. We will then explore the contours of the duty to prosecute those who commit international crimes. Next, we will focus on application of domestic and international law to the question of jurisdiction over international criminal activities. This is followed by three units examining substantive international criminal law as contained in multilateral treaties concerning terrorism, war crimes and crimes against humanity. Next, we will explore the procedural aspects of international cooperation in criminal matters, with particular attention to extradition and problems associated with obtaining evidence from abroad. We will also analyze the reach of U.S. constitutional protections to U.S. investigative and law enforcement activities overseas. Finally, we will study the new Yugoslavia and Rwanda War Crimes Tribunals and the permanent International Criminal Court. The class will be seminar-format, with short writing assignments, weekly simulations, and role-play exercises designed to bring the materials to life. There will be no final exam.

LAWS 5122. Transnational Litigation. 2 Units.
This seminar focuses on the litigation of transnational disputes in domestic courts. Topics include jurisdiction, international service of process procedures for obtaining evidence internationally, and the international enforcement of judgments. Students will complete a substantial research paper and will present the results of their research to the class.

LAWS 5123. Trade Law. 3 Units.
The public international and United States law regulating international trade. (The private law of international trade and investment is dealt with in International Business Transactions, LAWS 354.) It includes the economic theory of international trade (although no exposure to a course in economics in secondary or undergraduate education is necessary) as well as a legal examination of issues regulating global and regional (e.g., the Canada-U.S. Free Trade Agreement, EEC) international trade. Primary emphasis is on the General Agreement of Tariffs and Trade (GATT) and the World Trade Organization (WTO) as well as such United States legislation implementing the GATT as antidumping and countervailing duties legislation and escape clause relief. The roles of trade and aid are also explored, as well as U.S. legislation affecting the transfer of resources to less developed countries.

LAWS 5124. Islamic Law. 2 Units.
This course will cover major aspects of the Islamic Law. It will provide students with a better understanding of Islam and its adherents. Many topics related to Islam and its basic beliefs, including some contemporary issues, will be covered in this course.

LAWS 5127. Race and American Law. 3 Units.
This course provides students with both a broad survey of the history of race, racism, and American law, and an opportunity to focus individual research on a current issue through the lens, and in light, of the history. The course will focus on the historical, social and cultural context in which racisms originate and flourish; the role that law plays in both legitimating and overturning racisms; the role of courts and legislative bodies in addressing racisms; and other avenues of addressing racisms in light of law's limitations and complicity in racisms. Areas of particular focus will include racial identity; equality, state violence; voting; education; incarceration; housing; hate speech; and remedies. Prereq: LAWS 2002 or equivalent.
LAWS 5128. Holocaust and the Law. 2 Units.
Students will study the role of law before, during, and after the Holocaust. The course begins by examining the legal and political landscape in which the German Weimar Republic transformed into a dictatorship, and the role of law, lawyers, judges, and the courts in the transition and under the Nazi Regime. Students will also study the myriad of legal issues that arose after the Holocaust, including the Nuremberg trials; claims for restitution, slave wages, insurance proceeds, and artwork; Holocaust denial; immigration policy; and the how the Holocaust and its aftermath shapes the political and legal response to genocide today.

LAWS 5135. War and Morality. 3 Units.
The aim of this course is to explore a wide range of ethical issues relating to the decision to take a nation to war, how wars are conducted, and efforts to establish order in the wake of a conflict. Topics include the Just War tradition, pacifism, humanitarian intervention, moral repair and the establishment of a just peace, conduct of war, warrior codes, warrior transitions, and civil-military relations. We will be examining the ethics of war from the perspectives of both states and individuals. War is a crucible that strips those caught up in its horrors down to their fundamental selves inspiring acts of both inhuman depravity and seemingly superhuman nobility. This course is presented in a seminar format with lively discussions centering on contemporary readings in military ethics from texts and journals. Offered as PHIL 317, PHIL 417, and LAWS 5135.

LAWS 5136. International Humanitarian Law. 1 Unit.
This course is designed to prepare the student members of the Jean Pictet Competition team, but is open to all students with an interest in international humanitarian law. The course will be taught in two all-day Friday-Saturday sessions in January and February by international humanitarian law expert Gregory Noone, who is currently a fellow at the U.S. Institute of Peace and was previously Head of the Foreign Military Rights Affairs Branch of the Office of the Judge Advocate General at the Pentagon. Using case studies as well as simulations and role-playing exercises, the course will address the field of international humanitarian law as a whole, including the law of armed conflict, international criminal law, international human rights law, and the role of international organizations such as the ICRC and U.N. The objective of the course is to convey the reality of international law. Like humanitarian law itself, the course will not deal solely with legal disputes or judicial matters, but with practice and real life situations. The course grade will be based on a paper that will not satisfy the Writing Requirement.

LAWS 5137. Chinese Law. 3 Units.
This seminar will introduce students to the functions, purposes, and ongoing institutionalization of the law in the People's Republic of China. After briefly examining China's modern and traditional history, we examine the legal system's role in the political, social and economic development of China. Over the semester, we will investigate several areas of law—constitutional law, criminal law, economic law, property and intellectual property—and then highlight topics of particular concern to the international community, such as human rights, the WTO and China's commitment to international law. The goal is for students to understand both internal legal developments within China, the increasingly important role China plays on the global stage, and (ideally) to reflect upon the American legal system.

LAWS 5138. Chinese Business Law. 3 Units.
This course will introduce students to Chinese business law systems in the context of globalization and from the perspective of comparative law. We will examine the various legal aspects of "doing business in China" through discussing the Chinese corporate law, contract law, foreign direct investment law, and other relevant systems. Course objectives are for students to gain understanding of both the legal theories and practices in the field of Chinese business law, be able to identify and analyze the issues arising from the US businesses invested in China and/or the Chinese-US joint ventures, and be able to provide solutions to solve these issues.

LAWS 5140. Vis International Commercial Arbitration Practicum. 3 Units.
This course introduces students to the basics of international commercial arbitration ("CA"). They will learn both substantive law (such as how to use the CISG, UNCITRAL rules) and legal skills associated with the practice of ICA. The main assignments for the class will include a brief for either the claimant or respondent in a commercial arbitration, and an oral argument on behalf of the client. Course is limited to students in the Joint LLM Degree in International Commercial Law & Dispute Resolution. Prereq: Limited to students in the LLM program only.

LAWS 5172. Transnational Litigation Topics. 2 Units.
This course provides additional credits for students who are interested in doing additional research and writing in a specific area of transnational litigation. With the permission of the Instructor, this work may satisfy the JD Writing Requirement. Coreq: LAWS 5122.

LAWS 5173. International Trade and Dispute Settlement Topics. 2 Units.
This course offers students opportunities for advanced study and research in a selected area of International Trade and Dispute Settlement. Prereq or Coreq: LAWS 5123.

LAWS 5203. Food, Drug, and Biotech Law. 2 Units.
This course examines the federal Food, Drug and Cosmetic Act. It will entail a detailed look at the law, policy statements, and literature related to approving new drugs and devices. The course covers such topics as human subjects research; product labeling and testing; OTC vs. prescription status; compassionate use exceptions; control of biotechnology techniques; differences between food, drugs and devices; and FDA enforcement. We will also explore how law and the legal system anticipate and also respond to changes in technology in ways that may enhance or inhibit the development of new technologies and new applications of old technologies. Attendance at classes is mandatory. Grade is based on final exam.

LAWS 5204. Genetics and Law. 3 Units.
The current federal Human Genome Project is attempting to understand the health and behavioral implications of the 50,000 to 100,000 genes in the human body. Genetic tests are being offered to let people know if they are at risk of having a child with a genetic defect or if they will later in life suffer from cancer or other disease. Genetic predispositions are also being investigated for certain behaviors such as gay sexual preference, intelligence, and anti-social behavior. This course will cover the tort law, family law, constitutional law, criminal law, employment law, and insurance implications of developments in genetics.

LAWS 5205. Public Health Law. 2 Units.
This course surveys a range of issues in public health law including contagious diseases, health surveillance and privacy, tobacco, controlled substances, obesity, firearms, emergency preparedness and bioterrorism. It is designed to introduce students studying law or public health to the basic constitutional principles involved in public health law; the scope of local, state and federal authority to regulate; and the variety of ethical issues that arise.
LAWS 5212. Civil Law and Psychiatry. 2 Units.
The interaction between law and psychiatry in the rights of persons with mental disabilities in the community and in treatment settings. Topics include involuntary commitment, suicide, guardianship, psychiatric malpractice, psychic damages, special education, confidentiality and child abuse and custody. Students will test the analysis of legal issues against actual experience (videotaped interviews, visit to a state mental hospital). The course is jointly taught by a psychiatrist and an attorney specializing in mental health law.

LAWS 5213. Psychiatry and Law. 2 Units.
This course focuses on the interaction between mental health and the legal system. Topics include: basic psychiatry for attorneys, overview of psychiatric symptoms and disorders, insanity defense, competence as a concept, competence to stand trial, other criminal competencies, insanity acquittal release, diminished capacity/guilty but mentally ill defenses, battered women syndrome defense, duress defense, informed consent, right to treatment, right to refuse treatment, duty to protect, drug courts, therapeutic jurisprudence, testamentary capacity/undue influence, defendant and prisoner rights, juvenile justice, civil commitment, infanticide, family murder and mental illness, child abuse evaluations, suicide and violence risk assessment, stalking, psychiatric disability and emotional damages, brief history of psychiatry, psychiatrist malpractice, and psychiatry and the death penalty. This course is taught by a forensic psychiatrist and is open for law, medical, and bioethics students, and practicing mental health professionals.

LAWS 5215. Health Care and Human Rights. 3 Units.
This course combines two areas of law of increasing importance and public attention. In light of emerging medical, research, and genetic technology, courts, legislatures, administrative agencies and ordinary citizens around the world often face issues of health law. At the same time, in a world that is becoming both globalized and plagued by repeated instances of ethnic cleansing and other catastrophic abuses, issues of human rights are at the forefront of public debate. The intersection of health care and human rights, therefore, constitutes a worthy and fascinating area of study. Topics to be covered will be selected from among the following: 1) an overview of relevant human rights doctrines; 2) the concept of public health; 3) the status of the right to health care in different countries; 4) biomedical research involving human subjects; 5) genetic technologies; 6) disability rights; 7) women’s reproductive and health issues; 8) environmental abuses and human rights; 9) infectious disease, bioterrorism, and human rights; and 10) war crimes and other human rights abuses, as they impact public health.

LAWS 5218. Health Care Organizations, Finance, and Regulation. 3 Units.
This course will introduce students to legal issues associated with the financing of health care (both public and private payment systems), as well as the forms and structures of modern health care organizations, including the creation and regulation of tax-exempt organizations and how the antitrust laws impact the structure and conduct of health care providers. The course will also cover the federal and state laws that impose criminal and civil penalties on health care providers for a variety of activities. Coverage will include the five main Federal fraud and abuse laws: the False Claims Act, the Anti-Kickback Statute, the Stark Law, the Exclusion Statute, and the Civil Monetary Penalties Law, as well as an introduction to the Foreign Corrupt Practices Act. Discussions will include how health care businesses can comply with these laws in their relationships with payers (e.g., the Medicare and Medicaid programs), vendors (e.g., drug, biologic, and medical device companies), and fellow providers (e.g., hospitals, nursing homes, and physician colleagues). These areas will be reviewed both from the perspective of compliance and transactional issues. The course will also cover labor and employment issues and management of patient safety issues.

LAWS 5219. Health Care Transactions. 2 Units.
This course will examine a variety of typical transactions among health care providers and payors. Students will have the opportunity to understand the financial motivation behind these transactions and to identify the unique health care law issues presented by them. Students will learn to develop alternative methods for structuring transactions to minimize or avoid such issues. The types of transactions to be examined include: physician recruitment, physician practice acquisitions, physician practice management companies, joint ventures between hospitals and physicians, mergers and acquisitions of health care providers, and formation of integrated delivery networks. Prereq: LAWS 4201 and LAWS 5221.

LAWS 5220. Health Care Controversies. 2 Units.
In this experiential 2-credit course, students are confronted with a series of current, controversial, real-world problems in health law and policy, such as how to allocate transplant organs; how to ration expensive health care services; “reforming” the medical malpractice system; how the employment of physicians by hospitals alters the legal nature of the patient-physician relationship; legal issues associated with accountable care organizations under the Affordable Care Act; etc. To approximate real-world experience in the practice of health law, students are teamed with other students on a rotating basis and required to produce a team response and present and defend it in class. For each problem, the student also is required to write a short memo (approximately 5 pages) describing their own personal solution or response. Six memos are due over the course of the semester, approximately one every two weeks. The students’ grade will be based on the grades they receive on the memos. Students from other health professional schools may enroll in the course and will be included in the teams. In addition to the law instructor there will be an outside medical or policy expert assisting with each problem. Prereq: LAWS 4201.

LAWS 5224. Hospital Risk Management. 1 Unit.
Through the use of hypothetics and examples the following topics will be covered from the perspective of an experienced risk management professional: what is health care risk management; incident reporting and investigation; legal and regulatory risks including NPDB, SMDA, Sentinel events, comparison of state laws involving medical malpractice; interface of risk management with other departments in the institution; claims and litigation management; risk financing; claims resolution; on call advice; education of all levels of health care professionals.
LAWS 5225. Research Ethics and Regulation. 1 - 2 Units.
This course is designed to introduce students to the ethical, policy, and legal issues raised by research involving human subjects. It is intended for law students, post-doctoral trainees in health-related disciplines and other students in relevant fields. Topics include (among others): regulation and monitoring of research; research in third-world nations; research with special populations; stem cell and genetic research; research to combat bioterrorism; scientific misconduct; conflicts of interest; commercialization and intellectual property; and the use of deception and placebos. Course will meet once per week for 2 hours throughout the semester. Grades will be based on class participation and a series of group projects and individual short writing assignments. Offered as BETH 503, CRSP 603 and LAWS 5225.

LAWS 5226. Public Health Law Lab. 3 Units.
This course will examine licensing and regulations of physicians, LAWS 5227. Legal Issues Affecting Hospital Medical Staff. 1 Unit.
For Public Health Law, supervised by faculty at the School of Law. Topics may include environmental health regulations, emergency preparedness, cross-border public health, food safety, health information data sharing, injury prevention, maternal/child health, public health statutes and regulations, vaccination requirements, obesity prevention, and tobacco control. Grade will be based on collaborative work and written projects.

LAWS 5227. Legal Issues Affecting Hospital Medical Staff. 1 Unit.
This course will explore the primary legal and policy principles of enrolling patients, insurance and the law of health care research and related principles that govern how industry operates today in the United States and around the world. Day 1 will focus on general principles related to privacy and data security. We will explore the foundations of privacy law, focusing on Fair Information Privacy Principles. We will then proceed to the most recent history of privacy and security law in the United States, covering the key laws by industry sector (health care, financial services), specific practice (telemarketing, data from children), and the evolving law of data security. We will briefly review how these principles apply internationally as well. Then, we will explore emerging areas for privacy and information security, including new enforcement principles, application of these principles to vendor relationships, issues related to security breaches and breach notification and key litigation issues. Day 2 will focus on the health care industry and the specific laws, regulations and principles addressing the privacy and security of health care information. This day will emphasize the primary privacy and information security principles set out in the Health Insurance Portability and Accountability Act ("HIPAA") as a baseline framework, and will explore how these rules apply in theory and in practice. We will also explore emerging areas for privacy and information security, including enforcement activities, other privacy and security laws impacting health care beyond HIPAA, the law of health care research and related principles involving the "de-identification" of personal data, and the emergence of "non-HIPAA" data as a new challenge to the privacy and data security regulatory structure. Class sessions will consist of a combination of lecture, discussion, hypotheticals, and real-life problems drawn from the instructor's experience in order to keep the class engaged. The goal for both days is to understand the key principles of the developing law in this area, but also to teach what a lawyer actually does on these issues and the need to combine legal knowledge with practical analysis and an understanding of business implications. We also will focus attention on critical policy issues related to this law, including a discussion of the emerging implications of "big data" principles on privacy rights and industry actions overall. Beyond learning the general principles of the law in this new and evolving area, we will focus on how to be an effective lawyer and provide useful advice to clients in this new and challenging area.

LAWS 5229. Information Privacy Law. 1 Unit.
Data is everywhere today, and is being used by a broader range of entities for a broader range of purposes every day. Lawyers for virtually every industry (and around the world) must understand the key principles surrounding the use and disclosure of personal data when providing virtually all aspects of legal advice to their clients, including overall compliance, business strategy, mergers and acquisitions, litigation and the full range of specific privacy and data security laws and regulations. This law applies to the biggest companies in the world, as well as an incredible array of start-up and technology companies. This course will explore the primary legal and policy principles surrounding the use and disclosure of personal data, covering the key privacy and security laws, regulations and principles that govern how industry operates today in the United States and around the world. Day 1 will focus on general principles related to privacy and data security. We will explore the foundations of privacy law, focusing on Fair Information Privacy Principles. We will then proceed to the most recent history of privacy and security law in the United States, covering the key laws by industry sector (health care, financial services), specific practice (telemarketing, data from children), and the evolving law of data security. We will briefly review how these principles apply internationally as well. Then, we will explore emerging areas for privacy and information security, including new enforcement principles, application of these principles to vendor relationships, issues related to security breaches and breach notification and key litigation issues. Day 2 will focus on the health care industry and the specific laws, regulations and principles addressing the privacy and security of health care information. This day will emphasize the primary privacy and information security principles set out in the Health Insurance Portability and Accountability Act ("HIPAA") as a baseline framework, and will explore how these rules apply in theory and in practice. We will also explore emerging areas for privacy and information security, including enforcement activities, other privacy and security laws impacting health care beyond HIPAA, the law of health care research and related principles involving the "de-identification" of personal data, and the emergence of "non-HIPAA" data as a new challenge to the privacy and data security regulatory structure. Class sessions will consist of a combination of lecture, discussion, hypotheticals, and real-life problems drawn from the instructor's experience in order to keep the class engaged. The goal for both days is to understand the key principles of the developing law in this area, but also to teach what a lawyer actually does on these issues and the need to combine legal knowledge with practical analysis and an understanding of business implications. We also will focus attention on critical policy issues related to this law, including a discussion of the emerging implications of "big data" principles on privacy rights and industry actions overall. Beyond learning the general principles of the law in this new and evolving area, we will focus on how to be an effective lawyer and provide useful advice to clients in this new and challenging area.

LAWS 5235. Health Care & Human Rights Topics. 2 Units.
This is a writing seminar that corresponds to LAWS 5215, for students who wish to do an in-depth research exploration on a topic covered in the Health Care & Human Rights course. Coreq: LAWS 5215.

LAWS 5268. Health Law and Policy Lab. 3 Units.
This course is for student interested in a more detailed exploration of Health Care Regulation topics. Work will include lectures, simulations, guest speakers, and research work. Prereq or Coreq: LAWS 4806.
LAWS 5313. Copyright and Trademark Litigation. 2 Units.
This course will begin with an overview of a copyright litigation case and then proceed to discuss issues relating to pre-litigation strategy, infringement, and defenses to infringement. Thereafter, the course will explore the drafting of a complaint and the answer thereto, including counterclaims; drafting discovery documents; preparing witnesses; and taking and defending a deposition, which will take place in the context of a mock trial, many of the issues that pertain to a trial, including the roles of judge and jury, jury instructions, direct and cross-examination, jury selection, and post-trial motions. Prereq: LAWS 4300 or LAWS 4301 or LAWS 4303.

LAWS 5314. Cyberlaw. 3 Units.
This subject deals with how the law regulates and otherwise applies to activities taking place in 'cyberspace.' It considers how existing legal principles are being modified and extended in the digital information age to meet the needs of society, particularly in relation to electronic commerce. As the nature of dealings in cyberspace develops and new legal problems emerge over time, the focus of the subject may change to reflect current legal issues. However, topics for discussion will be drawn from the following: the nature of the internet, legal regulation of cyberspace vs. self-regulation, the relevance of international law/ international regulation, e-commerce contracting, 'property' in cyberspace with particular reference to intellectual property, trademarks and domain names, defamation on the Internet, online crime (e.g., fraud, pornography, etc.), information privacy and security, online dispute resolution and associated conflicts of law issues.

LAWS 5315. Entertainment Law. 1 - 3 Units.
This course is designed to introduce students to the basic legal issues relevant to the film and television industries, as well as live performances, theatre, and various other aspects of the entertainment industry.

LAWS 5318. Intellectual Property Licensing. 2 Units.
Students will explore how companies develop business and legal strategies to protect their intellectual property assets through agreements with strategic business partners, content providers, vendors, and licensees. As part of the course, students will select a company name and protect it, draft and negotiate agreements, and hold a mock negotiation at the end of the semester. One prior course in patent, trademark, or copyright is required. Grade is based on a final examination. Prereq: LAWS 4300 or LAWS 4301 or LAWS 4302 or LAWS 4303.

LAWS 5319. International Intellectual Property. 3 Units.
LAWS 5322. Intellectual Property & Dealmaking. 2 Units.
This course will provide you the opportunity to engage as an Intellectual Property (IP) specialist in a simulated M&A (merger and acquisition) corporate transaction. You will assume the role of an associate attorney in a law firm and handle certain aspects of the sale of assets of a business, including engaging in due diligence, reviewing and drafting documents, conducting research, analyzing negotiation techniques, learning about the specialist’s role in the transaction, and preparing for the closing of the transaction. Particular emphasis will be upon IP licensing (e.g., patent licenses, trademark licenses, etc.), such as reviewing and drafting IP licensing documents. You will learn skills that an IP lawyer should have by working on and resolving IP issues from actual projects. Accordingly, it is vital to your success in this course that you complete all assignments on time and actively participate in each class. Although this course is set within the context of a company acquisition, most of the IP issues you will be analyzing are generally applicable to many other projects that an IP associate will confront. Prereq: LAWS 4401 and (LAWS 4300 or LAWS 4302).

LAWS 5323. Intellectual Property Strategy. 1 Unit.
Intellectual property rights are legally created business assets used by companies to provide a competitive advantage in the marketplace. Companies use intellectual property differently depending on many factors, such as industry, business strategy, culture and maturity. Intellectual property attorneys are considered valuable members of business teams, contributing to business strategy, business planning and other executive level business decisions. Indeed, IP is a boardroom issue. This class will study the ways intellectual property is used by different companies and how the intellectual property laws impact not only the intellectual property assets, but also the business strategy and business planning. In addition to learning how intellectual property is being used by major corporations, universities, and entrepreneurs/start-ups, the students will pick one company and study how that company manages its intellectual property. Prereq: LAWS 4300 or LAWS 4302.

LAWS 5324. Law of the Music Industry. 2 Units.
This course will cover the major components of the music industry, including recording agreements (major label and independent labels), record producer deals, songwriting and music publishing concepts, group issues, personal appearances, and music in cyberspace. There will be an extensive discussion of fundamental copyright, trademark, and cyberlaw concepts, as well as advanced copyright concepts specifically related to the recording and publishing industry. Special attention will be paid to the topic of musical copyright infringement litigation. Course materials will include selected cases, forms of the above agreements, and selected handouts. Guest speakers will include a variety of industry professionals, including personal managers, recording artists, record company executives, and concert promoters. Students will be invited to participate in a variety of special events, including attending a music industry seminar at The Rock and Roll Hall of Fame sponsored by Cleveland’s volunteer Lawyers for the Arts and attending the annual Mountain Dew High School Rock-Off held at the Odeon. Prereq: LAWS 4301 or LAWS 4300.

LAWS 5325. Museum Law. 2 - 3 Units.
This seminar is concerned with the relationship between the art world and the law. The art world is comprised of numerous players, such as artists, dealers, museums, auction houses, art critics, forgers, thieves, looters, and the American and various foreign governments. This course focuses on the law’s relationship with each of these entities and how these entities relate to one another in both a cultural and legal sense. In particular, this course will explore at least three of the following issues: theft and plunder of art (especially from 1933-45); the illicit international art trade; artists’ rights such as First Amendment rights, copyright, moral rights, and the resale right; and the role and practice of museums in the art world, including provenance studies, and the museum’s relationship with the artist and community. The first class (and some subsequent classes) will be held at the Cleveland Museum of Art. After a lecture by a museum curator, the students will be given a tour of the museum’s collection that will focus on works of art that have particular relevance to the intersection of law and art.
LAWS 5328. Intellectual Property and First Amendment in the Arts. 3 Units.
Students in this course will explore the First Amendment’s protections for artistic and cultural expression and work directly on real-life issues for clients at the cutting edge of media and entertainment law. We will examine issues involving Hollywood studios, graffiti artists, virtual reality, reality television, art installations, electronic music, and journalism in still-evolving areas of law. We will discuss issues facing media and entertainment lawyers in practice, and survey the roles lawyers play in the creative process. Class members will work (under supervision) on client matters for the First Amendment and the Arts Project. Prereq: LAWS 4300, LAWS 4301, LAWS 4303 or LAWS 5717.

LAWS 5332. Sports Law. 1 Unit.
This introductory Sports Law course will offer an overview of the three major sports that dominate the American sports scene today: Major League Baseball, the National Football League, and the National Basketball Association. The course will devote approximately equal time to each of these three major sports and compare/contrast the similarities and differences among them, from a historical legal perspective. Other professional sports, including hockey and soccer, will also be discussed via updated links to the most relevant Sports Law news, which links will be provided prior to each class. Specifically, it will evaluate the legal evolution of America’s “three major leagues”, and examine how the Supreme Court’s, other courts’, and arbitrators’ landmark decisions have affected the path of each league’s progress. Additionally, this course will address contemporary Sports Law topics, including COVID-19’s impact upon the three major leagues, the recently executed 2020 NFL Collective Bargaining Agreement, and the world of esports (professional video gaming). Prereq: LAWS 4401 and LAWS 4405.

LAWS 5333. Representing the Professional Athlete. 2 - 3 Units.
This course will begin with an overview of the sports marketing industry and then proceed to discuss one of the more important legal doctrines relating to that industry, involving intellectual property, labor law, and contract law. In that context, the course will explore the skills necessary to conduct a series of sports-related contract negotiations. Students will participate in group-based contract drafting exercises, including drafting product endorsements and license agreements, with an emphasis on client representations. Next, in the context of mock litigation, students will assume a contract breach, and will be required to draft deposition questions and legal briefs in support of their respective contractual position.

LAWS 5334. Representing the Musical Artist. 2 - 3 Units.
This course focuses on practical training in counseling the musical artist with a particular focus on lawyering skills such as contract drafting, strategic thinking and negotiation. We follow the artist from the early days as a “baby band” to when the artist becomes “classic” or “heritage.” You will observe the artist in the recording studio, the interactions among the band members, the creation of songs/sound recordings. You will introduced to the cast of characters: the producer; the first manager; the label’s A&R person; the recording engineer, and others. You will—as music lawyers commonly do—observe the artist creating in the studio and on a live stage and get a chance to speak with prominent managers, concert promoters, club owners, and artists.

LAWS 5335. Negotiation Strategies in Sports Management. 2 - 3 Units.
This course covers drafting of sophisticated contractual documents in the Sports Law world. Document that will be negotiated and drafted include a lease agreement between a municipality that is constructing a new stadium/arena and the owner/operator of a team that will play in the new venue. Also covered will be naming rights, presenting sponsorship agreements for beverage/food, automobile/rental cars, and financial/medical services. We will also examine coordination of all sponsorships in the team’s print/multimedia advertising, as well as with the broadcasts of the team’s games.

LAWS 5336. Intellectual Property Advanced Topics Seminar. 2 Units.
This course is designed to provide students with an overview of several areas of law traditionally associated with intellectual property or IP, including copyright law, which pertains to the protection of literary, musical, and artistic creations and has issues replete with First Amendment implications; patent law and trade secret law, which focus on the protection of technological works ranging from chemical formulae, to software, to biotechnology; and trademark law, which relates to the goodwill associated with corporate identity and product recognition. We will also devote time to the study of the philosophy and economics of intellectual property keeping in mind, throughout the course, the need to strike an optimal balance between incentives to create and commercialize intellectual creations on the one hand and public access to these creations on the other hand. Prereq: LAWS 4301 or LAWS 4302.

LAWS 5339. Privacy Law. 3 Units.
The rapid grown of the Internet, coupled with new business practices and new efforts by government to deploy technology for law enforcement and the administration of programs, has raised far-reaching questions about the future of privacy. The role of law is central to many of these debates. This course begins by introducing students to the historic and philosophical justifications for recognizing a right of privacy. It then explores how these justifications have been applied to information gathered by the media, law enforcement, and private organizations. The course considers the developing principles for data collection, use, and security in general, and the extent to which legal protections exist in specific subject areas such as health and genetic information, and social, financial, and political activities. Students will learn the rules governing places, information, information integrity, and data security as developed under common law; statutes, regulations, and the U.S. Constitution. While the course focuses primarily upon U.S. law, it will regularly draw comparisons with EU privacy protection, and will also explore those rules on their own.
LAWS 5341. Commercialization and Intellectual Property Management. 3 Units.
This interdisciplinary course covers a variety of topics, including principles of intellectual property and intellectual property management, business strategies and modeling relevant to the creation of start-up companies and exploitation of IP rights as they relate to biomedical-related inventions. The goal of this course is to address issues relating to the commercialization of biomedical-related inventions by exposing law students, MBA students, and Ph.D. candidates (in genetics and proteomics) to the challenges and opportunities encountered when attempting to develop biomedical intellectual property from the point of early discovery to the clinic and market. Specifically, this course seeks to provide students with the ability to value a given technological advance or invention holistically, focusing on issues that extend beyond scientific efficacy and include patient and practitioner value propositions, legal and intellectual property protection, business modeling, potential market impacts, market competition, and ethical, social, and healthcare practitioner acceptance. During this course, law students, MBA students, and Ph.D. candidates in genomics and proteomics will work in teams of five (two laws students, two MBA students and one Ph.D. candidate), focusing on issues of commercialization and IP management of biomedical-related inventions. The instructors will be drawn from the law school, business school, and technology-transfer office. Please visit the following website for more information: fusioninnovate.com. Offered as LAWS 5341, MGMT 467, GENE 367, GENE 467, EBME 467 and ECSE 467.

LAWS 5363. Intellectual Property Theory Seminar. 3 Units.
We will explore and ask several questions from a philosophical and historical perspective, including: Should one's intellectual product be entitled to protection? What are the reasons for granting or denying protection? What form, if any, should this protection take? What are the costs and benefits to society of protecting one's intellectual product?

LAWS 5364. Intellectual Property and Social Norms. 2 Units.
This course will contrast the formal protections of intellectual property law with the informal, self-regulatory mechanisms that govern a variety of creative industries. Comedians, chefs, magicians, and tattoo artists, for example, have developed nuanced, informally enforced norms surrounding creative production. We will consider these norm-based alternatives, the motivations for their adoption, and what they might teach us about intellectual property law and policy. Prereq: LAWS 4300 or LAWS 4301 or LAWS 4302 or LAWS 4303.

LAWS 5365. World Intellectual Property Organization Research Lab. 3 Units.
The course will explore cutting-edge issues directly at the interface between research and policy in international intellectual property at the World Intellectual Property Organization (WIPO). WIPO is the pre-eminent international institution responsible for the development, management, and coordination of international intellectual property. As it moves into its new 21st century mission and interaction with global policy issues such as public health, climate change, WIPO has a need for a stronger evidence and research base for its work on treaty development and technical assistance to countries. Students in the course will carry out cutting edge research on issues at the core of WIPO’s work on the future of the international IP system. Working with the WIPO Traditional Knowledge, Genetic Resources and Folklore division, students will work in teams on specific research tasks with a finished written study or brief at the end of the course for internal WIPO use, and where appropriate, for broader dissemination. Projects may include carrying out country studies; comparative analyses of patent-related provisions in traditional knowledge laws; assessing implementation of international traditional knowledge, and folklore obligations in domestic law; assessing the state of play in negotiations and processes in other forums such as the Convention in Biological Diversity, the TRIPS Council, or the Trans-Pacific Partnership negotiations. Prereq: LAWS 4101 or LAWS 4300 or LAWS 4301 or LAWS 4302.

LAWS 5366. Venture Finance & Transactions. 2 Units.
This course is designed to provide law students with the fundamentals of creating, offering and closing a technology venture transaction. In each case, the goal is to imbue students with both the legal and compliance requirements of the given strategic scenario, as well as the business and technical drivers behind the transaction. Prereq or Coreq: LAWS 4401.

LAWS 5369. Intellectual Property and Social Norms Advanced Research. 1 Unit.
This is a supplemental course for students enrolled in the IP & Social Norms who wish to do additional research to create a paper for fulfillment of the JD Writing Requirement. Students will work closely with the Instructor to define a research proposal and draft, refine, and complete a substantial research paper on a topic of mutual interest. Coreq: LAWS 5364.

LAWS 5401. International Tax. 3 Units.
This course examines the U.S. taxation of transactions undertaken by foreign individuals or entities in the U.S. as well as the U.S. taxation of transactions undertaken by U.S. individuals or entities abroad. Major topics that will be covered include determination of the source of income, the taxation of income derived from a U.S. trade or business, the withholding tax regime, taxation of various entities, controlled foreign corporations, the U.S. anti-deferral rules, the U.S. foreign tax credit, taxation of foreign currency transactions and the role of tax treaties. Prereq: LAWS 5403 or LAWS 5404.

LAWS 5402. Estate Planning. 3 Units.
This course covers the federal law of estate and gift taxation. Topics include the computation of the estate tax, the taxation of gifts, the assets included in the gross estate, deductions from the gross estate to compute the taxable estate, credits against the tax, the generation-skipping transfer tax, and estate planning ideas and techniques, such as the use of trusts. The income taxation of estates and trusts is also covered. Grade is based on class participation and a major written paper on a topic chosen by the student and approved in advance by the instructor. Prereq or Coreq: LAWS 4809.
LAWS 5403. Federal Taxation of Corporation and Partnerships. 3 Units.
The course will focus on the basic provisions of the federal income
taxation of partnerships and corporations. The topics will include the
formation of the entity, distributions to partners and shareholders,
the allocation of profits and losses in a partnership, S corporations,
redemptions, liquidations, mergers and acquisitions, corporate or
partnership divisions, and certain corporate penalty taxes such as the
accumulated earnings tax and the personal holding company tax.

LAWS 5412. Advanced Securities Regulation. 3 Units.
This course will expand on the disclosure and enforcement themes
discussed in the Securities Regulation (LAWS 307) survey course to
engage in an in-depth examination of selected real-world securities
topics. The focus will be to deepen the student’s understanding of the
SEC regulatory regime through consideration of current "hot topics" in
securities law (such as executive compensation, 8-K disclosures, loss
contingencies and Management’s Discussion & Analysis), by reviewing
SEC pronouncements and working with actual or hypothetical disclosure
and counseling situations. In addition to analyzing rules, students will
participate in drafting, analyzing and commenting on sample disclosure
documents and client advice memos. The course is designed to further
the student’s understanding of a corporate/securities law practice as well
as deepen the student’s substantive knowledge in securities regulation
law. Prereq: LAWS 5431.

LAWS 5413. Antitrust Law. 3 Units.
A study of the implementation of federal trade regulation statutes with
emphasis on the interrelationship of these laws with the competitive
tensions of the contemporary economy.

LAWS 5415. Bankruptcy. 3 Units.
An introduction to bankruptcy law, with emphasis on the current Federal
Bankruptcy Code. The course includes Chapter 7 (liquidation bankruptcy
proceedings), Chapter 11 (business reorganizations), and Chapter 13
(simplified reorganizations for individuals and sole proprietorships). Also
considered are various state law debtor-creditor remedies and the impact
of bankruptcy on such remedies. Prior enrollment in the UCC and debtor-
creditor courses may be helpful but is not mandatory.

LAWS 5418. Corporate Real Estate Transactions. 2 Units.
Real estate is typically the largest single category of capital investment
and the second largest category of repeat expense (after total personnel
costs) for most businesses. Major industrial and service sector
companies are increasingly focused on the opportunities and challenges
inherent in the real estate portfolios that support their core operations.
This course will highlight the strategic case for effective corporate real
estate management and the role of inside and outside legal counsel in
the commercial real estate context. The course will consider advanced
transactional situations, including purchase and sale of commercial
properties, leasing of business properties, and complex industrial
facilities. The course’s emphasis on case studies and commercial
transaction scenarios are also designed to act as a capstone course
that complements and draws upon the students’ prior coursework
in contracts, real estate and commercial transactions, ethics and
government regulation. Three parallel case studies will run throughout
the course, illustrating the application of each topic to different types of
client organizations: a Fortune 500 industrial company, a small family-
owned retail business, and a medium-sized not-for-profit organization
with several sites. Each client organization will have mock client
representatives who will have different business and style preferences,
which the class will need to accommodate and will come to anticipate in
fashioning and recommending solutions for each client. The final exam
will build from these same client scenarios, offering the class participants
an opportunity to apply their learning to make recommendations to each
client with respect to specific situations and goals.

LAWS 5420. ERISA. 4 Units.
This class will cover employee benefits law. (ERISA): defined benefit
plans, including in-depth consideration of defined benefit plan
documents; VEBAs, their use and regulation; group life, Accidental Death
& Dismemberment, and Long Term Disability plans and related insurance
documents; insured and non-insured medical benefit plans; reporting and
disclosure requirements of ERISA, including summary plan descriptions,
summary of material modifications, Form 5500, and “top hat” elections;
and requests for favorable determinations of qualified plans, including
Form 5300 and Notices to Interested Parties.

LAWS 5421. Financial Principles for Lawyers. 3 Units.
This course provides an introduction to the use of financial economics
that are frequently relevant in many areas of law. Topics to be covered
include the time value of money, uncertainty, claim structure (including
the characteristics of debt, equity, and hybrid securities, and the benefits
and detriments of debt and equity financing), behavior of securities
markets, and analysis of financial statements. Use of these concepts in
specific areas of legal practice will be discussed.

LAWS 5422. Financial Markets: Law, Theory, and Practice. 2 Units.
Explores the interactions of law, principles of finance, and the theoretical
underpinnings of financial markets. It introduces students to the roots of
evolving financial market liabilities affecting the interests and conduct of
people at all levels in those markets by examining (a) the structure and
purpose of financial markets, (b) the financial and capital market theories
which today shape the contours of the law, (c) intermediation in financial
markets, and (d) the challenges of global market regulation.
LAWS 5423. Financial System Integrity. 3 Units.
In this course, which is offered alternately as either a lab or a seminar, students study and research key aspects of the international financial system integrity rules, with a focus on the anti-money laundering and terrorism financing standards of the Financial Action Task Force (FATF) and the Basel Core Principles on Banking Supervision of the Basel Committee (as well as similar standards promulgated for other financial institutions). When offered as a lab, the course engages students in projects for a variety of organizations involved in improving the integrity of financial institutions, including the FATF (as well as FATF-style regional bodies), the International Monetary Fund, the World Bank, the United Nations Office on Drugs and Crime, and locally based governmental and non-governmental organizations. Students satisfactorily completing this course will be eligible to apply for a fully paid summer internship with a local bank that will involve work in the bank's legal, anti-money laundering and financial intelligence units. Recommended preparation: LAWS 4405 and LAWS 5431.

LAWS 5424. Insurance. 3 Units.
A comprehensive introduction to the regulation of the insurance industry and to the legal issues arising from relations between the parties to insurance contracts. The course examines statutory regulation of the industry by state and federal agencies and analyzes cases involving aggressive regulation by the judiciary as well. Insurance decisions on the cutting edge of developments in contract, tort, and agency law are studied. Students are required to study the policy forms most frequently encountered in practice: the automobile policy, the homeowner's policy, and the life insurance policy. The course also provides exposure to problems relating to other areas of insurance including commercial general liability coverage, fire insurance, professional liability (malpractice) coverage, and health insurance.

LAWS 5426. International Real Estate Transactions. 2 Units.
The course will explore selected topics involved in international real estate transactions, from the perspective of an American counsel representing an American entity doing business abroad. Topics may include structuring, transactional goals, due diligence, letters of intent and documentation, deal implementation, title protection, and others. The course will use traditional learning techniques as well as case studies and simulations, with a major focus on letters of intent/documentation. Students will be graded based on class participation and presentations, written assignments, and a final paper/take home exam. Recommended preparation: LAWS 5429 (may be taken concurrently).

LAWS 5427. Mergers and Acquisitions. 3 Units.
Topics include the corporate and securities law governing various forms of mergers and acquisitions; business motivations for mergers; concerns of acquiring and acquired companies in friendly mergers; bidders' techniques and targets' defenses in hostile tender offers and proxy contests; valuation of businesses and investments, portfolio theory, and capital markets; concerns of companies and investors in negotiating corporate financing. Prereq: LAWS 4401.

LAWS 5428. Products Liability. 2 Units.
Explores in depth the liability of manufacturers and sellers for physical injury to persons or property caused by defective products. The relevant law includes UCC warranty provisions, Restatement of Tort (Second) section 402A and other tort law, state "tort reform" statutes, and federal and state statutes regulating product safety, such as the FDA and the Consumer Product Safety Act. The course will also examine proposals to "reform" the law of products liability.

LAWS 5429. Real Estate Transactions and Finance. 2 - 3 Units.
Covers basic real estate transactions as well as issues involved in complex finance and development. Topics include: brokers, land contracts of sale, deeds and title covenants, the recording system, title insurance, mortgages, shopping center development, cooperatives and condominiums, ground lease financing, construction lending, distressed properties, selected federal income tax issues, and the real estate attorney's professional responsibilities. Whenever possible, issues will be examined in the context of model transactions.

LAWS 5431. Securities Regulation. 3 Units.
This course explores the policies and techniques of state and federal investor protection, with emphasis on the distribution of securities by issuers and their affiliates. After an analysis of express general anti-fraud remedies, the "security" concept, and the diverse philosophies underlying "value judgment" and "disclosure" approaches to regulation of business fund-raising practices, the course proceeds to a full consideration of the impact of the Federal Securities Act of 1933 on primary and secondary distributions. Concurrent as well as independent effects of state blue sky laws, typified by the Uniform Securities Act, are also treated. To round out the total pattern of investor protection in the distributional setting, the course includes limited excursions into the anti-fraud, periodic reporting, public information availability, and broker-dealer aspects of the Securities Exchange Act of 1934. Prereq: LAWS 4401.

LAWS 5432. Business and Law Colloquium. 3 Units.
This course will bring together law students, business students, mid-level attorneys and senior leaders in the legal field for a one-semester weekly colloquium. Even though women have represented approximately half of law-school graduates for a number of years, women represent only 16% of law firm equity partners and even fewer corporate General Counsels. This course aims to offer an introduction to the business skills that both women and men will need to rise to the highest levels of law practice and organizational leadership. Each week will focus on a different aspect of law and business. The curriculum will include sessions focused in financial management, business development, communication skills, and intercultural business and law practices. Offered as LAWS 5432 and BLAW 411.

LAWS 5433. Payment Systems. 3 Units.
One of the basic courses in commercial law, dealing with the law of negotiable instruments and bank collections and deposits. These topics are considered primarily under the Uniform Commercial Code and, to some extent, recent federal banking and consumer credit legislation.

LAWS 5434. Secured Transactions. 3 Units.
This course deals with Article 9 of the UCC and other legal and equitable rules relating to the use of personal property as security for debts. Topics covered include creation of a security interest (mortgage), rights and obligations of the debtor (mortgagor) and the secured party (mortgagee), priority of interests in the same property, redemption rights of the debtor, and foreclosure of a security interest by the mortgagee. May not be taken by students who have taken or are taking the 4-credit Sales and Secured Transactions course (LAWS 5435). Students who have taken or are planning to take the 3-credit Sales (LAWS 4404) course may enroll.
LAWS 5436. Financial Institutions Regulation. 3 Units.
This course examines the regulation of financial institutions, with an emphasis on the federal regulation of U.S. banks and their affiliates. It focuses on the statutes that govern banking, the important cases that define the limits of banking powers, and the ever-increasing role of the regulatory agencies. The discussion will be viewed through the lens of the 2008-2010 financial crisis and the current challenges caused by the pandemic. It will review current enforcement orders issued by the regulatory agencies that have changed the banking landscape as much as the statutes upon which they are based. The discussion will also include relevant references to the International Basel Accords, which are the global standards for the regulation and supervision of banks.

LAWS 5438. Business Organizations Research Seminar. 2 Units.
An opportunity to undertake significant research and writing on the law of business organizations. Each student will be expected to complete a major paper in satisfaction of the upper level writing requirement. A satisfactory paper will meet the writing requirement for the concentration in Business Organizations. Limited to 12. Prereq: LAWS 4401.

LAWS 5439. Corporate Finance. 3 Units.
This course provides both an introduction to important financial concepts and, more centrally, an investigation of how those concepts come into play in the law (particularly corporate law). Topics covered will include: the capital asset pricing model, the efficient capital market hypothesis, the characteristics of debt and equity financing, options, and hedging. The course assumes no familiarity with these financial concepts, and while the math involved is critical, it will also be elementary. Throughout, the emphasis will be on gaining the ability to use concepts from finance in the context of legal problems. Prereq: LAWS 4401.

LAWS 5440. Communications Law. 3 Units.
This course provides a legal, technological, and policy introduction to modern communications regulation, including the regimes that govern broadcast, cable, wired and wireless telephony, satellite, and the Internet. Although there are no prerequisites for this course, prior study of the First Amendment, administrative law, antitrust law, and familiarity with communication technologies will be helpful.

LAWS 5482. Business and Law Advanced Research. 1 Unit.
This is a supplemental course for students enrolled in the Business and Law Colloquium course who wish to do additional research to create a paper for fulfillment of the JD Writing Requirement. Students will work closely with the Instructor to define a research proposal and draft, refine, and complete a substantial research paper on a topic of mutual interest. Coreq: LAWS 5432.

LAWS 5705. International & US Family Law. 3 Units.
This is an advanced course addressing practical family law topics. The course will cover fundamental United States family law issues as well as essential issues that touch on international aspects of family law, including a focus on the Hague Convention on the Civil Aspects of International Child Abduction. Students will be required to understand domestic and international statutes, case law and treaties and to apply their skills to simulated domestic and international fact patterns. Students can expect experienced lawyers as guest lecturers and participation of other family law practitioners throughout the course in an effort to provide a well-rounded experience.

LAWS 5706. Advanced Legal Research. 3 Units.
This course will provide students with the practice-ready research skills needed when entering an externship, work setting or the practice of law. The focus will be on learning to research efficiently and cost-effectively with exposure to current technologies used in legal practice. The course will expose students to the skills needed in presenting thorough and reliable research to a supervisor or a court. The class will be formulated in a way that will allow students to spend much class time specifically working on research problems where they can get real time assistance.

LAWS 5707. Alternative Dispute Resolution. 3 Units.
Students will examine the processes of alternative dispute resolution (ADR) through reading materials, videotapes, guest lectures, and simulation exercises. Particular emphasis will be given to the interaction of lawyers and clients in business negotiations and in litigation. Negotiation, arbitration, mediation, and the mini-trial will be examined. The class will also cover impediments to ADR, such as lack of understanding or hostility on the part of clients or lawyers.

LAWS 5708. Electronic Discovery. 3 Units.
Electronic Discovery provides an in-depth treatment of the legal, technical, and cost management issues involving identification, preservation, collection, review, and production of electronically stored information ("ESI") in civil litigation. This course will cover how the federal rules of civil procedure, such as the 2006 FRCP ESI amendments: (Rules 26 meet and confer, 34 production, and 37 sanctions), and the Federal Rules of Evidence, such as FRE 502 (privilege review and production), along with the rapidly developing ESI case law affect this important aspect of litigation. The class will explore e-discovery software, providing training and exercise hypotheticals in which students will become familiar with the practical side of e-discovery.

LAWS 5709. Animal Law. 2 Units.
The goals of the course are to: a. Provide a clear understanding of the status of animal law as it currently exists, with an emphasis on recent statutes and caselaw; b. Explore how the law handles animals and animal-related issues in comparison with humans and other property; c. Provide a hands-on, practical experience for students who wish to grapple with cases involving animal law with either a moot court or special research project; d. Get students to think about and develop their own philosophy as it relates to animal law, and to test legal theories for advancing animal jurisprudence in the direction they deem appropriate.

LAWS 5711. Civil Rights. 3 Units.
This course will examine the enforcement of federal civil rights against the government, government officials, and private individuals. The course will focus partly on the unique issues and challenges involved in litigating civil rights cases, and approximately the first half of the semester will be spent on 42 U.S.C. § 1983, the "all-purpose" civil rights statute. We will discuss the mechanics of litigating federal civil rights cases, such as the state action requirement, absolute and qualified immunities, liability of municipalities, limitations on injunctive relief, and attorney's fees. Much of the second half of the semester will be devoted to other civil rights statutes, such as the Fair Housing Act, the Voting Rights Act, Title IX, and Title VI. The course will not cover statutes dealing with discrimination in the workplace, however, as those topics are treated fully in the Employment Discrimination course.
LAWS 5712. Community Development Law. 2 Units.
An examination of the law of economic and land development in underserved and deteriorated areas. Legal issues related to business organization, financing, real estate development, governmental programs, and regulation and taxation (among other areas) will be covered. Topics include background of urban deterioration, governmental and private sources of assistance, organizing the developing entity, financing the project, governmental programs, tax policy and programs, land assembly, and administration of developments.

LAWS 5714. Complex Litigation. 2 Units.
Analysis of key issues typically encountered in complex civil litigation including substantive implications of seemingly procedural choices. Class actions, multidistrict litigation, joinder and consolidation. Exploration of practical and ethical issues encountered in complex civil litigation.

LAWS 5716. Conflict of Laws. 2 Units.
Competing approaches to choice of law in cases having multi-state and/or multi-national contacts. The course also covers personal jurisdiction, constitutional and international limitations on choice of law, and enforcement of judgments. Comparative and international perspectives are integrated throughout. Students develop their own choice of law theory in a simulated restatement conference.

LAWS 5717. Constitutional Law II. 3 Units.
This course explores the individual freedoms protected by the First Amendment. Primary attention is devoted to the freedoms of speech, assembly, and association. The course analyzes what is protected, why it is protected, and to what degree it is protected. Topics covered include prior restraint, advocacy of unlawful conduct, the hostile audience, defamation, commercial speech, obscenity, offensive speech, expression on public property, and symbolic speech.

LAWS 5718. Criminal Procedure II. 2 Units.
The adjudicatory stage of the criminal process. Pretrial release, preliminary hearings, grand jury practice, speedy and public trial, discovery, right to jury trial, guilty pleas, right to counsel, and double jeopardy are examined. Prereq: LAWS 4807.

LAWS 5720. Death Penalty Law and Process. 2 Units.
The course offers a review of the death penalty process, theory, and law from trial through execution, including examination of state laws and federal habeas corpus law. The course focuses on the legal principles implicated by the death penalty and also examines the social issues it raises including the social/legal arguments against the death penalty, race and gender issues, and the influence of political and other factors on the process. Recommended preparation: Evidence (LAWS 4808 or LAWS 4906).

LAWS 5721. Death Penalty Lab. 3 Units.
This Lab will involve students in an integrated experience of academic research and public service. Students will work on semester-long research projects arising from actual death penalty cases that will be of assistance to practitioners in death penalty cases or research projects for governmental and non-governmental organizations engaged in support for, opposition to, or reform of the death penalty at a local state, national, or global level. Issues may include: victim’s rights; jury selection (race/gender discrimination); proportionality (discrepancies in geographic application or application to different fact patterns); economic impact on the system; clemency; and transnational problems with foreign accused; systemic review (e.g., Illinois Commission); and other specific recurring issues arising from innocence, assistance of counsel, experts, jury instructions, or misconduct (judge, attorney, jury). The students will have no direct representation responsibilities.

LAWS 5722. Death Penalty Lab II. 2 Units.
This lab will involve students in an integrated experience of academic research and public service. As enrollment is limited to students who have successfully completed Lab I, these students will assume a supervisory role working with Lab I students. Students will work on research projects arising from actual death penalty cases that will be of assistance to practitioners in death penalty cases or research projects for governmental and non-governmental organizations engaged in support for, opposition to, or reform of the death penalty at a local state, national, or global level. Issues may include: jury selection issues; proportionality issues; economic impact of the application of the death penalty; examination of issues surrounding a specific state’s ability to provide a viable clemency; issues of international law; research, investigation, and litigation of case specific issues ranging from actual innocence, ineffective assistance of counsel, ineffective assistance of experts, prosecutorial misconduct, judicial misconduct, juror misconduct, etc. Prereq: LAWS 5721.

LAWS 5723. Disability Law. 3 Units.
Disability Law provides a comprehensive overview of the federal laws relating to individuals with disabilities. The course focuses on issues of nondiscrimination and affirmative rights in the areas of employment, government programs and services, places of public accommodation and education. Beyond analyzing the legal framework that shapes disability rights, the course will also discuss issues related to disability rights from a social policy perspective.

LAWS 5724. Discrimination in Employment. 3 Units.
This course will examine the federal laws concerning discrimination in the workplace. These include Title VII of the 1964 Civil Rights Act, the Equal Pay Act, the Age Discrimination in Employment Act, the Americans with Disabilities Act, the Genetic Information Nondiscrimination Act. We will study the regulation of discrimination based on race, sex, religion, national origin, age, disability, and genetic status, including policy and ethical question and strategic considerations in prosecuting and defending employment-based civil rights actions.

LAWS 5725. Education Law. 3 Units.
This course surveys the legal and social policy challenges related to public education settings. Students will study relevant constitutional issues, legislative mandates, school vouchers to supplement tuitions in private schools, charter schools, and more recent attempts under state constitutions to provide a quality education for all children. Beyond analyzing the legal frameworks that shape public education, the course will also cover the difficulties confronting public education from a sociological perspective.

LAWS 5726. Employment Law. 3 Units.
This course examines employer-employee relations in non-union settings. Topics include wrongful discharge, occupational safety and health regulation, minimum wage, and workplace privacy issues. The course emphasizes written work, including advanced legal research training. Minimal overlap with Labor Law (LAWS 5737) and Discrimination in Employment (LAWS 5724).

LAWS 5727. Environmental Law. 3 Units.
The course is designed to provide an overview of both the breadth and depth of environmental regulation in the United States and to consider ways our environmental regulatory system might be improved. Although all of the major environmental laws will be surveyed, several statutes will be examined in greater detail. Students will be expected to navigate select provisions of statutes and regulations through in-class problem sets. Guest speakers will also be invited to speak on topics of current interest.
LAWS 5728. ePayment Systems. 1 Unit.
This seminar builds on the foundation established during the first-year curriculum and focuses on the law and technology of payment systems. Such topics will include the contractual relationship amongst and between the various organizations transacting to enable a b2c payment; the various elements of such agreements; the various impacts of a payment system (criminal, civil, and administrative); the implications for legal structure and policy; and the ethical considerations of a lawyer advising clients within this domain. Grade is based on a paper, a presentation, and class attendance and participation.

LAWS 5729. Expert Witnesses and Scientific Evidence. 2 Units.
This course will examine the rules for the admissibility of expert testimony, provide an introduction to various types of expert and scientific evidence, understand the special role of experts in litigation, and provide practice-focused consideration of issues relating to expert evidence. Prereq: LAWS 1201 and LAWS 4800.

LAWS 5730. Family Law. 3 Units.
This survey course covers law relating to the creation, functioning, and dissolution of the family as a legal unit. Topics include legitimacy, adoption, procreative rights, cohabitation, marriage, family obligations, division of marital property, divorce and annulment, and child custody. Particular attention is given to the social forces that affect the development of rules and policies.

LAWS 5731. Federal Courts. 3 Units.
This course explores the relationships between the federal courts, Congress, and state courts and governments. Topics include congressional control of federal jurisdiction, justiciability, federal court abstention, suits against state and federal governments and officials, habeas corpus, and federal injunctions on state proceedings.

LAWS 5732. National Security and Procurement Law. 3 Units.
Government procurement law continues to interest policymakers, corporations, and legal employers in part because the total value of active federal contracts under administration exceeds several trillion dollars. This is a survey course covering many issues involved in the administration of federal contracts and procurement law., with a particular emphasis on the implications of procurement on national and international security interests.

LAWS 5733. Immigration Law. 2 Units.
The general principles of immigration law and procedure, including federal authority to regulate immigration, removal of aliens (deportation and exclusion), administrative and judicial review, fleeing persecution (refugees, asylees, and others), immigrant and nonimmigrant visas, and consular practice. The course will emphasize practical application of current immigration law.

LAWS 5734. Immigration Law II. 1 Unit.
The course is dedicated to the study of visas for visitors and aliens of extraordinary ability in the sciences, arts, or entertainment. Course materials will be drawn from Legomsky's Immigration and Refugee Law and Policy, the Immigration and Nationality Act, and Title 8 (CFR). Students will be required to write a paper or prepare a visa petition. The course will likely be offered every other year. Prereq: LAWS 5733.

LAWS 5735. Juvenile Law. 2 Units.
The role of the juvenile court in society: its jurisdiction, procedures, and dispositional alternatives. Students study both the quasi-criminal aspects of the juvenile court (jurisdiction over juvenile delinquents and status offenders) and the civil-protective aspects of the court (termination of parental rights and the handling of neglected, dependent, and abused children). In addition, the rights afforded juveniles are compared with the rights afforded adults in comparable circumstances. Many related juvenile justice issues, such as the right of a minor female to have an abortion without parental notice and the constitutionality of capital punishment for juvenile offenders, are also examined.

LAWS 5736. Juvenile Law. 3 Units.
The basic course in the area of union-management relations, designed both for students desiring to pursue the field further and for those whose interest lies in an introduction to legal principles in this area. The course begins with a brief historical study of the evolution of the labor movement and prestatutory law. It then considers federal regulation under the National Labor Relations Act of union organizational efforts, management-union interaction, and the representational process, then proceeds to the collective bargaining process. The collective bargaining process is examined in some depth with special emphasis on the scope and substance of the duty to bargain in good faith, the enforcement of collective bargaining agreements in courts and by arbitrators, and the legal regulation of industrial warfare, the strike and lockout.

LAWS 5737. Labor Law. 3 Units.
This course analyzes the public control of land use, primarily at the local and state levels. Both legal and policy perspectives are considered. Attention is given to constitutional limitations such as the takings doctrine, equal protection, and due process. Topics considered include zoning, subdivision controls, exclusionary regulations, and historic preservation.

LAWS 5738. Law of Archeological Relics. 2 Units.
This course addresses the private and public law relating to the ownership, sale, use, and repatriation of archeological artifacts other than human remains. The readings include excerpts from articles and books regarding the international trade (legal and illegal) in such artifacts. Significant attention is given to international law, such as the UNESCO Convention on Cultural Property.

LAWS 5739. Law of Archeological Relics. 2 Units.
This 13-week interactive course will provide students with the tools and techniques needed to be more capable speakers and communicators. While the course will include some training for persuasive public speaking in a courtroom, most of the focus will be on developing effective communication skills so that students will have the requisite confidence, focus, and control to speak in a variety of settings. A section of the class will also concentrate on handling the media including how to control a message and advice for clients who may be in the public spotlight. The program will be interactive so that students have numerous opportunities to participate and speak. Role-playing exercises will be utilized as well as video-taped playback. Grading is based on participation and improvement and there will not be a final exam.
LAWS 5744. Mediation Representation: Theory, Principle and Practice. 3 Units.
An advanced course exploring the fundamentals of conflict, mediation theory, doctrine and practice, its historical evolution and increasing use as a centerpiece of modern legal dispute resolution. The course will cover the theory, doctrine, history and practice of mediation; the mediation process; the mediator’s, client’s, and advocate’s role in mediation; the underlying principles of bargaining, risk and value and how to adapt these negotiation skills for a mediation setting. Students will also learn how to use mediation as a problem-solver for the client. Format is lecture, discussion and student presentation and simulation. The course includes the writing of mediation memoranda, as well as mediation role playing, with critique from the teachers and invited guest mediation practitioners.

LAWS 5745. Foreign Affairs Law. 3 Units.
Provides a study of the separation of powers in national security matters, presidential war powers, congressional and presidential emergency powers, the domestic effect of international law, the use of military force in international relations, investigating national security threats, the Freedom of Information and Privacy Acts, access to national security information in the federal courts, and restraints on disclosing and publishing national security information. The course builds upon a strong foundation of constitutional law and addresses the fundamental tension that exists in our foreign and domestic affairs by virtue of the constitutional separation of powers between the respective branches of government. Several classroom hours will be spent dealing with constitutional war powers and how the executive and legislative branches have tried to define their respective measures of expressed and implied power with regard to the Vietnam War, the War Powers Resolution of 1973, and more recent US incursions such as the first Persian Gulf War and the most recent invasion of Iraq.

LAWS 5747. Philosophy of Law. 3 Units.
This is an examination of the general nature of law, the broad concerns of jurisprudence, the study of comparative law, and many of the issues raised in the literature of legal philosophy. Students will examine the principles of legal positivism, mitigated natural law, and rights theory. Selected readings and cases will illustrate these theories, which will also be examined in the context of rule selection by new governments in developing or revolutionary societies. The course also looks at the general nature of legal systems: how politics, morality, and individual views of justice and rights affect particular court cases and the court and development of law generally. Topics will include abortion, obscenity and sin, civil disobedience, affirmative action, surrogatehood, and the death penalty. This is unlike any other of the legal theory or jurisprudence courses, and those who have sampled legal theory elsewhere in a different form are welcome and encouraged to enroll. Recommended preparation: PHIL 101. Offered as LAWS 5747, PHIL 335, and PHIL 435.

LAWS 5749. Prisoner Rights & Litigation. 3 Units.
This course explores the complex areas of habeas corpus and prisoner § 1983 litigation. The course explores the legal, procedural, social, economic and other issues surrounding federal court review of state court criminal convictions, conditions of confinement for prisoners, and prisoner rights. Topics will include standards of review, substantive rights, federal jurisdiction, and Constitutional reaches and limits.

LAWS 5751. Scientific Evidence in Criminal Litigation. 2 Units.
The legal issues associated with the use of scientific evidence at trial. It examines the admissibility of scientific evidence, expert testimony, and related issues. In addition, it considers specific techniques such as forensic pathology, fingerprint comparison, firearms identification, bite mark comparisons, questioned document examinations, and polygraph and DNA evidence testing. Outside experts are used to present many of the topics.

LAWS 5753. Child Welfare. 3 Units.
This course explores the underlying principles of child welfare. We will look at the state’s right to intervene where children are being abused or neglected; legal and psychological parameters of neglect; the parent’s right to raise children as they see fit, including the use of corporal punishment; the termination of parental rights; the role of an attorney GAL; legal representation of the agency and parents in child welfare hearings; and the liability of child welfare agencies. The format is lecture, discussion and student presentation, and simulation. The course includes a trial and concludes with a final paper and student presentations on topics of their choice.

LAWS 5754. Energy Law. 2 - 3 Units.
Energy law is a large and growing area of increased importance. Energy use and production is subject to a wide range of state and federal laws. This course will focus on current energy law issues, particularly issues relating to production and use of electrical power. The course covers the interplay of state and federal regulation, utility rate regulation, energy production, and regulation of the environmental consequences of energy production and use, including climate change.

LAWS 5755. LGBT Legal Issues. 3 Units.
The course will address the development of legislation and case law dealing with LGBT rights in different practice areas including family law, estate planning, and employment law. Further, the course will deal with possible scenarios for future legislative and judicial activity.

LAWS 5756. Elder Law. 3 Units.
This course explores a number of legal, ethical, and social issues raised by our nation’s growing elder population. It aims to do so in a way that is not only interesting for the general law school population, but also practical for those considering a career that involves advising older adults and those who may be called upon to assist elderly friends and family members. Focus is on the practical application of the current laws in Elder Law. Special attention is given to: (i) elder abuse, neglect, and financial exploitation; (ii) end-of-life issues, including health care directives and surrogacy; (iii) guardianships; (iv) managing and paying for health care, including Medicaid, Medicare, long-term care insurance, and health care reform issues; (v) property management, including durable powers of attorney for property, joint ownership and financial accounts, and estate planning to ensure Medicaid and/or Medicare coverage; (vi) ethical issues in elder representation; (vii) remedies available to vulnerable adults, such as criminal, administrative, and civil remedies, including medical malpractice. Finally, through simulated client cases, students will learn how to prepare documents related to surrogate decision-making, including drafting an Advanced Healthcare Directive, an Appointment of a Healthcare Agent, and a Personal Financial Powers of Attorney, as well as documents relating to the appeal of the denial of Medicare and Medicaid benefits.
LAWS 5758. Protest, Policing, and The First Amendment. 3 Units.
In this course, we engage in a holistic study of seminal Supreme Court cases surrounding freedom of speech, hate speech, incitement, freedom of assembly and association, and the right to petition. You will also learn and apply mass media theories to develop thoughtful critiques of newsgathering, news reporting and news dissemination. Integrating principles of mass media analysis, you will also learn and apply critical theories to rhetorical, visual and aural analyses of media text. We will continually evaluate how our readings inform and shape recent socio-legal-political events and issues such as events in Ferguson, Missouri, Cleveland, Ohio, and Charlottesville, Virginia.

LAWS 5760. The Wire and the War on Drugs. 3 Units.
Many currently criticize the American criminal justice system for being too severe and, in particular, having an unfairly harsh impact on African Americans. These complaints typically focus on the war on drugs and the way the American criminal justice system has prosecuted and punished drug offenses for the past several decades. This course uses the HBO series The Wire as a lens for understanding and evaluating the war on drugs. Students will examine: current drug offenses, the policy debate about legalization and decriminalization of drugs, conspiracy law, approaches to sentencing, the law of electronic surveillance, the fourth amendment, interrogation, the use of informants, the use of computerized statistical data to manage police departments, prisoner reentry programs and the influence of the media on criminal justice policy.

LAWS 5761. First Amendment and Media Law Practicum. 2 Units.
This course explores the substantive law and policy considerations involved in representing journalists, researchers, protesters, and other civil rights plaintiffs. The focus of this course is the public’s right to know: it will focus on legal mechanisms for inspecting judicial proceedings and government records, and legal issues surrounding newsgathering, speaking, and publishing. The work will be tied into live-client matters in the First Amendment Clinic, and students in the Practicum will support the representations through researching and drafting litigation documents and associated advocacy.

LAWS 5762. Urban Development Lab. 2 Units.
This course will involve students in an integrated experience of academic research and public service to the Greater Cleveland area. Students will work on semester long research projects arising from issues raised by local nonprofit development organizations and the development arms of other local nonprofit groups and government agencies. Specific topics will vary from semester to semester, but will generally fall within (i) barriers to development of urban properties, (ii) the role of local government and communities in encouraging or discouraging development projects and (iii) solutions for making urban areas, in general, and Cleveland, in particular, more livable and sustainable. When possible, students will present their findings directly to the organization(s) raising the issue. Students can expect direct or indirect exposure to aspects of real estate, finance, land use, tax and other regulatory law.

LAWS 5763. White Collar Crime: Prosecution and Defense. 2 Units.
This course will engage students in a study of issues relating to the prosecution and defense of white collar crime in America, e.g., defining/understanding “white collar crime,” the role of the federal government in investigating and prosecuting white collar crime, corporate vs. individual responsibility, analyzing various white collar offenses: mail fraud and wire fraud, RICO, perjury/false statements/obstruction, securities fraud, and analysis of current white collar criminal prosecutions in the news (US v. Martha Stewart, the Adelphia prosecution, the Tyco prosecution, the Worldcom prosecution, the Traficant prosecution here in Cleveland), and exercises in prosecuting and defending white collar crime: investigations, charging decisions, and strategies in structuring a trial presentation and crafting jury addresses in complex white collar cases. As part of their final exam, students will be required to prepare and deliver a live jury summation (either for the government or the defense) in a mock white collar criminal case. Students will also sit for a short essay exam dealing with the various topics covered in class.

LAWS 5764. Workers’ Compensation. 2 Units.
Workers’ Compensation law and theory continue to evolve through statutory change and judicial decisions. The statutes deal with benefits for work-connected injury and disability. Course material is national in scope with an emphasis on corresponding Ohio cases. The course also touches on related areas of law, such as torts.

LAWS 5766. Non-Capital Habeas Lab. 2 - 3 Units.
Students will be assigned to research, write, and litigate issues on live cases of both state and federal prisoners. As part of the course, students will learn how to properly and effectively represent clients in criminal cases through lecture, written assignments, oral advocacy and other skills-related activities. Prereq: LAWS 4808. Prereq or Coreq: LAWS 4807.

LAWS 5768. Advanced Legal Writing. 3 Units.
This is an intensive course for students interested in taking the skills and lessons of the CaseArc courses and refining their written work product that this it stands out in the community. The course is a rigorous mixture of lecture, in-class exercises, at-home assignments, and peer reviews.

LAWS 5769. State Constitutional Law Seminar. 1 - 2 Units.
This will be a ‘national’ (i.e., comparative) course on state constitutional law. The focus will be on individual rights litigation under state constitutions, and it will cover some (though probably not all) of the most important and controversial state constitutional issues (e.g., eugenics, compulsory flag salute, school funding, exclusionary rule, desegregation, marriage equality). There will also be a focus on current issues and current approaches to litigating state constitutional issues. Although the focus will be national and comparative, students interested in writing their papers on Ohio or other one-state topics will be permitted to do so.

LAWS 5772. Urban Development Topics. 1 Unit.
This course provides additional in-depth exploration and research opportunities in the area of Urban Development Law for students who have completed the Urban Development lab. Students and Instructor will mutually agree on specific topics to be explored in the course. Prereq: LAWS 5672.

LAWS 5902. Advanced Contracts. 3 Units.
We will examine the methodology of law and economics and of deontological approaches to contracts, legal realism, the methodology of default rules, gap filling and incomplete contracts, adjustment of long-term contracts, employment contracts and the employment at will doctrine, promissory estoppel, relational contracts, incorporation strategies in the U.C.C. and the new formalism in Contracts.
LAWS 5903. Advanced Criminal Law Seminar. 3 Units.
This seminar focuses on substantive criminal law rather than criminal procedure. It uses the first-year criminal law course as a foundation and examines a number of issues not typically covered in that course. Student interests will influence the topics chosen for examination, which will include: theft offenses, conspiracy, fetal abuse, decriminalization of drug use and commercial sex, and the roles of the executive, judicial, and legislative branches in making criminal law. Grade is based on class participation, a presentation, and a research paper.

LAWS 5906. African-American Lawyers Seminar. 3 Units.
This seminar takes an interdisciplinary approach to the study of African-American lawyers. It examines aspects of the history of black lawyers in America, as well as topics relating to black lawyers in contemporary America. The course will situate these experiences in the context of both the history of the legal profession and the history of race relations and the struggle for civil rights in the United States. Students will prepare a substantial research paper and make an oral presentation of their research to the class. Limited to 12.

LAWS 5908. Public Law Research Seminar. 2 Units.
This seminar permits students to write a substantial research paper on a topic in Constitutional Law, Civil Rights, Administrative Law, or regulatory law (broadly defined). With permission of the Instructor, the paper may be used to satisfy the JD Writing Requirement.

LAWS 5910. Environmental Law Research Seminar. 2 Units.
This course is for those students who wish to fulfill the writing requirement by writing on a contemporary environmental law subject.

LAWS 5912. Jurisprudence. 3 Units.
The seminar will explore classic jurisprudential questions using great works of literature as the vehicle through which the explorations will be made. The questions are: What is the nature of law? of justice? What is the nature of the obligation to obey or respect the law? Some of the texts which will be used include: "Antigone," "The Merchant of Venice," "Billy Budd," "Man for all Seasons," and "Judgment at Nuremberg."

LAWS 5916. Religion Clauses of First Amendment Seminar. 3 Units.
This seminar will explore the constitutional doctrines relating to the Free Exercise Clause and the Establishment Clause of the First Amendment. The readings will include key Supreme Court cases demonstrating the evolution of free exercise and Establishment Clause doctrines, as well as some historical materials, but we will also maintain a focus on current First Amendment controversies, such as school vouchers, faith-based government funding initiatives, and religious symbols on public property. Grade is based on class participation, final presentation, and a paper. Limited to 12.

LAWS 5918. Reproductive Rights. 3 Units.
This seminar will cover the basics of the Supreme Court's reproductive rights jurisprudence and will look at a series of topics relating to the reproductive rights law and policy, including "partial-birth" abortion and the health exception; minors' access to abortion, contraception, and sex education; reproductive rights and religion; and assisted reproductive technologies. In addition to various interim writing assignments, you will be required to submit a substantial paper by the end of the semester.

LAWS 5919. Scientific Evidence and Advanced Research. 2 Units.
Students must be concurrently enrolled in Scientific Evidence class (LAWS 5751). This course allows interested students to pursue additional research and writing within a particular focus area. With permission of the Instructor, the paper may be used to satisfy the JD Writing Requirement.

LAWS 5925. Wrongful Convictions. 2 Units.
This course focuses on the causes of wrongful convictions, including eyewitnes misidentifications, false confessions, jailhouse informants, scientific fraud, prosecutorial misconduct, and ineffective assistance of defense counsel. Remedies to prevent the conviction of the innocent are also discussed. Prereq or Coreq: LAWS 4808.

LAWS 5929. Judicial Selection. 3 Units.
This seminar will examine the present variety of judicial selection processes in the state courts of the United States through the lens of the ethical obligations defined in the Model Code of Judicial Conduct. Working from the Model Code, this seminar will focus on the various means used in states to select or elect judges and will examine the case law, challenges and controversies that have arisen from those methods. Do judicial election campaign contributions affect judicial independence and impartiality? In states which elect judges, can or should the right of free speech in a judicial campaign be limited or restricted? In states which do not elect judges, how to design or manage the selection process to ensure the appointment of an independent judiciary? This seminar will be graded based upon class participation and the submission of and presentation of a paper.

LAWS 5930. Human Trafficking Lab. 2 Units.
Students will examine and consider legal issues that arise in sex trafficking. Human trafficking is the second-largest crime in the world and is a $150 billion industry. Ohio has the fifth largest number of sex-trafficking victims and will serve as a backdrop for the course. Students will conduct research and craft solutions to issues raised by current gaps in legislation, victims’ issues, advocacy groups, and others. The subject matter will vary from semester to semester based on the issues the class is asked to investigate, but will frequently touch upon criminal, juvenile, human trafficking, municipal, housing, commercial, and other law. Students will participate in the representation of victims of human trafficking in both the adult and juvenile courts.

LAWS 5962. Jurisprudence Topics. 1 Unit.
This course provides the opportunity for guided research study on topics of Jurisprudence, as a supplement to the topics explored in the Jurisprudence course, which must be taken simultaneously. Students will work with the Instructor to write a significant academic research paper, which may be used to satisfy the JD Writing requirement. Coreq: LAWS 5912.

LAWS 5980. Human Trafficking Advanced Research Seminar. 1 Unit.
This is an optional "add-on" credit for students participating in the Human Trafficking Lab course who wish to undertake additional advanced research in this topic area. With the permission of the Instructor, this course may be used to satisfy the JD Writing Requirement. Coreq: LAWS 5930.

LAWS 6001. Civil Litigation Clinic. 3 Units.
In this course, students handle various kinds of civil disputes on behalf of consumers who need legal assistance but cannot afford to pay for a private lawyer. Students are responsible for all phases of litigation, including the initial client interview and case assessment, preparation of pleadings and motions, conducting discovery, settlement negotiations, and, if necessary, trying the case before a judge or jury. A weekly two-hour seminar session provides a regular forum for discussing the substantive law that applies to the students' caseloads, as well as discussion of the various legal, professional, and ethical issues that arise in the cases. In addition, after completing required basic mediation training, students act as mediators in small claims and/or landlord-tenant cases in municipal court. Students must be enrolled in and complete both semesters to receive credit. Prereq or Coreq: LAWS 4808.
LAWS 6002. Civil Litigation Clinic. 3 Units.
Continuation of LAWS 6001. Both semesters must be completed before credit is given.

LAWS 6011. Community Development Clinic I. 3 Units.
This is a year-long course; students must complete both semesters of work to receive credit. Students represent business and non-profit entities in formation of their businesses and to obtain tax exemption for non-profit corporations. They act as general counsel helping their clients plan for future projects and activities and operate in compliance with law that regulates their activities. Students may also help to structure tax, real estate and corporate transactions for entities. Students may have the opportunity to work on simple intellectual property matters including trademark, tradename and copyright registrations, as well as website issues and nondisclosure agreements. This clinic is primarily transactional in nature and is designed to expose students to the special problems encountered in representing entities and in structuring transactions. Seminar sessions will be devoted to discussions of applicable law pertaining to specific cases students are working on and development of the skills necessary to represent individuals and entities in transactional matters. Students also will be exposed to the ethical problems associated with entity representation. Prereq or Coreq: LAWS 4401 or LAWS 4402.

LAWS 6012. Community Development Clinic II. 3 Units.
(See LAWS 6011.)

LAWS 6021. Criminal Justice Clinic I. 3 Units.
Students handle a limited number of misdemeanor cases in municipal courts throughout Cuyahoga County. The seminar sessions are devoted to discussions of cases being handled by the students and to ethical and strategic considerations of criminal law practice, trial tactics, and plea bargaining. Hypothetical case studies are also used to increase the breadth of the students’ exposure to the criminal justice system. Each student also handles some prosecution in local court. Prereq or Coreq: LAWS 4807 and LAWS 4808.

LAWS 6022. Criminal Justice Clinic II. 3 Units.
Continuation of LAWS 413. Both semesters must be completed before credit is given.

LAWS 6031. Health Law Clinic I. 3 Units.
Students represent clients in social security disability claims, adult guardianships, health insurance claims and disputes, access to health care, special education for disabled children, nursing home transfers and discharges, and other health and disability law-related issues. They investigate complaints in nursing home and represent clients in administrative and court proceedings. A major part of the student’s responsibilities is to analyze the problems and determine the best way of resolving them. Seminar sessions are primarily devoted to specific skills and to discussions of matters being handled by the students. The ethical and practical problems encountered in health law practice are emphasized, as well as legal theory. This is a year-long course; students must be enrolled in and complete both semesters of work to receive credit. Prereq: LAWS 4808 and (LAWS 4200 or LAWS 4201).

LAWS 6032. Health Law Clinic II. 3 Units.
Continuation of LAWS 6031. Both semesters must be completed before credit is given.

LAWS 6041. Intellectual Property Venture Clinic. 3 Units.
The IP Venture Clinic will provide students with the opportunity to represent start-up companies and entrepreneurs and focus on intellectual property protection, technology assessment, corporate formation, confidentiality agreements and trade secret protection, material transfer agreements, technology valuation, opportunity analysis, private securities offerings, and technology transactions. The clinic provides opportunities to work collaboratively with inventors, MBA students, licensing managers, outside counsel, and venture capitalists. Prereq: LAWS 4300 or LAWS 4302.

LAWS 6042. Intellectual Property Venture Clinic II. 4 - 12 Units.
The IP Venture Clinic will provide students with the opportunity to represent start-up companies and entrepreneurs and focus on intellectual property protection, technology assessment, corporate formation, confidentiality agreements and trade secret protection, material transfer agreements, technology valuation, opportunity analysis, private securities offerings, and technology transactions. The clinic provides opportunities to work collaboratively with inventors, MBA students, licensing managers, outside counsel, and venture capitalists. Prereq: LAWS 6041.

LAWS 6051. Civil Rights, Human Rights, and Immigration Clinic. 4 Units.
The Clinic offers students a semester-long opportunity to experience a diverse range of civil rights and human rights litigation and advocacy in both the domestic and international context. Students will work on cases and projects, often as co-counsel with other lawyers and organizations, addressing constitutional rights and international human rights violations both in the United States and abroad. Examples of litigation and advocacy may include: representing individuals in Sec. 1983 civil rights cases relating to police misconduct, employment discrimination, and other civil rights violations; representing non-citizens in the United States unlawfully stopped by local law enforcement for civil immigration violations; representing non-citizens in applications for relief from removal or deportation, asylum, withholding of removal, and protection under the Convention Against Torture; partnering with foreign non-governmental organizations in South Africa in the research, reporting, and litigation of HIV/AIDS-related discrimination matters; working with a national human rights organization on an anti-human trafficking campaign, including providing the legal analysis; developing the legal analysis and strategy for ensuring that international sports associations enforce anti-discrimination treaties as applied to the LGBT community; and authoring amicus briefs in U.S. and international courts on behalf of selected human rights groups on a range of issues. Prereq: LAWS 4808. Prereq or Coreq: LAWS 5215 or LAWS 5711.

LAWS 6052. Civil Rights, Human Rights and Immigration Clinic II. 4 - 12 Units.
The Clinic is the second semester extension of LAWS 6051 for those students undertaking a year long capstone experience in the Civil and Human Rights clinic. Prereq: LAWS 6051.
LAWS 6061. First Amendment Clinic. 6 Units.
Students represent clients in litigation matters focusing on the First Amendment and the public’s right to know how their government operates. The focus of the work will be enforcing rights under state and federal freedom of information laws, civil rights litigation involving First Amendment rights (particularly free expression and newsgathering rights), and potentially matters involving First Amendment defenses, such as subpoena defense or defamation defense. Students will gather facts, interview clients, conduct discovery, draft briefs, handle any settlement conferences/discussions, and advocate at hearings and trials. There is heavy emphasis on oral and written advocacy, civil procedure, strategic case planning, and professional conduct. Weekly two-hour seminars will be supplemented by individual meetings with student teams to discuss their case work.

LAWS 6101. Immigration Law Practicum I. 3 Units.
The immigration Practicum provides an opportunity for students to achieve practical immigration experience by working with real-life situations before the immigration Court and the USCIS. Students will work on pending matters that may include preparation of legal memoranda or briefs, applications for relief (such as asylum, cancellation of removal, protection under the Violence Against Women, protections of non-citizen victims of domestic violence), and evidentiary submissions for pending cases. Students are required to attend master (preliminary) and individual hearings, and a pro bono refugee clinic offered with the Catholic Charities or Legal Aid Society. This is a year-long course. Prereq: LAWS 5733.

LAWS 6102. Immigration Law Practicum II. 3 Units.
The immigration Practicum provides an opportunity for students to achieve practical immigration experience by working with real-life situations before the immigration Court and the USCIS. Students will work on pending matters that may include preparation of legal memoranda or briefs, applications for relief (such as asylum, cancellation of removal, protection under the Violence Against Women, protections of non-citizen victims of domestic violence), and evidentiary submissions for pending cases. Students are required to attend master (preliminary) and individual hearings, and a pro bono refugee clinic offered with the Catholic Charities or Legal Aid Society. This is a year-long course. Prereq: LAWS 5733 and LAWS 6101.

LAWS 6103. Basic Mediation Training. 1 Unit.
This course provides students with basic mediation training. After successful completion, students will be certified, allowing them to serve as volunteer mediators in forums where basic training is required.

LAWS 6105. Pretrial Practice: Medical Malpractice. 2 Units.
This advanced skills course is a specialized version of the Pretrial Practice (Civil) course. The focus is on the work of counsel for plaintiffs and defense counsel in medical malpractice cases including pleading, discovery, motion practice, and settlement negotiation. The course will emphasize the special problems confronted in medical malpractice cases such as obtaining and interpreting medical records and dealing with expert medical witnesses.

LAWS 6107. Pretrial Practice: Civil. 2 Units.
This course picks up where most first-year legal research and writing courses leave off. We will examine intensively, among other things, the various discovery devices (including depositions, interrogatories, document requests, and requests to admit), pretrial motion practice, litigation as a means of achieving the best possible negotiated result, and alternative dispute resolution mechanisms (including mediation and arbitration). In other words, we will study the things that litigators spend most of their time doing and thinking about: how lawyers go about gathering and preserving evidence, the everyday interactions they have with courts, and the reasons they do all these things even though they rarely expect to get all the way to trial. The course will include simulations and extensive drafting assignments.

LAWS 6108. Pretrial Practice: Criminal. 2 Units.
This course introduces students to the key activities lawyers undertake in a criminal case in advance of trial. This course examines the various steps leading up to trial, such as the preparation of an indictment, the drafting of discovery requests, motion practice related to discovery and the suppression of evidence, preparation and negotiation of plea agreements, and other motion practice related to the pre-trial phase. This course is designed to expose students to the pretrial phase in a criminal case from the perspective of both the prosecution and defense. Anticipated topics for discussion will include case investigation, the gathering of evidence, pretrial problems typically encountered in a criminal case, and the role sentencing guidelines can have in shaping plea negotiations and other pretrial negotiations. The course will include simulations, drafting assignments, opportunities for mock oral argument, and negotiating exercises. Limited to 12 students.

LAWS 6110. Trial Tactics. 4 Units.
An intensive course in trial tactics, techniques, and advocacy. The emphasis during the first half of the semester is on practice in the separate components of a trial: direct examination, objections, cross-examination, use of rehabilitative devices, examination of expert witnesses, jury selection, opening statements, closing argument, and pretrial preparation. During the second half of the semester each student acts as co-counsel in a full trial. Videotape recording is used for critiquing student performance throughout the semester. Students may not take both LAWS 6110 and LAWS 395 (Trial Practice). Prereq: LAWS 4808.

LAWS 6111. Appellate Practice. 2 Units.
This course is designed to teach students the rules and formalities of appellate practice and help students develop the skills necessary to write an effective appellate brief and present a persuasive oral argument. During the first semester students research and write an appellate brief and engage in short in-class oral arguments. During the second semester students receive instruction on the organization and presentation of longer oral arguments, engage in a practice oral round and receive an individualized critique of their performance. They complete the course by competing in the Dunmore Moot Court Tournament, which culminates in a final round oral argument before sitting judges in the spring.

LAWS 6113. Deposition Skills. 1 Unit.
Students will learn, through group lectures and simulations, how to prepare for, take, and defend a deposition in a civil litigation case. Students will attend lectures presented by experienced civil litigation attorneys. Students will then practice the skills discussed in the lectures by taking and defending depositions that will be critiqued by the course instructor and other experienced civil litigation attorneys.
LAWS 6160. Appellate Litigation Clinic. 6 Units.
Students will represent clients in all phases of the appellate process in civil and criminal cases in both Ohio and federal courts. Students will interview clients, pursue any necessary post-judgement relief in the trial court, prepare the paperwork to initiate the appeal, ensure the completeness of the record, handle any settlement conferences/discussions, draft the appellate briefs, and conduct oral arguments. There is heavy emphasis on oral and written advocacy, appellate procedure, strategic case planning, and professional conduct. Weekly two-hour seminars will be supplemented by individual meetings with student teams to discuss their case work.

LAWS 6501. Canada - United States Law Journal. 0 - 2 Units.
Students enrolled in this non-credit course will serve as writers and editors for the annually published Canada - U.S. Law Journal.

LAWS 6503. Health Matrix Seminar. 2 Units.
Students write their Health Matrix notes through the year-long Health Matrix Seminar. Students work closely with the instructor to develop their topics, outlines, several drafts, and final note. The course will include multiple individual meetings with the professor, extensive feedback, and oral presentations of the papers. Students will develop their writing and oral presentation skills and will receive training concerning advanced legal research, plagiarism, and statutory interpretation. 2L associates will also have responsibilities for journal production work, such as verifying footnotes.

LAWS 6504. Law Review Seminar. 2 Units.
The seminar will provide training in writing, editorial skills, and advanced legal research for students writing notes for the Case Western Reserve Law Review. Topics to be covered include plagiarism, selecting a topic, web-based research, advanced Lexis and Westlaw research, advanced research training in selected substantive areas, and writing techniques. Satisfactory completion of the note will satisfy the upper-level writing requirement. Grade based on the quality of the note and class participation.

LAWS 6505. Law, Technology and Internet Journal. 0 - 3 Units.
The Journal of Law, Technology and the Internet Seminar offers students interested in technology and intellectual property the opportunity to write their notes through a year-long seminar. Students work closely with the instructor to develop their topics, thesis, outlines, and final note. Students will have numerous individual meetings with the professor and extensive feedback of the papers. Students will develop their writing skills, learn about plagiarizing, and will receive training concerning advanced legal research. 2L associates will be trained for journal production work such as verifying citations. The course will also include 3-4 whole group meetings through the quarter. Second year students will also be responsible for performing an in-depth evaluation of the article accepted through the peer-review process. 2L editors will ensure that submitted articles have not been preempted by any article already in print. Once an article has been approved by the Faculty Peer-Reviewers, 2L editors will be given portions of the article for which they are responsible for verifying all citations, and performing textual edits required to bring the article into compliance with Journal policies.

LAWS 6512. Intl Law Journal Board. 2 Units.
LAWS 6513. Health Matrix. 2 Units.
LAWS 6514. Law Review Editorial Board. 2 Units.
LAWS 6550. Mock Trial. 2 Units.
LAWS 6560. Moot Court Team. 2 Units.
LAWS 6570. Transactional Lawyering Team Competition. 2 Units.
Participants take part in national competition of drafting and negotiating sophisticated contracts and are judged on their drafting and negotiating skills. Course obligations include a competitive round internally to determine the team composition, research and drafting a sophisticated transactional agreement including classroom sessions on relevant topics, participation in practice sessions, and travel to and participation in a regional competitive meet and, if successful there, a national competitive meet.

LAWS 6600. Supervised Research Seminar. 1 - 3 Units.
Second- and third-year students may earn graded credit for an individual research project of scholarly depth and scope, under the close supervision of a faculty member. Approval of the faculty supervisor is required before registration. No student may undertake more than two Supervised Research projects or earn more than a total of four hours of Supervised Research credit. No student may work on more than one Supervised Research project in one semester. May satisfy the writing requirement.

LAWS 6601. Legal Writing Fellows. 1 Unit.
CaseArc Honors Fellows serve for either one semester of the full year as teaching assistants in the CaseArc program. With training, guidance, and under the supervision of the CaseArc faculty, the Honors Fellows work closely in small groups or one-on-one with students on their writing projects, in-class exercises and preparation for simulations. In addition to meeting regularly with students, Honors Fellows may participate for simulations, judge oral arguments and assist with research training. Overall, the Honors Fellows serve as mentors to their assigned students to help them make the most of the CaseArc courses and the law school experience in general.

LAWS 6605. Law, Technology and Internet Journal. 0 - 3 Units.
This course is intended exclusively for the foreign national J.D. or LL.M. law student who wishes to gain applied legal experience based on their intended career path with an organization that offers course credit for internship experience. These internships may be either paid or unpaid. This course will provide a means for the student to build required skills and bridge the gap between the classroom and real world application. The student is encouraged to explore and discover additional avenues to assist in the management and advancement of his/her career. Does not count toward J.D. credit.

LAWS 6705. Curricular Training: Law Field Research. 0 Unit.
This course is intended exclusively for the foreign national J.D. or LL.M. law student who wishes to gain applied legal experience based on their intended career path with an organization that offers course credit for internship experience. These internships may be either paid or unpaid. This course will provide a means for the student to build required skills and bridge the gap between the classroom and real world application. The student is encouraged to explore and discover additional avenues to assist in the management and advancement of his/her career. Does not count toward J.D. credit.

LAWS 7035. International Law Externship. 12 Units.
This program provides opportunity for students to participate in a semester long externship program arranged through the Cox International Law Center.

LAWS 7045. Federal Judicial Externship. 4 Units.
Students in the spring of their first year are selected for summer externships with specific federal district and circuit judges. Meetings with the externship supervisor at CWRU will complement the eight weeks of externing in the judge’s chamber.
LAWS 7080. Sports/Entertainment Law Externship. 3 Units.
This externship is offered to selected students who participate in the
summer Great Lakes Sports and Entertainment Law Academy. This
externship offers academic credit for placement with various high-profile
sports and entertainment law institutions.

LAWS 7110. Public Sector Externship. 2 - 4 Units.
The externship program allows for an upper-level law student to be
engaged in an experiential learning process by working alongside
practitioners in a variety of legal settings. The students' work is
supervised by both an on-site coordinator, and a law school faculty
member. All externship participation must be coordinated and approved
in advance by the school's externship coordinator.

LAWS 7120. Private Sector Externship. 2 - 4 Units.
The externship program allows for an upper-level law student to be
engaged in an experiential learning process by working alongside
practitioners in a variety of legal settings. The students' work is
supervised by both an on-site coordinator, and a law school faculty
member. All externship participation must be coordinated and approved
in advance by the school's externship coordinator.

LAWS 7130. Non-profit Externship. 2 - 4 Units.
The externship program allows for an upper-level law student to be
engaged in an experiential learning process by working alongside
practitioners in a variety of legal settings. The students' work is
supervised by both an on-site coordinator, and a law school faculty
member. All externship participation must be coordinated and approved
in advance by the school's externship coordinator.

LAWS 7200C. Capstone Externship. 1 - 12 Units.
This is an experiential learning conducted in an off-campus site, with
the student participating in a full-time, semester-long legal trainee
experience. Specific experiences will vary depending on the site of the
externship. Students are given extensive mentoring and supervision with
an on-site supervisor and a CWRU faculty supervisor.

LAWS 7510. SJD Thesis. 1 - 10 Units.
Students in the SJD program will develop and write a substantial
research paper as part of the requirements for conferral of the degree.
The topic and scope of the paper will be developed jointly by the student
and the student's program advisor. Students will meet periodically as
a group with the Director of Foreign Graduate Studies to discuss their
research and to present their research to each other and as part of a
faculty workshop.

LAWS 7511. Thesis - Master of Arts in Financial Integrity. 2 Units.
Each student researches a problem she or he has encountered in her
or his professional practice and prepares both a research paper and
a final, 10 minute presentation that describe the problem and how it
might be resolved. During the duration of the seminar each student
will lead a series of discussions laying out progress in addressing
the problem and seeking comments from other students. The final
presentation will be held at the US Treasury Department before a panel of
experts from the Office of the Comptroller of the Currency, the Financial
Crimes Enforcement Network, the Justice Department, the International
Monetary Fund, and the World Bank Prereq: Must be enrolled in the
Executive Master of Arts-Financial Integrity program.
SCHOOL OF MEDICINE

Since its founding in 1843 Case Western Reserve University School of Medicine has been a national leader in health care education, biomedical research, and commitment to its community, creating an intellectually sophisticated, service-oriented culture that enables bold ideas and new ways of thinking to take root and flourish.

Building on a stellar legacy, including praise in the seminal 1910 Flexner Report, today the School of Medicine is consistently ranked among the top 25 medical schools in the United States as well as earning distinction as the #1 medical school and largest biomedical research institution in Ohio. It also regularly places in the top tier of U.S. medical schools for NIH research funding.

Our educational offerings comprise nearly two dozen programs and degree options for prospective students, including the MD degree, the PhD, the joint MD-PhD, numerous MS degrees, and our physician assistant program. All are led by nationally recognized experts in their fields and feature faculties of wide-ranging distinction.

Continuing to steer the conversation in biomedical education, we have opened the doors of a new 485,000 square foot, high-tech Health Education Campus developed in collaboration with the Cleveland Clinic. The facility takes our longstanding emphasis on interprofessional education to the next level by bringing together under one roof medical students from our various programs (described below), CWRU’s School of Dental Medicine, the Frances Payne Bolton School of Nursing, and the Jack, Joseph and Morton Mandel School of Applied Social Sciences, as well as the medical school’s physician assistant program.

EDUCATION

MD Programs
The School of Medicine offers three outstanding programs leading to the MD degree: the University program, Cleveland Clinic Lerner College of Medicine at Case Western Reserve University, known as the College program, and the Medical Scientist Training Program, the nation’s oldest MD-PhD track.

Our students learn and practice in a wide range of clinical settings at some of the best teaching hospitals in the region and country:

- Cleveland Clinic – consistently chosen one of the nation’s best hospitals
- University Hospitals Cleveland Medical Center (including UH Rainbow Babies & Children’s Hospital, and UH Seidman Cancer Center) – one of the nation’s leading academic medical centers
- MetroHealth – a nationwide leader among public hospital systems
- Louis Stokes Cleveland VA Medical Center – one of the U. S.’s largest veterans’ health care facilities

The University Program
The University Program (four-year MD), our largest MD course of study, trains well-rounded physicians by emphasizing four cornerstones: clinical mastery, research and scholarship, leadership, and civic professionalism. It features our innovative Western Reserve2 (WR2) curriculum, which integrates medicine and public health – emphasizing the relationship between health and social and behavioral factors. Learn more about the University Program at https://case.edu/medicine/admissions-programs/md-programs/.

Case Inquiry (IQ)
Case Inquiry (IQ), a student-centered learning approach, is a foundation of the WR2 curriculum. Small groups of students join with a faculty facilitator to examine specially chosen medical cases – jointly developing learning objectives and carrying out pertinent reading and research. As with other components of WR2, IQ promotes deep-concept learning, enabling students to gain superb skills and a life-long orientation towards teamwork, professionalism, critical thinking, and wide exposure to primary literature. Learn more about IQ at http://casemed.case.edu/caseincl/education/iq-program.cfm.

Pathways
Our Pathways programs are health care concentrations for medical students seeking to gain extra knowledge in special aspects of health and patient care. Examples include the Jack, Joseph and Morton Mandel Wellness and Preventive Care Pathway, Andrew B. Kaufman World Health Pathway, and pathways in the humanities, health innovation and entrepreneurship, and urban health. Learn more about Pathways at https://case.edu/medicine/admissions-programs/md-programs/pathways-programs/.

The College Program
The Cleveland Clinic Lerner College of Medicine of Case Western Reserve University (five-year MD), is a research-focused curriculum that prepares students for careers as physician-investigators. Students graduate with an MD with special qualifications in biomedical research. Learn more about the College program at https://portals.clevelandclinic.org/cclcm/.

MD/PhD Program
The Medical Scientist Training Program – our MD/PhD track – develops physician-scientists who will spend most of their time doing research while still caring for patients. Established in 1956, this was the first MD/PhD program in the country, created nearly a decade before the NIH developed the Medical Scientist Training Program to similar training. Learn more about the MD/PhD program at https://case.edu/medicine/admissions-programs/md-phd-program/.

Graduate Education
The School of Medicine partners with the Case Western Reserve University School of Graduate Studies to offer many high-quality programs leading to PhD and MS degrees, such as the physician assistant program and master of science in anesthesia, as well as certificates in a number of disciplines and sub-fields in the School of Medicine. Learn more about the medical school’s graduate education offers at https://case.edu/medicine/admissions-programs/graduate-programs/.

RESEARCH
The School of Medicine has earned a sterling record of national leadership as a research institution, consistently ranking in the top tier of U. S. medical schools for federal research funding from the National Institutes of Health. A recent Academic Medicine study placed the School in the top 15 medical schools nationally based on the achievements of
its graduates. Faculty and trainee research is routinely reported in the top journals of all fields.

Within a wide and interdisciplinary research portfolio, the School has special strengths in the areas of cancer, big data, imaging, regenerative medicine, and brain health. We are home to more than 30 highly regarded research and teaching institutes and centers ranging from the Center for AIDS Research and Center for Global Health and Diseases (http://case.edu/orgs/cghd/) to the Digestive Health Research Institute (https://case.edu/medicine/dhri/) and Stem Cell Ethics Center (https://case.edu/medicine/bioethics/).

The School is a foundational partner in the Case Comprehensive Cancer Center, which links the cancer research activities of CWRU, Cleveland Clinic, and University Hospitals. Our researchers are supported by eight core facilities such as translational research and clinical trials, computational analysis, and omics and sequencing. We house two highly competitive Specialized Programs of Research Excellence (SPORE) programs – gastrointestinal and cancer disparities – established by the National Cancer Institute. We are the organizing partner for the Cleveland Brain Health Initiative (https://case.edu/medicine/neurosciences/cleveland-brain-health-initiative/), which includes all of our hospital affiliates and draws on our internationally recognized brain experts to address brain-based diseases such as stroke and Alzheimer’s disease.

Among numerous research-centered awards, we have earned a highly competitive Clinical Translational Service Award in partnership with our hospital affiliates – testimony of our entrepreneurial and team-oriented view of science and scholarship.

On the international setting our Center for Global Health and Diseases focuses on AIDS, tuberculosis, malaria, and other serious medical conditions that threaten world health and quality of life. Our Uganda-CWRU Research Collaboration, began in 1986 to assist with the HIV/AIDS epidemic, has expanded its remit to include building capacity and providing training through research on such topics Out as epidemiology, clinical trials, nursing, anthropology, bioethics, biomedical engineering, cancer, and cardiovascular disease. Our collaboration with Taipei Medical University includes exchange programs and joint research efforts in the areas of cancer, brain science, biomedical engineering, medical device and drug development, geriatrics, and long-term care.

We also partner with the business community on technology development and transfer, helping our researchers develop ideas, secure funding, and commercialize their technology – in the process transforming Cleveland into an “ideapolis.” A growing number of faculty-founded start-up companies have emerged from this effort – with many more in the pipeline.

**COMMITMENT TO COMMUNITY**

The School of Medicine demonstrates our commitment to the community in many ways. We have many programs aimed at improving the health of the community, ranging from healthy-eating initiatives to partnered projects to reduce infant mortality. Our Prevention Research Center for Healthy Neighborhoods (https://www.prchn.org/) fosters partnerships in Cleveland’s urban neighborhoods to prevent and reduce rates of chronic diseases such as diabetes and cardiovascular problems – including culturally appropriate interventions as well as evaluating and strengthening existing community programs. The Office of Cancer Disparities Research in the Case Comprehensive Cancer Center works to reduce the disproportionate burden of cancer on minority populations by promoting health equity-focused research and outreach. Our Youth Enjoy Science (YES) program brings diversity to cancer research by engaging underrepresented minorities in Cleveland-area schools in cancer investigation and study.

**History**

Since our founding in 1843 Case Western Reserve University School of Medicine has been widely recognized for innovative, inclusive medical education and pioneering biomedical research.

We were one of the first medical schools in the country to employ instructors devoted to full-time teaching and research. Six of the first seven women to receive medical degrees from accredited American medical schools graduated from Western Reserve College (as it was then called) between 1850 and 1856. Already a leading educational institution for more than a century, in 1952 the School of Medicine initiated the most advanced medical curriculum in the country, pioneering integrated education, a focus on organ systems, and team teaching in the preclinical curriculum. This curriculum instituted a pass/fail grading system for the first two years of medical school to promote cooperation among students instead of competitiveness, introduced students to clinical work and patients almost as soon as they arrived on campus, and provided free, unscheduled time for our students in an era when doing so seemed unthinkable. Many other medical schools followed suit on all of these fronts, and these components remain at the core of medical school curriculums everywhere.

In 1971 the Health Sciences Center was completed to house the university’s medical, dental, and nursing schools, as well as the Health Center Library. The proximity of these research and educational centers to other university departments, including the sciences, engineering, and social sciences, stimulates creative interaction between researchers and educators. We expand on this emphasis on intellectual cross-fertilization in our brand new Health Education Campus described above.

Another leap in research capabilities came in the early 1990s with the Richard F. Celeste Biomedical Research Building, which added 154,000 square feet of cutting-edge research space. In 2002 the University and Cleveland Clinic entered into an agreement to form the Cleveland Clinic Lerner College of Medicine of Case Western Reserve University, with the first class matriculating in 2004. The subsequent years saw additional new research space added, resulting in a complex of facilities on par with the best anywhere.

As described above, in 2006 the School of Medicine launched Western Reserve2, the latest evolution in our medical school curriculum. That same year we partnered with the Cleveland Municipal School District to create the School of Science and Medicine at John Hay High School, the first such school in the nation. That partnership lives on today in the form of numerous initiatives aimed at exposing Cleveland’s young people to careers in science and healing. Our medical and graduate students play vital roles in these initiatives, including mentoring, teaching, and providing shadowing opportunities. The next historical highlight came in 2007 when Pamela B. Davis was appointed the School’s first woman dean of the medical school.

Curricular advancements continued throughout the next decade. For example, in 2015 CWRU and Cleveland Clinic partnered with Microsoft to develop medical and engineering platforms as part of the new HoloAnatomy curriculum – a revolutionary way of learning the intricacies and cross-connections of the human body and its workings. HoloAnatomy plays a central role in the interprofessional education.
featured at our Health Education Campus. And our physician assistant program, begun in 2016, is fast becoming a national destination for those interested in this popular field.

A Rich Legacy

Eleven Nobel Prize holders have had ties to Case Western Reserve University School of Medicine:

- John J.R. Macleod, a Physiology Professor, shared the 1923 Nobel Prize in Physiology or Medicine for the discovery of insulin. Dr. Macleod completed much of his groundwork on diabetes in Cleveland.

- Corneille J.F. Heymans, a Visiting Scientist in the Department of Physiology, received the Nobel Prize in Physiology or Medicine in 1938 for work on carotid sinus reflexes.

- Frederick C. Robbins, a Pediatrics and Virology Professor, shared the 1954 Nobel Prize in Physiology or Medicine for his pioneering work on the polio virus, which led to the development of polio vaccines.

- Earl W. Sutherland Jr., Professor of Pharmacology, won the 1971 Nobel Prize in Physiology or Medicine for establishing the identity and importance of cyclic adenosine monophosphate (AMP) in the regulation of cell metabolism.

- Paul Berg, who earned his Biochemistry degree from CWRU, received the 1980 Nobel Prize in Chemistry for groundbreaking research in recombinant DNA technology.

- H. Jack Geiger, an alumnus of the medical school, is a founding member and past President of Physicians for Social Responsibility, which shared the 1985 Nobel Peace Prize as part of the international campaign to ban landmines.

- George H. Hitchings, an Oncology Professor, shared the 1988 Nobel Prize in Physiology or Medicine for pathbreaking research leading to the development of drugs to treat leukemia, organ transplant rejection, gout, herpes virus, and AIDS-related bacterial and pulmonary infections.

- Alfred G. Gilman, a graduate of the medical school, shared the 1994 Nobel Prize for Physiology or Medicine for identifying the role of G proteins in cell communication.

- Ferid Murad, a graduate of the medical school, shared the 1998 Nobel Prize in Physiology or Medicine for novel discoveries concerning nitric oxide as a signaling molecule in the cardiovascular system.

- Paul C. Lauterbur, PhD, a Visiting Professor of Radiology, shared the 2003 Nobel Prize in Physiology or Medicine for pioneering work in the development of magnetic resonance imaging.

- Peter C. Agre, who completed a Fellowship in Hematology at CWRU, shared the 2003 Nobel Prize in Chemistry for major discoveries that clarified how salts and water are transported out of and into the cells of the body, leading to a better understanding of diseases of the kidneys, heart, muscles, and nervous system.

Two other distinguished alumni have served as U.S. Surgeon General: Jesse Steinfeld, from 1969 to 1973, and David Satcher, from 1998 to 2002. Dr. Satcher also served as Director of the Centers for Disease Control and Prevention from 1993 to 1998. Another medical school graduate, Julie Gerberding, MD, MPH, followed in his footsteps in 2002 becoming the first woman to be named CDC director.

Administration

Stanton Gerson, MD
Interim Dean, School of Medicine, and Senior Vice President for Medical Affairs

Lindsey Whitting, MA
Vice Dean for Development and Alumni Relations

Usha Stiefel, MD
Interim Vice Dean for Faculty Development and Diversity

Lia Logio, MD, MACP
Vice Dean for Medical Education

Mukesh Jain, MD
Vice Dean for Medical Sciences

Stanton Gerson, MD
Vice Dean for Oncology

Mark Chance, PhD
Vice Dean for Research

Michael W. Konstan, MD
Vice Dean for Translational Research

Lisa M. Mencini, CPA, MBA
Senior Associate Dean, and Chief of Staff

Matthew J. Lester, MBA, MHA
Vice Dean for Finance and Administration

Brian Cmolik, MD
Senior Associate Dean for Louis Stokes Cleveland Veterans Affairs Medical Center

Bernard Boulanger, MD
Senior Associate Dean for the MetroHealth System

J. Harry Isaacson, MD
Executive Dean for Cleveland Clinic Lerner College of Medicine

Lina Mehta, MD
Associate Dean for Admissions

Jeffrey L. Ponsky, MD
Associate Dean for Alumni Affairs

Neil Mehta, MBBS, MS
Associate Dean for Curricular Affairs for Cleveland Clinic Lerner College of Medicine

Amy Wilson-Delfosse, PhD
Associate Dean for Curriculum

Gene H. Barnett, MD
Associate Dean for Faculty Affairs for Cleveland Clinic Lerner College of Medicine

Marvin Nieman, PhD
Interim Associate Dean for Graduate Education

Susan Nedorost, MD
Associate Dean for Graduate Medical Education
In 2002, the university and Cleveland Clinic (http://my.clevelandclinic.org/default.aspx) entered into a landmark agreement to form the Cleveland Clinic Lerner College of Medicine of Case Western Reserve University, with the first students matriculating in 2004. The "College Program" is a program within the Case Western Reserve University School of Medicine. Cleveland Clinic serves as an outstanding clinical teaching site for all medical students in the School of Medicine, in addition to being the site for pre-clerkship education in the College Program.

Cleveland Clinic was founded in 1921 by four Case Western Reserve faculty members, three of whom are counted among the alumni of the Case School of Medicine, with a vision of providing outstanding patient care based upon the principles of cooperation, compassion and innovation. Cleveland Clinic's main campus, where much of the activity associated with the program occurs, is located near the Case Western Reserve campus.

Cleveland Clinic is a 6,026-bed health system that includes a 165-acre main campus near downtown Cleveland, 18 hospitals, more than 220 outpatient facilities, and locations in southeast Florida; Las Vegas, Nevada; Toronto, Canada; Abu Dhabi, UAE; and London, England.

Among Cleveland Clinic's 67,554 employees worldwide are more than 4,520 salaried physicians and researchers, and 17,000 registered nurses and advanced practice providers, representing 140 medical specialties and subspecialties.

In 2019, there were 9.8 million total outpatient visits, 309,000 hospital admissions and observations, and 255,000 surgical cases throughout Cleveland Clinic's health system. Patients came for treatment from every state and 185 countries.

Cleveland Clinic has pioneered many medical breakthroughs, including coronary artery bypass surgery and the first face transplant in the United States. U.S. News & World Report consistently names Cleveland Clinic as one of the nation’s best hospitals in its annual "America's Best Hospitals" survey. Learn more about Cleveland Clinic (http://www.clevelandclinic.org/).

Louis Stokes Cleveland Department of Veterans Affairs Medical Center

The Louis Stokes Cleveland Department of Veterans Affairs Medical Center (VAMC) (http://www.cleveland.va.gov/) is a major teaching hospital of the School of Medicine and is an important site for the education of medical students. The Cleveland VAMC also supports more than 100 residency and fellowship training positions in medicine, surgery, and psychiatry and their subspecialties. Most VAMC physicians hold faculty appointments within the School of Medicine. The affiliation is overseen by the Deans Committee, consisting of the dean, department chairpersons from the School of Medicine, and key VAMC officials.

The Cleveland VAMC is a part of the VA Healthcare System of Ohio, linking VA health care facilities in Ohio in an integrated service network. Inpatient care is provided at the Wade Park location and includes medicine, surgery, psychiatry, spinal cord injury, neurology, and rehabilitation medicine as well as a nursing home and a domiciliary. Outpatient care is delivered in primary and specialty care clinics.
located at Wade Park, Akron, Canton, Cleveland, East Liverpool, Lorain, Mansfield, New Philadelphia, Painesville, Ravenna, Sandusky, Warren, and Youngstown. The medical center serves more than 100,000 individual veterans annually through approximately 11,600 hospital admissions and 1,884,000 outpatient visits.

An active research program includes activities funded through the Department of Veterans Affairs and other governmental and private funding sources. Total funding of approximately $21.5 million annually (from all sources) supports more than 50 principal investigators in a broad range of research endeavors.

**MetroHealth System**

The MetroHealth System (http://metrohealth.org/) is one of the largest, most comprehensive health care providers in Northeast Ohio, caring for people in and around Greater Cleveland for more than 170 years. This academic health care system is committed to the communities it serves by saving lives, restoring health, promoting wellness, and providing outstanding, lifelong care that is accessible to all.

Affiliated with Case Western Reserve University School of Medicine since 1914, MetroHealth is a center for medical research and education, with all active staff physicians holding CWRU faculty appointments. More than 400 primary care and specialty care physicians practice within the MetroHealth System. At the core of the MetroHealth system, is the MetroHealth Medical Center. The system's main health care provider, research facility, and teaching hospital is also home to the region's only Level 1 trauma and burn center. However, The MetroHealth System also serves Greater Cleveland with more than a dozen urban and suburban primary and specialty healthcare centers in Cleveland, Strongsville, Westlake, Lakewood, Pepper Pike, and Beachwood.

MetroHealth has received many accolades for its high level of care and the innovation of its physicians. Surgeons at MetroHealth are pioneering new techniques in minimally-invasive surgery for faster recoveries, while its primary care physicians are developing cutting-edge ways to manage common and chronic diseases through the use of electronic medical records and a patient-centered medical home model called Partners in Care. Its maternal-fetal medicine specialists are successfully managing the riskiest of pregnancies and saving the tiniest of lives. In addition, MetroHealth is nationally recognized by the American Heart Association for cardiac and stroke care and the cancer center has earned outstanding achievement awards for the treatment of cancer patients. Every year, MetroHealth provides care to more than 28,000 inpatients and delivers approximately 3,000 newborns. More than 790,000 visits are recorded each year in the medical center's outpatient centers, and patient visits to the emergency department exceed 99,000.

**University Hospitals**

University Hospitals (http://www.uhhospitals.org/) serves the needs of patients through an integrated network of hospitals, outpatient centers, and primary care physicians. At the core of the health system is University Hospitals Cleveland Medical Center. University Hospitals Cleveland Medical Center is home to some of the most prestigious clinical centers of excellence in the nation and the world, including cancer, pediatrics, women's health, orthopedics and spine, radiology and radiation oncology, neurosurgery and neuroscience, cardiology and cardiovascular surgery, organ transplantation and human genetics.

Its main campus includes the internationally celebrated UH Rainbow Babies & Children's Hospital, ranked among the top children's hospitals in the nation; UH MacDonald Women's Hospital, Ohio's only hospital for women; and UH Seidman Cancer Center, part of the NCI-designated Case Comprehensive Cancer Center.

**Advanced Platform Technology Research Center**

216.707.6421
Ronald J. Triolo, PhD, Executive Director
Clay Kelly, MD, Medical Director

https://www.aptcenter.research.va.gov/

The Advanced Platform Technology (APT) Center (https://www.aptcenter.research.va.gov) at the Louis Stokes Cleveland VA Medical Center (LSCVAMC) is one of 13 designated Centers in the Rehabilitation Research and Development Service. The APT Center focuses on serving veterans with sensorimotor dysfunction, cognitive impairment, or limb-loss using cutting edge technologies and rehabilitation techniques, translating them from proof of concept to viable clinical options. Advances in material science, microfabrication and microsystem design, neural engineering, mechanics, and communications are captured and integrated for applications in prosthetics/orthotics, neural interfacing, wireless health monitoring and maintenance and all forms of enabling and enabling technologies. The APT Center is able to provide or facilitate access to the following resources:

- Neural modeling and analysis of interface designs
- Polymer and bioactive material development
- Microelectromechanical (MEMS) systems design and fabrication
- 3-D and laser printing/prototyping, mechanical testing and dynamic simulation
- Pre-clinical in vitro and in vivo verification of device performance
- Circuit, sensor and software design and fabrication
- System validation and design control documentation
- Professional engineering support and project management
- Administrative support for intellectual property protection, regulatory affairs, and quality systems.

The APT Center was established in 2005 as a collaboration between the LSCVAMC and Case Western Reserve University (CWRU). Over 50 Engineers and Clinician Scientists at the LSCVAMC, CWRU, Cleveland Clinic, University Hospitals, Cleveland State University, Kent State University, University of Michigan, and Cornell University are affiliated with the APT Center and contribute to its mission.

**Case Comprehensive Cancer Center**

216.368.1122
Stanton L. Gerson, MD, Director
http://cancer.case.edu

The Case Comprehensive Cancer Center (Case CCC) (http://cancer.case.edu) based at Case Western Reserve University (CWRU) is a partnership organization supporting cancer-related research efforts at CWRU, University Hospitals Cleveland Medical Center, and Cleveland Clinic. Located in Cleveland, Ohio, the Case CCC serves the
cancer research and clinical needs of an urban manufacturing and rural agricultural region containing over 4 million people in Northern Ohio.

The Case CCC provides a unique forum and academic network for cancer researchers across our community to accomplish more than they may individually. Through the Case CCC, our medical institutions are linked in a stronger and more unified effort to understand the causes and progression of cancer and to use that understanding to develop treatments and to reduce the likelihood that our population will develop cancer and suffer from its consequences. The Cancer Center advocates for cancer research support across the institutions; provides funding for promising pilot grants, shared resource development, training programs, and recruitment; and catalyzes multidisciplinary and transdisciplinary cancer research across institutions, emphasizing innovative discovery that will have an impact on cancer patients.

The mission of the Case CCC is to:

- Improve the prevention, diagnosis and therapy of cancer through discovery, evaluation and dissemination.
- Stimulate and support innovative, coordinated interdisciplinary clinical research on cancer diagnosis, treatment, prevention and control.
- Develop clinical applications of discovery and make these available to Northern Ohio residents as quickly as possible through the integrated efforts of the major health systems in the region.
- Develop cancer prevention and control activities that build on the expertise of the Center and result in a reduction of cancer morbidity and mortality in Northern Ohio and the nation.

The research efforts of the Case CCC members are organized into seven interdisciplinary scientific programs. The clinical research effort is supported by 12 Clinical Trials Disease Teams that develop and prioritize clinical trials, and a single Protocol Review and Monitoring System, Data Safety and Monitoring Plan integrate cancer research, cancer therapeutics, and prevention services at the partner institutions and throughout the region.

Research programs of the Case CCC are also extending into community medical centers operated by University Hospitals and Cleveland Clinic. Outreach programs for clinical practice-based prevention and screening initiatives, educational programs, minority recruitment, and facilitation of patient referrals are also supported by the partner institutions.

In addition to successfully competing for a Cancer Center Support Grant from the National Cancer Institute, the Center must meet specific criteria for:

- Breadth and depth of basic cancer research; clinical cancer research; and prevention, control and population/behavioral sciences research in cancer; and
- Strength of interaction among these three major research areas.

The Case Comprehensive Cancer Center is one of only 50 NCI-designated Comprehensive Cancer Centers in the nation. Learn more about the National Cancer Institute’s Cancer Centers program at cancercenters.cancer.gov (http://cancercenters.cancer.gov/).

Case Cardiovascular Center

216.368.5678
Sanjay Rajagopalan, MD, Director, Case Cardiovascular Research Institute
Aaron Proweller, MD, Associate Director, Case Cardiovascular Research Institute

https://case.edu/medicine/cvri/

The Case Cardiovascular Center (http://www.case.edu/cvri/) was established in 2006 with the central mission to develop premier clinical, research, and education programs in heart and vascular disease. The structure of the Center includes clinical (University Hospitals Harrington-McLaughlin Heart & Vascular Institute—UH-HMHVI) and research (Case Cardiovascular Research Institute—CVRI) arms.

The UH-HMHVI (http://www.uhhospitals.org/services/heart-and-vascular/institute/) is a multi-disciplinary team of nearly 60 full-time faculty members dedicated to (a) the prevention, diagnosis, and treatment of heart and vascular disease to both local and regional patient populations in Northeast Ohio, (b) the education and training of medical students, residents and fellows, and (c) the development of breakthrough medical advancements and practices to deliver superior clinical outcomes. These clinical services range from primary to quaternary levels of expertise and are provided at all the health care facilities within the University Hospitals healthcare system. The clinical programs are organized into 11 program centers that comprise the Institute.

The research activities of the CCC are focused on the development of premier research programs that span the full spectrum of activities from basic bench-side research to translational research (“first-in-man”) and clinical trials. The CVRI is focused on basic and translational studies. The Research & Innovation Center (RIC) of the UH-HMHVI is dedicated to innovative clinical trials and applied technology. The major areas of research focus in the CVRI include cardiovascular biology, mechanisms of gene regulation, innate immunity & inflammation, and stem cell & regenerative medicine. Investigators in the CVRI have full access to two laboratories for in vivo research in small and large animals. The RIC oversees all clinical research activities within cardiovascular medicine and surgery and is supported by a lead administrator along with nurse coordinators and staff to facilitate patient enrollment as well as regulatory/grant activities. Active areas of clinical research include interventional cardiology, vascular medicine, heart failure, electrophysiology, preventive cardiology & rehabilitative medicine, and cardiovascular imaging.

Case Center for Imaging Research (CCIR)

216.983.3264
James Basilion, PhD, Director - CCIR
Chris Flask, PhD, Director - Imaging Research Core

The CCIR (https://case.edu/medicine/ccir/) is a joint venture between Case Western Reserve University School of Medicine and University Hospitals Cleveland Medical Center. The CCIR, through its numerous faculty members and state-of-the-art clinical and preclinical imaging capabilities, promotes interdisciplinary and translational imaging research. As the imaging research program at CWRU continues to grow, we strive to make the CCIR imaging capabilities available to the broader research community. This overarching goal has led to a strong collaborative relationship between the CCIR imaging faculty and both basic and clinical researchers in many disciplines.

Within the CCIR, the Imaging Research Core provides facilities for both preclinical and clinical imaging studies. The Imaging Research Core serves as a shared resource for CWRU’s Cystic Fibrosis Center, the Case Comprehensive Cancer Center, the Clinical and Translational Science Collaborative (CTSC), the Cleveland Digestive Diseases Research Cores Center, and the SMART Center in the School of Nursing. The preclinical facility includes two high-resolution MRI scanners, a microPET/CT scanner, an ultrasound scanner, an X-ray scanner, and three...
bioluminescence and fluorescence systems. Magnetic relaxometers are also available for high throughput screening of developmental MRI contrast agents. In addition, a novel cryo-imaging imaging system provides high resolution, 3D optical imaging capabilities. The Core also provides support for quantitative analysis of all imaging data.

A human 3T MRI scanner and an ultrasound scanner are also available through the Core for clinical research studies. Other clinical imaging options are also available within the Department of Radiology. The creation of a new radiopharmaceutical facility within the CCI, together with our existing cyclotron and radioisotope delivery system, now provide the capacity to conduct a variety of molecular PET imaging studies from preclinical animal studies all the way to routine clinical studies.

The Center for AIDS Research
216.368.0271
Jonathan Karn, PhD, Director
Michael Lederman, MD, Associate Director
Since its founding in 1994, the Case Western Reserve University/University Hospitals Center for AIDS Research (CWRU CFAR (http://casemed.case.edu/cfar/)) has been a center of excellence for both clinical and basic science AIDS research. Investigators participating in the CWRU CFAR draw on resources from the Case Western Reserve University School of Medicine, University Hospitals Cleveland Medical Center, MetroHealth Medical Center, the Cleveland Clinic Foundation and the Joint Clinical Research Center in Kampala Uganda. As one of only 19 CFARs nationally, the CFAR plays an important role in ensuring that cutting-edge AIDS research and well-received community outreach is supported in our region of the country. Major strengths in the CWRU CFAR include international research, especially with respect to research in tuberculosis and HIV malignancy, microbicides, pathogenesis, virology, clinical trials, and training, at the national and international levels. As the first CFAR to make a major investment in international research, we have been able to expand a highly productive and long-standing scientific relationship with Makerere University, Kampala.

The CWRU CFAR shares and supports the mission of the National CFAR program to support a multi-disciplinary environment that promotes basic, clinical, epidemiologic, behavioral, and translational research in the prevention, detection, and treatment of HIV infection and AIDS. The CWRU CFAR provides: Leadership and strategic planning that promotes and supports outstanding HIV/AIDS research at our participating institutions, a vibrant series of seminars and meetings regularly bringing leaders in HIV research to our campus, laboratory cores with expertise, state-of-the-art instrumentation and technologies; pilot grant awards and mentoring to develop junior faculty interested in HIV; educational and training efforts which encompass the whole range of contemporary HIV/AIDS research; community outreach programs, and the promotion of and participation in collaborative research efforts within the national CFAR network and in Uganda.

Center for Antimicrobial Resistance and Epidemiology
216.791.3800, ext. 4788
Louis Stokes Cleveland Department of Veterans Affairs Medical Center (VAMC)
Robert A. Bonomo (robert.bonomo@va.gov), MD Chief, Medical Service
As antibiotic resistance has become a national and global public-health problem, top academic centers are preparing to launch ambitious programs addressing research on the basic, translational and clinical aspects of antibiotic resistance. The CWRU-Cleveland VAMC Center for Antimicrobial Resistance and Epidemiology (Case VA CARES) aims to translate research findings into clinically useful tools for the diagnosis and treatment of patients infected with multidrug-resistant (MOR) Gram-negative organisms and mycobacteria. The center’s long term goals are: 1) to continue and expand this dynamic research program directed at understanding the mechanistic bases of resistance in order to develop innovative clinical and therapeutic approaches to deal with MOR organisms; 2) to develop a strong clinical research program of translational medicine on antibiotic resistance; 3) to incorporate drug discovery, whole genomic sequencing and other rapid diagnostic technologies into the management of patients infected with MOR organisms and mycobacterial pathogens, including tracking of outbreaks and molecular epidemiology of these organisms; 4) to enhance educational activities of trainees in aspects related to antibiotic resistance; and 5) work with existing services available at the School of Medicine, University Hospitals, and the Clinical and Translational Science Collaborative to disseminate research and educational activities both nationally and internationally.

The Center for Child Health and Policy at Rainbow Babies & Children’s Hospital
216.844.6253
Ann Nevar, MPA, Director
Established in 2007, the Center for Child Health and Policy at Rainbow (http://www.uhospitals.org/rainbow/for-clinicians/child-health-policy/) focuses on major health policy issues that are central to the well-being of children and youth. The Center recognizes that health policy forms a framework for all health care delivery and that health policy is therefore essential to improving children’s health. In this way, the Center focuses on the nexus between policy and practice of pediatric medicine.

The Center fills the need to amalgamate expertise in pediatric medicine and research with expertise in health policy. Operating as a think tank, the Center brings together experts in child health, health finance, law and policy to perform policy analyses, consultations, research, educational programming, and community outreach to advance child health through policy. Work is focused on several areas including: Maternal/Fetal/Newborn Health; Chronic Illness; Quality; and Care Delivery Systems. The Center is the only program devoted to child health policy in Cleveland and one of few nationwide.

To date, the Center has accrued many products and achievements including: Ohio Health Policy Researcher of the Year in 2006; Ohio Health Policy Researcher of the Year for Independent Research in 2009; programs designated Centers of Excellence; multiple white papers, reports, and peer-reviewed publications; grants and awards from the National Institutes of Health, The Centers for Disease Control and Prevention, the Ohio Department of Health, the Ohio Department of Job and Family Services, and numerous foundations; and invited/elected memberships in state and national policy committees.

Center for Clinical Investigation
216.368.3286
Pamela B. Davis, MD, PhD, Director
The Center for Clinical Investigation (CCI) was founded in 2007 and is part of Case Western Reserve University School of Medicine’s Division of General Medical Sciences. The CCI serves as the academic home of
Cleveland’s Clinical & Translational Science Collaborative, a partnership of 4 local institutions (Case Western Reserve University, the Cleveland Clinic Foundation, the MetroHealth System, and University Hospitals) and member of a national consortium of approximately 66 institutions funded by the National Institutes of Health to increase the efficiency and speed of clinical and translational research across the country.

The CCI’s mission is to enhance clinical and translational research efforts across the Cleveland area by: (1) spurring advances in knowledge of risk factors, outcomes and treatment effectiveness in the population; (2) facilitating the transfer of scientific advances to the community; and (3) developing a new generation of clinical researchers equipped with the skills needed to efficiently design, implement and interpret novel studies that address important public health questions. To accomplish its mission, the CCI provides computer systems and applications support for basic science and clinical research activities and works closely with basic science and clinical investigators in the CWRU Schools of Medicine, Nursing, and Dental Medicine, as well as the University Hospitals Case Medical Center, Cleveland Clinic, and MetroHealth System. The CCI has supported hundreds of clinical research and epidemiology projects, including local and national multicenter, longitudinal studies. The CCI has two cores that provide research support to all investigators: the Academic Development Core and Statistical Sciences Core.

The Academic Development Core manages the newly created PhD Program in Clinical Translational Science, the Master’s Degree Program in Clinical Research (Clinical Research Scholars Program - see “Clinical Research MS” tab above), and the Graduate Certificate Program in Clinical Research. The Academic Development Core also delivers seminars and short courses in clinical research and works to coordinate educational activities in interdisciplinary clinical research across the CTSC’s institutional members. The programs target investigators and other key members of the research team, including data managers and study coordinators. Training efforts in research design, research data management, statistical sciences, statistical software, and scientific communication are emphasized.

The Statistical Sciences Core provides data management and statistical support for study design and data analysis. Members who provide data management consist of skilled data managers and programmers who consult and collaborate with investigators on data collection instrument development and coding, database development and administration, data cleaning and quality assurance, statistical programming, and dataset preparation. Members providing statistical support collaborate and consult with clinical investigators on proposal development, study design, study monitoring, and data analysis. “The Statistical Sciences Core currently consists of 1 PhD biostatistician and 1 MS biostatistician. Statistical software packages that are supported by the CCI Statistical Sciences Core include SAS, SPSS, R/S-Plus, NCSS PASS and Minitab. In addition, the Statistical Science core serves as a gateway for connecting investigators with the broad expertise available through the biostatistics faculty in the Department of Population and Quantitative Health Sciences.

**Center for Community Health Integration**

https://case.edu/medicine/healthintegration/

CHI-Information@case.edu (CHI-Information@case.edu/)

Kurt C. Stange, MD, PhD, Director

The Center for Community Health Integration (CHI) (https://case.edu/medicine/healthintegration/) conducts collaborative research and development to advance community health and integrated, personalized health care. We work with colleagues across multiple levels of a complex system to develop a shared understanding of the effects of social, environmental, and human systems, and to use that understanding to improve the health of individuals, vulnerable populations, and communities.

Building on three decades of work with partners in Cleveland and around the world, this new center is in an early phase of making and reinforcing connections that challenge problems often perceived as intractable. We are investing in relationships, analytical capacity, and novel ideas. We welcome conversations to explore collaborative opportunities.

**Center for Global Health and Diseases**

216.368.4818

http://www.case.edu/orgs/cghd/

James W. Kazura, MD, Director

The Center for Global Health and Diseases links the numerous international health resources of the University, its affiliated institutions, and the northern Ohio community in transdisciplinary programs of research and education related to global health. The scope of the Center’s activities also includes education and service as these are related to molecular, clinical and population studies of human health and disease.

The Center is currently a national leader in National Institutes of Health-supported studies of the major infectious diseases of developing countries. Cutting-edge approaches are implemented in order to examine the molecular, genetic and immunologic basis of susceptibility to infectious diseases of public health significance - malaria, river blindness, lymphatic filariasis, schistosomiasis, HIV and other viral diseases such as Rift Valley fever. Clinical research in endemic countries is concerned with testing and implementing cost-effective public health interventions that are aimed at the control of malaria and Neglected Tropical Diseases (worm infections of children, elimination of lymphatic filariasis). The Center has ongoing research and educational collaborations with academic and governmental institutions in Papua New Guinea, Brazil, Kenya, Uganda, and several other countries in Sub-Saharan Africa.

Educational programs sponsored by the Center include electives in international health, population biology, and genetics of infectious diseases (available to undergraduate, graduate and professional school students), a weekly World Health Interest Group (WHIG) seminar series, overseas rotations for graduate and professional school students, and training programs at the university and abroad for scholars from developing countries (with support from the Fogarty International Center at NIH).

A certificate in Global Health is available (see Certificates).

**Center for Health Care Research & Policy**

216.778.3902

Randall D. Cebul, MD, Director

The mission of the Center for Health Care Research & Policy (http://www.chrp.org/) is to: 1) improve the health of the public by conducting research that improves access to health care, increases the quality and value of healthcare services, and informs health policy and practice; and 2) lead education and training programs that promote these goals. Formally established in 1994, the Center’s mission is carried out by a cross-disciplinary faculty who both lead and collaborate with other scholars in Northeast Ohio and beyond. A core faculty of 17 is extended by affiliated Senior Scholars throughout the university, assisted by an able staff and over 30 grant-supported research associates. The Center’s
home at MetroHealth’s Rammelkamp Research and Education Building is an outstanding venue for collaborative research, mentoring of students and junior faculty, and cross-disciplinary seminars.

The Center’s research and training focus in programmatic areas that reflect national health care priorities as well as high impact problems in adults. Center Programs pertain to chronic conditions, especially stroke, obesity and diabetes, and kidney disease. Programs are supported by methods units, including biostatistics and evaluation, health care decision making, and health economics and health policy. Research using clinical informatics capitalizes on growing institutional capacities in electronic medical records (EMR) and clinical decision support. Center faculty view Northeast Ohio as a laboratory for research, recognizing the national relevance of regional challenges and opportunities. For over four years, the Center has served as the administrative home for Better Health Greater Cleveland, an EMR-catalyzed initiative to measure, publicly report, and improve health outcomes for the region’s residents with chronic medical problems. Center faculty also assume leadership roles in federally-supported degree programs in Health Services Research and Clinical Investigation and teach in the core curriculum of the School of Medicine.

Center for Medical Education
216.368.1948
Lia Logio, MD, Director
Klara Papp, PhD, Director, CAML

The Center for Medical Education, established in 2010, provides an organizational home for teaching and learning programs in the School of Medicine and a supportive environment for those who want to develop special skills in medical education.

The Center also sponsors faculty appointments, both full- and part-time, for faculty whose roles are predominantly focused on teaching medical students and physician assistant students. These include community clinicians who welcome medical students into their clinics and practices.

The Center for the Advancement of Medical Learning (https://case.edu/medicine/caml/) (“CAML”) operates its programs under the auspices of the CMed. CAML supports and promotes the development of teaching and lifelong-learning skills among students, faculty, staff, residents, and alumni. CAML pursues research into educational innovations to advance our knowledge of medical learning and teaching. The Center offers workshops to faculty locally, regionally, and nationally to enhance faculty teaching, research and evaluation skills.

Center for Proteomics and Bioinformatics
216.368.0291
http://proteomics.case.edu/index.html
Biomedical Research Building, Ninth Floor
Mark R. Chance, PhD, Director

The Case Center for Proteomics and Bioinformatics was created, in part, to strengthen Cleveland’s presence in modern proteomics and bioinformatics research to make the region a leader in the field. The vision for the Center has been shaped over the past several years by the leadership of the Center’s Director, Mark Chance, PhD, with over $120 million in grants awarded to the Center and its collaborators since its inception in February 2006. One of the primary goals of the CPB is to develop an infrastructure of sophisticated equipment that facilitates and maximizes shared equipment usage, as well as to offer a wide array

of proteomics, and metabolomic services including protein and small molecule mass spectrometry, protein expression/interactions, systems biology, and biostatistical analyses.

The CPB has expanded its vision to include education of graduate students in systems biology and bioinformatics. The Center for Proteomics and Bioinformatics developed a graduate program in Systems Biology and Bioinformatics in collaboration with Schools and Departments across the campus. For more information regarding the SYBB graduate program please see “Systems/Bioinformatics” tab above. You may also visit http://bioinformatics.case.edu/.

In studying proteins and metabolites, bioinformatics analysis enables researchers to take an integrated pan-omics approach for discovering networks involved in human disease. The School of Medicine has established the Center for Proteomics and Bioinformatics to perform research to better understand the genetic and environmental bases of disease as well as provide new technologies to diagnose diseases such as cancer, heart disease, and diabetes. Utilizing bioinformatics enables researchers to take an integrated -omics approach for discovering networks involved in human disease.

New technologies in mass spectrometry are also allowing protein expression, localization, structure, post-translational modifications, and interactions to be studied in increasing detail and on a genome-wide scale. The Center is also developing and applying state-of-the-art structural proteomics technology, metabolomic and small molecule analysis, especially for pharmaco-kinetic (PK) studies to support clinical, translational, and structural research.

The CPB has three major research areas: Proteomics and Bioinformatics, Metabolomics, and Macromolecular Structure.

**Proteomics and Bioinformatics** faculty and staff support research in protein expression analysis, protein modifications, and protein interactions in a wide variety of biological contexts as well as develops new bioinformatics tools in Proteomics research. This includes multiple Proteomics Cores to support these activities.

**Metabolomics** faculty and staff support metabolite small molecule quantification research in the CWRU community. The services provided range from drug PK studies to quantification of endogenous metabolites in clinical and preclinical samples.

**Macromolecular Structure** faculty and staff supports interdisciplinary research in new methods of structure determination, the combination of computational and experimental structural biology approaches and developing and maintaining the infrastructure for macromolecular structure determination.

The CPB also offers a wide range of seminars, workshops, and possibilities for individual training. These activities are posted on the CPB Web site. For a list of services and to explore opportunities to collaborate, please visit the Web site: https://case.edu/medicine/nutrition/case-center-proteomics-and-bioinformatics (https://case.edu/medicine/nutrition/case-center-proteomics-and-bioinformatics/)

Center for Psychoanalytic Child Development
Kimberly Bell, PhD, Director
Email: kmb207@case.edu
216.991.4472
The Center for Psychoanalytic Child Development was established in 2001 in memorial to John A. Hadden Jr., past President of the Board of Trustees of the Cleveland Center for Research in Child Development and of the Hanna Perkins School. The mission of the center is to advance the science of psychoanalytic child development at the School of Medicine.

The Center offers medical students and residents who are interested in working with children the opportunity for observational learning in the Hanna Perkins school. In addition, didactic courses, case conferences, and supervision are available to deepen students’ understanding of the relationship between physical and psychological development in the first 5 years of life.

The Center for RNA Science and Therapeutics
216.368.0299
http://www.case.edu/med/rncenter/home.htm
Eckhard Jankowsky, PhD, Interim Director

The Center for RNA Science and Therapeutics is a free-standing academic unit in the basic sciences within the School of Medicine at Case Western Reserve University. The RNA Center was established in the mid-nineties as a core entity in recognition of the strong cadre of research laboratories devoted to studying post-transcriptional mechanisms of gene expression focusing on various aspects of RNA Biology. The current mission of the RNA Center is to parlay the strengths of RNA Center scientists towards the development of unique therapeutic initiatives. The RNA Center is combining the usage of nanoparticle technology with RNA science to develop new classes of drugs, leading towards the amelioration of a variety of diseases. Current efforts are focused on metabolic disorders, cancer immunotherapies, immunity, and protein replacement. In addition, we are developing new technologies that promise to improve diagnostics, allowing for earlier detection of a variety of human diseases, especially cancer.

The RNA Center contains one of the largest concentrations of RNA scientists in the nation. The faculty of the RNA Center cover nearly every aspect of RNA research. Current research in the Center focuses on several problems ranging from extremely basic questions such as the mechanism of RNA catalysis and how proteins interact with RNA to the roles of RNA processing in disease. Specific research interests include splicing and its regulation, RNA editing, RNA maturation, mechanisms of translation regulation, RNA trafficking, RNA interference and regulation of gene expression by microRNAs and non-coding RNAs.

Collectively, the RNA Center provides a valuable resource for collaborative efforts within the University and its affiliated institutions: the Cleveland Clinic Foundation, MetroHealth Medical Center, the Cleveland VA Medical Center, and University Hospitals Cleveland Medical Center. In addition, the official journal of the RNA Society “RNA” was founded and continues to be housed in the RNA Center. The members of the RNA Center have an excellent funding record and the research performed is regularly published in highly visible journals such as Science, Nature, Molecular Cell, NSMB, Molecular Cell, etc.

Center for Science, Health and Society
216.368.2059
http://casemed.case.edu/cshs/
Nathan A. Berger, MD, Director

Recognizing that the successful futures of Case Western Reserve University, the City of Cleveland, and Cuyahoga County are integrally related, the Center for Science, Health and Society (CSHS) was created in 2002 to focus the efforts of the University and the community in a significant new collaboration to impact the areas of health and healthcare delivery systems through community outreach, education, and health policy. The Center, based in the School of Medicine, with university-wide associations, is engaging the many strengths of the University and the community to improve the health of the community.

The Center has engaged the community at the level of the individual and the neighborhood, in public and private schools, at civic and faith-based organizations, and at the level of governmental agencies and community leadership to identify community problems, perceptions, assets, and resources; advise the community of faculty skills, assets and expertise; and, catalyze that community service based scholarship that benefits community interests and promotes mutual enhancement. The Center coordinates the Scientific Enrichment Opportunity outreach program that brings Cleveland high school students on to the medical school campus in the summer to work along with our distinguished faculty in their research labs, to introduce and stimulate the students and help prepare them to enter careers in the health career professions and biomedical workforce. The Center also coordinates the Mini Medical School Program presented every Spring and Fall to educate the community about the latest developments in healthcare, particularly those developed at CWRU. The overall goal of these programs is to educate and empower the community to become better consumers of healthcare and more informed and stronger advocates for healthcare policy and legislation in their own interests.

Center for the Study of Kidney Biology and Disease

John R. Sedor, MD, Director

Chronic Kidney Disease (CKD) is a growing public health problem in the United States. More than seventeen percent of US adults—more than 40 million Americans—have CKD. CKD generally progresses over time and can cause cardiovascular disease, anemia, bone disease, fluid overload, and eventually end-stage kidney disease (ESKD). Patients with ESKD need renal replacement therapy, either from dialysis or a kidney transplant, to live. The risk of death for patients receiving dialysis is nearly eight times higher than the non-ESRD population, leading to a 20% annual probability of death. Kidney disease disproportionately affects minorities and vulnerable populations. Kidney disease treatment is expensive and uniquely tied to federal expenditures through the Medicare entitlement program. The cost of care for ~ 550,000 ESKD patients is nearly $34 billion annually, exceeding the total NIH budget. Treating all health conditions of CKD and ESRD patients consumes nearly 25% of the Medicare’s budget.

The Center’s mission is to accelerate discovery and its translation for treatment and cure of kidney diseases in an interdisciplinary environment within the rich, research environment of the CWRU School of Medicine. The faculty is an accomplished and highly interactive group of investigators, based in the adult or pediatric Divisions of Nephrology in CWRU-affiliated hospitals (Cleveland Clinic, MetroHealth, Stokes VAMC, University Hospitals) as well as other clinical and basic science departments at the School of Medicine and Lerner Research Institute. Research interests of the faculty include digital pathology image analysis using machine learning tools, glomerular diseases, diabetic and other chronic kidney diseases, epithelial cell biology and
ion transport, tubular physiology, genetic epidemiology, health services research, renal transplantation, health disparities research and clinical trials. Center faculty are members of the NIDDK-funded Kidney Precision Medicine Project and the APOLLO, NEPTUNE and CureGN consortia, all of which use "omics" tools to generate deep molecular phenotypes for discovery of new treatment targets and biomarkers. Research projects use cellular, molecular biological, computational, genetic, genomic and epidemiological methods to study in vitro and animal models and/or patients. Projects by Center investigators use health data, culled from electronic health records, and biological samples from patients with kidney diseases in order to generate novel hypotheses, which can then be tested with animal models and cell lines. Training opportunities are available for undergraduate, pre- and post-doctoral students.

Cleveland Functional Electrical Stimulation (FES) Center
216.231.3257
Robert F. Kirsch, PhD, Executive Director
Robert Ruff, MD, PhD, Medical Director

The Cleveland Functional Electrical Stimulation (FES) Center (http://fescenter.org/) is a consortium of three nationally recognized institutions: Department of Veterans Affairs, MetroHealth Medical Center, and Case Western Reserve University. Through the support of these partners, the Cleveland FES Center is able to provide a continuum of advancement. Created in 1991 with a grant from the Department of Veterans Affairs, the FES Center currently has research funding at the federal, state and local levels and additional industry and foundation funding in excess of $17M in order to achieve its mission.

The Center focuses on the application of electrical currents to either generate or suppress activity in the nervous system. This technique is known as functional electrical stimulation (FES). FES can produce and control the movement of otherwise paralyzed limbs for standing and hand grasp, activate visceral bodily functions such as bladder control or respiration, create perceptions such as skin sensibility, arrest undesired activity such as pain or spasm, and facilitate natural recovery and accelerate motor relearning.

Founded to introduce FES into clinical practice, the Center provides innovative options for restoring neurological health and function by developing advanced technologies and integrating them into clinical care.

Institute for Transformative Molecular Medicine
216.368.5725
Jonathan S. Stamler, MD, Director

The Institute for Transformative Molecular Medicine (ITMM), which operates under the combined aegis of Case Western Reserve University and University Hospitals, is composed of physician-scientists and basic discovery researchers who work to acquire fundamental scientific knowledge within the field of molecular medicine. Founded in 2010, the ITMM provides physician-scientists with the opportunity for professional advancement based on their contributions to life sciences, protected from demanding clinical schedules or administrative responsibilities. The mission of the ITMM is to foster the unrestricted pursuit of new knowledge that can be cultivated as the basis for therapeutic innovation and to inspire new generations of physician-scientists.

The operation of the ITMM is based on a new model that unites academic medical centers, physician- and discovery-scientists and commercial partners to maximize the conversion of basic science discoveries into novel, high-value therapeutics. Thus, the ITMM facilitates connectivity between medical disciplines and the basic research community in order to catalyze fundamental discovery and its transformation into therapies that benefit humankind. Creativity and innovation are highly valued in the culture fostered by the ITMM. Expertise in interdisciplinary science is prioritized, including signal transduction, receptor biology, regenerative medicine, RNA biology and chemical biology, in the pursuit of cutting-edge advances that can impact human disease.

The Mt. Sinai Skills and Simulation Center
216.368.0064
Andrea Bryner, BA, MSM, Administrative Director

The Mt. Sinai Skills and Simulations Center (MSSSC) (http://casemed.case.edu/simcenter/) was initially conceived in response to common concerns over the nationwide increased incidence of medical errors, the rising costs of healthcare, and the need for improved patient-caregiver communication. Since its founding in 2006, the MSSSC continues to work with an ever-expanding list of healthcare partners to become an integral resource for the education of healthcare students and professionals in the Northeastern Ohio region and throughout Ohio.

Simulation develops confident practitioners who can significantly contribute to the goal of improved patient outcomes. By providing a variety of simulation tools, such as life-like computerized manikins and standardized professionals performing within carefully crafted scenarios, we can replicate the complex environment of the clinical setting. Participation in these specially designed scenarios allows learners to practice the critical skills needed to provide safe, quality care to patients, including communication, technique development, decision making and data analysis. These models have allowed us to have ongoing research projects in education development and intervention and advanced our partnership for the development of new techniques and materials.

The MSSSC has all the tools available for simulation training, including Standardized patients – individuals trained to portray situations or conditions; Task trainers – devices used to teach individual techniques; High fidelity trainers – manikins with programming capabilities; Virtual reality – real-life interactive trainers for surgery, cardiology and other disciplines; and Hybrid combinations of the above.

During the past five years, the Center has provided educational opportunities and course for learners at all levels from high school students, medical, physician assistant, dental and nursing students at Case Western Reserve University and The Lerner College of Medicine, residents and fellows from training programs at University Hospitals Case Medical Center, The Cleveland Clinic and VA Medical Center, graduate education for practicing physicians and surgeons, nursing and other healthcare providers at all levels.

National Center for Regenerative Medicine
216.368.3614
http://ncrm.us
Stanton L. Gerson, MD, Director
Timothy A. Chan, MD, PhD, Co-Director

The Center for Regenerative Medicine (http://ncrm.us) is a multi-institutional center composed of investigators from Case Western Reserve University, University Hospitals Case Medical Center, the
Cleveland Clinic, Athersys, Inc., and The Ohio State University. Building on over 30 years of experience in adult stem cell research in northeast Ohio, the Center was created in 2003 with a $19.4 million award from the State of Ohio as a Wright Center of Innovation. An additional $8M award in 2006 from the State of Ohio’s Biomedical Research and Commercialization Program (BRCP) was successfully completed and enabled 3 new clinical trials to enroll patients. In 2009, $5M was awarded by the Ohio Third Frontier (OTF) Research Commercialization Program (RCP) which further validated the Center’s ability to achieve its mission to utilize human stem cell and tissue engineering technologies to treat human disease. In 2010, $1M was awarded to the NCRM by the OTF Biomedical Program (OTFBP) to advance the clinical treatment of spinal cord injury, and a $2.1M OTF Wright Program Project (WPP) award was made to create a consortium of quantitative analysis imaging systems for stem cells.

**Neural Engineering Center**

216.368.3978  
Dominique M. Durand, PhD, Director  
Kenneth Gustafson, PhD, Associate Director

The Neural Engineering Center (NEC) (http://www.case.edu/cse/nec/) is a coordinated group of scientists and engineers dedicated to research and education in an area at the interface between neuroscience and engineering. They share the common goal of analyzing the function of the nervous system, developing methods to restore damaged neurological function, and creating artificial neuronal systems by integrating physical, chemical, mathematical, biological and engineering tools.

The center was started in 2001 and replaced the Applied Neural Control Laboratory (ANCL) started in 1972. The center offers breadth and depth in Neural Engineering research and education in a highly ranked biomedical engineering department and medical school. The center is located on the campus of Case Western Reserve University and its members collaborate with four major hospitals in the Cleveland area.

The center provides core facilities in tissue culture, microscopy and histology. The center facilities also include an electrode fabrication laboratory, surgical suite for acute and sterile surgery, staffed by two full-time animal technicians. The center also holds several laboratories in neural regeneration, neural interfacing, neural prosthetics, materials for neural interfacing computer modeling and in-vitro electrophysiology. The students, research associates, and faculty can carry out research at many levels starting from cellular and molecular to animal experimentation and into the clinic. Many other facilities such as electronic design, microfabrication, and rapid prototyping are also available in collaboration with other closely related centers, the Functional Stimulation Center (FES) and the Advanced Platform development Laboratory (APT). Center members work closely with the partner hospitals and the technology transfer office of CWRU for translation and clinical implementation of solutions restore neural function such as development of electrodes for communication with the nervous system, regenerating neural tissue, restoring function in paralyzed patients, preventing seizures, motor disorders, incontinence aspiration or obstructive sleep apnea.

The center provides financial support for students through research and training grants. The graduates of this program have made significant contributions to the development and the growth of this fast-growing area of neural engineering in academic, industrial and federal institutions.

**Prevention Research Center for Healthy Neighborhoods**

216.368.1738  
Erika S. Trapal, PhD, Director

The Prevention Research Center for Healthy Neighborhoods (PRCHN) (https://www.prchn.org/) at Case Western Reserve University was established in 2009 with funding from the Centers for Disease Control and Prevention (CDC). Built upon the foundation of two previous centers that merged to become the PRCHN - the Center for Health Promotion Research and the Center for Adolescent Health - the PRCHN seeks to foster partnerships within Cleveland's neighborhoods for developing, testing, and implementing research strategies to prevent and reduce the burden of chronic disease. The PRCHN, midway into its second 5-year cycle of CDC funding, is a highly responsive and collaborative community-based research center that partners with public health agencies, community organizations, neighborhood leaders and residents to address significant environmental and lifestyle issues strongly linked to chronic disease and influenced by the conditions, disparities and resources of the neighborhood itself. Its faculty and staff have also served as an active partner and leader in the transformative process occurring in Cleveland around the concepts of health equity, collective action, and the understanding of multiple determinants of health.

The PRCHN supports a comprehensive research agenda that centers around food access and community nutrition, tobacco prevention, and cessation, environments supporting healthy eating and active living, place-based health and health behavior surveillance, and community-clinical linkages and chronic disease management research. This includes core research project, Freshlink, that aims to increase nutritional food access (NFA) in low-income neighborhoods throughout Cleveland. A goal of the PRCHN is to build capacity for community-based research among University and community partners by offering formal training programs (i.e., PEER Program, PRCHN Student Internship Program) monthly seminars, workshops and webinars, and by providing technical assistance, evaluation services and subject matter expertise to its community partners.

The PRCHN partners include experienced community based researchers, heads of local boards of health, more than 50 community and health organizations, neighborhood leaders and residents, and Affiliated Faculty from five schools within the University (College of Arts and Sciences, the Frances Payne Bolton School of Nursing, the Mandel School of Applied Social Sciences, and the School of Dental Medicine), to support the mission of the Center. Representatives from these local agencies and organizations serve on the PRCHN’s Network of Community Advisors (NOCA), offering guidance to identify emerging issues, set research and programmatic priorities, and ensure that the community’s voice informs our work.

**Skin Cancer Research Institute**

216.368.0324  
Kevin D. Cooper, MD, Director

The Skin Cancer Research Institute (http://mediswww.case.edu/dept/dermatology/Centers/SCRI.html) engages the foremost experts in dermatology and oncology to work collaboratively across disciplines to identify new ways to treat and prevent skin cancers. The Skin Cancer Research Institute (SCRI) at Case Western Reserve University exists to
discover causes of skin cancers, prevent skin cancers more effectively, and to develop new therapies for skin cancer treatment.

The Department of Dermatology is poised to create a research institute unique in scope on a national scale. Its efforts are validated by generous grant funding from the National Institutes of Health as well as through its continuous stream of groundbreaking discoveries over the past decade. What exists now within this rich infrastructure is an opportunity to transform discovery in skin cancer research. CWRU plans four new centers exclusively dedicated to the study of skin cancer, which will complement existing centers of excellence in the Department. The emerging centers will include a melanoma center, a basal/squamous cell carcinoma center, a photo medicine center, and an environmental agent center.

The Skin Cancer Research Institute has an opportunity to be unique in the nation in its capacity to bring new therapies "from lab to life" by aligning specialized skills and catalyzing new knowledge through these centers.

**The Swetland Center for Environmental Health**

216.368.5437  
http://casemed.case.edu/swetland/  
Darcy Freedman (li.li@case.edu), PhD, MPH, Director

The mission of the Mary Ann Swetland Center for Environmental Health is to study the complex interplay between the environment and health. The center places special emphasis on investigating the environmental determinants of health disparity and translating the findings into practices and programs that promote community and population health.

The environments in which we live, work and play have a great impact on our health. Environmental health embraces all the physical, psychosocial, and biological factors that affect health. Today, the Swetland Center continues Mary Ann Swetland's legacy, promoting awareness of the environment's disparate impact on disadvantaged populations.

The strategic vision of the Swetland Center is:

- Promoting translational environmental health research
- Integrating environmental health science into medical education
- Engaging the community in environmental health sciences

**The Visual Sciences Research Center**

216.368.4752  
Irina Pikuleva, PhD, Director

The Visual Sciences Research Center (VSRC) was founded at Case Western Reserve University in 1996 and its mission is to promote the study of basic and clinical problems of the eye and visual system, expectantly leading to improvements in the prevention and treatment of major blinding disorders. The VSRC now comprises a multidisciplinary and comprehensive research program in vision and ophthalmology, with 30 members in different departments including Ophthalmology and Visual Sciences (http://case.edu/med/ophthalmology/), Pharmacology (http://pharmacology.case.edu), Chemistry (http://chemistry.case.edu), Medicine (http://medicine.case.edu), Molecular Biology (http://case.edu/med/microbio/), Population and Quantitative Health Sciences (http://epibwww.case.edu) (formerly Epidemiology & Biostatistics), Neurosciences (http://case.edu/medicine/neurosciences/), Pathology (http://case.edu/med/pathology/), Pediatrics (http://casemed.case.edu/pediatrics/), and Proteomics (http://proteomics.case.edu/). VSRC scientists study basic and clinical aspects of the eye and focus on Retinal Degeneration, Aging and Diabetes, Biochemistry of Aging Lens, as well Glaucoma. Also, through multidisciplinary and comprehensive research involving both basic and clinical departments, the VSRC seeks to advance the visual sciences at the University and to promote its efforts to the scientific community.

The VSRC is supported by a National Eye Institute (NEI) (https://www.nei.nih.gov/) funded P30 Core Grant (EY11373) (http://case.edu/med/ophthalmology/VisualSciencesResearchCenter.html/TheCOREModules.html) and an NEI T32 Training Grant (EY007157), as well as generous contributions from both the university and University Hospitals.

The P30 grant supports four Core Modules, which enhance research quality in the most efficient and economical manner. The Core Modules are: Molecular Biology (http://case.edu/med/ophthalmology/VisualSciencesResearchCenter.html/MolecularBiologyCore.html), Tissue Culture & Hybridoma (http://case.edu/med/ophthalmology/VisualSciencesResearchCenter.html/TissueCultureHybridomaCore2.html), Microscopy, Digital Imaging (http://case.edu/med/ophthalmology/VisualSciencesResearchCenter.html/MicroscopyDigitalImagingCore2.html) & Histology (http://case.edu/med/ophthalmology/VisualSciencesResearchCenter.html/HistologyCore2.html), and Specialized Animal Resources with a Vision Function submodule (http://case.edu/med/ophthalmology/VisualSciencesResearchCenter.html/SpecializedAnimalResourcesCore2.html). The provided services include genotyping, DNA cloning, paraffin or cryostat sections and slides, histological stains, high-quality images, microscopy training, image analysis, maintenance and breeding of mice as well as in vivo eye imaging and testing. Each Core manager is very knowledgeable in his/her respective field. The P30 grant Core facilities provide first-rate service with quick turnaround times. Individual consultations are also available.

The T32 training grant offers the graduate course 'Biochemical and molecular aspects of vision' facilitated by Dr. Paul Park (http://case.edu/med/ophthalmology/BasicResearch/PaulParkResearchPage2.html). This course, listed under the graduate program of three VSRC basic science departments - Pharmacology (PHRM 432), Neurosciences (NEUR 432) and Pathology (PATH 432), is taught by VSRC investigators, and covers the major components of the eye, visual processing and disease conditions. The course is open to all students, although VSTP Training Grant awardees take this course in their first or second year of training. Together with the Core Grant facilities, the T32 Training grant has had the most profound influence on the development and growth of the VSRC by bringing young investigators into the field that have full access to Core Grant facilities for pre- and post-doctoral training.

The VSRC coordinates an annual seminar series (http://case.edu/med/ophthalmology/Seminars/2016SeminarSeries.html), which brings to campus renowned vision researchers on a regular basis during the academic year. An all-day annual symposium, held on the Medical School Campus, comprises an external keynote speaker, talks from the faculty, post-docs, ophthalmology residents and training grant awardees as well as post-doctoral presenters. In addition, monthly VSRC Primary Investigator meetings are a forum for the VSRC members to discuss science on a regular basis. Also, members from each Ophthalmology research lab take turns presenting their research at monthly Departmental Ophthalmology Research meetings. These three seminar series and the symposium foster a multitude of opportunities for collaboration, in addition to bringing non-vision investigators into the field.
Willard A. Bernbaum Cystic Fibrosis Research Center

216.368.6896
Mitchell Drumm, PhD and Michael Konstan, MD, Co-Directors
Constance May, Administrative Assistant

The Cystic Fibrosis Research Center is a translational center composed of investigators from Case Western Reserve University and University Hospitals of Cleveland. The Center’s research is supported annually by funds from the National Institutes of Health, the Cystic Fibrosis Foundation and other sources. The Center provides core facilities and services for investigators carrying out research related to cystic fibrosis, including a Clinical Studies core that provides clinical data for research studies and aids in IRB generation and study design, an Animal Models core that maintains the world’s largest assortment of CF mouse models, a Bioanalyte core that measures a range of biomolecules (proteins, lipids, mRNA) from blood, tissues or cell culture, an Animal Imaging core that uses such technologies as MRI, PET and SECT to generate high resolution images of rodents, a Biostatistical core to carry out complex statistical analyses of CF-related studies, a Histology core that generates slide-mounted and stained sections of tissues from animal or human samples and a Cell Culture core that provides facilities and media for cultured cells. These cores facilitate translational, or "bench to bedside" projects that take very mechanistic, basic research on CF-related biochemistry and cell biology to in vivo studies in animal models and on to humans. Center members have access to all the cores as well as involvement in the weekly seminar series focused on CF or pediatric pulmonary research.

Doctor of Medicine (MD)

Programs Leading to MD

Today, applicants can choose from three programs to obtain a medical degree at Case Western Reserve University: the University Program, the College Program (Cleveland Clinic Lerner College of Medicine of Case Western Reserve University), and the Medical Scientist Training Program (https://case.edu/medicine/admissions-programs/md-phd-program/). Students in all three programs:

- are introduced to clinical work and patients almost as soon as they arrive on campus.
- learn medicine using an integrated, systems-based approach.
- are treated as junior colleagues by faculty members.
- are taught the science of medicine infused with the skills of communication and compassion.
- learn how to learn- a skill they will call on throughout their careers in the quickly changing field of medicine.

Educational Authority

Governance of the educational programs leading to the medical degree resides in the Faculty of Medicine. Each class of students selects representatives who become voting members of the Faculty of Medicine. The faculty of the School of Medicine is responsible for the content, implementation, and evaluation of the curriculum. The Dean of the School of Medicine serves as its chief academic officer, with overall responsibility to the university for the entire academic program. The Vice Dean for Medical Education carries the Dean’s academic and administrative authority and has direct supervisory responsibility for the units that lead and support the curriculum.

The faculty’s Committee on Medical Education (CME) evaluates, reviews and makes recommendations concerning overall goals and policies of the School’s medical education program, which includes the University and College programs. Acting for the faculty, the Committee on Medical Education is responsible for: 1) the formal approval and adoption of the School’s educational program objectives and ongoing monitoring to ensure that the objectives serve as guides for establishing curriculum and provide the basis for evaluating program effectiveness, 2) the review of performance in each program’s competencies, and 3) the evaluation of the overall content and appropriateness of the educational programs and curricula leading to the MD degree. The faculty elects the majority of the members of the Committee on Medical Education. Student representatives also serve on this committee and its curriculum councils.

The operational responsibility for the medical curriculum is invested in curriculum committees that report to the Committee on Medical Education. There are four curriculum committees: (a) the WR2 Curriculum Committee (University Program), (b) the Program Evaluation and Assessment Committee (University Program), (c) the Curriculum Steering Council (College Program), and (d) the Joint Clinical Oversight Group. These committees are responsible for the strategic planning, content, design, selection of teaching leadership, oversight of the curriculum, student assessment, and program evaluation.

Expectations for Personal and Professional Characteristics

Students are evaluated on their knowledge base, clinical skills, and professional behavior and attitudes. The following characteristics are evaluated throughout the medical curriculum, and students are expected to adhere to these standards in both their academic and personal pursuits:

**Interpersonal relationships:** Provide supportive, educational and empathetic interactions with patients and families, and is able to interact effectively with "difficult" patients. Demonstrates respect for and complements roles of other professionals, and is cooperative, easy to work with, commanding respect of the health care team.

**Initiative:** Independently identify tasks to be performed and makes sure that tasks are completed. Performs duties promptly and efficiently, and is willing to spend additional time, assume new responsibilities, and able to recognize the need for help and ask for guidance when appropriate.

**Dependability:** Complete tasks promptly and well. Present on time and actively participates in clinical and didactic activities. Always follows through and is exceptionally reliable.

**Attitude:** Are actively concerned for others. Maintain a positive outlook toward assigned tasks. Recognizes and admits mistakes. Seeks and accepts criticism, using it to improve performance.

**Integrity and honesty:** Demonstrate integrity. Is honest in professional encounters. Adheres to professional ethical standards.

**Tolerance:** Demonstrate exceptional ability to accept people and situations. Acknowledges her or his biases and does not allow them to affect patient care.
Function under stress: Consistently maintain professional composure and exhibits good clinical judgment in stressful situations.

Appearance: Always display an appropriate professional appearance.

Graduation Requirement
To graduate from CWRU School of Medicine with the MD degree (or the MD degree with Special Qualifications in Biomedical Research for students in the Cleveland Clinic Lerner College of Medicine program), students must:

1. Satisfactorily complete all Program Specific Requirements and Educational Program Objectives of the School of Medicine
2. Pass the USMLE Step 1 and USMLE Step 2 CK and CS
3. Pass or remEDIATE the School of Medicine’s Clinical Skills Exam
4. Satisfactorily complete the MD Thesis
5. Meet financial obligations to the University
6. Be approved to graduate by the Committee on Students

Licensure
Licensure to practice medicine in the United States and its territories is a privilege granted by the individual licensing boards of the states and territories. Each licensing board of the individual jurisdictions establishes its policies, eligibility, and requirements for the practice of medicine within its boundaries pursuant to statutory and regulatory provisions. The degree of doctor of medicine awarded by Case Western Reserve University is an academic degree and does not provide a legal basis for the practice of medicine.

Pathways
Case Western Reserve University School of Medicine is actively developing Pathway programs, health care concentrations available to medical students who want to focus on particular aspects of health and patient care. The current Pathways are the Jack, Joseph and Morton Mandel Wellness and Preventive Care, Humanities, Urban Health, Health Innovation and Entrepreneurship, and World Medicine. Students in both University and College programs have the option of specializing in one of several longitudinal pathways:

Urban Health Pathway:
The Urban Health Pathway is designed to provide selected students with the opportunity to expand their knowledge and skills in caring for patients in an urban setting, and to foster a better understanding of medicine and health in urban communities by aligning students’ engagement, clinical and research goals with the community’s health care needs.

The Jack, Joseph, and Morton Mandel Wellness and Preventive Care Pathway:
The mission of this pathway is to provide participants with insight and skills in wellness and health promotion as it relates to the domain of the mind, body, and spirit, social interactions, and the community. The vision is to incorporate and advance the promotion of health and wellness at the individual, family, institutional, professional and community levels.

Humanities Pathway:
The vision of the Humanities Pathway is to use arts and humanities-based courses and experiences to promote the development of health care professionals who will explore the fundamental questions of what it is to be human and to be a healthcare professional. Students will think critically about the complex interplay among patients, health care professionals, and culture. They will develop innovative and informed approaches to health, well-being, and quality of life for the patients and communities they serve while developing resilience and passion to improve the culture of medicine.

Health Innovation and Entrepreneurship Pathway:
In today’s world, innovation and aligned entrepreneurial activities are increasingly focused upon as required value-drivers in patient care, healthcare economics, and regional economic development. The goal of the Health Innovation and Entrepreneurship Pathway is to address issues relating to the commercialization of medical-related inventions by exposing students to the challenges and opportunities encountered when attempting to develop innovative concepts from the point of early discovery to the market. The students will gain insight into what constitutes innovation, the skills necessary to become successful entrepreneurs, and future approaches on how to manage their clinical practice.

Andrew B. Kaufman World Medicine Pathway:
The World Medicine Pathway will prepare medical students for advanced training and careers that address global health challenges. A foundational curriculum during the pre-clerkship years will focus on building knowledge, skills, and attitudes through a series of seminars, simulations, and other experiences. Students will then have a mentored experience in the clinical years focused on biomedical research, clinical care, capacity building, or global health policy/advocacy which will include international elective time.

Medical Student Organizations
The list of organizations and activities available to medical students continually evolves to reflect the interests of current students. Visit here for the most up-to-date list of student organizations (http://www.casemed.org/). (http://casemed.case.edu/admissions/studentlife/organizations.cfm)

Admission
There are three paths to a medical degree at Case Western Reserve University School of Medicine: the University Program (4 yr. MD), the Cleveland Clinic Lerner College of Medicine of Case Western Reserve University (College Program - 5 yr. MD), and the Medical Scientist Training Program (MSTP). Inquiries about admission and application should be addressed to the appropriate office:

Office of Admissions-University Program
School of Medicine
9501 Euclid Avenue
Cleveland, Ohio 44106-4920
Phone: 216.368.3450 or casemed-admissions@case.edu

Office for Admissions and Student Affairs-College Program
Cleveland Clinic Lerner College of Medicine of Case Western Reserve University
9501 Euclid Avenue
Cleveland, Ohio 44106
Phone: 216.445.7170 or 866.735.1912 or cclcm@ccf.org (//cclcm@ccf.org)
Medical Scientist Training Program
School of Medicine
Case Western Reserve University
10900 Euclid Avenue
Cleveland, Ohio 44106-4936
Phone: 216.368.3404 or mstp@case.edu

Getting Started
Students wishing to apply to any MD program at the School of Medicine must initiate this electronic process through the American Medical Colleges Application Service (AMCAS). Visit AMCAS (https://www.aamc.org/students/applying/amcas/) to learn more about the medical school application process.

Admissions Process
After the American Medical College Application Service (https://students-residents.aamc.org/applying-medical-school/applying-medical-school-process/applying-medical-school-amcas/) (AMCAS) is completed the applicant receives an e-mail directing him or her to the CWRU School of Medicine online secondary (final) application where the applicant can designate to which MD program(s) they wish to apply. Applicants can apply to both MD programs and/or MSTP. It is possible for an applicant to be interviewed by and receive an admission offer from all three programs.

Applicants should complete this secondary application as instructed. After the applicant has submitted the secondary application and all supporting materials, the appropriate admissions subcommittee will review the information and decide whether to invite the applicant for an interview. After the interview, the Admissions Committee of the CWRU SOM will discuss each applicant and decide whether to extend an offer of admission.

Admissions Criteria
Although academic credentials are important in the admissions process, high grades and a high score on the MCAT are not the only criteria for admission. Just as important are interpersonal skills, exposures to medicine, well-roundedness and qualities such as professionalism, empathy, and leadership ability. The School of Medicine includes a widely diverse student body.

Academic Requirements
Given the variability in the way undergraduate institutions structure various courses, there is some flexibility with some of our prerequisite courses. Please closely review the prerequisite charts (http://case.edu/medicine/admissions/application-process/requirements/) for each program.

If these prerequisites were not fulfilled at an accredited, four-year, degree-granting American or Canadian college or university, the applicant should be prepared to take at least 1 year of challenging, upper-level sciences at one of these institutions prior to application.

If all science prerequisites were taken at a community college, the committee strongly recommends that the applicant take at least one year of upper-level sciences from an accredited four-year degree granting university within the United States or Canada. If a few science prerequisite courses were taken at a community college, the committee will evaluate them on a case-by-case basis.

Undergraduate students should pursue a major in a subject of their own choosing; they should not structure their undergraduate experiences in an attempt to sway the medical school admissions committee but instead, base it on their own personal interests and goals.

Financial Aid
About 70 percent of the University Program’s medical students receive some financial aid based strictly on financial need. It’s impossible to provide precise figures for financial aid before each specific situation is completely analyzed, but here is a description of the general aspects of the process:

The School of Medicine adheres to the unit loan concept used by most private medical schools. Under this concept, if a student qualifies for financial aid, he or she is expected to obtain a specific portion of his or her support from outside sources such as a Federal Direct Loan, savings, and family. Once the student obtains this amount, the remaining aid would be provided through the School of Medicine resources, up to the amount determined to be his or her reasonable need. The school’s contribution would be a combination of loan and scholarship, with the exact ratio determined by the student’s particular circumstances.

All students within the College Program receive a full scholarship covering tuition and fees. Additionally, the Medical Scientist Training Program offers financial support for participants. For more information, see other entries in this publication and contact the specific program.

The University Program each year offers a number of merit scholarships to each class through its Dean’s Scholars program. These scholarships, which vary in annual amounts, are awarded for up to four years for selected students. Application for the scholarships is by invitation of the Admissions Committee. Recipients are students with records of exceptional academic and personal achievement.

Overview of the University Program
The School of Medicine curriculum always has reflected the most current educational principles, practices, and knowledge. In the 1950s the School of Medicine was the first to introduce the organ systems approach to teaching the basic sciences. In July 2006, the University Program launched the Western Reserve2 Curriculum (WR2) to develop a learner-centered and self-directed curriculum framework and implement dynamic small group learning teams. Students learn in an environment that fosters scientific inquiry and excitement.

The University Program in Detail
The WR2 Curriculum has high expectations for self-directed learning, and seeks to train physician scholars who are prepared to treat disease, promote health and examine the social and behavioral context of illness. It interweaves four themes - 1) research and scholarship, 2) clinical mastery, 3) teamwork and leadership, and 4) civic professionalism and health advocacy to prepare students for the ongoing practice of evidence-based medicine in the rapidly changing healthcare environment of the 21st century.

Scholarship and clinical relevance are the benchmarks for learning, and clinical experiences and biomedical and population sciences education are integrated across the four years of the curriculum. The WR2 Curriculum also creates an independent, educational environment.
The Western Reserve2 Curriculum has 10 Guiding Principles:

1. The core concepts of health and disease prevention are fully integrated into the curriculum.
2. Medical education is experiential and emphasizes the skills for scholarship, critical thinking, and lifelong learning.
3. Educational methods stimulate an active interchange of ideas among students and faculty.
4. Students and faculty are mutually respectful partners in learning.
5. Students are immersed in a graduate school educational environment characterized by flexibility and high expectations for independent study and self-directed learning.
6. Learning is fostered by weaving the scientific foundations of medicine and health with clinical experiences throughout the curriculum. These scientific foundations include basic science, clinical science, population-based science, and social and behavioral sciences.
7. Every student has an in-depth mentored experience in research and scholarship.
8. Recognizing the obligations of physicians to society, the central themes of public health, civic professionalism and teamwork & leadership are woven through the curriculum.
9. The systems issues of patient safety, quality medical care, and health care delivery are emphasized and integrated throughout the curriculum.
10. Students acquire a core set of competencies in the knowledge, mastery of clinical skills and attitudes that are pre-requisite to graduate medical education. These competencies are defined, learned and assessed and serve as a mechanism of assessment of the school's success.

Curricular Composition

The four years of the WR2 Curriculum are divided into four major components, each of which focuses on health as well as disease.

Foundations of Medicine and Health

This component is made up of six curricular blocks.

The first block, Becoming a Doctor, is five weeks in duration and gives students an understanding of population health and the doctor's role in society. Typically students begin their medical education by studying basic science at the molecular level and are often not fully aware of the relevance that this knowledge has in their future education as physicians or how it relates to the actual practice of medicine. This curricular block focuses on how physicians can act as advocates for their patients in the health care system; how social and environmental factors impact health; and the importance of population health. Medical students participate in an Extensive Care Unit, an experiential, longitudinal, service learning project intended to introduce them to key population health concepts including epidemiology, biostatistics, community assessment, health risk behavior, and social-environmental determinants of health.

The next five blocks in the Foundations of Medicine and Health are comprised of basic science education complemented by early contact with patients in clinical preceptorships and simulated clinical experiences. Subject matter is integrated across entire biological systems, which permits faculty in the different disciplines to leverage teaching time to convey content and concepts common to their disciplines. Content is divided into the following blocks:

- **The Human Blueprint**: Comprised of endocrine, reproductive development, genetics, molecular biology, and cancer biology.
- **Food to Fuel**: Encompasses gastro-intestinal system, nutrition, energy, metabolism, and biochemistry.
• **Homeostasis**: Includes cardiovascular system, pulmonary system, renal system, cell regulation, and pharmacology.

• **Host Defense and Host Response**: Focuses on host defense, microbiology, blood, skin, and the auto-immune and the musculoskeletal systems.

• **Cognition, Sensation and Movement**: Comprised of neurosciences and behavioral sciences.

Several concepts and themes stretch longitudinally across these blocks, including **Structure** (anatomy, histopathology, and radiology), **Systems and Scholarship**, and clinical mastery. **Systems and Scholarship** enables students to integrate concepts of basic, clinical and systems science to ensure improved patient care that meets the Institute of Medicine’s six quality domains: safety, patient centeredness, equitable, efficient, timely and effective. Teamwork, interprofessional collaboration, and bioethics are likewise incorporated longitudinally.

During Block 4’s Clinical Immersion Week, students leave the classroom and enter the clinical setting to see the relevance of the basic science they have been studying as the concepts are used in the setting of patient care.

The Reflection and Integration week is the final week of blocks 2-6. During this week, no new material is introduced. Learning activities are planned to help students spiral back to concepts introduced earlier in the block by presenting these concepts again, sometimes in new contexts, and now integrated with other concepts previously learned. End of block assessment takes place during the reflection and integration week.

**Research and Scholarship**

The WR2 Curriculum is in concert with CWRU’s emphasis on research and scholarship to encourage student career development in the areas of clinical investigation and population research. The practice of medicine is becoming increasingly evidence- and science-based, and research teaches students a way of framing questions and developing an approach to answering them. The focus on research and scholarship provides medical students with opportunities to pursue individualized areas of interest in great depth. Through this 16-week, mentored experience in research and scholarship (which can be taken at any point from March of the second year onward), students acquire the intellectual tools needed to formulate research questions, critically assess scientific literature and continue the life-long pursuit of learning that is a critical aspect in the careers of all physicians and physician/scientists. The research project culminates in a thesis, which is written in the format of a manuscript of the leading journal in the particular area of interest.

**Clinical Experiences**

The clinical curriculum cuts across all four years of the medical school curriculum, and can be divided into three areas of involvement:

1. **Foundations of Clinical Medicine**

   This segment of the clinical curriculum runs longitudinally through the Foundations of Medicine and Health and seeks to develop a broad range of clinical and professional capabilities. FCM develops the necessary skill sets through 4 separate, but integrated programs:

   • **Tuesday Seminars**: Course continues the theme of “doctoring” begun in Block 1 through the Year 1 and Year 2 curriculum. Topics examined include the relationship between the physician and the patient, the family and the community; professionalism; healthcare disparities; cultural competence, quality improvement; law and medicine; medical error/patient safety, development of mindful practitioners and end of life issues.

   • **Communications in Medicine**: Course is comprised of various workshops running through Year 1 and Year 2 that focus on the range of skills needed for effectively talking with patients including the basic medical interview, educating patients about a disease, counseling patients for health behavior change, and presenting difficult news and diagnosis.

   • **Physical Diagnosis**: Course runs throughout Year 1 and Year 2 and includes: Physical Diagnosis 1 introducing the basic adult exam to Year 1 students for one session per week for eight weeks, Physical Diagnosis 2 in-depth regional exams in various formats during Year 1 and Year 2, and Physical Diagnosis 3 in Year 2 where students spend five session doing complete histories, physicals and write-ups on patients they see in an in-patient setting.

   • **Patient-based Programs**: Community Patient Care Preceptorship (CPCP) during either Year 1 or Year 2 students spend 10 afternoons in a community physician’s office developing and reinforcing medical interviewing, physical exam and presentation skills (written and oral) with ongoing mentorship from a preceptor.

   • **Interprofessional Education (IPE)**: IPE provides students from the health professions (Medical, Dental, Nursing, Social Work, Public Health, Nutrition and Physician Assistants) the opportunity to engage in a dynamic and interactive team learning environment to better understand the goals, purpose, and benefits of inter-professional collaboration.

   • **Procedures**: Training in basic medical and surgical procedures in Years 1 and 2, including hemorrhage control, scene safety, basic airway management, sterile field, gloving and gowning, OR scrub, suturing, injections, IV placement and Foley placement.

2. **Core Clinical Rotations**

   The Core Clinical Rotations are designed to provide students from both the University and College programs of the Medical School with both breadth and depth in clinical care. Experiences are developmental, with opportunities to reinforce, build upon, and transfer knowledge and skills from all parts of the curriculum. Clinical learning is integrated across disciplines whenever possible through a unique block structure, and important themes related to scholarship, humanism, and science are supported through specially designed weekly small group programs. A unified approach to addressing and assessing a core clinical curriculum is utilized at all teaching sites with the flexibility to take advantage of the unique strengths of each clinical setting.

   **Core Rotations**: Beginning in March of their second year, students have the opportunity to begin their core clinical rotations. These rotations are organized in blocks that integrate core specialties in at one site for 8 or 12 weeks. Core I combines Internal Medicine, Family Medicine, and Aging for 12 weeks, Core II combines Pediatrics and OB/Gyn for 12 weeks, Core 3 combines Neuroscience and Psychiatry for 8 weeks, and Core 4 combines Surgery and Emergency Medicine for 8 weeks. Each of these clinical rotations is offered at all of the School of Medicine’s hospital affiliates including University Hospitals of Cleveland, MetroHealth Medical Center and the Louis Stokes VA Medical Center.

   **Cleveland Clinic Longitudinal Clerkship**: Students will have the option of completing their core clinical rotations as part of a 12-month longitudinal clerkship experience at the Cleveland Clinic. The educational learning
Objectives remain the same for all Case Western Reserve University students on their core rotations, however, the structure of this experience will offer some unique features aimed at increased learning, longitudinal experiences with faculty and creation of a learning community. Students will complete all 40 weeks of their core rotations within the Cleveland Clinic Health System and have 8 weeks of electives that can be taken at other core hospitals in Cleveland or as a visiting student at another institution. The structure of the core rotations will differ from other sites in order to integrate a longitudinal ambulatory block. The rotation structure will be as follows:

Longitudinal Ambulatory Block (LAB) – 12 weeks
Team-Based Care 1 – Inpatient Internal Medicine/Surgery – 12 weeks
Team-Based Care 2 – OB, Inpatient Gynecology, Inpatient Pediatrics – 8 weeks
Team-Based Care 3 – Neurology/Psychiatry – 8 weeks
Electives (any site) – 8 weeks

The LAB will include outpatient components of Family Medicine, Internal Medicine, OB/Gyn, Pediatrics, Emergency Medicine, Palliative Medicine, and Geriatrics. LAB will also provide exciting opportunities for students to explore disciplines and possible areas of career interest and establish longitudinal experiences by working a half-day a week with the same preceptor over 12 weeks. The longitudinal clerkship will also allow students to create a community of learning by participating in Longitudinal Learning Groups over the year. Topics such as quality/safety, high-value care, and palliative medicine will be covered as part of a year-long curriculum.

The MetroHealth-CWRU Longitudinal Integrated Clerkship (MCLIC):
Students will have the option of completing their core clinical rotations as part of a 12-month longitudinal integrated clerkship experience in the MetroHealth System. The educational learning objectives remain the same for all Case Western Reserve University students on their core rotations, however, the structure of this experience will emphasize longitudinal and integrated experiences with faculty and patients in the diverse MetroHealth community. Students will complete all 40 weeks of their core rotations within the MetroHealth System and have 8 weeks of electives that can be taken at other core hospitals in Cleveland or as a visiting student at another institution.

The structure of the MCLIC is rooted in a year-long, half-day/week, outpatient mentorship with a family physician, internist, pediatrician, surgeon, and obstetrician/gynecologist. The student will work with the same attending physician in each core specialty for the entire year and become an integral member of the clinic team. They will develop longitudinal relationships with patients of all age groups who they can help care for in the inpatient and outpatient settings and across specialties. Time is set aside each outpatient week for students to do surgeries and procedures, deliver babies, work on quality improvement, attend learning sessions, address health disparities, and participate in the care of their panel of patients. On weekends and at other convenient times, the students will be able to work in the emergency department and urgent care settings.

Spread across the academic year at approximately four-week intervals, the MCLIC students will engage in their inpatient core rotations. Each inpatient burst will last 14 days and the student will be a member of the inpatient teams on the internal medicine, pediatric, obstetric, surgical, neurology, and psychiatry services. During their inpatient bursts, they will be full members of the inpatient team caring for the hospitalized and diverse, urban, and underserved community served by the MetroHealth Medical Center.

**Sciences and Art of Medicine, Integrated (SAMI)** is an undifferentiated-patient curriculum that takes place during the clerkship year. Utilizing a small group format, SAMI provides University Program medical students with an opportunity to practice patient care with direct observation and feedback from clinical facilitators. Each SAMI case incorporates healthcare disparities as well as integrates basic, health systems, and clinical sciences in order to improve students’ skills of clinical reasoning and decision making. Finally, SAMI provides students with an environment to further develop their humanism through activities like reflection and advanced communication skills.

### 3. Advanced Clinical and Scientific Studies

Advanced clinical and scientific studies provide students with flexible learning opportunities that support ongoing professional development and residency preparation and planning:

- Two Acting Internships are required: one in Internal Medicine, Surgery, Pediatrics, or Inpatient Family Medicine, and one in an area of student choice.
- One Acting Internship and all electives can potentially be done outside of the CWRU system.
- Students are encouraged to augment their interest in scholarship through rotations and activities that focus on sciences basic to medicine as well as clinical rotations.

### Evaluation and Assessment

Student assessment in the WR2 Curriculum is designed to accomplish three goals:

1. drive the types of conceptual learning and scientific inquiry that are goals for the WR2 Curriculum
2. assess whether students have attained the level of mastery set for each phase of the curriculum
3. prepare students for medical licensure

These three goals are accomplished through multiple assessment methods.

Independent study and inquiry are hallmarks of WR2 through assessment strategies that are formative, focus on the synthesis of concepts, and promote student responsibility for the mastery of skills and material. The following assessments are used in Foundations of Medicine and Health:

1. Assessment of students’ participation in weekly Case Inquiry (IQ) groups by faculty facilitators, utilizing observable behavior anchors and focusing on contributions to team process and content, critical appraisal skills, and professional behaviors.
2. Synthesis Essay Questions (SEQs). Weekly, formative, open book concept reasoning exercises in which students are given a brief written clinical scenario and asked to explain a clinical phenomenon and its basic science underpinnings. Throughout a teaching block, students complete SEQs at the end of each week. They compare their own answers to an ‘ideal’ answer and receive feedback from their IQ group facilitator.
3. Summative Synthesis Essay Questions (SSEQs), or exercises that measure what students know at specific points in their education, are closed book exercises with approximately 5 clinical vignettes that take an estimated 3-4 hours to complete. These SSEQs are based on...
the synthesis essays students have been assigned throughout the block. In the final week of the block SSEQs present concepts from previous exercises in new contexts and require concept integration. These summative exercises are scheduled at the end of each large teaching module (every 3-4 months) and are graded by faculty.

4. Structure Practical Exercises. These assessments occur in the final week of blocks 2-6 and assess anatomy, histo-pathology and radiology through clinical scenarios and questions that require anatomic localization and histo-pathologic identification.

5. Cumulative Achievement Tests (CAT). At the end of each block, students complete a secure formative MCQ achievement test, based on content covered in the current teaching block as well as on content from each previous block. These exams are designed utilizing test question resources available through the National Board of Medical Examiners (NBME). Tests will become progressively longer throughout the Foundations of Medicine and Health. The final CAT reflects material across all curriculum blocks. These formative tests enable students to gain perspectives on their overall progress and preparedness for the USMLE Step 1.

6. Student progress in Foundations of Clinical Medicine is measured by small group facilitator assessment in the Seminars of Clinical Practice, direct observation of skills, preceptor evaluation of patient-based activities, and OSCE examinations.

7. Professional Learning Plan. During the Block, students review learning objectives and reflect on their learning, identifying their strengths and areas for further study. A reflective essay is completed that links to pieces of evidence, accumulated throughout the block, to support areas of strength and areas for further growth that have been identified. Students, working with their Society Deans develop a plan for further learning.

The WR2 Curriculum provides students with a focused education that is faculty-directed and student-centered. Classroom hours are limited. The content of WR2, organized across biological systems, provides students with an integrated view of medicine and health and an understanding of how the basic sciences and clinical practice relate to one another. The flexibility of WR2 permits students to explore in depth an area of interest to them alongside a mentor. The curriculum places great emphasis on the social and behavioral context of health and disease as well as on population medicine which will prepare students to face the emerging challenges of today’s health care system.

Assessment for Promotion and Graduation

The faculty of the School of Medicine is charged with assessing student performance, including knowledge, skills and personal characteristics that are important qualities of a responsible, competent and humane physician. This responsibility is delegated by the faculty to the Committee on Students, a standing committee of the faculty of medicine, with a majority of its members faculty-elected.

The Committee on Students reviews the performance of every medical student in the University Program during each of the four years, determines each student’s continuing status as a student in the school, and recommends candidates for graduation. The committee reviews a medical student’s total performance, which includes the usual indices such as formal grades and assessments, as well as the professional attitudes and behavior manifested by the student. Medical education entails the mastery of didactic, theoretical, and technical matters as well as the demonstration of appropriate professional and interpersonal behavior, sensitivity, sense of responsibility and ethics, and the ability to comport oneself suitably with patients, colleagues and co-workers.

To be eligible for promotion and graduation, students must complete the requirements and perform satisfactorily in all components of the curriculum. Medical students in the University Program are graded “meets expectations” or “does not meet expectations” in the first two years and as “honors,” “commendable,” “satisfactory,” “unsatisfactory,” or “achieves or exceeds expectations” in the clerkships of the third and fourth years. There is no class ranking.

Graduation Requirements

To graduate from CWRU School of Medicine with the MD degree (or the MD degree with Special Qualifications in Biomedical Research for students in the Cleveland Clinic Lerner College of Medicine program), students must:

1. Satisfactorily complete all Program Specific Requirements and Educational Program Objectives of the School of Medicine
2. Pass the USMLE Step 1 and USMLE Step 2 CK and CS
3. Pass or remediate the School of Medicine’s Clinical Skills Exam
4. Satisfactorily complete the MD Thesis
5. Meet financial obligations to the University
6. Be approved to graduate by the Committee on Students

Overview of the College Program

The Cleveland Clinic Lerner College of Medicine (CCLCM or College Program) is a distinct 5-year program within the School of Medicine. In 2002, Cleveland Clinic and CWRU formed a historic partnership to collaborate in education and research through creation of the CCLCM. As stated in the affiliation agreement between the two institutions, “the principal purpose and educational mission of the College shall be to attract and educate, in specially designed programs, a limited number of highly qualified persons who seek to become physician investigators and scientists who will advance biomedical research and practice.” To achieve this mission, the CCLCM selects students with a desire to pursue careers as physicians and researchers, educates them to be excellent doctors, nurtures their curiosity about science and medicine, provides them with substantive research experience and core research skills, and offers financial support to ensure that excess debt does not preclude their ability to follow careers in research and medicine.

The College Program in Detail

Training the Physician Investigators of Tomorrow: A Synopsis of the Program

Recognizing the critical shortage of physicians engaged in research, the College Program offers an educational program that provides medical students with the necessary skills and knowledge to enter academic residencies and pursue successful careers as basic, translational or clinical investigators and expert doctors – without requiring them to complete an advanced degree in addition to the MD. Graduates are expected to be scientifically inquisitive, to be life-long learners, to be independent thinkers with excellent teamwork skills, to have broad-based research knowledge as well as strong clinical acumen, and to be reflective practitioners of medicine and science who take a critical approach to self-assessment and self-improvement. All three components of the curriculum – basic science, clinical and research – in addition to the advising and assessment processes have been created to support the development of these attributes in our medical students.

The basic science curriculum applies adult learning principles, building on problem-based learning (PBL) to create an early link between clinical
problems and basic science learning and to help students develop their skills in hypothesis generation, critical thinking, self-identification of learning objectives, oral presentation, and teamwork. Almost all faculty-student contact time involves some form of active learning – graduate school-style seminars and problem sets rather than lectures, case-based anatomy sessions using projections and cross-sectional images rather than full cadaver dissections, interactive lab sessions rather than demonstrations, and journal clubs. To support this educational model, curriculum schedules provide extensive time for independent study. The basic science curriculum is organ-system based, with the disciplines of anatomy/embryology, biostatistics/epidemiology, cell biology, histology, imaging, immunology, pathology, pharmacology, physiology, infectious disease, oncology, genetics, evidence-based medicine, bioinformatics and ethics designated as curricular threads woven through every organ-based basic science course and extending into the year 3-5 clinical curriculum. Learning objectives for the thread disciplines are used to determine the organ system curriculum structure in the first two years, with the goal of providing a logical, coherent two-year curriculum in each of these topics basic to medicine. Courses in Year 1 focus on normal human structure and function; in Year 2, courses focus on pathophysiology of disease. Later, in Years 3 through 5, students revisit advanced basic science concepts in their core clinical rotations, clinical electives, and College Program specific pullout sessions.

The clinical curriculum begins in the fall of the first year contiguous with the first basic science course in Year 1. At its foundation is a continuity teaching and learning experience with a primary care preceptor and his/her patients throughout the first two years. Students spend one half-day every other week in Year 1 and one half-day every week in Year 2 with the same preceptor. During Year 1, students learn core clinical skills in doctor-patient communications and physical diagnosis in sessions linked whenever possible to the basic science courses (e.g., learning the cardiac and lung exams during the Cardiovascular and Respiratory Sciences course and the basic neurological exam during the Neurological and Behavioral Sciences course) and then practice those skills with real patients in their preceptors’ offices on alternate weeks. Once they have mastered the basics of the history and physical, they begin to apply their skills to more complete evaluations of ambulatory patients with direct observation and feedback from their preceptors. By the end of Year 2, students are capable of performing a complete history and physical and confidently evaluating adults with common outpatient problems.

In Year 2, students spend a second half-day each week in sessions focused on building advanced clinical skills or clinical activities designed to complement concomitant basic science systems topics (e.g., a session in the Diabetes Clinic during the week devoted to learning about diabetes). The other key component of the clinical curriculum in Years 1 and 2 is the weekly Art and Practice of Medicine Seminar series. This course focuses on principles of leadership and their application to medical practice, professionalism and ethics, health care systems, population medicine, and provides a setting for students to reflect on their experiences and observations of the health care system. In Years 3 through 5, students in CCLCM participate in the same core clinical experiences as students in CWRU’s University Program. Friday afternoon sessions in Years 3-5 bring CCLCM students together regardless of clinical location and focus on program-specific topics in research and human values.

During all five years, there are close mentoring and advising relationships between students and faculty. To ensure this happens, at the beginning of medical school each student is assigned a physician advisor who serves as the student’s partner and guide in navigating and mastering the curriculum throughout all five years. In addition, during the first summer, each student is assigned to an experienced basic or translational research preceptor who integrates the student into all activities in his/her lab and provides guidance and feedback to the student in such areas as working effectively with the lab team, research design, data analysis, and oral and written presentations of research. During the second summer, each student develops a similar relationship with an experienced clinical researcher who includes the student as an active participant in one or more ongoing research projects. Students are exposed to a broad range of basic, translational and clinical researchers during the first two years – during the summer research blocks, during weekly research seminars (Advanced Research in Medicine series), and in class during basic science and clinical courses. Students then select a research advisor for the master’s level research project on which they will spend 12 to 15 months during the last three years of medical school.

The College uses a unique approach to student assessment designed to enhance student learning and to promote self-directed learning. There are no grades for any course or rotation and no class ranking. Instead, each student is expected to attain a defined level of achievement in each of the 9 CWRU School of Medicocompetencies. Seven of these defined competencies encompass the 6 core competencies defined for all U.S. graduate medical education programs accredited by the ACGME (Accreditation Council for Graduate Medical Education) as well as research and personal development. Starting on the first day of medical school, students begin collecting evidence from faculty and peers of their progress in achieving the standards in each of the 9 competencies and reflecting on how the evidence demonstrates their development as doctors and researchers – the two interrelated professional roles for which they are preparing.

One of the principles of the College is that assessment drives learning – that a curriculum designed to foster self-directed learning and achievement of competencies is ineffective if assessment focuses on what the “teacher” said in class and factual recall. Therefore, the College uses a student-centered, student-driven approach to assessment with strong support from the physician advisors who know the students well and guide them as they develop skills and self-confidence as self-directed learners.

Students gather a broad range of types of evidence over their five years of study and work as partners with their physician advisors to review the evidence and their reflections, to create individual learning plans to address areas of relative weakness and to tailor the curriculum to build on their areas of particular strength. Evidence of achievement and reflections on progress in their professional development are collected in electronic Student Portfolios and used to document readiness for promotion and graduation from the program. By training students in accurate self-assessment and developing their reflective ability, we intend to send them out of medical school already skilled in the kind of independent, self-directed learning habits that will be required of them as residents and throughout the rest of their professional lives.

CCLCM’s Foundation: A Comprehensive Research Curriculum

The research curriculum begins on the first day of medical school with the basic and translational research block and is integrated throughout all five years of the College Program. Every student participates actively in a “bench” project in the first summer, prepares an oral presentation describing the project in the format used at most scientific meetings, and develops a mock research proposal that extends the summer research project to the next research question. In addition, students learn the basic principles of research design and data analysis, ethics of the use of
animals in research, and critical appraisal and interpretation of the basic science research literature in a journal club. At the end of the summer, students formally present their research project and findings to students and preceptors. Linked with the summer research curriculum is a core curriculum in basic biochemistry, cell biology, molecular biology, genetics, and bioinformatics.

The second summer is devoted to clinical research. Coursework focuses on applied medical biostatistics, clinical epidemiology, including appropriate design and analysis of various kinds of clinical research protocols, and ethical issues such as human subjects protection. Each student participates actively in an ongoing clinical research project and writes an original clinical research protocol to extend the summer research project to the next research question, prepares an oral presentation describing the proposed research protocol, and formally presents this proposal at the end of the summer.

During the remainder of Years 1 and 2, students participate in Advanced Research in Medicine (ARM), a weekly series of highly interactive research seminars linked to the content of the basic molecular science courses. In Year 1, ARM is designed to provide students opportunities for interaction with a wide range of successful investigators to help them understand the sequence of problem identification, exploring prior work in the area, hypothesis development, experimentation, successes and failures that lead to new research findings. ARM 1 also helps students appreciate the interaction between basic and clinical research – how basic science discoveries translate into changes in the clinical care of patients and how clinical observations or research findings result in new directions in basic science research. In ARM 2, the presentations are linked to the basic clinical science content each week but are more focused on current research projects and development of well-constructed research questions and reinforcement of epidemiology and biostatistics principles learned in the Year 2 summer. The sessions take on the format of a formal research presentation at a scientific meeting.

Deans' chats are held 4-6 times a year separately for all CCLCM students that provides a forum for students to meet and interact with Cleveland Clinic health care leaders and learn the complexity of managing health care and health care systems through the eyes of senior leaders.

By the end of Year 2, each student has experienced basic and clinical research first-hand, has met a large number of investigators with different research interests, has developed essential research skills, and is ready to choose an advisor to supervise and support his/her research project. Students must submit a research proposal with the thesis advisor and review it with their preceptor to set the expectations for the summer. The week includes individual meetings with the student's summer research preceptor and physician advisor, an introduction to the unique assessment system and the Student Portfolio, and an introduction to the summer curriculum and its expectations. A White Coat Ceremony that commemorates the entry of all students in both the College and University programs into the CWRU School of Medicine highlights the week.

The Basic and Translational Research Block occupies the first 10 weeks of Year 1 and includes a course reviewing core concepts in cell biology, molecular biology and biochemistry. Scheduled classes and meetings occur 5 days a week for 2 hours, with the remainder of each day devoted to independent study and hands-on experience in the lab of the student's summer research preceptor. This block sets the stage for active learning in the rest of the curriculum. Throughout the core basic science course and all the basic science courses, each week has a conceptual "theme" within which more detailed learning objectives fall. All assignments and scheduled activities are designed to help students master the core concepts for the week. Mastery is defined as being able to explain the concepts and to apply them to new or different problems or situations, rather than simply "listing" all the factual details. Sessions for the core basic science course are held on Monday, Wednesday and Friday mornings and students are expected to study background material before class and self-assess their understanding of the readings. They then work together in class to solve complex problems related to what they have studied. Tuesday mornings are devoted to focused discussions and presentations related to the science topics discussed that week or introduce students to key concepts in areas such as genetics, oncology, and bioinformatics.

Students meet each Friday for a Journal Club aimed at enhancing skills in critically assessing the basic science research literature. Each week, two students present an article; the other students are expected to read the articles carefully and come prepared with questions. Each presenter works with a faculty facilitator to review the paper and presentation before Journal Club. Using feedback from faculty and other students on their presentations and on the questions they ask of others, students begin to hone their communication skills and develop confidence participating as speakers in this setting.

The primary focus of the Year 1 Basic and Translational Research Block is the summer research project. Students are assigned to a summer research preceptor with attention to individual preferences for specific research areas. They are expected to engage fully in all activities in the preceptor's research group, such as special lab meetings or journal clubs, in addition to working on their defined project. At the end of week 2, they submit a draft plan for their summer research project and review it with their preceptor to set the expectations for the summer. During the summer, students also develop a brief research proposal that extends their research project. At the end of week 5, they submit a draft outline of their brief research proposal. The final document is due in week 9. During week 10, students present their projects orally in the format used at many scientific meetings – a 10-minute presentation with audiovisuals followed by 5 minutes for questions. Thus, in addition to actually working on a bench project, students are guided by their preceptors in developing a number of other key skills. Students receive
feedback from their preceptors, other members of the lab team, and peers on their contributions in the lab and their written and oral presentations.

During the summer, students schedule their first formal meeting with their physician advisors to review the evidence in their Student Portfolios, to discuss their reflections on their development in their new professional roles, and to review their learning plans to address any specific weaknesses or gaps they have identified. They review feedback on their activities in small group and journal club, lab work, mock grant proposal, oral presentations and scientific writing. This evidence is provided by their summer preceptors, peers, and self-assessments of their mastery of the core basic science concepts. Just as the interactive learning in class sets the stage for research and the rest of the curriculum, the first summer sets the stage for student success in the unique assessment process used in College Program.

Each week of the Year 1 and 2 basic science courses is organized around a theme that provides a focus of learning for the students and an opportunity to integrate when possible the basic science, clinical, and research curriculum components. For example, the theme of one of the weeks of the Gastrointestinal System 1 course is “Liver, Gallbladder and Pancreas.” The Problem-Based Learning (PBL) case focuses on a patient who takes an overdose of acetaminophen and alcohol and subsequently develops liver failure. Students learn normal liver function as they explore this case. (All PBL cases used in the curriculum are based on real cases at the Cleveland Clinic.) The case provides the framework for the anatomy and other seminar sessions that focus on liver, gallbladder and pancreas anatomy, histology, drug elimination, and genetics. Friday Advanced Research in Medicine session is a meeting of the Liver Transplant Selection Committee attended by all the students where research, bioethics, and clinical care are integrated in the discussion of liver transplant candidates. During Years 1 and 2, the topics of the 2 Deans’ Dinners for each class are also coordinated with the basic science course and weekly theme.

The first basic science course in Year 1, Cardiovascular and Respiratory Sciences 1 (CRS1), is a 7-week course in which students learn basic concepts of the normal structure and function of these systems. There are 14 hours of scheduled curricular time each week in the basic science courses, including 6 hours devoted to PBL cases and 8 hours devoted to other activities such as labs, seminars, and problem sets.

Throughout Year 1, anatomy, imaging and embryology are integrated into the basic science courses with information presented in two ways — self-directed learning modules that cover basic anatomical information (and are available online), and Case Directed Anatomy Sessions on Monday mornings for which students study clinical cases designed to introduce anatomical concepts and facts before coming to the lab. In the lab, students rotate among a number of stations using cadaver prossections to demonstrate anatomy relevant to the cases and radiological images such as 3-dimensional CT scans. For example, a case of a patient who has suffered a penetrating injury to the chest may be used to focus students on the anatomical structures that might be injured and their relationship to one another.

Histology is also integrated into the basic science courses, with students using a computer-based virtual microscopy system rather than a mechanical microscope to look at slides. This allows students not only to scan slides but also to see slide annotations and related gross and radiographic images. Specific learning objectives for histology are included in PBL cases in addition to seminars devoted to histology. The goal is for students to understand the gross and histological structures of each organ system in relation to its function, rather than as isolated anatomical facts. For example, during the week in CRS1 devoted to the theme of how the heart functions as a pump, students learn the structure and anatomical relationships of the four chambers of the heart and heart valves and the histological appearance of myocardial cells while they are studying the physiological concepts of preload, afterload, and contractility.

In addition to anatomy/embryology, imaging, and histology, the other “threads” in Year 1 include cell biology, pharmacology, physiology, bioinformatics, evidence-based medicine, genetics, nutrition, health care systems, ethics and humanities, building on the core concepts from the summer in specific relation to each organ system. In CRS1, students learn not only the molecular structures and functions of α- and β-receptors but also the pharmacology of endogenous and exogenous agonists and antagonists of these receptors as they study myocardial contractility and physiological regulation of blood pressure. They learn the biochemical pathways involved in aerobic and anaerobic production of ATP as they study determinants of oxygen delivery to myocardial cells, concepts they will revisit and build upon during subsequent courses when they study skeletal muscle metabolism during exercise and the role of the liver in maintenance of normal blood glucose levels. They study physiology of the heart, lungs, red blood cells and plasma as an integrated system providing oxygen and removing carbon dioxide, supporting metabolic needs of the entire body. During each course, students return to the core concepts they mastered in previous courses, using those concepts as a framework for building their understanding of the human organism as a whole. The basic science curriculum continues with Gastrointestinal System (4.5 weeks), Endocrinology and Reproductive Biology (4 weeks), Renal Biology (3 weeks), Musculoskeletal Sciences (3 weeks), Neurosciences (5 weeks), and Hematology, Immunology and Microbiology (7 weeks). Each basic science course focuses on normal structure and function, relating back to previous courses and preparing students for concepts in future courses.

Starting in the fall of Year 1, the Basic and Translational Research Summer Block’s Friday journal clubs are replaced by Advanced Research in Medicine 1, a weekly series of research seminars in which students are exposed to a wide range of basic and clinical research topics in interactive discussions with accomplished investigators. Presentations are linked closely with the basic science curriculum in order to reinforce core basic science concepts, help students feel confident in questioning the investigators based on what they are learning at the time, and illustrate the process whereby new biomedical discoveries change clinical practice.

Foundations of Clinical Medicine begins at the same time as the first basic science course and continues throughout Years 1 and 2. The guiding principle is that early exposure to patients, with direct observation and feedback by experienced faculty physicians, is optimal for real-time assessment and feedback of student clinical skills. Foundations of Clinical Medicine has 3 interrelated components — clinical skills training, patient care experiences, and Art and Practice of Medicine seminar series. The Art and Practice of Medicine seminar series is a two-year continuum addressing professionalism, ethics, leadership and its application to the care of patients and the practice of medicine, evidence-based medicine, health care systems and patient safety introduced to students primarily through the humanities.

Core clinical skills training occurs every other week from September through May and is coordinated with the organ systems under study. On alternate weeks, students practice the basic skills they just learned with standardized patients in the classroom by conducting histories and physical exams with real patients and writing chart notes on the
Students have extensive experience in self-directed learning both independently and in teams and have mastered core basic science concepts related to human health and disease. They are comfortable "doctoring" adult outpatients and competent in the complete history, physical examination, oral and written presentations, and basic clinical skills such as reading EKGs. Perhaps most important, they have learned to accurately assess their own strengths and weaknesses and create learning plans for themselves – preparing them to succeed in the next three years of the curriculum and a lifetime of professional practice.

Curriculum Timeline: Years 3 through 5
After Year 2, the clinical curriculum for the College Program is the same as the University Program. In all Core Clinical Rotations, students experience both breadth and depth in clinical care, and clinical experiences are developmental, with opportunities to reinforce, build upon, and transfer knowledge and skills. Clinical learning is also integrated across disciplines whenever possible, and the roles of basic science, civic professionalism, scholarship, and population health in clinical care are evident throughout the clinical curriculum. Students likewise have patient care responsibilities that are progressive in sophistication and increasing in amount as their level of clinical skill and knowledge increases, and all core clinical competencies are addressed and assessed using common methods applied at the clinical sites at which rotations occur.

Core Rotations: Beginning in July of their third year, students have the opportunity to begin their core clinical rotations. These rotations are organized in blocks that integrate core specialties at one site for 8 or 12 weeks. Core 1 combines Family Medicine, Internal Medicine, and Geriatrics for 12 weeks, Core 2 combines Pediatrics and OB/Gyn for 12 weeks, Core 3 combines Neurology and Psychiatry for 8 weeks, and Core 4 combines Surgery and Undifferentiated Care for 8 weeks. Each of these clinical rotations is offered at all of the School of Medicine’s hospital affiliates (including University Hospitals of Cleveland, the Cleveland Clinic, MetroHealth Medical Center and the Louis Stokes VA Medical Center).

These Core Clinical Rotations, launched in July 2006 and modified in 2009 and 2012, represent an integrated approach to clinical education that is shared by students from both the University and College programs of the School of Medicine. Students engage in clinical learning with basic science correlation through patient-based experiences that are developmental and provide opportunities to acquire, reinforce, build upon, and transfer knowledge and skills.

Advanced Clinical and Scientific Studies
Advanced clinical and scientific studies provide students with flexible learning opportunities that support ongoing professional development and residency preparation and planning:

- Two Acting Internships are required: one in Internal Medicine, Surgery, Pediatrics, or Inpatient Family Medicine, and one in an area of student choice.
- One Acting Internship and all electives can potentially be done outside of the CWRU system.
- Students are encouraged to augment their interest in scholarship through rotations and activities that focus on sciences basic to medicine as well as clinical rotations.

The last three years are purposely designed as a flexible continuum of core clinical rotations, clinical and other electives, and research – to allow each student to individualize the curriculum to address his/her own career goals, learning needs and research interests. Each student plans
Every CWRU student must pass the CWRU Clinical Skills Examination and USMLE Step 2 CK (Clinical Knowledge) and CS (Clinical Skills) Examinations to graduate from the CWRU School of Medicine. Students take OSCEs similar in format and content to the USMLE Step 2 CS Examination as part of routine assessments of their clinical skills beginning in Year 1 and are well prepared for the CWRU Clinical Skills Examination and USMLE Step 2 CS Examination by the time they have completed the required clinical rotations. Students must take the USMLE Step 2 CK and CS Examinations by October 31 of their 5th year.

Students spend 12 to 15 months during the last three years on their mentored research project, including preparation and defense of a masters’ level thesis. Students are expected to complete their research in one block of time. During time devoted primarily to research, students spend one half-day each week in related clinical activities. Students must complete all required research rotations by December 31 of Year 5 and defend the Research Thesis within 3 months of research completion, but no later than February 15 of Year 5. Within these guidelines, students and their advisors are encouraged to be as creative as possible in designing the final 3-year continuum. Research may be conducted with faculty research advisors at any CWRU campus, or in some instances, with advisors at a limited number of other institutions (e.g., the NIH), with advanced approval from the Research Education Committee. Student research may focus on clinical, translational or basic research. Some students may wish to engage in health services research, research in biomedical ethics, or other areas relevant to the advancement of biomedical science and the care of patients in addition to the more "traditional" research areas.

The Student Portfolio: Competency-Based Assessment and Reflective Practice

The College's approach to student assessment is based on two key educational concepts—“competency-based assessment” and “reflective practice.” Competency-based assessment emphasizes the need for every student to achieve the broad range of required learning outcomes by providing an appropriate curriculum, learning resources, and regular formative assessments. No grades are assigned in the College Program during the 5-year program; when a student achieves the standards for all competencies, they are assigned a “Achieves Expectations” (“AE”) for each course on their transcript. Assessment of student performance is criterion-referenced, not norm-referenced; students are not compared to one another but to faculty-defined standards of achievement. A full range of assessment methods are used to profile learning outcomes. Reflective practice emphasizes that learning is dependent upon the integration of reflection and experience. Professionals learn by reflecting on their experiences both during the experiences (“reflection-in-action”) and after the experiences (“reflection-on-action”) and by using these reflections to develop new knowledge and skills. The assessment process helps our students develop their reflective practice skills—the ability to accurately describe, analyze and evaluate their performance and to identify and follow through on effective learning plans. We are committed to helping every student achieve our competency standards and develop reflective practice skills through frequent formative assessments and close advising.

Evidence of achievement for each of the Case Western Reserve University School of Medicine’s Program’s 9 competencies is collected and managed in an electronic portfolio. Students and their advisors share access to the e-Portfolio database of evidence and thus can track and document student progress in meeting our nine competencies. A broad range of types of evidence is collected from the learning experiences in the research, basic science, and clinical curriculum.

During research blocks, research preceptors, journal club facilitators, problem-solving session facilitators, and student peers provide written assessments of both individual work and teamwork in the lab, written and oral presentations, and critical thinking and reasoning skills. Written research proposals and reports and the final thesis are also included in the e-Portfolio.

During the basic science courses, students complete weekly online quizzes called Self-Assessment Questions (SAQs) that cover the breadth of knowledge for each week’s theme at the level of factual recall and simple application of the facts. Faculty design the SAQs so that students who are actively participating and studying should expect to know at least 80% of the answers; the individual results of the SAQs are available only to the students, but students are encouraged to contact the course director for help with any difficulties they are having. Students have continued access to the SAQs to assess their retention of this basic science knowledge. At the end of each week, students complete 1-2 open book Concept Appraisals (CAPPs) designed to determine if they have mastered the concepts for that week well enough to apply them to new or different problems or situations in brief, well-organized, clearly written essay(s). CAPPs are designed to assess depth of knowledge in key concept areas. Other evidence is provided by PBL facilitators and peers who provide assessments of performance in PBL sessions.

Assessments in the clinical curriculum include written feedback on performance from longitudinal preceptors and other faculty physicians and residents, results of OSCEs, patient logs documenting breadth of clinical exposure, patient journals in which students record their reflections on specific patients and their problems, self-assessments of videotaped interviews with patients (both standardized and real), and feedback from patients and other health care providers.

Students are expected to meet regularly with their physician advisor to discuss their progress. Several times each year, they are required to review their assessment evidence in relation to expected levels of achievement in the 9 competencies and write Formative Portfolios composed of structured reflective essays on how the evidence demonstrates their development as doctors and researchers. Based on this analysis, they develop learning plans to address areas needing improvement. The essays also include judgments on whether previously established learning goals have been achieved and reflections on the process of achieving these goals. Students discuss these materials with their physician advisors during Formative Assessment meetings. During the last three years, students submit learning plans on a bi-annual basis and meet with their physician advisor to review their progress. Students are expected to assume more and more responsibility and independence in accurate self-assessment, in developing learning plans and following through on addressing their own learning needs, and in recognizing and building on their own strengths.

At the end of Years 1, 2 and 4, students assemble a Summative Portfolio for review by the Medical Student Promotions and Review Committee that determines if the evidence presented by the student indicates a level of achievement sufficient for promotion to the next year of the program (or graduation). Students are expected to choose not only their best examples of their work, but more importantly evidence demonstrating their growth across the year in specific competencies. We want to graduate students who recognize areas needing improvement, identify an approach to addressing them, and can show that they have now achieved...
that skill as well as those students who excel in specific areas throughout the year. Graduates of CCLCM will have not only achieved a defined level of achievement of each of the 9 competencies, they will also have developed their reflective ability to accurately assess their own strengths and areas needing improvement. The assessment process is designed to enhance student learning and the student portfolio enables students to document their progress in the achievement of defined competencies.

**Graduation Requirements**

To graduate from CWRU School of Medicine with the MD degree (or the MD degree with Special Qualifications in Biomedical Research for students in the Cleveland Clinic Lerner College of Medicine program), students must:

1. Satisfactorily complete all Program Specific Requirements and Educational Program Objectives of the School of Medicine
2. Pass the USMLE Step 1 and USMLE Step 2 CK and CS
3. Pass or remediate the School of Medicine's Clinical Skills Exam
4. Satisfactorily complete the MD Thesis
5. Meet financial obligations to the University
6. Be approved to graduate by the Committee on Students

**Dual Degree Programs**

**Dual Degree Programs with the MD**

The degree programs listed in this section may require admission to another school at the university in addition to or instead of the School of Medicine. Each school may have different deadlines and requirements for admissions. Please contact the other schools separately using information provided under that school's listing in this publication. Additional dual degree programs not including the MD are also offered through the medical school's departments. Several certificate programs (p. 845) are also offered in General Medical Sciences (p. 831).

**MD/PhD (MSTP)**

The Medical Scientist Training Program (p. 785) leads to the MD/PhD in various biomedical programs. Additional admissions information can be obtained here (https://case.edu/medicine/admissions-programs/md-phd-program/prospective-students/mstp-admissions/).

**Doctor of Medicine- MD/JD**

The School of Law and the School of Medicine offer a specialized dual degree program that allows a student to complete both degrees in six years. Law students enrolled in the dual JD/MD degree program may earn up to 12 credits toward the JD in graduate level MD courses. A student who begins at the law school spends two years studying law, then four years studying medicine. Alternatively, a student may spend the first two years and the last two years at the medical school, and the two middle years at the law school. For more information about the JD portion of the program, call the law school admissions office at 216.368.3600 or 800.756.0036, or e-mail lawadmissions@case.edu (https://lawadmissions@case.edu).

**Master of Arts in Bioethics- MD/MA**

The 27-credit-hour Master's degree program, including a 12-hour foundations course taken during the first year of medical school, provides advanced training in bioethics while emphasizing the interdisciplinary and interprofessional nature of the field. In this program, medical students will participate in and contribute to the critical analysis of moral issues related to health, health care, and health policy at local, national and international levels. Medical school students complete the bioethics program while pursuing their medical degrees; no additional time is required. Admission for the master's degree portion is through the Case Western Reserve University School of Graduate Studies. For more information about the MA requirements, visit the Bioethics section (p. 818), call 216.368.8718, or e-mail bioethics@case.edu (//bioethics@case.edu).

**Master of Public Health- MD/MPH**

Graduates of this 5-year, 42-hour master's degree program are qualified to work in local and state health departments, universities and colleges, hospitals, ambulatory medical centers, non-profit organizations and the insurance and pharmaceutical industries. Areas of concentration include health promotion and disease prevention, population health research, health policy and management, global health, and health informatics. For more information about the MPH requirements, visit the Master of Public Health website (https://epbiwww.case.edu/dual-degree-programs/), call 216.368.2601, or email mph-info@case.edu (mph-info@case.edu).

**Master of Science in Applied Anatomy- MD/MS**

Students seeking advanced training in the anatomical sciences may begin the 30-hour master's degree program in the fall or spring semester of the first year of medical school. Required graduate courses include the anatomical sciences core curriculum, completed during the first two years of medical school, and an advanced surgical anatomy course taken in the fourth year. Students earn the remaining credits through elective courses. Completion of a thesis is not required, but students may undertake independent research experiences as electives; a thesis-based program also is available. Interested medical students must apply to the master's program through the Department of Anatomy. For more information about the MS requirements, visit the Master of Science in Applied Anatomy website (https://case.edu/medicine/anatomy/curriculum/), call 216.368.2433, or email anatomy@case.edu.

**Master of Science in Biomedical Engineering- MD/MS**

Medicine is undergoing a transformation based on the rapid advances in science and technology that are combining to produce more accurate diagnoses, more effective treatments with fewer side effects, and improved ability to prevent disease. The goal of the MD/MS in Engineering is to prepare medical graduates to be leaders in the development and clinical deployment of this technology and to partner with others in technology based translational research teams. Current CWRU medical students in either the University Program (UP) or the Cleveland Clinic Lerner College of Medicine (CCLCM) may apply to the MD/MS in Engineering program. Students should apply through the BME department admissions office. For more information about the MS requirements, visit the Biomedical Engineering website (http://engineering.case.edu/ebme/), call 216.368.4063, or email bmedept@case.edu.

**Master of Science in Biomedical Investigation- MD/MS**

The goal of the 5-year joint MD/ Masters of Science in Biomedical Investigation program is to train medical students in basic or clinical
A combined MD/PhD program in biomedical sciences, the Medical Scientist Training Program (MSTP) is available for students desiring research careers in medicine and related biosciences. This program takes seven to eight years to complete, depending on the time needed to complete the PhD dissertation research. Financial support includes a stipend and full tuition support.

Candidates must meet established prerequisites for admission to both the School of Medicine and the School of Graduate Studies. Criteria include demonstrated capabilities in research and superior undergraduate academic credentials. Applicants must have either U.S. citizenship or permanent residency status to be considered for admission to the MSTP. Information can be obtained by contacting the MSTP program (mstp@case.edu) or from the program website (http://mstp.case.edu). Admissions are coordinated via the School of Medicine admissions program and the AMCAS application.

The first two years of the MSTP are centered on the University Program pre-clinical core medical school curriculum, which occupies five mornings each week. Afternoons include time for graduate courses and/or research rotations, as well as clinical training, thus integrating the medical school and graduate school experiences. The next three to four years are devoted to completion of graduate courses and PhD thesis research in one of the multiple MSTP-affiliated graduate programs. During the PhD phase, MSTP students participate in the MSTP Clinical Tutorial, a program designed to enhance clinical skills and allow students to develop connections between their research and clinical interests (this further addresses the goal of integrating medicine and science). After completion of the PhD program, students return to medical school for two years to complete clinical clerkships and finish the MD curriculum.

The program is administered by the MSTP Steering Committee, which consists of faculty from both basic science and clinical departments. Its functions include selecting candidates for admission, designing and administering the program curriculum, advising students and evaluating student progress.

Please see the Doctor of Medicine (MD) (http://bulletin.case.edu/schoolofmedicine/md/) page for information about the MD curriculum.

**MSTP Program by Year**

**Year 1**
- University Program MD curriculum
- Summer Intro to MSTP course
- One graduate course or research rotation each semester (fall and spring)

**Year 2**
- University Program MD curriculum
- Summer research rotations (1 or 2)
- Graduate course or research rotation in the fall semester

**Year 3**
- PhD program

**Year 4**
- PhD program
- MSTP Clinical Tutorial

**Year 5**
- PhD program
- Optional MSTP Clinical Tutorial

**Year 6 (If Needed)**
- PhD program
- Optional MSTP Clinical Tutorial
- All PhD work, including dissertation defense and publications, to be completed before starting the 3rd year MD curriculum

**Year 7**
- Third year MD curriculum (core clinical clerkships)
Year 8

- Fourth year MD curriculum (completion of core clinical clerkships if necessary, clinical and research electives)

General Description
The Case Medical Scientist Training Program (MSTP) provides training for future physician-scientists by integrating well-developed curricula in science and medicine. Unique aspects of the program include the integration of graduate school and medical school in many phases of the program to optimize dual-degree training and a high degree of student involvement in running the program.

The MSTP includes three major phases of training.

First phase: During the first two years, each student completes the first two years of the University Program medical school curriculum, including early clinical experiences, completes at least three research rotations, takes graduate courses, and chooses his or her PhD graduate program and thesis lab. During the summer between the first two years of medical school, students complete one or two research rotations. During the fall and spring semesters of year one and the fall semester of year two, students take a graduate course or complete a research rotation.

Second phase: During the PhD phase, students complete all requirements of their PhD program. They also participate in the MSTP Clinical Tutorial for at least one year in a patient-based clinical specialty. A second year of MSTP Clinical Tutorial is optional.

Third phase: In the final phase, students complete years three and four of the University Program medical school curriculum. The focus is clinical training, but research electives can be taken for part of year four.

Although each of these three phases has a different focus, opportunities exist for students to pursue both research and clinical training in each phase. The philosophy of the Case MSTP is to integrate medicine and science throughout the program as much as possible.

The Case MSTP is run by faculty, students and staff. The MSTP Council is a body of students that plans and runs certain aspects of the program. The administrative director, program coordinator, and program assistant have many important roles and run the day-to-day management of the program. The co-director is involved in decisions at all levels of the MSTP Clinical Tutorial for at least one year in a patient-based clinical specialty. A second year of MSTP Clinical Tutorial is optional.

The MSTP includes three major phases of training.

Total Units in Sequence: 26-37

* MSTP 400 Research Rotation in Medical Scientist Training Program or an appropriate graduate school course.

IBIS 401 Integrated Biological Sciences I, IBIS 402 Integrated Biological Sciences II and IBIS 403 Integrated Biological Sciences III are 4 credits each. IBIS 411 Clinical Science I, IBIS 412 Clinical Science II, and IBIS 413 Clinical Science III are 2 credit hours each. In contrast to their fellow medical students, MSTP students are graded during years one and two of the medical school curriculum for these graduate courses, which provide graduate school credit for the medical school curriculum. These grades are for graduate school purposes and do not affect standing in the medical school.

In addition to the medical curriculum, students take MSTP 400 Research Rotation in Medical Scientist Training Program or one 3-4 credit graduate school course per semester in the first two years. Graduate courses are scheduled in the afternoon in the fall and spring semesters to avoid conflict with the medical school curriculum. MSTP students will be registered for MSTP 400 during the summer terms before each of the first two years of medical school. Students also may complete a research...
rotation instead of a graduate school course during the fall or spring semester.

The PhD Phase

After completion of the second year of medical school, each student chooses a PhD thesis mentor, joins a specific PhD program, and completes any remaining graduate school course work and other requirements for the PhD degree. The following training programs are affiliated with the MSTP. (If the training program is not itself an independent PhD program, the program through which it is offered is indicated in parentheses.)

• Biochemistry
• Biomedical Engineering
• Cancer Biology (Pathology)
• Cell Biology
• Clinical Translational Science
• Developmental Biology (Genetics and Neurosciences PhD programs)
• Epidemiology and Biostatistics
• Genetics and Genome Sciences
• Immunology (Pathology)
• Molecular Biology and Microbiology
• Molecular Virology
• Neurosciences
• Nutrition
• Pathology (Molecular and Cellular Basis of Disease)
• Pharmacology
• Physiology and Biophysics
• Structural Biology and Biophysics (Biochemistry, Pharmacology, Physiology & Biophysics)
• Systems Biology and Bioinformatics

All MSTP students are required to take IBMS 450 Fundamental Biostatistics to Enhance Research Rigor & Reproducibility and IBMS 500 On Being a Professional Scientist: The Responsible Conduct of Research during the spring semester of their third year in the program. IBMS 501 Responsible Conduct of Research for Advanced Trainees is offered every spring semester (beginning 2020). The SOM requires that PhD students who are 4 years beyond their initial RCR training in IBMS 500, register for IBMS 501.

Clinical Tutorial, Clinical Refresher Course and Years Three and Four of Medical School

During the PhD thesis phase, MSTP students take the MSTP Clinical Tutorial, which provides a unique longitudinal part-time clinical experience. The MSTP Clinical Tutorial is a year-long course that enhances clinical skills for year three of medical school. It also serves a special career development objective by allowing students to balance medical and scientific interests and explore the connections between these areas. The MSTP Clinical Tutorial, offered during the PhD phase, is an example of the integration of science and medicine in the Case MSTP. An optional MSTP Clinical Refresher course may be taken before the start of year three. After completion of the PhD, MSTP students are enrolled in medical school to complete the requirements for the MD (see description provided for the University Program (http://bulletin.case.edu/schoolofmedicine/md/#universityprogramtext)).

MSTP Activities

The MSTP supports several activities that enhance the scientific and professional development of students. These activities also foster a vibrant and collegial MSTP community with a strong sense of mission in the training of physician scientists. The student-directed MSTP Council coordinates many activities of the Case MSTP. The Council meets once each month to discuss activities that are run by different student committees. The overall goals of the MSTP Council are to identify objectives for the program, to allow students to initiate programs to enhance the MSTP, to encourage increased student involvement in the operation of the MSTP, and to enhance development of leadership skills of MSTP students. The president, vice president, and secretary are all elected for a one-year period. Committees are led by 1-3 committee chairs who take charge of committee activities and coordinate the involvement of other students in the committee activities. All students are welcome and encouraged to participate in the various committees and to attend the council meetings. Recent Council committees and other program activities have included the following:

1. Monthly Dinner Meeting Committee
   This committee is responsible for planning monthly dinner meetings, selecting topics, speakers, and menus. The series is organized by students and is attended by students, Steering Committee members, and research mentors. Invited speakers (students, faculty, alumni and outside speakers) address issues pertinent to research, professional issues, career development or other topics of interest. The informal environment at these gatherings promotes social and professional interactions.

2. Communications and Webpage Committee
   This committee organizes communications and the Case MSTP website content.

3. Summer Retreat Committee
   This committee plans the summer retreat.

4. Intro to MSTP
   This committee organizes events for first year MSTP students, to integrate them into the program and the community.

5. Community Service Committee
   Plans events for involvement of MSTP students in community service.

6. Social Committee
   This important committee plans fun events throughout the year!

7. Student Representative to Faculty Council
   One student is selected to represent the MSTP on Faculty Council.

8. Student Representative to the Committee on Medical Education

9. Representative to the Graduate Student Senate

10. MSTP Women’s Committee
    Women in the MSTP organize luncheons or other meetings to discuss issues that face women pursuing careers in science.
Students may invite a successful woman scientist who provides a role model as a physician scientist.

11. Scientific meetings

The program strongly encourages students to present their research at national or international meetings and provides financial support to pay for part of meeting travel expenses (other funding is obtained from the research mentor). In addition to the general meeting support for all students, each year two students are offered the opportunity to attend the annual MD/PhD national student conference in Colorado or the American Physician Scientist Association annual meeting in Chicago, with all expenses paid by the MSTP.

12. Research symposia

MSTP students are encouraged to present their research at Case student symposia, including the annual graduate student symposium and the Irwin H. Lepow Student Research Day. These symposia feature a nationally recognized keynote speaker, and students have the opportunity to interact extensively with the noted scientist. A committee awards prizes for outstanding student presentations.

13. Summer retreat

The annual MSTP summer retreat is a two-day event focusing on scientific presentations, professional development and program planning for the upcoming academic year.

14. Works in Progress Seminar Series

Students in their research years present their thesis work to the department through an oral presentation.

Assessment of MSTP Students

Students in the MSTP are assessed for the medical school component of the program in the same manner as students in the University Program, with the exception that grades are awarded for those courses in the MD curriculum in years one and two that receive graduate school credit and are used to satisfy requirements for the PhD degree. Students must satisfactorily complete all requirements for both the MD and the PhD.

IBIS Courses

IBIS 401. Integrated Biological Sciences I. 1 - 9 Units.
A four-semester sequence encompassing anatomy, biochemistry, physiology, pharmacology, pathology, and microbiology.

IBIS 402. Integrated Biological Sciences II. 1 - 9 Units.
A continuation of IBIS 401.

IBIS 403. Integrated Biological Sciences III. 1 - 9 Units.
A continuation of IBIS 402.

IBIS 411. Clinical Science I. 2 Units.
IBIS 412. Clinical Science II. 2 Units.
IBIS 413. Clinical Science III. 2 Units.

IBIS 434. Integrated Biological Sciences in Medicine. 6 Units.
This course is open only to candidates enrolled in the M.D./M.S. program (College plan). Registration is for the Spring semester of the second year in medical school. The course content includes the areas of hematology, gastroenterology and renal physiology. Students will also be required to participate in Process of Discovery. Assessment of performance will be through reaching required levels of competency for the medical areas identified above and by the evaluation of a term paper. Recommended preparation: First three semesters of medical school and currently a medical student in good standing.

IBIS 600. Exam in Biomedical Investigation. 0 Unit.
Students are required to pass an examination established for each student, generally reflecting the preparation and oral defense of a written report on the project. Prereq: Must be enrolled in MD/MS Biomedical Investigation program.

MSTP Courses

MSTP 400. Research Rotation in Medical Scientist Training Program. 0 - 9 Units.
All students must complete research rotations in a minimum of three different MSTP-approved laboratories and submit rotation reports and rotation evaluations for each to the MSTP office. All three of the rotations must be completed before the beginning of each student’s third year of the program. The main purpose of research rotations is to aid the student in selecting a laboratory for their thesis work.

MSTP 401. Introduction to MSTP. 0 Unit.
Focus and Scope of Course: The course examines the unique challenges that MSTP students face as they navigate a dual degree program. The course will explore strategies that successful MSTP students employ, including mentor choice, time management, strategy and networking. The course will also offer exposure to the various resources available at CWRU for medical and graduate students. Lastly, through journal clubs and formal lecturing, the critical thinking required of an MSTP student will be explored. Objectives: Students will be able to - Employ successful strategies for research rotation set-up and mentor choice - Enunciate strategies for the reconciliation of dual career training with an emphasis on networking, granting and timing - Employ the critical thinking required for manuscript critique and employ successful strategies in both oral and written presentation. Required Texts: None, however, manuscripts may be assigned and will be provided in pdf format. Format and Expectations: As the class is meant to be in dialogue format, meaningful class participation is expected and required. An individual cannot participate if he or she is absent, therefore, attendance is required. If there is a conflict with a required medical school assignment or activity, the medical school activity takes precedence, and attendance in the MSTP course will be waived for that session. Individual students will at times be assigned responsibility for leading the discussion relevant to specified readings. It is expected that all students will complete the readings and assignments prior to the start of the class at which the reading was assigned. Grading: Grading will be Pass/Fail. If students are present at all sessions (excepting when required for an alternative activity at the medical school and excepting excused absences with permission from the instructor), and if the student makes an attempt at a meaningful contribution to the discussion, it is anticipated that all students will pass.
Physician Assistant Program
Master of Science in Physician Assistant Studies

Cynthia Booth Lord, MHS, PA-C
PA Program Director

CWRU PA Program Curriculum Overview

The Case Western Reserve University PA program is a 102 credit-hour professional degree program that spans the course of 27 months. The program is a generalist program preparing learners to be leaders in PA practice in a variety of clinical settings. This intensive full-time graduate curriculum awards a Master of Science in Physician Assistant Studies (MSc in Physician Assistant Studies) from the School of Medicine upon completion. The curriculum, which must be successfully completed in order to meet program requirements for graduation, enables graduates to sit for the PA National Certifying Examination (administered by the National Commission on Certification of Physician Assistants) and obtain a state license.

The educational philosophy of the PA program emphasizes the practice of evidence-based, patient-centered medical care as well as accountability to patients, society and the profession through experiential learning and active community involvement. The first 15 months of the program are didactic in nature, divided into four semesters. This is followed by 12 months of clinical instruction comprised of twelve, four-week clinical rotations. Early clinical exposure is accomplished through pre-clinical clerkships in the first year. The PA program begins each year in May and ends in August. Students are recruited from the CASPA system.

The program design utilizes a hybrid blend of learning methodologies and styles including:

- Asynchronous learning
- Clinical simulations
- Case-based learning and clinical correlations
- Experiential learning in the community-the community is the “learning lab” of the PA program. Wellness, prevention, professionalism, communication skills and philanthropy are best taught directly in the community with patients in their own environment.
- Early clinical exposure/Pre-clinical clerkships-by the beginning of November of their first year, PA students are placed in clinical sites in the community for one-half day a week to practice their clinical skills and begin to acculturate to the clinical environment and learn how to function on a team. The focus of this experience is to hone the students’ clinical skills in history, physical exam, oral presentation, medical documentation, communication skills, and professionalism. It also serves as an early critical-thinking activity.
- Medical writing across the curriculum (MWAC) is introduced in the didactic phase through student reflections and progress in the clinical phase to the creation of a scientific poster, patient-safety paper, and oral case presentations.

Organization and sequencing of coursework is both horizontally and vertically integrated facilitating a connected flow of systems and conditions, creating a curricular thread intended to enhance the development of critical thinking and problem-solving. Planned redundancies help build a strong pre-clinical knowledge base. Through demonstrations, case discussions and simulation activities, students learn critical thinking and how to synthesize information to formulate and implement a patient management plan. Simulation activities allow the students to participate in scenarios that closely approximate real-life patient encounters and, through a team-based approach (small group), create their care plans. Hands-on activities enhance the student’s ability to develop their critical thinking and technical skills. Experiential learning through community engagement introduces students to some of the concepts of team-based care and population health.

Physician Assistant Program Plan of Study-27 Months

Courses

PAST 401. Foundations of Clinical Medicine-Principles of Interviewing. 3 Units.
The general purpose of this course is to teach the physician assistant student the skills necessary to conduct a clinical/medical interview with a patient and to be able to present the information to other health care professionals in both an oral and written format. This course, which is designed as small, group seminars, will focus on the skills necessary to question patients in a directed fashion and to listen to the patient with concern and empathy. Instruction will emphasize what data is needed in a complete medical history as well as the focused interview, the proper technique for gathering information, and the format for presentation of the data. Instructional techniques will include role-playing, small group discussion, and observation and critique by instructors, other students and simulated patient models. Prereq: Students must be in Physician Assistant Program.

PAST 402. Physical Diagnosis. 4 Units.
This lecture/discussion/laboratory course presents and explores the techniques for performing a complete and competent physical examination, understanding the pathophysiology presented by the patient, and organizing and reporting the findings in both written and oral format. Synthesis of historical and physical presentations for an accurate evaluation of the patient will be emphasized. The problem-oriented physical examination and special examination tools and techniques will be presented. Instructional techniques will include small group discussion, practical experience with other students and faculty, and the observation and critique of physical examination skills by faculty. Prereq: Students must be in Physician Assistant Program.

PAST 403. Diagnostic Methods-Clinical Lab. 1 Unit.
This course is designed to introduce the student to clinical laboratory and diagnostic medicine. Lectures are designed to review the various types of laboratory tests, acquisition and handling of specimens, normal values as well as interpretation of results and correlation with clinical conditions. This course also includes an introduction to radiology, microbiology and electrocardiogram interpretation. The skills learned here carry over to the principles of medicine series in subsequent semesters. Prereq: Students must be in Physician Assistant Program.

PAST 404. Clinical Correlations. 1 Unit.
This seminar course places emphasis on internal organs with clinical correlation to anatomic conditions. Content will include basic concepts of genetics, the comparison of normal and abnormal structural relationships and the demonstration of how these things relate to health and disease. Students will review on-line genetics learning modules and meet in small seminar groups to review anatomical clinical correlates. Prereq: Students must be in Physician Assistant Program.

PAST 405. Medical Microbiology & Infectious Disease. 2 Units.
This course is the study of microorganisms and the diseases they cause in man. It includes consideration of infectious disease microorganisms including their biochemical, serological and virulence characteristics, and clinical manifestations. An organ system approach is used to examine the fundamentals of pathogenicity, host response, epidemiological aspects of infectious disease, as well as clinical manifestations, diagnosis and treatment of infections with clinical correlations. Prereq: Students must be in Physician Assistant Program.
PAST 406. Ethics in Healthcare Delivery. 1 Unit.
This course is an overview of the discipline of medical ethics presenting the study and application of relevant principles, insights, and understandings of modern medical practice. The course includes a brief overview of ethical theories which lay the foundation for subsequent investigation into specific ethical problems found in medical science and technology. The purpose of the course is to provide a framework which enables the student to reason clearly and effectively about the ethics involved in medical science and technology. The course assumes no prior knowledge of philosophical ethics or medical science. A framework of ethical decision making is introduced and practiced using realistic medical cases via seminar discussion. Prereq: Students must be in Physician Assistant Program.

PAST 407. Clinical Procedures. 4 Units.
The purpose is to prepare these future clinicians for clinical management of health and disease by preparing them for common clinical procedures. These will include basic and advanced surgical skills, basic laboratory skills, common outpatient procedures, common emergency procedures, and interpretation of common radiologic tests. Prereq: Students must be in Physician Assistant Program.

PAST 410. Cadaver dissection-based human anatomy with histology and physiologic correlations. 6 Units.
This course will provide students with a sound understanding of the normal human body as a foundation for subsequent pursuing biomedical careers. A combination of daily lectures and laboratories integrates cadaver dissection-based gross anatomy with the associated histology, embryology, neuroanatomy and basic physiology. This course is well suited to all biomedical careers, including pre-clinical and biomedical undergraduates, post-baccalaureate, pre-clinical master of science graduate programs, plus medical and dental students seeking additional training in the anatomical sciences. It will meet any of the anatomy-oriented prerequisites being implemented for medical and dental school applications, including those preferring or requiring a cadaver-based experience. The assessments will include a combination of written and cadaver-based practical questions. Offered as ANAT 410 and PAST 410. Prereq: Students must be in Physician Assistant Program.

PAST 411. Professional Issues for PA's-History & Roles of the PA I. 1 Unit.
In this three course series students explore, through lecture and discussion, the factors affecting the development of the profession and role socialization with emphasis on history and regulations/organizations governing PA practice. An overview of clinical responsibilities, team based practice, the PA role, and licensing/credentialing practices will be presented and discussed. Prereq: Students must be in Physician Assistant Program.

PAST 412. Professional Issues for Physician Assistants II. 2 Units.
In this three course series students will explore factors affecting the development of the profession, the status of the PA in the U.S. healthcare system and current issues in clinical practice including practice-based improvement and systems-based practice. Through lecture and discussion, this series prepares the student for the transition from classroom to clinical training and clinical practice. Emphasis is given to the responsibilities that come with being a professional, professionalism and practicing quality improvement. Prereq: Students must be in Physician Assistant Program.

PAST 413. Professional Issues for Physician Assistants III. 2 Units.
In this three course series students will explore factors affecting the development of the profession, the status of the PA in the U.S. healthcare system and current issues in clinical practice including practice-based improvement and systems-based practice. Through lecture and discussion, this series prepares the student for the transition from classroom to clinical training and clinical practice. Emphasis is given to the responsibilities that come with being a professional, professionalism and practicing quality improvement. Prereq: Students must be in Physician Assistant Program.

PAST 420. Pharmacology I. 2 Units.
In this two course series, (PAST 421 Pharmacology II) students will be provided with a basic introduction to the principles of pharmacology and to drug classes of particular relevance to the physician assistant. Information concerning drug doses and calculations used in determining doses will be included in this course and PAST 421 Pharmacology. Prereq: Students must be in Physician Assistant Program.

PAST 421. Pharmacology II. 3 Units.
In this two course series (PAST 420 Pharmacology), physician assistant students will be provided with foundational knowledge of the therapeutic uses and effects of drugs. The indications, contraindications and adverse effects of prototypical drugs are covered. Drug dependence and addiction are also discussed. This course also includes a problem-based learning component which will enhance students' teamwork and clinical reasoning skills by examining and analyzing case scenarios in small groups. Prereq: Students must be in Physician Assistant Program.

PAST 430. Principles of Internal Medicine. 7 Units.
This one semester lecture/discussion course provides students with a detailed study of the etiology, pathophysiology, signs, symptoms, diagnosis and treatment of various disorders encountered in internal medicine. A broad array of diseases in cardiology, dermatology, endocrinology, gastroenterology, gerontology, hepatology, hematology, oncology, urology, nephrology, neurology, pulmonology and rheumatology are explored. Prereq: Students must be in Physician Assistant Program.

PAST 431. Principles of Clinical Medicine-Surgery & Emergency Medicine. 4 Units.
This one semester lecture course presents the fundamentals of surgical disease and care of the acutely injured and ill patients. The purpose is to familiarize the student with the etiology, anatomy, pathophysiology, clinical manifestations and appropriate diagnosis and treatment of selected surgical conditions and conditions encountered in the surgical subspecialty and emergency medical settings. Prereq: Students must be in Physician Assistant Program.

PAST 432. Principles of Clinical Medicine-OB/GYN. 3 Units.
This lecture/case presentation course gives the student an overview of commonly encountered obstetric and gynecologic disorders. Anatomy and physiology of the human reproduction system are examined, including the changes in pregnancy, prenatal care, medical and surgical complications of pregnancy, pre- and postpartum care. Common gynecologic conditions, methods and effectiveness of contraception, cancer detection methods and the diagnosis and treatment of sexually transmitted infections in the female are explored. Prereq: Students must be in Physician Assistant Program.
PAST 433. Principles of Clinical Medicine-Pediatrics. 3 Units.
This course introduces the student to a unique, complex and challenging field of pediatrics. It emphasizes aspects of general pediatrics and provides a foundation for those students who elect to further study the health care of infants, children and adolescents. This course addresses issues unique to childhood and adolescence by focusing on human developmental biology, and by emphasizing the impact of family, community, and society on child health and well-being. Additionally, it focuses on the impact of disease and its treatment on the developing human, and emphasizes growth and development, principles of health supervision, and recognition of common health problems. Prereq: Students must be in Physician Assistant Program.

PAST 434. Principles of Clinical Medicine-Behavioral Medicine. 2 Units.
This one semester course gives students an overview of some of the most important areas in behavioral psychiatry. This course is an overview of basic psychiatric concepts and focuses on assessing patients who manifest psychological symptoms. Topics include diagnosis and treatment of anxiety disorders, mood disorders, common child and adolescent disorders, somatoform and factitious disorders, psychotic disorders, sleep disorders, adjustment and personality disorders, and drug and alcohol abuse and addresses forensic issues in behavioral health. Prereq: Students must be in Physician Assistant Program.

PAST 440. Pre-Clinical Clerkships I. 1 Unit.
This course/clerkship provides the student with clinical experience at clinical sites in the didactic year utilizing what was learned in Foundations of Clinical Medicine (Interviewing and Physical Diagnosis class/lab). During the pre-clinical time at program designated sites, students will continue to develop and apply their history and physical exam skills, interpersonal skills, oral presentation and medical documentation skills. For expanding skills and creating relationships within the community, this course also encompasses community service, experiential learning and interprofessional education activities. This course/clerkship will help to better prepare students to gain experience and develop confidence in approaching patients prior to entering the clinical year. Prereq: Students must be in Physician Assistant Program.

PAST 441. Pre-Clinical Clerkships II. 1 Unit.
This course/clerkship provides the student with clinical experience at clinical sites in the didactic year utilizing what was learned in Foundations of Clinical Medicine (Interviewing and Physical Diagnosis class/lab). During the pre-clinical time at program designated sites, students will continue to develop and apply their history and physical exam skills, interpersonal skills, oral presentation and medical documentation skills. For expanding skills and creating relationships within the community, this course also encompasses community service, experiential learning and interprofessional education activities. This course/clerkship will help to better prepare students to gain experience and develop confidence in approaching patients prior to entering the clinical year. Prereq: Students must be in Physician Assistant Program.

PAST 450. Culture and Health. 2 Units.
This lecture/discussion course provides students with a detailed understanding of the societal and individual prejudices, preconceptions, and biases that enter into the clinical interaction and how to develop appropriate responses and coping strategies. This course provides the student with common psychosocial problems encountered by health professionals today. Students explore issues related to sexuality, cultural competency, multicultural health, cross-cultural communication, and healthcare disparities. Prereq: Students must be in Physician Assistant Program.

PAST 451. Introduction to Public Health. 1 Unit.
This course will introduce students to concepts of public health and provide experience in public health by completion of a project. The course will enhance the student’s knowledge of the history and philosophy of public health, the Healthy People 2020 initiatives and the social determinants of health and how they can be impacted. Teaching methodologies will include discussion, lecture and development of a public health project. Prereq: Students must be in Physician Assistant Program.

PAST 452. Introduction to Evidence Based Medicine. 2 Units.
This course is intended to provide learners with a basic understanding of the principles of epidemiology, biostatistics and evidence-based medicine. The course involves analysis of prospective and retrospective studies, cross-sectional studies and experimental epidemiology. It will focus on epidemiological scenarios that relate to both infectious disease and chronic disease. In addition, the course will provide the student with a basic understanding of the application of statistical techniques to the biological and health sciences and to demonstrate their areas of application. Emphasis will be placed on probability laws, sampling and parameter estimation, test of hypothesis, correlation, regression and analysis of variance. Finally, students will be introduced to the basic concepts of evidence-based medicine, information mastery, and critical appraisal of the medical literature. Prereq: Students must be in Physician Assistant Program.

PAST 453. Medical Spanish Elective. 1 Unit.
This course will teach students the basics of Spanish as it applies to the medical field such as physical examinations, emergencies, common diseases within the Latino population, and specializations. By familiarizing students with conversational Spanish and medical Spanish, this course will enable students to apply their learning to real-world situations, to assist in communications, and ultimately to break down the barrier between doctors and patients. Prereq: Students must be in Physician Assistant Program.

PAST 454. Research Methods Elective. 1 Unit.
This lecture course introduces students to research design and scientific inquiry and provides them with the skills necessary for interpretation and critical evaluation of the medical literature. It includes a brief review of important statistical principles and methods and their application to problems in medicine and health. Prereq: Students must be in Physician Assistant Program.

PAST 477. Human Physiology. 4 Units.
This lecture/seminar experience is meant to enhance the student’s fundamental knowledge in human physiology with an emphasis on physiologic concepts in relationship to health, disease and illnesses. The course will provide students with an understanding of the function, regulation and integration of the major organ systems. Offered as PAST 477 and PHOL 477. Prereq: Students must be in Physician Assistant Program.
PAST 500. Clinical Residency: Emergency Medicine Rotation. 3 Units.
This clinical rotation is designed to expose the student to the wide variety of problems encountered in the hospital-based emergency room setting in both the fast track and acute care sides of the emergency department. The rotation experience includes the medical/surgical management of patients of all ages (infant to geriatric) with presenting problems that may be of a life threatening nature. The formulation and understanding of the many and varied medical problems is accomplished via the accurate collection of data through a history and physical exam, interpretation of diagnostic testing, and the development of a plan. The student will also be exposed to and perform diagnostic and therapeutic procedures. These experiences will be under appropriate supervision. Prereq: Students must be in Physician Assistant Program.

PAST 501. Clinical Residency: Family Medicine. 3 Units.
This clinical rotation is designed to give the student an understanding of family medicine/primary care medicine as practiced in office and/or clinic in an outpatient setting. The student will work with patients from a variety of social, economic and cultural backgrounds across the lifespan. They will experience continuity of care while assessing, diagnosing, monitoring, managing, referring and educating patients. The student will be exposed to both acute and chronic problems as well as the psychosocial problems that are encountered in this setting. Students may encounter and participate in the care of patients of all ages: pediatric, adolescent, adult and geriatric populations. The formulation and understanding of the many and varied medical problems is accomplished via the accurate collection of data through a complete history and physical exam, interpretation of diagnostic testing, formulation of a problem list, and the development of a plan for each presenting problem. Prereq: Students must be in Physician Assistant Program.

PAST 502. Clinical Residency: Geriatrics. 3 Units.
This clinical rotation is designed to give the student an understanding of geriatric medicine. The understanding of the many and varied medical and psycho-social problems in geriatric patients is accomplished via the accurate collection of data through a complete history and physical examination, interpretation of diagnostic testing, formulation of a problem list, and the development of a plan for each presenting problem. Teaching rounds and lectures may be used to introduce concepts of geriatric medicine. Prereq: Students must be in Physician Assistant Program.

PAST 503. Clinical Residency: Internal Medicine Rotation. 3 Units.
This clinical rotation is designed to provide the student with an understanding of the wide variety of problems encountered in hospital-based internal medicine. The formulation and understanding of the many and varied medical problems is accomplished via the accurate collection of data through a complete history and physical exam, interpretation of diagnostic testing, formulation of a problem list, and the development of a plan for each presenting problems. Students are assigned to medical teams during their rotation. Teaching rounds and lectures are used to introduce concepts of internal medicine. Prereq: Students must be in Physician Assistant Program.

PAST 504. Clinical Residency: Obstetrics & Gynecology. 3 Units.
This clinical rotation is designed to expose the student to the variety of problems encountered in women's health care. The focus of the learning experience is on recognition and management of common gynecological illnesses, sexually transmitted infections, family planning, birth control, and cancer of the female reproductive system and breast. Obstetrical focus is on pregnancy, labor and delivery, and postpartum care. The student will also have an exposure to the surgical management of gynecological and obstetric problems. Teaching rounds and lectures may be used to introduce concepts of obstetrics and gynecology. Prereq: Students must be in Physician Assistant Program.

PAST 505. Clinical Residency: Pediatrics. 3 Units.
This clinical rotation is designed to emphasize care of the child from birth to adolescence. The focus of the learning experience is on recognition and management of common childhood illnesses, assessment of variations of normal growth and development, and the counseling of parents regarding immunizations, preventative health care visits, growth and development, nutrition, injury prevention and common psychosocial problems. The formulation and understanding of the many and varied medical problems is accomplished via the accurate collection of data through a complete history and physical exam, interpretation of diagnostic testing, formulation of a problem list, and the development of a plan for each presenting problem. Teaching rounds and lectures may be used to introduce concepts of pediatrics. Prereq: Students must be in Physician Assistant Program.

PAST 506. Clinical Residency: Behavioral and Mental Health. 3 Units.
This clinical rotation is designed to give the student an understanding of the psycho-social and behavioral components of health, disease, and disability. The student will be exposed to a variety of mental illnesses and disabilities and will also be able to recognize and categorize psychiatric disorders along with the therapeutic modalities used in their treatment. The formulation and understanding of the varied psychiatric problems is accomplished via the accurate collection of data through a complete history and mental status exam, interpretation of diagnostic testing when appropriate, formulation of a problem list, and the development of a plan for each presenting problem. Emphasis is placed on early recognition, intervention, and psychiatric referral and/or consultation. Teaching rounds and lectures are used to introduce concepts of psychiatric medicine. Prereq: Students must be in Physician Assistant Program.

PAST 507. Clinical Residency: Surgery. 3 Units.
This clinical rotation is designed to expose the student to the varied population with surgically manageable disease from adolescence to geriatrics. The formulation and understanding of the varied medical problems is accomplished via the accurate collection of data through a complete history and physical exam, interpretation of diagnostic testing, formulation of a problem list, and the development of a plan. The focus of the learning experience is on the pre-operative evaluation and preparation of the patients for surgery, procedures and assisting during the intra-operative period, and the care of patients post-operatively. The student will be exposed to both emergent and non-emergent surgical management of patients. The student may be assigned to surgical teams during his/her rotation. Teaching rounds and lectures are used to introduce concepts of surgical care. Prereq: Students must be in Physician Assistant Program.
PAST 508. Clinical Residency: Primary Care Elective. 3 Units.
This clinical rotation is designed to give the student an understanding of family medicine/primary care medicine as practiced in office and/or clinic in an outpatient setting. The student will work with patients from a variety of social, economic and cultural backgrounds across the lifespan. They will experience continuity of care while assessing, diagnosing, monitoring, managing, referring and educating patients. The student will be exposed to both acute and chronic problems as well as the psychosocial problems that are encountered in this setting. Students may encounter and participate in the care of patients of all ages: pediatric, adolescent, adult and geriatric populations. The formulation and understanding of the many and varied medical problems is accomplished via the accurate collection of data through a complete history and physical exam, interpretation of diagnostic testing, formulation of a problem list, and the development of a plan for each presenting problem. Prereq: Students must be in Physician Assistant Program.

PAST 509. Clinical Residency: Inpatient Medicine Elective. 3 Units.
This clinical rotation is designed to provide the student with an understanding of the wide variety of problems encountered in hospital-based internal/surgical medicine. The formulation and understanding of the many and varied medical and/or surgical problems is accomplished via the accurate collection of data through a complete history and physical exam, interpretation of diagnostic testing, formulation of a problem list, and the development of a plan for each presenting problem. Students are assigned to medical teams during their rotation. Teaching rounds and lectures are used to introduce concepts of hospital based medicine. Prereq: Students must be in Physician Assistant Program.

PAST 510. Clinical Residency: Elective. 3 Units.
This elective clinical rotation is designed to provide the student with the knowledge and skills in an area of interest. Students will gain an understanding of the variety of problems encountered in a medical or surgical sub-specialty discipline. The formulation and understanding of the many and varied medical and/or surgical sub-specialty problems is accomplished via the accurate collection of data through a complete history and physical exam, interpretation of diagnostic testing, formulation of a problem list, and the development of a plan for each presenting problem including pharmacologic and non-pharmacologic management. Acquisition of these skills helps facilitate the PA student to progress through the clinical rotation with increasing complexity of clinical experiences, building confidence, competence and compassion. In addition to gaining clinical skills specific to the specialty of the rotation, the student will also continue to develop skills in systematic medical problem solving and patient management abilities, establish or reinforce patterns of independent learning, self-evaluation, interprofessional relationships and communication skills. Elective rotation sites are chosen based on practice characteristics that are important for the PA student within this rotation. These may include practice location, patient populations, and availability of specific experiences and procedures. Prereq: Students must be in Physician Assistant Program.

PAST 511. Clinical Residency: Elective. 3 Units.
This elective clinical rotation is designed to provide the student with the knowledge and skills in an area of interest. Students will gain an understanding of the variety of problems encountered in a medical or surgical sub-specialty discipline. The formulation and understanding of the many and varied medical and/or surgical sub-specialty problems is accomplished via the accurate collection of data through a complete history and physical exam, interpretation of diagnostic testing, formulation of a problem list, and the development of a plan for each presenting problem including pharmacologic and non-pharmacologic management. Acquisition of these skills helps facilitate the PA student to progress through the clinical rotation with increasing complexity of clinical experiences, building confidence, competence and compassion. In addition to gaining clinical skills specific to the specialty of the rotation, the student will also continue to develop skills in systematic medical problem solving and patient management abilities, establish or reinforce patterns of independent learning, self-evaluation, interprofessional relationships and communication skills. Elective rotation sites are chosen based on practice characteristics that are important for the PA student within this rotation. These may include practice location, patient populations, and availability of specific experiences and procedures. Prereq: Students must be in Physician Assistant Program.

PAST 600. Capstone Quality Improvement Project & Comprehensive Examination. 3 Units.
The Quality Improvement (QI) Project (PAST 600 Capstone) is one of two major components of the capstone of the PA program. This component of the PAST 600 Capstone course provides students with clinical practice opportunities to synthesize practice based improvement knowledge and skills through participation in evaluation of practice based quality improvement projects and quality measures. The Capstone Quality Improvement evaluation project is conducted over the course of the year. The Comprehensive Examination (PAST 600) is the summative evaluation and the second of two major components of the capstone of the PA program. The purpose of the exam is to determine whether the student has been able to integrate knowledge and skills obtained from individual courses (didactic and clinical) into unified concepts and demonstrate the acquisition of the competencies needed for entry into clinical practice. Consisting of a written exam, oral exam and an OSCE, the Comprehensive Examination measures the learner’s knowledge, interpersonal skills, patient care skills and professionalism required to enter clinical practice. It is conducted within the final four months of the program. Prereq: Students must be in Physician Assistant Program.

The School of Medicine is proud to administer doctoral, master’s, professional and certificate graduate programs in the biomedical sciences, described fully in this bulletin under their departmental or center affiliations. The Graduate Education Office provides support and
information on the graduate and postdoctoral training programs in the School of Medicine, as well as professional skill development and training grant proposal support. Resources for proposal development as well as current training information are available at the SOM Graduate Education Office (https://case.edu/medicine/admissions-programs/graduate-programs/) website.

Case Western Reserve University School of Medicine has a strong commitment to the importance of diversity in its research and educational programs. The CWRU community celebrates how our individual diversity in race, ethnicity, gender, country of origin, sexual orientation or gender identity enhances our work together. CWRU programs welcome diverse individuals, including those individuals of racial and ethnic groups underrepresented in biomedical science, those with physical disabilities, and those with disadvantaged backgrounds.

**Common Academic Requirements**

Each graduate program follows the overall regulations established and described in Graduate Studies Academic Requirements pages (p. 1274) and documented to the Regents of the State of Ohio. In particular, students and faculty are directed to sections regarding *Academic Requirements for Master’s and Doctoral Degrees* regarding total and graded course requirements, dissertation advisory committees, maintenance of quality-point average, and other general aspects of graduate study at CWRU. Within those overall expectations, a specific course of study for each graduate program is required and described in each degree plan of study.

**Guiding Principles for Graduate Education in the School of Medicine**

Training and educating graduate students in the biomedical sciences is a complex process that continually evolves based on the rapid progression of scientific discovery and ever expanding technological landscape. Graduate programs must continually modify their approaches to meet these modern-day needs. Students are expected to master their overall discipline, become experts in their field of research, as well as gain expertise in a diverse, but interrelated professional skill set. That skill set should be clearly defined, widely communicated and integrated across all PhD disciplines at CWRU SOM. Moreover, a set of common principles or goals for educating all graduate students in the SOM helps to guide our programs in course or curriculum development. The School of Medicine Graduate Education Office, in collaboration with the graduate program directors, developed a formal set of Guiding Principles (https://case.edu/medicine/sites/case.edu.medicine/files/2019-06/Guiding%20Principles_rev%202018_0.pdf) for the education and training of all PhD students in order to help accomplish these important goals.

**Graduate Admissions to School of Medicine Programs**

Graduate students are admitted to our programs through several streams, including the Biomedical Sciences Training Program (http://www.case.edu/med/BSTP/), the Medical Scientist Training Program (http://mstp.cwru.edu/), dual-degree initiatives, and direct admission to specific programs (please see individual program entries under their affiliated department pages). Postdoctoral Fellows and Postdoctoral Scholars are appointed through the Office of Postdoctoral Affairs (http://postdoc.case.edu/).

**Student Affinity Groups**

Graduate students interact in vibrant groups in the School of Medicine including:

The Biomedical Graduate Student Organization (BGSO) (https://community.case.edu/bgso/about/) seeks to unite biomedical graduate students pursuing master's and doctoral degrees in various biomedical graduate programs in the Case Western Reserve University School of Medicine, with the ultimate goal of enriching the student experience and promoting career and professional development.

**What We Do:**
Promote greater career and professional development
Promote more interaction between graduates and professionals of the School of Medicine
Ease the transition into graduate school by creating a “survival guide”

**Get Involved:**
It’s your graduate career - why not make sure you get what you want out of it? As a graduate student, you can get involved by becoming a representative for your department or coming to monthly meetings. Please email us for more information or attend our next meeting.

**Highlights include:**
Hosted the following professional development seminars - “Funding 101: Funding Opportunities for Graduate Students”, "Scientific Journalism”, "Life as a Forensic Scientist”, "Planning Your Graduate Years and the Individual Development Plan”, "A Day in the Life of a Biotech Scientist”
Hosted New Student Acclimation Luncheons - “Everything You Need to Know About Research Rotations and Surviving C3MB”, "Surviving Grad School”, and “Choosing a Thesis Lab and Department”
The Community Outreach & Volunteering Committee participated in the following events - Homeless Stand Down 2010 through InterAct Cleveland, School Supplies Drive, and teaching a DNA Lab to underprivileged girls at an inner-city middle school in conjunction with the Department of Genetics
Social events included a party at Dive Bar, a pasta dinner social, and group outing to Wicked

In addition, doctoral students in the School of Medicine organize the annual Biomedical Graduate Student Symposium.

The Graduate Student Council (GSC) (http://gsc.case.edu/home/) is the governing body for all graduate students at CWRU. The aim is to enrich your experience at CWRU in every way possible. We connect students through social and professional events, provide funding and assistance for their initiatives, and work to insure that they are treated as valued members of the campus community.

The Minority Graduate Student Organization promotes, engages and advances underrepresented minority graduate and postdoctoral trainees in the various fields of biomedical research within the Case Western Reserve University community, in the greater Cleveland area, and in the nation.

**Professional Development**

The Graduate Education Office provides professional development opportunities for trainees including:

**Professional Enrichment for Trainees Series (PETS)**
The PETS seminar series focuses on developing core competencies of leadership, entrepreneurship, communication skills, appreciative inquiry, emotional intelligence, teamwork and other key areas. This noon luncheon series is held monthly, together with the COTS (described
Career Opportunities for Trainees Series (COTS)
The COTS seminar series is designed to introduce trainees to the array of career paths that are available to PhD biomedical researchers. Local, regional, and national leaders as speakers or panel discussants are invited to present each semester. Presentations include information on the speaker's career trajectory, their daily activities, and a description of additional training necessary for entering each career path. Major advantages and disadvantages of the career choice are also discussed. These sessions are often followed by an informal networking event allowing trainees to interact with the speaker and each other in a more informal setting.

Pre-Professional Health Seminar Series
The pre-professional health seminar series is geared for students who plan to go on to medical school, dental school or other allied health professions. Through workshops and seminars, we can help you make these applications less intimidating and you more prepared.

Mental Wellness & Resilience Seminar Series
The mental wellness and resilience seminar series is designed to provide trainees with the tools to develop coping mechanisms to manage and reduce stress.

MGRD 425: Leadership and Professional Development Skills for Biomedical Sciences
MGRD 425 Leadership and Professional Development Skills for Biomedical Sciences was designed to give graduate students in the biomedical and health sciences an opportunity to reflect on their professional skills and develop skills in the area of leadership, teamwork, critical thinking, creativity and problem solving. This course is typically offered each semester. It is a zero credit course that meets once a week.

The Enhancing Research and Industry Career Horizons (EnRICH) Program
The CWRU School of Medicine EnRICH Program provides career guidance and support to PhD and Master’s students pursuing biomedical science degrees and simultaneously develops partnerships with organizations and mentors who recognize the skills of such students. A mentor and student spend time together for a paid or non-paid work or exposure experience that is beneficial to both the employer and student. The timeframe and duration of the experience are flexible where the mentor and student agree on the duration of the work experience and to an hourly and weekly work schedule. During the experience, students will clarify career goals as s/he; realizes the results of applied skills and reduces the barrier between academia and industry, allowing young researchers to explore their interest in developing their own products or start their own company. Every third Wednesday of the month, local experts are invited to introduce the basics of commercialization such as intellectual property, regulatory, finances available at CWRU, and entrepreneurship opportunities here at CWRU to our trainees, and each meeting is wrapped up with a networking session. For more information, email cvmp@case.edu

CWRU Venture Mentor Program (CVMP)
The CWRU Venture Mentor Program (CVMP) provides team mentoring to CWRU and affiliate young faculty, students, and staff from a pool of local experts in a wide range of industries. Our process stems from the MIT Venture Mentor Service, a hugely successful program that has spawned over 100 similar programs across the U.S and around the world. Their processes are shown to provide a more likely chance that the venture will succeed, and that mentoring works best in a conflict-free, confidential, safe environment. For more information, email cvmp@case.edu

Biomedical Sciences Training Program (BSTP)
Phone: 216.368.3347
http://www.case.edu/med/BSTP/
George Dubyak, PhD (gxd3@case.edu), Director
Debbie Noureddine (dm2@case.edu), Coordinator
The Biomedical Sciences Training Program (BSTP) offers a common admission portal to most biomedical PhD degree programs at CWRU School of Medicine. The BSTP includes eleven doctoral programs in the School of Medicine with more than 200 faculty based in both basic science and clinical departments, giving BSTP students a tremendous range of research opportunities in many disciplines. It also provides a distinct advantage over traditional programs, which restrict choices of research area and faculty advisors.

Admissions
Students usually apply in the fall or winter and begin their studies the following summer. The application deadline is January 15th. Priority will be given to applications received by December 1. Applications will be considered by the Admissions Committee as soon as they are complete. In general a year of biology, organic chemistry and mathematics through calculus are required, and biochemistry and molecular biology are strongly recommended. We also seek students with strong backgrounds in physics or math who may be interested in our Structural Biology track (http://sbbp.tp.case.edu/) or Systems Biology and Bioinformatics (http://bioinformatics.case.edu/) programs. Depending on preparation, we may suggest additional biology coursework once graduate training begins. This background prepares most students for success in our programs.

Research Experience and Recommendations
Experience performing original research is essential. This might include an undergraduate honors thesis, summer research internships, or a technical position after graduation. Letters of recommendation from research mentors that describe creativity, handwork, and promise in science are very important.

Exams
The GRE general test is no longer required for admission through the BSTP. The Test of English as a Foreign Language (TOEFL) is required for international students unless they are from an English-speaking country or have a degree from a university where the instruction is primarily in English. Students may be eligible to apply for the transfer of some graduate credit from their previous institution. Please go here (http://gradstudies.case.edu/) for more information. Transfer credit must be requested prior to beginning coursework at CWRU.

The First Year
Coursework
Students take integrated courses in Cell and Molecular Biology (IBMS 453 Cell Biology I, IBMS 455 Molecular Biology I). They also complete a course in biostatistics (IBMS 450 Fundamental Biostatistics to Enhance Research Rigor & Reproducibility) and a literature based reading course (IBMS 456A Since You Were Born: Nobel Prize Biomedical Research in the Last 21 Years- Section A ). These four courses, offered in the fall semester, emphasize the molecular approaches that form the basis of modern biology. We also seek students with strong quantitative training who may have majored in physics or math, and offer alternative courses for these students to acquire foundations in biology. Qualified students also may take more specialized elective courses. All students take IBMS 500 On Being a Professional Scientist: The Responsible Conduct of Research.

Research Rotations
The research rotations allow students to explore research areas and become familiar with faculty members and their laboratories. The main purpose of these rotations is to aid students in selecting a laboratory for their thesis work. Students are encouraged to begin their rotations in July. Doing so gives them the opportunity to complete rotations during the summer before classes begin at the end of August. Students must complete at least three rotations.

Choosing a Thesis Advisor
During the first year, students select an advisor for their dissertation research. Each student also joins the PhD program with which their advisor is affiliated. Once students choose a PhD program, the requirements of that program are followed to obtain the PhD. The emphasis of the PhD work is on research, culminating in the completion of an original, independent research thesis and publishing the results in the scientific literature. PhD programs also focus on educating students to work as professional scientists.

Participating Training Programs
- Biochemistry (p. 813)
- Cell Biology (p. 866)
- Genetics and Genome Sciences (p. 863)
- Molecular Biology and Microbiology (p. 866)
- Molecular Virology (p. 866)
- Neurosciences (p. 873)
- Nutrition (p. 885)
- Pathology (p. 893)
- Pharmacology (p. 906)
- Physiology and Biophysics (p. 912)
- Systems Biology and Bioinformatics (p. 840)

These programs have tracks that allow specialization in the following areas: Cancer Biology; Cancer Therapeutics; Cell and Molecular Physiology; Developmental Biology; Experimental Pathology; Immunology; Membrane Structural Biology; Molecular and Cellular Biophysics; Molecular Pharmacology and Cell Regulation; Molecular Pharmacology and Cell Regulation; Organ Systems Physiology; RNA Biology; Structural Biology & Biophysics; Translational Therapeutics.

Training faculty, course offerings, and individual degree requirements are described in detail in the separate listings for each of these programs. All PhD programs have similar requirements, including an original thesis, coursework, examinations, publications in scientific journals with lead authorship, seminars, journal clubs, and other activities.
Bstp Course

BSTP 400. Research Rotation in Biomedical Sciences Training Program. 0 - 9 Units.

IBMS Courses

IBMS 450. Fundamental Biostatistics to Enhance Research Rigor & Reproducibility. 1 Unit.

This is a required graduate level course for all first year PhD students in the School of Medicine biomedical PhD programs excluding Biomedical Engineering, Population and Quantitative Health Sciences, Molecular Medicine and Clinical Translation Science. This course focuses on providing students with a basic working knowledge and understanding of best practices in biostatistics that can be applied to common biomedical research activities in numerous fields. Weekly sessions involve a combination of basic programming activities, lectures, exercises, hands-on data manipulation and presentation. Topics include experimental design and power analysis, hypothesis testing, descriptive statistics, linear regression, and others with an emphasis on when and in which experimental design a particular test is properly used. The overall goal of the course is to empower students to use these biostatistics to enhance the rigor of their experimental design and reproducibility of their primary data. The major focus is not on theory, but on a practical acquisition of a working knowledge of basic data processing analysis, interpretation, and presentation skills.

IBMS 453. Cell Biology I. 3 Units.

Part of the first semester curriculum for first year graduate students along with IBMS 455. This course is designed to give students an intensive introduction to prokaryotic and eukaryotic cell structure and function. Topics include membrane structure and function, mechanisms of protein localization in cells, secretion and endocytosis, the cytoskeleton, cell adhesion, cell signaling and the regulation of cell growth. Important methods in cell biology are also presented. This course is suitable for graduate students entering most areas of basic biomedical research. Undergraduate courses in biochemistry, cell and molecular biology are excellent preparation for this course. Recommended preparation: Undergraduate biochemistry or molecular biology.

IBMS 455. Molecular Biology I. 3 Units.

Part of the first semester curriculum for first year graduate students along with IBMS 453. This course is designed to give students an intensive introduction to prokaryotic and eukaryotic molecular biology. Topics include protein structure and function, DNA and chromosome structure, DNA replication, RNA transcription and its regulation, RNA processing, and protein synthesis. Important methods in molecular biology are also presented. This course is suitable for graduate students entering most areas of basic biomedical research. Undergraduate courses in biochemistry, cell and molecular biology are excellent preparation for this course. Recommended preparation: Undergraduate biochemistry or molecular biology.

IBMS 456A. Since You Were Born: Nobel Prize Biomedical Research in the Last 21 Years- Section A. 1 Unit.

This course is one of four sections that will cover major advances in biomedical research by review of Nobel Prize-winning topics from the past 21 years. Each section will cover 8 Nobel prize topics (1 topic/2 hour session/week for 8 weeks). Students will read critical research papers of the Nobel prize scientist(s) in preparation for guided in-class discussion led by the faculty mentor. The IBMS 456A section will cover Nobel Prizes related to the areas of Genetics & Genome Science, Virology, Pathology-Immunology, and Cell Biology. These include: 1) 2016 Prize, Y. Ohsumi: Mechanisms of Autophagy; 2) 2015 Prize, W. Campbell, S. Omura, and Y. Tu: Therapies against roundworms & malaria; 3) 2011 Prize, B. Beutler, J. Hoffman, and R. Steinman: Mechanisms underlying innate immunity and adaptive immunity; 4) 2008 Prize, H. zur Hausen, F. Barre-Sinoussi, and L. Montagnier: Discovery of human immunodeficiency virus and oncogenic papilloma viruses; 5) 2008 Prize, O. Shimomura, M. Chalfie, and R. Tsien: Discovery/development of green fluorescent protein for biological applications; 6) 2005 Prize, B. Marshall and J. Warren: Discovery of Helicobacter pyloris as pathogenic mechanism in peptic ulcers/gastritis; 7) 1999 Prize, G. Blobel: Mechanisms of protein sorting and subcellular trafficking; 8) 1996 Prize, P. Doherty and R. Zinkernagel: Mechanisms of cell-mediated immune defense.
IBMS 456C. Since You Were Born: Nobel Prize Biomedical Research in the Last 21 Years- Section C. 1 Unit.

This course is one of four sections that will cover major advances in biomedical research by review of Nobel Prize-winning topics from the past 21 years. Each section will cover 8 Nobel prize topics (1 topic/2 hour session/week for 8 weeks). Students will read critical research papers of the Nobel prize scientist(s) in preparation for guided-in-class discussion led by the faculty mentor. The IBMS 456C section will cover Nobel Prizes related to the areas of Biochemistry, Nutrition, Pharmacology, and Pathology-Cancer. These include: 1) 2015 Prize, T. Lindahl, P. Modrich, and A. Sancar: Mechanisms of DNA Repair; 2) 2014 Prize, E. Betzig, S. Hell, W. Moerner: Development of super-resolution fluorescence microscopy; 3) 2012 Prize, R. Lefkowitz and B. Kobilka: Structure/function analysis of G protein-coupled receptors; 4) 2004 Prize, A. Ciechanover, A. Hershko, and I. Rose: Mechanisms of ubiquitin-mediated protein degradation; 5) 2003 Prize, P. Lauterbur and P. Mansfield: Development of magnetic resonance imaging (MRI) methods; 6) 2002 Prize, S. Brenner, H.R. Horvitz, and J. Sulston: Mechanisms for genetic regulation of organ development and programmed cell death; 7) 2002 Prize, J. Fenn, K. Tanaka, and K. Wuthrich: Development of mass spec and NMR methods for biological macromolecules; 8) 2001 Prize, L. Hartwell, T. Hunt, and P. Nurse: Mechanisms of cell cycle regulation.

IBMS 456D. Since You Were Born: Nobel Prize Biomedical Research in the Last 21 Years- Section D. 1 Unit.

This course is one of four sections that will cover major advances in biomedical research by review of Nobel Prize-winning topics from the past 21 years. Each section will cover 8 Nobel prize topics (1 topic/2 hour session/week for 8 weeks). Students will read critical research papers of the Nobel prize scientist(s) in preparation for guided-in-class discussion led by the faculty mentor. The IBMS 456D section will cover Nobel Prizes related to the areas of Neuroscience, Physiology & Biophysics, and Pathology-Molecular Basis of Disease. These include: 1) 2014 Prize, J. O'Keefe, M-B. Moser, and E. Moser: Mechanisms of nerve cell spatial positioning in the brain; 2) 2013 Prize, J. Rothman, R. Scheckman, and T. Sudhof: Mechanisms of intracellular vesicle trafficking and biomolecule secretion; 3) 2004 Prize, R. Axel and L. Buck: Structure/function of odorant receptors and organization of olfactory system; 4) 2003 Prize: P. Agre and R. MacKinnon: Structure/function analysis of channel proteins in cell membranes; 5) 2000 Prize, A. Carlsson, P. Greengard, and E. Kandel: Mechanisms of signal transduction in the nervous system; 6) 1998 Prize, R. Furchgott, L. Ignarro, and F. Murad: Discovery/mechanisms of nitric oxide as signaling molecule in cardiovascular system; 7) 1997 Prize, S. Prusiner: Discovery/prions as new biological principle of infection in neurological disease; 8) 1997 Prize, P. Boyer, J. Walker, and J. Skou: Mechanisms of mitochondrial ATP synthesis and Na,K-ATPase pump function.

IBMS 500. On Being a Professional Scientist: The Responsible Conduct of Research. 1 Unit.

The goal of this course is to provide graduate students with an opportunity to think through their professional ethical commitments before they are tested, on the basis of the scientific community’s accumulated experience with the issues. Students will be brought up to date on the current state of professional policy and federal regulation in this area, and, through case studies, will discuss practical strategies for preventing and resolving ethical problems in their own work. The course is designed to meet the requirements for “instruction about responsible conduct in research” for BSTP and MSTP students supported through NIH/ADAMHA institutional training grant programs at Case. Attendance is required.

IBMS 501. Responsible Conduct of Research for Advanced Trainees. 0 Unit.

The life of a professional scientist is complicated, and it is not always easy to know how to “do the right thing” with regard to their data, colleagues, and subjects. Responsible Conduct of Research (RCR) is an essential component of research knowledge. Active thought about the issues of RCR should occur throughout a scientist’s career. Instruction in RCR should be appropriate to the career stage of the individuals receiving training. All doctoral students in the School of Medicine receive initial RCR training in their second semester and NIH requires another intense exposure if doctoral students are four years beyond their initial training. The goal of this course is to provide fifth year biomedical doctoral students with additional RCR training by exposing them to a variety of research ethics topics through lectures and small group discussions led by professional scientists and ethicists. Students will be brought up to date on the current state of professional policy and federal regulation regarding research (where these exist), and will discuss practical strategies for preventing and resolving ethical problems in their own work. This course is designed for predoctoral graduate students that are in their fifth year of graduate studies and MSTP students that are in their fourth year of their PhD phase of study. These sessions are also appropriate for postdoctoral trainees.

MGRD Courses

MGRD 310. Introduction to Clinical Inquiry (IQ). 3 Units.

This course is designed for pre-allied health students to introduce key overarching medical topics, including bioethics, public health and health disparities, as well as to integrate key MCAT topics from other courses into a clinically applicable context. Further, select human anatomy and physiology topics will be introduced. An important component of this course is the IQ process, which will reinforce scientific inquiry, self-reflection and constructive criticism. This course will have limited enrollment and is by permission only. Offered as MGRD 310 and MGRD 410.

MGRD 311. Introduction to Clinical Inquiry (IQ) II. 3 Units.

This course is the second semester in a 2 semester series designed for pre-professional health students to introduce key overarching medical topics, including bioethics, public health and health disparities, as well as to integrate key MCAT topics from other courses into a clinically applicable context. Further, select human anatomy and physiology topics will be introduced. An important component of this course is the IQ process, which will reinforce scientific inquiry, self-reflection and constructive feedback. Offered as MGRD 311 and MGRD 411.

MGRD 399. Independent Research in Biomedical Science. 1 - 3 Units.

This course is a graded independent research course offered in the School of Medicine at the undergraduate level. Students may use the School of Medicine EnRICH (Enhancing Research and Industry Career Horizons) program to find external research opportunities, may work in the laboratory of a School of Medicine faculty or may identify an appropriate mentored research opportunity independently. Students work with research mentor and course director to create their customized learning objectives. Grades are based on meeting objectives and completing reflections. In lieu of a final exam, students will give a short presentation on their experience and what they learned.
MGRD 401. PREP-aring for Success in a Biomedical PhD Program. 1 Unit.
This course is designed to prepare NIH Postbaccalaureate Research Education Program (PREP) Scholars for the rigors of a biomedical PhD program. This is a two-semester series (with MGRD 402 offered in the spring) that will help PREP Scholars navigate the biomedical PhD program application and admissions process, improve their application credentials, and prepare them for success in top biomedical PhD programs throughout the nation. Students receive scientific research training, instruction and experience in reading the primary literature, develop oral and written communication skills, and participate in professional development activities. Students will prepare a professional scientific abstract, submit it to a national meeting, prepare a scientific poster presentation on their research and present that research poster at a national meeting. Students will be graded on their quality of their work and the overall level of participation in class. This course is for the eight students accepted and enrolled in the PREP program as of July of each year.

MGRD 402. PREP-aring for Success in a Biomedical PhD Program. 1 Unit.
This course is designed to prepare NIH Postbaccalaureate Research Education Program (PREP) Scholars for the rigors of a biomedical PhD program. This is a two-semester series (with MGRD 401 offered in the fall) that will help PREP Scholars navigate the biomedical PhD program application and admissions process, improve their application credentials, and prepare them for success in top biomedical PhD programs throughout the nation. Students continue receiving scientific research training, instruction and experience in reading the primary literature, developing oral and written communication skills, and participating in professional development activities. This semester, students will learn the skills necessary for professional interviews. They will also be exposed to grant writing including determining the proper available grant funding mechanisms, developing a testable hypothesis, generating compelling aims, and searching of relevant literature. They will prepare professional presentation of a journal article. They will also prepare and orally present their own research at our Annual PREP Research Day. Students will be graded on their quality of their work and the overall level of participation in class.

MGRD 410. Introduction to Clinical Inquiry (IQ). 3 Units.
This course is designed for pre-allied health students to introduce key overarching medical topics, including bioethics, public health and health disparities, as well as to integrate key MCAT topics from other courses into a clinically applicable context. Further, select human anatomy and physiology topics will be introduced. An important component of this course is the IQ process, which will reinforce scientific inquiry, self-reflection and constructive criticism. This course will have limited enrollment and is by permission only. Offered as MGRD 310 and MGRD 410.

MGRD 411. Introduction to Clinical Inquiry (IQ) II. 3 Units.
This course is the second semester in a 2 semester series designed for pre-professional health students to introduce key overarching medical topics, including bioethics, public health and health disparities, as well as to integrate key MCAT topics from other courses into a clinically applicable context. Further, select human anatomy and physiology topics will be introduced. An important component of this course is the IQ process, which will reinforce scientific inquiry, self-reflection and constructive feedback. Offered as MGRD 311 and MGRD 411.

MGRD 425. Leadership and Professional Development Skills for Biomedical Sciences. 0 Unit.
This course is designed to give graduate students in the biomedical and health sciences an opportunity to reflect on their professional skills and develop skills in the area of leadership, teamwork, critical thinking, creativity and problem solving.

MGRD 525. Independent Study for PREP Scholars. 1 Unit.
Independent Study for PREP Scholars enables the Scholar to undertake study of advanced topics in biomedical research science that are not offered as standing courses at Case Western Reserve University. Generally, the Scholar(s) work closely with their primary research mentor to explore the background research literature and current results of the Scholar’s research project. A guided program of study using research reviews, primary research papers, discussions, critiques, and grant-writing sessions will ultimately result in written research proposal that focuses on specific aims or goals of the project and the research strategy including the background, significance, innovation, and experimental approach. This is a one-credit graded course that requires approximately 15h of total contact time for the semester and 3-4 hours of outside work each week. The purpose of this course is to provide knowledge and experience in fellowship grant writing, with a focus on the F31 application. This course is for the students accepted and enrolled in the PREP program.

MGRD 610. Internship in Biomedical Sciences. 1 - 9 Units.
This course is an ungraded (pass/fail) internship. Students are expected to identify a potential internship that will enhance their career in a meaningful way. For example, a student interested in education might choose to work with the Great Lakes Science Center to develop and help deliver content for a medical-themed summer camp. Students interested in getting a job in industry may find a company in their field and intern with them. Research experiences within CWRU or affiliated hospitals MAY be appropriate only if the student wouldn't otherwise get those experiences in their program and it would significantly help their career. Therefore, all internships must be identified and approved by the course director and, if counting as an elective toward their degree, their program director, prior to enrolling. All students must identify an internship mentor at the location of their internship. The course director will check in with their mentor regularly to ensure an appropriate experience for student as well as the hosting institution. Credits depend on the scope of the internship. For each credit you are enrolled in, you will be expected to work at least 50 hours. So, in other words, if you register for 9 credits in one semester, you will be expected to work a total of at least 450 hours, or about 11-12 weeks full time. Thus, the number of credits registered should coincide with the agreed upon scope of the internship. In order to pass this course, students will be expected to keep, and submit weekly, a reflection log. In addition, students will be expected to present on their experiences, including what they did and what they learned, at an end of the semester, and their internship mentor, program director and other students in this course will be invited to attend this public presentation. Students who do not meet the criteria for hours worked, miss more than 2 of the weekly reflections or do not do an end of the semester presentation will receive a failing grade.

MGRD 701. Dissertation Ph.D.. 1 - 9 Units.
Research experience in a selected faculty research laboratory designed for international exchange students doing PhD dissertation research. Prereq; Predoctoral research consent or advanced to Ph.D. candidacy milestone.

Department of Anatomy
Room WG-46, School of Medicine
Acceptance into the joint MD/MS program requires: (1) that the medical student be in good academic standing in the CWRU medical curriculum at the time of matriculation into the program; and (2) approval from their respective Associate (‘Society’ and Dean of Student Affairs).

No direct tuition or stipend support is currently provided with acceptance into the MS in Applied Anatomy program (Plan A or B). No additional tuition is required for enrolled medical students who pursue the joint MD/MS degree.

**Degree Requirements**

The MS in Applied Anatomy degree requires a minimum of 30 graduate course credits. Required courses generally include 17 credits of the Anatomical Sciences Core Curriculum; the remaining credits are elective courses selected to fulfill individual student interests and goals. Medical students are required to take at least one surgical anatomy course (ANAT 515 - Orthopedics or ANAT 516 - Head & Neck), typically during their final year. A research thesis is required only for students pursuing the Plan A MS in Applied Anatomy degree; students pursuing the Plan B MS in Applied Anatomy degree can gain research experience by enrolling in ANAT 499: Independent Study with individual faculty members.

A comprehensive written (Plan B) or oral (Plan A) exam covering the basic scientific principles presented in the core curriculum must be passed after successful completion of the formal coursework comprising the Anatomical Sciences Core Curriculum. All degree requirements must be completed within five years. Most students complete the degree requirements in two years; they can be completed in one year, but this is not generally recommended.

**MS in Applied Anatomy (Plan A and Plan B) & MD/MS in Applied Anatomy, Plan of Study (4 semesters)**

The sequence of classes below shows the order in which the courses are typically taken to complete the Master of Science in Applied Anatomy degree. The four required courses comprising the Anatomical Sciences Core Curriculum (17 credits) are listed individually; elective courses (13 credits minimum) are not specified since they vary significantly among students. Students become eligible to take the MS Comprehensive Examination upon successful completion of the ASCC courses.

### Admission

Acceptance into the Master of Science in Applied Anatomy program (Plan A or B) requires a baccalaureate degree from an accredited institution and is based on undergraduate and/or graduate GPAs, results of admission examinations (GRE, MCAT, DAT), letters of recommendation, and a personal statement. An Educational Credential Evaluation and Authentication Report is required for foreign transcripts, and foreign applicants must provide documentation of English language skills (TOEFL).
Courses

ANAT 312. Basic Histology. 3 Units.
Fundamental histology course covering microscopic structure, nomenclature, and function of normal cells, tissues, and organs (human emphasis) to provide a sound foundation for bioengineering, pre-medical and pre-dental students.

ANAT 375. Human Evolution: The Fossil Evidence. 3 Units.
This course will survey the biological and behavioral changes that occurred in the hominid lineage during the past five million years. In addition to a thorough review of the fossil evidence for human evolution, students will develop the theoretical framework in evolutionary biology. Recommended preparation: ANTH 377, BIOL 225. Offered as ANAT 375, ANTH 375, ANAT 475 and ANTH 475. Prereq: ANTH 103.

ANAT 377. Human Osteology. 4 Units.
This course for upper division undergraduates and graduate students will review the following topics: human skeletal development and identification; and forensic identification (skeletal aging, sex identification and population affiliation). Offered as ANAT 377, ANTH 377, ANAT 477 and ANTH 477.

ANAT 391. Embryology. 3 Units.
A detailed description of development will be presented, focusing mainly on the developing human. Discussions and presentations will also include several developing systems that have served as useful models in experimental embryology for deciphering mechanisms responsible for producing adult metazoan organisms. Offered as ANAT 377, ANTH 377, ANAT 477 and ANTH 477.

ANAT 399. Independent Study. 1 - 4 Units.
Laboratory research project. Student must obtain approval of a supervising Anatomy department professor before registration and list the professor’s name on the schedule card.

ANAT 401. Virtual Anatomy of Human Body. 2 Units.
This course introduces students to the gross anatomical structure of the human body using innovative Microsoft HoloLens and other virtual technologies. It differs from most traditional anatomy courses not only in its use of three-dimensional imaging technology but also in its systemic rather than regional approach; the structure of the human body is learned by studying organ systems (e.g., the nervous system, the musculoskeletal system) rather than focusing on one region at a time (e.g., the thorax or the lower limb). This approach gives students the ‘big picture’ of how the human body is organized, thereby providing a solid foundation for other courses that deal with the anatomy of the human body in greater detail.

ANAT 410. Cadaver dissection-based human anatomy with histology and physiologic correlations. 6 Units.
This course will provide students with a sound understanding of the normal human body as a foundation for subsequent pursuing biomedical careers. A combination of daily lectures and laboratories integrates cadaver dissection-based gross anatomy with the associated histology, embryology, neuroanatomy and basic physiology. This course is well-suited to all biomedical careers, including pre-clinical and biomedical undergraduates, post-baccalaureate, pre-clinical master of science graduate programs, plus medical and dental students seeking additional training in the anatomical sciences. It will meet any of the anatomy-oriented prerequisites being implemented for medical and dental school applications, including those preferring or requiring a cadaver-based experience. The assessments will include a combination of written and cadaver-based practical questions. Offered as ANAT 410 and PAST 410.

ANAT 411. Gross Anatomy. 6 Units.
This in-depth, regionally-oriented, cadaver dissection-based course covers all aspects of human gross anatomy. It is team-taught by Department of Anatomy faculty and is divided into six sections: thorax, abdomen, pelvis and perineum, upper limb and back, lower limb, and head and neck. Registration for both the lecture and lab components is required. Students should be prepared to devote additional time outside of class in order to master the material. The dissection lab is open 24 hours, 7 days a week to students registered for the course. Recommended preparation: introductory coursework in human anatomy or B.A./B.S. in Biology or related field.

ANAT 412. Histology and Ultrastructure. 4 Units.
Comprehensive functional histology course integrating microscopic identification (‘structure plus nomenclature’) of normal cells, tissues, and organs with aspects of their cell biology, biochemistry, and physiology (‘function’). Topical coverage includes complete (‘head-to-toe’) tissue and organ survey with human emphasis.

ANAT 414. Neurological Anatomy. 4 Units.
This course employs a variety of teaching-learning methods—among them lectures, small-group discussions, hands-on “construction” of pathways, and brain dissection. Regional morphology will be studied via examination of the preserved brain and of sections through the CNS; functional systems will be “followed” through the spinal cord, brain stem and/or forebrain.

ANAT 431. Statistical Methods I. 3 Units.
Application of statistical techniques with particular emphasis on problems in the biomedical sciences. Basic probability theory, random variables, and distribution functions. Point and interval estimation, regression, and correlation. Problems whose solution involves using packaged statistical programs. First part of year-long sequence. Offered as ANAT 431, BIOL 431, CRSP 431, PQHS 431 and MPHP 431.
ANAT 445. Mammal Diversity and Evolution. 4 Units.
This course focuses on the anatomical and taxonomic diversity of mammals in an evolutionary context. The emphasis is on living (extant) mammals, but extinct mammals are also discussed. By the end of the course, students will be able to: (1) describe the key anatomical and physiological features of mammals; (2) name all orders and most families of living mammals; (3) identify a mammal skull to order and family; (4) understand how to create and interpret a phylogenetic tree; (5) appreciate major historical patterns in mammal diversity and biogeography as revealed by the fossil record; (6) read and critique a scientific article dealing with mammal evolution. One weekend field trip to Cleveland Metroparks Zoo; additional individual and group visits to the Cleveland Museum of Natural History. This course satisfies a laboratory requirement for the biology major. Recommended preparation: BIOL 223 Vertebrate Biology, BIOL 225 Evolution, or BIOL 346 Human Anatomy. Offered as ANAT 445 and BIOL 345. Prereq: BIOL 214.

ANAT 462. Principles of Developmental Biology. 3 Units.
The descriptive and experimental aspects of animal development. Gametogenesis, fertilization, cleavage, morphogenesis, induction, differentiation, organogenesis, growth, and regeneration. Students taking the graduate-level course will prepare an NIH-format research proposal as the required term paper. Offered as BIOL 362, BIOL 462 and ANAT 462.

ANAT 467. Topics in Evolutionary Biology. 3 Units.
The focus for this course on a special topic of interest in evolutionary biology will vary from one offering to the next. Examples of possible topics include theories of speciation, the evolution of language, the evolution of sex, evolution and biodiversity, molecular evolution. ANAT/ANTH/EEPS/PHIL/PHOL 467/BIOL 468 will require a longer, more sophisticated term paper, and additional class presentation. Offered as ANTH 367, BIOL 368, EEPS 367, PHIL 367, ANAT 467, ANTH 467, BIOL 468, EEPS 467, PHIL 467 and PHOL 467.

ANAT 475. Human Evolution: The Fossil Evidence. 3 Units.
This course will survey the biological and behavioral changes that occurred in the hominid lineage during the past five million years. In addition to a thorough review of the fossil evidence for human evolution, students will develop the theoretical framework in evolutionary biology. Recommended preparation: ANTH 377, BIOL 225. Offered as ANTH 375, ANTH 375, ANAT 475 and ANTH 475. Prereq: ANTH 103.

ANAT 477. Human Osteology. 4 Units.
This course for upper division undergraduate and graduate students will review the following topics: human skeletal development and identification; and forensic identification (skeletal aging, sex identification and population affiliation). Offered as ANAT 377, ANTH 377, ANAT 477 and ANTH 477.

ANAT 491. Embryology. 3 Units.
A detailed description of development will be presented, focusing mainly on the developing human. Discussions and presentations will also include several developing systems that have served as useful models in experimental embryology for deciphering mechanisms responsible for producing adult metazoan organisms. Offered as ANAT 391 and ANAT 491.

ANAT 499. Independent Study. 1 - 4 Units.
Laboratory research project. Student must obtain approval of a supervising Anatomy department professor before registration and list the professor’s name on the schedule card.

ANAT 503. Readings and Discussions. 1 - 3 Units.
In-depth consideration of special selected topics through critical evaluation of the literature. Student must obtain approval of supervising Anatomy department professor before registration.

ANAT 515. Surgical Anatomy: Orthopaedic Musculoskeletal. 4 Units.
This orthopaedic musculoskeletal anatomy course is offered to M.S. in Applied Anatomy students and fourth year medical students. The course will familiarize participants with surgical approaches used to treat musculoskeletal disease. Students will learn to correlate normal and abnormal anatomical findings with radiographical studies. Recommended preparation: ANAT 411.

ANAT 516. Surgical Anatomy: Head and Neck. 4 Units.
This cadaver-based advanced anatomy course is offered to M.S. in Applied Anatomy students and fourth year medical students. Students will build on their understanding of basic gross, histological, pathologic, and embryonic anatomy of the head and neck. The course will familiarize participants with surgical approaches used to treat pathological conditions of the head and neck including cranial cavity, cranial base, orbit, maxillofacial, oral, otic, pharyngeal, and airway. Students are required to attend and participate in lectures, surgical labs, and discussions in order to successfully complete the course. Instructor consent is required. Recommended preparation: ANAT 411.

ANAT 520. Imaging Anatomy. 3 Units.
This course is constructed to reinforce normal anatomy by imaging modalities of plain film, CT, and MRI images. Imaging anatomy will reinforce the student’s knowledge of anatomy and introduce the field of radiology. Students would be motivated to broaden their understanding of anatomy by being exposed to the application of that knowledge. The curriculum would introduce radiologic concepts, while stressing the normal anatomy of organ systems by imaging modalities. Anatomical structures will be recognized by projectional and cross-sectional modalities. The student will be expected to demonstrate the anatomical characteristics of that structure, for example course, area of supply, relations, morphology, etc. Primarily for medical and graduate students who have a comprehensive knowledge of human anatomy. We would encourage having taken ANAT 411, Gross Anatomy or Structure.

ANAT 523. Histopathology of Organ Systems. 3 Units.
Comprehensive course covering the underlying basic mechanisms of injury and cell death, inflammation, immunity, infection, and neoplasia followed by pathology of specific organ systems. Material will include histological ('structure') and physiological ('function') aspects related to pathology (human emphasis). Recommended preparation: ANAT 412 or permission of instructor. Offered as ANAT 523 and PATH 523.

ANAT 560. Applied Neuroanatomy. 3 Units.
This course is constructed to reinforce the student’s understanding of neuroanatomy. Through problem-based learning the student will set their own learning objectives based on a neurosurgical case. Presentations will use imaging, anatomic diagrams, and cadaveric dissection to demonstrate applications. Learning in this clinical context will increase motivation and understanding of this important subject. Primarily for medical students and graduate students, enrollment is by permission of instructor and completing ANAT 414, Neurological Anatomy. Prereq: ANAT 414.

ANAT 610. Oxygen and Physiological Function. 1 Unit.
Lecture/discussion course which explores the significance and consequences of oxygen and oxygen metabolism in living organisms. Topics to be covered include oxygen transport by blood tissues, oxygen toxicity, and mitochondrial metabolism. Emphasis will be placed on mammalian physiology with special reference to brain oxidative metabolism and blood flow as well as whole body energy expenditure and oxidative stress related to disease. The course will cover additional spans of physiology, nutrition and anatomy. Offered as ANAT 610, NTRN 610, and PHOL 610.
ANAT 611. Practicum in Human Gross Anatomy. 3 Units.
A course of study designed especially for the preparation of teachers that involves the supervised practical application of previously studied theory. The teaching experience obtained will be obtained in ANAT 411 - Human Gross Anatomy. Teaching will be guided, supervised, and evaluated by the appropriate faculty from the department of anatomy. The three sections of ANAT 611 and the subjects covered are: Trunk Gross Anatomy (6 weeks), Musculoskeletal Gross Anatomy (3 weeks), Head & Neck Gross Anatomy (4 weeks). Required preparation: ANAT 411 and permission of instructor.

ANAT 612. Practicum in Histology and Ultrastructure. 2 Units.
A course of study designed especially for the preparation of teachers that involves the supervised practical application of previously studied theory. The prerequisite knowledge required for ANAT 612 must have been obtained previously in ANAT 412: Histology and Ultrastructure and the associated laboratory ANAT 413: Histology Laboratory. Required participation in ANAT 612 is defined as: 1. Meet weekly with course instructor to (pre)review course material; 2. Attend all ANAT 412 lectures; 3. Participate/assist in all ANAT 413 laboratory sessions. Teaching will be guided, supervised, and evaluated by the course instructor with reference to the graduate student's overall progress and performance as a teacher. Required prerequisites: ‘A’ grades on ANAT 412 and ANAT 413; permission of instructor required.

ANAT 651. Thesis M.S.. 1 - 9 Units.
Master’s Thesis Plan A.

Master of Science in Anesthesia Program

Program Overview
Joseph M. Rifici, CAA, MEd
Executive Program Director

Jennifer Puin, PhD
Network Admissions Director

msaprogram@case.edu or 216.368.2336
https://case.edu/medicine/msa-program/

The Master of Science in Anesthesia (MSA) Program at Case Western Reserve University began in 1970, the second anesthesia program of its kind in the nation. The program originally awarded a baccalaureate degree, then evolved into a professional postgraduate program in 1987 and began granting the master’s degree. Today, students earn a Master of Science in Anesthesia degree that is designed to prepare them to enter the certified anesthesiologist assistant profession.

Admission to the MSA Program requires a bachelor's degree with prescribed prerequisites typical of premedical coursework and successful completion of the MCAT or GRE. The early decision deadline for admission into the program is in October and the regular decision deadline is in February each year. Coursework begins at the end of May, and consists of 24 consecutive months of didactic and clinical study. The MSA Program is accredited by the Commission on Accreditation of Allied Health Education Programs (http://www.caaher.org/) and is based on the Standards for Anesthesiologist Assistant Programs. Graduates must complete a curriculum that includes 70 credit hours (six semesters) of classroom and clinical instruction. The first three semesters integrate basic science and clinical instruction.

In addition to the main campus program, CWRU also oversees the Master of Science in Anesthesia Program’s Houston, Texas branch (https://case.edu/medicine/msa-program/houston/) and Washington, DC branch. (https://case.edu/medicine/msa-program/washington/)

The network is led by Joseph M. Rifici, CAA, MEd, and Matthew P. Norcia, MD, and the program is housed within the School of Medicine of Case Western Reserve University. Additionally, the MSA Program maintains partnerships with more than 80 affiliate clinical sites across the country. More information can be obtained from Jennifer Puin, (msaprogram@case.edu) Network Admissions Director.

Academic Requirements for Admission

The mission of the Master of Science in Anesthesia Program is to graduate skilled and compassionate anesthesiologist assistants. The admission policy reflects this goal. Applicants are considered on a variety of parameters that measure academic ability, communication skills, clinical aptitude, and personality traits.

Admission to the MSA Program requires that the following criteria are met:

1. Bachelor’s degree from an accredited college or university

Applicants for admission must complete a course of study leading to a baccalaureate degree at an accredited U.S. or Canadian college or university, or its equivalent, prior to matriculation.

2. Prerequisite courses

Documentation of each of the prerequisites having been completed with a grade of B- or higher at an accredited U.S. or Canadian institution of higher learning is required. Prerequisites must be taken within five years of the application deadline. For those courses that have been repeated, the highest grade will be used in the calculation. Prerequisites include:

- one semester of biochemistry
- one year of biology with laboratory*
- one semester of human anatomy with laboratory
- one semester of human physiology
- one year of chemistry with laboratory*
- one year of organic chemistry with laboratory*
- one year of physics with laboratory*
- one semester of calculus*
- one semester of advanced statistics (preferably for the life sciences)*
- one semester of English with expository writing*

All academic requirements must be completed satisfactorily before matriculation.

* Courses marked with an asterisk that were completed with a grade of B- or higher in excess of five years prior to the application deadline will meet the prerequisite criteria only if the MCAT composite score is 500 or higher. A high MCAT score indicates your knowledge of the coursework is still current, and we do not ask that you retake your older coursework.

3. Admissions Tests

If the applicant has taken the Medical College Admissions Test (MCAT), then they must earn a minimum composite score of 493 on the MCAT. The test must be taken within three years of the application deadline.
If the applicant has taken the Graduate Record Examination (GRE), then they must earn a minimum score of 153 in Verbal Reasoning, 156 in Quantitative Reasoning, and 4.0 in Analytical Writing. The test must be taken within five years of the application deadline.

When an applicant has taken the MCAT or GRE more than once, component scores will not be combined. If an applicant has taken both admissions tests, they should submit both official scores for review.

4. CASPer Test
Applicants must complete the Computer-Based Assessment for Sampling Personal Characteristics, or CASPer test, in order for their application to be considered complete. CASPer is an online assessment that can only be taken once per cycle. The scores are valid for one year. There is no minimum score required, but successful completion of CASPer is required in order to maintain admission eligibility. The program recommends taking CASPer before or concurrently with the submission of your application materials so that the scores will be received in a timely manner.

International Admissions
Applicants with international undergraduate, graduate or advanced degrees must meet the standard admission requirements listed above. International application requirements also include the Test of English as a Foreign Language (TOEFL), the International English Language Testing System (IELTS), or the Pearson Test of English (PTE-Academic). An Education Credential Evaluation and Authentication Report for foreign transcripts is required.

The Application Process
All materials must be received by the deadline. Candidates participate in interviews with members of the Admissions Committee, which is comprised of faculty and staff members of the MSA Program. Prospective candidates are permitted and encouraged to shadow an anesthetist in the operating room. Prior approval for this visitation is required, and dates are approved and determined by the individual location of study. An overview of the admissions timeline can be viewed here. ([https://case.edu/medicine/msa-program/admissions/](https://case.edu/medicine/msa-program/admissions/))

Curriculum Overview
The 24-month program includes 70 credit hours (six consecutive semesters) of classroom and clinical instruction. The first three semesters integrate basic science and clinical instruction. During the remaining three semesters, students complete month-long rotations in all subspecialties of anesthesiology: ambulatory surgery, burns and trauma, cardiothoracic surgery, general surgery, neurosurgery, obstetrics, pediatrics, surgical intensive care unit. Clinical training focuses on all types of anesthesia including general, epidural, spinal and peripheral nerve blockade.

Instruction is also provided in advanced patient care monitoring techniques and pre-testing, calibration and operation of anesthesia delivery systems and monitors. At CWRU, our personal approach and rigorous educational standards produce compassionate and highly skilled anesthesiologist assistants.

The MSA Program is accredited by the Commission on Accreditation of Allied Health Education Programs (CAAHEP) and is based on the Standards for Anesthesiologist Assistant Programs. Graduates sit for the Certification Examination administered by the National Commission for Certification of Anesthesiologist Assistants (NCCAA) and co-sponsored by the National Board of Medical Examiners (NBME).

Additional information may be found on the Master of Science in Anesthesia Program website ([http://case.edu/medicine/msa-program/](http://case.edu/medicine/msa-program/)).

**Courses**

**ANES 403. Cardiac Electrophysiology. 2 Units.**
In this course students will learn basic and advanced Electrocardiogram interpretation using simulators and electrocardiograms to understand an overview of heart anatomy, function, and neurophysiology.

**ANES 440. Patient Monitoring and Instrumentation I. 2 Units.**
Students are taught the proper balance between circuits and engineering concepts and the clinical application of anesthesia instrumentation. Monitors and devices used in the operating room are studied with respect to principles of operation, calibration, and interpretation of data. A hands-on laboratory is utilized to maximize direct contact to the instrumentation of the profession.

**ANES 441. Patient Monitoring and Instrumentation II. 2 Units.**
Continuation of ANES 440. Recommended preparation: ANES 440.

**ANES 456. Applied Physiology for Anesthesiologist Assistants I. 3 Units.**
Basic and applied human systems physiology with emphasis on topics and areas of special concern to the anesthetist.

**ANES 458. Applied Physiology for Anesthesiologist Assistants II. 3 Units.**
Continuation of ANES 456. Recommended preparation: ANES 403 and ANES 456.

**ANES 460. Introduction to Anesthesia. 2 Units.**
Introduction to basic concepts dealing with clinical anesthesia. Medical terminology, human anatomy, medical chart interpretation and drug dosage calculations.

**ANES 461. Orientation to Clinical Experience. 3 Units.**
Introduction to experience in the operating room with emphasis on the fundamental procedures and techniques used in administering an anesthetic. Preoperative assessment, IV placement techniques, airway management, intraoperative patient care and postoperative management are all emphasized in this course. BLS (basic life support) certification is required for course completion. Recommended preparation: Acceptance in the M.S.A. program.

**ANES 462. Anesthesia Clinical Correlation I. 1 Unit.**
A series of conferences presented by students that applies to anesthetic theory as it relates to the clinical experience. Specific anesthetic situations are emphasized. Recommended preparation: ANES 460.

**ANES 463. Anesthesia Clinical Experience I. 3 Units.**
A continuation of the preparation, observation, and hands-on learning format initiated in ANES 461. Patient management and technical skills are refined with close attention to the didactic course work. A comprehensive clinical examination is administered at the end of the semester. ACLS (Advanced Cardiac Life Support) certification is required for course completion. Recommended preparation: ANES 461.

**ANES 464. Anesthesia Clinical Correlation II. 1 Unit.**
A spectrum of case presentation conferences presented by the students dealing with basic and major problems in anesthesia management. Medical and surgical history of individual patients and the outcomes of anesthesia and surgery are emphasized. Journal Club and Morbidity and Mortality conferences are included. Recommended preparation: ANES 462.

**ANES 465. Anesthesia Clinical Experience II. 4 Units.**
A continuation of ANES 463. A comprehensive clinical examination is administered at the end of the semester. PALS (Pediatric Advanced Life Support) and ACLS (Advanced Cardiac Life Support) certification is required for course completion. Recommended preparation: ANES 463, BLS Certification, ACLS Certification.

**ANES 467. Anesthesia Clinical Experience III. 4 Units.**
Extended exposure to all of the clinical subspecialties of anesthesiology (obstetrics, pediatrics, neurosurgery, cardiovascular, etc.). Students alternate through rotations at several area hospitals. Recommended preparation: ANES 465, ACLS certification and PALS.

**ANES 468. Anesthesia Clinical Correlation III. 1 Unit.**

**ANES 469. Anesthesia Clinical Experience IV. 1 - 10 Units.**
A continuation of ANES 467. A comprehensive clinical examination is administered at the end of the semester. Recommended preparation: ANES 467.

**ANES 470. Anesthesia Clinical Correlation IV. 1 Unit.**
ANES 471. Anesthesia Clinical Experience V. 1 - 10 Units.
A continuation of ANES 469. A comprehensive clinical examination is
administered at the end of the semester. Recommended preparation:
ANES 469.

ANES 475. Pharmacology for Anesthesiologist Assistants I. 3 Units.
Pharmacodynamics, pharmacokinetics, uptake, distribution and action of
the volatile and intravenous anesthetics, muscle relaxants, narcotics,
hypnotics and other pharmaceuticals used in the administration of an
anesthetic. Prereq: Consent of Department.

ANES 476. Pharmacology for Anesthesiologist Assistants II. 3 Units.
Continuation of ANES 475. Prereq: ANES 475.

ANES 477. Clinical Decision Making in Anesthesia. 3 Units.
An introduction to thinking about clinical situations and problems and
coming to safe and effective solutions to these problems. This course
focuses on common clinical situations where appropriate decision
making is important to the outcome of the case. Numerous areas of
medicine and anesthesia will be covered to provide the student with
a wide sampling of decisions made each day with patient care.
This course supplements the other courses offered during the spring
semester by integrating and applying basic science knowledge to the
care of patients. Prereq: Consent of department.

ANES 478. Clinical Decision Making in Anesthesia II. 3 Units.
Guided and targeted discussion on common anesthetic considerations
relegated by co-existing disease, comorbidity, anatomy, surgical
procedures and common practice. Prereq: ANES 477.

ANES 485. Introduction to Physiological Model-Based Simulation. 1 Unit.
Introduction to physiological model-based simulation using on-screen
computer simulation and mannequins. Emphasis is placed on improving
appropriate anesthesia-related basic science knowledge, manual skills
in anesthesia machine checkout, drug and equipment setup, safety
inspections, and performing anesthesia for uncomplicated surgical
cases.

ANES 486. Physiological Model-Based Simulation I. 1 Unit.
An extension of ANES 485 with emphasis on improving or exercising
knowledge of anesthesia-appropriate basic science, the use of more
advanced equipment and techniques for uncomplicated surgical cases
with an introduction to crisis management. Recommended preparation:
ANES 485.

ANES 487. Physiological Model-Based Simulation II. 1 Unit.
An extension of ANES 486 emphasizing the physical techniques aspects
of crisis management, team work and rescue in anesthesia, including
support for and review of training in Basic Life Support and Advanced
Cardiac Life Support. Recommended preparation: ANES 486.

ANES 488. Anesthesia Non-Technical Skills Lab. 1 Unit.
In this course the student will learn anesthesia non-technical skills, which
are used integrally with medical knowledge and clinical techniques. They
encompass both interpersonal skills (e.g. communication, team working,
leadership) and cognitive skills (e.g. situation awareness, decision
making). This course uses modified Crew Resource Management
techniques taught in the aviation industry and considers the limitations
of human performance and the nature of human error. The goals are to
train individuals to avoid, capture and mitigate against the consequences
of error. During the course, behaviors shown to minimize errors and
maximize patient safety are highlighted and then practiced, with feedback
being given to students on their performance.

ANES 490. Ethics, Law and Diversity for Anesthesiologist Assistants. 2
Units.
This course will focus on three topics. First, a discussion of legal practice
as it applies to health care including basics of medical jurisprudence,
negligence, and how to avoid a lawsuit. Second, a discussion of ethical
theory including the principles of medical ethics, do not resuscitate, truth
telling, and assessment of competence. Last, a discussion on diversity
that will focus on the differences and similarities among people and how
these factors influence patient care. The final grade will be based on an
essay and a multiple choice exam.

ANES 499. Clinical Remediation. 1 - 10 Units.
(Credit as arranged.) Course offered to the student one time during the
program of study which remediates "C" or below work in a clinical course.

ANES 580. Principles of Anesthesia Safety and Science Review I. 1 Unit.
A continuum of online courses over the fall and spring semesters that
covers a series of topics in basic medical science with special emphasis
in the specialty of anesthesia. Using well-defined virtual platform, the
course combines high-quality realistic practice questions, cognitive
research, and individualized student testing behaviors to guide learning
and increase performance on high stake medical exams. Regularly
scheduled examinations throughout the semester are administered.

ANES 581. Principles of Anesthesia Safety and Science Review II. 1 Unit.
A continuum of online courses over the fall and spring semesters that
covers a series of topics in basic medical science with special emphasis
in the specialty of anesthesia. Using a well-defined virtual platform, the
course combines high-quality realistic practice questions, cognitive
research, and individualized student testing behaviors to guide learning
and increase performance on high stake medical exams. Regularly
scheduled examinations throughout the semester are administered.

ANES 584. Physiological Model-Based Simulation III. 1 Unit.
An extension of ANES 487 emphasizing the physical techniques and
aspects of crisis management, team work, and rescue in anesthesia.
Prereq: ANES 487.

ANES 585. Physiological Model-Based Simulation IV. 1 Unit.
Extension of ANES 584 emphasizing the physical techniques and aspects
of crisis management, team work, and rescue in anesthesia. Prereq:
ANES 584.

ANES 599. Clinical Remediation. 1 - 10 Units.
(Credit as arranged.) Course offered to the student one time during the
program of study which remediates "C" or below work in a clinical course.

J. Alan Diehl, PhD, Chair
jad283@case.edu

Department Coordinator (biochemistry@case.edu)

Biochemistry is the study of the molecular basis of cellular and
organismal function, making it a central discipline in the biological
sciences. Biochemists ask the question, "How do life processes
work at the molecular level?" The Department of Biochemistry
offers undergraduate programs leading to the BA and BS degrees.
in biochemistry and graduate programs leading to the MS and PhD degrees. There are also dual-degree programs, leading to the MD/PhD, MD/MS in Biomedical Investigation, JD/MS, MS/MBA, and MS/MA in Patent Practice degrees. The department also participates in several interdisciplinary and interdepartmental programs in the School of Medicine and at Case Western Reserve University that provide additional avenues of study.

Research by Biochemistry faculty members covers a range of topics aimed at understanding life processes at the molecular level. Our efforts are broadened by collaborations with faculty in other university departments and with scientists at other academic and biotech research institutions. Our research is aimed at understanding the structures of biological macromolecules, the functions of proteins and enzymes, and the growth and differentiation of normal and cancer cells. There is also a focus on antibiotics and drug development.

Major

The two undergraduate major programs in Biochemistry, BA and BS, are based on the Arts and Sciences General Education Requirements but differ in amount and intensity of the mathematics and physical sciences required. Either degree is excellent for students planning to undertake graduate work in biochemistry or in related areas of the biomedical sciences. Both the BA and the BS programs permit students to follow many options after graduation. Graduates are well prepared for further studies in the biological sciences, for degrees in the health sciences (MD, DO, DDS, PharmD), for employment in the chemical, pharmaceutical, and biotechnology industries, or as research assistants in research laboratories. The BA makes a considerable amount of elective time available, which allows students to concentrate on biochemistry more intensively than the curriculum requires, or pursue other subjects in science or liberal arts. The BS degree has additional course requirements in the quantitative and physical sciences; it is intended for students with interests in these areas.

In both programs, undergraduate research is required. As many as nine hours of Research in Biochemistry (BIOC 391 Research Project) may be credited toward the requirements for graduation. At least six credits are highly recommended. Students present their research during their last semester (BIOC 393 Senior Capstone Experience) as a written thesis and a presentation at the Biochemistry Undergraduate Retreat.

**Total Units in Sequence:** 120-123

**Bachelor of Science in Biochemistry**

**Required Courses:**

- BIOC 307: Introduction to Biochemistry: From Molecules To Medical Science 4
- BIOC 308: Molecular Biology 4
- BIOC 312: Proteins and Enzymes 3
- BIOC 334: Structural Biology 3
- BIOC 373: Biochemistry SAGES Seminar 3
- BIOC 393: Senior Capstone Experience 3
- BIOL 214 & 214L: Genes, Evolution and Ecology and Genes, Evolution and Ecology Lab 4
- BIOL 215 & 215L: Cells and Proteins and Cells and Proteins Laboratory 4
- CHEM 105 or CHEM 111: Principles of Chemistry I or Principles of Chemistry for Engineers 3-4
- CHEM 106 or ENGR 145: Principles of Chemistry II or Chemistry of Materials 3-4
- CHEM 113: Principles of Chemistry Laboratory 2
- CHEM 223 or CHEM 323: Introductory Organic Chemistry I or Organic Chemistry I 3
- CHEM 224 or CHEM 324: Introductory Organic Chemistry II or Organic Chemistry II 3
- CHEM 301 or CHEM 335: Introductory Physical Chemistry I or Physical Chemistry I 3
- CHEM 302 or CHEM 336: Introductory Physical Chemistry II or Physical Chemistry II 3
- CHEM 233: Introductory Organic Chemistry Laboratory I 2
- CHEM 234: Introductory Organic Chemistry Laboratory II 2
- MATH 121: Calculus for Science and Engineering I 4
- MATH 122: Calculus for Science and Engineering II 4
- or MATH 124: Calculus II

**Note:** At least 3 credits of undergraduate research, BIOC 391 Research Project, is recommended for the Capstone. An additional 3 credits of BIOC 391 is highly recommended. Students should consult their academic advisers about the elective parts of the curriculum. A course in statistics or quantitative biology is suggested but not required.

- Selected students may be invited to take CHEM 323 Organic Chemistry I or CHEM 324 Organic Chemistry II
- Selected students may be invited to take PHYS 123 Physics and Frontiers I - Mechanics and PHYS 124 Physics and Frontiers II - Electricity and Magnetism in place of PHYS 121 General Physics I - Mechanics and PHYS 122 General Physics II - Electricity and Magnetism
- BA students must take either BIOC 312 Proteins and Enzymes or BIOC 334 Structural Biology. For BA students who take both courses, one course will serve as a technical elective.

Note: At least 3 credits of undergraduate research, BIOC 391 Research Project, is recommended for the Capstone. An additional 3 credits of BIOC 391 is highly recommended. Students should consult their academic advisers about the elective parts of the curriculum.

- Selected students may be invited to take CHEM 323 Organic Chemistry I or CHEM 324 Organic Chemistry II
- Selected students may be invited to take PHYS 123 Physics and Frontiers I - Mechanics and PHYS 124 Physics and Frontiers II - Electricity and Magnetism in place of PHYS 121 General Physics I - Mechanics and PHYS 122 General Physics II - Electricity and Magnetism.

**Honors Program**

Biochemistry majors who have excellent academic records may be admitted to the department's Undergraduate Honors Program. To
graduate with departmental honors in biochemistry, a student must satisfy the following requirements:

1. A combined grade point average of at least 3.600
2. A minimum of 6 credit hours of undergraduate research (BIOC 391) in one laboratory
3. A BIOC 393 capstone report approved by the Undergraduate Education Committee of the department on the basis of the quality of the research, the written report, and an oral presentation. An acceptable report:
   a. Should follow a standard journal format
   b. Should demonstrate the student’s understanding of the research area, experimental techniques, goals and implications of the project
   c. Should show that the student has advanced his/her knowledge of the applicable techniques and the underlying scientific concepts.
4. Using all or part of the capstone report, the student must be a co-author on a manuscript either submitted, in press or published in a peer reviewed journal.

MS in Biochemistry

The Biochemistry MS program prepares students for employment in academia and biotechnology, and for advancement to other degree programs. Classroom work provides the latest advancements in biochemistry and related fields. In addition, laboratory courses allow students to acquire technical laboratory skills in biotechnology and a solid understanding of the practice of biochemical research. Students typically enroll in three courses for each of four semesters.

The duration of the program is 21 months; it follows Plan B for the Master's degree. The advisor for this program is usually the Graduate Advisor, but another advisor may be selected. The student's progress is monitored by the Graduate Advisor and by the Graduate Education Committee. The program requires 36 hours of academic credit of which 18 hours must be graded coursework. BIOC 407 and 408 are the only required courses, providing students with flexibility in constructing a program that meets their interests. Many students get hands-on experience by working in the laboratory of a faculty mentor and taking 6-12 hours of BIOC 601 Biochemical Research. Other students opt for the Experimental Biotechnology Track, which provides research experience and builds lab skills. All courses must be at the 400 level or higher; they must be on the list of approved electives or be approved by the advisor.

MS in Biochemistry: Experimental Biotechnology Track

Many graduates of the Biochemistry MS program work as researchers in academia, government laboratories, and the biotechnology sector. To prepare students for employment opportunities in biotech, the Experimental Biotechnology Track in the MS program prepares students for lab careers. Students take a laboratory-directed sequence in the first year: BIOC 500, BIOC 501, BIOC 502A, BIOC 502B, BIOC 502C, and BIOC 511. BIOC 500-502 introduce students to common techniques used in biochemistry labs and provide hands-on experience and training. BIOC 511 presents information about the organization of biotechnology research in academic and industrial settings. It also covers product development, as well as the biotech and pharmaceutical industries.

In the first year, students take BIOC 500, 501, 502, and 511, which provide a solid foundation in lab skills and techniques. In the second
year, students perform research in an academic or biotech laboratory as BIOC 601, providing hands-on experience to improve the skills they acquired in the first-year courses. Students in this track also take didactic Biochemistry courses to provide a strong base of knowledge to complement the laboratory experiences.

### MD/MS Biomedical Investigation-Biochemistry Track

The joint MD/MS program combine type B MS programs ([http://bulletin.case.edu/schoolofgraduestudies/academicrequirements/](http://bulletin.case.edu/schoolofgraduestudies/academicrequirements/)) at the School of Medicine with the MD, using a common template. The core activities for this degree include limited credit from the medical core curriculum, 3-6 graduate courses in specific tracks, participation in a common seminar series, scientific integrity training, and a requirement for a special problems project that reflects a full year of research (18 hours of BIOC 601 Biochemical Research) culminating in a written report and examination. Both degrees can be completed within 5 years. Students who wish to join the MD/MS program may apply to the program after arriving at the University any time prior to fall of their second year of medical school. For more information, please see [MD Dual Degrees](http://bulletin.case.edu/schoolofgraduestudies/academicrequirements/).

The Biochemistry track is designed to provide students with knowledge of the latest advances in biochemistry and related fields. Courses offered by other departments may be included with the approval of the Graduate Advisor. Depending on the research project, students may substitute one of the courses below in lieu of one of the biochemistry electives with permission from the Graduate Advisor.

**Students in the Biochemistry track must complete:**

**Note:** Students may finish in 18 months if they devote a summer to research (6 credits of BIOC 601 Biochemical Research).

### JD/MS in Biochemistry

This program allows students in the School of Law to earn an MS degree in Biochemistry with an additional year of study. This program is useful for students planning careers in patent law or in areas related to biotechnology or pharmaceutical research.

Students in the School of Law can apply to the Biochemistry program for admission to the JD/MS program. In the dual degree program, students complete 12 fewer hours of law school coursework than they would if they were in the JD program alone. The Department of Biochemistry accepts 9 hours of law school classwork in courses dealing with science issues, in place of 9 credits of other elective work. Thus, the student will take a total of 27 hours of Biochemistry coursework of which at least 12 hours must be letter graded.

Dual degree students are advised about the JD degree by the Associate Dean for Academic Affairs at the School of Law. In addition, dual degree students are granted priority registration for upper-level courses, ensuring that they will be able to adjust their schedules to take all the required classes. Dual degree students are advised about the MS in Biochemistry by the program's Graduate Advisor.

### JD/MS in Biochemistry Plan of Study (plan B (p. 1274))

Because most students will apply for the JD/MS in Biochemistry Program after beginning law school, the sample schedule below begins with Biochemistry coursework in the third year. However, Biochemistry coursework can be taken in any of the last three years and with a variety of combinations of law courses. Schedules will be worked out with the Biochemistry Graduate Advisor to suit the student's needs and interests.
PhD Biochemistry

The PhD in Biochemistry program prepares students for careers in biochemistry. The emphasis of the doctoral program is on research, culminating in the completion of an original independent research project under the guidance of a faculty member in the biochemistry program. PhD students also participate in formal courses both within and outside the department, formal and informal seminars, discussions of current literature, and career development activities. Although students choose from the various tracks within the department, all are broadly trained in modern aspects of biochemistry and become familiar with techniques and literature in a variety of areas. Many collaborative projects with other departments also are available to broaden the spectrum of training offered. Most students begin with an integrated curriculum in cellular and molecular biology in addition to specialized courses in biochemistry. Students are admitted to the Biochemistry PhD program through the Biomedical Sciences Training Program (BSTP) (https://case.edu/medicine/admissions-programs/graduate-programs/phd-programs/bstp/) or via the Medical Scientist Training Program (MSTP) (https://case.edu/medicine/admissions-programs/md-phd-program/). The BSTP offers a common entry point to most of our biomedical PhD programs. The MSTP is available for students desiring the dual MD/PhD degrees and research careers in medicine and related biosciences.

Prerequisites for admission into the Biochemistry PhD Program include one year each of chemistry, organic chemistry, calculus, biology and physics. Applicants must also have a BA, BS or equivalent undergraduate degree. Students must submit scores from the Graduate Record Examination and may submit scores from an advanced area test, usually in biology, biochemistry or chemistry. Some students with otherwise excellent qualifications, but lacking some of the prerequisites may be conditionally admitted allowed to make up the deficiencies. Please visit the Department’s web page (http://www.cwru.edu/medicine/biochemistry/) for details about the application process.

Prerequisites for admission into the Biochemistry PhD Program include one year each of chemistry, organic chemistry, calculus, biology and physics. Applicants must also have a BA, BS or equivalent undergraduate degree. Some students with otherwise excellent qualifications, but lacking some of the prerequisites may be conditionally admitted allowed to make up the deficiencies. Please visit the BSTP’s web page (https://case.edu/medicine/admissions-programs/graduate-programs/phd-programs/bstp/) for details about the application process.

To earn a PhD in Biochemistry, students must complete rotations in at least three laboratories, followed by selection of a research advisor, and complete core and elective coursework, including Responsible Conduct of Research, as described in the Course of Study below. Students who have completed relevant coursework elsewhere, (for example, with an MS) may petition to complete alternative courses.

Each PhD student must complete a qualifying examination on their research topic in the form of a short grant proposal with oral defense for advancement to candidacy. The qualifying examination is usually completed during the second year. During the dissertation period, students are expected to meet regularly with their thesis committees, present seminars in the department, and fulfill journal publication requirements. Throughout the doctoral training, students are expected to be enthusiastic participants in seminars, journal clubs, and research meetings in the lab and program. Completion of the PhD degree requires 36 hours of coursework (24 hours of which are graded) and 18 hours of BIOC 701 Dissertation Ph.D.

Footnotes:
* IBMS 501 Responsible Conduct of Research for Advanced Trainees is offered every spring semester (beginning 2020). The SOM requires that PhD students who are 4 years beyond their initial RCR training in IBMS 500 On Being a Professional Scientist: The Responsible Conduct of Research, register for IBMS 501.

Courses

**BIOC 101. Frontiers in Biochemistry. 1 Unit.**
The goal of this course is to introduce first- and second-year students to the field of biochemistry as a fundamental discipline in the biomedical sciences. The course will present basic concepts in biochemistry and highlight recent advances. It will also emphasize the way that biochemistry forms a foundation for research in many other areas of the basic and clinical biomedical sciences and provides the molecular basis for new therapies. Finally, the course will feature an introduction to the practice of biochemistry, including research and careers in biochemistry. This course is an excellent introduction for students who are considering majoring in Biochemistry. Material will be presented in a format that is accessible to students who have taken high school biology and chemistry.

**BIOC 307. Introduction to Biochemistry: From Molecules To Medical Science. 4 Units.**
Overview of the macromolecules and small molecules key to all living systems. Topics include: protein structure and function; enzyme mechanisms, kinetics and regulation; membrane structure and function; bioenergetics; hormone action; intermediary metabolism, including pathways and regulation of carbohydrate, lipid, amino acid, and nucleotide biosynthesis and breakdown. The material is presented to build links to human biology and human disease. One semester of biology is recommended. Offered as BIOC 307 and BIOC 407. Prereq: CHEM 223 and CHEM 224.

**BIOC 308. Molecular Biology. 4 Units.**
An examination of the flow of genetic information from DNA to RNA to protein. Topics include: nucleic acid structure; mechanisms and control of DNA, RNA, and protein biosynthesis; recombinant DNA; and mRNA processing and modification. Where possible, euukaryotic and prokaryotic systems are compared. Special topics include yeast as a model organism, molecular biology of cancer, and molecular biology of the cell cycle. Current literature is discussed briefly as an introduction to techniques of genetic engineering. Recommended preparation: BIOC 307. Offered as BIOC 308 and BIOC 408. Prereq: CHEM 223, BIOL 214, and BIOL 215.

**BIOC 312. Proteins and Enzymes. 3 Units.**
Aspects of protein and nucleic acid function and interactions are discussed, including binding properties, protein-nucleic acid interactions, kinetics and mechanism of proteins and enzymes, and macromolecular machines. Recommended Preparation: CHEM 301. Offered as BIOC 312 and BIOC 412. Prereq: BIOC 307.

**BIOC 315. Nuclear Receptors in Health and Disease. 3 Units.**
This course focuses on hormone-gene interactions mediated by the ligand-inducible transcription factors termed nuclear hormone receptors. The course will address the mechanisms of action, regulatory features, and biological activities of several nuclear receptors. The usage of nuclear receptors as therapeutic targets in disease states such as cancer, inflammation, and diabetes will also be discussed. The course aims to teach students to critically evaluate primary literature relevant to nuclear hormone receptors biology, and to reinforce presentation/discussion skills. Grades for undergraduates will be based on midterm, final exam; grades for graduates will be based on midterm, final exam, and presentation of a recently published research article related to the role of nuclear receptors in health and disease. Offered as PHRM 315, BIOC 315, PHRM 415 and BIOC 415.

**BIOC 334. Structural Biology. 3 Units.**
Introduces the major techniques used to study high resolution three-dimensional structures of proteins, and their applications to biomedically-relevant problems. Topics include the elucidation of protein structure by cryo-electron microscopy, X-ray crystallography, multidimensional NMR, and computational methods. Offered as BIOC 334 and BIOC 434. Prereq: BIOC 307.

**BIOC 335. Biochemistry and Biology of RNA. 3 Units.**
Systematic overview of RNA biochemistry and biology. Course provides solid foundation for understanding processes of post-transcriptional regulation of gene expression. Topics include: RNA structure, RNA types, RNA-protein interactions, euukaryotic RNA metabolism including mRNA processing, ribosome biogenesis, tRNA metabolism, miRNA processing and function, bacterial RNA metabolism, transcriptomics. BIOC 454 requires an additional research proposal. Recommended preparation for BIOC 354: Undergraduate Biology (1 semester minimum), equivalents of CHEM 301, BIOC 307 or BIOC 308. Offered as BIOC 354 and BIOC 454. Prereq: BIOC 223, CHEM 224.

**BIOC 373. Biochemistry SAGES Seminar. 3 Units.**
Discussion of current topics in biochemical research using readings from the scientific literature. The goals are for the student: 1) to discuss and critically analyze selections from the biochemical literature; 2) to gain a broader understanding of important topics not formally covered in the didactic courses; and 3) to learn to write in the style of journals in the field of biochemistry. Counts as SAGES Departmental Seminar. Prereq: BIOC 307 and BIOC 308. Restricted to majors in Biochemistry.

**BIOC 391. Research Project. 1 - 9 Units.**
(Credit as arranged.) Offered on a pass/fail basis only. Maximum 9 hours total credit.
**BIOC 393. Senior Capstone Experience. 3 Units.**
Students will complete their Capstone Projects, begun in BIOC 391. Pertinent research activities will depend on the nature of the student's project. The student will meet regularly with their Capstone adviser, at least twice monthly, to provide progress reports, discuss the project, and for critique and guidance. By the end of this course, the student will have completed their SAGES Senior Capstone research project, written a project report in the form of a manuscript, and presented their project reports orally in the department and at the Senior Capstone Fair, or its equivalent. Counts as SAGES Senior Capstone. Prereq: BIOC 307 and BIOC 308.

**BIOC 405. Principles of Biochemistry: An Introduction to the Molecules of Life. 3 Units.**
This summer course provides an introduction to the macromolecules and small molecules that are the foundation of living systems. The focus is on mammalian biochemistry, with links to human biology and human disease. Topics include: protein structure and function; enzyme mechanisms, kinetics and regulation; membranes; hormone action; bioenergetics; intermediary metabolism, including pathways and regulation of carbohydrate, lipid, amino acid, and nucleotide biosynthesis and breakdown. One semester of biology is recommended. Suitable for students interested in careers in the health professions. This course is not open to undergraduate Biochemistry majors or Biochemistry graduate students. Prereq: CHEM 223 and CHEM 224.

**BIOC 407. Introduction to Biochemistry: From Molecules To Medical Science. 4 Units.**
Overview of the macromolecules and small molecules key to all living systems. Topics include: protein structure and function; enzyme mechanisms, kinetics and regulation; membrane structure and function; bioenergetics; hormone action; intermediary metabolism, including pathways and regulation of carbohydrate, lipid, amino acid, and nucleotide biosynthesis and breakdown. The material is presented to build links to human biology and human disease. One semester of biology is recommended. Offered as BIOC 307 and BIOC 407. Prereq: CHEM 223 and CHEM 224.

**BIOC 408. Molecular Biology. 4 Units.**
An examination of the flow of genetic information from DNA to RNA to protein. Topics include: nucleic acid structure; mechanisms and control of DNA, RNA, and protein biosynthesis; recombinant DNA; and mRNA processing and modification. Where possible, eukaryotic and prokaryotic systems are compared. Special topics include yeast as a model organism, molecular biology of cancer, and molecular biology of the cell cycle. Current literature is discussed briefly as an introduction to techniques of genetic engineering. Recommended preparation: BIOC 307. Offered as BIOC 308 and BIOC 408.

**BIOC 412. Proteins and Enzymes. 3 Units.**
Aspects of protein and nucleic acid function and interactions are discussed, including binding properties, protein-nucleic acid interactions, kinetics and mechanism of proteins and enzymes, and macromolecular machines. Recommended Preparation: CHEM 301. Offered as BIOC 312 and BIOC 412.

**BIOC 415. Nuclear Receptors in Health and Disease. 3 Units.**
This course focuses on hormone-gene interactions mediated by the ligand-inducible transcription factors termed nuclear hormone receptors. The class will address the mechanisms of action, regulatory features, and biological activities of several nuclear receptors. The usage of nuclear receptors as therapeutic targets in disease states such as cancer, inflammation, and diabetes will also be discussed. The course aims to teach students to critically evaluate primary literature relevant to nuclear hormone receptors biology, and to reinforce presentation/discussion skills. Grades for undergraduates will be based on midterm, final exam; grades for graduates will be based on midterm, final exam, and presentation of a recently published research article related to the role of nuclear receptors in health and disease. Offered as PHRM 315, BIOC 315, PHRM 415 and BIOC 415.

**BIOC 420. Current Topics in Cancer. 3 Units.**
The concept of cancer hallmarks has provided a useful guiding principle in our understanding of the complexity of cancer. The hallmarks include sustaining proliferative signaling, evading growth suppressors, enabling replicative immortality, activating invasion and metastasis, inducing angiogenesis, resisting cell death, deregulating cellular energetics, avoiding immune destruction, tumor-promoting inflammation, and genome instability and mutation. The objectives of this course are to (1) examine the principles of some of these hallmarks, and (2) explore potential therapies developed based on these hallmarks of cancer. This is a student-driven and discussion-based graduate course. Students should have had some background on the related subjects and have read scientific papers in their prior coursework. Students will be called on to present and discuss experimental design, data and conclusions from assigned publications. There will be no exams or comprehensive papers but students will submit a one-page critique (strengths and weaknesses) of one of the assigned papers prior to each class meeting. The course will end with a full-day student-run symposium on topics to be decided jointly by students and the course director. Grades will be based on class participation, written critiques, and symposium presentations. Offered as BIOC 420, Mbio 420, PATH 422, and PHRM 420. Prereq: CBIO 453 and CBIO 455.

**BIOC 432. Current Topics in Vision Research. 3 Units.**
Vision research is an exciting and multidisciplinary area that draws on the disciplines of biochemistry, genetics, molecular biology, structural biology, neuroscience, and pathology. This graduate level course will provide the student with broad exposure to the most recent and relevant research currently being conducted in the field. Topics will cover a variety of diseases and fundamental biological processes occurring in the eye. Regions of the eye that will be discussed include the cornea, lens, and retina. Vision disorders discussed include age-related macular degeneration, retinal ciliopathies, and diabetic retinopathy. Instructors in the course are experts in their field and are members of the multidisciplinary visual sciences research community here at Case Western Reserve University. Students will be exposed to the experimental approaches and instrumentation currently being used in the laboratory and in clinical settings. Topics will be covered by traditional lectures, demonstrations in the laboratory and the clinic, and journal club presentations. Students will be graded on their performance in journal club presentations (40%), research proposal (40%), and class participation (20%). Offered as NEUR 432, PATH 432, PHRM 432 and BIOC 432.
BIOC 434. Structural Biology. 3 Units.
Introduces the major techniques used to study high resolution three-dimensional structures of proteins, and their applications to biomedically-relevant problems. Topics include the elucidation of protein structure by cryo-electron microscopy, X-ray crystallography, multidimensional NMR, and computational methods. Offered as BIOC 334 and BIOC 434.

BIOC 452. Nutritional Biochemistry and Metabolism. 3 Units.
Mechanisms of regulation of pathways of intermediary metabolism; amplification of biochemical signals; substrate cycling and use of radioactive and stable isotopes to measure metabolic rates. Recommended preparation: BIOC 307 or equivalent. Offered as BIOC 452 and NTRN 452.

BIOC 454. Biochemistry and Biology of RNA. 3 Units.
Systematic overview of RNA biochemistry and biology. Course provides solid foundation for understanding processes of post-transcriptional regulation of gene expression. Topics include: RNA structure, RNA types, RNA-protein interactions, eukaryotic RNA metabolism including mRNA processing, ribosome biogenesis, tRNA metabolism, miRNA processing and function, bacterial RNA metabolism, transcriptomics. BIOC 454 requires an additional research proposal. Recommended preparation for BIOC 354: Undergraduate Biology (1 semester minimum), equivalents of CHEM 301, BIOC 307 or BIOC 308. Offered as BIOC 354 and BIOC 454.

BIOC 475. Protein Biophysics. 3 Units.
This course focuses on in-depth understanding of the molecular biophysics of proteins. Structural, thermodynamic and kinetic aspects of protein function and structure-function relationships will be considered at the advanced conceptual level. The application of these theoretical frameworks will be illustrated with examples from the literature and integration of biophysical knowledge with description at the cellular and systems level. The format consists of lectures, problem sets, and student presentations. A special emphasis will be placed on discussion of original publications. Offered as BIOC 475, CHEM 475, PHOL 475, PHRM 475, and NEUR 475.

BIOC 500. Biotechnology Laboratory: Molecular Biology Basics. 1 Unit.
This course provides basic hands-on laboratory experience in molecular biology with a focus on handling and manipulating DNA in bacterial systems. Specific topics include: General laboratory safety, buffers, media, and other reagent preparation, sterile technique, transformation and culture of bacterial cells, DNA molecular biology techniques including DNA isolation and purification, polymerase chain reaction (PCR), restriction digests, ligation, agarose gel electrophoresis, and sequence analysis. Prereq: Biochemistry Graduate student or Requisites Not Met permission.

BIOC 501. Biochemical and Cellular Techniques for Biotechnology. 3 Units.
This lecture course covers the basics of common, essential laboratory and analytical techniques used in biomedical research and the biotechnology industry. The course will cover recombinant protein production and characterization, mammalian cell culture, molecular and cell biology, and mass spectrometry. Specific topics include: general laboratory safety, record keeping, preparation of research reports, manipulation of bacteria, protein overexpression and purification, enzyme assays, high-throughput techniques, high performance liquid chromatography (HPLC) and mass spectrometry, mammalian cell culture, Western blotting, protein-protein interactions, reverse transcription-quantitative polymerase chain reaction (RT-qPCR), immunofluorescence microscopy and assays for gene expression. This course is suitable for Biochemistry MS students interested in pursuing careers in academia or biotechnology. It is also recommended for undergraduate students to enhance their technical skills and position them for productive research experiences. Graduate students in other programs within or outside the School of Medicine are permitted to enroll. Prereq: (BIOL 215L and CHEM 113) or Graduate standing. Coreq: CHEM 233 or Graduate standing.

BIOC 502A. Biotechnology Laboratory: Molecular Biology and Biochemical Techniques. 2 Units.
This spring course provides hands-on laboratory experience in bacterial recombinant protein biochemistry and molecular and cell biology. Specific topics include: General laboratory safety, good laboratory practices (GLP), standard operating procedures (SOPs), buffers, media, and other reagent preparation, sterile technique, manipulation of bacterial cells, work with DNA including polymerase chain reaction (PCR), molecular cloning, and site-directed mutagenesis, protein overexpression and purification, enzyme activity and biophysical assays, DNA and protein gel electrophoresis, and high performance liquid chromatography (HPLC). This course, together with BIOC 502B and 502C, comprise a one-semester lab course that provides students with a comprehensive introduction to skills used in modern biotechnology laboratories. Students may take one, two, or three of these courses in a single semester. Suitable for biochemistry MS students interested in biotechnological and/or industry careers. All other graduate students and/or undergraduate students must contact the instructor for permission to enroll. Prereq: BIOC 500 and BIOC 501 or Requisites Not Met permission.

BIOC 502B. Biotechnology Laboratory: Eukaryotic Molecular and Cellular Biology. 2 Units.
This spring course provides hands-on laboratory experience in mammalian cell culture and molecular and cell biology. Specific topics include: General laboratory safety, good laboratory practices (GLP), standard operating procedures (SOPs), buffers, media, and other reagent preparation, sterile technique, manipulation of mammalian cells, mammalian cell culture, work with DNA and RNA, polymerase chain reaction (PCR) techniques including quantitative reverse transcription (RT-qPCR) and molecular cloning, reporter assays, transfection, immunoprecipitation, immunofluorescence, and protein gel electrophoresis and blotting. This course, together with BIOC 502A and 502C, comprise a one-semester lab course that provides students with a comprehensive introduction to skills used in modern biotechnology laboratories. Students may take one, two, or three of these courses in a single semester. Suitable for biochemistry MS students interested in biotechnological and/or industry careers. All other graduate students and/or undergraduate students must contact the instructor for permission to enroll. Prereq: BIOC 500 and BIOC 501 or Requisites Not Met permission.
BIOC 502C. Biotechnology Laboratory: Mass Spectrometry Techniques. 1 Unit.
This spring course provides hands-on laboratory experience in mass spectrometry with an emphasis on biomolecules. Specific topics include analysis of small molecules and biomolecules using high performance liquid chromatography (HPLC) and mass spectrometry. This course, together with BIJC 502A and 502B, comprise a one-semester lab course that provides students with a comprehensive introduction to skills used in modern biotechnology laboratories. Students may take one, two, or three of these courses in a single semester. Suitable for biochemistry MS students interested in biotechnological and/or industry careers. All other graduate students and/or undergraduate students must contact the instructor for permission to enroll. Prereq: BIJC 500 and BIJC 501 or Requisites Not Met permission.

BIJC 511. Practice and Professionalism in Biotechnology. 1 Unit.
This course provides an overview of a variety of topics that are relevant to biotechnology research and development in academic and industrial settings. It also provides an opportunity for students to develop professional written and oral communication skills. Specific topics include: Professional communications by email, letters, reports, and oral presentations; data documentation, security, and confidentiality; laboratory safety, certification, and regulation; intellectual property protection and patents; the drug discovery pipeline and approval process; financial aspects of research and development. Prereq: Graduate Student in Biochemistry.

BIJC 528. Contemporary Approaches to Drug Discovery. 3 Units.
This course is designed to teach the students how lead compounds are discovered, optimized, and processed through clinical trials for FDA approval. Topics will include: medicinal chemistry, parallel synthesis, drug delivery and devices, drug administration and pharmacokinetics, and clinical trials. A special emphasis will be placed on describing how structural biology is used for in silico screening and lead optimization. This component will include hands-on experience in using sophisticated drug discovery software to conduct in silico screening and the development of drug libraries. Each student will conduct a course project involving in silico screening and lead optimization against known drug targets, followed by the drafting of an inventory disclosure. Another important aspect of this course will be inclusion of guest lectures by industrial leaders who describe examples of success stories of drug discovery software to conduct in silico screening and lead optimization. Offered as BIJC 528, PHOL 528, PHRM 528, and SYBB 528.

BIJC 601. Biochemical Research. 1 - 18 Units.
Credit as arranged.

BIJC 611. Biochemistry Seminar I. 1 Unit.
Student presentations of topics from the current scientific literature unrelated to the student's research project. Participants are required to present a seminar.

BIJC 612. Biochemistry Seminar II. 1 Unit.
Discussion of current research.

BIJC 641. Proposition I. 2 Units.
Design of research proposal.

BIJC 651. Thesis M.S.. 1 - 6 Units.
(Credit as arranged.)

BIJC 701. Dissertation Ph.D.. 1 - 9 Units.
(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

Department of Bioethics

Room TA-200, School of Medicine

http://www.case.edu/med/bioethics/bioethics.html
Phone: 216.368.8718
Mark P. Aulisio, PhD, Susan E. Watson Professor and Chair
mark.aulisio@case.edu

Marie (man12@case.edu) Norris, MNO, Graduate Programs Coordinator

The mission of the Department of Bioethics is to improve public and professional understanding of the ethical and contextual issues involved in health sciences research, health care delivery, and health policy development through teaching, research and community dialogue.

The department has offices at the CWRU School of Medicine and MetroHealth Medical Center. Faculty represent multiple disciplines, including philosophy, religion, law, political science, anthropology, history, literature, sociology, psychology, nursing and medicine, in addition to bioethics.

Department faculty teach in both core and elective components of the medical school curriculum, undergraduate courses in ethics and medical humanities, and an intensive course in responsible conduct of research for PhD students in the School of Medicine. The department also has a highly successful master's degree program in bioethics and medical humanities, a PhD degree program, and an undergraduate minor.

Department faculty have gained international prominence for research in many areas of biomedical ethics and medical humanities that collectively address the concerns of the School of Medicine's spectrum of biomedical disciplines and questions of health, society and culture more broadly.

Please visit the department website (http://www.case.edu/med/bioethics/) to obtain information about the Master's degree program and learn about department and faculty activities.

Minor in Bioethics and Medical Humanities

Bioethics and Medical Humanities together comprise a vibrant area of scholarship concerning the most important and cutting-edge ethical issues surrounding biomedical research and the delivery of health care today. The study of such ethical issues calls into action our most central human values and related behaviors, the exploration of which is of crucial importance for all students whether one plans to enter a career in the healthcare professions, biomedical research, law, nonprofit administration, or some other career path. The topics covered in Bioethics and Medical Humanities will help prepare students to become responsible world citizens in an increasingly complex biomedical environment.

The CWRU Minor in Bioethics and Medical Humanities formally recognizes a student's coordinated course of study comprised of courses currently offered by the Department of Bioethics and other departments in the College of Arts and Sciences. The Bioethics and Medical Humanities Minor is designed to give students ethical, cultural and social analytic training centered around the delivery of healthcare; social and cultural contexts of health, illness and healing; and biomedical research, doing so in a highly interdisciplinary manner.

Plan of Study

I. Students should select three of the following four course offerings. (9 credit hours)

Humanities are required to complete the interdisciplinary core of 12 credit hours (the equivalent of four courses) in the first two semesters of their first year of study.

**MA in Bioethics and Medical Humanities Concentrations**

Bioethics MA students have a number of options. One option is to complete the traditional MA program without a specific area of concentration. Students who opt for the traditional program are eligible to select from approved electives offered throughout the University. Another option is to do the MA program with an area of concentration—Research Ethics or Medicine, Society and Culture. Each area of concentration has its own requirements and elective choices.

**Total Units in Sequence:**

**Dual Degree Programs**

**JD/MA**

This program combines the Master of Arts in Bioethics and Medical Humanities with the Doctor of Jurisprudence and is offered in cooperation with the School of Law. Advances in health sciences have created new and difficult moral choices for individuals, their families, and the health professionals who work with them.

The Department of Bioethics is dedicated to responding to the challenge of health care choices faced in today’s society. It focuses on the ethical, cultural, and policy dimensions of healthcare, technology, and the life sciences. Professionals from many arenas, including public health, prevention sciences, health sciences, the life sciences, and the social sciences have contributed to and drawn from the field of Bioethics.

The JD Degree is a terminal degree; persons with the degree may pursue a variety of career paths. The MA in Bioethics and Medical Humanities is considered a supplemental degree—it enhances careers in other fields. The combined JD/MA program provides excellent preparation for students who desire to practice health law by giving law students firsthand experience in multiple healthcare settings. It is designed to help students identify and assess challenges facing the medical and health law professions in the coming decades, and explore a broad range of health law and policy issues. The program emphasizes the interdisciplinary and inter-professional nature of the field and includes a significant clinical component.

**MA in Bioethics and Medical Humanities**

The Department of Bioethics offers a program leading to the Master of Arts degree in Bioethics and Medical Humanities, emphasizing the interdisciplinary and inter-professional nature of the field. This graduate program is designed to provide advanced training in bioethics and medical humanities for students and professionals who anticipate encountering ethical issues in the course of their primary careers.

The 30 credit-hour degree can be earned full-time in one year or part-time in up to three years. Core courses are taught by department faculty and are scheduled so that part-time students can continue their professional responsibilities while completing the degree.

The Master of Arts program provides students with a firm understanding of the intellectual content of the study of bioethics, bioethical literature, medical humanities, and the underlying philosophical arguments and empirical assumptions that inform these areas. Students are taught to understand the institutions, structures, and contexts of health care and the ethical issues that arise in medical practice. They are trained to identify and analyze a range of clinical ethics issues and the psycho-social and cultural contexts in which such issues arise.

All students pursuing a Master of Arts degree in Bioethics and Medical Humanities are required to complete the interdisciplinary core of 12 credit hours (the equivalent of four courses) in the first two semesters of their first year of study.
Students must apply and be accepted to each degree program to qualify. New students can apply to both programs simultaneously; current law students may apply before the end of their first year. Students are expected to complete course requirements for the two degrees in either three-and-one-half years, or three years combined with some summer school work. The curriculum for this dual degree program begins with one year of full-time study in law school.

The Department of Bioethics accepts 6 credits of elective law courses toward MA elective requirements. The law school accepts 12 credits of the required Foundations in Bioethics I and II courses as law elective credits toward the JD degree.

MA/MSN

This program combines the Master of Arts in Bioethics and Medical Humanities with the Master of Science in Nursing, in cooperation with the School of Nursing. The program provides excellent preparation for advanced practice nurses to gain knowledge about the principles and problem resolution techniques that are foundational to bioethics.

The combined MA/MSN program will enable students to obtain graduate preparation in both fields, contributing to the integration of ethics in advanced practice nursing and thereby increasing the availability of ethics expertise to the nursing community.

Students must apply and be accepted to each program to qualify. Students may take courses required for each program concurrently or may complete the requirements for one program prior to beginning the requirements for another. The Department of Bioethics accepts 6 credits of required elective nursing school courses toward the MA elective requirement. The nursing school accepts 5 credits of the required Foundations in Bioethics I course towards the MSN degree requirement.

MA/MPH

This program combines the Master of Arts in Bioethics and Medical Humanities with the Master of Public Health degree. The Master of Public Health Program prepares students to address the broad mission of public health, defined as "enhancing health in human populations, through organized community effort," utilizing education, research, and community service. Public health practitioners must be prepared to identify and assess health needs of different populations, and able to plan, implement and evaluate programs to respond to those needs.

It is the task of the public health practitioner to prevent illness, and to protect and promote the wellness of humankind. A Master of Public Health degree provides education in public health basics, including biostatistics, epidemiology, environmental health sciences, health policy, and social and behavioral sciences.

The Department of Bioethics offers a graduate program leading to the degree of Master of Arts in Bioethics and Medical Humanities. Advances in health sciences have created new and difficult moral choices for individuals, their families, and the health professionals who work with them. The Department of Bioethics is dedicated to responding to the challenge of health care choices faced in today's society. Professionals from many arenas, including public health, prevention sciences, health sciences, the life sciences, and the social sciences have contributed to and drawn from the field of bioethics.

Because of the breadth and scope of the field of public health and the discipline of bioethics, the CWRU MPH and Bioethics Programs are ideally suited to combine in a joint effort. The MPH/Bioethics and Medical Humanities shared degree will enable students to obtain graduate preparation in both fields, contributing to the application of ethics in public health practice and thereby increasing the availability of leadership and scholarship relating to Bioethics in the public health community.

It is anticipated that this collaboration will improve the ethics component of the public health educational experience for all students through closer collaboration between departments, and through peer interactions of dual degree students and their colleagues.

The MPH Degree is a "terminal" degree and persons with the degree may pursue a variety of career paths. The MA in Bioethics and Medical Humanities is considered a supplementary degree in that it enhances careers in other fields, e.g. law, medicine, nursing, or in this case, public health.

The joint bioethics-public health degree would fuel careers in every aspect of public health, including international and global health, public health preparedness and function, environmental health sciences, behavioral sciences, health education, health communications, and health policy and management.

Bioethics Masters students receive their degree after 30 hours of study over one year. The School of Graduate Studies awards the MPH degree for 36 credit hours over two years. The joint MA/MPH program can be completed in three years of full-time study to complete a minimum of 57 credit hours. It should be noted that in 2007, changes in national education criteria for the Master of Public Health degree will require increasing credit hour requirements to 42 credits.

Options will be available for part-time pursuit of the degree within five years, or for an accelerated plan competed in five semesters. Students will develop individual education plans (IEP) with their advisors and may customize their approach and pace through the program. Each program has a set of core courses that must be completed; 15 core credits in Public Health and 15 core credits in Bioethics for a combined total of 30 required credit hours. The 9-credit Capstone experience is also required of all public health students.

The stand-alone Bioethics program also requires 12 credits taken from a list of approved elective courses plus a 1.5 hour capstone and 1.5 hour mini-elective. In addition to its 24 required credits, the stand-alone MPH program requires 9 concentration credits and 3 elective credits. Joint MA/MPH candidates will combine their Bioethics electives and Public Health concentration and elective courses to complete a total of 18 credit hours of advanced electives.

MA/MSSA

This program joins two well-known academic programs to offer students an interdisciplinary experience blending the similar values of social work and medicine. This is a "side-by-side" program composed of existing elements of ongoing programs provided by the faculty usually engaged in these efforts. These new elements will be supplemented by an integrative experience designed to make the interdisciplinary character of the program concrete.

Dual-degree students must receive the MSSA and MA degrees simultaneously to be granted credit for specific courses taken in the other program. The dual degree program offered by Case Western Reserve's Jack, Joseph and Morton Mandel School of Applied Social Sciences and the Department of Bioethics is unlike other programs in the United States. As the number and complexity of ethical dilemmas in health
care, aging, and mental health and social work continue to increase, there is a growing need for advanced practice social workers who are knowledgeable about the principles and problem resolution techniques that are fundamental to Bioethics.

In healthcare settings, ethical consultations are often requested on decisions having to do with end-of-life, organ donation, or initiation or withdrawal of medical treatments. In addition, graduates of this program will be able to help counsel health care providers, organizations, and clients, participate in setting policy and teach others about these issues.

Students must apply separately to the Mandel School and the Department of Bioethics for admission into each program. Admission to one program is not a guarantee that the student will gain admission to the other, and application to both programs should be made simultaneously. A joint committee of the two programs will meet and review the joint degree applications.

**MA/MD**

This program combines the Master of Arts in Bioethics and Medical Humanities with the MD degree, in cooperation with either the School of Medicine or the Cleveland Clinic Lerner College of Medicine of Case Western Reserve University. This program provides physicians with advanced knowledge and experience in Bioethics integrated into the medical curricula in each program.

**MS/MA in Genetic Counseling and Bioethics and Medical Humanities**

The Departments of Genetics & Genome Sciences and Bioethics and Medical Humanities offer a dual degree program between the Masters in Genetic Counseling and the Masters in Bioethics and Medical Humanities Programs. The dual degree program provides a comprehensive curriculum integrating foundational principles of genetics and ethics. The goal of the program is to train Genetic Counselors who wish to apply additional Bioethics expertise into their clinical practice and/or research.

The dual degree program allows graduates to engage in both contemplative analysis and application of knowledge in the counseling of patients and should allow graduates to be more prepared to participate in the ongoing national dialogue about the ethical, legal, and social implications of advances in genomic technology as well as research within their home institutions and with other counselors nationwide regarding issues of new genomic testing technology, concerns about genetic services, and issues related to genetic discrimination, privacy, and the return of genetic and genomic results.

The curriculum for the Dual Genetic Counseling/Bioethics Degree consists of 62 credit hours to be completed in 2.5 years. Students enrolled in the dual degree program will spend their first year taking courses entirely within the Genetic Counseling Program and then will spread out their Bioethics coursework over the next 1.5 years while continuing with required coursework and clinical rotations in the genetic counseling program.

In addition to both a written and oral comprehensive examination as part of the Genetic Counseling Training Program, the dual degree requires a research project be carried out for the completion of both degrees. For the dual degree, students will be required to choose a research project that includes ethical, legal, or social issues of genetic counseling practice, clinical genetics or genomics, or genetic research. Students will also be required to include at least one Bioethics Faculty member on their Research Project Committee.

Students who would like to enroll in the dual degree program will apply and be admitted into each program separately. While admissions committees for each program will communicate with each other regarding applicants, each admissions committee will decide independently about the suitability of the applicant to their program.

Once students have been admitted, the Director of the Genetic Counseling Training Program and the Director of the MA Program in Bioethics and Medical Humanities will act as student advisors for each of the two programs individually but will meet monthly to assess student progress, address any student or faculty concerns, and assure that student progress in each of the programs, and their overlapping components, are being achieved.

BETH Course Elective 3
BETH Capstone 1.5
Mini-Elective 1.5
Year Total: 12

Total Units in Sequence: 62

Doctoral Program in Bioethics
The goal of the PhD program is to train scholars in the conceptualization, design, and conduct of interdisciplinary research on issues in bioethics, medical humanities, and related areas. Candidates may enter the program from any discipline. All doctoral students will become fluent in the ways in which bioethics and medical humanities scholarship employ concepts and methods from the humanities, social sciences, clinical research, jurisprudence, and health policy. The Department of Bioethics is a multi-disciplinary learning environment, with faculty representing the fields of philosophy, anthropology, psychology, history, literature, public health, law, medicine, and nursing. The doctoral program’s curriculum is organized around core areas which include: normative and social science theory and methods; research ethics; clinical ethics; public health ethics; and medical humanities. Concentrations are available to students interested in 1) problems in genetics and genomics; 2) stem cell research and regenerative medicine; 3) research ethics and public health ethics; 4) clinical ethics; and 5) medicine, society and culture (medical humanities and social medicine).

Requirements: Candidates should have a strong background in the social/behavioral sciences, public health/health services research, legal/health policy research, or philosophy and related humanities disciplines. An overall grade point average of 3.3 out of 4.0 (at the undergraduate level) is preferred. Applicants must demonstrate competency in the English language.

Courses
BETH 210. Perspectives on Health: Introduction to Medical Humanities and Social Medicine. 3 Units.
This survey course is designed to give students a broad overview of medical humanities and medical social sciences. Students will engage materials from a wide range of disciplines and learn how to analyze which perspectives afford and obscure which types of knowledge relevant to health, illness and clinical practice. Students will learn how to identify epistemology, methodology, theory and data from various disciplinary perspectives. This course is relevant for students engaged in pre-clinical education as well as those interested in medical humanities and medical social sciences.

BETH 271. Bioethics: Dilemmas. 3 Units.
We have the genetic technology to change nature and human nature, but should we? We have the medical technology to extend almost any human life, but is this always good? Should we clone humans? Should we allow doctor-assisted suicide for the terminally ill? This course invites students from all academic disciplines and fields to examine current and future issues in bioethics—e.g., theory and methods in bioethics; death and dying; organ transplantation; genetics; aging and dementia; fertility and reproduction; distributive justice in health care access. The course will include guest lecturers from nationally-known Bioethics faculty. Offered as BETH 271 and PHIL 271.

BETH 302. Independent Studies in Bioethics. 1 - 3 Units.
This course is for students with Bioethics-related special interests not adequately addressed in regular courses, and who wish to work independently in consultation with faculty.

BETH 314. Global Health: India. 3 Units.
Bioethics is the study of ethical controversies arising at the intersection of biology, medicine, technology, politics, law, philosophy, religion and culture. This course will discuss and analyze the issue of health in India; recognizing that health is more than the diagnosis and treatment of a disease. Using three diseases (HIV/AIDS, leprosy and tuberculosis) students will explore the relationship between culture and health care outcomes. Relevant issues addressed in the course include the history of British rule in India, Hinduism, the Caste system, poverty, access to education and public policy. Faculty will introduce readings on the history of India, medical anthropology, religion and the law. Students will then be given the opportunity to focus on a particular topic, research the existing literature, present their findings to the class and create a plan to observe the chosen topic while in India during the Summer semester. Course instructors include Nicole Deming, JD, MA Assistant Professor of Bioethics; Deepak Sarma, PhD, Associate Professor of South Asian Religions; and Gopal Yadavalli, MD Assistant Professor of Medicine and Chief of the Infectious Diseases Clinic at the Cleveland VA Medical Center. The course will also invite guest lectures from many different departments and schools to share their expertise and experience in the areas of Global Justice, Anthropology, and Human Rights.

BETH 315. International Bioethics: Policy and Practice. 3 Units.
Taught by Case and international faculty, this course will include 7-10 days of intensive didactic and experiential learning in one of several "host" countries. Examples of sites include: Free University of Amsterdam and University of Utrecht in the Netherlands; University of Paris in France; and Ben Gurion University in Israel. It will afford a unique opportunity to gain perspective on important bioethics issues in different societies, i.e., euthanasia, public health policies, access to healthcare, and stem cell research. At the international site, students will spend 6 hours per day (5 days) in seminar (involving didactics, discussion, and guided-observation clinical experience). There will be two 3-hour preparatory sessions, required reading, and two 3-hour post trip sessions. Requirements: preparation, attendance, and class participation, a 12-15 page paper (undergraduate credit) and a 15-20 page paper (graduate credit). Graduate credit will also require students to prepare a presentation for a post-intensive session. Enrollment will be capped at 25. This course has an additional fee to cover costs of travel and lodging. Limited scholarships are available. Offered as BETH 315 and BETH 415.

BETH 315A. International Bioethics Policy and Practice: Women's Health in the Netherlands. 3 Units.
This 3-credit course allows students to familiarize themselves with social policies and practices related to women's health in the United States and the Netherlands. Issues covered in the course include birth control and family planning, abortion, prenatal testing, childbirth, health care disparities, cosmetic surgery, prostitution and trafficking in women. This course also addresses the US and Dutch national policies regarding the public provision of health care for women. The course places an emphasis on the ways in which social norms shape policies over time, which political actors are involved in shaping women's health policy, and the balance between women's health as a matter of the public good or individual responsibility. This course substantively explores gender-specific cultural values and practices in relation to women's health in the United States and the Netherlands and will help students develop the analytical skills necessary for evaluating social policy and ethical issues related to women's health. Offered as BETH 315A, BETH 415A and WGST 315A. Counts for CAS Global & Cultural Diversity Requirement.
BETH 315B. International Bioethics Policy and Practice: Public Health in the Netherlands. 3 Units.
This one week 3-credit intensive course will be held in Amsterdam, The Netherlands. Taught by faculty from Case and Utrecht University, this course offers students a cross-cultural perspective on ethical dilemmas raised by the practice of public health in the United States and Northern Europe. Additionally, this course examines policies related to prostitution, drug use, sex education, infectious disease prevention, and access to health care and how they differ in the cultural and political settings of U.S. and the Netherlands. We will examine both the rationales and outcomes of Dutch and American policies, stimulating course participants to consider their own views on these often controversial issues. Prior to the trip, students will attend lectures at Case, which will acquaint them with the theoretical approaches to public health ethics and major issues raised in the practice of public health. In these pre-trip sessions, students will also analyze and report on a case study designed to stimulate critical thinking on comparative public health ethics. In Amsterdam, students will attend lectures that will be supplemented by site visits and discussion sessions aimed at exploring the ethics of public health policy and practice in the Netherlands. Following the intensive week in Amsterdam, students will meet with instructors at Case for two hours to discuss their experiences and compare policies and practices in the U.S. and the Netherlands. Offered as BETH 315B and BETH 415B. Counts for CAS Global & Cultural Diversity Requirement.

BETH 315C. International Bioethics Policy and Practice: Health Care Costa Rica. 3 Units.
This 3-credit course gives students the unique opportunity to observe patients and practitioners encounter in a radically different health care system. Costa Rica has one of the most comprehensive health care systems in the Western hemisphere, featuring the innovative use of middle-level health care workers organized in basic comprehensive health care teams. This has resulted in a longer life expectancy than the United States, despite a per capita GDP of only $10,000 per person. Students will gain first-hand experience of Costa Rican health care through field experiences at sites including a national hospital in the capital city, San Jose; a peripheral treatment clinic in a smaller town; and observation of the work of an integrated basic health care team in an indigenous reserve. Following each visit, students will discuss the practical and ethical dilemmas that practitioners face in the context of the Costa Rican health care system. Specific topics include: health inequalities within and between nations; the ethics of transplantation, medical research, and end-of-life care; and health care in rural environments and with indigenous populations. Offered as BETH 315C and BETH 415C. Counts for CAS Global & Cultural Diversity Requirement.

BETH 315D. French Connections, A Cross-Cultural Comparison of Medical Ethics. 3 Units.
This 3-credit course is collaboration between Case Western Reserve University and the University of Paris. The course includes a ten-day trip to Paris, France over Spring Break. This course offers a cross-cultural comparison of the French and American medical systems. Students will have the unique opportunity to learn first-hand how the French medical education system is structured and how the social, cultural and political contexts in France shape medical and ethical issues. The trip includes guided field experiences in French clinical settings as well as opportunities to engage with French faculty members and physicians about contemporary issues in bioethics. Ethical issues that may be considered may include reproductive rights, decision-making involving severely impaired newborns, withholding/withdrawing life-sustaining treatment and issues in organ donation and transplant. The course also will also emphasize the role of French culture and history while in Paris with museum and site visits designed to complement seminar content and offer real-life illustrations of course content. Prior to the trip, students attend six hours of lectures, either at Case Western Reserve University or via a web-based tutorial. They are expected to become familiar with the representative articles assigned for the course, and be prepared to integrate those readings into pre-trip class participation and active participation while in France. Following the trip, students meet with the instructor for an additional four hours to discuss and synthesize their experiences. Offered as BETH 315D and BETH 415D. Counts for CAS Global & Cultural Diversity Requirement.

BETH 315E. Comparison in Bioethics, Spanish and American Perspectives on Health, Medicine, and Culture. 3 Units.
This 3-credit intensive course will include several day long sessions at CWRU and two weeks of classes and activities in the city of Granada, Spain. Taught by faculty from CWRU and UPV/EHU, this course offers students a cross-cultural perspective on bioethics in the United States and Spain. It uses the medium of film, complemented by readings in bioethics, film criticism, and medical research, to introduce students to a number of compelling bioethics issues, including end-of-life, reproductive ethics, biomedical research and organ transplantation. Offered as BETH 315F and BETH 415F. Counts for CAS Global & Cultural Diversity Requirement.

BETH 315F. Death, Dying & Euthanasia: Netherlands & the USA. 3 Units.
Is it ever permissible for physicians to kill their patients? In the Netherlands, the answer is yes. In the United States, it is no. Are the Dutch sliding down a moral slippery slope? Are the Americans compromising the rights and dignity of dying patients? This 3-credit course is a unique opportunity to examine a range of Dutch and American end-of-life policies and practices with special focus on the unique ethical, cultural, religious, and legal contexts in which they developed. This course will compare how two liberal democracies, the United States and the Netherlands, have handled difficult end-of-life issues, including: The Dutch regulation of euthanasia; Regulation of physician-assisted suicide in the state of Oregon; Terminal sedation; End-of-life decisions in newborns; Withholding and withdrawing of artificially-provided fluids and nutrition; The legal basis for end-of-life decision making in the USA; Palliative care and hospice; Public trust in medicine and physicians. In the United States, teaching methods will include lectures, case discussion, and exposure to how some of the course’s themes are reflected in popular culture such as movies. Offered as BETH 315G and BETH 415G. Counts for CAS Global & Cultural Diversity Requirement.
BETH 315H. Water Security and Social Justice in Brazil. 3 Units.
CWRU, through the Center for Global Health and Diseases, has had projects, student exchanges and courses with institutions in Brazil and especially with the state of Bahia for over 30 years. In that time, personal and professional relationships have been developed with branches of the Ministry of Health (Oswaldo Cruz Foundation, the Municipal and State Health Departments), the Federal University of Bahia, and the Bahiana School of Medicine and Public Health. Brazil is the second largest country in the Western Hemisphere and the 7th or 8th largest economy in the world. There are more people who speak Portuguese in South America than Spanish. Despite newly discovered oil, enormous natural and human resources, development in Brazil has been uneven with the Northeast remaining the least developed. The Northeastern state of Bahia ranked 22nd out of 27 states on the UN’s Index of Human Development (http://www.pnud.org.br/IDH/DH.aspx and http://www.atlasbrasil.org.br/2013/pt/home/). The State capital, Salvador, ranks 14th out of 20 major metropolitan regions and is one site for this study abroad program. The second site, the rural town of Ubaíra, is ranked 4590 out of 5565 municipalities. Even with large social inequities and health care disparities, the Brazilian government and society have produced remarkable social policies, have shown a willingness to implement these policies and have the resources to significantly improve the lives of its most impoverished citizens. Critical basic infrastructure for health and development is water. Its consumption is essential; it is a mechanism for waste disposal, industry and agriculture are dependent on it. The problem of water quantity and quality are common for all human societies (witness the drought in California and the burning Cuyahoga). Individuals from all walks of life will need to assess issues of water at some time, from doctors, engineers, urban planners, lawyers and politicians. In Brazil the issues of water are more exposed and easier to examine on different scales than in the U.S. The problem also resides within a social, health care, and political context that compares well and at the same time contrasts sharply with that of the USA. As a student in this course, you will gain first-hand knowledge of the social and public health challenges regarding water security in Brazil. Through field experiences in the capital city of Salvador and the rural town of Ubaíra, you will immerse yourself in interdisciplinary perspectives on the public health, scientific, political, and bioethical dimensions of water security in Brazil. This immersive experience will be facilitated by faculty from the CWRU Dept. of Bioethics and the Center for Global Health and Diseases, the Brazilian Ministry of Health, the Federal University of Bahia, the Bahiana School of Medicine and Public Health, and Brazilian graduate student participants. Offered as: INTH 315, INTH 415, BETH 315H, and BETH 415H. Counts for CAS Global & Cultural Diversity Requirement.

BETH 315J. Dutch Perspectives: Drugs, Decriminalization and Detention. 3 Units.
This course will offer students the opportunity to compare and contrast the ways in which the Netherlands and the United States approach drug use. In particular, students will be asked to carefully examine the ethical dimensions of harm reduction programs, policies regarding the availability and the decriminalization of drugs, and the critical role of detention and correctional medical care in addressing drug use. The course will include an introduction to the Dutch and U.S. health care and health insurance systems and will consider how the construction of the patient-physician relationship impacts the prevalence and treatment of drug use in each country. In addition, students will explore the ethics of public health initiatives and social programs aimed at drug users in both settings, including those designed for particular populations such as immigrants and older users. The course will pay special attention to the unique challenges and ethics of the opioid crisis in the U.S. Offered as BETH 315J and BETH 415J. Counts for CAS Global & Cultural Diversity Requirement.

BETH 315Y. Conservation, Compassion and Awe in Yellowstone National Park: Environmental Ethics and Human Health. 3 Units.
This class brings together the study of conservation, ethics and human well-being in a hands-on investigation at Yellowstone National Park. The course returns to the original meaning of the term bioethics as including the biome. It covers conservation ethics and human relationships with the environment and other species as they impact human health across multiple levels. The course draws on theories, models, and methods from psychological anthropology and political ecology to frame the complex dynamics of interaction. The evolution and psychology of compassion and awe are engaged in processual models of human interaction with the natural world and other species. Both have important implications for human health in everyday behavioral practice and in clinical settings. The course involves pre-departure study and will then integrate the materials in the field in Yellowstone National Park looking at contemporary and historical issues in partnership with Yellowstone Forever Institute instructors. In particular, the case of the conservation of the American bison will be used to understand multi-level issues over time in culture, politics, environment, human behavior, and health. The course requires papers, participation, attendance and a field journal. Offered as BETH 315Y and BETH 415Y.

BETH 319. Medical Science and Technology in Society. 3 Units.
Science, Technology, and Society (STS) is an interdisciplinary field of scholarship that examines how social, cultural, historical, ethical, and political forces impact scientific research and technological development: and, in turn, how our beliefs, values, and perspectives change in response to scientific and technological innovation. This course will take an STS approach to the study of human health and medicine. We will explore how advances in contemporary biomedicine have affected society and culture, and in turn, how society and culture influence medical science, technology, and clinical practice. Topics we will explore include reproductive technologies, genetics, disability, cyborgs and human enhancement, pharmaceuticals, medical practice, and end-of-life care. The course will prepare students to think critically about scientific and medical knowledge, to thoughtfully examine the relationships between science, technology and culture at large, and to consider the ways that new medical technologies shape and re-shape our understandings of illness, health, and the human body. Weekly course meetings will implement a blend of lectures, discussions, and in-class exercises. Offered as BETH 319 and BETH 419.
BETH 360. Science and Society. 3 Units.
This course examines the complex ethical and other value relationships that exist between science and society. Students will be encouraged to question the simplistic view that science proceeds independently of societal values and contentious ethical commitments. A range of other social factors, such as ethical belief systems, political forces, and large-scale financial interests all influence new scientific and technological developments. In order to illuminate each of these larger themes, this course focuses on three exciting areas of scientific inquiry: stem cell research; synthetic biology; and nanotechnology. Each of these contentious scientific fields provides an excellent view into the challenging ethical, cultural, social, political, and economic issues that will face students, both as scholars and as citizens. No prior technical knowledge is necessary for any of these scientific areas. All relevant scientific information will be provided during the course by the professor. Offered as BETH 360, BETH 460 and PHIL 360.

BETH 371. Advanced Bioethics. 3 Units.
This course offers upper-level instruction on many key bioethical issues introduced in BETH/PHIL 271. The class follows a discussion-intensive seminar format. Students begin with an in-depth analysis of ethical issues surrounding the conduct of clinical trials, both within the U.S. and through U.S.-sponsored research abroad. Next students examine the philosophical and practical challenges involved in medical decision making for adults and pediatric patients. This course concludes by addressing the broader ethical problem of what duties we owe to future generations in terms of our reproductive choices and the allocation of health-related public expenditures. Each of these general topic areas - clinical trials, medical decision making, and future generations - is of crucial importance for all students whether one plans to enter a career in biomedical research, the healthcare professions, or some other career path. Everyone is a potential patient or the family member of a potential patient. The topics covered in Advanced Bioethics will help prepare students to become responsible participants in an increasingly complex biomedical world. Offered as BETH 371 and PHIL 371. Prereq: BETH 271 or PHIL 271.

BETH 371C. Advanced Bioethics: Clinical Observation. 1 Unit.
This course is a one credit class intended to supplement BETH 371: Advanced Bioethics. In this course students will become familiar with the clinical, psychological, social, professional, and institutional context in which bioethical problems arise. Students are exposed to clinical cases as they arise, to hospital ethics committees and ethics consultation programs, to institutional review boards (IRB), and to hospital policies covering "do not resuscitate" orders (DNR), advance directives, withdrawal of artificial feeding, and medical futility. The clinical rotation will consist of 20 hours of supervised observation where students attend structured clinical activities such as ICU rounds, case conferences as well as shadow clinicians that work with the Department of Bioethics and are used to having students at various levels of observers. The purpose of the clinical rotation will be to give students first hand observational experience in the health care system and how the key bioethical issues discussed in BETH 371 manifest in the clinical setting. The primary locations for this course are MetroHealth Medical Center and Louis Stokes Cleveland VA Medical Center. Prereq: BETH 271 or PHIL 271. Coreq: BETH 371 or PHIL 371.

BETH 401. Foundations in Bioethics I. 6 Units.
The first of the two required seminar courses, this course covers five basic topic areas in bioethics: death and dying; health professional-patient relationship; method and theory in bioethics; organ transplantation; and ethics and children. The course meets twice weekly and is taught in seminar format by Center faculty members who are experts on specific topics. Preentry.

BETH 402. Foundations in Bioethics II. 6 Units.
This course completes the required seminar core and covers the basic bioethics topic areas: health care justice; defining 'health care needs;' reproduction and fertility ethics; research ethics; and ethics in genetics. The course meets twice weekly and is taught in seminar format by Center faculty members who are experts on specific topics. Recommended preparation: BETH 401.

BETH 402C. Bioethics and Medical Humanities Capstone. 1.5 Unit.
The Capstone paper is an opportunity for the student to demonstrate mastery in an area of Bioethics and Medical Humanities. It is intended to show engagement with interdisciplinary literature in Bioethics and Medical Humanities and also an ability to construct and support an argument. The specific topic in Bioethics and Medical Humanities is chosen by the student in consultation with faculty advisers. Prereq: BETH 401 and student in MA Bioethics and Medical Humanities program. Coreq: BETH 402.

BETH 403. Mental Illness and Bioethics in Film and Literature. 1.5 Unit.
This course examines bioethical issues that arise in the representation of mental illness and its treatment in film and literature. Course requirements include viewing 3 films and reading 3 or more books during the course of the semester, in-class discussion, and assigned writing. The films and works of literature will be rotated each year, with some possible repetitions. Prereq: Graduate Bioethics student or Requisites Not Met permission.

BETH 404. Poetry Boot Camp Workshop: Bioethic Poetry Topics Human, Mental Illness and Animal Welfare. 3 Units.
In this introductory poetry writing workshop and study of bioethical issues in poetry, you will write poems each day and read a wide variety of poems that are organized according to either bioethical themes or demonstrations of types of poem or craft. Participants will undertake in-class study of the following poets: James Wright, John Keats, Sylvia Plath, Robert Lowell, Theodore Roethke, and Langston Hughes, among others. As the week proceeds, we will consider how to read and review poetry with special attention to tone, theme, structure, and response to specific words and lines from poems.

BETH 405. Clinical Ethics Rotation. 1.5 - 3 Units.
In this course students will become familiar with the clinical, psychological, social, professional, and institutional context in which ethical problems arise. This course exposes students to clinical cases, to hospital ethics committees and ethics consultation programs, to institutional review boards (IRB), and to hospital policies covering the "do not resuscitate" orders (DNR), advance directives, withdrawal of artificial feeding, organ procurement and transplantation, and medical futility. Requires minimum of 8 total hours of rotation experience per week during two semester 10-week rotations. Locations for this course include: MetroHealth Medical Center, University Hospitals of Cleveland, and the Hospice of the Western Reserve. Recommended preparation: BETH 401 or concurrent enrollment.
BETH 406. Society, Religion, and Bioethics. 3 Units.
Focus and Scope of Course: The course examines the interplay of politics, governmental structures, culture and religion and their impact on ethics questions that arise in the health arena. The course provides a broad overview of the basic tenets of several major faith traditions and examines how and why the interpretation of such tenets and their impact on bioethics issues varies across different societies. The specific domains in which we explore such issues, e.g., reproductive health, regenerative medicine, end-of-life issues, infectious disease, may be rotated each year. Objectives: Students will be able to *Describe religious views and interests affect policymaking with respect to a variety of health-related issues *Enunciate strategies for the reconciliation of bioethics perspectives stemming from diverse religious interests in a pluralistic society *Compare and contrast the perspective of various world religions with respect to specific bioethics issues Prereq: Open to Graduate Students and Seniors only.

BETH 407. Interprofessional Integrative Seminar. 0 Unit.
This is an integrative seminar for dual professional degree students in Bioethics, e.g. Bioethics and Law, Bioethics and Public Health, Bioethics and Medicine. It is required for all dual professional degree students in Bioethics who were admitted to Bioethics on or after January 1, 2013. Students are required to take the seminar for two semesters at any time during their Bioethics program. The course focuses on the study of selected texts with respect to ethical issues and interprofessional relationships. Prereq: Must be a dual professional degree student.

BETH 408. Ethics, Law and Health Research. 3 Units.
This course focuses on an examination of issues arising at the juncture of law, ethics, and health research, such as informed consent, the assessment of risks and benefits, conflict of interest, and scientific misconduct. Particular attention is placed on issues arising in the context of study design and community based research. To the extent possible, the class will utilize a case-focused approach.

BETH 409. Aging, Ageism, and Embodiment. 3 Units.
We all grow old (if we are so lucky!). But who wants to be called "old"? And how does the experience of "growing old" differ based on one's sex or gender, sexuality, race or ethnicity, and socioeconomic or disability status? In this course, we will consider the social, cultural, scientific, medical, and personal meanings of aging, and how these meanings, as well as the embodied experience of aging in America, are influenced by multiple forms of ageism. We will interrogate the assumptions and stereotypes about age that circulate through mainstream American culture and medicine and how these shape interpersonal and institutional practices. How might we begin to recognize, respond to, and change ageism, and thus our own inevitable experiences of aging? The course requires reading quizzes, papers, participation, and attendance, and for graduate students an additional presentation.

BETH 410. Foundations of Medicine, Society and Culture. 3 Units.
Topics will include comparative medical systems and concepts of health, medical history, illness narratives and narrative ethics, social determinants of health and health inequalities, analysis of representations of illness and medicine in literature and the arts, and medical rhetoric. Students who complete the course should develop a command of the basic problems, approaches, and literatures in the social and cultural contexts of health sickness, and medicine. Students will be able to identify epistemology, theory, methodology and data from neighboring disciplines and understand affordances and costs in each.

BETH 411. Narrative Medicine: Methodology in patient-centered medical education. 3 Units.
Narrative Medicine, or medicine practiced with narrative skills (as defined by Rita Charon, MD, PhD), is a methodology in patient-centered medical education. Narrative medicine is informed by the theory and practice of reading, writing, telling, and receiving of stories as a clinically empowering practice for anyone engaged (or planning to engage) in the field of healthcare. This course will employ various methods of learning and experiencing narrative, including fundamental skills of close reading and reflective writing and other forms of self-representation. Narrative competence is an important skill that enables a person to "recognize, absorb, interpret, represent, and be moved by the stories of illness". Major themes throughout the course will include caregivers' and patients' empowerment, empathy, narrative ethics, testimony, reflexive writing, and illness and medical stories. The course will be conducted in a seminar-type format. Each session will have readings that relate to the theory of narrative (primarily from the Charon textbook but also from other sources in the Ethics and Humanities professional literature) and related health humanities. Many of the sessions will also include the application of reflective practice/close reading. Additional elements will be writing workshops and use of film and visual art as narrative. The class will meet once weekly for a 3 hour session. This class is open to graduate students in any humanities or healthcare field, and will be especially useful to those who intend to have a future career in which direct care of patients/clients is a part of their work.

BETH 412. Ethical Issues in Genetics/Genomics. 3 Units.
This course is designed to familiarize graduate students with the major controversies over the generation and use of new human genetic information. Topics will include the spread of predictive genetic testing, prenatal diagnosis, genetic discrimination, human genetic variation research, eugenics, genetic counseling, and the limits of human gene therapy. The course will be conducted as a seminar, involving discussions of readings, guest speakers, and student presentations.

BETH 413. A Social Justice Perspective on Digital Medicine and the Digital Divide. 1.5 Unit.
This course begins by exploring bioethical and social justice perspectives related to the digital divide and to efforts to address gaps. We will then consider the risks and benefits to individuals and to populations from the proliferating use of health-relevant data from smartphone apps, wearable devices, data generated from our google searches, etc. We will apply a social justice lens to evaluating how the FDA regulates consumer digital health technology and consider the potential risks and harms that an IRB might consider in evaluating proposals for using devices in clinical research. Finally, we will apply our learning about the digital divide and digital devices to assess individual and societal risks and benefits associated with apps intended to mitigate the risk of COVID-19.
BETH 414. International Health Research Ethics. 3 Units.
This course will introduce students in the health and social sciences to key ethical issues that arise in international health research. The course will include intensive reading and case-based discussion of current ethical and moral quandaries posed by research conducted in the international arena. Five full-day sessions are planned. Each day will be divided into a series of formal presentations and active, group-based discussions around topics that include: the historical context of international health research; current international ethics principles, standards, and declarations; key tools and concepts for unpacking ethical issues in international health research; issues in informed consent and conflict of interest; "reasonable availability" and the conduct of clinical trials; cutting-edge international genetics research; and, the responsibility of researchers to the international health community. Course evaluation is based on class participation, a written exercise, and a case analysis.

BETH 415. International Bioethics: Policy and Practice. 3 Units.
Taught by Case and international faculty, this course will include 7-10 days of intensive didactic and experiential learning in one of several "host" countries. Examples of sites include: Free University of Amsterdam and University of Utrecht in the Netherlands; University of Paris in France; and Ben Gurion University in Israel. It will afford a unique opportunity to gain perspective on important bioethics issues in different societies, i.e., euthanasia, public health policies, access to healthcare, and stem cell research. At the international site, students will spend 6 hours per day (5 days) in seminar (including didactics, discussion, and guided-observation clinical experience). There will be two 3-hour preparatory sessions, required reading, and two 3-hour post trip sessions. Requirements: preparation, attendance, and class participation, a 12-15 page paper (undergraduate credit) and a 15-20 page paper (graduate credit). Graduate credit will also require students to prepare a presentation for a post-intensive session. Enrollment will be capped at 25. This course has an additional fee to cover costs of travel and lodging. Limited scholarships are available. Offered as BETH 315 and BETH 415.

BETH 415A. International Bioethics Policy and Practice: Women's Health in the Netherlands. 3 Units.
This 3-credit course allows students to familiarize themselves with social policies and practices related to women's health in the United States and the Netherlands. Issues covered in the course include birth control and family planning, abortion, prenatal testing, childbirth, health care disparities, cosmetic surgery, prostitution and trafficking in women. This course also addresses the US and Dutch national policies regarding the provision of health care for women. The course places an emphasis on the ways in which social norms shape policies over time, which political actors are involved in shaping women's health policy, and the balance between women's health as a matter of the public good or individual responsibility. This course substantively explores gender-specific cultural values and practices in relation to women's health in the United States and the Netherlands and will help students develop the analytical skills necessary for evaluating social policy and ethical issues related to women's health. Offered as BETH 315A, BETH 415A and WGST 315A. Counts for CAS Global & Cultural Diversity Requirement.

BETH 415B. International Bioethics Policy and Practice: Public Health in the Netherlands. 3 Units.
This one week 3-credit intensive course will be held in Amsterdam, The Netherlands. Taught by faculty from Case and Utrecht University, this course offers students a cross-cultural perspective on ethical dilemmas raised by the practice of public health in the United States and Northern Europe. Additionally, this course examines policies related to prostitution, drug use, sex education, infectious disease prevention, and access to health care and how they differ in the cultural and political settings of U.S. and the Netherlands. We will examine both the rationales and outcomes of Dutch and American policies, stimulating course participants to consider their own views on these often controversial issues. Prior to the trip, students will attend lectures at Case, which will acquaint them with the theoretical approaches to public health ethics and major issues raised in the practice of public health. In these pre-trip sessions, students will also analyze and report on a case study designed to stimulate critical thinking on comparative public health ethics. In Amsterdam, students will attend lectures that will be supplemented by site visits and discussion sessions aimed at exploring the ethics of public health policy and practice in the Netherlands. Following the intensive week in Amsterdam, students will meet with instructors at Case for two hours to discuss their experiences and compare policies and practices in the U.S. and the Netherlands. Offered as BETH 315B and BETH 415B. Counts for CAS Global & Cultural Diversity Requirement.

BETH 415C. International Bioethics Policy and Practice: Health Care Costa Rica. 3 Units.
This 3-credit course gives students the unique opportunity to observe patients and practitioners encounter in a radically different health care system. Costa Rica has one of the most comprehensive health care systems in the Western hemisphere, featuring the innovative use of mid-level health care workers organized in basic comprehensive health care teams. This has resulted in a longer life expectancy than the United States, despite a per capita GDP of only $10,000 per person. Students will gain first-hand experience of Costa Rican health care through field experiences at sites including a national hospital in the capital city, San Jose; a peripheral treatment clinic in a smaller town; and observation of the work of an integrated basic health care team in an indigenous reserve. Following each visit, students will discuss the practical and ethical dilemmas that practitioners face in the context of the Costa Rican health care system. Specific topics include: health inequalities within and between nations; the ethics of transplantation, medical research, and end-of-life care; and health care in rural environments and with indigenous populations. Offered as BETH 315C and BETH 415C. Counts for CAS Global & Cultural Diversity Requirement.
BETH 415D. French Connections, A Cross-Cultural Comparison of Medical Ethics. 3 Units.
This 3-credit course is collaboration between Case Western Reserve University and the University of Paris. The course includes a ten-day trip to Paris, France over Spring Break. This course offers a cross-cultural comparison of the French and American medical systems. Students will have the unique opportunity to learn first-hand how the French medical education system is structured and how the social, cultural and political contexts in France shape medical and ethical issues. The trip includes guided field experiences in French clinical settings as well as opportunities to engage with French faculty members and physicians about contemporary issues in bioethics. Ethical issues that may be considered may include reproductive rights, decision-making involving severely impaired newborns, withholding/withdrawing life-sustaining treatment and issues in organ donation and transplant. The course also will also emphasize the role of French culture and history while in Paris with museum and site visits designed to complement seminar content and offer real-life illustrations of course content. Prior to the trip, students attend six hours of lectures, either at Case Western Reserve University or via a web-based tutorial. They are expected to become familiar with the representative articles assigned for the course, and be prepared to integrate those readings into pre-trip class participation and active participation while in France. Following the trip, students meet with the instructor for an additional four hours to discuss and synthesize their experiences. Offered as BETH 315D and BETH 415D. Counts for CAS Global & Cultural Diversity Requirement.

BETH 415F. Comparison in Bioethics, Spanish and American Perspectives on Health, Medicine, and Culture. 3 Units.
This 3-credit intensive course will include several day long sessions at CWRU and two weeks of classes and activities in the city of Granada, Spain. Taught by faculty from CWRU and UPV/EHU, this course offers students a cross-cultural perspective on bioethics in the United States and Spain. It uses the medium of film, complemented by readings in bioethics, film criticism, and medical research, to introduce students to a number of compelling bioethics issues, including end-of-life, reproductive ethics, biomedical research and organ transplantation. Offered as BETH 315F and BETH 415F. Counts for CAS Global & Cultural Diversity Requirement.

BETH 415G. Death, Dying & Euthanasia: Netherlands & the USA. 3 Units.
Is it ever permissible for physicians to kill their patients? In the Netherlands, the answer is yes. In the United States, it is no. Are the Dutch sliding down a moral slippery slope? Are the Americans compromising the rights and dignity of dying patients? This 3-credit course is a unique opportunity to examine a range of Dutch and American end-of-life policies and practices with special focus on the unique ethical, cultural, religious, and legal contexts in which they developed. This course will compare how two liberal democracies, the United States and the Netherlands, have handled difficult end-of-life issues, including: The Dutch regulation of euthanasia; Regulation of physician-assisted suicide in the state of Oregon; Terminal sedation; End-of-life decisions in newborns; Withholding and withdrawing of artificially-provided fluids and nutrition; The legal basis for end-of-life decision making in the USA; Palliative care and hospice; Public trust in medicine and physicians. In the United States, teaching methods will include lectures, case discussion, and exposure to how some of the course’s themes are reflected in popular culture such as movies. Offered as BETH 315G and BETH 415G. Counts for CAS Global & Cultural Diversity Requirement.

BETH 415H. Water Security and Social Justice in Brazil. 3 Units.
CWRU, through the Center for Global Health and Diseases, has had projects, student exchanges and courses with institutions in Brazil and especially with the state of Bahia for over 30 years. In that time, personal and professional relationships have been developed with branches of the Ministry of Health (Oswaldo Cruz Foundation, the Municipal and State Health Departments), the Federal University of Bahia, and the Bahiana School of Medicine and Public Health. Brazil is the second largest country in the Western Hemisphere and the 7th or 8th largest economy in the world. There are more people who speak Portuguese in South America than Spanish. Despite newly discovered oil, enormous natural and human resources, development in Brazil has been uneven with the Northeast remaining the least developed. The Northeastern state of Bahia ranked 22nd out of 27 states on the UN's Index of Human Development (http://www.pnud.org.br/IDH/DH.aspx# and http://www.atlasbrasil.org.br/2013/pt/home/). The State capital, Salvador, ranks 14th out of 20 major metropolitan regions and is one site for this study abroad program. The second site, the rural town of Ubaíra, is ranked 4590 out of 5565 municipalities. Even with large social inequities and health care disparities, the Brazilian government and society have produced remarkable social policies, have shown a willingness to implement these policies and have the resources to significantly improve the lives of its most impoverished citizens. Critical basic infrastructure for health and development is water. Its consumption is essential; it is a mechanism for waste disposal, industry and agriculture are dependent on its supply. The problem of water quantity and quality are common all human societies (witness the drought in California and the burning Cuyahoga). Individuals from all walks of life will need to assess issues of water at some time, from doctors, engineers, urban planners, lawyers and politicians. In Brazil the issues of water are more exposed and easier to examine on different scales than in the U.S. The problem also resides within a social, health care, and political context that compares well and at the same time contrasts sharply with that of the USA. As a student in this course, you will gain first-hand knowledge of the social and public health challenges regarding water security in Brazil. Through field experiences in the capital city of Salvador and the rural town of Ubaíra, you will immerse yourself in interdisciplinary perspectives on the public health, scientific, political, and bioethical dimensions of water security in Brazil. This immersive experience will be facilitated by faculty from the CWRU Dept. of Bioethics and the Center for Global Health and Diseases, the Brazilian Ministry of Health, the Federal University of Bahia, the Bahiana School of Medicine and Public Health, and Brazilian graduate student participants. Offered as: INTH 315, INTH 415, BETH 315H, and BETH 415H. Counts for CAS Global & Cultural Diversity Requirement.
BETH 415J. Dutch Perspectives: Drugs, Decriminalization and Detention. 3 Units.
This course will offer students the opportunity to compare and contrast the ways in which the Netherlands and the United States approach drug use. In particular, students will be asked to carefully examine the ethical dimensions of harm reduction programs, policies regarding the availability and the decriminalization of drugs, and the critical role of detention and correctional medical care in addressing drug use. The course will include an introduction to the Dutch and U.S. health care and health insurance systems and will consider how the construction of the patient-physician relationship impacts the prevalence and treatment of drug use in each country. In addition, students will explore the ethics of public health initiatives and social programs aimed at drug users in both settings, including those designed for particular populations such as immigrants and older users. The course will pay special attention to the unique challenges and ethics of the opioid crisis in the U.S. Offered as BETH 315J and BETH 415J. Counts for CAS Global & Cultural Diversity Requirement.

BETH 415Y. Conservation, Compassion and Awe in Yellowstone National Park: Environmental Ethics and Human Health. 3 Units.
This class brings together the study of conservation, ethics and human well-being in a hands-on investigation at Yellowstone National Park. The course returns to the original meaning of the term bioethics as including the biome. It covers conservation ethics and human relationships with the environment and other species as they impact human health across multiple levels. The course draws on theories, models, and methods from psychological anthropology and political ecology to frame the complex dynamics of interaction. The evolution and psychology of compassion and awe are engaged in processual models of human interaction with the natural world and other species. Both have important implications for human health in everyday behavioral practice and in clinical settings. The course involves pre-departure study and then will integrate the materials in the field in Yellowstone National Park looking at contemporary and historical issues in partnership with Yellowstone Forever Institute instructors. In particular, the case of the conservation of the American bison will be used to understand multi-level issues over time in culture, politics, environment, human behavior, and health. The course requires papers, participation, attendance and a field journal. Offered as BETH 315Y and BETH 415Y.

BETH 416. Death, Dying, and Modern Medicine. 1.5 Unit.
Despite death’s inevitability, we consciously and unconsciously disguise or resist its reality in dreams, fairy tales, allegories, and even jokes. In his book, How We Die: Reflections on Life's Final Chapter, Sherwin Nuland describes how we have turned increasingly to modern medicine as one more means of denying the reality of death. As a surgeon with more than forty years of experience in a major metropolitan hospital, Nuland admits to actively participating in this denial. Modern medicine, he argues, influences how we as individuals and as a culture not only view but also experience death. "Modern dying," he contends, "takes place in the modern hospital, where it can be hidden, cleansed of its organic blight, and finally packaged for modern burial." This course uses literature, history, and personal and critical accounts related to death as points of reference for examining the role modern medicine has come to play in how we die. The course requires out-of-class service learning, reading quizzes, papers, participation, and attendance. For graduate students, there are additional paper and presentation requirements. No prerequisites required.

BETH 417. Introduction to Public Health Ethics. 3 Units.
The course will introduce students to theoretical and practical aspects of ethics and public health. This course will help students develop the analytical skills necessary for evaluating and working with ethical issues in public health policy and public health prevention, treatment, and research. Will include intensive reading and case-based discussions. Evaluation based on course participation, a written exercise and a case analysis. Open to graduate students with permission from instructors.

BETH 419. Medical Science and Technology in Society. 3 Units.
Science, Technology, and Society (STS) is an interdisciplinary field of scholarship that examines how social, cultural, historical, ethical, and political forces impact scientific research and technological development and, in turn, how our beliefs, values, and perspectives change in response to scientific and technological innovation. This course will take an STS approach to the study of human health and medicine. We will explore how advances in contemporary biomedicine have affected society and culture, and in turn, how society and culture influence medical science, technology, and clinical practice. Topics we will explore include reproductive technologies, genetics, disability, cyborgs and human enhancement, pharmaceuticals, medical practice, and end-of-life care. The course will prepare students to think critically about scientific and medical knowledge, to thoughtfully examine the relationships between science, technology, culture, and society, and to consider the ways that new medical technologies shape and re-shape our understandings of illness, health, and the human body. Weekly course meetings will implement a blend of lectures, discussions, and in-class exercises. Offered as BETH 319 and BETH 419.

BETH 421. Research Ethics Practicum. 1.5 Unit.
The Research Ethics Practicum (80 hours, 1.5 CREDITS) is designed to complement the theoretical and conceptual training received in the course, Critical Issues in Research Ethics. By way of a series of campus-wide rotations, students learn about the practical, everyday side of research administration, compliance, and scientific review. Students will work with key staff in research ethics centers, and observe their day-to-day operations, as well as attend institutional review board (IRB) and Institutional Animal Care and Use Committee (IACUC) meetings. They will become familiar with human subjects, animal, and tissue research regulations and policies as these are applied in an institutional/academic research context. Students will also spend time in a clinical trials unit and tour animal care facilities. The practicum has the following overall objectives: (1) students will be able to identify, analyze, and understand research ethics issues as they develop in the context of actual institutional research governance (2) students will gain an understanding of methods of ethical research design and implementation.
BETH 422. Clinical Ethics: Theory & Practice. 3 Units.
This course will focus on both theoretical and practical issues in clinical ethics. Clinical ethics will be distinguished from other areas of bioethics by highlighting distinctive features of the clinical context which must be taken into account in clinical ethics policy and practice. Fundamental moral and political foundations of clinical ethics will be examined, as will the role of bioethical theory and method in the clinical context. Topical issues to be considered may include informed consent; decision capacity; end of life decision making; confidentiality and privacy; the role and function of ethics committees; ethics consultation; the role of the clinical ethicist; decision making in various pediatric settings (from neonatal through adolescent); the role of personal values in professional life (e.g., rights of conscience issues, self disclosure and boundary issues); dealing with the chronically non-adherent patient; ethical issues in organ donation and transplant; health professional-patient communication; medical mistakes; and other ethical issues that emerge in clinical settings.

BETH 423. Neuroethics. 3 Units.
This course is designed to provide an overview of ethical issues related to current and future neurotechnologies as they are applied clinical care for patients with neurological disorders, including cognitive vulnerability, neurodiversity, stigma and biases in mental health, brain implants, consciousness, selfhood in neurodegenerative disease, and enhancement. Classroom activities will primarily consist of discussion of selected readings related to a topic in neuroethics, moderated by the instructor. In addition, experts will be invited to visit the classroom to assist in the dialogue. Students will actively participate in discussion, debate, written scholarship and presentation to peers. Evaluation will be based on classroom participation, short writing assignments, and an independent project that will be designed in collaboration with the instructor culminate in both a written and oral presentation.

BETH 430. Bioethics in Literature. 1 Unit.
This course complements the Foundation course in the MA bioethics program by introducing students to narrative literature (fiction, nonfiction and poetry) that addresses ethical issues in medicine. The material is frequently the work of physicians and patients who narrate their respective experiences. As such, narrative provides direct insights into the practice of modern medicine tested against both accepted and controversial moral norms and serves as a vehicle for discussion and analysis of ethical issues. These issues involve topics such as death and dying, reproduction, pediatrics, women as patients and clinicians, public health and medicine as a profession and its practice as a privilege. Students will sample the work, among others, of William Carlos Williams, Lewis Thomas, Toni Morrison, Margaret Atwood, John Donne, Dylan Thomas and Abraham Verghese.

BETH 440. Science and Society Through Literature. 3 Units.
This course will examine the interaction of scientific investigation and discovery with the society it occurred in. What is the effect of science on society and, as importantly, what is the effect of society on science? An introduction will consider the heliocentric controversy with focus on Galileo. Two broad areas, tuberculosis and the Frankenstein myth, will then be discussed covering the period 1800-present. With tuberculosis, fiction, art and music will be examined to understand the changing views of society towards the disease, how society’s perception of tuberculosis victims changed, and how this influenced their treatments and research. With Frankenstein, the original novel in its historical context will be examined. Using fiction and film, the transformation of the original story into myth with different connotations and implications will be discussed. Most classes will be extensive discussions coupled with student presentations of assigned materials. Offered as PHRM 340, BETH 440, PHRM 440, and HSTY 440.

BETH 455. Research Ethics Journal Club. 1 Unit.
This seminar course will discuss current topics in biomedical research ethics via recently published articles in both the scholarly literature and the popular science press. For each session, students will choose articles with instructor’s guidance, prepare discussion questions, and lead discussion. Prereq: Enrolled in the M.A. in Bioethics and Medical Humanities program.

BETH 456. Research Ethics Journal Club. .5 Unit.
This in-person seminar course will discuss current topics in biomedical research ethics via recently published articles in both the scholarly literature and the popular science press. For each session, students will choose articles with Dr. Michie’s guidance, prepare discussion questions, and lead discussion.

BETH 460. Science and Society. 3 Units.
This course examines the complex ethical and other value relationships that exist between science and society. Students will be encouraged to question the simplistic view that science proceeds independently of societal values and contentious ethical commitments. A range of other social factors, such as ethical belief systems, political forces, and large-scale financial interests all influence new scientific and technological developments. In order to illuminate each of these larger themes, this course focuses on three exciting areas of scientific inquiry: stem cell research; synthetic biology; and nanotechnology. Each of these contentious scientific fields provides an excellent view into the challenging ethical, cultural, social, political, and economic issues that will face students, both as scholars and as citizens. No prior technical knowledge is necessary for any of these scientific areas. All relevant scientific information will be provided during the course by the professor. Offered as BETH 360, BETH 460 and PHIL 360.

BETH 466. Promoting Health Across Boundaries. 3 Units.
This course examines the concepts of health and boundary spanning and how the synergy of the two can produce new, effective approaches to promoting health. Students will explore and analyze examples of individuals and organizations boundary spanning for health to identify practice features affecting health, compare and contrast practices and approaches, and evaluate features and context that promote or inhibit boundary spanning and promoting health. Offered as MPH 466, PQHS 466, SOCI 466, NURS 466 and BETH 466. Prereq: Graduate student status or instructor consent.
BETH 501. Advanced Study in Bioethics. 1.5 Unit.
The focus and content of this course rotates each semester that it is offered. The course provides students with an opportunity to examine in greater depth a particular issue or dimension of bioethics and/or a particular event with significant bioethical implications. Prereq: Graduate Standing.

BETH 503. Research Ethics and Regulation. 1.5 - 3 Units.
This course will introduce students to key ethical requirements and issues that arise in the design and implementation of scientific research. Historical developments leading to the establishment of national and international guidelines for ethical conduct in research with human subjects will be addressed. Specific national and international guidelines for ethically responsible research will be explored with attention to their merits and limitations in the conduct of research. Informed consent, a fundamental requirement for ethical research will be examined. The function and role of institutional review boards (IRBs) will be described with attention to challenges faced by investigators in adhering to regulatory requirements. Ethical issues associated with risk assessment and recruitment strategies will be examined. Ethical issues that arise in the implementation of biobanks and stem cell research will be discussed. Challenges associated with the development and production of pharmaceuticals will be assessed. The importance of scientific integrity in the conduct of research will be examined with special attention to conflicts of interest and scientific misconduct such as research fraud. The role of advocacy in promoting research will be addressed. Research ethics and human rights will be explored. The course will end with a discussion of emerging issues in research ethics. Case examples will be used to illustrate ethical complexities surrounding the topics discussed. Offered as BETH 503, CRSP 603 and LAWS 5225.

BETH 505. Methods Normative Bioethics. 3 Units.
The purpose of this intensive graduate seminar is to master and to critique core philosophical concepts that are implicit in a wide array of bioethical issues. We will critically examine in a range of contemporary ethical theories beginning with modern conceptions of individual autonomy and concluding with theories of ethical justification. While no advanced knowledge of ethical theories is presupposed, students are expected to come to class prepared with the course readings and to engage in rigorous philosophical discussions with one another and the professor.

BETH 507. Research Design in Bioethics I. 3 Units.
The first of two empirical research courses will introduce students to theoretical and methodological approaches in the design and implementation of empirical research on topics in biomedical ethics. Students will be provided with a comprehensive and robust exploration of empirical models for the development of bioethics research and the skills for critically assessing the optimal methods for designing studies relevant to ethical issues in biomedicine. Prereq: BETH 507.

BETH 508. Research Design in Bioethics II. 3 Units.
The second of two empirical research courses will introduce students to theoretical and methodological approaches in the design and implementation of empirical research on topics in biomedical ethics. Students will be provided with a comprehensive and robust exploration of empirical models for the development of bioethics research and the skills for critically assessing the optimal methods for designing studies relevant to ethical issues in biomedicine. Prereq: BETH 507.

BETH 520. Foundations in Bioethics I - Ph.D.. 3 Units.
The first of the two required seminar courses, this course covers five basic topic areas in bioethics: death and dying; health professional-patient relationship; method and theory in bioethics; organ transplantation; and ethics and children. The course meets twice weekly and is taught in seminar format by Center faculty members who are experts on specific topics.

BETH 521. Foundations in Bioethics II - Ph.D.. 3 Units.
The second of the two required seminar courses, this course covers five basic topic areas in bioethics: death and dying; health professional-patient relationship; method and theory in bioethics; organ transplantation; and ethics and children. The course meets twice weekly and is taught in seminar format by Center faculty members who are experts on specific topics.

BETH 602. Special Topics in Bioethics. 1 - 3 Units.
Students will explore particular issues and themes in biomedical ethics in depth through independent study and research under the direction of a faculty member.

BETH 603. Bioethics Research. 6 Units.
Research leading toward the MD/MA degree is Bioethics.

BETH 604. Advanced Research Ethics Seminar. 0 Unit.
This course meets for two hours each month and is focused on the following topics and the development of the stated competencies: September Introduction; How to critically analyze the literature; Facilitator critique of assigned manuscript; Designing re-entry projects Critical analysis of literature. October Trainee #1 critique of assigned manuscript; Methodological and ethical issues in designing and reviewing research; Trainee presentation of concept papers for re-entry projects Critical review of research protocols and manuscripts; Issues in designing research. November Trainee #2 critique of assigned manuscript; How to prepare and present professional presentations Critical analysis of literature; Oral presentation skills December Trainee #3 critique of assigned manuscript; Principles of adult education Critical analysis of literature; Oral presentation skills; Development of teaching skills. January Trainee #1 critique of assigned manuscript; Principles of adult education Critical analysis of literature; Oral presentation skills February Trainee #2 critique of assigned manuscript; Developing submissions for IRB review Critical analysis of literature; Oral presentation skills; Identifying and addressing ethical issues in research; Preparation of IRB submissions. March Trainee #3 critique of assigned manuscript; Update on development of re-entry projects; Logistical issues related to re-entry projects; Manuscript preparation Critical analysis of literature; Oral presentation skills; Implementing research; Preparing work for publication; Negotiation skills. April Re-entry issued Implementing research; Readjustment. This course is only open to trainees in the Fogarty-funded Training Program in International Research Ethics.

BETH 605. Special Study: IRB Administration. 1.5 Unit.
This course is limited to Fogarty-sponsored trainees in the Training Program in International Research Ethics. The course, which meets 1.5 hours per week, focuses on issues relevant to the management and administrations of the various functions of research ethics review committees. Topics to be covered include identification and selection of appropriate community representatives for membership and/or consultation, utilization of independent experts/consultants, recordkeeping, approaches to communication with investigators, and others. Regular guest lectures will be provided by members of the various local IRBs, staff members of local IRBs, and senior investigators. The course will utilize a case-based approach.
The mission of the Case CCC is to:

- Develop clinical applications of discovery and make these available to Northern Ohio residents as quickly as possible through the integrated efforts of the major health systems in the region.
- Develop cancer prevention and control activities that build on the expertise of the Center and result in a reduction of cancer morbidity and mortality in Northern Ohio and the nation.

The research efforts of the Case CCC members are organized into seven interdisciplinary scientific programs. The clinical research effort is supported by 12 Clinical Trials Disease Teams that develop and prioritize clinical trials, and a single Protocol Review and Monitoring System, Data Safety and Monitoring Plan integrate cancer research, cancer therapeutics, and prevention services at the partner institutions and throughout the region.

Research programs of the Case CCC are also extending into community medical centers operated by University Hospitals and Cleveland Clinic. Outreach programs for clinical practice-based prevention and screening initiatives, educational programs, minority recruitment, and facilitation of patient referrals are also supported by the partner institutions.

In addition to successfully competing for a Cancer Center Support Grant from the National Cancer Institute, the Center must meet specific criteria for:

- Breadth and depth of basic cancer research; clinical cancer research; and prevention, control and population/behavioral sciences research in cancer; and
- Strength of interaction among these three major research areas.

The Case Comprehensive Cancer Center is one of only 50 NCI-designated Comprehensive Cancer Centers in the nation. Learn more about the National Cancer Institute’s Cancer Centers program at cancercenters.cancer.gov (http://cancercenters.cancer.gov/).

**Environmental Health Sciences**

Phone: 216.368.5957
Jonathan Haines, PhD, Interim Chair
jonathan.haines@case.edu

Programs in Environmental Health Sciences are on hiatus and are being reevaluated as part of the merger of the Department of Environmental Health Sciences and the Department of Epidemiology & Biostatistics into the new Department of Population & Quantitative Health Sciences (http://bulletin.case.edu/schoolofmedicine/epidemiologyandbiostatistics/).

**General Medical Sciences**

The Division of General Medical Sciences was established in 1986 to provide an organizational home for units pursuing interdisciplinary research and education objectives. The division is the equivalent of an academic department, and its constituent units are characterized as Centers. The Dean of the School of Medicine serves as the Chair of the division; each Center is led by a director. The unique nature of each of the General Medical Sciences centers is described in the paragraphs below. (Centers are listed in alphabetical order by full title, and associated academic programs including certificate, MS and PhD programs described in top navigation tabs).

**Case Comprehensive Cancer Center**

Phone: 216.844.8797
http://cancer.case.edu
Stanton L. Gerson, MD, Director, Case Comprehensive Cancer Center

The Case Comprehensive Cancer Center (Case CCC) based at Case Western Reserve University (CWRU) is a partnership organization supporting cancer-related research efforts at CWRU, University Hospitals Cleveland Medical Center, and Cleveland Clinic. Located in Cleveland, Ohio, the Case CCC serves the cancer research and clinical needs of an urban manufacturing and rural agricultural region containing over 4 million people in Northern Ohio.

The Case CCC provides a unique forum and academic network for cancer researchers across our community to accomplish more than they may individually. Through the Case CCC, our medical institutions are linked in a stronger and more unified effort to understand the causes and progression of cancer and to use that understanding to develop treatments and to reduce the likelihood that our population will develop cancer and suffer from its consequences. The Cancer Center advocates for cancer research support across the institutions; provides funding for promising pilot grants, shared resource development, training programs, and recruitments; and catalyzes multidisciplinary and transdisciplinary cancer research across institutions, emphasizing innovative discovery that will have an impact on cancer patients.

The mission of the Case CCC is to:

- Improve the prevention, diagnosis and therapy of cancer through discovery, evaluation and dissemination.
- Stimulate and support innovative, coordinated interdisciplinary clinical research on cancer diagnosis, treatment, prevention and control.
- Develop clinical applications of discovery and make these available to Northern Ohio residents as quickly as possible through the integrated efforts of the major health systems in the region.
- Develop cancer prevention and control activities that build on the expertise of the Center and result in a reduction of cancer morbidity and mortality in Northern Ohio and the nation.

The research efforts of the Case CCC members are organized into seven interdisciplinary scientific programs. The clinical research effort is supported by 12 Clinical Trials Disease Teams that develop and prioritize clinical trials, and a single Protocol Review and Monitoring System, Data Safety and Monitoring Plan integrate cancer research, cancer therapeutics, and prevention services at the partner institutions and throughout the region.

Research programs of the Case CCC are also extending into community medical centers operated by University Hospitals and Cleveland Clinic. Outreach programs for clinical practice-based prevention and screening initiatives, educational programs, minority recruitment, and facilitation of patient referrals are also supported by the partner institutions.

In addition to successfully competing for a Cancer Center Support Grant from the National Cancer Institute, the Center must meet specific criteria for:

- Breadth and depth of basic cancer research; clinical cancer research; and prevention, control and population/behavioral sciences research in cancer; and
- Strength of interaction among these three major research areas.

The Case Comprehensive Cancer Center is one of only 50 NCI-designated Comprehensive Cancer Centers in the nation. Learn more about the National Cancer Institute’s Cancer Centers program at cancercenters.cancer.gov (http://cancercenters.cancer.gov/).

**Center for Clinical Investigation**

Phone: 216.368.3286
James Spilsbury, PhD, Academic Development Core Director

The Center for Clinical Investigation (CCI) was founded in 2007 and is part of Case Western Reserve University School of Medicine’s Division of General Medical Sciences. The CCI serves as the academic home of Cleveland’s Clinical & Translational Science Collaborative, a partnership of 4 local institutions (Case Western Reserve University, the Cleveland Clinic Foundation, the MetroHealth System, and University Hospitals) and member of a national consortium of approximately 66 institutions funded by the National Institutes of Health to increase the efficiency and speed of clinical and translational research across the country.

The CCI’s mission is to enhance clinical and translational research efforts across the Cleveland area by: (1) spurring advances in knowledge of risk factors, outcomes and treatment effectiveness in the population; (2) facilitating the transfer of scientific advances to the community; and (3) developing a new generation of clinical researchers equipped with the skills needed to efficiently design, implement and interpret novel studies that address important public health questions. To accomplish its mission, the CCI provides computer systems and applications support for basic science and clinical research activities and works closely with basic science and clinical investigators in the CWRU Schools of Medicine, Nursing, and Dental Medicine, as well as the University Hospitals Case Medical Center, Cleveland Clinic, and MetroHealth System. The CCI has supported hundreds of clinical research and epidemiology projects, including local and national multicenter, longitudinal studies. The CCI
has two cores that provide research support to all investigators: the Academic Development Core and Statistical Sciences Core.

The Academic Development Core manages the newly created PhD Program in Clinical Translational Science, the Master's Degree Program in Clinical Research (Clinical Research Scholars Program - see "Clinical Research" tab above), and the Graduate Certificate Program in Clinical Research. The Academic Development Core also delivers seminars and short courses in clinical research and works to coordinate educational activities in interdisciplinary clinical research across the CTSC's institutional members. The programs target investigators and other key members of the research team, including data managers and study coordinators. Training efforts in research design, research data management, statistical sciences, statistical software, and scientific communication are emphasized.

**Center for Global Health and Diseases**

Phone: 216.368.6321
https://case.edu/medicine/globalhealth/node/1

James W. Kazura, MD, Director

The Center for Global Health and Diseases was formed in 2002 as a result of a merger between the Center for International Health (first established in 1987) and the Division of Geographic Medicine. The new center is located on the fourth floor of the Biomedical Research Building on the Case Western Reserve University's School of Medicine campus in Cleveland, Ohio. The center provides a coordinating structure to help link the numerous international health resources of the university, its affiliated institutions, and the Northern Ohio community in a multidisciplinary program of research, training and clinical application related to global health. The center brings together many disciplines at CWRU to make life better in developing countries, and thus facilitates international collaborations throughout the institution.

The mission of the Center for Global Health and Diseases is to promote health in the world and enrich the community around CWRU.

This is accomplished by:

- bringing together experts from the university's community that specialize in infectious diseases, epidemiology, anthropology, tropical diseases, neglected tropical diseases (dengue, dracunculiasis [guinea-worm disease], lymphatic filariasis, onchocerciasis [river blindness], rabies, schistosomiasis, and various helminthiases), nursing, pediatrics, etc.
- uniting university faculty in programs of collaborative research and education, student and faculty international exchanges, and community enrichment to promote health in the world and enrich the international community.

The center focuses on three main objectives that have been present throughout its history:

- developing a critical mass of creative investigators with multidisciplinary capabilities and providing them with appropriate resources and environments for basic, clinical and epidemiological research, in order to develop linkages within and beyond the university community.
- establishing an education and training program to ensure the continuing replenishment of the pool of intellectual talent in this country and to enhance the scientific proficiency of scientists from developing countries via an educational program based at the university, reaching a wide audience.
- advancing a collaborative interdisciplinary application program in international health overseas to bring together diverse disciplines, adaptation, and adoption of practices and the application of technology to underserved populations of the world.

A certificate in Global Health is available (https://case.edu/medicine/globalhealth/training-courses/certificate-in-global-health/).

**Center for Medical Education**

Phone: 216.368.1948
Patricia A. Thomas, MD, FACP Director
Klara Papp, PhD, Director, CAML

The Center for Medical Education, established in 2010, provides an organizational home for teaching and learning programs in the School of Medicine and a supportive environment for those who want to develop special skills in medical education.

The Center also sponsors faculty appointments, both full- and part-time, for faculty whose roles are predominantly focused on teaching medical students and physician assistant students. These include community clinicians who welcome medical students into their clinics and practices. The Center for the Advancement of Medical Learning ("CAML") operates its programs under the auspices of the CMEd. CAML supports and promotes the development of teaching and lifelong-learning skills among students, faculty, staff, residents, and alumni. CAML pursues research into educational innovations to advance our knowledge of medical learning and teaching. The Center offers workshops to faculty locally, regionally, and nationally to enhance faculty teaching, research and evaluation skills.

**Center for Proteomics and Bioinformatics**

Phone: 216.368.0291
http://proteomics.case.edu

Mark R. Chance, PhD, Director

Biomedical Research Building, Ninth Floor

The Case Center for Proteomics and Bioinformatics was created, in part, to strengthen Cleveland's presence in modern proteomics and bioinformatics research to make the region a leader in the field. The vision for the Center has been shaped over the past several years by the leadership of the Center's Director, Mark Chance, PhD, with over $120 million in grants awarded to the Center and its collaborators since its inception in February 2006. One of the primary goals of the CPB is to develop an infrastructure of sophisticated equipment that facilitates and maximizes shared equipment usage, as well as to offer a wide array of proteomics, and metabolomic services including protein and small molecule mass spectrometry, protein expression/interactions, systems biology, and biostatistical analyses.

The CPB has expanded its vision to include education of graduate students in systems biology and bioinformatics. The Center for Proteomics and Bioinformatics developed a graduate program in Systems Biology and Bioinformatics in collaboration with Schools and Departments across the campus. For more information regarding the SYBB graduate program please see "Systems/Bioinformatics" tab above. You may also visit http://bioinformatics.case.edu/.

In studying proteins and metabolites, bioinformatics analysis enables researchers to take an integrated pan-omics approach for discovering...
networks involved in human disease. The School of Medicine has established the Center for Proteomics and Bioinformatics to perform research to better understand the genetic and environmental bases of disease as well as provide new technologies to diagnose diseases such as cancer, heart disease, and diabetes. Utilizing bioinformatics enables researchers to take an integrated -omics approach for discovering networks involved in human disease.

New technologies in mass spectrometry are also allowing protein expression, localization, structure, post-translational modifications, and interactions to be studied in increasing detail and on a genome-wide scale. The Center is also developing and applying state-of-the-art-structural proteomics technology, metabolomic and small molecule analysis, especially for pharmacokinetic (PK) studies to support clinical, translational, and structural research.

The CPB has three major research areas: Proteomics and Bioinformatics, Metabolomics, and Macromolecular Structure.

**Proteomics and Bioinformatics** faculty and staff support research in protein expression analysis, protein modifications, and protein interactions in a wide variety of biological contexts as well as develop new bioinformatics tools in Proteomics research. This includes multiple Proteomics Cores to support these activities.

**Metabolomics** faculty and staff support metabolite small molecule quantification research in the CWRU community. The services provided range from drug PK studies to quantification of endogenous metabolites in clinical and preclinical samples.

**Macromolecular Structure** faculty and staff support interdisciplinary research in new methods of structure determination, the combination of computational and experimental structural biology approaches and developing and maintaining the infrastructure for macromolecular structure determination.

The CPB also offers a wide range of seminars, workshops, and possibilities for individual training. These activities are posted on the CPB Web site. For a list of services and to explore opportunities to collaborate, please visit the Web site: [https://case.edu/medicine/nutrition/case-center-proteomics-and-bioinformatics/](https://case.edu/medicine/nutrition/case-center-proteomics-and-bioinformatics/)

**Center for Psychoanalytic Child Development**

Phone: 216.991.4472
Kimberly Bell (kmb207@case.edu), PhD; John A. Hadden Jr. Assistant Professor of Psychoanalytic Child Development

The Center for Psychoanalytic Child Development was established in 2001 as a memorial to John A. Hadden Jr., past President of the Board of Trustees of the Cleveland Center for Research in Child Development and of the Hanna Perkins School. The mission of the center is to advance the science of psychoanalytic child development at the School of Medicine.

The Center offers medical students and residents who are interested in working with children the opportunity for observational learning in the Hanna Perkins school. In addition, didactic courses, case conferences and supervision are available to deepen students’ understanding of the relationship between physical and psychological development in the first 5 years of life.

**The Center for RNA Science and Therapeutics**

Phone: 216.368.0299
https://www.rnacenter.org/
Jeffery M. Coller, PhD, Director

The Center for RNA Science and Therapeutics is a free standing academic unit in the basic sciences within the School of Medicine at Case Western Reserve University. The RNA Center was established in the mid-nineties as a core entity in recognition of the strong cadre of research laboratories devoted to studying post-transcriptional mechanisms of gene expression focusing on various aspects of RNA Biology. The current mission of the RNA Center is to parlay the strengths of RNA Center scientists towards the development of unique therapeutic initiatives. The RNA Center is combining the usage of nanoparticle technology with RNA science to develop new classes of drugs, leading towards the amelioration of a variety of diseases. Current efforts are focused on metabolic disorders, cancer immunotherapies, immunity, and protein replacement. In addition, we are developing new technologies that promise to improve diagnostics, allowing for earlier detection of a variety of human diseases, especially cancer.

The RNA Center contains one of the largest concentrations of RNA scientists in the nation. The faculty of the RNA Center cover nearly every aspect of RNA research. Current research in the Center focuses on several problems ranging from extremely basic questions such as the mechanism of RNA catalysis and how proteins interact with RNA to the roles of RNA processing in disease. Specific research interests include splicing and its regulation, RNA editing, tRNA maturation, mechanisms of translation regulation, RNA degradation, RNA trafficking, RNA interference and regulation of gene expression by microRNAs and non-coding RNAs.

Collectively, the RNA Center provides a valuable resource for collaborative efforts within the University and its affiliated institutions: the Cleveland Clinic Foundation, MetroHealth Medical Center, the Cleveland VA Medical Center, and University Hospitals Cleveland Medical Center. In addition, the official journal of the RNA Society “RNA” was founded and continues to be housed in the RNA Center. The members of the RNA Center have an excellent funding record and the research performed is regularly published in highly visible journals such as Science, Nature, Molecular Cell, NSMB, Molecular Cell, etc.

**Center for Science, Health and Society**

Phone: 216.368.2059
http://casemed.case.edu/cshs/
Nathan A. Berger, MD, Director

Recognizing that the successful futures of Case Western Reserve University, the City of Cleveland, and Cuyahoga County are integrally related, the Center for Science, Health and Society (CSHS) was created in 2002 to focus the efforts of the University and the community in a significant new collaboration to impact the areas of health and healthcare delivery systems through community outreach, education, and health policy. The Center, based in the School of Medicine, with university wide associations, is engaging the many strengths of the University and the community to improve the health of the community.

The Center has engaged the community at the level of the individual and the neighborhood, in public and private schools, at civic and faith-based organizations, and at the level of governmental agencies and community
leadership to identify community problems, perceptions, assets and resources; advise the community of faculty skills, assets and expertise; and, catalyze that community service based scholarship that benefits community interests and promotes mutual enhancement. The Center coordinates the Scientific Enrichment Opportunity outreach program that brings Cleveland high school students on to the medical school campus in the summer to work along with our distinguished faculty in their research labs, to introduce and stimulate the students and help prepare them to enter careers in the health career professions and biomedical workforce. The Center also coordinates the Mini Medical School Program presented every Spring and Fall to educate the community on the latest developments in healthcare, particularly those developed at CWRU. The overall goal of these programs is to educate and empower the community to become better consumers of healthcare and more informed and stronger advocates for healthcare policy and legislation in their own interests.

Center for the Study of Kidney Biology and Disease
Phone: 216.444.8415
John R. Sedor, MD, Director
Thomas H. Hostetter, MD, Co-director
Jeffrey Garvin, MD, PhD, Co-director
Jeffrey Schelling, MD, Co-director

Chronic Kidney Disease (CKD) is a growing public health problem in the United States. More than seventeen percent of US adults—more than 30 million Americans—have CKD. CKD generally progresses over time and can cause cardiovascular disease, anemia, bone disease, fluid overload, and eventually end-stage kidney disease (ESKD). Patients with ESKD need renal replacement therapy, either from dialysis or a kidney transplant, to live. The risk of death for patients receiving dialysis is nearly eight times higher than the non-ESRD population, leading to a 20% annual probability of death. Kidney disease disproportionately affects minorities and vulnerable populations. Kidney disease treatment is expensive and uniquely tied to federal expenditures through the Medicare entitlement program. The cost of care for ~ 550,000 ESKD patients is nearly $34 billion annually, exceeding the total NIH budget. Treating all CKD and ESRD patients consumes nearly 25% of Medicare's budget.

The Center’s mission is to accelerate discovery and its translation for treatment and cure of kidney diseases in an interdisciplinary environment within the rich, research environment of the CWRU School of Medicine. The faculty is an accomplished and highly interactive group of investigators, based in the adult or pediatric Divisions of Nephrology in CWRU-affiliated hospitals as well as other clinical and basic science departments. Research interests of the faculty include digital pathology image analysis, glomerular diseases, diabetic and other chronic kidney diseases, epithelial cell biology and ion transport, tubular physiology, genetic epidemiology, health services research, renal transplantation, health disparities research and clinical trials. Center faculty are members of the NIDDK-funded Kidney Precision Medicine Project. Research projects use cellular, molecular biological, computational, genetic, genomic and epidemiological methods to study in vitro and animal models and/or patients. Many projects by Center investigators use health data, culled from electronic health records, and biological samples from patients with kidney diseases in order to generate novel hypotheses, which can then tested with animal models and cell lines. Training opportunities are available for undergraduate, pre- and post-doctoral students.

National Center for Regenerative Medicine
Phone: 216.368.0846
http://www.ncrm.us/
Stanton L. Gerson, MD, Director

The National Center for Regenerative Medicine (NCRM) is a platform to facilitate translational research, clinical application, and commercialization of regenerative medicine, tissue engineering, and stem cell therapeutics across a consortium of institutions. NCRM is driven by four nationally ranked, medical research powerhouses, Case Western Reserve University, Cleveland Clinic, University Hospitals Cleveland Medical Center and Ohio State University. Through this network of researchers and clinicians, research discoveries are actively being translated into cell-based therapies for patient care.

NCRM is leading the way in Northeast Ohio in the following areas:

- Regenerative medicine and stem cell research
- Cellular manufacturing
- Clinical trials for cellular therapeutics

Global partnerships have been established with academic institutions and biotechnology companies to further expand research and discovery efforts.

NCRM Goals:

- Translational Research: To support stem cell and regenerative medicine research across various disciplines, institutions and commercial entities.
- Education and Training: To develop cutting-edge education programs for researchers, clinicians, trainees and the general public. For more information regarding the RGME graduate program please visit https://case.edu/medicine/ncrm/training-education/.
- Strategic Partnership: To build networks across academic, clinical, commercial and public sectors.
- Commercialization: To translate innovative technologies and cell-therapies into business opportunities.

Case Western Reserve University offers three areas of study in Clinical Research/Clinical Translational Science:

1. Graduate Certificate in Clinical Research (p. 845)
2. Master’s in Clinical Research
3. PhD in Clinical Translational Science

Each of the aforementioned programs was designed to fit an ever growing need for well-trained clinical investigators. The curriculum for each program was designed to make the student a more effective, ethical, and efficient researcher.

The Graduate Certificate in Clinical Research
This 11 credit hour program (https://case.edu/medicine/crsp/programs/certificate-program/) provides the foundational training in clinical research methods to those individuals who are seeking an alternative to the Master of Science in Clinical Research. It is geared towards clinicians
and other health-science professions who are interested in conducting 
clinical research and/or collaborating with other clinician-scientists who 
are conducting clinical research. This program is also beneficial to health-
science students, basic-science researchers, and other health science 
professionals who would like to enhance their skills in patient-oriented 
research.

Clinical Research Scholars Program (CRSP)
The Clinical Research Scholars Program (CRSP) (http://
casemed.case.edu/CRSP/) is designed for individuals committed to a 
career in clinical investigation in an academic or related field. CRSP offers 
a Master’s Degree in Clinical Research through two pathways.

Training in both clinical research and career development provides CRSP 
Scholars with an educational experience that prepares them to identify a 
research question and critically evaluate relevant literature; transform the 
question into a feasible and valid study design; develop and execute the 
study protocol; and analyze and effectively communicate the findings.

The PhD in Clinical Translational Science Program
The goal of this program (https://case.edu/medicine/crsp/programs/
phd-clinical-translational-science-cts/) is to train and graduate clinical-
translational scientists to meet the need for a transformed clinical and 
translational enterprise. Students in the program will be rigorously 
educated in the theory and practice of clinical translational science 
in order to make significant clinical discoveries and to move these 
discoveries across the translational continuum. The curriculum is 
based on a set of nationally-developed core competencies to guide the 
nationwide training of clinical and translational scientists and will provide 
students with the required knowledge, skills, and experience to become 
productive and innovative researchers in the field of Clinical Translational 
Science.

Faculty
The program resides in the Department of Population and Quantitative 
Health Sciences (PQHS) (http://epbiwww.case.edu/) in the School of 
Medicine. The academic units involved include the School of Medicine, 
Nursing, Management, and Dentistry. The faculty is selected for their 
expertise and commitment to teaching and mentorship in clinical 
investigation. They are primarily drawn from the Departments of 
Medicine, Pediatrics, and PQHS from the School of Medicine.

For Questions and Information Please Contact:
Clinical Research Scholars Program
Case Western Reserve University
10900 Euclid Ave., W-G74A
Cleveland, OH 44106-4945
crsp-course@case.edu
216.368.2601

Clinical Research Scholars Program (CRSP)
The Clinical Research Scholars Program (CRSP) (http://
casemed.case.edu/CRSP/) is designed for individuals committed to a 
career in clinical investigation in an academic or related field.

CRSP offers a Master’s Degree in Clinical Research through two 
pathways:
1. CRSP Type A (Thesis) - (https://case.edu/medicine/crsp/programs/
ms-clinical-research-crsp/crsp-courses/)
   • Curriculum was developed for those with an existing 
degree in medicine, dentistry, nursing, or an allied science 
such as pharmacy or biomedical engineering.
   • This pathway is to prepare a new generation of 
clinical investigators for leadership roles in academia, 
government, and industry.

2. CRSP Type B (Capstone) - (https://case.edu/medicine/crsp/ 
programs/ms-clinical-research-crsp/crsp-courses/)
   • Curriculum was created for individuals who may not be 
playing a principal investigator or clinical research study, 
but who:
   • desire strong preparation in clinical research methods and 
associated statistical approaches
   • envision themselves playing a critical role on the clinical 
research team as a research assistant, study coordinator, 
or data manager
   • This pathway is to provide the student with fundamental 
knowledge and/or experience in important tasks related to 
the clinical research endeavor.

Training in both clinical research and career development provides CRSP 
Scholars with an educational experience that prepares them to identify a 
research question and critically evaluate relevant literature; transform the 
question into a feasible and valid study design; develop and execute the 
study protocol; and analyze and effectively communicate the findings.

The CRSP program consists of three parts:
• Formal didactic modular and semester-long course work
• A seminar series that focuses on communication skills required 
for career development
• An intensive mentored experience centered on a specific clinical 
problem (Type A Pathway) or a Capstone Project (Type 
B Pathway)

It is expected that individuals so trained can master fully the challenges 
in clinical investigation of the next decade, particularly the new 
translational opportunities being developed. As such, they should be 
attractive candidates for positions in clinical science departments, 
research institutes, or industry.

A dual degree track has also been established for medical students 
interested in obtaining dual MD/MS degree. The dual MD/MS program:
• seeks individuals committed to a career in clinical investigation 
in an academic or related environment
• consists of a total of 30 credits: 21 credit hours of coursework, 
9 credit hours of mentored research and a formal oral thesis 
defense
• both focus and flexibility in its curriculum -
• Focus is provided through a core curriculum (15-16 credit 
hours) highlighting clinical research methods, the ethical 
conduct of research, and a seminar series that introduces the 
skills necessary for scholarly success.
• Flexibility is provided through elective coursework. Students 
typically have special interests in a particular area of clinical 
research, both clinically and methodologically. This program 
facilitates pursuit of different methodological interests 
guided by seasoned CWRU research faculty and addressed 
partly with choice of appropriate electives (5-6 credit hours).
Requirements for the dual MD/MS degree differ to reflect integration with the medical school curriculum. Most graduates of this program are currently working in academic medical settings, with smaller numbers located in research positions in the private sector or private practice.

**CURRICULUM FOR THE TYPE A (THESIS) MASTER'S DEGREE IN CLINICAL RESEARCH**

30 credit hours are required (of which 15 are core coursework; 9 of thesis research; and 6 of elective coursework) for completion of this Master of Science in Clinical Research degree.

PhD in Clinical Translational Science

The goal of the PhD in Clinical Translational Science (https://case.edu/medicine/crsp/programs/phd-clinical-translational-science-cts/) program is to train and graduate clinical-translational scientists to meet the need for a transformed clinical and translational enterprise. Students in the program will be rigorously educated in the theory and practice of clinical translational science in order to make significant clinical discoveries and to move these discoveries across the translational continuum.

The program's curriculum is based on a set of nationally-developed core competencies to guide the nationwide training of clinical and translational scientists and is purposefully designed to furnish our students with the required knowledge, skills and experience to become productive and innovative researchers in the field of clinical translational science.

Program graduates will be able to:

• Independently lead, design, execute, manage and interpret multidisciplinary clinical-translational research in a conceptually, methodologically, ethically and regulatory sound manner
• Assume leadership roles in both academic and industry settings
• Establish national reputations as leaders in a given area of expertise.

Eligible applicants include:

• Individuals with an advanced clinical degree (e.g., MD, DMD, DRNP)
• Individuals enrolled in dual clinical-research degree programs, such as CWRU's MD-PhD and DMD-PhD programs
• Individuals with an existing Master's degree in a health-related field (e.g., MS, MSN, MPH)
• Individuals with other scientific or clinical backgrounds to be evaluated on a case-by-case basis.

Curriculum Requirements:

Curriculum requirements are based on student's previous education and training:
General Medical Sciences

- **Student with No Existing Advanced Research Degree**
  - Students will complete a minimum of 54 credit hours
  - 36 credit hours is coursework, of which a minimum of 24 must be graded.
  - 19 credit hours will be required coursework
  - 17 credit hours are elective coursework
  - 18 credit hours of Dissertation

**Students with an Advanced Research Degree (e.g. MS, MPH, MNS)**

Students with a relevant advanced degree must petition the PhD Steering Committee to obtain a waiver for required coursework. For the waiver, the student must submit transcripts showing the course and grade, as well as the syllabus for the course.

Per the School of Graduate Studies, curriculum for individual with relevant advanced degree:

- Minimum of 18 credit hours of coursework, of which 12 must be graded. The courses used to achieve the 18 credit hours will depend on individual needs and require the academic advisor's (mentor's) approval.
- 18 credit hour of Dissertation

Students Seeking Dual Degree MD/PhD Through Case Western Reserve University's Medical Scientist Training Program and Clinical Translational Science Training Program: (https://case.edu/medicine/crsp/programs/phd-clinical-translational-science-cts/program-study-tracks/seeking-dual-degree/)

Curricula of the two-degree programs are integrated.

Curriculum for Dual-Degree students:

- 39 credit hours of coursework, as follows:
  - 16 credit hours of required courses (CRSP 401, “Introduction to Clinical Research”, is waived as course material is covered in medical school's curriculum)
  - 2 credit hours of core electives
  - 6 credit hours of research rotations
  - Up to 18 credit hours of CRSP 601, “Research Practicum”, or electives

**The PhD in Clinical Translational Science Curriculum:**

- Required Courses:

| CRSP 401 | Introduction to Clinical Research Summer Series | 3 |
| PQHS 490 | Epidemiology: Introduction to Theory and Methods | 3 |
| CRSP 412 | Communication in Clinical Research - Grant Writing | 1 |
| CRSP 413 | Communication in Clinical Research - Oral Presentation, Posters, and the Mass Media | 1 |
| CRSP 431 | Statistical Methods I | 3 |
| CRSP 432 | Statistical Methods II | 3 |
| CRSP 440 | Translational & Patient-Oriented Research Theory | 3 |

| CRSP 450 | Seminar in Multidisciplinary Clinical & Translational Research | 0 |
| CRSP 501 | Team Science - Working in Interdisciplinary Research Teams | 1 |
| CRSP 550 | Meta-Analysis & Evidence Synthesis | 2 - 3 |
| CRSP 603 | Research Ethics and Regulation | 1 - 2 |

Total Units: 21-23

**Core Electives**

Student must take a minimum of 2 credit hours of courses from the list below, depending on their specific needs and mentor approval.

| CRSP 500 | Design and Analysis of Observational Studies | 3 |
| CRSP 502 | Leadership Skills for Clinical Research Teams | 2 |
| SYBB 421 | Fundamentals of Clinical Information Systems | 3 |
| PQHS 416 | Introduction to Computing in Biomedical Health Informatics | 3 |
| PQHS 450 | Clinical Trials and Intervention Studies | 3 |
| PQHS 467 | Comparative and Cost Effectiveness Research | 1 - 3 |

Total Units: 9

**Electives:**

Students will take required and elective courses to satisfy the graded and pass/fail course requirements and to advance to candidacy. These courses are selected based on students' needs and mentor approval. Any CWRU credit-bearing course may qualify. The courses could be "field specific" or include other core elective courses not taken as part of the requirement above. The following list is for illustrative purposes only and is not limited to those listed. Students are not limited to these courses.

| CRSP 410 | Independent Study in Clinical Research | 1 - 3 |
| CRSP 503 | Innovation and Entrepreneurship | 1 |
| CRSP 510 | Health Disparities | 3 |
| NURS 518 | Qualitative Nursing Research | 3 |
| PQHS 411 | Introduction to Health Behavior | 3 |
| PQHS 416 | Introduction to Computing in Biomedical Health Informatics | 3 |
| PQHS 490 | Epidemiology: Introduction to Theory and Methods | 3 |
| SASS 614 | Models of Qualitative Research | 3 |

Total Units: 20-22

**Research Component**

| CRSP 601 | Research Practicum | 1 - 9 |
| CRSP 701 | Dissertation Ph.D. | 1 - 9 |

Total Units: 2-18
### SAMPLE TRACK OF STUDENT WITH NO EXISTING ADVANCED RESEARCH DEGREE:

Phone: 216.368.6971
David T. Lodowski, PhD, Co-Director
Mark Chance, PhD, Co-Director
Program email: sybb@case.edu

Do you want to convert big data into understandable models that just might change the world? With a graduate degree in systems biology and bioinformatics, you can combine your love of math, statistics, computers and biology to develop computational models with which to provide new insight and understanding of big data, leading to big discoveries in both laboratory and clinical settings.

Data science is the convergence of data engineering, math, statistics, advanced computing, the scientific method and subject-matter expertise. It involves the collection, management and transformation of "big data" into actionable information that can answer some of the world's most pressing problems. Yet there is a distinct need for data science experts who can efficiently interpret data into information that is useful for strategic decision-making. It is the goal of the Systems Biology and Bioinformatics program to produce the scientists that are needed to assist in extracting meaning from the burgeoning biological 'omics field.
The SYBB program offers a multidisciplinary training program personally customized to the student leading to an MS or PhD. The program draws training faculty (currently 38 trainers) from more than 12 departments and 6 schools across the CWRU campus, ensuring students in the program acquire the core competencies needed to succeed in the bioinformatics analysis of biological big data.

The Systems Biology and Bioinformatics PhD program at CWRU offers trainees the opportunity to combine both experimental and computational or mathematical disciplines to understand complex biological systems. The SYBB program will train scientists who are able to generate and analyze experimental data for biomedical research and to develop physical or computational models of the molecular components that drive the behavior of a biological system. The goal of the program is to produce scientists who are familiar with multiple disciplines and equipped to conduct interdisciplinary research.

The Case Western Reserve University (CWRU) graduate program in Systems Biology and Bioinformatics (SYBB) has two tracks:

Translational Bioinformatics
The SYBB track in Translational Bioinformatics poises students to work at the interface of applied ‘omics research and clinical medicine. From integrating genomic and functional genomic data into electronic medical records, to developing meta-analysis tools for communicating genomic risk to patients to utilizing this data in personalized medicine. Students trained in the Translational Bioinformatics track work to integrate bioinformatics tools and technologies into clinical workflows. Graduates of this training track will find ample opportunities within industry and, as genomics enters the clinical arena, within hospitals, as well.

Molecular and Computational Biology
The SYBB track in Molecular and Computational Biology embraces the pursuit of basic science research, employing the application and development of computational approaches to address difficult questions derived from today’s “Big data” derived from ‘omics approaches. This track equips students in the acquisition of experimental data utilizing approaches including proteomics, metabolomics, genomics and structural biology and extends this work with interpretation provided by computational analysis. Graduates of this training track will find ample opportunities within the pharmaceutical industry, contract research organizations as well as more traditional academic career paths.

Students can choose either track for both the MS and PhD programs.

The SYBB participating departments and centers include:

- Biology
- Biomedical Engineering
- Case Comprehensive Cancer Center
- Cleveland Clinic Lerner College of Medicine
- Center for Proteomics and Bioinformatics
- Center for Systems Immunology
- Electrical Engineering and Computer Science
- Epidemiology and Biostatistics
- Genetics and Genome Sciences
- Mathematics
- Nutrition
- Physiology and Biophysics
- Pharmacology

Program Competencies
The specific academic requirements of the SYBB Program are intended to provide students with a required core curriculum in Systems Biology and a set of electives designed both to assure minimum competencies in Fundamental Core Competencies and equip them for their particular thesis research discipline. Each trainee will be guided in their customized course of study by a mentoring committee to ensure the completion of training in the program competencies as well as maintenance of a focus on molecular systems theory. These competencies include:

- Evaluation of the scientific discovery process and of the role of bioinformatics in it in detail, including data generation steps and understanding biology
- Application of computational and statistical methods appropriate to solve a given scientific problem
- Construction of software systems of varying complexity based on design and development principles
- Effective teamwork to accomplish a common scientific goal
- Building knowledge in local and global impact of bioinformatics and systems biology on individuals, organizations, and society
- Effective communication of bioinformatics and systems biology problems to a range of audiences, including, but not limited to, other bioinformatics professionals.

Masters Degree Plan A Summary
The minimum requirements for the master’s degree under Plan A are 21 semester hours of course work plus a thesis equivalent to at least 9 semester hours of registration for 30 hours total. These must include SYBB 501 Biomedical Informatics and Systems Biology Journal Club, and a minimum of 9 hours of SYBB 651 Thesis MS. Additional required courses for the Translational Bioinformatics and Molecular and Computational Biology tracks are SYBB 459 Bioinformatics for Systems Biology and SYBB 555 Current Proteomics. The curriculum plan must be approved by the program steering committee and include appropriate coverage of the core competencies in genes and proteins, bioinformatics, and quantitative modeling and analysis. At least 18 semester hours of course work, in addition to thesis hours, must be at the 400-level or higher.

Each student must prepare an individual thesis that must conform to regulations concerning format, quality, and time of submission as established by the dean of graduate studies as well as conforming to the SYBB program guidelines. For completion of master's degrees under Plan A, an oral examination (defense) of the master's thesis is required, where the examination is conducted by a committee of at least three members of the university faculty.

Masters Degree Plan B Summary
The minimum requirements for the master’s degree under Plan B are 30 semester hours of course work (with at least 18 semester hours of course work at the 400 level or higher) and a written comprehensive examination or major project with report to be administered and evaluated by the program steering committee. The coursework must include SYBB 501 Biomedical Informatics and Systems Biology Journal Club. Additional required courses for the Translational Bioinformatics and Molecular and Computational Biology tracks are SYBB 459 Bioinformatics for Systems Biology and SYBB 555 Current Proteomics. The curriculum plan must be approved by the program steering committee and include appropriate coverage of the core competencies in genes and proteins, bioinformatics, and quantitative modeling and analysis.

### PhD Program Summary

The Systems Biology and Bioinformatics program differs from current CWRU programs in the comprehensive requirement for an understanding of biological systems, bioinformatics, and quantitative analysis & modeling. The program includes a minimal set of required courses including [SYBB 501](http://bulletin.case.edu/search/?P=SYBB%20501) Biomedical Informatics and Systems Biology Journal Club and a course in the Responsible Conduct of Research (IBMS 500) On Being a Professional Scientist: The Responsible Conduct of Research. Additional required courses for the Translational Bioinformatics and Molecular and Computational Biology tracks are SYBB 459 Bioinformatics for Systems Biology and SYBB 555 Current Proteomics. At least six additional courses will be required based upon individualized student interests. Other requirements include a qualifier exam, a PhD Dissertation, and oral defense. The total credits required for the PhD is at least 54 credits: 24 graded credits, 12 pre-dissertation research credits, and at least 18 dissertation research credits. Admissions to this program may be obtained through the integrated [Biomedical Sciences Training Program](http://bioinformatics.case.edu/).

### Sample Plan of Study for PhD Degree

§ Please also see Graduate Studies Academic Requirements for Doctoral Degrees (p. 1274)

Plan of study includes required courses as well as electives. Visit [http://bioinformatics.case.edu/](http://bioinformatics.case.edu/) for information regarding Plan of Study for all SYBB Tracks.

Total Units in Sequence: 45-109

**Footnotes**

- MSTP would take MSTP 400 for research rotations
- IBMS 501 Responsible Conduct of Research for Advanced Trainees is offered every spring semester (beginning 2020). The SOM requires that PhD students who are 4 years beyond their initial RCR training in IBMS 500 On Being a Professional Scientist: The Responsible Conduct of Research, register for IBMS 501.

The Master’s program in RGME will train individuals to work in academic, commercial, and clinical settings to support cellular manufacturing, exponential growth and application of the field of regenerative medicine. The program in systems biology and bioinformatics offers a flexible curriculum with a minimal number of required classes (SYBB 501 Biomedical Informatics and Systems Biology Journal Club, SYBB 459 Bioinformatics for Systems Biology, SYBB 555 Current Proteomics and Bioinformatics are the only required classes); the majority of classes taken toward the MS are tailored to the student’s research interests and thesis project. This flexibility enables students that are interested in pursuing the MS on a part time basis to maximize employee tuition benefits. A CWRU employee (or spouse) has a total of 15 credit hours/year (6 per semester and 3 per summer session) with which to pursue a degree. Taking only this number will net a part time student a MS in 5 semesters and 2 summer sessions; not taking a class during the summer sessions will result in taking 6 semesters to get the MS; and if a student were to take a single class a semester, it would take 11 semesters to reach the requisite number of classes needed for the MS.

Master’s of Science in Regenerative Medicine & Entrepreneurship (RGME)

Stanton L. Gerson, MD (https://case.edu/medicine/ncrm/node/276/) Professor, Medicine-Hematology/Oncology
Director, Case Comprehensive Cancer Center
Director, National Center for Regenerative Medicine
Associate Professor, Pediatrics
slg5@case.edu

Tracey Bonfield, PhD (https://casemed.case.edu/pediatrics/people/faculty-profile.cfm?people_id=136) 
Associate Professor, Pediatrics 
tracey.bonfield@case.edu (Tracey.Bonfield@case.edu)

Horst von Recum, PhD (https://case.edu/cancer/members/member-directory/horst-von-recum/) 
Associate Professor, Biomedical Engineering 
horst.vonrecum@case.edu (horst.vonrecum@case.edu)

The RGME is the first two-year master’s level program in Ohio focused on Regenerative Medicine and Entrepreneurship. Students enrolled in the RGME program will have access to cutting-edge clinical and research facilities along with small biotechnology companies within the network of the National Center for Regenerative Medicine (NCRM).

This unique, interdisciplinary program will provide a rigorous educational pathway targeting individuals seeking the advanced skills and training required to excel in the unique workforce necessary to support the exponential growth and application of the field of regenerative medicine. The Master’s program in RGME will train individuals to work in academic, commercial, and clinical settings to support cellular manufacturing, biotechnology innovation, legal and compliance, financial analyst and venture capital, and business development activities taking advantage of our strengths across the disciplines of regenerative medicine as a whole.

Part-time SYBB MS program

Our full-time students complete the 30-credit hour master’s degree in two years while learning from internationally renowned faculty across the University. The core courses provide the foundational elements including stem-cell biology, biomaterial engineering, medical product development, federal regulations, bioethics, and how to take a discovery to market. In addition, students select an independent study in either hands-on laboratory research or an industry internship. Various science and business development electives, paired with seminars and career development opportunities, round out your tailored experience. In lieu of a thesis, students create public presentations and written scientific projects throughout the program.

### Required Core Courses

### Certificate in Global Health

**Daniel Tisch, PhD, Director**

216.368.0875

The Certificate is the centerpiece of the Framework for Global Health Curricula comprised of faculty from across the Case Western Reserve University campus, whose objective is to promote education in global health issues. Nearly every department at CWRU offers multiple educational activities in global health. Rather than attempt to own all of these activities, the group at CWRU (representing Applied Social Sciences, Anthropology, Bioethics, Biology, Engineering, Mathematics, Medicine, Nursing, Population and Quantitative Health Sciences) elected to develop a structure within which each department could develop independently while taking advantage of what the others had to offer. The organizing structure for this became the certificate program rather than a separate degree. This approach recognizes that students need to graduate within a recognized discipline as well as recognition of a student’s focus, time and effort in training.

Each student in the Certificate Program will be grounded in global health by a core course (INTH 301 Fundamentals of Global Health/INTH 401 Fundamentals of Global Health) that will allow them to understand concepts and vocabulary across disciplines and that will facilitate meaningful communication with others based in a different discipline. In addition to the Certificate, the Framework for Global Health Curricula had identified and is annotating all global health related courses at CWRU. It has supported the recent revival of Medical Spanish and new courses and electives in Global Health.

### Requirements for Certificate in Global Health:

#### Anthropology

**Undergraduate:**

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>INTH 301</td>
<td>Fundamentals of Global Health</td>
<td>3</td>

</tr>
</tbody>
</table>

And complete one elective selected from list of approved electives in the Bioethics Department

**Contact:** Patricia Marshall (patricia.marshall@case.edu), 216.368-6196
Population and Quantitative Health Sciences

INTH 401  Fundamentals of Global Health  3
PQHS 484  Global Health Epidemiology  1 - 3
And complete an epidemiology research project with global perspective (may be substituted with other course work).

Contact: Daniel Tisch (daniel.tisch@case.edu), 216.368.0875

Math/Applied Math specialization:

INTH 301  Fundamentals of Global Health  3
or INTH 401  Fundamentals of Global Health
PQHS 431  Statistical Methods I  3
or POHS 490  Epidemiology: Introduction to Theory and Methods
MATH 449  Dynamical Models for Biology and Medicine  3

Complete a heal related modeling project with global perspective (may be substituted with other course work).

Contact: David Gurarie (david.gurarie@case.edu), 216.368.2857

Mathematics

INTH 401  Fundamentals of Global Health  3

Complete a global health related project (may be student’s thesis or may be substituted with other course work)

Contact: Ronald Blanton (ronald.blanton@case.edu), 216.368.4814

Nursing

Undergraduate:

INTH 301  Fundamentals of Global Health  3
NURS 372  Health in the Global Community  3
NURS 394  Global Health Seminar  3

Complete a global health related project (may be substituted with other course work)

Graduate:

INTH 401  Fundamentals of Global Health  3
NURS 394  Global Health Seminar  3

Complete a global health related project (may be substituted with course work)

Contact: Kristi Lehmer (kxl488@case.edu), 216.368.1794

Biology

INTH 301  Fundamentals of Global Health  3
or INTH 401  Fundamentals of Global Health

Additional Biology electives from approved list

Contact: Christopher Cullis (christopher.cullis@case.edu), 216.368.5362

Engineering

INTH 301  Fundamentals of Global Health  3
or INTH 401  Fundamentals of Global Health

Approved electives Engineering related courses

Contact: N. Sree Sreenath (n.sreenath@case.edu), 216.368.6219

Mandel School of Applied Social Sciences

INTH 401  Fundamentals of Global Health  3

Additional MSASS elective from approved list

Contact: Sharon Milligan (sharon.milligan@case.edu), 216.368.2335

Certificate in Cancer Biology

216.368.1994

Stanton Gerson, MD, Director
Damian J. Junk (djj40@case.edu), PhD, Assistant Director Cancer Training and Education, Case Comprehensive Cancer Center
http://www.case.edu/cancer/

The Clinical Oncology Research Career Development Program (CORP) provides interdisciplinary training in clinical and translational oncology research for clinical oncology junior faculty physicians who are interested in pursuing academic research careers as physician-scientists. This training addresses the need for clinician investigators to translate fundamental cancer research discoveries into medical care of cancer patients. Eligible candidates are physicians (MD, DO or MD/PhD) with a clinical training background in one of a number of oncology disciplines, including medical, surgical, pediatric, dermatological, gynecological and radiation oncology. Scholars select one of three areas of concentration:

• Mechanism Based Therapeutics and Clinical Trials
• Stem Cell Biology and Hematopoietic Malignancy Clinical Trials
• Prevention, Aging and Cancer Genetics and Clinical Trials

The Scholars’ individual training plan consists of a 2-year certificate program which includes a didactic curriculum designed to provide basic background and highly individualized advanced training in both clinical and methodological components of clinical and translational cancer research.

Each Scholar is co-mentored by both a basic or behavioral scientist and a clinical investigator. A mentoring committee comprised of faculty in the Scholar’s focus of oncology research provides additional guidance and support. During the period of mentored laboratory training, the Scholars develop original hypothesis-based experiments related to disease mechanisms at a molecular or cellular level. As the Scholars build on their laboratory conclusions to create and implement clinical trials, they are mentored by clinical investigators. Clinical trials are aimed at developing new methods for diagnosis and testing promising ideas for novel therapeutic interventions. These components come together with the Scholar’s presentations at a national conference, publications in peer review journals and application for independent funding as a physician-scientist.

This two-year certificate program is administered through the Case Comprehensive Cancer Center. The overall goal of the K12 CORP
The formal didactic program includes a course in responsible conduct of research, a course on Research Ethics and Regulation. Additional required activities include Clinical Protocol Tutorials, Intensive Mentored Research Project, Ongoing seminars, Meetings and Presentations; and applications for independent funding.

Formal Didactic Curriculum Coursework *:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>IBMS 500</td>
<td>On Being a Professional Scientist: The Responsible Conduct of Research</td>
<td>1-2</td>
</tr>
<tr>
<td>or CRSP 603</td>
<td>Research Ethics and Regulation</td>
<td></td>
</tr>
<tr>
<td>CNCR 501</td>
<td>Translational Cancer Research A (All four modules required, one each semester of the program (501-1, 501-2, 501-3, 501-4))</td>
<td>1</td>
</tr>
</tbody>
</table>

*Additionally, choose one course from following core courses for credit towards certificate:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>CRSP 401</td>
<td>Introduction to Clinical Research Summer Series</td>
<td>1-3</td>
</tr>
<tr>
<td>CRSP 402</td>
<td>Study Design and Epidemiologic Methods</td>
<td>3</td>
</tr>
<tr>
<td>CRSP 406</td>
<td>Introduction to R Programming</td>
<td>3</td>
</tr>
<tr>
<td>CRSP 413</td>
<td>Communication in Clinical Research - Oral Presentation, Posters, and the Mass Media</td>
<td>1</td>
</tr>
<tr>
<td>CRSP 412</td>
<td>Communication in Clinical Research - Grant Writing</td>
<td>1</td>
</tr>
<tr>
<td>CRSP 500</td>
<td>Design and Analysis of Observational Studies</td>
<td>3</td>
</tr>
<tr>
<td>CRSP 501</td>
<td>Team Science - Working in Interdisciplinary Research Teams</td>
<td>1</td>
</tr>
</tbody>
</table>

**Additional Requirement:** All students are required to be certified in responsible conduct of research before they can complete the program.

**Exit Standards:** Students who complete all required coursework and CREC certification will submit a checklist to the Clinical Research Scholars Program (http://case.edu/medicine/crsp/programs/certificate-program/) notifying the Education Administrator/Manager (crsp@case.edu) that all coursework has been completed. This administrator will verify with the registrar's office that all requirements have been met and will then issue a certificate to the enrollee, documenting completion of the program.

**Health Informatics Certificate**

Questions and Information:

Nickalaus Koziura, EdM
Graduate Certificate in Health Informatics
Case Western Reserve University
10900 Euclid Avenue, W-G74
Cleveland, Ohio 44106-4945
216.368.5957 - phone
informatics@case.edu

Students who want to explore Biomedical and Health Informatics certificate program without – or before – committing to a Master’s, can take a series of four or five courses that provide an overview and grounding in the fundamentals with practical applications in research, clinical care and population health. If you choose to continue to a Master's program within our department, all courses are transferable.

A 12-credit or 15-credit certificate is available, taking from one year to two-and-a-half years to complete, depending on a student’s chosen area of interest.
pace. Certificates are granted from the CWRU School of Medicine, Department of Population and Health Information Sciences. Only the 15-credit certificate will show on an official CWRU transcript. The Graduate Certificate in Health Informatics requires students to complete 6 credits of required courses and 6-9 credits of courses in a concentration. For a list of courses visit the Biomedical and Health Informatics certificate program (p. 931) page.

Post-baccalaureate Readiness Instruction for BioMedical Education (PRIME) Certificate Program
216.368.5296
https://case.edu/medicine/prime
Anthony Saar, MED
Director, PRIME Program
prime@case.edu

PRIME is a post-baccalaureate certificate (non-degree) program for students who need additional preparation to have a competitive application for MD or DO programs.

This program is designed for two types of students:

• Career changers - students who have not yet completed all their pre-med requirements.
• Academic enhancers - students who need to improve their undergraduate GPA and their foundation in key pre-med content.

Key features of this program include:

• A highly flexible and individually tailored program of study providing each student the preparation that they need to be competitive applicants
• A dedicated program director who has experience advising for medical school admissions and who meets regularly with students one-on-one
• Problem-based Clinical Inquiry (IQ) coursework designed to give students exposure to medical terminology and clinical reasoning and develop professional growth via self-reflection
• Specialized Medical College Admissions Test (MCAT) preparatory course designed to comprehensively review all MCAT content areas, as well as testing methods.
• Diverse opportunities for shadowing, volunteering, and research in affiliation with 4 world-class health systems (The Cleveland Clinic, University Hospitals Cleveland Medical Center, VA Medical Center, and MetroHealth Medical Center)
• Opportunity to interview with the CWRU School of Medicine for select students

The PRIME program is highly flexible. To earn the certificate, students must complete at least 24 credit hours. A program of study must be approved by the program director. Each student will work closely with the program director to tailor the program to their needs. Based on previous coursework taken, some students may need to take more than 24 credit hours to complete the prerequisite courses for medical school and earn the PRIME certificate. This program can be completed in 1-2 years, depending on a student’s individual needs.

</tbody>
</table>

Students may have completed some of these required courses prior to the start of this program and thus the students would be eligible for exemption from taking these courses for the certificate. Depending on course grades, students, with approval of the program director, may waive the required courses. Students may also elect to retake these courses for reference and/or to improve their undergraduate GPA.

Elective Coursework
In consultation with the program director, students will develop the best program of study for their needs. Typically, if a student has already taken the medical school prerequisites, but needs to improve their overall undergraduate GPA, taking upper-level undergraduate courses would show more rigor compared to retaking lower-level courses. With successful grades, a student’s undergraduate GPA will also improve.

Students may take additional elective coursework (http://casemed.case.edu/gradprog/PRIME/electives.php) across the university with program director and instructor approval. Although science and math classes will be the primary focus for most students, some students may also seek to take graduate coursework to demonstrate academic rigor. Further, some students may also elect to take other courses based on interests or a desire to improve technical skills (such as writing or language skills).
CRSP Courses

CRSP 401. Introduction to Clinical Research Summer Series. 1 - 3 Units.
This course is designed to familiarize one with the language and concepts of clinical investigation and statistical computing, as well as provide opportunities for problem-solving, and practical application of the information derived from the lectures. The material is organized around the internal logic of the research process, beginning with mechanisms of choosing a research question and moving into the information needed to design the protocol, implement it, analyze the findings, and draw and disseminate the conclusion(s). Prereq: M.D., R.N., Ph.D., D.D.S., health professionals.

CRSP 402. Study Design and Epidemiologic Methods. 3 Units.
This course will cover the methods used in the conduct of epidemiologic and health services research and considers how epidemiologic studies may be designed to maximize etiologic inferences. Topics include: measures of disease frequency, measures of effect, cross-sectional studies, case-control studies, cohort studies, randomized controlled trials, confounding, bias, effect modification, and select topics. Recommended preparation: CRSP 401 or permission of instructor.

CRSP 406. Introduction to R Programming. 3 Units.
This course will provide students with an introduction to R. Major topics will include session management, data objects, reading and writing data, restructuring and combining data frames, handling missing data, working with dates, statistical analysis concepts, and R traditional graphics. Students will learn R programming conventions, how to create, manage and edit R scripts programs, and how to interpret output. Each class will consist of a demo on each lesson followed by a practice session when time permits. Small research datasets will be used both in class examples and in the exercises for each lesson. Students will be expected to complete all homework assignments on time and submit a take-home final exam.

CRSP 407. Logistic Regression and Survival Analysis. 3 Units.
This course will focus on the conceptual understanding and practical application of multivariable modeling in the context of binary and time to event outcomes. Particular emphasis will be placed on model specification, assessment of model assumptions and proper interpretation and visualization of model results. Classes will generally involve a conceptual discussion of the topic in question, followed by a practical application using R statistical software. Planned topics include contingency tables, logistic regression models, Kaplan-Meier curves, Cox proportional hazard models, and sample size estimation for binary and time to event outcomes. Students will be expected to complete biweekly assignments and two course projects involving problem specification, data collection, analysis using R, and a presentation. Prior to taking this course students should have working knowledge of linear regression and its application using R. Students must have the latest software version of R installed on their laptops. Recommended preparation: CRSP 406. Prereq: NURS 630.

CRSP 410. Independent Study in Clinical Research. 1 - 3 Units.
Independent Study in Clinical Research enables the student to undertake study of advanced topics in clinical research that are not offered as standing courses at Case Western Reserve University. The student(s) and a member of the Clinical Research Scholars Program faculty, or another faculty member at CWRU, submit a 1-2 page proposal for independent study to the CRSP Program Director. The proposal should include a descriptive title (e.g., research method or clinical topic area) to be studied; a list of up to 5 student-centered objectives of the study; how the subject matter will be learned; and how success in achieving the objectives will be measured (e.g., manuscript, essay, grant proposal, or other written product; examination, etc.). It is expected that there will be at least one contact hour per week for each credit hour requested.

CRSP 412. Communication in Clinical Research - Grant Writing. 1 Unit.
Written communication is a critical skill in clinical science. We disseminate our work to others through publications, and we obtain the resources to conduct research through grant proposals. This course has been developed for K12 and CRSP scholars. The course focuses on writing grant proposals and, in particular, specific sections of an NIH-style grant. However, the principles discussed in the course apply to any type of proposal. Prereq: CRSP 401 or equivalent.

CRSP 413. Communication in Clinical Research - Oral Presentation, Posters, and the Mass Media. 1 Unit.
To move their work forward, investigators must be able to present their research effectively to both scientific and lay audiences. Although "the written word" is probably the first medium that comes to mind when we think of communication in scientific circles, other modes of communication are also vital. The main objective of this course is to help scholars improve their oral and poster presentation skills, as well as interaction with the mass media. This objective will be achieved through a combination of didactic sessions, readings, and presentations by the students. Prereq: CRSP 401 or equivalent.

CRSP 431. Statistical Methods I. 3 Units.
Application of statistical techniques with particular emphasis on problems in the biomedical sciences. Basic probability theory, random variables, and distribution functions. Point and interval estimation, regression, and correlation. Problems whose solution involves using packaged statistical programs. First part of year-long sequence. Offered as ANAT 431, BIOL 431, CRSP 431, PQHS 431 and MPHP 431.

CRSP 432. Statistical Methods II. 3 Units.
Methods of analysis of variance, regression and analysis of quantitative data. Emphasis on computer solution of problems drawn from the biomedical sciences. Design of experiments, power of tests, and adequacy of models. Offered as BIOL 432, PQHS 432, CRSP 432 and MPHP 432. Prereq: PQHS/EPBI 431 or equivalent.

CRSP 440. Translational & Patient-Oriented Research Theory. 3 Units.
Clinical (patient-oriented) and translational science has emerged as a new scientific discipline aimed to accelerate scientific discovery into effective practice. This course provides an overview of the theoretical framework, rationale, process, methodologies, and ethics of clinical and translational research. An integral feature of this course is the participation of a multidisciplinary teaching team, whose expertise and perspective will contribute to providing real-world insights into the complexities of translational and patient-oriented research.
CRSP 450. Seminar in Multidisciplinary Clinical & Translational Research. 0 Unit.
The purpose of this monthly seminar is to introduce students to the processes and challenges of multidisciplinary clinical/translational science, through which discoveries in the laboratory or in early clinical studies are transformed into interventions, treatments, and ultimately, best practices and policies on national and international levels. The seminar will use a case-based approach. Examination of active projects at Case Western Reserve University, Cleveland Clinic Foundation, the MetroHealth Medical Center, University Hospitals Case Medical Center, and the Louis Stokes Veterans Administration Medical Center will enable students to learn first-hand about clinical translational science in action.

CRSP 500. Design and Analysis of Observational Studies. 3 Units.
An observational study investigates treatments, policies or exposures and the effects that they cause, but it differs from an experiment because the investigator cannot control assignment. We introduce appropriate design, data collection and analysis methods for such studies, to help students design and interpret their own studies, and those of others in their field. Technical formalities are minimized, and the presentations will focus on the practical application of the ideas. A course project involves the completion of an observational study, and substantial use of the R statistical software. Topics include randomized experiments and how they differ from observational studies, planning and design for observational studies, adjustments for overt bias, sensitivity analysis, methods for detecting hidden bias, and focus on propensity score methods for selection bias adjustment, including multivariate matching, stratification, weighting and regression adjustments. Recommended preparation: a working knowledge of multiple regression, some familiarity with logistic regression, with some exposure to fitting regression models in R. Offered as CRSP 500 and PQHS 500.

CRSP 501. Team Science - Working in Interdisciplinary Research Teams. 1 Unit.
This course will assist learners to understand how different professional disciplines, each representing a body of scientific knowledge, can best work together to develop and disseminate translational knowledge. Learners will develop a set of skills specific to be an effective member and leader of an interdisciplinary research team, including working with different value and knowledge sets across disciplines, understanding the mental models of other disciplines, creating shared mental models, running effective meetings, managing conflict, giving and receiving feedback, and group decision making techniques. Using the small group seminar approach and case studies, learners will practice individual and group communication, reflective and self-assessment techniques, and engage in experiential learning activities regarding effective teamwork in interdisciplinary research teams. Techniques to increase group creativity and frame new insights will be discussed.

CRSP 502. Leadership Skills for Clinical Research Teams. 2 Units.
Leadership Assessment and Development is for participants to learn a method for assessing their knowledge, abilities, and values relevant to management; and for developing and implementing plans for acquiring new management related knowledge and abilities. The major goals of this course include generating data through a variety of assessment methods designed to reveal your interests, abilities, values, and knowledge related to leadership effectiveness; learning how to interpret this assessment data and use it to design/plan developmental activities; small group sharing of insights from the various assessments. Recommended preparation: K grant appointment or consent of instructor.

CRSP 503. Innovation and Entrepreneurship. 1 Unit.
The purpose of this module is to acquaint and ultimately engage clinical researchers with the business of innovation and entrepreneurship. Goals include: (1) to provide researchers with many of the skills that they would need to translate academic research into commercial uses; (2) to sensitize clinical researchers to the goals of the business community and facilitate their ability to work with the private sector on technology development; and (3) to make clinical researchers aware of the processes of academic technology development and transfer. Sessions consist of a lecture and case discussion facilitated by one of the co-directors.

CRSP 504. Managing Research Records - A System's Approach. 2 - 3 Units.
This course will provide an approach to managing data for research studies. Major topics include a discussion of a research study system including database design and development, data management, and clinical data management; how to evaluate the data needs of a study including the impact of required regulations; summary of key regulations; the role of the data manager including protocol review, development of a data management plan, CRF design, data cleaning, locking studies and ensuring best practices. Each session will include a lecture, class discussion, and student presentation.

CRSP 505. Investigating Social Determinants of Health. 2 - 3 Units.
The biopsychosocial model highlights the inter-related roles that biological, psychological, and social factors play in health and illness. This course is geared towards clinical research scholars who would like to incorporate aspects of the "social context" in their research. The course will examine the conceptualization, measurement, and effects of several key socio-cultural determinants of health and illness. Sample studies that incorporate social determinants of health will be reviewed. The course will also consider strategies and techniques to conduct clinical research involving social factors in socially and ethnically diverse settings. Students will be encouraged to develop a prototypical study design to incorporate social determinants in their research. To earn an optional third credit hour for this course, students will be required to complete additional assignments tailored to the students’ research needs and interests upon mutual agreement with the instructor at the beginning of the course. Recommended preparation: CRSP 401.

CRSP 510. Health Disparities. 3 Units.
This course aims to provide theoretical and application tools for students from many disciplinary backgrounds to conduct research and develop interventions to reduce health disparities. The course will be situated contextually within the historical record of the United States, reviewing social, political, economic, cultural, legal, and ethical theories related to disparities in general, with a central focus on health disparities. Several frameworks regarding health disparities will be used for investigating and discussing the empirical evidence on disparities among other subgroups (e.g., the poor, women, uninsured, disabled, and non-English speaking populations) will also be included and discussed. Students will be expected to develop a research proposal (observational, clinical, and/or intervention) rooted in their disciplinary background that will incorporate materials from the various perspectives presented throughout the course, with the objective of developing and reinforcing a more comprehensive approach to current practices within their fields. Offered as CRSP 510, PQHS 510, MPHP 510, NURS 510, and SASS 510.
CRSP 500. Meta-Analysis & Evidence Synthesis. 2 - 3 Units.
Systematic reviews use reproducible methods to systematically search the literature and synthesize the results of a specific topic area. Meta-analysis is a specific analytic technique used to pool results of individual studies. Systematic reviews are useful ways to establish one's knowledge in a particular field of study, and can highlight gaps in research which can be pursued in future work. They can also inform the background of a grant. This course is designed to introduce students to the methods of conducting a high quality systematic review and meta-analysis of intervention studies. We will cover the design, methods, and analytic techniques involved in systematic reviews. These concepts will prepare students to conduct their own systematic review or evaluate the systematic reviews of others. Sessions will be lectures, labs, and presentations. Topics include developing a search strategy, abstracting key data, synthesizing the results qualitatively, meta-analytic techniques, grading the quality of studies, grading the strength of the evidence, and manuscript preparation specific to systematic reviews and meta-analysis of intervention studies. Caveat: If you would like to conduct a systematic review of your own that can be published after the course ends, you will need to have several other class members or colleagues willing to work with you on the project. The systematic review should be on a topic where you expect no more than 20-30 included studies in order to be able to complete the review soon after the course ends. Offered as CRSP 550 and PQHS 550. Prereq: CRSP 401, PQHS/EPBI 431, MPHP 405, NURS 532 or Requisites Not Met permission.

CRSP 560. Special Topics in Clinical Research. 1 Unit.
In this 1 credit hour course, students will explore particular issues and themes related to Clinical Research. The course content will vary and is designed to explore content not covered in other CRSP courses or to expand student knowledge on topics introduced by other CRSP courses.

CRSP 601. Research Practicum. 1 - 9 Units.
Research practicum and/or laboratory rotation.

CRSP 603. Research Ethics and Regulation. 1 - 2 Units.
This course is designed to introduce students to the ethical, policy, and legal issues raised by research involving human subjects. It is intended for law students, post-doctoral trainees in health-related disciplines and other students in relevant fields. Topics include (among others): regulation and monitoring of research; research in third-world nations; research with special populations; stem cell and genetic research; research to combat bioterrorism; scientific misconduct; conflicts of interest; commercialization and intellectual property; and the use of deception and placebos. Course will meet once per week for 2 hours throughout the semester. Grades will be given based on class participation and a series of group projects and individual short writing assignments. Offered as BETH 503, CRSP 603 and LAWS 5225.

CRSP 650. Capstone Experience. 3 Units.
The Capstone will provide hands-on experience in conducting clinical research. To complete the Capstone project the student will register for 3 credit hours and dedicate at least 160 hours over the course of a semester, typically 20 hours per week for 8 weeks. Under the guidance of a Capstone Advisor the student will develop a Capstone project or internship/practicum, which may take diverse forms: A study project; Internship/Practicum; A combination of tasks necessary for the successful implementation of a study, such as attending team meetings, developing an IRB protocol, designing study forms, assisting with recruitment, study procedures, data management/cleaning, descriptive analysis, secondary analysis; Another format, with approval of CRSP director and Capstone Advisor.

CRSP 651. Clinical Research Scholars Thesis. 1 - 18 Units.
CRSP Thesis M.S.

CRSP 701. Dissertation Ph.D.. 1 - 9 Units.
Ph.D. Dissertation credits. Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

RGME Courses

RGME 525. Current Topics in Regenerative Medicine. 2 Units.
Current Topics in Regenerative Medicine, will be an elective course in the newly approved Master's Program in Regenerative Medicine and Entrepreneurship. The objective of this course is for each student to develop a general understanding of concepts and current topics related to Regenerative Medicine, Stem Cell research, entrepreneurship and product development. -To expose students to principles in Cell Biology and Tissue Engineering relevant to the field -To review the current landscape and spectrum of topics which makes up the field of regenerative medicine -To explore current and emerging technologies supporting regenerative medicine research -To discuss federal regulatory and compliance issues related to clinical research and the development of therapeutics -To explore cellular manufacturing approaches for regenerative medicine products -Discuss ethical and societal issues related to regenerative medicine research and technologies

RGME 535. Foundations in Regenerative Medicine. 3 Units.
Foundations in Regenerative Medicine is a team-taught course using multiple faculty content experts. The objective of this course is for each student to develop a general understanding of the foundations and concepts related to Regenerative Medicine and Stem Cell research. -To expose students to foundational principles in Cell Biology and Tissue Engineering relevant to the field -To review the current landscape and spectrum of topics which makes up the field of regenerative medicine -To explore current and emerging technologies supporting regenerative medicine research -To discuss federal regulatory and compliance issues related to clinical research and the development of therapeutics -To explore cellular manufacturing approaches for regenerative medicine products -Discuss ethical and societal issues related to regenerative medicine research and technologies

RGME 545. Stem Product Biology, Bench to Bedside Development and Therapeutic Translation. 3 Units.
This course is a team-taught course using multiple faculty content experts. The objective of this course is for each student to understand the concept of stem cell biology from procurement to therapeutic development. This course will provide an overview of the regulatory framework, concepts, lab operations, and biologic techniques to support cell and regenerative medicine product manufacturing. To work in this emerging field, students must understand the scientific and regulatory development of biologic therapies as well as operational issues related to manufacturing in the cleanroom space under quality systems. The goals are to: 1) Develop an understanding of the infrastructure and compliance required to manufacture biologics for clinical use of stem cells. 2) Identify and critically analyze key operational issues related to clinical development and use of biologics from expansion to pre-clinical validation and therapeutic use. 3) Perform hands on activities using current techniques. 4) Discuss ethical and societal issues related to regenerative medicine research and technologies.
SYBB 311B. Survey of Bioinformatics: Data Integration in Bioinformatics. 1 Unit.
SYBB 311B/411B is a five week course that surveys the conceptual models and tools used to analyze and interpret data collected by high-throughput technologies, providing an entry points for students new to the field of bioinformatics. The knowledge structures that we will cover include: biomedical ontologies, signaling pathways, and interaction networks. We will also cover tools for genome exploration and analysis. The SYBB survey series is composed of the following course sequence: (1) Technologies in Bioinformatics, (2) Data Integration in Bioinformatics, (3) Translational Bioinformatics, and (4) Programming for Bioinformatics. Each standalone section of this course series introduces students to an aspect of a bioinformatics project - from data collection (SYBB 311A/411A), to data integration (SYBB 311B/411B), to research applications (SYBB 311C/411C), with a fourth module (SYBB 311D/411D) introducing basic programming. Graduate students have the option of enrolling in all four courses or choosing the individual modules most relevant to their background and goals with the exception of SYBB 411D, which must be taken with SYBB 411A. Offered as SYBB 311A, BIOL 311B, and SYBB 411B. Prereq: BIOL 214 and BIOL 215. Coreq: SYBB 311A and SYBB 311C.

SYBB 311C. Survey of Bioinformatics: Translational Bioinformatics. 1 Unit.
SYBB 311C/411C is a longitudinal course that introduces students to the latest applications of bioinformatics, with a focus on translational research. Topics include: omic drug discovery, pharmacogenomics, microbiome analysis, and genomic medicine. The focus of this course is on illustrating how bioinformatic technologies can be paired with data integration tools for various applications in medicine. The course is organized as a weekly journal club, with instructors leading the discussion of recent literature in the field of bioinformatics. Students will be expected to complete readings beforehand; students will also work in teams to write weekly reports reviewing journal articles in the field. The SYBB survey series is composed of the following course sequence: (1) Technologies in Bioinformatics, (2) Data Integration in Bioinformatics, (3) Translational Bioinformatics, and (4) Programming for Bioinformatics. Each standalone section of this course series introduces students to an aspect of a bioinformatics project - from data collection (SYBB 311A/411A), to data integration (SYBB 311B/411B), to research applications (SYBB 311C/411C), with a fourth module (SYBB 311D/411D) introducing basic programming. Graduate students have the option of enrolling in all four courses or choosing the individual modules most relevant to their background and goals with the exception of SYBB 411D, which must be taken with SYBB 411A. Offered as SYBB 311C, BIOL 311C and SYBB 411C. Prereq: BIOL 214 and BIOL 215. Coreq: SYBB 311A and SYBB 311B.

SYBB 312R. Basic Statistics for Engineering and Science Using R Programming. 3 Units.
For advanced undergraduate students in engineering, physical sciences, life sciences. Comprehensive introduction to probability models and statistical methods of analyzing data with the object of formulating statistical models and choosing appropriate methods for inference from experimental and observational data and for testing the model's validity. Balanced approach with equal emphasis on probability, fundamental concepts of statistics, point and interval estimation, hypothesis testing, analysis of variance, design of experiments, and regression modeling. Note: Credit given for only one (1) of STAT 312, STAT 312R, STAT 313 or SYBB 312R. Offered as STAT 312R and SYBB 312R. Prereq: MATH 122 or equivalent.
SYBB 319. Applied Probability and Stochastic Processes for Biology. 3 Units.
Applications of probability and stochastic processes to biological systems. Mathematical topics will include: introduction to discrete and continuous probability spaces (including numerical generation of pseudo random samples from specified probability distributions), Markov processes in discrete and continuous time with discrete and continuous sample spaces, point processes including homogeneous and inhomogeneous Poisson processes and Markov chains on graphs, and diffusion processes including Brownian motion and the Ornstein-Uhlenbeck process. Biological topics will be determined by the interests of the students and the instructor. Likely topics include: stochastic ion channels, molecular motors and stochastic ratchets, actin and tubulin polymerization, random walk models for neural spike trains, bacterial chemotaxis, signaling and genetic regulatory networks, and stochastic predator-prey dynamics. The emphasis will be on practical simulation and analysis of stochastic phenomena in biological systems. Numerical methods will be developed using a combination of MATLAB, the R statistical package, MCell, and/or URDME, at the discretion of the instructor. Student projects will comprise a major part of the course. Offered as BIOL 319, ECSE 319, MATH 319, SYBB 319, BIOL 419, EBME 419, MATH 419, PHOL 419, and SYBB 419. Prereq: MATH 224 or MATH 223 and BIOL 300 or BIOL 306 and MATH 201 or MATH 307 or consent of instructor.

SYBB 322. Clinical Informatics at the Bedside and the Bench (Part II). 3 Units.
This course is part of a two semester series that provides student with an overview of the field of clinical informatics and its research applications. SYBB 422 focuses on the use of informatics in public health, epidemiology, and translational bioinformatics; topics include: pharmacosurveillance, comparative effectiveness research, and personalized medicine. Through lectures and in-depth readings of literature in the field, students will learn to approach population-level problems in medicine through the lens of "informatics", the science of information, with a focus on application over theory. Students will be required to use R (or another programming language) for data analysis assignments. Offered as SYBB 322 and SYBB 422. Prereq: SYBB 321.

Robotic Process Automation (RPA) is the fastest-growing software segment, growing at 63% in 2018. Many organizations are exploring or have implemented RPA. New college graduates will be a key driver in the future of automation. Students will be provided a comprehensive introduction to RPA centered on these fundamentals: overview of RPA, use of the technology, benefits and risks, and applications, process improvement and application to various work processes/industries. The course also includes guidelines on selecting the appropriate processes, workload and people implications, tools for automation, and strategies for successful implementations. It begins by introducing basic RPA concepts, the course then outlines how to apply these concepts to real working environment. UiPath is the primary software for students to practice and do group projects. The course is primarily intended for undergraduate students (in at least their junior year) who want to kick-start their career in this high-demand domain, have an interest in learning how to improve and want to use software to accelerate processes. Basic programming knowledge of any development language (C#, .Net, VB, Java, etc.) is beneficial but not required. Prereq: Undergraduate Junior or Senior standing.

SYBB 387. Undergraduate Research in Systems Biology. 1 - 3 Units.
This course provides students research experience in data science, proteomics, bioinformatics, and clinical informatics under the guidance of faculty affiliated with the Systems Biology and Bioinformatics program. Areas of research include production of big data at bench (cellular proteomics, structural proteomics, genomics, and interaction proteomics) and analysis of big data such as computational/statistical biology, bioinformatics tool development and clinical research informatics. A written report must be approved by the sponsor and submitted to the director of the Center for Proteomics and Bioinformatics before credit is granted.

SYBB 388. Undergraduate Research. 1 - 3 Units.
Guided laboratory research under the sponsorship of a biology faculty member. May be carried out within the biology department or in associated departments. Appropriate forms must be secured in the biology department office. A written report must be approved by the biology sponsor and submitted to the chairman of the biology department before credit is granted. Only 3 credit-hours may count towards the biology majors or minor. Offered as BIOL 388 and SYBB 388.

SYBB 388S. Undergraduate Research - SAGES Capstone. 3 Units.
Guided laboratory research under the sponsorship of a biology faculty member. May be carried out within the biology department or in associated departments. May be taken only one semester during the student’s academic career. Appropriate forms must be secured in the biology department office. A written report must be approved by the biology sponsor and submitted to the chairman of the biology department before credit is granted. A public presentation is required. Offered as BIOL 388S and SYBB 388S. Counts as SAGES Senior Capstone.

SYBB 411A. Survey of Bioinformatics: Technologies in Bioinformatics. 1 Unit.
SYBB 311A/411A is a 5-week course that introduces students to the high-throughput technologies used to collect data for bioinformatics research in the fields of genomics, proteomics, and metabolomics. In particular, we will focus on mass spectrometer-based proteomics, DNA and RNA sequencing, genotyping, protein microarrays, and mass spectrometry-based metabolomics. This is a lecture-based course that relies heavily on out-of-class readings. Graduate students will be expected to write a report and give an oral presentation at the end of the course. SYBB 311A/411A is part of the SYBB survey series which is composed of the following course sequence: (1) Technologies in Bioinformatics, (2) Data Integration in Bioinformatics, (3) Translational Bioinformatics, and (4) Programming for Bioinformatics. Each standalone section of this course series introduces students to an aspect of a bioinformatics project - from data collection (SYBB 311A/411A), to data integration (SYBB 311B/411B), to research applications (SYBB 311C/411C), with a fourth module (SYBB 311D/411D) introducing basic programming skills. Graduate students have the option of enrolling in all four courses or choosing the individual modules most relevant to their background and goals with the exception of SYBB 411D, which must be taken with SYBB 411A. Offered as SYBB 311A, BIOL 311A and SYBB 411A. Prereq: Graduate Standing or Requisites Not Met Permission.
SYBB 411B. Survey of Bioinformatics: Data Integration in Bioinformatics. 1 Unit.

SYBB 311B/411B is a five week course that surveys the conceptual models and tools used to analyze and interpret data collected by high-throughput technologies, providing an entry points for students new to the field of bioinformatics. The knowledge structures that we will cover include: biomedical ontologies, signaling pathways, and interaction networks. We will also cover tools for genome exploration and analysis. The SYBB survey series is composed of the following course sequence: (1) Technologies in Bioinformatics, (2) Data Integration in Bioinformatics, (3) Translational Bioinformatics, and (4) Programming for Bioinformatics. Each standalone section of this course series introduces students to an aspect of a bioinformatics project - from data collection (SYBB 311A/411A), to data integration (SYBB 311B/411B), to research applications (SYBB 311C/411C), with a fourth module (SYBB 311D/411D) introducing basic programming. Graduate students have the option of enrolling in all four courses or choosing the individual modules most relevant to their background and goals with the exception of SYBB 411D, which must be taken with SYBB 411A. Offered as SYBB 311B, BIOL 311B, and SYBB 411B. Prereq: Graduate Standing or Requisites Not Met Permission.

SYBB 411C. Survey of Bioinformatics: Translational Bioinformatics. 1 Unit.

SYBB 311C/411C is a longitudinal course that introduces students to the latest applications of bioinformatics, with a focus on translational research. Topics include: ‘omic drug discovery, pharmacogenomics, microbiome analysis, and genomic medicine. The focus of this course is on illustrating how bioinformatic technologies can be paired with data integration tools for various applications in medicine. The course is organized as a weekly journal club, with instructors leading the discussion of recent literature in the field of bioinformatics. Students will be expected to complete readings beforehand; students will also work in teams to write weekly reports reviewing journal articles in the field. The SYBB survey series is composed of the following course sequence: (1) Technologies in Bioinformatics, (2) Data Integration in Bioinformatics, (3) Translational Bioinformatics, and (4) Programming for Bioinformatics. Each standalone section of this course series introduces students to an aspect of a bioinformatics project - from data collection (SYBB 311A/411A), to data integration (SYBB 311B/411B), to research applications (SYBB 311C/411C), with a fourth module (SYBB 311D/411D) introducing basic programming. Graduate students have the option of enrolling in all four courses or choosing the individual modules most relevant to their background and goals with the exception of SYBB 411D, which must be taken with SYBB 411A. Offered as SYBB 311C, BIOL 311C and SYBB 411C. Prereq: Graduate Standing or Requisites Not Met Permission.

SYBB 412. Survey of Bioinformatics: Programming for Bioinformatics. 3 Units.

SYBB 412 is a 3 credit-course that will introduce students to bioinformatics analysis and basic programming. This course is designed for those with little or no prior programming experience. However, advanced programmers can still learn bioinformatics pipelines and software packages to conduct research. Students will gain hands-on experience working with bioinformatics software, R packages and functions designed for bioinformatics applications. Programming for Bioinformatics course mainly focuses on R (rproject.org), and introduces students to basic programming in R, what packages are available, and teaches an introductory hands-on experience working with R by walking through the students in analyzing large -omics datasets. At the end of the class, the students are assessed with a small-scale project, where they analyze a publicly available dataset and produce a short report. This is an active learning class where adaptive learning and active learning teaching practices are used. Adaptive learning provide personalized learning, where efficient, effective, and customized learning paths to engage each student is offered. Recommended Preparation: BIOL 326 (Genetics) or equivalent Prereq: (SYBB 411A and Graduate Standing) or Requisites Not Met Permission.

SYBB 419. Applied Probability and Stochastic Processes for Biology. 3 Units.

Applications of probability and stochastic processes to biological systems. Mathematical topics will include: introduction to discrete and continuous probability spaces (including numerical generation of pseudo random samples from specified probability distributions), Markov processes in discrete and continuous time with discrete and continuous sample spaces, point processes including homogeneous and inhomogeneous Poisson processes and Markov chains on graphs, and diffusion processes including Brownian motion and the Ornstein-Uhlenbeck process. Biological topics will be determined by the interests of the students and the instructor. Likely topics include: stochastic ion channels, molecular motors and stochastic ratchets, actin and tubulin polymerization, random walk models for neural spike trains, bacterial chemotaxis, signaling and genetic regulatory networks, and stochastic predator-prey dynamics. The emphasis will be on practical simulation and analysis of stochastic phenomena in biological systems. Numerical methods will be developed using a combination of MATLAB, the R statistical package, MCell, and/or URDME, at the discretion of the instructor. Student projects will comprise a major part of the course. Offered as BIOL 319, ECSE 319, MATH 319, SYBB 319, BIOL 419, EBME 419, MATH 419, PHOL 419, and SYBB 419.
SYBB 421. Fundamentals of Clinical Information Systems. 3 Units.
Technology has played a significant role in the evolution of medical science and treatment. While we often think about progress in terms of the practical application of, say, imaging to the diagnosis and monitoring of disease, technology is increasingly expected to improve the organization and delivery of healthcare services, too. Information technology plays a key role in the transformation of administrative support systems (finance and administration), clinical information systems (information to support patient care), and decision support systems (managerial decision-making). This introductory graduate course provides the student with the opportunity to gain insight and situational experience with clinical information systems (CIS). Often considered synonymous with electronic medical records, the "art" of CIS more fundamentally examines the effective use of data and information technology to assist in the migration away from paper-based systems and improve organizational performance. In this course we examine clinical information systems in the context of (A) operational and strategic information needs, (B) information technology and analytic tools for workflow design, and (C) subsequent implementation of clinical information systems in patient care. Legal and ethical issues are explored. The student learns the process of "plan, design, implement" through hands-on applications to select CIS problems, while at the same time gaining insights and understanding of the impacts placed on patients and health care providers. Offered as EBME 473, IIME 473 and SYBB 421.

SYBB 422. Clinical Informatics at the Bedside and the Bench (Part II). 3 Units.
This course is part of a two-semester series that provides student with an overview of the field of clinical informatics and its research applications. SYBB 422 focuses on the use of informatics in public health, epidemiology, and translational bioinformatics; topics include: pharmacosurveillance, comparative effectiveness research, and personalized medicine. Through lectures and in-depth readings of literature in the field, students will learn to approach population-level problems in medicine through the lens of "informatics", the science of information, with a focus on application over theory. Students will be required to use R (or another programming language) for data analysis assignments. Offered as SYBB 322 and SYBB 422. Prereq: SYBB 321.

SYBB 437. Laboratory Course in Proteomics. 3 Units.
SYBB 437 is designed to train students, postdoctoral fellows, and senior investigators in advanced methods in quantitative proteomics in the context of investigating the effects of pH on protein expression in the model organism E. coli. This intensive laboratory course is a 3-credit laboratory course and will be offered for a scheduled three hours time block once each week. In this course, we will cover topics in proteomics including protein sample preparation, total protein quantification, gel based separation and quantification methods, quantitative high throughput mass spectrometry and data analysis methods for examining these high throughput data. Students enrolled in SYBB 437 will be expected to turn in weekly lab reports summarizing their findings on each of the lab topics and will write two project reports at the end of labs 9 and 14 interpreting and summarizing the results obtained.

SYBB 450. High-Dimensional Data Modeling and Computing. 3 Units.
Students will learn how to specify, fit, and validate predictive models for high-dimensional data, such as omics data from any high-throughput technology. Students will be introduced to the statistical issues and systemic problems related to this type of data and appropriate modern machine learning models to deal with them. Because of the nature of the data, emphasis is also placed on learning the necessary statistical computing techniques and hyper-performance computing environment (HPC Cluster) that are required to address the above goals efficiently in these settings. Students will also learn to develop effective code writing and presentation skills: (1) Write organized and commented codes with coding styles and use of modularity for effective debugging and execution. (2) Present data and analytical results in an understandable, insightful and engaging manner to a general scientific audience. Previous experience in R is required. Prereq: SYBB 412 and PQHS 431.

SYBB 459. Bioinformatics for Systems Biology. 3 Units.

SYBB 472. BioDesign. 3 Units.
Medical device innovations that would have been considered science fiction a decade ago are already producing new standards of patient care. Innovation leading to lower cost of care, minimally invasive procedures and shorter recovery times is equally important to healthcare business leaders, educators, clinicians, and policy-makers. Innovation is a driver of regional economic development and wealth creation in organizational units ranging in size from the start-up to the Fortune 500 companies. In a broader context, the pace of translational research leading to product and service innovation is highly interdisciplinary, thus, new products and services result from team efforts, marked by a systematic, structured approach to bringing new medical technologies to market and impacting patient care. In this course we examine medical technology innovations in the context of (A) addressing unmet clinical needs, (B) the process of inventing new medical devices and instruments, and (C) subsequent implementation of these advances in patient care. In short, the student learns the process of "identify, invent, implement" in the field of BioDesign. Offered as EBME 472, IIME 472 and SYBB 472.
SYBB 501. Biomedical Informatics and Systems Biology Journal Club. 0 Unit.
The purpose of this journal club is to provide an opportunity for students to critically discuss a wide variety of informatics and systems biology topics and to present their works in progress. A wide range of informatics and systems theory approaches to conducting biomedical research will be discussed during the club. Potential articles will be chosen from scientific journals including: Nature, Science, BMC Bioinformatics, BMC Systems Biology, the Journal of Bioinformatics and Computational Biology, and the Journal for Biomedical Informatics. During journal presentations, trainees will be expected to lead a discussion of the article that leads to the critical evaluation of the merit of the article and its implication for biomedical informatics and systems biology. The Journal Club will also provide a forum for trainees to present proposed, on-going, and completed research. Trainees will attend and participate in the Journal Club throughout their tenure in the program. The Journal Club will meet twice a month, with each trainee required to attend and participate. The Journal Club will also include sessions where issues related to the responsible conduct of research are reviewed and extended.

SYBB 502. Clinical Informatics Journal Club. 0 Unit.
The Clinical Informatics Journal Club serves as a forum for students to present current research in the field of clinical informatics. Students are required to coregister for SYBB 421 or SYBB 422; weekly lectures in SYBB 421/422 will introduce topics for discussion in the journal club. Coreq: SYBB 421 or SYBB 422

SYBB 528. Contemporary Approaches to Drug Discovery. 3 Units.
This course is designed to teach the students how lead compounds are discovered, optimized, and processed through clinical trials for FDA approval. Topics will include: medicinal chemistry, parallel synthesis, drug delivery and devices, drug administration and pharmacokinetics, and clinical trials. A special emphasis will be placed on describing how structural biology is used for in silico screening and lead optimization. This component will include hands-on experience in using sophisticated drug discovery software to conduct in silico screening and the development of drug libraries. Each student will conduct a course project involving in silico screening and lead optimization against known drug targets, followed by the drafting of an inventory disclosure. Another important aspect of this course will be inclusion of guest lectures by industrial leaders who describe examples of success stories of drug development. Offered as BIOL 528, PHOL 528, PHRM 528, and SYBB 528.

SYBB 535. Independent Study in Biomedical Informatics. 1 - 3 Units.
For students pursuing MS or PhD degrees in SYBB, this course provides the opportunity for in-depth exposure to a subfield of systems biology and/or biomedical informatics. Degree-seeking students can enroll in this course prior to beginning 601 or 701 research. In conjunction with their proposed research advisor, enrolled students will undertake a self-directed study of a subfield of systems biology and/or biomedical informatics pertinent to their research area. The selected readings may also represent topics not covered by the student’s coursework. The student’s performance will be evaluated in an end-of-semester presentation or report at their advisor’s discretion.

SYBB 555. Current Proteomics and Bioinformatics. 3 Units.
This course is designed for graduate students across the university who wish to acquire a better understanding of fundamental concepts of proteomics and related bioinformatics as well as hands-on experience with techniques used in current proteomics. Lectures will cover protein/peptide separation techniques, protein mass spectrometry, and biological applications which include quantitative proteomics, protein modification proteomics, interaction proteomics, structural genomics and structural proteomics. Also, it will cover experimental design, basic statistical concept and issues related to high-dimensional data from high-throughput technologies. Laboratory portion will involve practice on the separation of proteins by two-dimensional gel electrophoresis, molecular weight measurement of proteins by mass spectrometry, peptidic structural characterization by tandem mass spectrometry. It will also include bioinformatics tools for protein identification and protein-protein interaction networks. The instructors’ research topics will also be discussed. Recommended preparation: CBIO 453, CBIO 455, and PQHS 431. Offered as PHRM 555 and SYBB 555.

SYBB 601. Systems Biology and Bioinformatics Research. 1 - 18 Units.
(Credit as arranged.)
SYBB 651. Thesis M.S.. 1 - 18 Units.
(Credit as arranged.)
SYBB 701. Dissertation Ph.D.. 1 - 9 Units.
(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

CMED (CMED)

CMED 401. Intro to Clinical Research and Scientific Writing. 3 Units.
This seminar brings in numerous experts to cover a variety of essential issues and concepts in clinical research and scientific writing. The overarching goal is for students to produce a short but well-crafted research proposal. Topics for reading and discussion include general principles of research design and proposal development; key concepts and issues in biostatistical science for study planning, data management, analysis, interpretation, and presentation; modern medical library informatics; ethical issues in clinical research and necessary rigmarole; technical writing emphasizing research proposals; designing studies of diagnostic tests; outcomes research and medical decision making; clinical genomics research.

CMED 402. Statistical Science for Medical Research. 3 Units.
A rigorous, practical introduction to core concepts and methods in statistical planning, managing, and analyzing data, and interpreting and communicating biostatistical information. Seminar sessions: discuss readings, work through realistic examples using popular commercial software. Project sessions: individuals in small groups discuss their own examples and receive on-the-spot feedback. Topics: types of data and common distributions; database and statistical software; understanding and describing data with simple statistics and effective tables and graphics; statistical transforms (log, logit) and what they imply, basic inference tests, confidence intervals, and related sample-size analyses involving categorical data (analyzing proportions), ordinal data (analyzing ranks), continuous data (analyzing means), and time-to-event data with censoring. A substantial introduction to statistical modeling unifies seemingly diverse methods to induce a cohesive, flexible, and broad understanding of biostatistics. Medical students enrolled in CRSP must complete CCLCM Introduction to Clinical Research, IBIS 431 and IBIS 490 to satisfy the CRSP 401, 402 and 403 series. Prereq: Must be enrolled in School of Medicine.
CMED 403. Introduction to Clinical Epidemiology. 3 Units.
Using multiple learning modalities, including case-based seminars, computer-based interactive learning, journal club, and readings from texts as well as contemporary clinical literature, students will receive a rigorous introduction to methods of research in clinical epidemiology. Topics to be covered will include human subjects protections; legal and ethical components of clinical research; measures of disease frequency; basics of clinical study design; nature of and analysis of risk factors; cohort study design and analysis; case-control study design and analysis; confounding; interaction; bias; survey research; diagnostic tests; disease screening; design, analysis, and reporting of clinical trials; meta-analysis; decision analysis; cost-effectiveness analysis; and a brief introduction to health services research. Medical students enrolled in CRSP must complete CCLCM Introduction to Clinical Research, IBIS 431, and IBIS 490 to satisfy the CRSP 401, 402, and 403 series. Prereq: Must be enrolled in School of Medicine.

CMED 404. Clinical Research Seminars. 1 Unit.
The Clinical Research Seminars series is intended to give students a broad exposure to issues unique to clinical research as well as career development. Students attend seminars on relevant clinical research topics offered either on the Case or CCF campuses, and will write a short summary of each seminar attended. A total of 12-14 one-hour seminars per semester is required for successful completion of the course. Students are expected to take two semesters. Prereq: Must be enrolled in School of Medicine and consent of CCLCM Office.

CMED 405. Clinical Research Seminars. 1 Unit.
The Clinical Research Seminars series is intended to give students a broad exposure to issues unique to clinical research as well as career development. Students attend seminars on relevant clinical research topics offered either on the Case or CCF campuses, and will write a short summary of each seminar attended. A total of 12-14 one-hour seminars per semester is required for successful completion of the course. Students are expected to take two semesters. Prereq: Must be enrolled in School of Medicine and consent of CCLCM Office.

CMED 450. Fundamental Biostatistics to Enhance Research Rigor & Reproducibility. 1 Unit.
This is a required graduate level course for all first year PhD students in the School of Medicine biomedical PhD programs excluding Biomedical Engineering, Population and Quantitative Health Sciences, Molecular Medicine and Clinical Translation Science. This course focuses on providing students with a basic working knowledge and understanding of best practices in biostatistics that can be applied to common biomedical research activities in numerous fields. Weekly sessions involve a combination of basic programming activities, lectures, exercises, hands-on data manipulation and presentation. Topics include experimental design and power analysis, hypothesis testing, descriptive statistics, linear regression, and others with an emphasis on when and in which experimental design a particular test is properly used. The overall goal of the course is to empower students to use these biostatistics to enhance the rigor of their experimental design and reproducibility of their primary data. The major focus is not on theory, but on a practical acquisition of a working knowledge of basic data processing analysis, interpretation, and presentation skills.

CMED 453. Cell Biology I. 3 Units.
Part of the first semester curriculum for first year graduate students along with IBMS 455. This course is designed to give students an intensive introduction to prokaryotic and eukaryotic cell structure and function. Topics include membrane structure and function, mechanisms of protein localization in cells, secretion and endocytosis, the cytoskeleton, cell adhesion, cell signaling and the regulation of cell growth. Important methods in cell biology are also presented. This course is suitable for graduate students entering most areas of basic biomedical research. Undergraduate courses in biochemistry, cell and molecular biology are excellent preparation for this course. Recommended preparation: Undergraduate biochemistry or molecular biology.

CMED 455. Molecular Biology I. 3 Units.
Part of the first semester curriculum for first year graduate students along with IBMS 455. This course is designed to give students an intensive introduction to prokaryotic and eukaryotic molecular biology. Topics include protein structure and function, DNA and chromosome structure, DNA replication, RNA transcription and its regulation, RNA processing, and protein synthesis. Important methods in molecular biology are also presented. This course is suitable for graduate students entering most areas of basic biomedical research. Undergraduate courses in biochemistry, cell and molecular biology are excellent preparation for this course. Recommended preparation: Undergraduate biochemistry or molecular biology.
IBMS 456A. Since You Were Born: Nobel Prize Biomedical Research in the Last 21 Years - Section A. 1 Unit.

IBMS 456B. Since You Were Born: Nobel Prize Biomedical Research in the Last 21 Years - Section B. 1 Unit.

IBMS 456C. Since You Were Born: Nobel Prize Biomedical Research in the Last 21 Years - Section C. 1 Unit.
This course is one of four sections that will cover major advances in biomedical research by review of Nobel Prize-winning topics from the past 21 years. Each section will cover 8 Nobel prize topics (1 topic/2 hour session/week for 8 weeks). Students will read critical research papers of the Nobel prize scientist(s) in preparation for guided in-class discussion led by the faculty mentor. The IBMS 456C section will cover Nobel Prizes related to the areas of Biochemistry, Nutrition, Pharmacology, and Pathology-Cancer. These include: 1) 2015 Prize, T. Lindahl, P. Modrich, and A. Sancar: Mechanisms of DNA Repair; 2) 2014 Prize, E. Betzig, S. Hell, W. Moerner: Development of super-resolution fluorescence microscopy; 3) 2012 Prize, R. Lefkowitz and B. Kobilka: Structure/function analysis of G protein-coupled receptors; 4) 2004 Prize, A. Ciechanover, A. Hershko, and I. Rose: Mechanisms of ubiquitin-mediated protein degradation; 5) 2003 Prize, P. Lauterbur and P. Mansfeld: Development of magnetic resonance imaging (MRI) methods; 6) 2002 Prize, S. Brenner, H.R. Horvitz, and J. Sulston: Mechanisms for genetic regulation of organ development and programmed cell death; 7) 2002 Prize, J. Fenn, K. Tanaka, and K. Wuthrich: Development of mass spec and NMR methods for biological macromolecules; 8) 2001 Prize, L. Hartwell, T. Hunt, and P. Nurse: Mechanisms of cell cycle regulation.

IBMS 456D. Since You Were Born: Nobel Prize Biomedical Research in the Last 21 Years - Section D. 1 Unit.

IBMS 500. On Being a Professional Scientist: The Responsible Conduct of Research. 1 Unit.
The goal of this course is to provide graduate students with an opportunity to think through their professional ethical commitments before they are tested, on the basis of the scientific community’s accumulated experience with the issues. Students will be brought up to date on the current state of professional policy and federal regulation in this area, and, through case studies, will discuss practical strategies for preventing and resolving ethical problems in their own work. The course is designed to meet the requirements for "instruction about responsible conduct in research" for BSTP and MSTP students supported through NIH/ADAMHA institutional training grant programs at Case. Attendance is required.
IBMS 501. Responsible Conduct of Research for Advanced Trainees. 0 Unit.
The life of a professional scientist is complicated, and it is not always easy to know how to “do the right thing” with regard to their data, colleagues, and subjects. Responsible Conduct of Research (RCR) is an essential component of research knowledge. Active thought about the issues of RCR should occur throughout a scientist’s career. Instruction in RCR should be appropriate to the career stage of the individuals receiving training. All doctoral students in the School of Medicine receive initial RCR training in their second semester and NIH requires another intense exposure if doctoral students are four years beyond their initial training. The goal of this course is to provide fifth year biomedical doctoral students with additional RCR training by exposing them to a variety of research ethics topics through lectures and small group discussions led by professional scientists and ethicists. Students will be brought up to date on the current state of professional policy and federal regulation regarding research (where these exist), and will discuss practical strategies for preventing and resolving ethical problems in their own work. This course is designed for predoctoral graduate students that are in their fifth year of graduate studies and MSTP students that are in their fourth year of their PhD phase of study. These sessions are also appropriate for postdoctoral trainees.

INTH (INTH)

INTH 301. Fundamentals of Global Health. 3 Units.
This course seeks to integrate the multiple perspectives and objectives in global health by investigating how the disciplines of Biology, Medicine, Anthropology, Nursing, Mathematics, Engineering analyze and approach the same set of international health problems. Students will develop a shared vocabulary with which to understand these various perspectives from within their own discipline. The focus sites will emphasize issues related to the health consequences of development projects, emergency response to a health care crisis and diseases of development in presence of underdevelopment. Offered as INTH 301 and INTH 401. Prereq: Junior or senior.

INTH 315. Water Security and Social Justice in Brazil. 3 Units.
CWRU, through the Center for Global Health and Diseases, has had projects, student exchanges and courses with institutions in Brazil and especially with the state of Bahia for over 30 years. In that time, personal and professional relationships have been developed with branches of the Ministry of Health (Oswaldo Cruz Foundation, the Municipal and State Health Departments), the Federal University of Bahia, and the Bahiana School of Medicine and Public Health. Brazil is the second largest country in the Western Hemisphere and the 7th or 8th largest economy in the world. There are more people who speak Portuguese in South America than Spanish. Despite newly discovered oil, enormous natural and human resources, development in Brazil has been uneven with the Northeast remaining the least developed. The Northeastern state of Bahia ranked 22nd out of 27 states on the UNs Index of Human Development (http://www.pnud.org.br/IDH/DH.aspx# and http://www.atlasbrasil.org.br/2013/pt/home/). The State capital, Salvador, ranks 14th out of 20 major metropolitan regions and is one site for this study abroad program. The second site, the rural town of Ubaíra, is ranked 4590 out of 5565 municipalities. Even with large social inequities and health care disparities, the Brazilian government and society have produced remarkable social policies, have shown a willingness to implement these policies and have the resources to significantly improve the lives of its most impoverished citizens. Critical basic infrastructure for health and development is water. Its consumption is essential; it is a mechanism for waste disposal, industry and agriculture are dependent on its supply. The problem of water quantity and quality are common all human societies (witness the drought in California and the burning Cuyahoga). Individuals from all walks of life will need to assess issues of water at some time, from doctors, engineers, urban planners, lawyers and politicians. In Brazil the issues of water are more exposed and easier to examine on different scales than in the U.S. The problem also resides within a social, health care, and political context that compares well and at the same time contrasts sharply with that of the USA. As a student in this course, you will gain first-hand knowledge of the social and public health challenges regarding water security in Brazil. Through field experiences in the capital city of Salvador and the rural town of Ubaïra, you will immerse yourself in interdisciplinary perspectives on the public health, scientific, political, and bioethical dimensions of water security in Brazil. This immersive experience will be facilitated by faculty from the CWRU Dept. of Bioethics and the Center for Global Health and Diseases, the Brazilian Ministry of Health, the Federal University of Bahia, the Bahiana School of Medicine and Public Health, and Brazilian graduate student participants. Offered as: INTH 315, INTH 415, BETH 315H, and BETH 415H. Counts for CAS Global & Cultural Diversity Requirement.

INTH 401. Fundamentals of Global Health. 3 Units.
This course seeks to integrate the multiple perspectives and objectives in global health by investigating how the disciplines of Biology, Medicine, Anthropology, Nursing, Mathematics, Engineering analyze and approach the same set of international health problems. Students will develop a shared vocabulary with which to understand these various perspectives from within their own discipline. The focus sites will emphasize issues related to the health consequences of development projects, emergency response to a health care crisis and diseases of development in presence of underdevelopment. Offered as INTH 301 and INTH 401. Prereq: Graduate student.
INTH 415. Water Security and Social Justice in Brazil. 3 Units.

Offered as: INTH 315, INTH 415, BETH 315H, and BETH 415H. Counts for CAS Global & Cultural Diversity Requirement.

INTH 484. Global Health Epidemiology. 1 - 3 Units.

This course provides a rigorous problem-centered training in the epidemiology, prevention, treatment, and control of infectious diseases and, more generally, global health. This is an advanced epidemiology that embraces an active learning environment. Students are expected to invest time outside of the classroom reading and working with classmates. Classes will be conducted with discussions, debates, group projects, and group presentations. By taking this course, students will develop a framework for interpreting, assessing, and performing epidemiologic research on issues of global importance. The course will be divided into three modules: 1) Global Health Epidemiology 2) Helminth Epidemiology, and 3) Epidemiology of Disease Elimination. Each module is worth 1 credit hour and may be taken separately. Each module will have a separate project and/or exam. The final exam time will be used for group presentations and panel discussion. Active class participation is required through discussions, case studies, and group projects. Offered as PQHS 484, INTH 484, and MPHP 484.

INTH 551. World Health Seminar. 1 Unit.

This seminar series examines a broad range of topics related to infectious disease research in international settings. Areas of interest are certain to include epidemiology, bioethics, medical anthropology, pathogenesis, drug resistance, vector biology, cell and molecular biology, vaccine development, diagnosis, and socio-cultural factors contributing to or compromising effective health care delivery in endemic countries. Additionally we will discuss intellectual property policies on global access to medical innovations. Topics will also include neglected diseases and the interactions between these diseases with HIV and malaria infections. Speakers will include a diverse group of regional faculty and post-doctoral trainees, as well as visiting colleagues from around the world. Students will be asked to read a journal article written by the speaker and then discuss this article with the speaker after their seminar.
The Center for Human Genetics is an integral part of the Department of Genetics and consists of both research and clinical laboratories involved in human and clinical genetics. This center supports research and clinical programs focusing on the molecular basis of inherited disease, human genetic disease mapping, and the genetic dissection of complex disease, as well as providing clinical care and training for postdoctoral fellows and genetic counseling students.

The Center for Computational Genomics is an interdisciplinary research and training program involving faculty in the Department of Population and Quantitative Health Sciences in the School of Medicine and in the Department of Electrical Engineering and Computer Science in the School of Engineering. The center provides opportunities to combine research in genetics, genomics, epidemiology, biostatistics, computer science, and systems biology.

The Genomic Medicine Institute is a joint program involving the Cleveland Clinic Foundation and Case. Its emphasis involves translating discoveries in basic and clinical research to clinical practice. The mission is to exploit the discoveries in genomics, epidemiology, ethics, pharmacology, genetics, and physiology to revolutionize the practice of medicine.

**MS Genetic Counseling (plan B)**

The Genetic Counseling Training Program, which is accredited by the Accreditation Council for Genetic Counseling (ACGC) is a 40 credit hour program that spans four academic semesters and an intervening summer. Acquisition and mastery of clinical competencies are reflected in the Program’s didactic coursework, clinical rotations, research process, and supplementary experiences. The sequence of medical genetics courses and genetic counseling courses are designed to introduce concepts regarding medical genetics, general medical practice, counseling theory and clinical skills such that they build from beginning skills to a more advanced skill set in the order needed for clinical experiences. The goal of the program is to provide students with the knowledge and clinical skills to function as competent and empathetic genetic counselors in a wide range of settings and roles. All of these activities enable successful graduates to meet the clinical competencies as outlined by the ACGC and successfully pass the American Board of Genetic Counseling certification examination (ABGC).

Experiential professional training occurs concurrently with formal coursework and over the summer between years one and two. Clinical settings include a variety of clinics and inpatient services at the Center for Human Genetics at University Hospitals Cleveland Medical Center, the Genomic Medicine Institute at the Cleveland Clinic, Genetic Services at MetroHealth Medical Center and Medical Genetics at Akron Children’s Hospital. Students also rotate at the Cleveland Clinic Molecular Laboratory which includes experiences in cytogentic, molecular genetics, and cancer cytogenetics as well as learning the roles and responsibilities of laboratory genetic counselors. Student participation in these and other departmental professional and educational activities such as lectures, seminars, journal club, grand rounds, genetics conferences, and various research, counseling and patient management conferences is expected throughout the program. Coursework and clinical experiences are designed to develop the competencies expected by the ACGC.

### The First Year

The major activities during the first year consist of course work in the plan of study below, clinical observations and defining a research question and preparing a research proposal. Observational clinical rotations begin early in fall semester with students observing in prenatal genetics, cancer genetics, and general genetics clinics at the program’s three affiliated institutions. Additionally, students meet several times over the fall semester to discuss the research process, potential topics, development of a research question and are introduced to the faculty’s research areas of interest.

In addition to continuing clinical observational rotations and research, students continue with course work including an introduction to research methods and more in-depth theory and practice in the psychosocial aspects of counseling during spring semester.

During the intervening summer of years 1 and 2, students begin clinical rotations at the Medical Genetics Division at Akron Children’s Hospital to gain exposure in various clinical settings including prenatal, general genetics, pediatrics, specialty clinics, and cancer genetics clinic. They also rotate through the Cleveland Clinic Molecular Laboratory to become familiarized with the clinical aspects of a diagnostic cytogenetics and molecular genetics laboratory.

### The Second Year

The major focus of the second year is continued clinical experiences, research and taking the comprehensive written and oral examinations. Students also complete their coursework, taking one course each semester.

At the beginning of spring semester in January, the students sit for the written comprehensive examination (covering the didactic and clinical genetic counseling material covered to date in the program) and the oral section of the examination, which is given shortly after the written portion. Both examinations are intended to allow students to expand on their knowledge base of human and medical genetics and genetic counseling. Students are expected to pass both sections of the examination in order to meet graduation requirements by the Program. The written portion of the examination is patterned after the national certification examination given by the American Board of Genetic Counseling.

Students continue to work on data collection and analyses for their research projects, which should result in a publishable document. They meet with the Program Director periodically to review their progress as well as with their research committee and of course, are meeting with their mentor on a more frequent basis. During the fall semester of the second year, the students also attend the National Society of Genetic Counselors annual education meeting. This provides an opportunity for students to meet genetic counselors from across the country to attend scientific sessions to continue adding to their knowledge base and to meet and discuss job opportunities with prospective employers. Successful completion of the program fulfills the curricular and clinical training requirements for eligibility to sit for the certification examination given by the ABGC.

### The sequence of courses for students is as follows:

**MS/MA in Genetic Counseling and Bioethics (plan B)**

The Departments of Genetics & Genome Sciences and Bioethics offer a dual degree program between the Masters in Genetic Counseling and the Masters in Bioethics Programs. The dual degree program provides a comprehensive curriculum integrating foundational principles of genetics and ethics. The goal of the program is to train Genetic Counselors who wish to apply additional Bioethics expertise into their clinical practice and/or research.

The dual degree program allows graduates to engage in both contemplative analysis and application of knowledge in the counseling of patients and should allow graduates to be more prepared to participate in the ongoing national dialogue about the ethical, legal, and social implications of advances in genomic technology as well as research within their home institutions and with other counselors nationwide regarding issues of new genomic testing technology, concerns about genetic services, and issues related to genetic discrimination, privacy, and the return of genetic and genomic results.

The curriculum for the Dual Genetic Counseling/Bioethics Degree consists of 62 credit hours to be completed in 2.5 years. Students enrolled in the dual degree program will spend their first year taking courses entirely within the Genetic Counseling Program and then will spread out their Bioethics coursework over the next 1.5 years while continuing with required coursework and clinical rotations in the genetic counseling program.

In addition to both a written and oral comprehensive examination as part of the Genetic Counseling Training Program, the dual degree requires a research project be carried out for the completion of both degrees.

For the dual degree, students will be required to choose a research project that includes ethical, legal, or social issues of genetic counseling practice, clinical genetics or genomics, or genetic research. Students will also be required to include at least one Bioethics Faculty member on their Research Project Committee.

Students who would like to enroll in the dual degree program will apply and be admitted into each program separately. While admissions committees for each program will communicate with each other regarding applicants, each admissions committee will decide independently about the suitability of the applicant to their program.

Once students have been admitted, the Director of the Genetic Counseling Training Program and the Director of the MA Program in Bioethics will act as student co-advisors for each of the two programs individually as well as collaboratively - meeting monthly to assess student progress, address any student or faculty concerns, and assure that student progress in each of the programs, and their overlapping components, are being achieved.

PhD Genetics

Admissions to the Genetics program may be obtained through the integrated Biomedical Sciences Training Program, by direct admission to the department or via the MSTP program. The following summary pertains to most incoming PhD students, regardless of the route through which they enter the program. Exceptions are occasionally made to reflect previous educational experiences (e.g., a prior MS degree).

The First Year

Course work, rotations in at least three laboratories, and participation in seminars, journal clubs, and research meetings are the major activities of first year students. During the Fall term, most students take core courses in Cell and Molecular Biology (IBMS 453 Cell Biology I/IBMS 455 Molecular Biology I) that are offered for Biomedical Sciences Training Program departments. Laboratory rotations begin in early July and the choice of a thesis advisor is usually made at the end of December (see below for more details on Choosing an Advisor).

During the Spring term, PhD students take the core Advanced Eukaryotic Genetics course sequence (GENE 500 Advanced Eukaryotic Genetics I/GENE 504 Advanced Eukaryotic Genetics II). This core course is designed to acquaint students with fundamental principles and methodologies used in modern genetic research. The focus is on similarities and differences between different model organisms used in genetics research. Also during the Spring term and continuing into the Summer, students begin formulating a doctoral research proposal.

The Second Year and Beyond

During the second year, students participate in a Proposal Writing Workshop (GENE 511 Grant Writing and Reviewing Skills Workshop) and take other advanced elective courses based on the academic background and interest of the student. The remaining elective credits can be satisfied by choosing from the courses offered by departmental faculty or participating training faculty from other departments (see List of Courses below). At the end of the second academic year, students must pass an oral proposal defense in order to advance to candidacy for the PhD degree. An outline of the typical course of study is shown below.

PhD Genetics, Plan of Study Sample

Total Units in Sequence: 54

**Footnotes:**
- IBMS 501 Responsible Conduct of Research for Advanced Trainees is offered every spring semester (beginning 2020). The SOM requires that PhD students who are 4 years beyond their initial RCR training in IBMS 500 On Being a Professional Scientist: The Responsible Conduct of Research, register for IBMS 501.

Please also see Graduate Studies Academic Requirements for Doctoral Degrees (p. 1274).

**Other Requirements**
- Students meet twice per year with Thesis Committee
- Students meet once per year with Genetics Graduate Education Committee
- Genetics Student Seminar (weekly attendance, yearly presentation)
- Genetics Journal Club (weekly attendance, yearly presentation in spring semester)
- Genetics Retreat (yearly participation, organized by students)
- Two first-author, peer-reviewed publications

**Courses**

**BETH 412. Ethical Issues in Genetics/Genomics. 3 Units.**
This course is designed to familiarize graduate students with the major controversies over the generation and use of new human genetic information. Topics will include the spread of predictive genetic testing, prenatal diagnosis, genetic discrimination, human genetic variation research, eugenics, genetic counseling, and the limits of human gene therapy. The course will be conducted as a seminar, involving discussions of readings, guest speakers, and student presentations.

**GENE 367. Commercialization and Intellectual Property Management. 3 Units.**
This interdisciplinary course covers a variety of topics, including principles of intellectual property and intellectual property management, business strategies and modeling relevant to the creation of start-up companies and exploitation of IP rights as they relate to biomedical-related inventions. The goal of this course is to address issues relating to the commercialization of biomedical-related inventions by exposing law students, MBA students, and Ph.D. candidates (in genetics and proteomics) to the challenges and opportunities encountered when attempting to develop biomedical intellectual property from the point of early discovery to the clinic and market. Specifically, this course seeks to provide students with the ability to value a given technological advance or invention holistically, focusing on issues that extend beyond scientific efficacy and include patient and practitioner value propositions, legal and intellectual property protection, business modeling, potential market impacts, market competition, and ethical, social, and healthcare practitioner acceptance. During this course, law students, MBA students, and Ph.D. candidates in genomics and proteomics will work in teams of five (two laws students, two MBA students and one Ph.D. candidate), focusing on issues of commercialization and IP management of biomedical-related inventions. The instructors will be drawn from the law school, business school, and technology-transfer office. Please visit the following website for more information: fusioninnovate.com. Offered as LAWS 5341, MGMT 467, GENE 367, GENE 467, EBME 467 and ECSE 467.

**GENE 451. A Data-Driven Introduction to Genomics and Human Health. 3 Units.**
This course introduces the foundational concepts of genomics and genetic epidemiology through four key principles: 1) Teaching students how to query relational databases using Structure Query Language (SQL); 2) Exposing students to the most current data used in genomics and bioinformatics research, providing a quantitative understanding of biological concepts; 3) Integrating newly learned concepts with prior ones to discover new relationships among biological concepts; and 4) providing historical context to how and why data were generated and stored in the way they were, and how this gave rise to modern concepts in genomics. Offered as PQHS 451, GENE 451, and MPHP 451.
GENE 467. Commercialization and Intellectual Property Management. 3 Units.
This interdisciplinary course covers a variety of topics, including principles of intellectual property and intellectual property management, business strategies and modeling relevant to the creation of start-up companies and exploitation of IP rights as they relate to biomedical-related inventions. The goal of this course is to address issues relating to the commercialization of biomedical-related inventions by exposing law students, MBA students, and Ph.D. candidates (in genetics and proteomics) to the challenges and opportunities encountered when attempting to develop biomedical intellectual property from the point of early discovery to the clinic and market. Specifically, this course seeks to provide students with the ability to value a given technological advance or invention holistically, focusing on issues that extend beyond scientific efficacy and include patient and practitioner value propositions, legal and intellectual property protection, business modeling, potential market impacts, market competition, and ethical, social, and healthcare practitioner acceptance. During this course, law students, MBA students, and Ph.D. candidates in genomics and proteomics will work in teams of five (two laws students, two MBA students and one Ph.D. candidate), focusing on issues of commercialization and IP management of biomedical-related inventions. The instructors will be drawn from the law school, business school, and technology-transfer office. Please visit the following website for more information: fusioninnovate.com. Offered as LAWS 5341, MGMT 467, GENE 367, GENE 467, EBME 467 and ECSE 467.

GENE 488. Yeast Genetics and Cell Biology. 3 Units.
This seminar course provides an introduction to the genetics and molecular biology of the yeasts S. cerevisiae and S. pombe by a discussion of current literature focusing primarily on topics in yeast cell biology. Students are first introduced to the tools of molecular genetics and special features of yeasts that make them important model eukaryotic organisms. Some selected topics include cell polarity, cell cycle, secretory pathways, vesicular and nuclear/cytoplasmic transport, mitochondrial import and biogenesis, chromosome segregation, cytoskeleton, mating response and signal transduction. Offered as CLBY 488, GENE 488, MBIO 488, and PATH 488.

GENE 500. Advanced Eukaryotic Genetics I. 3 Units.
Fundamental principles of modern genetics; transmission, recombination, structure and function of the genetic material in eukaryotes, dosage compensation, behavior and consequences of chromosomal abnormalities, mapping and isolation of mutations, gene complementation and genetic interactions. Recommended preparation: BIOL 362.

GENE 503. Readings and Discussions in Genetics. 0 - 3 Units.
(Credit as arranged.) In-depth consideration of special selected topics through critical evaluation of classic and current literature.

GENE 504. Advanced Eukaryotic Genetics II. 3 Units.
Fundamental principles of modern genetics: population and quantitative genetics, dissection of genome organization and function, transgenics, developmental genetics, genetic strategies for dissecting complex pathways in organisms ranging from Drosophila and C. elegans to mouse and human. Recommended preparation: GENE 500 or permission of instructor.

GENE 505. Genetics Journal Club. 1 Unit.
Genetics Journal Club is a graduate level course designed to facilitate discussion of topics in Genetics. Students choose “hot” papers in Genetics and present them to their peers. Group presentations are designed to encourage audience participation. The intent of this class is to expose students to cutting edge topics in Genetics and to instill teaching and leadership skills.

GENE 511. Grant Writing and Reviewing Skills Workshop. 3 Units.
This is an introductory graduate course in grant writing and reviewing skills. During this course each student will write a research grant on a topic of his or her choice. Proposals may form the basis for the written component of the preliminary examination in the Genetics Department. Students will also participate in editing and reviewing the proposals of their classmates. Prereq: GENE 500 and GENE 504 or consent of instructor.

GENE 524. Advanced Medical Genetics: Molecular & Cytogenetics. 2 - 3 Units.
This course provides an in-depth forum for discussion of fundamental principles regarding clinical cytogenetics and molecular genetics and their relevance to medical genetics, genomics and genetic counseling. Following a historical overview, topics include a discussion of numerical and structural aberrations, sex chromosome abnormalities, issues regarding population cytogenetics, clinical relevance of such findings as marker chromosomes, mosaicism, contiguous gene deletions and uniparental disomy. The course will cover principles of molecular genetics including structure, function and regulations of genes (DNA, RNA, proteins), genetic variation, inheritance patterns and both cytogenetic and molecular laboratory techniques (fluorescence in situ hybridization, micro-array, SNP analyses, sequencing) in the clinical laboratory. Students who register for 3.00 credit hours are required to do an additional paper.

GENE 525. Advanced Medical Genetics: Clinical Genetics. 2 - 3 Units.
Fundamental principles regarding congenital malformations, dysmorphology and syndromes. Discussion of a number of genetic disorders from a systems approach: CNS malformations, neurodegenerative disorders, craniofacial disorders, skeletal dysplasias, connective tissue disorders, hereditary cancer syndromes, etc. Discussions also include diagnosis, etiology, genetics, prognosis and management.

GENE 526. Advanced Medical Genetics: Quantitative Genetics & Genomics. 2 - 3 Units.
The purpose of this course is twofold: first, to provide a foundation in quantitative genetics and second, to focus on genomic approaches and technologies which have greatly expanded our understanding of not only rare genetic disorders but common ones as well. We will cover concepts related to risk assessment and calculation and its application to medical genetics including principles and application of Hardy Weinberg equilibrium as well as applying Bayes’ Theorem as a mechanism to refine risk assessment based on data specific to a patient. We will also focus on understanding the clinical implications of the interpretation of next generation sequencing results, identify limitations of genomic technologies, and practice curation / annotation and interpretation of genomic testing results. In addition, we will discuss resources and bioinformatics tools including national databases and clinical labs to aid in the interpretation of genomic test results including variants of uncertain significance. Students who register for 3.00 credit hours are required to do an additional paper.

GENE 527. Advanced Medical Genetics: Biochemical Genetics. 2 - 3 Units.
Fundamental principles of metabolic testing; amino acid disorders; organic acid disorders; carbohydrate disorders; peroxisomal disorders; mitochondrial disorders; etc. Discussion of screening principles and newborn screening as well as approaches to diagnosis, management and therapy for metabolic diseases.
GENE 528. Principles and Practices of Genetic Counseling. 3 Units.  
Fundamental principles needed for the practicing genetic counselor.  
Topics include skills in obtaining histories (prenatal, perinatal, medical,  
developmental, psychosocial and family); pedigree construction and  
analysis, physical growth and development; the genetic evaluation; the  
physical examination and laboratory analyses; prenatal issues, prenatal  
screening and diagnosis; and teratogenicity.

GENE 529. Psychosocial Issues in Genetic Counseling. 3 Units.  
Fundamental principles regarding the psychosocial aspects of genetic  
disease and birth defects, its psychological and social impact on  
the individual and family. Topics include the genetic counseling  
interview process, issues regarding pregnancy and prenatal diagnosis,  
chronicity, death and loss. Cultural issues and their impact on the genetic  
counseling session are addressed. Resources for families are also  
explored. Basic interviewing skills are presented. Students will have an  
opportunity for practice of skills through role play and actual interviewing  
situations.

GENE 531. Cancer Genetics. 2 - 3 Units.  
This seminar will discuss basic concepts in cancer epidemiology,  
principles of cancer genetics, inherited cancer syndromes, cytogenetics  
of cancers, pedigree analysis for familial cancer risk and approaches to  
the differential diagnosis of inherited and familial cancers. Additionally,  
topics of risk assessment, genetic testing, screening, management and  
psychosocial issues in providing genetic counseling to patients with  
familial and inherited cancers will be discussed.

GENE 532. Clinical Practicum in Genetic Counseling. 1 - 6 Units.  
This clinical practicum provides the student an opportunity to function  
as a genetic counselor by preparing for cases; obtaining appropriate  
histories; determining risks; performing psychosocial assessments;  
discussing disease characteristics, inheritance, and natural history;  
providing anticipatory guidance and supportive counseling; using medical  
and community resources; and follow-up. Students rotate through four  
clinical areas and one laboratory and will register for a total of 12 hours  
over the course of the program. Recommended preparation: Admission to  
Genetic Counseling Training Program.

GENE 537. Microscopy-Principles and Applications. 3 Units.  
This course provides an introduction to various types of light microscopy,  
digital and video imaging techniques, and their applications to biological  
and biomedical sciences via lectures and hands-on experience. Topics  
covered include geometrical and physical optics; brightfield, darkfield,  
phase contrast, DIC, fluorescence and confocal microscopes; and digital  
image processing. Offered as GENE 537, M BIO 537, and PHOL 537.

GENE 601. Research in Genetics. 1 - 9 Units.  
(Credit as arranged.)

GENE 651. Thesis M.S.. 1 - 9 Units.  
(Credit as arranged.) Master’s Thesis Plan A.

GENE 701. Dissertation Ph.D.. 1 - 9 Units.  
(Credit as arranged.) Prereq: Predoctoral research consent or advanced to  
Ph.D. candidacy milestone.

Molecular Biology and Microbiology

Room W200, School of Medicine  
https://case.edu/medicine/microbio/  
Phone: 216.368.3420  
Jonathan Karn, PhD, Reinberger Professor, Chair  
jonathan.karn@case.edu

Brinn Omabegho (brinn.omabegho@case.edu), Manager

The Department of Molecular Biology and Microbiology provides a focus within the School of Medicine for the study of the growth and development of microorganisms at the molecular level and the host’s response to infection. The department is home to three PhD programs: Cell Biology, Molecular Biology and Microbiology, and Molecular Virology.

Faculty have nationally-funded research programs. Many faculty serve on study sections of national agencies, publish in the most prestigious journals, serve as editors of journals, and take leadership positions throughout the Case Western Reserve University School of Medicine. The department also enjoys numerous collaborations with faculty in the Departments of Biochemistry, Neuroscience, Pathology, Nutrition, and Genetics and Genome Sciences, the Case Comprehensive Cancer Center, the Visual Sciences Research Center, the Center for AIDS Research, and the Center for RNA Science and Therapeutics, and the Department of Cell Biology at the Lerner Research Center at CCF, because of shared research interests. All these activities create a vibrant scientific environment.

Research areas include the study of normal cell functions, microbial systems, viruses, and infectious diseases. It is only by developing a thorough understanding of the fundamental biology of cells and pathogenic microbes, their host organisms, and how the two interact during infection that improved strategies for prevention and treatment of infectious diseases can be achieved.

PhD in Cell Biology, Molecular Biology and Microbiology, Molecular Virology

The Department of Molecular Biology and Microbiology is home to three PhD programs: Cell Biology, Molecular Biology and Microbiology, and Molecular Virology. Admissions for all three of these programs occurs through the common PhD admissions program, the Biomedical Sciences Training Program (p. 796). In addition, students in the Medical Scientist Training Program (p. 785) (MSTP) can also pursue these three PhD programs.

PhD Requirements

Students entering through BSTP begin the first of three research rotations during the summer and participate in the Core Curriculum in Cell and Molecular Biology (C3MB), two integrated courses which provide formal instruction in modern cell and molecular biology. Some exceptional students with strong backgrounds, such as a previous Master’s Degree, may be eligible to be exempted from part of the Core Curriculum, and instead, enroll in one or more advanced courses during the fall semester. Some students may be eligible to apply for the transfer credit from their previous institution (please visit here (http://gradstudies.case.edu/) for more information). Transfer credit must be requested prior to beginning coursework at CWRU.

A student who chooses a thesis advisor from Cell Biology, Molecular Biology and Microbiology or Molecular Virology can become a member of one of these three PhD programs. To earn a PhD a student must complete 400-level graduate Core and Elective coursework including Responsible Conduct of Research and Research Rigor and Reproducibility as described in the course of study.

Students in each program are expected to attend the joint student seminars (MBIO 435 Seminar in Molecular Biology/Microbiology/MVIR 435 Seminar in Molecular Biology/Microbiology/CLBY 435 Seminar in Molecular Biology/Microbiology) for at least 3 seminars (3 credit hours). Continued participation in the seminars after
completion of this requirement is encouraged. Up to 4 credit hours can be allocated to the seminar course (one credit per semester).

Molecular Biology and Microbiology/ Molecular Virology and Cell Biology students should take MBIO 450 Cells and Pathogens/MVIR 450 Cells and Pathogens/CLBY 450 Cells and Pathogens.

In addition, Cell Biology Students must take both of the following fundamental course: CLBY 526 Cell Biology and Human Disease/MBIO 526 Cell Biology and Human Disease and CLBY 488 Yeast Genetics and Cell Biology. Molecular Virology Students must take MVIR 445 Molecular Biology and Pathogenesis of RNA and DNA Viruses and MVIR 450 Cells and Pathogens. MVIR 450 and MVIR 445 are offered on alternating spring semesters.

Beyond that, any combination of graduate courses from within or outside the department can be used to fulfill the requirement as long as the planned program of study has the approval of the Graduate Program Director, the student’s advisor, and the committee.

In addition, each PhD student must successfully complete a qualifying examination for advancement to candidacy in the form of a short grant proposal with oral defense. The qualifying exam is generally completed in the summer after year two. During the dissertation period, students are expected to meet twice a year with the thesis committee, present seminars in the department, and fulfill journal publication requirements. Throughout the doctoral training, students are expected to be enthusiastic participants in seminars, journal clubs, and research meetings in the lab and program.

Total Units in Sequence: 25-52

Third Year. Either semester, complete elective coursework so that total graded courses = 24 credits; Research credits switch from 601 to 701 once passed into candidacy.

Third Year + Full-time thesis research (701) - 18 total credit hours total

IBMS 501 Responsible Conduct of Research for Advanced Trainees is offered every spring semester (beginning 2020). The SOM requires that PhD students who are 4 years beyond their initial RCR training in IBMS 500 On Being a Professional Scientist: The Responsible Conduct of Research, register for IBMS 501.

### CLBY Courses

**CLBY 416. Fundamental Immunology. 4 Units.**

Introductory immunology providing an overview of the immune system, including activation, effector mechanisms, and regulation. Topics include antigen-antibody reactions, immunologically important cell surface receptors, cell-cell interactions, cell-mediated immunity, innate versus adaptive immunity, cytokines, and basic molecular biology and signal transduction in B and T lymphocytes, and immunopathology. Three weekly lectures emphasize experimental findings leading to the concepts of modern immunology. An additional recitation hour is required to integrate the core material with experimental data and known immune mediated diseases. Five mandatory 90 minute group problem sets per semester will be administered outside of lecture and recitation meeting times. Graduate students will be graded separately from undergraduates, and 22 percent of the grade will be based on a critical analysis of a recently published, landmark scientific article. Offered as BIOL 316, BIOL 416, CLBY 416, PATH 316 and PATH 416. Prereq: Graduate standing.
CLBY 417. Cytokines: Function, Structure, and Signaling. 3 Units.
Regulation of immune responses and differentiation of leukocytes is modulated by proteins (cytokines) secreted and/or expressed by both immune and non-immune cells. Course examines the function, expression, gene organization, structure, receptors, and intracellular signaling of cytokines. Topic include regulatory and inflammatory cytokines, colony stimulating factors, chemokines, cytokine and cytokine receptor gene families, intracellular signaling through STAT proteins and tyrosine phosphorylation, clinical potential, and genetic defects. Lecture format using texts, scientific reviews and research articles. Recommended preparation: PATH 416 or equivalent. Offered as BIOL 417, CLBY 417, and PATH 417.

CLBY 435. Seminar in Molecular Biology/Microbiology. 1 Unit.
Graduate students will attend the departmental seminar given by all graduate students in the Department of Molecular Biology and Microbiology, in the Molecular Virology Program, and in the Cell Biology Program, as well as give a seminar on their own thesis research. Students will be evaluated by the faculty member in charge of that student’s seminar with input from the students’ own thesis committee. After each seminar, the student presenter will meet with other graduate students for peer-review of the content, delivery, and style of the seminar. Peer reviewers will also be evaluated for the quality of their input. Offered as CLBY 435 and MBIO 435 and MVIR 435.

CLBY 450. Cells and Pathogens. 3 Units.
Modern molecular cell biology owes a great debt to viral and bacterial pathogens as model systems. In some instances pathogens operate by faithful mimicry of host proteins, and other cases represent the result of extensive molecular tinkering and convergent evolution. This course will also explore numerous mechanisms utilized by pathogens to subvert the host and enhance their own survival. Topics include regulatory mechanisms, protein synthesis and stability, membrane-bound organelles, endocytosis and phagocytosis, and factors that influence cell behavior such as cytokuent rearrangements, cell-cell interactions, and cell migration. Additional topics include cell signaling and co-evolution of pathogens and host cell functions. Students are expected to come to class prepared to discuss pre-assigned readings consisting of brief reviews and seminal papers from the literature. Student assessment will be based on effective class participation (approximately 80%) and successful presentation of an independent research topic (approximately 20%). Offered as CLBY 450, MBIO 450, and MVIR 450. Prereq: CBIO 453 and CBIO 455 or permission of instructor.

CLBY 466. Cell Signaling. 3 Units.
This is an advanced lecture/journal/discussion format course that covers cell signaling mechanisms. Included are discussions of neurotransmitter-gated ion channels, growth factor receptor kinases, cytokine receptors, G protein-coupled receptors, steroid receptors, heterotrimeric G proteins, ras family GTPases, second messenger cascades, protein kinase cascades, second messenger regulation of transcription factors, microtubule-based motility, actin/myosin-based motility, signals for regulation of cell cycle, signals for regulation of apoptosis. Offered as CLBY 466, PHOL 466 and PHRM 466.

CLBY 488. Yeast Genetics and Cell Biology. 3 Units.
This seminar course provides an introduction to the genetics and molecular biology of the yeasts S. cerevisiae and S. pombe by a discussion of current literature focusing primarily on topics in yeast cell biology. Students are first introduced to the tools of molecular genetics and special features of yeasts that make them important model eukaryotic organisms. Some selected topics include cell polarity, cell cycle, secretory pathways, vesicular and nuclear/cytoplasmic transport, mitochondrial import and biogenesis, chromosome segregation, cytoskeleton, mating response and signal transduction. Offered as CLBY 488, GENE 488, MBIO 488, and PATH 488.

CLBY 525. Neurodegenerative Diseases of the Brain and the Eye: Molecular Basis of the Brain-Eye Connection. 3 Units.
This is a graduate-level seminar course that familiarizes students with common neurodegenerative conditions of the brain and the eye. The molecular basis of each disorder and associated ophthalmic pathology will be emphasized. Contribution of heavy metals in brain and ocular pathology will be discussed where appropriate. Specific examples include Alzheimer’s Disease, Parkinson’s Disease, prion disorders, Huntington’s Disease, age-related macular degeneration, glaucoma, and others based on popular demand. The students will be expected to discuss relevant research publications in class in an interactive format. Grading will be based on class participation and completion of an R21 grant proposal. Concurrent enrollment in PATH 526 on grant writing skills is strongly recommended but not required. Offered as PATH 525 and CLBY 525.

CLBY 526. Cell Biology and Human Disease. 3 Units.
This course is designed to provide broad base of knowledge regarding cell structure and function. The basic structure of the cell will be discussed, as will the various functional systems that are superimposed upon and interact with this structure. The course will discuss organellar biogenesis, materials movement inside cells, cell interaction with the external environment, cell cycle and cell death regulation, cytoskeleton dynamics, quality control mechanisms, and basic signal transduction concepts. The course will also discuss how abnormal cell function may lead to human disease, and how basic cell function may be harnessed by intracellular pathogens to provide favorable intracellular environments for replication. The major goals of this course are to provide students with a working knowledge of the cell to facilitate understanding of the scientific literature, and to familiarize students with modern experimental approaches in cell biology. The course will rely heavily on student participation. Students will be provided with study guides with the expectation they will come to class prepared to lead interactive group discussions with minimal input from instructors. Offered as CLBY 526, MBIO 526 and MVIR 526.

CLBY 601. Special Problems. 1 - 18 Units.
This is the listing for independent research. Students should enroll in this course once they have selected their laboratory for Ph.D. research. The number of credit hours depends on how many didactic courses they are following at the same time. Once they have passed their qualifying examination they should register for CLBY 701.

CLBY 701. Dissertation Ph.D.. 1 - 9 Units.
This is the listing for independent research toward the Ph.D. The number of credit hours depends on how many didactic courses students are following at the same time. Students may register for this course only once they have passed their qualifying examination. Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.
MBIO Courses

**MBIO 399. Undergraduate Research. 1 - 3 Units.**
Permits qualified undergraduates to work in a faculty member's laboratory.

**MBIO 420. Current Topics in Cancer. 3 Units.**
The concept of cancer hallmarks has provided a useful guiding principle in our understanding of the complexity of cancer. The hallmarks include sustaining proliferative signaling, evading growth suppressors, enabling replicative immortality, activating invasion and metastasis, inducing angiogenesis, resisting cell death, deregulating cellular energetics, avoiding immune destruction, tumor-promoting inflammation, and genome instability and mutation. The objectives of this course are to (1) examine the principles of some of these hallmarks, and (2) explore potential therapies developed based on these hallmarks of cancer. This is a student-driven and discussion-based graduate course. Students should have had some background on the related subjects and have read scientific papers in their prior coursework. Students will be called on to present and discuss experimental design, data and conclusions from assigned publications. There will be no exams or comprehensive papers but students will submit a one-page critique (strengths and weaknesses) of one of the assigned papers prior to each class meeting. The course will end with a full-day student-run symposium on topics to be decided jointly by students and the course director. Grades will be based on class participation, written critiques, and symposium presentations. Offered as BIOT 420, MBIO 420, PATH 422, and PHRM 420. Prereq: CBIO 453 and CBIO 455.

**MBIO 435. Seminar in Molecular Biology/Microbiology. 1 Unit.**
Graduate students will attend the departmental seminar given by all graduate students in the Department of Molecular Biology and Microbiology, in the Molecular Virology Program, and in the Cell Biology Program, as well as give a seminar on their own thesis research. Students will be evaluated by the faculty member in charge of that student's seminar with input from the students’ own thesis committee. After each seminar, the student presenter will meet with other graduate students for peer-review of the content, delivery, and style of the seminar. Peer reviewers will also be evaluated for the quality of their input. Offered as BIOT 435 and MBIO 435 and MVIR 435. Prereq: CBIO 453 and CBIO 455.

**MBIO 445. Molecular Biology and Pathogenesis of RNA and DNA Viruses. 3 Units.**
Through a combination of lectures by Case faculty and guest lecturers, along with student discussion of current literature, this course emphasizes mechanisms of viral gene expression and pathogenesis. RNA viruses to be discussed include positive, negative, and retroviruses. DNA viruses include SV40, adenovirus, herpes, papilloma, and others. Important aspects of host defense mechanisms, antiviral agents, and viral vectors will also be covered. Students will be evaluated based on their quality of presentation of course papers assigned to them and their overall participation in class discussions. Offered as MBIO 445 and MVIR 445.

**MBIO 450. Cells and Pathogens. 3 Units.**
Modern molecular cell biology owes a great debt to viral and bacterial pathogens as model systems. In some instances pathogens operate by faithful mimicry of host proteins, and other cases represent the result of extensive molecular tinkering and convergent evolution. This course will also explore numerous mechanisms utilized by pathogens to subvert the host and enhance their own survival. Topics covered include nuclear regulatory mechanisms, protein synthesis and stability, membrane-bound organelles, endocytosis and phagocytosis, and factors that influence cell behavior such as cytokine signaling pathways, cell-cell interactions, and cell migration. Additional topics include cell signaling and co-evolution of pathogens and host cell functions. Students are expected to come to class prepared to discuss pre-assigned readings consisting of brief reviews and seminal papers from the literature. Student assessment will be based on effective class participation (approximately 80%) and successful presentation of an independent research topic (approximately 20%). Offered as CLBY 450, MBIO 450, and MVIR 450. Prereq: CBIO 453 and CBIO 455 or permission of instructor.

**MBIO 488. Yeast Genetics and Cell Biology. 3 Units.**
This seminar course provides an introduction to the genetics and molecular biology of the yeasts S. cerevisiae and S. pombe by a discussion of current literature focusing primarily on topics in yeast cell biology. Students are first introduced to the tools of molecular genetics and special features of yeasts that make them important model eukaryotic organisms. Some selected topics include cell polarity, cell cycle, secretory pathways, vesicular and nuclear/cytoplasmic transport, mitochondrial import and biogenesis, chromosome segregation, cytoskeleton, mating response and signal transduction. Offered as CLBY 488, GENE 488, MBIO 488, and PATH 488.

**MBIO 513. Bacterial Virulence and Host Interactions. 3 Units.**
The goal of this seminar course is to familiarize students with bacterial virulence mechanisms and how they interact with the host. The focus will be on current literature pertaining to this field. While the molecular basis of bacterial virulence mechanisms will be the main focus, some time will be spent on the host immune response. Topics covered will include adhesins/pili, secretion mechanisms, AB toxins, bacterial invasion and intracellular survival, regulation of virulence gene expression. Prereq: CBIO 453 and CBIO 455 or equivalent courses.

**MBIO 526. Cell Biology and Human Disease. 3 Units.**
This course is designed to provide broad base of knowledge regarding cell structure and function. The basic structure of the cell will be discussed, as will the various functional systems that are superimposed upon and interact with this structure. The course will discuss organelle biogenesis, materials transport inside cells, cell interaction with the external environment, cell cycle and cell death regulation, cytoskeleton dynamics, DNA repair mechanisms, and basic signal transduction concepts. The course will also discuss how abnormal cell function may lead to human disease, and how basic cell function may be harnessed by intracellular pathogens to provide favorable intracellular environments for replication. The major goals of this course are to provide students with a working knowledge of the cell to facilitate understanding of the scientific literature, and to familiarize students with modern experimental approaches in cell biology. The course will rely heavily on student participation. Students will be provided with study guides with the expectation they will come to class prepared to lead interactive group discussions with minimal input from instructors. Offered as CLBY 526, MBIO 526 and MVIR 526.
Mbio 537. Microscopy-Principles and Applications. 3 Units.
This course provides an introduction to various types of light microscopy, digital and video imaging techniques, and their applications to biological and biomedical sciences via lectures and hands-on experience. Topics covered include geometrical and physical optics; brightfield, darkfield, phase contrast, DIC, fluorescence and confocal microscopes; and digital image processing. Offered as GENE 537, MBIO 537, and PHOL 537.

MBIO 601. Research in Molecular Biology and Microbiology. 1 - 18 Units.

MBIO 701. Dissertation Ph.D.. 1 - 9 Units.
(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

MVIR Courses

MVIR 435. Seminar in Molecular Biology/Microbiology. 1 Unit.
Graduate students will attend the departmental seminar given by all graduate students in the Department of Molecular Biology and Microbiology, in the Molecular Virology Program, and in the Cell Biology Program, as well as give a seminar on their own thesis research. Students will be evaluated by the faculty member in charge of that student’s seminar with input from the students’ own thesis committee. After each seminar, the student presenter will meet with other graduate students for peer review of the content, delivery, and style of the seminar. Peer reviewers will also be evaluated for the quality of their input. Offered as CLBY 435 and MBIO 435 and MVIR 435.

MVIR 445. Molecular Biology and Pathogenesis of RNA and DNA Viruses. 3 Units.
Through a combination of lectures by Case faculty and guest lecturers, along with student discussion of current literature, this course emphasizes mechanisms of viral gene expression and pathogenesis. RNA viruses to be discussed include positive, negative, and retroviruses. DNA viruses include SV40, adenovirus, herpes, papilloma, and others. Important aspects of host defense mechanisms, antiviral agents, and viral vectors will also be covered. Students will be evaluated based on their quality of presentation of course papers assigned to them and their overall participation in class discussions. Offered as MBIO 445 and MVIR 445. Prereq: CBIO 453 and CBIO 455.

MVIR 450. Cells and Pathogens. 3 Units.
Modern molecular cell biology owes a great debt to viral and bacterial pathogens as model systems. In some instances pathogens operate by extensive molecular tinkering and convergent evolution. This course will also explore numerous mechanisms utilized by pathogens to subvert the host and enhance their own survival. Topics covered include nuclear regulatory mechanisms, protein synthesis and stability, membrane-bound organelles, endocytosis and phagocytosis, and factors that influence cell behavior such as cytoskeleton rearrangements, cell-cell interactions, and cell migration. Additional topics include cell signaling and co-evolution of pathogens and host cell functions. Students are expected to come to class prepared to discuss pre-assigned readings consisting of brief reviews and seminal papers from the literature. Student assessment will be based on effective class participation (approximately 80%) and successful presentation of an independent research topic (approximately 20%). Offered as CLBY 450, MBIO 450, and MVIR 450. Prereq: CBIO 453 and CBIO 455 or permission of instructor.

MVIR 526. Cell Biology and Human Disease. 3 Units.
This course is designed to provide broad base of knowledge regarding cell structure and function. The basic structure of the cell will be discussed, as will the various functional systems that are superimposed upon and interact with this structure. The course will discuss organelle biogenesis, materials movement inside cells, cell interaction with the external environment, cell cycle and cell death regulation, cytoskeleton dynamics, quality control mechanisms, and basic signal transduction concepts. The course will also discuss how abnormal cell function may lead to human disease, and how basic cell function may be harnessed by intracellular pathogens to provide favorable intracellular environments for replication. The major goals of this course are to provide students with a working knowledge of the cell to facilitate understanding of the scientific literature, and to familiarize students with modern experimental approaches in cell biology. The course will rely heavily on student participation. Students will be provided with study guides with the expectation they will come to class prepared to lead interactive group discussions with minimal input from instructors. Offered as CLBY 526, MBIO 526 and MVIR 526.

MVIR 601. Research. 1 - 18 Units.
Grade of S/U only.

MVIR 701. Dissertation Ph.D.. 1 - 9 Units.
Grade of S/U only. Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

Molecular Medicine Program

Lerner Research Institute, ND-46
http://www.lerner.ccf.org/molecmed/phd/
Phone: 216.445.9417
Jonathan Smith, PhD, Program Director

The Molecular Medicine PhD Program is a unique collaborative graduate training opportunity that integrates medical knowledge into graduate training. The goal of this program is to produce scientists trained in translational research: basic or applied research relevant to human health and disease that can lead to new understanding of disease, clinical and diagnostic tools, medications, and therapies.

Students train rigorously to apply basic science discoveries to human health and to the causes and treatments of human disease. The mastery of competencies necessary to translate scientific observations from the research bench to clinical care is the focus of this PhD program. Graduates will be well prepared to collaborate with physicians and for the challenge of using molecular and cellular biology to advance human health.

PhD in Molecular Medicine

Admission into the Molecular Medicine PhD program is obtained through application directly to the program. Graduate students complete didactic coursework, independent research, and other doctoral requirements to earn the PhD. First-year students complete two to four laboratory rotations among the laboratories of training faculty and are exposed to trainer research projects during the Frontiers of Molecular Medicine seminars. The first year begins mid-July. Students from all years present their research and received feedback in the Student Seminar Series.

During subsequent years, students will devote the majority of their time to thesis research while attending advanced graduate courses, and seminars. Advanced elective courses may be chosen from any department or program on campus with the approval of the graduate
program director and the student’s thesis committee over the first two years. Students must take a total of 36 semester hours of courses and pre-candidacy thesis research, including 24 graded credit hours, and maintain a B average.

The qualifying exam will be comprised of preparing and defending a grant application in the NIH format. The topic of the grant is the area of the student’s thesis research. At least one aim of this proposal will consist of a specific translational or clinical aim.

All efforts should be made to complete the PhD within five years from the date of matriculation. All students are expected to submit two or more first-authored primary research publications in peer-reviewed scientific journals. At least one manuscript must be accepted for publication prior to the thesis defense.

**PRISM Program (Physicians Researchers Innovating in Science and Medicine)**

NIH recognizes the need for physician on-ramps into research training, including the option for obtaining a PhD during residency / fellowship. The Molecular Medicine PhD Program offers a track for Cleveland Clinic physician trainees in GME accredited programs, who wish to pursue a PhD in laboratory-based research in the Molecular Medicine PhD Program, a program completely housed and administered at the Cleveland Clinic. If you are a Cleveland Clinic physician trainee and have questions about this opportunity, please email molmedphd@ccf.org.

**PhD Program Requirements**

**Coursework**

Students begin in July by taking MMED 402 Tools for Research and MMED 410 Introduction to Human Physiology and Disease. The student will follow a progressive curriculum including Cell Biology; Metabolism and Pharmacology; Nucleic Acids, Gene Expression and Gene Regulation; Mammalian Genetics; and Infection and Immunity. In the second summer, students take Principles of Clinical and Translational Research. During year 2, students are required to take MMED 521 Molecular aspects of the diagnosis, pathology, and treatment of selected human diseases focusing on molecular mechanisms of human disease, and an independent study mentored MMED 612 Clinical Experience.

**Research Rotations**

The research rotations allow the student to sample areas of research and become familiar with faculty members and their laboratories. The main purpose of these rotations is to aid the student in selecting a laboratory for the thesis work. Students will begin their rotations in July. At least two rotations are highly recommended prior to choosing the thesis advisor.

**Choosing a Thesis Advisor**

During or after the second semester of the first year, students select an advisor for their dissertation research. The emphasis of the PhD work is on research, culminating in the completion of an original, independent research thesis.

**Plan of Study**

* Starts in July
** Credits vary
+ Credits may vary to yield 9 credits per semester

**Third Year and beyond:** Complete elective coursework so total graded courses equal at least 24 credits; Research credits switch from MMED 601 Dissertation Research to MMED 701 Dissertation Ph.D. once passed into candidacy. Minimum of 1 credit of MMED 701 Dissertation Ph.D. is required each regular semester thereafter for a total of 18 credits to graduate.
Courses

**MMED 400. Research Rotations. 0 Unit.**
Research rotations are conducted to expose the student to several laboratory environments, a variety of research problems and numerous laboratory techniques as well as to assist them in the selection of their Research Advisor. Rotations will begin immediately upon enrollment and continue through the second semester of the first year. Usually rotations will last 12 weeks, however if a student decides that he/she is not interested in the assigned laboratory a shorter rotation is appropriate. The student is responsible for arranging each rotation with an approved trainer with the consultation of the Graduate Program Director. To assist in this endeavor, the Graduate Program Director will provide a list of approved trainers who have space, time and money to support a graduate student. During the rotation, students are expected to participate in all lab and departmental activities, e.g., lab meetings and seminars. At the completion of a rotation the student is required to submit a written Rotation Report including an outline of the problem being studied, a description of the experimental approaches, a discussion of the results of performed experiments as well as future directions.

**MMED 402. Tools for Research. 2 Units.**
The goal of this course is to provide a thorough and comprehensive review of current laboratory technology essential to research in molecular medicine, focusing on basic underlying principles, important controls and caveats. The students will clone a cytokine during a laboratory component of the course, which will involve designing appropriate primers, obtaining RNA from cytokine-expressing cells, performing RT/PCR, and ligating isolated, characterized fragments into cloning- and expression vectors, followed by transfection into mammalian cells. Additional bench work will include characterizing the cloned product using real time PCR, ELISA, western blot analysis, and immunohistochemistry. Seminars on commonly used molecular techniques will be given intermittently by guest lecturers with the relevant expertise. Evaluation will be based on the student’s lab techniques, class participation, and contribution to the group learning process.

**MMED 404. Journal Club / Frontiers in Molecular Medicine. 1 Unit.**
This course is a combination of a weekly discussion-based Journal Club with selected articles relevant to the core curriculum of the week and the Frontiers in Molecular Medicine Seminar series. The seminars are presented by Molecular Medicine faculty and guest lecturers to introduce first year students to the opportunities and issues in translational and clinical research.

**MMED 410. Introduction to Human Physiology and Disease. 4 Units.**
The purpose of this course is to give an introduction to the physiology of the major human organ systems, as well as selected associated pathophysiologies. The course will provide a physiological basis for subsequent study and research in Molecular Medicine. The integration of clinical faculty into the course will emphasize the importance of bringing scientific knowledge to bear on clinical problems, a theme which will be stressed throughout the Molecular Medicine curriculum. The course will also acquaint students with medical terminology.

**MMED 412. Metabolism and Introduction to Principles of Pharmacology. 2 Units.**
The course will include a combination of interactive lectures, research presentations, related journal club article, and group projects with presentations. Topics to be covered include: bioenergetics/oxidative phosphorylation, carbohydrate metabolism; lipid and lipoprotein metabolism, amino acid and nucleotide metabolism; integrative regulation of metabolism; and principals of pharmacology.

**MMED 413. Nucleic Acids, Gene Expression, and Gene Regulation. 2 Units.**
The course will include a combination of interactive lectures and problem-based learning. Each week will conclude with at least one clinical correlation where the weekly topic is presented in the context of a clinical problem. Topics to be covered include: DNA structure, chromosome structure, replication and repair; RNA synthesis and RNA processing, the organization of eukaryotic genes and the genetic code and translation; and gene regulation.

**MMED 414. Mammalian Genetics. 2 Units.**
The course focuses on genetics, genomics, and bioinformatics, and it will include a combination of interactive lectures, problem-based learning and a week-long group project. Topics to be covered include: genetic variation; linkage studies; association studies; complex traits, linkage disequilibrium, the Hap Map, pharmacogenetics; genome-wide expression studies, and mouse models of human disease, and bioinformatics.

**MMED 415. Cell Biology. 2 Units.**
The course will include a combination of interactive lectures and problem-based learning. Each week will conclude with at least one clinical correlation where the weekly topic is presented in the context of a clinical problem. Topics to be covered include: cell structure and organelles, prokaryotes/eukaryotes; intracellular compartments and protein sorting; receptors/endocytosis/rafts; the nucleus; cell communication; and mechanics of cell division.

**MMED 416. Host Defense: Infection and Immunity. 2 Units.**
The course will include a reading program, lectures, and weekly problem-based student-led presentations. Weeks 1 and 2 are dedicated to building the scope of the field and forming vocabulary. Week 3 and part of Week 4 will cover immune mechanisms. The remainder of the course will deal with clinical aspects of immunobiology. On a regular basis Clinical Correlations, relevant to weekly topics, are integrated into the material. Topics to be covered include: biology and molecular biology of infectious agents; fundamentals of immunology; innate and adaptive responses to infection, immune effector mechanisms; and clinical aspects of immunobiology.

**MMED 501. Principles of Clinical and Translational Research. 4 Units.**
To give an introduction to the ethical, statistical, methodologic and informatics basis of clinical and translational research. Topics will include the history of clinical and translational research, regulatory aspects of human subjects research, clinical trials study design, conflicts of interest, human subjects recruitment, research and publication ethics, technology transfer, biobank construction and utilization, and clinical and research database construction and utilization. In addition, students will be introduced to principles of biostatistics and clinical epidemiology relevant to clinical and translational research and gain expertise in statistical tool using problem based learning sets.

**MMED 504. Student Seminar Series. 1 Unit.**
This course is designed as a weekly seminar series that will include presentations by the MMED graduate students. The format will be as follows: seminar talks by students in years 3 and beyond to provide a research update presentations by second year students involving basic science-clinical case translation topics, and short presentations on lab rotation accomplishments by first year students. The primary goals of this series are to gain experience and improve oral presentation skills, to share results and thoughts with peers during research discussions, and to learn to take the lead in developing and asking questions during seminars.
MMED 521. Molecular aspects of the diagnosis, pathology, and treatment of selected human diseases. 3 Units.
The goal of this course is to integrate medical knowledge into PhD training. This team-taught seminar course focuses on a top down examination of selected human diseases starting with clinical presentations of the manifestations, diagnoses, and treatment of disease. This is followed by study of the pathology, cell biology, and molecular biology of the disease. This information forms the foundation of a final discussion of current treatment strategies and ongoing research to identify new strategies. Three to four separate disease areas will be discussed during each semester, such as diabetes, cancer, and cardiovascular diseases. The specific areas of discussion are selected to demonstrate the strength of an integrated team of clinical and basic scientists; and to provide a model for students to follow in future studies in their own area of expertise. Emphasis will be given to the basic scientific observations that formed the basis of successful clinical practice, and how this was utilized by integrated teams of basic and clinical investigators to provide better patient care. Students will prepare for discussions with close reading of the literature. Faculty will present an overview in a discussion format. It is anticipated that each disease area will be presented by an integrated team of clinical and basic scientists. The final weeks of the semester will be devoted to student preparation of a research proposal based upon the information discussed during the course. The specific topic of this proposal will be of the students choosing. Grading will be based both upon preparation for and participation in discussions, and upon the research proposal. Recommended Preparation: Introductory Graduate or Medical School courses in Cell Biology, Molecular Biology, and Physiology

MMED 522. Grant Proposal Writing. 2 Units.
The goal of this course is to learn about the NIH institutes and grant proposal review and administration, how to compose the various sections of an NIH style grant proposal, and to gain practice in grant proposal writing skills. The course includes weekly writing assignments covering the different sections of an NIH style grant proposal. Upon completion of the grant proposal, students engage in a mock study section to review each other’s proposals. Grading will be based on grant writing assignments and participation in the mock study section.

MMED 601. Dissertation Research. 1 - 9 Units.
Research leading toward the Ph.D. dissertation in Molecular Medicine.

MMED 612. Clinical Experience. 2 Units.
Each student will be assigned a Clinical Mentor who will co-advises the student and serve on both the Qualifying Examination Committee and Thesis Committee. The Clinical Mentor will develop an individualized curriculum for the student in consultation with the Thesis Research Mentor and Program Director. The curriculum will be organized around the integrated, multidisciplinary disease groups at the Clinic. The students will attend and actively participate in the regularly scheduled multidisciplinary clinical conference organized by their disease group (most meet for one hour every week or every other week), usually involving a combination of case presentations and research presentations. At the conclusion of the semester the student will make a presentation to the group focused on a relevant translational research problem. The Clinical Mentor will also organize a series of supervised clinical experiences (with a Mentor) to various locations where students will observe clinician interactions with patients to better understand the disease from the patient perspective and to disease-related diagnostic and research laboratories.

MMED 701. Dissertation Ph.D.. 1 - 9 Units.
Research leading toward the Ph.D. dissertation in Molecular Medicine. Recommended preparation: Advancement to candidacy in MMED. Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

Department of Neurosciences
Room E-653, School of Medicine, Robbins Building

Lin Mei, MD, PhD, Chair
lin.mei@case.edu

Katie Wervey (kathleen.wervey@case.edu), Department Assistant

Understanding how the nervous system develops and functions to process information and mediate behavior and how it is altered by disease, injury and the environment is one of the most exciting frontiers remaining in biological science. Neuroscience is inherently multidisciplinary and integrative and solving the major outstanding problems will require knowledge of molecular, cellular, systems, and behavioral levels of organization. It also requires a multidisciplinary approach combining the tools of electrophysiology, anatomy, biochemistry and molecular biology in studies of animals, brain slices, and tissue culture models.

The department offers a PhD program that provides interdisciplinary training in modern neurosciences through a combination of course work, seminars, and research experience. Medical students are encouraged to pursue research projects with neurosciences faculty. Neuroscientists at CWRU are using state-of-the-art techniques and instrumentation to study diverse aspects of nervous system function, including neural circuitry and plasticity, development and regeneration, and cellular and molecular neurobiology. Techniques used include electrical recording and imaging to study the behavior of neurons from ion channels to how they function in awake, behaving animals; molecular genetic approaches to discover the roles of specific genes in circuit formation, synaptic function, and in neurological disorders; and anatomical, biochemical, computational, and behavioral methods to understand the normal nervous system and how it is affected by disease and injury.

PhD in Neurosciences

The Neurosciences graduate program has a strong emphasis on cellular and molecular mechanisms that mediate the function and development of the nervous system. Admissions to the Neurosciences PhD program may be obtained through the integrated Biomedical Sciences Training Program or via the Medical Scientist Training Program. To earn a PhD in Neurosciences, a student must complete rotations in at least three laboratories, followed by selection of a research advisor, and complete Core and Elective coursework including responsible conduct of research as described in the plan of study, below. In general, students must be registered for a total of 9 credit hours each fall and spring semester until they advance to candidacy, at the end of their 2nd year. Students who previously completed relevant coursework, for example, with a Master’s of Science, may petition to complete alternative courses. Each graduate program follows the overall regulations established and described in CWRU Graduate Studies and documented to the Regents of the State of Ohio.

In addition, each student must successfully complete a preliminary exam after year one, and a qualifier examination for advancement to candidacy.
in the form of a short grant proposal with oral defense. The qualifier is generally completed in the summer after year two. During the dissertation period, students are expected to meet at least once a year with their thesis committee, present seminars in the department, and fulfill journal publication requirements. Throughout the doctoral training, students are expected to be enthusiastic participants in seminars, journal clubs, and research meetings in the lab and program. Completion of the PhD degree will require 36 hours of coursework (24 hours of which are graded) and 18 hours of NEUR 701 Dissertation Ph.D.

**Total Units in Sequence:** 42-90

* IBMS 501 Responsible Conduct of Research for Advanced Trainees is offered every spring semester (beginning 2020). The SOM requires that PhD students who are 4 years beyond their initial RCR training in IBMS 500 On Being a Professional Scientist: The Responsible Conduct of Research, register for IBMS 501.

### Courses

**NEUR 166. Explorations in Neuroscience. 1 Unit.**

This survey course provides students with an opportunity to learn about some of the most exciting and timely concepts in neuroscience, including topics in basic and translational research, as well as perspectives on neuroscience as a profession, through a series of 14 lectures given by members of the Neurosciences Department in the Case Western Reserve University School of Medicine. Topics are presented in a way that can be understood by students who have taken a high school biology class. Every effort is made to explain any new concepts that are included in the lectures. Each lecturer will provide general background reading material for the topics they discuss.
NEUR 201. Fundamentals of Neuroscience I. 3 Units.
The purpose of this course is to provide students with a systematic and comprehensive introduction to the field of neuroscience. The topics that will be discussed and the level at which they are discussed assumes that the students have a basic familiarity with general features of cell structure and function and specialized properties of cells found in different physiological systems, from their previous biology coursework. The course will also provide a foundation for elective upper-level courses in the undergraduate neuroscience curriculum. Prereq: BIOL 214 and BIOL 215. Prereq or Coreq: BIOL 216.

NEUR 202. Fundamentals of Neuroscience II. 3 Units.
This course is the second in a sequence and designed to provide students with an understanding of signaling mechanisms that are utilized by nerve cells, including mechanisms that are responsible for signaling within cells and mechanisms that underlie signaling between cells. These mechanisms will range from the fast, millisecond time-scale transitions of ion channels that contribute to action potentials and synaptic signaling, to slower events that underlie modulation of channel activity and neurotransmitter synthesis and degradation, to even slower events on the hour and day timescale involving changes in gene expression and protein synthesis that underlie phenotypic development and neural plasticity. Prereq: NEUR 201.

NEUR 301. Biological Mechanisms of Brain Disorders. 3 Units.
This course is designed to introduce students to a broad range of neurological and neuropsychiatric diseases and disorders in order to understand how genetic and environmental perturbations can disrupt normal brain function. The primary focus will be on understanding the biological bases of nervous system dysfunction. For each disease discussed, the subject matter will be organized to explain how normal brain function is impacted, the biological mechanisms underlying dysfunction (including still-unanswered questions) and current efforts to develop effective treatments (translational research). With this approach, students will gain an understanding of disease presentation, how animal models and human studies are being used to elucidate pathophysiological mechanisms, and opportunities and challenges in the development of new therapies. The class format will be a mix of lecture-based sessions and discussions of scientific journal articles. Offered as NEUR 301 and NEUR 401. Prereq: BIOL 216 or PSCL 352.

NEUR 388. Undergraduate Research. 3 Units.
Guided laboratory research under the sponsorship of a SOM faculty member who conducts basic and/or translational neuroscience research. Students are required to obtain permission from the prospective research supervisor and the Neuroscience Undergraduate Curriculum Committee (NUCC) prior to enrolling in the course. Appropriate forms must be submitted to the Neurosciences Department office. At the end of the semester, a research report, written in the format of a scientific research publication, must be submitted and approved by the research mentor and the NUCC before credit is granted.

NEUR 388S. Undergraduate Research SAGES Capstone. 3 Units.
Guided laboratory research supervised and guided by a SOM faculty member who conducts basic and/or translational neuroscience research. Students are required to obtain permission from the prospective research supervisor and the Neuroscience Undergraduate Curriculum Committee (NUCC) prior to enrolling in the course. Appropriate forms must be submitted to the Neurosciences Department office. At the end of the semester, a research report, written in the format of a scientific research publication, must be submitted and approved by the research mentor and the NUCC before credit is granted. A public presentation is required.

NEUR 390. Advanced Undergraduate Research in Neuroscience. 1 - 3 Units.
Guided laboratory research under the sponsorship of a SOM faculty member who conducts basic and/or translational neuroscience research. Students are required to obtain permission from the prospective research supervisor and the Neuroscience Undergraduate Curriculum Committee (NUCC) prior to enrolling in the course. Appropriate forms must be submitted to the Neurosciences Department office. Does not count toward the hours required for a major in neuroscience, but may be counted toward the total number of hours required for graduation. At the end of the semester, a research report, written in the format of a scientific research publication, must be submitted and approved by the research mentor and the NUCC before credit is granted. Prereq: NEUR 388 or NEUR 388S.

NEUR 401. Biological Mechanisms of Brain Disorders. 3 Units.
This course is designed to introduce students to a broad range of neurological and neuropsychiatric diseases and disorders in order to understand how genetic and environmental perturbations can disrupt normal brain function. The primary focus will be on understanding the biological bases of nervous system dysfunction. For each disease discussed, the subject matter will be organized to explain how normal brain function is impacted, the biological mechanisms underlying dysfunction (including still-unanswered questions) and current efforts to develop effective treatments (translational research). With this approach, students will gain an understanding of disease presentation, how animal models and human studies are being used to elucidate pathophysiological mechanisms, and opportunities and challenges in the development of new therapies. The class format will be a mix of lecture-based sessions and discussions of scientific journal articles. Offered as NEUR 301 and NEUR 401.

NEUR 402. Principles of Neural Science. 3 Units.
Lecture/discussion course covering concepts in cell and molecular neuroscience, principles of systems neuroscience as demonstrated in the somatosensory system, and fundamentals of the development of the nervous system. This course will prepare students for upper level Neuroscience courses and is also suitable for students in other programs who desire an understanding of neurosciences. Recommended preparation: CBIO 453. Offered as BIOL 402 and NEUR 402.

NEUR 415. Neuroscience Seminars. 1 Unit.
Current topics of interest in neurosciences. Students attend weekly seminars. From this series, students prepare critiques. No credit is given for less than 75% attendance.

NEUR 419. Critical Thinking in Neuroscience. 3 Units.
The goal of this course is to develop the student's critical reasoning skills through reading and discussing primary research papers. Each year, the course will focus on 3-4 different topics selected by participating Neuroscience faculty members. Students will receive a letter grade based on their contributions to discussions, and at the discretion of the faculty, performance on exams and/or term paper. Prereq: NEUR 402.
NEUR 432. Current Topics in Vision Research. 3 Units.
Vision research is an exciting and multidisciplinary area that draws on the disciplines of biochemistry, genetics, molecular biology, structural biology, neuroscience, and pathology. This graduate level course will provide the student with broad exposure to the most recent and relevant research currently being conducted in the field. Topics will cover a variety of diseases and fundamental biological processes occurring in the eye. Regions of the eye that will be discussed include the cornea, lens, and retina. Vision disorders discussed include age-related macular degeneration, retinal ciliopathies, and diabetic retinopathy. Instructors in the course are experts in their field and are members of the multidisciplinary visual sciences research community here at Case Western Reserve University. Students will be exposed to the experimental approaches and instrumentation currently being used in the laboratory and in clinical settings. Topics will be covered by traditional lectures, demonstrations in the laboratory and the clinic, and journal club presentations. Students will be graded on their performance in journal club presentations (40%), research proposal (40%), and class participation (20%). Offered as NEUR 432, PATH 432, PHRM 432 and BIOC 432.

NEUR 466. Cell Signaling. 3 Units.
This is an advanced lecture/journal/discussion format course that covers cell signaling mechanisms. Included are discussions of neurotransmitter-gated ion channels, growth factor receptor kinases, cytokine receptors, G protein-coupled receptors, steroid receptors, heterotrimeric G proteins, ras family GTPases, second messenger cascades, protein kinase cascades, second messenger regulation of transcription factors, microtubule-based motility, actin/myosin-based motility, signals for regulation of cell cycle, signals for regulation of apoptosis. Offered as CLY 466, PHOL 466 and PHRM 466.

NEUR 473. Introduction to Neurobiology. 3 Units.
How nervous systems control behavior. Biophysical, biochemical and molecular biological properties of nerve cells, their organization into circuitry, and their function within networks. Emphasis on quantitative methods for modeling neurons and networks, and on critical analysis of the contemporary technical literature in the neurosciences. Term paper required for graduate students. This course satisfies a lab requirement for the B.A. in Biology, and a Quantitative Laboratory requirements for the B.S. in Biology. Offered as BIOL 373, BIOL 473, and NEUR 473.

NEUR 474. Neurobiology of Behavior. 3 Units.
In this course, students will examine how neurobiologists interested in animal behavior study the linkage between neural circuitry and complex behavior. Various vertebrate and invertebrate systems will be considered. Several exercises will be used in this endeavor. Although some lectures will provide background and context on specific neural systems, the emphasis of the course will be on classroom discussion of specific journal articles. In addition, students will each complete a project in which they will observe some animal behavior and generate both behavioral and neurobiological hypotheses related to it. In lieu of examinations, students will complete three written assignments, including a theoretical grant proposal, a one-page Specific Aims paper related to the project, and a final project paper. These assignments are designed to give each student experience in writing biologically-relevant documents. Classroom discussions will help students understand the content and format of each type document. They will also present their projects orally to the entire class. Offered as BIOL 374, BIOL 474 and NEUR 474. Counts as SAGES Departmental Seminar.

NEUR 475. Protein Biophysics. 3 Units.
This course focuses on in-depth understanding of the molecular biophysics of proteins. Structural, thermodynamic and kinetic aspects of protein function and structure-function relationships will be considered at the advanced conceptual level. The application of these theoretical frameworks will be illustrated with examples from the literature and integration of biophysical knowledge with description at the cellular and systems level. The format consists of lectures, problem sets, and student presentations. A special emphasis will be placed on discussion of original publications. Offered as BIOC 475, CHEM 475, PHOL 475, PHRM 475, and NEUR 475.

NEUR 478. Computational Neuroscience. 3 Units.
Computer simulations and mathematical analysis of neurons and neural circuits, and the computational properties of nervous systems. Students are taught a range of models for neurons and neural circuits, and are asked to implement and explore the computational and dynamic properties of these models. The course introduces students to dynamical systems theory for the analysis of neurons and neural learning, models of brain systems, and their relationship to artificial and neural networks. Term project required. Students enrolled in MATH 478 will make arrangements with the instructor to attend additional lectures and complete additional assignments addressing mathematical topics related to the course. Recommended preparation: MATH 223 and MATH 224 or BIOL 300 and BIOL 306. Offered as BIOC 378, COGS 378, MATH 378, BIOL 478, CSDS 478, EBME 478, ECSE 478, MATH 478 and NEUR 478.

NEUR 540. Advanced Topics in Neuroscience Ethics. 0 Unit.
This course offers continuing education in responsible conduct of research for advanced graduate students. The course will cover the nine defined areas of research ethics through a combination of lectures, online course material and small group discussions. Six 2-hr meetings per semester. Maximum enrollment of 15 students with preference given to graduate students in the Neurosciences program. All neurosciences graduate students must complete this course during their 3rd or 4th year.

NEUR 601. Research in Neuroscience. 1 - 18 Units.
NEUR 651. Master's Thesis (M.S.). 1 - 6 Units.
(Credit as arranged.) Recommended preparation: M.S. candidates only.
NEUR 701. Dissertation Ph.D.. 1 - 9 Units.
(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

Department of Nutrition
School of Medicine, Room WG 48
https://case.edu/medicine/nutrition/
Phone: 216.368.2440; Fax: 216.368.6846
Hope Barkoukis, PhD, RDN, LD, FAND, Chair
hdb@case.edu

For general questions please email nutrition@case.edu.

The department's focus is on human nutrition and the application of the science of nutrition to health promotion and disease prevention. Undergraduate programs are designed for students interested in nutritional biochemistry and metabolism, clinical nutrition, professional study in dietetics, public health nutrition, medicine, physical therapy, pharmacy or dentistry. Graduate programs emphasize dietetics, public health nutrition, nutritional biochemistry and clinical nutrition.

The Department of Nutrition offers programs leading to the bachelor of arts degree in nutrition, the bachelor of science degree in nutrition, the bachelor of arts degree in nutritional biochemistry and metabolism, the
bachelor of science degree in nutritional biochemistry and metabolism, the master of science degree in nutrition, the dual degree of master of public health/master of science nutrition, and the doctor of philosophy degree. The master of science in nutrition is approved as a Post-baccalaureate Premedical Program (https://apps.aamc.org/postbac/#/program/542). Three minors are available: the minor in nutrition, the minor in sports nutrition, and the minor in environmental nutrition. Graduate certificate programs, which are designated on the student’s transcript, are available in areas such as maternal and child nutrition and nutrition for health care professionals. The certificates are in addition to the basic graduate degree. Students are able to pursue certificates at no additional cost to the student.

**Major Programs**

The undergraduate degree in nutrition is appropriate for students who wish to:

1. pursue programs in nutritional biochemistry, dietetics, public health and community nutrition or other biomedical sciences
2. enter professional schools of dentistry, medicine, physical therapy, or pharmacy
3. apply to dietetic internships or approved experience programs in order to prepare for the professional practice of dietetics
4. pursue careers with the government or in the food or pharmaceutical industry

This major offers flexibility in course selection within a framework of general program requirements. The selection of courses depends on the student’s choice of emphasis. Students wishing to qualify for admission to professional or graduate programs need to include specific courses considered prerequisites for admission. Students interested in applying to dietetic internships must meet specific course requirements (Didactic Program in Dietetics) as required by the Accreditation Council for Education in Nutrition and Dietetics of the Academy of Nutrition and Dietetics. These requirements are met in the courses that comprise the Didactic Program in Dietetics (DPD). The DPD at Case Western Reserve University is currently granted Accreditation by the Accreditation Council for Education in Nutrition and Dietetics of the Academy of Nutrition and Dietetics, 120 South Riverside Plaza, Suite 2000, Chicago, IL 60606-6995, 800.877.1600. A department advisor should be consulted in the freshman year to plan the dietetics coursework.

**Human Nutrition**

**Nutritional Biochemistry and Metabolism**

**Bachelor of Arts degree requires:**

Required courses:

- NTRN 201 Nutrition 3
- NTRN 343 Dietary Patterns 3
- NTRN 363 Human Nutrition I: Energy, Protein, Minerals 3
- NTRN 364 Human Nutrition II: Vitamins 3
- NTRN 397 SAGES Capstone Proposal Seminar 3
- NTRN 398 SAGES Senior Capstone Experience 3
- NTRN 452 Nutritional Biochemistry and Metabolism 3

Three nutrition electives at 300-level (or above with instructor consent) chosen from the following:

- NTRN 300 Healthy Lifestyles as Preventive Medicine
- NTRN 328 Child Nutrition, Development and Health
- NTRN 338 Dietary Supplements
- NTRN 341 Food as Medicine: How what we eat influences how we feel, think, and our health status
- NTRN 351 Food Service Systems Management
- NTRN 360 Clinical Assessment and Diagnosis: Nutritional, Functional, Physical
- NTRN 361 Metabolic Dysregulation of Energy from Obesity to Anorexia

Total Units: 81

**Bachelor of Science degree requires:**

Required courses:

- NTRN 201 Nutrition 3
- NTRN 343 Dietary Patterns 3
- NTRN 363 Human Nutrition I: Energy, Protein, Minerals 3
- NTRN 364 Human Nutrition II: Vitamins 3
- NTRN 397 SAGES Capstone Proposal Seminar 3

### Masters Degrees

The Department of Nutrition offers six distinct programs leading to Masters Degrees: (1) MS in Nutrition (2) MS in Public Health Nutrition (3) MS in Public Health Nutrition Dietetic Internship (4) Combined Dietetic Internship/Master’s Degree Program (5) Master of Public Health/ Master of Science in Nutrition Dual Degree Program and (6) MD/MS in Biomedical Investigation - Nutrition Track.

### MS in Nutrition

This degree program offers two options. For those pursuing the thesis option, 30 semester hours of a planned program of study are required, including six to nine semester hours of research, as well as a final oral defense of the thesis. The non-thesis option requires 30 semester hours and a final written, comprehensive examination.

All candidates are required to take 21 semester hours of nutrition, including seven hours of advanced human nutrition. In addition, students are encouraged to pursue complementary studies in the biomedical, social and behavioral sciences. The plan of study may vary considerably depending on the education, goals and specific interests of each student. Students may elect to focus on nutritional biochemistry and metabolism or molecular nutrition. The individual program also may be planned to fulfill the academic requirements for dietetic registration (Didactic Program in Dietetics). Students must obtain advisor approval for elective courses selected that will be used to satisfy graduation requirements.

### MS in Public Health Nutrition

The primary goal of this 16-month program is to prepare students for employment in public health or community agencies where you will work to promote health and reduce the risk of chronic disease and advance the nutritional health of our population. Coursework includes training in public health theory, program development and evaluation, nutritional epidemiology, human nutrition and life-cycle specific nutritional needs and concerns. A minimum of 31 semester hours of academic coursework is required to earn the degree. Note: students who have not previously earned an undergraduate degree in nutrition must complete NTRN 401 before beginning this program.

In addition to the general public health nutrition curriculum, students may elect to complete a certificate in Maternal and Child Nutrition. Specialty certificates may require completion of additional coursework.

### MS in Public Health Nutrition Dietetic Internship Program  

The primary goal of this program is to prepare Registered Dietitian Nutritionists (RDNs) for employment in public health or community agencies. A minimum of 30 semester hours of combined academic work and supervised practice is required to earn the degree. Supervised practice is concurrent with coursework utilizing local agencies for translation of theory and science into practice. The program includes a ten-twelve week experience in an out of town public health agency that has a strong nutrition program.  

In addition to the public health nutrition curriculum, students may elect to complete a certificate in Maternal and Child Nutrition. Specialty certificates may require completion of additional coursework. If a certificate program is selected, supervised practice will be geared toward the specific population group.  

Upon completion of the program, students are eligible to take the Registered Dietitian Nutritionist (RDN) exam. The program is accredited by the Accreditation Council for Education in Nutrition and Dietetics (ACEND). This program is a non-thesis program of study.  

**General Track: Plan of Study**  

Note: Students must take either NTRN 436 or NTRN 440.

### Combined Dietetic Internship/Master's Degree Program  

The Combined Dietetic Internship/Master's Degree Program combines academic work with clinical practice at a dietetic internship at University Hospitals Case Medical Center, the Louis Stokes Cleveland Department of Veterans Affairs Medical Center, or the Cleveland Clinic. A minimum of 30 semester hours is required. Admission is contingent on the student being selected and matched to one of the hospitals’ dietetic internship programs. Appointment to these internships follows the admission procedure outlined by the Accreditation Council for Education in Nutrition and Dietetics of the Academy of Nutrition and Dietetics.  

Coursework is planned individually with the student’s academic advisor. This program is a non-thesis program of study.

Master of Public Health/Master of Science in Nutrition Dual Degree Program

This is a dual degree program that is offered jointly by the Departments of Epidemiology and Biostatistics, and Nutrition. The core Master Degree courses include a mixture of those from nutrition, biochemistry and public health.

The trained graduate could be employed in a wide variety of settings, including (but not limited to) local, state, national, or global public policy, governmental public health, hospital outreach, community-based health non-profit organizations, health organizations, research projects; or the Food and Drug Administration. Additionally, these graduates could serve as health emissaries to foreign countries regarding nutrition, sufficient food supply, sanitary environment, food safety, oral rehydration, or the advisability of food supplements.

The MPH/Nutrition dual degree is envisioned with students able to apply for either degree, then later join the other; or apply directly for the joint degree. Both the MPH and MS programs confer degrees through the School of Graduate Studies and as such are subject to Graduate Studies rules and procedures. Both programs are housed in the School of Medicine. This program is a non-thesis program of study.

### MD/MS Biomedical Investigation-Nutrition Track

For Admissions and MD requirements, see the MD Dual Degree Programs section (p. 784). This track is designed to provide medical students with more in-depth knowledge and research experience in nutrition. Students may elect to focus on nutrition biochemistry and metabolism or molecular nutrition or clinical nutrition. The student’s mentor or the Graduate Program Director will assist the student in selecting the appropriate courses for their interests.

**Students in Nutrition must complete:**

- NTRN 433 Advanced Human Nutrition I 4
- NTRN 434 Advanced Human Nutrition II 3
- NTRN 551 Seminar in Advanced Nutrition 1
- NTRN 601 Special Problems 1 - 18
- IBIS 600 Exam in Biomedical Investigation 0
- IBIS 401 Integrated Biological Sciences I 1 - 9
- IBMS 500 On Being a Professional Scientist: The Responsible Conduct of Research 1

And 2-3 credits or one course from those listed below:

- NTRN 435 Nutrition during Pregnancy and Lactation 3
- NTRN 436 Pediatric Nutrition 3
- NTRN 437 Nutrition Communication, Counseling and Behavior Change Strategies 3
- NTRN 438 Dietary Supplements 3
- NTRN 439 Food Behavior: Physiological, Psychological and Environmental Determinants 3
- NTRN 440 Nutrition for the Aging and Aged 3
- NTRN 452 Nutritional Biochemistry and Metabolism 3
- NTRN 448 Integrative and Functional Nutrition 3
- NTRN 459 Diabetes Prevention and Management 3
- NTRN 454 Advanced Nutrition and Metabolism: Investigative Methods 3
- NTRN 455 Molecular Nutrition 3
- NTRN 456 Pediatric Obesity 3
- NTRN 460 Sports Nutrition 3
- NTRN 461 Metabolic Dysregulation of Energy from Obesity to Anorexia 3
- NTRN 529 Nutritional Epidemiology for Evidence Based Health Practice (online) 3
Graduate Certificates in Nutrition

Maternal and Child Nutrition

Certificate Requirements: Degree-seeking students who are enrolled in the MS in Nutrition, MS in Public Health Nutrition, MS in Public Health Nutrition Internship, the Coordinated Dietetic Internship/Master’s Degree Program and the MD/MS program are eligible for this certificate. Credits for this coursework may be double counted toward the degree program and this certificate. Students must maintain a cumulative GPA of 3.0 to obtain this certificate. *Please note that only dietetic interns may apply NTRN 516 toward the requirements of this certificate.

Total Units: 15-16

PhD in Nutrition

The PhD degree in Nutrition is awarded for study and research in nutrition. Areas of concentration are nutritional biochemistry and metabolism, and molecular nutrition. Admissions to the PhD in Nutrition program are obtained through the integrated Biomedical Scientist Training Program (BSTP) (https://case.edu/medicine/admissions-programs/graduate-programs/phd-programs/bstp/), by direct admission to the department or via the Medical Scientist Training Program (MSTP) (https://case.edu/medicine/admissions-programs/md-phd-program/).

In order to earn a PhD in Nutrition, a student must complete rotations in at least three laboratories followed by selection of a research advisor, completion of Core and Elective coursework, including responsible conduct of research, as described in the plan of study. Each graduate program follows the overall regulations established and described in CWRU Graduate Studies and documented to the Regents of the State of Ohio. Completion of the PhD degree will require 36 hours of coursework (24 hours of which are graded) and 18 hours of NTRN 701 Dissertation Ph.D.

In addition, each student must successfully complete a qualifier examination for advancement to candidacy in the form of a short grant proposal with oral defense. During the dissertation period, students are expected to meet twice a year with the thesis committee, present seminars in the department, and fulfill journal publication requirements. Throughout the doctoral training, students are expected to be enthusiastic participants in seminars, journal clubs, and research meetings in the lab and program.

Sample Plan of Study

Total Units in Sequence: 41 - 98

After completion of required coursework, student enrolls in a minimum of one credit of NTRN 701 Dissertation Ph.D., Fall and Spring Semesters until graduation.

IBMS 501 Responsible Conduct of Research for Advanced Trainees is offered every spring semester (beginning 2020). The SOM requires that PhD students who are 4 years beyond their initial RCR training in IBMS 500 On Being a Professional Scientist: The Responsible Conduct of Research, register for IBMS 501.

### Courses

**NTRN 200. Case Cooks: Ethnic Eats. 1 Unit.**

In a world as connected as ours, it is important to learn about others’ cultures; and what better way to learn than through the medium of food! Something as simple as food can be interpreted thousands of ways and can serve as a link from our culture to ethnicities around the world. This half-semester class focuses on exploring cultural diversity in a way that everyone can relate to while also incorporating healthy, simple, budget friendly cooking skills. Course is geared towards the beginner skill level. Each week we will explore a different region of the world including Africa, South America, Europe, Asia, and the Middle East! Note: Please email instructor before registering if you have food allergies.

**NTRN 200H. Case Cooks: Healthy Lifestyles. 1 Unit.**

This half-semester class focuses on healthy, simple, budget friendly cooking skills to increase your confidence in the kitchen. Course is geared towards the beginner skill level. Weekly cooking topics include, Treasures from the earth, Keep it simple & Make it quick, Protein power, Grocery game plans & Mastering Student Meals, Make it lighter. Note: Please email instructor before registering if you have food allergies.

**NTRN 201. Nutrition. 3 Units.**

The nutrients, their functions, food sources, and factors affecting human needs throughout life.

**NTRN 202. Culinary Lab Teaching Kitchen Experience. 1 Unit.**

The course provides an experiential teaching kitchen classroom, for students to learn foundational culinary skills, food safety techniques, and core food & nutrition education strategies to help Case Cooks course students gain competency in the areas identified in the Case Cooks descriptor included below. Additionally, a core course goal is to offer students the opportunity to translate the ‘science, of their food, nutrition and culinary knowledge into clear and concise instruction and skill development for non-nutrition major Case Cooks students. After successful completion of a boot camp, students will be directly assisting Case Cooks students, under the guidance of a faculty member, during seven 2.25-hour culinary sessions. Students will assist and apply culinary skills, food and nutrition knowledge through assignment to offer guidance during 7 specific Case Cooks classes (labs), offered once weekly during one semester (1/2 semester). Students will be required to plan, set-up, and present one culinary education session to Case Cooks students. Students will also create a teaching kitchen curriculum to serve community/health populations and for use as professionals. Prereq: (Nutrition major and NTRN 201) or (NTRN 200 and NTRN 201) or (NTRN 200H and NTRN 201).
NTRN 300. Healthy Lifestyles as Preventive Medicine. 3 Units.
Decades of research have shown that a healthy lifestyle will significantly reduce the risk of chronic disease, improve health and quality of life. Because of this research, support has emerged that healthy lifestyles are in fact the “best preventive medicine”. This course will focus on learning the key components of these healthy lifestyle principles and developing the skills necessary to practice and advocate a healthy lifestyle. It is designed for any student interested in learning how to practice and promote healthy lifestyles, but it is particularly helpful for all pre-health, public health, and nutrition majors. *A unique feature of this course is the opportunity for enrolled students, (who are interested), to pair with advanced nutrition students throughout the semester for ‘healthy eating’ guidance. Enrolled students will have healthy eating coaches!

NTRN 310. Understanding Plant-Based Diets in Health and Disease. 3 Units.
This course presents a holistic understanding of plant-based diets in human health, including influence on disease risk, as well as controversies and confusion associated with these plant-based diets. Students will also learn how to plan budget friendly, easy to prepare plant-based diets.

NTRN 328. Child Nutrition, Development and Health. 3 Units.
The relationship between nutrition and physical/cognitive growth and development of the child from the prenatal period through adolescence, including individuality, maturation and biological needs. Nutritional influences (nutrient requirements, food choices, and nutritional/feeding problems) and effects on health are emphasized.

NTRN 337. Nutrition Communication, Counseling and Behavior Change Strategies. 3 Units.
How do we help someone make a dietary behavior change, such as choosing a side salad instead of fries when eating a hamburger? Yes, it is a very challenging task and most often, providing just nutrition education is not sufficient. Therefore, the focus of this course is to prepare students for their future career by providing fundamental knowledge about human decision making and developing communication skills that can help improve others nutritional well-being. In addition, the course will critically evaluate and interpret nutrition information for the consumer. Changes in food marketing and sources of nutrition information for consumers over the past five decades will be analyzed and discussed. Furthermore, the impact of nutrition labeling, the food industry and food marketing on the dietary intake of Americans and various demographic groups in the U.S. will be studied. Offered as NTRN 337 and NTRN 437 Prereq: NTRN 201 or Requisites Not Met permission.

NTRN 338. Dietary Supplements. 3 Units.
An examination of dietary supplements specific to health promotion and disease prevention/treatment throughout the life cycle. Topics and concepts include regulation, controversies, safety, efficacy, and the surrounding scientific evidence for dietary supplement use. For NTRN 338, preference will be given to senior level Nutrition majors.

NTRN 340. Global Food Systems: Environmental Issues, Sustainability, and Health. 3 Units.
Environmental changes impact humans worldwide, with an influence lasting many generations into the future. An in-depth understanding of the interplay between food systems - global food production, distribution, and selection - and environment and sustainability issues, as related to human nutrition, health, and well-being has never been more important. This course will provide an in-depth analysis regarding how food systems and the environment are interconnected in a multitude of ways. Additionally, the course will examine how issues of sustainability effect food production, distribution, and quality. Further, how environmental and sustainability issues directly affect the nutritive qualities of foods. Course topics initially include a review of environmental factors impacting food systems, types of sustainable food systems, historical perspectives, and aspects of human nutrition. Once students master the initial concepts, then into more detailed topics related to production approaches, biotechnology, soil/water quality, and food security on a local, national, and global level will be studied.

NTRN 341. Food as Medicine: How what we eat influences how we feel, think, and our health status. 3 Units.
This course will discuss key aspects of the interplay between food and health/wellness and in particular food synergy - interactions among dietary components and the effects on health. What are “whole foods” vs. basic nutrients? What are the most common nutrient deficiencies in men, women and children, including the elderly? Students will learn to interpret dietary recommendations/guidelines and which foods are used to improve digestion, optimize cardiovascular health and immune function, and help prevent cancer. Basic discussion of importance of gut micro-flora. Diet and body weight; also pros and cons of different dieting strategies. Increasing awareness of "culinary medicine" (i.e. how food acts as an integrated therapy). How what we eat influences how we feel, think and our general health status. There is an integrated culinary experience. Prereq: NTRN 201 or requisites not met permission.

NTRN 342. Food Science. 3 Units.
Chemical, physical and biological properties of food constituents and their interactions in food preparation and processing and practical application of processing methods and their effect on nutritional quality and acceptability; including global food biodiversity. Prereq: CHEM 105.

NTRN 342L. Food Science Lab. 2 Units.

NTRN 343. Dietary Patterns. 3 Units.
Examination of the food supply in the United States as it is affected by production, processing, marketing, government programs, regulation, and consumer selection. Nutritional evaluation of dietary patterns of different cultures. Counts for CAS Global & Cultural Diversity Requirement. Prereq: NTRN 201.

NTRN 351. Food Service Systems Management. 3 Units.
The application of organizational theory and skills in the preparation and service of quantity food. Laboratory experience in professional food services are included. Graduate students will analyze one aspect of food service management in depth. Offered as NTRN 351 and NTRN 451. Prereq: Nutrition major or consent of instructor.
NTRN 360. Clinical Assessment and Diagnosis: Nutritional, Functional, Physical. 3 Units.
Methods for the provision of nutrition services to individuals and groups. Principles of professional practice including ethics, standards, and regulatory issues. Prereq: NTRN 201 and NTRN 363 or MS in Nutrition or MS in Public Health Nutrition.

NTRN 361. Metabolic Dysregulation of Energy from Obesity to Anorexia. 3 Units.
Energy imbalance and the implications on health will be explored in this course. Key concepts covered in this class include: 1. Energy imbalance refers to positive and negative states of energy balance and occurs when energy intake does not match energy expended in metabolic processes, daily living activities, and physical activity; 2. Obesity is a result of chronic positive energy balance whereas anorexia nervosa is a condition of chronic negative energy balance; 3. Energy metabolism is controlled by a complex array of neural and hormonal signaling; 4. Energy imbalance disrupts the neural and hormonal signaling pathways of energy metabolism resulting in unfavorable health consequences such as pro-inflammatory state, oxidative stress, immune dysregulation, menstrual dysfunction, sarcopenia, and low bone mineral density; and 5. Exercise training can impact energy imbalance health-related outcomes. Learning Outcomes: Students will be able to 1. define energy balance and explain the components of energy expenditure; 2. define disordered eating, female athlete triad, and disordered eating; 3. explain the relationship among energy intake, energy expenditure, and body composition in energy imbalance; 4. describe alterations in skeletal muscle and adipose physiology in energy imbalance; 5. diagram neural control of feeding and energy homeostasis and hormonal control of energy metabolism; 6. explain the neural and hormonal changes that occur in chronic energy imbalance and describe current theories in how it results in menstrual dysfunction, inflammatory response, oxidative stress, immune dysregulation, sarcopenia, and low bone mineral density; and 7. explain how exercise training can influence inflammatory response, oxidative stress, immune function, and musculoskeletal health in energy imbalance. Offered as NTRN 361 and NTRN 461. Prereq: NTRN 201 or requisites not met permission.

NTRN 362. Exercise Physiology and Macronutrient Metabolism. 3 Units.
The purpose of this course is to provide students with the knowledge of theoretical and applied concepts of exercise physiology. Students will gain an understanding of the acute and chronic physiological responses and adaptations of the cardiovascular, metabolic, hormonal, and neuromuscular systems in response to exercise. Additional topics include factors effecting performance, assessing cardiorespiratory and muscular fitness, designing exercise programs for health and wellness, special populations, and athletes, environmental considerations and nutrition’s role in sport and exercise performance. Offered as NTRN 362 and NTRN 462. Prereq: NTRN 201 and BIOL 216.

NTRN 363. Human Nutrition I: Energy, Protein, Minerals. 3 Units.
Chemical and physiological properties of specific nutrients, including interrelationships and multiple factors, in meeting nutritional needs throughout the life cycle. Prereq: BIOL 216 and (Junior or Senior status).

NTRN 364. Human Nutrition II: Vitamins. 3 Units.
Chemical and physiological properties of vitamins, including interrelationships and multiple factors, in meeting nutritional needs throughout the life cycle. Prereq: NTRN 363.

NTRN 365. Nutrition for the Prevention and Management of Disease: Pathophysiology. 4 Units.
Interplay among etiology, metabolic perturbations, pathophysiology, clinical signs and symptoms, and nutrition principles for the prevention and management of disease. Prereq: NTRN 363 and BIOC 307 or equivalent or consent of instructor.

NTRN 366. Nutrition for the Prevention and Management of Disease: Clinical Applications. 3 Units.
Application of nutrition principles and knowledge for the prevention and management of disease. Case studies and other educational approaches and techniques will be used. Course includes evidence-based assessments and interpretation of key data (biochemical, dietary, physical) to develop nutritional interventions. Coreq: NTRN 365.

NTRN 367. Nutrition Strategies and Wellness Programming. 3 Units.
Wellness and its implication on nutritional choices will be explored in this class. Key concepts covered in this class include: 1. Overall well-being extends beyond smart dietary choices including social, emotional, spiritual, occupational, intellectual, and physical wellness. 2. The interrelationship among the wellness areas can alter adherence to a healthy diet. 3. Cultural differences in wellness exist and have an impact on nutritional choices. 4. Nutritional strategies must be individualized taking into account all aspects of wellness and cultural differences. 5. Interprofessional teams that include experts from each area of wellness are essential to provide optimal health care to individuals. Prereq: NTRN 201.

NTRN 368. THE BEST OF THE BEST: Nobel Prizes in Biomedical Research. 3 Units.
According to the will of Alfred Nobel, the prize that bears his name should be awarded "to the person(s) who shall have made the most important discovery within the domain of physiology or medicine (or chemistry)" that year. The Nobel awards are well known and highly publicized: they signify the "absolute best" - a concept close to the hearts of all, especially young students. Yet, the body of scientific work that has been carried out by the award recipient(s), and the criteria used to justify that particular choice are not trivial. Often, thorough understanding of complicated biological processes and experimental systems is required in order to fully appreciate why a particular discovery was chosen by the Nobel committee. In addition to covering in depth critical issues in biomedical research, the course will also address general questions: what is "best" or "most important"? How were the criteria developed and how applied? How do the criteria and findings endure the test of time? Offered as NTRN 368 and NTRN 468. Prereq: BIOL 307 and BIOL 308 and Senior standing.

NTRN 371. Special Problems. 1 - 3 Units.
Independent reading, research, or special projects supervised by a member of the nutrition faculty. Prereq: Junior or senior standing.

NTRN 388. Seminar in Sports Nutrition. 3 Units.
Study of energy and nutrient needs to support recreational exercise and competitive athletics, dietary supplements and specific foods and beverages that are marketed to athletes, and how nutrition can provide optimal muscle development, recovery and sports performance. Prereq: Junior or senior standing.

NTRN 390. Undergraduate Research. 3 - 9 Units.
Guided laboratory research in nutritional biochemistry or molecular nutrition under the sponsorship of a nutrition faculty member.
NTRN 397. SAGES Capstone Proposal Seminar. 3 Units.
In this departmental seminar course, students will conceptualize, develop and prepare a written plan, known as the "Capstone Proposal," for their senior Capstone project (NTRN 398: Senior Capstone Experience). Discussion will include, but not be limited to basic research principles, different types of research, ethics and IRB procedures. The Capstone Proposal shall include the project design, aims, methodology, budget, data analysis and presentation. Upon completion of this course, students will have confirmed student/Capstone advisor and, if applicable, mentor relationships, written a Capstone proposal and given an oral presentation of their proposal at a departmental colloquium. Counts as SAGES Departmental Seminar. Prereq: Declared Nutrition or Nutritional Biochemistry and Metabolism major and junior standing.

NTRN 397C. SAGES Capstone Proposal Seminar: Community. 3 Units.
This course fulfills the SAGES Department Seminar requirement. As such, it focuses on developing writing and discussion skills in your major area. This course will guide you through the process of selecting and planning your SAGES Capstone Experience (Community) to be completed in NTRN 398. Students will be matched to existing faculty projects in the Greater Cleveland community. Concurrent enrollment with any other SAGES requirement is not permitted. Counts as SAGES Departmental Seminar. Prereq: Nutrition major with Junior standing. Completed SAGES First Seminar and both SAGES University Seminars.

NTRN 397R. SAGES Capstone Proposal Seminar: Research. 3 Units.
This course fulfills the SAGES Department Seminar requirement. As such, it focuses on developing writing and discussion skills in your major area. This course will guide you through the process of selecting and planning your SAGES Capstone Experience to be completed in NTRN 398. Students will be matched to existing faculty nutrition research projects for their capstone experience. Concurrent enrollment with any other SAGES requirement is not permitted. Counts as SAGES Departmental Seminar. Prereq: Nutrition major with Junior standing. Completed SAGES First Seminar and both SAGES University Seminars.

NTRN 398. SAGES Senior Capstone Experience. 3 Units.
Students will implement their "Capstone Proposal" projects as designed in NTRN 397: Capstone Proposal Seminar. Pertinent research activities will depend on the nature of the student’s "Capstone Proposal" project. The student will meet regularly with their Capstone advisor, at least twice monthly, to provide progress reports, discuss the project, and for critique and guidance. By the end of this course, the student will have completed their SAGES Senior Capstone research project and presented their project results/findings orally at the Senior Capstone Fair and at a departmental colloquium. Counts as SAGES Senior Capstone. Prereq: NTRN 397.

NTRN 399. Senior Project. 3 Units.

NTRN 399G. Nutrition Study Abroad: Greece and the Mediterranean Diet. 3 Units.
Mediterranean Diet is a generic term used to describe the typical eating habits in the countries surrounding the Mediterranean Sea. While there is some regional variability, the Mediterranean diet is a primarily plant-based eating plan that is rich in whole grains, olive oil, fruits, vegetables, legumes, nuts, fish, seafood, herbs, and spices. Interestingly, despite endless diets being touted for their ability to reduce risk of cardiovascular disease and overall mortality, the Mediterranean Diet is just one of two diets shown in the literature to consistently reduce risk of cardiovascular disease and overall mortality. Given its important role in disease prevention and overall wellness, this course will enable you to become an expert on the Mediterranean Diet through an experiential learning excursion to Ikaria, Greece. Enrollment preference is given to students majoring in Nutrition. Offered as NTRN 399G and NTRN 499G. Counts for CAS Global & Cultural Diversity Requirement.

NTRN 401. Nutrition for Community and Health Care Professionals. 2 - 3 Units.
This course will focus on understanding how diet and nutrition impact health and wellness throughout the life cycle. There are core concepts in human nutrition that all health care providers should understand to optimize their care of individuals, themselves, and the community. These core concepts are the focus of this course. Students who complete all course modules and assignments with a passing grade will earn 2 credits. In order to earn 3 credits, students must complete all course modules and assignments with a passing grade and complete an additional 20 page paper on a nutrition topic approved by the instructor.

NTRN 402. Culinary and Lifestyle Medicine Coaching I. 3 Units.
This course will focus on learning the key components of healthy lifestyle principles* and develop the counseling and behavior change skills necessary to promote these competencies to advocate a healthy lifestyle. Participation in culinary medicine food labs, (which is the blending of the science of nutrition with skills in fundamental cooking and food education) is also a key component of this class. Culinary medicine is designed to foster a greater understanding of the core principles in medical nutrition therapy and foundational food and nutrition education, which is critical to overall well-being. Students will also have the elective opportunity to participate in the first core online tele-class module towards certification as a health coach by Wellcoaches®. Module 1 is the required first step towards a Wellcoaches® health coaching certification, with two additional online/hybrid modules required to participate in the certification exam, (modules 2 and 3 not provided by the University). These remaining modules and accompanying oral and written skill assessments must be completed within an 18 month period of time after completion of Module 1 to be fully eligible for the Wellcoaches® Health Coach certificate. Certification as a Health and Wellness Coach is available for health care professionals. Certified Personal Coach is available for the non-health care professional. See Wellcoaches website link for more program details, (found under student outcomes).

NTRN 403. Evidence-Based Practice for Healthcare Professionals. 1 Unit.
In this course, students will learn how to use the evidence-based practice process to make decisions and answer questions in a clinical setting. This course may be appropriate for any student pursuing a career in healthcare, however the examples and cases used in class focus on nutrition-related issues. Prereq: Graduate student standing.
NTRN 410. Basic Oxygen & Physiological Function. 3 Units.
On-line lecture only course which explores the significance and consequences of oxygen and oxygen metabolism in living organisms. Topics to be covered include transport by blood tissues, oxygen toxicity, and mitochondrial metabolism. Emphasis will be placed on mammalian physiology with special reference to brain oxidative metabolism and blood flow as well as whole body energy expenditure and oxidative stress related to disease. The course will cover additional spans of physiology, nutrition and anatomy. Offered as NTRN 410 and PHOL 410.

NTRN 433. Advanced Human Nutrition I. 4 Units.
Emphasis on reading original research literature in energy, protein and minerals with development of critical evaluation and thinking skills. Recommended preparation: NTRN 201 and CHEM 223 and BIOL 348 or equivalent.

NTRN 434. Advanced Human Nutrition II. 3 Units.
Emphasis on reading original research literature on vitamins with development of critical evaluation and thinking skills. Recommended preparation: NTRN 433 or consent.

NTRN 435. Nutrition during Pregnancy and Lactation. 3 Units.
Study of current research literature on nutrition for pregnancy and lactation including nutrient requirements, nutrition assessment, and nutrition intervention. Prereq: Graduate Student in Nutrition or Public Health Nutrition or (NTRN 363 and NTRN 364) or requisites not met permission.

NTRN 436. Pediatric Nutrition. 3 Units.
This course will focus on understanding the nutritional needs of infants, children and adolescents. Evidence based guidelines will be used as we discuss best clinical practice for the management of pediatric nutrition issues. Anthropometric measurements used in growth assessment will be reviewed. Nutrient requirements for each stage of development will be explored with a specific focus on micronutrients relevant to pediatrics such as fluoride, iron, calcium and vitamin D. Abnormal growth resulting in malnutrition and obesity will be examined with a focus on prevention, diagnosis and treatment. Skills necessary to complete a pediatric nutrition assessment will be reviewed with opportunities to practice and demonstrate competency. Prereq: NTRN 435.

NTRN 437. Nutrition Communication, Counseling and Behavior Change Strategies. 3 Units.
How do we help someone make a dietary behavior change, such as choosing a side salad instead of fries when eating a hamburger? Yes, it is a very challenging task and most often, providing just nutrition education is not sufficient. Therefore, the focus of this course is to prepare students for their future career by providing fundamental knowledge about human decision making and developing communication skills that can help improve others nutritional well-being. In addition, the course will critically evaluate and interpret nutrition information for the consumer. Changes in food marketing and sources of nutrition information for consumers over the past five decades will be analyzed and discussed. Furthermore, the impact of nutrition labeling, the food industry and food marketing on the dietary intake of Americans and various demographic groups in the U.S. will be studied. Offered as NTRN 337 and NTRN 437 Prereq: NTRN 201 or Requisites Not Met permission.

NTRN 438. Dietary Supplements. 3 Units.
An examination of dietary supplements specific to health promotion and disease prevention/treatment throughout the life cycle. Topics and concepts include regulation, controversies, safety, efficacy, and the surrounding scientific evidence for dietary supplement use. For NTRN 338, preference will be given to senior level Nutrition majors. Offered as NTRN 338 and NTRN 438. Prereq: NTRN 364 or requisites not met permission.

NTRN 439. Food Behavior: Physiological, Psychological and Environmental Determinants. 3 Units.
Good dietary habits are associated with improved population health. Despite this, a large proportion of individuals do not meet current dietary recommendations and there are significant disparities between groups based on sociodemographic characteristics. Why is this? Traditional views on this question focused solely on individual decision making without taking into account the complex influence of biology, social forces, and environment on dietary behavior. This course will introduce students to the major influences on dietary behavior and their interactions and modifying factors in the context of the socioecological model.

NTRN 440. Nutrition for the Aging and Aged. 3 Units.
Consideration of the processes of aging and needs which continue throughout life. The influences of food availability, intake, economics, culture, physical and social conditions and chronic disease as they affect the ability of the aged to cope with living situations. Recommended preparation: Nutrition major or consent of instructor.

NTRN 441. Human Lactation. 3 Units.
This course explores the complexities and importance of human milk and breastfeeding. Using lectures, group discussion, and experiential learning we will explore the following topics: nutrition and development in the breastfeeding infant/mother dyad; the physiology of breastfeeding; maternal and infant disease states and their effects on breastfeeding; common pathologies in breastfeeding; pharmacology and breastfeeding; psychological, social, and cultural issues and breastfeeding; clinical skills and techniques in advising the breastfeeding mother; public health, ethical, and legal issues in breastfeeding and breastfeeding advocacy; current research topics in breast milk and breastfeeding; and options for certification in lactation education. Prereq: NTRN 363 or NTRN 433 or NTRN 401 or Requisites Not Met permission.

NTRN 446. Advanced Maternal Nutrition: Special Topics. 3 Units.
Analysis of the problems commonly associated with high-risk pregnancies and fetal outcome. Discussion of causes, mechanisms, management and current research. Recommended preparation: NTRN 435 or consent.

NTRN 448. Integrative and Functional Nutrition. 3 Units.
An examination of the core concepts and principles surrounding integrative and functional medical nutrition therapy (IFMNT). The course will emphasize a whole systems approach to addressing clinical imbalances and creating personalized therapeutic interventions based upon an individual’s genetics, environment and lifestyle. Topics include precision medicine, IFMNT nutrition care plan processes, IFMNT laboratory tests and interpretation, dietary supplementation, and discussion of the evidence for integrative therapeutic nutrition/diet plans related to the gut microbiome/gastrointestinal disorders, food sensitivity/intolerance, methylation, immune function, detoxification, cardiometabolic intervention, energy, hormones, and wellness.
**NTRN 451. Food Service Systems Management. 3 Units.**
The application of organizational theory and skills in the preparation and service of quantity food. Laboratory experience in professional food services are included. Graduate students will analyze one aspect of food service management in depth. Offered as NTRN 351 and NTRN 451. Prereq: Nutrition major.

**NTRN 452. Nutritional Biochemistry and Metabolism. 3 Units.**
Mechanisms of regulation of pathways of intermediary metabolism; amplification of biochemical signals; substrate cycling and use of radioactive and stable isotopes to measure metabolic rates. Recommended preparation: BIOC 307 or equivalent. Offered as BIOC 452 and NTRN 452.

**NTRN 454. Advanced Nutrition and Metabolism: Investigative Methods. 3 Units.**
Lecture/discussion course on the use of analytical techniques in metabolic research on whole body metabolism, energy balance, and disease (diabetes, obesity, and neuropathologies); discussions include the design of in-vitro and in-vivo investigative protocols in humans and animals using stable isotope tracer and mass spectrometric analysis; critical interpretation of data from the literature with emphasis on metabolic pathway identification, regulation and kinetics. Recommended preparation: BIOC 407.

**NTRN 455. Molecular Nutrition. 3 Units.**
Students will gain in-depth understanding of the basic science and translational aspects of ‘hot topics’ in current molecular nutrition. Class will be conducted by interactive discussion of assigned primary research articles. Prereq: BIOC 407 or Requisites Not Met permission.

**NTRN 456. Pediatric Obesity. 3 Units.**
This is an upper-level, discussion- and case-based course. This course will examine the epidemiology, potential causes, assessment, and treatment of pediatric obesity. Special topics from the current pediatric obesity literature will also be covered. This course has a large discussion component and incorporates weekly readings from the scientific literature. Class sessions take place via synchronous, web-based video conferencing with additional asynchronous video lectures and course work each week. Prereq: MS student in Nutrition or Requisites Not Met permission.

**NTRN 459. Diabetes Prevention and Management. 3 Units.**
In this course, we will explore the diabetes epidemic, its effects on the healthcare system, and strategies for prevention. The pathophysiology of the disease will be examined as well as environmental factors leading to the increase in diagnoses. Comorbid conditions and acute and chronic complications of diabetes and hyperglycemia will be addressed. Rationale for current therapeutic strategies will be explored, including the use of blood glucose monitoring, physical activity, nutrition counseling, oral medications, and insulin therapy. Patient education and health literacy will be studied in the context of patient centered goal setting. Requirements for developing a Diabetes Self-Management Education Program will be discussed. Community development program will be examined in the context of population-based prevention strategies. Prereq: Graduate Standing.

**NTRN 460. Sports Nutrition. 3 Units.**
Study of the relationships of nutrition and food intake to body composition and human performance. Laboratory sessions include demonstrations of body composition and fitness measurements and participation in a research project. Recommended preparation: NTRN 363 or NTRN 433 or consent.

**NTRN 461. Metabolic Dysregulation of Energy from Obesity to Anorexia. 3 Units.**
Energy imbalance and the implications on health will be explored in this course. Key concepts covered in this class include: 1. Energy imbalance refers to positive and negative states of energy balance and occurs when energy intake does not match energy expended in metabolic processes, daily living activities, and physical activity; 2. Obesity is a result of chronic positive energy balance whereas anorexia nervosa is a condition of chronic negative energy balance; 3. Energy metabolism is controlled by a complex array of neural and hormonal signaling; 4. Energy imbalance disrupts the neural and hormonal signaling pathways of energy metabolism resulting in unfavorable health consequences such as pro-inflammatory state, oxidative stress, immune dysregulation, menstrual dysfunction, sarcopenia, and low bone mineral density; and 5. Exercise training can impact energy imbalance health-related outcomes. Learning Outcomes: Students will be able to 1. define energy balance and explain the components of energy expenditure; 2. define disordered eating, female athlete triad, and disordered eating; 3. explain the relationship among energy intake, energy expenditure, and body composition in energy imbalance; 4. describe alterations in skeletal muscle and adipose physiology in energy imbalance; 5. diagram neural control of feeding and energy homeostasis and hormonal control of energy metabolism; 6. explain the neural and hormonal changes that occur in chronic energy imbalance and describe current theories in how it results in menstrual dysfunction, inflammatory response, oxidative stress, immune dysregulation, sarcopenia, and low bone mineral density; and 7. explain how exercise training can influence inflammatory response, oxidative stress, immune function, and musculoskeletal health in energy imbalance. Offered as NTRN 361 and NTRN 461. Prereq: NTRN 201 or requisites not met permission.

**NTRN 462. Exercise Physiology and Macronutrient Metabolism. 3 Units.**
The purpose of this course is to provide students with the knowledge of theoretical and applied concepts of exercise physiology. Students will gain an understanding of the acute and chronic physiological responses and adaptations of the cardiovascular, metabolic, hormonal, and neuromuscular systems in response to exercise. Additional topics include factors effecting performance, assessing cardiorespiratory and muscular fitness, designing exercise programs for health and wellness, special populations, and athletes, environmental considerations and nutrition’s role in sport and exercise performance. Offered as NTRN 362 and NTRN 462. Prereq: Nutrition Major.

**NTRN 464. Human Nutrition II. 3 Units.**
The focus of this class is on vitamins including metabolism, food sources, status assessment, primary and secondary deficiencies, and toxicity. Current knowledge and research gaps will be discussed for each vitamin. Prereq: NTRN 433.
NTRN 468. THE BEST OF THE BEST: Nobel Prizes in Biomedical Research. 3 Units.

According to the will of Alfred Nobel, the prize that bears his name should be awarded "to the person(s) who shall have made the most important discovery within the domain of physiology or medicine (or chemistry)" that year. The Nobel awards are well known and highly publicized: they signify the "absolute best" - a concept close to the hearts of all, especially young students. Yet, the body of scientific work that has been carried out by the award recipient(s), and the criteria used to justify that particular choice are not often. Often, thorough understanding of complicated biological processes and experimental systems is required in order to fully appreciate why a particular discovery was chosen by the Nobel committee. In addition to covering in depth critical issues in biomedical research, the course will also address general questions: what is "best" or "most important"? How were the criteria developed and how applied? How do the criteria and findings endure the test of time? Offered as NTRN 368 and NTRN 468.

NTRN 470A. Nutrient Drug Interactions: Introduction. 1 Unit.

We rely on the gastrointestinal system for processing not only food and beverages but also drugs. The mass of ingested food (100's of grams) exceeds that of most drugs (a few mg) by 10,000-fold or more. Nutrients and drugs follow similar processes through absorption, distribution, metabolism and excretion. Nutritional state is also a powerful determinant of drug action. Drugs have potent effects on nutritional status. Conversely, nutrition modifies the action of drugs. Herbal supplements and functional foods have properties of both foods and drugs, but are regulated by the FDA as foods. Flavonoids from foods have mild medicinal properties and interact with multiple drug metabolizing pathways. Current teaching around nutrient-drug interactions consists almost entirely of listings of potential interactions, or interactions that have been reported in humans as seldom as a single instance. Fortunately, most nutrient drug interactions are not dangerous and have a low potential for seriousness. Clinical impact is great only for those drugs with a low therapeutic index, meaning that the threshold concentration for toxicity is close to the concentration needed for therapeutic efficacy. To identify these potentially life-threatening interactions, healthcare professionals should learn more about the principles of pharmacology. Prereq: Graduate standing and NTRN 468.

NTRN 470C. Nutrient Drug Interactions: Clinical Applications. 1 Unit.

The clinical management of patients and clients must integrate pharmacotherapeutics with nutrition based care plans. Drugs can affect nutritional needs and conversely nutrition can modify the efficacy of drugs. Disease states modify the actions of both nutrients and drugs as well as their interactions. Distinct nutrient-drug interactions are prominent in different patient populations. NTRN 452 is recommended but not required. Prereq: Graduate standing and NTRN 470A.

NTRN 499G. Nutrition Study Abroad: Greece and the Mediterranean Diet. 3 Units.

Mediterranean Diet is a generic term used to describe the typical eating habits in the countries surrounding the Mediterranean Sea. While there is some regional variability, the Mediterranean diet is a primarily plant-based eating plan that is rich in whole grains, olive oil, fruits, vegetables, legumes, nuts, fish, seafood, herbs, and spices. Interestingly, despite endless diets being touted for their ability to reduce risk of cardiovascular disease and overall mortality, the Mediterranean Diet is just one of two diets shown in the literature to consistently reduce risk of cardiovascular disease and overall mortality. Given its important role in disease prevention and overall wellness, this course will enable you to become an expert on the Mediterranean Diet through an experiential learning excursion to Ikaria, Greece. Enrollment preference is given to students majoring in Nutrition. Offered as NTRN 399G and NTRN 499G. Counts for CAS Global & Cultural Diversity Requirement.

NTRN 516. Seminar in Dietetics 1. 4 Units.

Study of evidence-based guidelines for dietetic practice in medical nutrition therapy. Emphasis on life cycle stages and common disease states that require specialized nutrition care. Enrollment restricted to those accepted into Case Coordinated Dietetic Internship/Master Degree Program.

NTRN 517. Seminar in Dietetics 2. 3 Units.

Study of scientific basis for clinical and community nutrition practice and developments in food service systems management. Recommended preparation: Dietetic internship.

NTRN 528. Introduction to Public Health Nutrition. 3 Units.

An introduction to the field of public health/community nutrition with a focus on three key themes: (1) The role of nutrition in population based health, (2) the multilevel nature of key influences on dietary behavior, and (3) skills needed to be a successful public health practitioner. Prereq: Graduate Student in Nutrition or Public Health Nutrition or Requisites Not Met permission.

NTRN 529. Nutritional Epidemiology for Evidence Based Health Practice. 3 Units.

This course is designed to establish the foundation in evidence based practice (EBP), which requires you to understand clinical and epidemiological study design and statistical interpretation. It also establishes basic scientific writing skills to ensure students are well prepared for future graduate courses and a career in the medical sciences. The course is based on the core competencies in evidence-based practice for health professionals (Albarqouni et al, JAMA Network Open 2018). In this consensus statement, the authors divide EBP into five steps: (1) Ask, (2) Acquire, (3) Appraise and Interpret, (4) Apply and (5) Evaluate, all of the skills which are developed in this course. Students will work together online to understand how to apply these 5 steps to understand the current research literature to answer questions that might arise in health sciences practice and to identify gaps in the literature that require developing their own research questions.
NTRN 530. Public Health Nutrition. 3 Units.
Exploration of the professional role of the Public Health Dietitian/ Nutritionist with a focus on three key themes: (1) The conduct of research and interpretation of research findings related to public health nutrition; (2) development of skills in the domains of public health management, program design and implementation, and communications and marketing; and (3) approaches to thinking about public health more broadly through the use of entrepreneurship and community building. Prereq: Graduate Student in Nutrition or Public Health Nutrition or Requisites Not Met permission.

NTRN 531. Public Health Nutrition Field Experience. 1 - 6 Units.
Individually planned public health experience. May be concurrent with course work in local agencies or in blocks of full-time work with a city, county, or state health agency. Prereq: Open to public health nutrition students only. Consent of instructor.

NTRN 532C. Specialized Public Health Nutrition Field Experience. 1 - 3 Units.
Individually arranged clinical experience. Prereq: Public Health Nutrition students only. Consent of instructor.

NTRN 533. Nutritional Care of Neonate. 3 Units.
Nutritional assessment and management of high-risk newborns with emphasis on prematurity and low birth weight. Review of current literature coordinated with clinical experience in the neonatal intensive care unit. Issues on follow-up included. Recommended preparation: NTRN 435 or consent.

NTRN 534. Advanced Public Health Nutrition Field Experience. 1 - 6 Units.
Individually planned advanced public health experience. Prereq: Open to public health nutrition students only.

NTRN 550A. Advanced Community Nutrition. 3 Units.
An introduction to the field of public health/community nutrition with a focus on three key themes: (1) The role of nutrition in population based health, (2) the multilevel nature of key influences on dietary behavior, and (3) skills needed to be a successful public health practitioner. Prereq: Senior Nutrition major or Requisites Not Met permission.

NTRN 551. Seminar in Advanced Nutrition. 1 Unit.
Ph.D. students meet weekly to discuss topical journal articles. Students gain experience in critical evaluation of research and develop presentation/communication skills. Discussion of research integrity and ethics. Students participate in departmental seminars with invited speakers.

NTRN 561. Investigative Methods in Nutrition. 1 - 4 Units.
Research methods appropriate for nutrition. Methods for conducting research in nutrition and food sciences, food service management and dietetics. Designing research proposals. Prereq: Nutrition major.

NTRN 562. Research Practicum. 1 - 4 Units.
Students will participate in nutrition-related research activities that employ a variety of research methodologies (clinical research, bench science, surveys, systematic reviews, etc.). Students will be engaged in the acquisition of scientific data, and data entry, analysis and interpretation.

NTRN 601. Special Problems. 1 - 18 Units.

NTRN 602. Special Project in Nutrition. 1 - 3 Units.
Under the supervision of the instructor, the student will develop and/or implement an individual or group special project in global nutrition, community nutrition, wellness, or other area of food and nutrition practice. Prereq: Graduate Standing.

NTRN 605A. Advanced Research Methods in Nutrition. 1 - 2 Units.
Research methodology for nutrition research. Emphasis on the research process, design, interpretation of data, and statistical methods. Prereq: Graduate Student in Nutrition or Requisites Not Met permission.

NTRN 610. Oxygen and Physiological Function. 1 Unit.
Lecture/discussion course which explores the significance and consequences of oxygen and oxygen metabolism in living organisms. Topics to be covered include oxygen transport by blood tissues, oxygen toxicity, and mitochondrial metabolism. Emphasis will be placed on mammalian physiology with special reference to brain oxidative metabolism and blood flow as well as whole body energy expenditure and oxidative stress related to disease. The course will cover additional spans of physiology, nutrition and anatomy. Offered as ANAT 610, NTRN 610, and PHOL 610.

NTRN 651. Thesis M.S.. 1 - 18 Units.
(Credit as arranged.)

NTRN 701. Dissertation Ph.D.. 1 - 9 Units.
(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

Department of Pathology

Wolstein Research Building 5537
http://www.case.edu/med/pathology/
Phone: 216.368.1993; Fax: 216.368.0494
Clifford V. Harding, MD, PhD, Chair
clifford.harding@case.edu

Christine Kehoe (christine.kehoe@case.edu), Student Affairs

The clinical, research and educational activities of the CWRU Department of Pathology (https://case.edu/medicine/pathology/) are centered at CWRU School of Medicine and University Hospitals Cleveland Medical Center (UHMC). There are five Divisions within the Department, including two basic science units housed in the School of Medicine (the Division of Experimental Pathology and the Center for Global Health and Diseases) and three clinical divisions housed at University Hospitals (the Division of Anatomic Pathology, the Division of Clinical Pathology, and the Division of Community Hospitals Pathology). In addition, our affiliates include the Cuyahoga County Medical Examiner's Office and the Pathology Department at the Louis Stokes Cleveland VA Medical Center.

The CWRU Department of Pathology NIH funding level is ranked in the top 10 nationally. World-class research is conducted in the department in many areas with the largest research focus areas being, immunology, cancer biology and neurodegenerative diseases. The department’s research activities are characterized by highly cooperative and collaborative interactions within the department, and with many other departments at Case and its affiliated institutions. Research laboratories of the department are located primarily in the Wolstein Research Building and Institute of Pathology.

Educational programs include graduate programs, clinical residency and fellowships and contributions to medical student and undergraduate teaching. The Pathology Graduate Program includes a PhD program with three constituent training programs (Immunology Training Program, Cancer Biology Training Program, Molecular and Cellular Basis of Disease Training Program) and two MS programs (Plan A and Plan B). For information about graduate programs, please see here (https://case.edu/medicine/pathology/). The Pathology Residency includes 24 residency training positions, and the Department provides three clinical fellowship programs (Cytopathology, Hematopathology and Transfusion Medicine). For information about the Pathology Residency, please see here (https://case.edu/medicine/pathology/training/residency-and-clinical-fellowships/).
MS in Pathology (Plan B)

The Molecular and Cellular Basis of Disease (MCBD) Program is intended for students with a background in the biological sciences who are interested in pursuing advanced coursework in the basis of disease. The core curriculum and electives include many topics of medical relevance, including cell and molecular biology, disease pathogenesis, cancer biology, immunology, histology, and gross anatomy. This coursework may be useful for those interested in pursuing a professional doctoral degree (e.g., MD, DO, or PhD) or opportunities in basic or clinical research, teaching, biotechnology, pharmaceuticals, healthcare, or government. Our standard program is now 16 months. The time of matriculation in the MCBD Program is flexible; a typical time to degree for the full-time program is 3 semesters, but extended (21-month) and accelerated (12-month) programs are also available. The course of study will be determined by the student, their Academic advisor, and the Graduate Program Committee and will consist of 30 credit hours of coursework plus a final project. Flexible electives allow students to focus on an area of interest. While the Master's may be a terminal degree, it may also lead to admission to doctoral programs. For information on the Pathology MS Program, please contact Pamela Wearsch, PhD, paw28@case.edu /216.368.5059, or Christy Kehoe, cxk15@case.edu /216.368.1993.

Description of Program

Students will earn a Plan B Masters from Case Western Reserve University. The degree program is comprised of core courses in cell biology and disease pathogenesis (PATH 475 Cell and Molecular Foundations of Pathology or IBMS 455 Molecular Biology I/IBMS 453 Cell Biology I; PATH 510 Basic Pathologic Mechanisms), one concentration elective coursework from related disciplines, and a comprehensive final project in the form of a review paper that will ideally be suitable for publication. The topic of the review paper will be determined by the student and their academic advisor. In the final two semesters, student will register for 1-3 credits of PATH 650 Independent Study while writing their paper. An advisor for the paper should be identified by mutual interest during the first year.

Typical Curriculum

First Year

<tr>
<td>Histology and Ultrastructure (ANAT 412)</td>
</tr>
</tbody>
</table>

Spring Requirements:

| Basic Pathologic Mechanisms (PATH 510) |
| Independent Study (PATH 650) |
| SPRING ELECTIVES (choose one or two): |
| Fundamental Immunology (PATH 416) |
| Neurodegenerative Diseases: Pathological, Cell & Molecular Perspectives (PATH 444) |
| Basic Cancer Biology and the Interface with Clinical Oncology (PATH 406) |
| Experimental Pathology Seminar II (PATH 512) |
| Immunology Journal Club (PATH 513) |

Summer Term: Optional coursework and activities

| Cadaver dissection-based human anatomy with histology and physiologic correlations (ANAT 410) |
| Students may apply to laboratories to do research projects in related fields (e.g. cancer, immunology, neuropathology) |
| Pre-professional students may wish to spend time on school applications |

Year Total: 6-12

Second Year

| FALL REQUIREMENTS: |
| Independent Study (PATH 650) |
| FALL ELECTIVES (choose two or three for 16 month standard program): |
| Current Topics in Cancer (PATH 422) |
| Advanced Immunobiology (PATH 465) |
| Neurodegenerative Diseases of the Brain and the Eye: Molecular Basis of the Brain-Eye Connection (PATH 525) |
| Aging and the Nervous System (PATH 410) |
| Immunology Journal Club (PATH 513) |
| Other electives upon approval |

Year Total: 4-10

Total Units in Sequence: 18-40

Admission Criteria

Applicants will be screened by the Pathology Department Admissions Committee. Students will be required to supply a GRE, MCAT, or USMLE score, a transcript, three letters of recommendation and an application essay that details the student's interest in the Program. Students will be interviewed on campus or via electronic media (i.e. FaceTime or Skype).
Although there are no set requirements, successful applicants would be expected to have an MCAT >500, GRE verbal and quantitative >150, and an undergraduate GPA around 3.0. Applications are accepted on a rolling basis for matriculation during any academic term.

**Tuition**
Financial aid will not be provided by the Department. Students may apply for financial aid through the federal government at [http://www.fafsa.ed.gov/](http://www.fafsa.ed.gov/).

**MS in Pathology (Plan A)**
A part-time program leading to the Master of Science degree in Pathology is available to laboratory staff who are employed by Case Western Reserve University. Students in this program must be full-time university employees and must have the agreement of their supervisor to begin studies as a part-time student. Courses are available as an employee fringe benefit (up to 6 credits per semester for Fall and Spring, and 3 credits for Summer) and can only be taken as limited by the fringe benefit regulations.

A formal application for this program must be submitted to the graduate school. Prior to submission of this application, the employee, the supervisor, and the Director of the Pathology Graduate Program must meet to review and facilitate the student's application for admission.

This program can lead to a MS degree through Plan A. Required core courses include IBMS 453 Cell Biology I (3 credits), IBMS 455 Molecular Biology I (3 credits), PATH 510 Basic Pathologic Mechanisms (4 credits), and participation in a seminar course (PATH 511 Experimental Pathology Seminar I and/or PATH 512 Experimental Pathology Seminar II) for at least one semester. IBMS 453 Cell Biology I, IBMS 455 Molecular Biology I and must be taken as graded courses (not P/F).

Plan A requires a minimum of 30 total coursework credits. In addition to the required core courses, the student must take a minimum of 6 credits of PATH 651 Thesis M.S. Thesis, which involves research in the laboratory of the supervisor (who serves as the MS Thesis Mentor) and thesis preparation. The student must register for at least one credit of PATH 651 Thesis M.S. every semester until graduation. A GPA of 2.75 or better must be maintained for a terminal MS degree. (Students considering using the MS in Pathology as a "stepping stone" to the PhD degree must maintain a GPA of 3.0 or better.) An MS thesis must be prepared based on the research, and the student must pass an MS Thesis Examination in which the thesis is defended.

**MD/MS Biomedical Investigation—Pathology Track**
For Program Admissions and MD requirements, see MD Dual Degree Programs (p. 784). This track is designed to provide students with an in-depth understanding of the cellular basis of disease or immunity. During the first year of medical school, the student should identify a mentor and begin planning coursework and a research project leading to the MS degree. Because the background and interest of applicants vary widely, members of the Program Oversight Committee will assist each student in designing an individualized schedule of graduate courses for any track.

Students are expected to complete at least two graduate courses (3 credits each or total 6 credits) before beginning the laboratory research period (year 3), and students should take three graduate courses before the research period if this is possible. For students to receive graduate credit for any medical coursework (as IBIS credit, e.g. IBIS 403 Integrated Biological Sciences III), they must register at the beginning of the semester. Students in the MD/MS joint degree program must attain a cumulative GPA of 3.0 in the graduate courses. Students in this program may participate in any of the three tracks of the Department of Pathology Graduate Program.

For information about the Pathology Track in the MD/MS program, contact Pamela Wearsch, PhD, paw28@case.edu/216.368.5059, or Christy Kehoe, ckx15@case.edu/216.368.1993.

**Total Units in Sequence:** 32-34

* 15 graded credits of graduate school courses should be taken in the first 2 years, including IBIS 403 Integrated Biological Sciences III (6 credits) and three PATH graduate courses (3 credits each). Students may defer a maximum of one 3-credit hour course to Year 3.

PhD Training in the Pathology Graduate Program occurs in three tracks that share a common core curriculum but provide additional track-specific curricular offerings. This provides a cohesive program that addresses the specific needs of different Pathology-related areas of research training. Section II of the handbook "Pathology PhD Program" describes core features of the program that are shared and provides detailed descriptions of the three training tracks:

- Molecular and Cellular Basis of Disease Training Program (MCBTP)
- Immunology Training Program (ITP)
- Cancer Biology Training Program (CBTP)

To earn a PhD in Pathology, a student must complete rotations in at least three laboratories followed by selection of a research advisor, and complete Core and Elective coursework including responsible conduct of research as described in the Course of Study, below. Students who previously completed relevant coursework, (for example, with a MS) may petition to complete alternative courses. Each training track follows the overall regulations established and described in CWRU Graduate Studies and documented to the Regents of the State of Ohio. Completion of the PhD degree will require 36 hours of coursework (24 hours of which are graded) and 18 hours of PATH 701 Dissertation Ph.D.:

In addition, each PhD student must successfully complete a qualifier examination for advancement to candidacy in the form of a short grant proposal with oral defense. The qualifier is generally completed in the summer after year two. During the dissertation period, students are expected to meet twice a year with the thesis committee, present seminars in the department, and fulfill journal publication requirements. Throughout the doctoral training, students are expected to be enthusiastic participants in seminars, journal clubs, and research meetings in the lab and program.

**Total Units in Sequence:** 43-126

---

**Important:** Students should take the following steps to reduce charges to their mentor and department: 

**After advance to candidacy:** It is no longer necessary to register for 9 credits per semester to maintain full-time student status. In the first semester after advancement to candidacy, students should register only for the number of credits of PATH 701 Dissertation Ph.D. needed to bring their total number of accumulated credits of PATH 701 to 9 by the end of the semester (and should register for no other courses).

In subsequent semesters, students should register for only 1 credit of PATH 701 (and no other courses), except that in the final semester registration should be for the number of credits of PATH 701 needed to complete a total of 18 credits by the end of the semester. **Exception:** It is important to maximize the number of PATH 701 credits that can be completed during periods where training grant support is available. If the student is on the NIH T32 training grant of NRSA award or other funding mechanism that supports this level of tuition, registration should be for the full 9 credits during semesters when grant support for tuition will be available, until a total of 18 credits of PATH 701 is accumulated, after which registration should be for only 1 credit of PATH 701 each semester until graduation. Even prior to advancing to candidacy, if a student has completed 36 “foundation” credits of graduate courses (at least 24 of which must be graded courses), the student should enroll in as many credits of PATH 701 as possible up to a maximum of 6 credits with the remaining credits to be graded courses or PATH 601. In the semester in which the student advances to candidacy, any PATH 601 credits for that semester that are beyond the 36 “foundation” credits should be converted to PATH 701 by petition to Graduate Studies. Students registering for PATH 601, PATH 651 or PATH 701 must indicate their thesis advisor as the Instructor. If a Class Section does not exist with your Thesis Advisor as Instructor, please see the Student Affairs Coordinator to add the Section in order for you to register.

**Note:** Schedule beyond year 5 will generally be the same as year 5.

---

### Courses

**PATH 316. Fundamental Immunology. 4 Units.**

Introductory immunology providing an overview of the immune system, including activation, effector mechanisms, and regulation. Topics include antigen-antibody reactions, immunologically important cell surface receptors, cell-cell interactions, cell-mediated immunity, innate versus adaptive immunity, cytokines, and basic molecular biology and signal transduction in B and T lymphocytes, and immunopathology. Three weekly lectures emphasize experimental findings leading to the concepts of modern immunology. An additional recitation hour is required to integrate the core material with experimental data and known immune mediated diseases. Five mandatory 90 minute group problem sets per semester will be administered outside of lecture and recitation meeting times. Graduate students will be graded separately from undergraduates, and 22 percent of the grade will be based on a critical analysis of a recently published, landmark scientific article. Offered as BIOL 316, BIOL 416, CLBY 416, PATH 316 and PATH 416. Prereq: BIOL 215 and BIOL 215L.
PATH 390. Undergraduate Research in Cancer Biology, Immunology, or Pathology. 1 - 3 Units.
Students undertake a research project directly related to ongoing research in the investigator’s/instructor’s laboratory. Written proposal outlining research topic, a schedule of meetings and format and length of final written report to be prepared prior to registration for credit. Recommended preparation: One year of college chemistry and consent of instructor.

PATH 405. Discussions in Molecular Immunology (Health and Disease). 2 Units.
Targeted student population would be undergraduate (Biology major), PhD, MD, or MD/PhD students interested in emerging research on the mechanisms of molecular immunology and effects on health and defects in disease. Readings will be assigned, and students will come to class prepared for discussions. P/NP grades will be based on these discussions. 5 or fewer students will be selected for this class. Prereq: Undergraduate Biology majors, PhD, MD, or MD/PhD students.

PATH 406. Basic Cancer Biology and the Interface with Clinical Oncology. 3 Units.
This is a graduate-level introductory course in cancer biology taught through the Departments of Pharmacology and Pathology. This course will give students a broad overview of current basic cancer biology, highlight recent advances in cancer therapeutics, and provide a clinical perspective of the pathogenesis and treatment of common cancers. Classes will be of lecture and discussion format, and will also include student discussion of journal research articles to develop critical thinking in cancer research and experimental design as well as presentation/communication skills. About 1 to 3 students per class will be scheduled to lead the presentation and discussion of the selected journal articles. However, all students will be required to read the material in advance and be ready for discussion. Topics will cover growth factor action and signal transduction, oncogenes, tumor suppressor genes, DNA damage, apoptosis, cancer immunology, cancer stem cells, metastasis, angiogenesis, chemotherapy, radiation therapy, targeted therapeutics, photodynamic therapy, targeting cancer stem cells, chemoprevention, and clinical aspects of cancers of the breast, prostate, lymphatic tissue, and colon. Course grades for PHRM/PATH 520 (Ph.D. track): will be determined by class participation/presentation (40%), an original research grant proposal (35%) and written and oral critiques of two research proposals (25%). Course grades for PHRM/PATH 406 (M.S. and non-degree track): will be determined by class participation/presentation (40%), a literature review term paper (35%) and oral defense of term paper with course directors (25%). Presentations/Participation: Instructors will complete a standardized evaluation form to provide you uniform feedback in a timely manner. Required Reading: Assigned reviews, original articles (in blackboard) Recommended Reading: The Biology of Cancer (2nd Edition), by Robert A. Weinberg Garland Science, copyright 2014 Recommended Preparation: A course in Cell Biology. A course in Molecular Biology. Offered as PATH 406, PATH 520, PHRM 406 and PHRM 520.

PATH 410. Aging and the Nervous System. 1 Unit.
Lectures and discussion on aspects of neurobiology of aging in model systems; current research on Alzheimer’s, Parkinson’s, and Huntington’s diseases.

PATH 416. Fundamental Immunology. 4 Units.
Introductory immunology providing an overview of the immune system, including activation, effector mechanisms, and regulation. Topics include antigen-antibody reactions, immunologically important cell surface receptors, cell-cell interactions, cell-mediated immunity, innate versus adaptive immunity, cytokines, and basic molecular biology and signal transduction in B and T lymphocytes, and immunopathology. Three weekly lectures emphasize experimental findings leading to the concepts of modern immunology. An additional recitation hour is required to integrate the core material with experimental data and known immune mediated diseases. Five mandatory 90 minute group problem sets per semester will be administered outside of lecture and recitation meeting times. Graduate students will be graded separately from undergraduates, and 22 percent of the grade will be based on a critical analysis of a recently published, landmark scientific article. Offered as BIOL 316, BIOL 416, CLBY 416, PATH 316 and PATH 416. Prereq: Graduate standing and consent of instructor.

PATH 417. Cytokines: Function, Structure, and Signaling. 3 Units.
Regulation of immune responses and differentiation of leukocytes is modulated by proteins (cytokines) secreted and/or expressed by both immune and non-immune cells. Course examines the function, expression, gene organization, structure, receptors, and intracellular signaling of cytokines. Topic include regulatory and inflammatory cytokines, colony stimulating factors, chemokines, cytokine and cytokine receptor gene families, intracellular signaling through STAT proteins and tyrosine phosphorylation, clinical potential, and genetic defects. Lecture format using texts, scientific reviews and research articles. Recommended preparation: PATH 416 or equivalent. Offered as BIOL 417, CLBY 417, and PATH 417.

PATH 418. Tumor Immunology. 3 Units.
Interactions between the immune system and tumor cells. Topics include the historical definition of tumor specific transplantation antigens, immune responses against tumor cells, the effects of tumor cell products on host immune responses, molecular identification of tumor specific transplantation antigens and recent advances in the immunotherapy of human cancers. Prereq: PATH 416.

PATH 420. Topics in Evolution and Medicine. 3 Units.
The course will be based primarily on the textbook, as well as additional readings to supplement this lucid but relatively brief introduction to the field. Topics to be covered include the overview of the relevance of evolution to medicine; human demography, history and disease; basic and evolutionary genetics; cystic fibrosis; life history trade-offs and the evolutionary biology of aging; cancer; host-pathogen interactions and co-evolution; somatic cell mutation, selection, and evolution in health and disease (not in textbook); sexually transmitted diseases; malaria; gene culture co-evolution; and man-made diseases. Recommended Preparation: Undergraduate knowledge of genetics, biochemistry, cell biology, microbiology, and immunology is advisable. Prior consultation and permission from the Course Director is strongly advised.
PATH 422. Current Topics in Cancer. 3 Units.
The concept of cancer hallmarks has provided a useful guiding principle in our understanding of the complexity of cancer. The hallmarks include sustaining proliferative signaling, evading growth suppressors, enabling replicative immortality, activating invasion and metastasis, inducing angiogenesis, resisting cell death, deregulating cellular energetics, avoiding immune destruction, tumor-promoting inflammation, and genome instability and mutation. The objectives of this course are to (1) examine the principles of some of these hallmarks, and (2) explore potential therapies developed based on these hallmarks of cancer. This is a student-driven and discussion-based graduate course. Students should have had some background on the related subjects and have read scientific papers in their prior coursework. Students will be called on to present and discuss experimental design, data and conclusions from assigned publications. There will be no exams or comprehensive papers but students will submit a one-page critique (strengths and weaknesses) of one of the assigned papers prior to each class meeting. The course will end with a full-day student-run symposium on topics to be decided jointly by students and the course director. Grades will be based on class participation, written critiques, and symposium presentations. Offered as BIOL 420, MBIO 420, PATH 422, and PHRM 420. Prereq: CBIO 453 and CBIO 455.

PATH 430. Oxidative Stress and Disease Pathogenesis. 1 Unit.
Oxidative stress and free radicals are implicated in a number of disease processes including aging, arthritis, emphysema, Alzheimer's disease and cancer. Lecture course with discussion of recent studies concerning the formation and destructive mechanisms of free radicals in the context of various disease processes. Students read assigned papers and discuss these in class.

PATH 432. Current Topics in Vision Research. 3 Units.
Vision research is an exciting and multidisciplinary area that draws on the disciplines of biochemistry, genetics, molecular biology, structural biology, neuroscience, and pathology. This graduate level course will provide the student with broad exposure to the most recent and relevant research currently being conducted in the field. Topics will cover a variety of diseases and fundamental biological processes occurring in the eye. Regions of the eye that will be discussed include the cornea, lens, and retina. Vision disorders discussed include age-related macular degeneration, retinal ciliopathies, and diabetic retinopathy. Instructors in the course are experts in their field and are members of the multidisciplinary visual sciences research community here at Case Western Reserve University. Students will be exposed to the experimental approaches and instrumentation currently being used in the laboratory and in clinical settings. Topics will be covered by traditional lectures, demonstrations in the laboratory and the clinic, and journal club presentations. Students will be graded on their performance in journal club presentations (40%), research proposal (40%), and class participation (20%). Offered as NEUR 432, PATH 432, PHRM 432 and CBIO 432.

PATH 444. Neurodegenerative Diseases: Pathological, Cell. & Molecular Perspectives. 3 Units.
This course, taught by several faculty members, encompasses the full range of factors that contribute to the development of neurodegeneration. Subjects include pathological aspects, neurodegeneration, genetic aspects, protein conformation and cell biology in conditions such as Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis and prion diseases. Students read assigned primary literature and present and discuss these in class.

PATH 450. Interdisciplinary Musculoskeletal Research: Selected Topics and Grant Writing Workshop. 3 Units.
This is an introductory graduate course in MSK research topics, grant writing, and reviewing skills. During this course, each student will be introduced to diverse multidisciplinary topics in MSK research and will write a research grant on a MSK topic of his/her choice that is not regurgitation of their mentor's grant. Students will also participate in editing and reviewing the proposals of their classmates. Proposals can form the basis of fellowship applications (F30/F31). For predocs, your department/program may allow the proposal to form the basis for the written component of your preliminary examination. Recommended Preparation: Current engagement in musculoskeletal research.

PATH 455. Advanced Immunobiology. 4 Units.
This course will cover fundamental (innate and adaptive responses, antigen recognition, cell activation, etc.) and applied (immune evasion, autoimmunity, allergy, transplantation, vaccines, etc.) immunology topics, highlighting the most important and recent advancements found in the primary literature. Lectures will be derived largely from the primary literature, but will also include modern techniques and fundamental background knowledge to enhance the learning environment for the immunology concepts presented. Course organization consists of two lectures per week by the immunology faculty, midterm and final examinations, and an oral presentation. Enrolled students have the option of concurrent enrollment in PATH 466 Writing for Immunologists. Prereq: PATH 416

PATH 466. Proposal Writing for Immunologists. 1 Unit.
This course is an introduction to research proposal writing and evaluation for immunology graduate students. One of the most important aspects of being an active investigator in academia, biotechnology, or pharmaceutical industries is being a skilled communicator of one's ideas. This course is designed to teach these practical writing skills and will include lectures and discussions of key writing strategies. Throughout the semester, students will write a research proposal on a topic outside of their thesis research focus (but it can be related), present their ideas in front of the class, and take part in an end-of-semester review panel of the proposals of their classmates. Enrollment requires concurrent enrollment in PATH 465 Advanced Immunobiology and instructor permission. Prereq: PATH 416. Coreq: PATH 465.

PATH 457. Cell and Molecular Foundations of Pathology. 3 Units.
This course is designed for M.S. students in the Pathology Graduate Program, and is an introductory course covering normal cell and molecular biology as well as cell physiology. Additional topics to be discussed in the course will include cell structure and function, as well as correlates to cellular and molecular pathology. Recommended Preparation: Should have undergrad-level cell biology and biochemistry.
PATH 480. Logical Dissection of Biomedical Investigations. 3 Units. PATH 480 is an upper level graduate course encompassing discussion and critical appraisal of both published and pre-published research papers, book chapters, commentaries and review articles. Emphasis will be placed on evaluating the logical relationships connecting hypotheses to experimental design and experimental data to conclusions drawn. Thus, the course will aim to develop students’ capacities for independent thinking and critical analysis. Half of the course will be devoted to an analysis of fundamental conceptual issues pertaining to immunology, but this material will be applicable to a wide variety of fields. The other half of the course will be devoted to the analysis of papers that have been submitted for publication (with the students acting as primary reviewers of these papers). Our expectation is that this course will have practical relevance for students by providing them with methods to review their own prepublication manuscripts and eliminate common errors. It should also give students the tools to question widely held beliefs in diverse biomedical fields. Recommended preparation is completion of the C3MB curriculum and 2nd year or higher graduate school training. Previous exposure to immunology and molecular biology will be helpful but not required.

PATH 481. Immunology of Infectious Diseases. 3 Units. This course centers on mechanisms of immune defense, immune escape and disease pathogenesis caused by important human pathogens. Some of the infectious diseases covered in this course include AIDS, TB and Malaria. Most topics focus on immunology of viral, bacterial, protozoan and fungal infections. Topics will also include aspects of epidemiology and global health. Classes will consist of literature review of current scientific articles, faculty lectures and student presentations. Grades will be determined by exams, class presentations, participation, and short reports. Graduate students will also be asked to write a brief research proposal. PATH 481 involves faculty from: Division of Infectious Diseases and HIV Medicine, Center for Global Health & Diseases, Department of Pathology. Prereq: PATH 416.

PATH 488. Yeast Genetics and Cell Biology. 3 Units. This seminar course provides an introduction to the genetics and molecular biology of the yeasts S. cerevisiae and S. pombe by a discussion of current literature focusing primarily on topics in yeast cell biology. Students are first introduced to the tools of molecular genetics and special features of yeasts that make them important model eukaryotic organisms. Some selected topics include cell polarity, cell cycle, secretory pathways, vesicular and nuclear/cytoplasmic transport, mitochondrial import and biogenesis, chromosome segregation, cytoskeleton, mating response and signal transduction. Offered as CLBY 488, GENE 488, MBIO 488, and PATH 488.

PATH 510. Basic Pathologic Mechanisms. 4 Units. An interdisciplinary introduction to the fundamental principles of molecular and cellular biology as they relate to the pathologic basis of disease. Lectures, laboratories, conferences.

PATH 511. Experimental Pathology Seminar I. 1 Unit. Weekly discussions of current topics and research by students, staff and distinguished visitors.

PATH 512. Experimental Pathology Seminar II. 1 Unit. Weekly discussions of current topics and research by students, staff and distinguished visitors.

PATH 513. Immunology Journal Club. 1 Unit. The Immunology Journal Club is a weekly seminar course in which enrolled students present recently published articles from the primary immunology literature for discussion by the group. Registered students are required to present one article and participate in discussions. Articles are selected by the students, must not be directly related to their own research project, and are approved by the course director. The purpose of the course is to provide the opportunity to practice presentation skills and to foster discussion of recent and high profile advances in immunology. Prereq: Enrolled in M.S. Pathology program.

PATH 520. Basic Cancer Biology and the Interface with Clinical Oncology. 3 Units. This is a graduate-level introductory course in cancer biology taught through the Departments of Pharmacology and Pathology. This course will give students a broad overview of current basic cancer biology, highlight recent advances in cancer therapeutics, and provide a clinical perspective of the pathogenesis and treatment of common cancers. Classes will be of lecture and discussion format, and will also include student discussion of journal research articles to develop critical thinking in cancer research and experimental design as well as presentation/communication skills. About 1 to 3 students per class will be scheduled to lead the presentation and discussion of the selected journal articles. However, all students will be required to read the material in advance and be ready for discussion. Topics will cover growth factor action and signal transduction, oncogenes, tumor suppressor genes, DNA damage, apoptosis, cancer immunology, cancer stem cells, metastasis, angiogenesis, chemotherapy, radiation therapy, targeted therapeutics, photodynamic therapy, targeting cancer stem cells, chemoprevention, and clinical aspects of cancers of the breast, prostate, lymphatic tissue, and colon. Course grades for PHRM/PATH 520 (Ph.D. track): will be determined by class participation/presentation (40%), an original research grant proposal (35%) and written and oral critiques of two research proposals (25%). Course grades for PHRM/PATH 406 (M.S. and non-degree track): will be determined by class participation/presentation (40%), a literature review term paper (35%) and oral defense of term paper with course directors (25%). Presentations/Participation: Instructors will complete a standardized evaluation form to provide you uniform feedback in a timely manner. Required Reading: Assigned reviews, original articles (in blackboard) Recommended Reading: The Biology of Cancer (2nd Edition), by Robert A. Weinberg Garland Science, copyright 2014 Recommended Preparation: A course in Cell Biology. A course in Molecular Biology. Offered as PATH 406, PATH 520, PHRM 406 and PHRM 520.

PATH 521. Special Topics in Cancer Biology and Clinical Oncology. 1 Unit. This one credit hour course in Cancer Biology is intended to give students an opportunity to do independent literature research while enrolled in PHRM 520/PATH 520. Students must attend weekly Hematology/Oncology seminar series and write a brief summary of each of the lectures attended. In addition, students must select one of the seminar topics to write a term paper which fully reviews the background related to the topic and scientific and clinical advances in that field. This term paper must also focus of Clinical Oncology, have a translational research component, and integrate with concepts learned in PHRM 520/PATH 520. Pharmacology students must provide a strong discussion on Therapeutics, while Pathology students must provide a strong component on Pathophysiology of the disease. Recommended preparation: CBIO 453 and CBIO 455, or concurrent enrollment in PHRM 520 or PATH 520. Offered as PATH 521 and PHRM 521.
PATH 523. Histopathology of Organ Systems. 3 Units.
Comprehensive course covering the underlying basic mechanisms of injury and cell death, inflammation, immunity, infection, and neoplasia followed by pathology of specific organ systems. Material will include histological (‘structure’) and physiological (‘function’) aspects related to pathology (human emphasis). Recommended preparation: ANAT 412 or permission of instructor. Offered as ANAT 523 and PATH 523.

PATH 524. Cell Biology of Neurodegenerative Disorders. 3 Units.
PATH 524 is a 3 credit hour introductory course on neurodegenerative disorders intended for Master’s and first and second-year medical students. This course attempts to bridge the gap between molecular mechanisms at the cellular level with disease presentation and therapeutic options for neurodegenerative disorders of protein misfolding and metal mis-metabolism. The course will cover topics related to Alzheimer’s disease, Parkinson’s disease, Huntington’s disease, Amyotrophic lateral sclerosis, Multiple sclerosis, Prion diseases, disorders of iron and copper metabolism, and other disorders of interest to the students. The class will meet once every week, and following an introductory lecture, the students will discuss relevant scientific reports from recent literature. Students are expected to participate actively in class discussion, and write a 5-6 page research proposal following NIH guidelines for the final exam. The students are expected to present and defend their proposal in class. Grading criteria: Class participation (70%), final paper and presentation (30%).

PATH 525. Neurodegenerative Diseases of the Brain and the Eye: Molecular Basis of the Brain-Eye Connection. 3 Units.
This is a graduate-level seminar course that familiarizes students with common neurodegenerative conditions of the brain and the eye. The molecular basis of each disorder and associated ophthalmic pathology will be emphasized. Contribution of heavy metals in brain and ocular pathology will be discussed where appropriate. Specific examples include Alzheimer’s Disease, Parkinson’s Disease, prion disorders, Huntington’s Disease, age-related macular degeneration, glaucoma, and others based on popular demand. The students will be expected to discuss relevant research publications in class in an interactive format. Grading will be based on class participation and completion of an R21 grant proposal. Concurrent enrollment in PATH 526 on grant writing skills is strongly recommended but not required. Offered as PATH 525 and CLBY 525.

PATH 526. Introduction to Scientific Grant Writing. 1 Unit.
PATH 526 is a graduate-level course that will familiarize students with grant writing and reviewing skills. The students will be exposed to material pertaining to different grant opportunities, the grant review process, and strategies for maximizing chances of success. Grading will be based on class participation and the preparation and presentation of an R21 grant proposal in class. Coreq: PATH 525.

PATH 601. Special Problems. 1 - 18 Units.
Research on the nature and causation of disease and on host factors which tend to protect against disease. Special courses and tutorials in subspecialty areas of general and/or systemic anatomic and/or clinical pathology.

PATH 650. Independent Study. 1 - 9 Units.
Laboratory rotation experience in a selected faculty research laboratory designed to introduce the M.S. student to all aspects of modern laboratory research including the design, execution and analysis of original experimental work.

PATH 651. Thesis M.S.. 1 - 18 Units.
(Credit as arranged.)
CNCR 504. Translational Cancer Research D. 1 Unit.
In this course Case K12 Paul Calabresi Scholars will discuss an article on essential components of leadership in an academic and clinical setting; how to advance their clinical research career to the level that they can present at the ASCO national conference; learn how to present research and clinical trials progress orally and written to peers/ faculty for evaluation by making two PowerPoint presentations: one to the class and their two K12 mentors and a second to the K12 CORP Advisory Committee for written evaluation. Both of these sessions will be videotaped and a copy of the tape will be reviewed with the scholar. Each scholar will also provide a written summary of their research and date along with their goals for the next 12 months on April 1. Recommended preparation: Acceptance to Case K12 Clinical Oncology Career Development Training Program as Paul Calabresi Research Scholar.

Department of Pharmacology
Room W-321, School of Medicine
http://pharmacology.case.edu/
Phone: 216.368.0248
Edward Yu, PhD, Interim Chair
edy5@case.edu

The Department of Pharmacology offers training leading to MS, PhD, or MD/PhD degrees for highly qualified post-undergraduate candidates committed to research careers in the biomedical sciences. Adequate preparation in the biological sciences, mathematics, organic chemistry, and physics or physical chemistry is a prerequisite for admission.

Multidisciplinary training carried out by faculty in pharmacology and other basic science departments, emphasizes molecular, cellular, physiological, and translational aspects of the pharmacological sciences. Areas of faculty expertise include drug/xenobiotic metabolism; receptor-ligand interactions, and biochemical reaction mechanisms; cell biology of signaling pathways; structure-function of membrane components; endocrine and metabolic regulation; cell surface and nuclear receptors, hormonal regulation of gene expression; cancer biology and therapeutics, bacterial and viral pathogenesis, neuroscience/neuropharmacology, and drug resistance.

Students who desire the combined MD/PhD degrees are admitted to the Medical Scientist Training Program (http://bulletin.case.edu/schoolofmedicinedualdegreeprograms/#medicalsciencestrainingprogramtext) (MSTP). These students participate in the two-year integrated preclinical curriculum of the School of Medicine (University Program), which features clinical correlation of basic biologic concepts. Combined degree students who select the PhD in pharmacology undertake a series of advanced courses, research rotations, preliminary examinations and dissertation research in the same manner as that described for the PhD program.

Facilities
The Department of Pharmacology occupies about 25,000 net square feet distributed among several locations, namely the School of Medicine Harland Goff Wood Building and the adjacent Wood Research Tower, as well as facilities in the West Quad Bldg. Facilities include extensive chromatographic and tissue culture facilities, a transgenic mouse laboratory, imaging and confocal microscopy equipment, and ready access to specialized research techniques, including various aspects of recombinant DNA and hybridoma technology, in situ hybridization histochemistry, fluorescence cell sorting, NMR spectroscopy and mass spectrometry, X-ray crystallography, and cryo electron microscopy.

Masters Degrees
Although training efforts by the Department of Pharmacology are primarily directed toward the award of the PhD degree, training for the MS degree is offered also in a variety of contexts. For example, research assistants in the Department who seek educational advancement may pursue the MS degree via Plan A (thesis) or Plan B (coursework only). Medical students who seek to specialize in Pharmacology during the scholarly research component of their preclinical program may pursue the MS degree. Employees in the Biotechnology Industry may seek advanced training in Pharmacology by pursuing the MS degree at Case. Finally, a PhD candidate who is unable to complete the PhD requirements for extraordinary reasons may petition to have earned credits transferred to fulfill MS degree requirements.

Masters Plan B (Coursework, MS direct admit)
This program is aimed at students who seek a Master’s Degree but do not intend to specialize in research following their Master’s work. To satisfy the requirement for a Comprehensive Exam for the MS Degree, students register for 1 credit of EXAM 600 Master’s Comprehensive Exam during their final semester and sit for an integrative essay question-style examination on the content of the required coursework. A total of 30 credit hours are required (see below).

The advancement of understanding and practice of therapeutics is based on research. Therefore all students in degree programs in Pharmacology are expected to become involved in independent research and scholarship. Registration for PHRM 601 Independent Study and Research requires a pre-arrangement with a faculty mentor who will oversee the combination of study and bench research and prescribe the basis for satisfactory performance, including oral and written reports. With pre-approval of the Departmental Director of Graduate Studies, a student’s study plan may substitute additional specific advanced courses to replace PHRM 601 Independent Study and Research credits.

Masters Plan A (Research, direct admit)

In addition to the course requirements below, candidates for this degree are required to submit an acceptable written thesis based on their original research, and register for at least 9 credit hours of PHRM 651 Thesis M.S. (master's dissertation research). The acceptability of the thesis will be determined by an oral examination administered by the student's Thesis Advisory Committee. This committee must be chaired by a member of the primary Faculty of Pharmacology, and it should include the research mentor and two other faculty members (total of four faculty members, two from the Department of Pharmacology). As above, a minimum of 27 credit hours are required. For these students, passing the final exams in PHRM 401 Principles of Pharmacology I: The Molecular Basis of Therapeutics and PHRM 402 Principles of Pharmacology II: The Physiological Basis of Therapeutics satisfies the requirement for a Comprehensive Exam for the MS Degree.

**Total Units in Sequence:** 36
PhD in Pharmacology

Students seeking the PhD degree in Pharmacology are admitted into the Department of Pharmacology through the administrative structure of Biomedical Sciences Training Program (http://casemed.case.edu/bsttp/) which provides an introduction to many related training areas within the biomedical field during the first year. PhD applicants may indicate Pharmacology as their “primary program of interest” (PPI) during the application process. Alternatively, admission may be through the Medical Scientist Training Program (MSTP) (https://case.edu/medicine/admissions-programs/md-phd-program/prospective-students/mstp-admissions/).

The PhD program is divided into three phases. The first phase allows students to follow an integrated first-year sequence of course work that involves a core curriculum in cell and molecular biology. In addition, the first year includes three research rotations that allow the students to sample areas of research and become familiar with faculty members and their laboratories. Selection of a specific training program and thesis advisor is made before the end of the first year. The second phase involves a two part core course in the fundamentals of pharmacology, oral presentations, and laboratory experience, which is concluded with a comprehensive written exam designed to challenge students to apply key concepts in new contexts. Successful completion of this phase leads to admission to PhD candidacy.

After advancing to PhD candidacy, students enter one of four Research Interest Groups according to the interest of the student, the mentor and the anticipated nature of the thesis project. The four interest groups are: Cancer Therapeutics, Membrane & Structural Biology and Pharmacology, Molecular Pharmacology and Cellular Regulation, and Translational Therapeutics.

Upon completion of coursework requirements (54 total credits, see below), the PhD degree is awarded to students who also complete and defend a research project leading to two original and meritorious scientific contributions that are submitted for publication to leading journals in the field of study; at least one manuscript must be accepted for publication before scheduling the PhD thesis defense.

Core course requirements for the PhD in Pharmacology

The first year consists of the core curriculum in Cell Biology and Molecular Biology (IBMS 453 Cell Biology I, IBMS 455 Molecular Biology I), research rotations, scientific ethics, part one of the Pharmacology core course, and an advanced course (18 credit hours total). During Year two, part two of the Pharmacology core course, a second advanced course, two seminar presentation courses, and independent study complete the course requirements. In all, 24 credits of graded coursework and 12 credits of P/N coursework are completed. Then 18 credits of dissertation research fulfill the program of study.

Dissertation Ph.D. (PHRM 701) 3
Dissertation Ph.D. (PHRM 701) 3
Responsible Conduct of Research for Advanced Trainees (IBMS 501) 0
Year Total: 3 3

Total Units in Sequence: 54

Footnotes:
* Rotation 1 takes place during Summer prior to First Year Fall Semester.
† IBMS 501 Responsible Conduct of Research for Advanced Trainees is offered every spring semester (beginning 2020). The SOM requires that PhD students who are 4 years beyond their initial RCR training in IBMS 500 On Being a Professional Scientist: The Responsible Conduct of Research, register for IBMS 501.

Courses

PHRM 309. Principles of Pharmacology. 3 Units.
Principles of Pharmacology introduces the basic principles that underlie all of Pharmacology. The first half of the course introduces, both conceptually and quantitatively, drug absorption, distribution, elimination and metabolism (pharmacokinetics) and general drug receptor theory and mechanism of action (pharmacodynamics). Genetic variation in response to drugs (pharmacogenetics) is integrated into these basic principles. The second half of the course covers selected drug classes chosen to illustrate these principles. Small group/recitation sessions use case histories to reinforce presentation of principles and to discuss public perceptions of therapeutic drug use. Graduate students will be expected to critically evaluate articles from the literature and participate in a separate weekly discussion session. Recommended preparation for PHRM 409: Undergraduate degree in science or permission of instructor. Offered as PHRM 309 and PHRM 409. (CHEM 223 and CHEM 224), or (CHEM 323 and CHEM 324), or (EBME 201 and EBME 202), or (BIOL 116 and BIOL 117).

PHRM 315. Nuclear Receptors in Health and Disease. 3 Units.
This course focuses on hormone-gene interactions mediated by the ligand-inducible transcription factors termed nuclear hormone receptors. The class will address the mechanisms of action, regulatory features, and biological activities of several nuclear receptors. The usage of nuclear receptors as therapeutic targets in disease states such as cancer, inflammation, and diabetes will also be discussed. The course aims to teach students to critically evaluate primary literature relevant to nuclear hormone receptors biology, and to reinforce presentation/ discussion skills. Grades for undergraduates will be based on midterm, final exam; grades for graduates will be based on midterm, final exam, and presentation of a recently published research article related to the role of nuclear receptors in health and disease. Offered as PHRM 315, BIOC 315, PHRM 415 and BIOC 415.

PHRM 340. Science and Society Through Literature. 3 Units.
This course will examine the interaction of scientific investigation and discovery with the society it occurred in. What is the effect of science on society and, as importantly, what is the effect of society on science? An introduction will consider the heliocentric controversy with focus on Galileo. Two broad areas, tuberculosis and the Frankenstein myth, will then be discussed covering the period 1800-present. With tuberculosis, fiction, art and music will be examined to understand the changing views of society towards the disease, how society’s perception of tuberculosis victims changed, and how this influenced their treatments and research. With Frankenstein, the original novel in its historical context will be examined. Using fiction and film, the transformation of the original story into myth with different connotations and implications will be discussed. Most classes will be extensive discussions coupled with student presentations of assigned materials. Offered as PHRM 340, BETH 440, PHRM 440, and HSTY 440.

PHRM 400. Research Experience in Pharmacology. 0 - 1 Units.
Research rotation in pharmacology.

PHRM 401. Principles of Pharmacology I: The Molecular Basis of Therapeutics. 3 Units.
This core course focuses on the chemical and biochemical properties of therapeutic agents and molecular mechanisms of therapeutic action, including kinetic and thermodynamic principles of enzyme catalysis and drug-receptor interactions. Moreover, emphasis is placed on fundamental principles of pharmacokinetics, including the absorption, distribution, metabolism, and excretion of drugs. Mathematical concepts needed to understand appropriate administration of drugs and maintaining therapeutic concentrations of drugs in the body are discussed. A second broad area of emphasis is on fundamental principles of pharmacodynamics, including drug-receptor theory, log dose-response relationships, therapeutic index, receptor turnover, and signal transduction mechanisms. The primary learning objective is to develop a self-directed, critical approach to the evaluation and design of experimental research in the broad context of receptor interactions with endogenous ligands and therapeutic agents in the context of disease models. This is a team-coordinated course involving session organized by faculty to facilitate student-directed learning experiences including discussion of study questions, problem solving applications, and primary literature presentations. A two-part laboratory exercise introduces experimental methodologies widely applied during the study of molecular interactions between therapeutic agents and receptor targets to reinforce fundamental principles of drug action. This 3-credit hour course meets 3 hr per week during the spring semester of year 1.
PHRM 402. Principles of Pharmacology II: The Physiological Basis of Therapeutics. 3 Units.
This course focuses on human physiology of organ systems including the central nervous system, cardiovascular system, and those systems (gastrointestinal, hepatic, and renal) that are involved in determining the pharmacokinetics or time course of drug action in vivo. A second major emphasis is placed on disease-based sessions where normal physiology, pathophysiology, and key drug classes to treat pathophysiology are discussed. The students learn key concepts in endocrine pathologies, inflammatory disorders, pulmonary diseases, infectious diseases, and cancer. The main learning objectives are for the student to gain an understanding of basic principles of modern pharmacology and physiology and to build self-directed learning skills. This is a highly interactive course in which faculty lectures are minimized. A heavy emphasis is placed on student-directed learning experiences including presentation and discussion of primary literature, problem solving applications, small group discussion and team-based learning. This 3-credit hour course meets 3 hr per week during the fall semester of year 2.

PHRM 403. Public and Professional Views of Modern Therapeutics. 3 Units.
This course will present the students with headline news stories from the popular press along with pertinent published articles from the scientific literature. The object is to engage the students in critical evaluation of the scientific literature and news reports to discern the scientific basis for decisions such as removal of drugs from the market. The course will focus on topics such as Cox-2 Inhibitors and Heart Disease, Antidepressant Use for Adolescents, and Parkinson’s Disease and Stem Cell Therapy, among others. Evaluation will be based on participation in student-led discussion sessions, weekly topical quizzes, and on written critiques of the primary literature.

PHRM 406. Basic Cancer Biology and the Interface with Clinical Oncology. 3 Units.
This is a graduate-level introductory course in cancer biology taught through the Departments of Pharmacology and Pathology. This course will give students a broad overview of current basic cancer biology, highlight recent advances in cancer therapeutics, and provide a clinical perspective of the pathogenesis and treatment of common cancers. Classes will be of lecture and discussion format, and will also include student discussion of journal research articles to develop critical thinking in cancer research and experimental design as well as presentation/communication skills. About 1 to 3 students per class will be scheduled to lead the presentation and discussion of the selected journal articles. However, all students will be required to read the material in advance and be ready for discussion. Topics will cover growth factor action and signal transduction, oncogenes, tumor suppressor genes, DNA damage, apoptosis, cancer immunology, cancer stem cells, metastasis, angiogenesis, chemotherapy, radiation therapy, targeted therapeutics, photodynamic therapy, targeting cancer stem cells, chemoprevention, and clinical aspects of cancers of the breast, prostate, lymphatic tissue, and colon. Course grades for PHRM/PATH 520 (Ph.D. track): will be determined by class participation/presentation (40%), an original research grant proposal (35%) and written and oral critiques of two research proposals (25%). Course grades for PHRM/PATH 406 (M.S. and non-degree track): will be determined by class participation/presentation (40%), a literature review term paper (35%) and oral defense of term paper with course directors (25%). Presentations/Participation: Instructors will complete a standardized evaluation form to provide you uniform feedback in a timely manner. Required Reading: Assigned reviews, original articles (in blackboard) Recommended Reading: The Biology of Cancer (2nd Edition), by Robert A. Weinberg Garland Science, copyright 2014 Recommended Preparation: A course in Cell Biology. A course in Molecular Biology. Offered as PATH 406, PATH 520, PHRM 406 and PHRM 520.

PHRM 409. Principles of Pharmacology. 3 Units.
Principles of Pharmacology introduces the basic principles that underlie all of Pharmacology. The first half of the course introduces, both conceptually and quantitatively, drug absorption, distribution, elimination and metabolism (pharmacokinetics) and general drug receptor theory and mechanism of action (pharmacodynamics). Genetic variation in response to drugs (pharmacogenetics) is integrated into these basic principles. The second half of the course covers selected drug classes chosen to illustrate these principles. Small group/recitation sessions use case histories to reinforce presentation of principles and to discuss public perceptions of therapeutic drug use. Graduate students will be expected to critically evaluate articles from the literature and participate in a separate weekly discussion session. Recommended preparation for PHRM 409: Undergraduate degree in science or permission of instructor. Offered as PHRM 309 and PHRM 409.

PHRM 412. Membrane Transport Processes. 3 Units.
Membranes and membrane transporters are absolutely required for all cells to take up nutrient, maintain membrane potential and efflux toxins. This course will consider the classification and structure of membrane transport proteins and channels, examine the common mechanistic features of all systems and the specific features of different classes of transporter. Understanding the physiological integration of transport processes into cell homeostasis and consideration of transporters and channels as drug targets will be a goal. Course format is minimal lecture, primarily student presentations of primary literature papers. Offered as PHOL 412 and PHRM 412. Prereq: CBIO 453 and CBIO 455.
PHRM 415. Nuclear Receptors in Health and Disease. 3 Units.
This course focuses on hormone-gene interactions mediated by the ligand-inducible transcription factors termed nuclear hormone receptors. The class will address the mechanisms of action, regulatory features, and biological activities of several nuclear receptors. The usage of nuclear receptors as therapeutic targets in disease states such as cancer, inflammation, and diabetes will also be discussed. The course aims to teach students to critically evaluate primary literature relevant to nuclear hormone receptors biology, and to reinforce presentation/discussion skills. Grades for undergraduates will be based on midterm, final exam; grades for graduates will be based on midterm, final exam, and presentation of a recently published research article related to the role of nuclear receptors in health and disease. Offered as PHRM 315, BIO 315, PHRM 415 and BIO 415.

PHRM 420. Current Topics in Cancer. 3 Units.
The concept of cancer hallmarks has provided a useful guiding principle in our understanding of the complexity of cancer. The hallmarks include sustaining proliferative signaling, evading growth suppressors, enabling replicative immortality, activating invasion and metastasis, inducing angiogenesis, resisting cell death, deregulating cellular energetics, avoiding immune destruction, tumor-promoting inflammation, and genome instability and mutation. The objectives of this course are to (1) examine the principles of some of these hallmarks, and (2) explore potential therapies developed based on these hallmarks of cancer. This is a student-driven and discussion-based graduate course. Students should have had some background on the related subjects and have read scientific papers in their prior coursework. Students will be called on to present and discuss experimental design, data and conclusions from assigned publications. There will be no exams or comprehensive papers but students will submit a one-page critique (strengths and weaknesses) of one of the assigned papers prior to each class meeting. The course will end with a full-day student-run symposium on topics to be decided jointly by students and the course director. Grades will be based on class participation, written critiques, and symposium presentations. Offered as BiOC 420, Mbio 420, PATH 422, and PHRM 420. Prereq: CBIO 453 and CBIO 455.

PHRM 432. Current Topics in Vision Research. 3 Units.
Vision research is an exciting and multidisciplinary area that draws on the disciplines of biochemistry, genetics, molecular biology, structural biology, neuroscience, and pathology. This graduate level course will provide the student with broad exposure to the most recent and relevant research currently being conducted in the field. Topics will cover a variety of diseases and fundamental biological processes occurring in the eye. Regions of the eye that will be discussed include the cornea, lens, and retina. Vision disorders discussed include age-related macular degeneration, retinal ciliopathies, and diabetic retinopathy. Instructors in the course are experts in their field and are members of the multidisciplinary visual sciences research community here at Case Western Reserve University. Students will be exposed to the experimental approaches and instrumentation currently being used in the laboratory and in clinical settings. Topics will be covered by traditional lectures, demonstrations in the laboratory and the clinic, and journal club presentations. Students will be graded on their performance in journal club presentations (40%), research proposal (40%), and class participation (20%). Offered as NEUR 432, PATH 432, PHRM 432 and BIO 432.

PHRM 440. Science and Society Through Literature. 3 Units.
This course will examine the interaction of scientific investigation and discovery with the society it occurred in. What is the effect of science on society and, as importantly, what is the effect of society on science? An introduction will consider the heliocentric controversy with focus on Galileo. Two broad areas, tuberculosis and the Frankenstein myth, will then be discussed covering the period 1800-present. With tuberculosis, fiction, art and music will be examined to understand the changing views of society towards the disease, how society’s perception of tuberculosis victims changed, and how this influenced their treatments and research. With Frankenstein, the original novel in its historical context will be examined. Using fiction and film, the transformation of the original story into myth with different connotations and implications will be discussed. Most classes will be extensive discussions coupled with student presentations of assigned materials. Offered as PHRM 340, BETH 440, PHRM 440, and HSTY 440.

PHRM 466. Cell Signaling. 3 Units.
This is an advanced lecture/journal/discussion format course that covers cell signaling mechanisms. Included are discussions of neurotransmitter-gated ion channels, growth factor receptor kinases, cytokine receptors, G protein-coupled receptors, steroid receptors, heterotrimeric G proteins, ras family GTPases, second messenger cascades, protein kinase cascades, second messenger regulation of transcription factors, microtubule-based motility, actin/myosin-based motility, signals for regulation of cell cycle, signals for regulation of apoptosis. Offered as CLBY 466, PHOL 466 and PHRM 466.

PHRM 475. Protein Biophysics. 3 Units.
This course focuses on in-depth understanding of the molecular biophysics of proteins. Structural, thermodynamic and kinetic aspects of protein function and structure-function relationships will be considered at the advanced conceptual level. The application of these theoretical frameworks will be illustrated with examples from the literature and integration of biophysical knowledge with description at the cellular and systems level. The format consists of lectures, problem sets, and student presentations. A special emphasis will be placed on discussion of original publications. Offered as BiOC 475, CHEM 475, PHOL 475, PHRM 475, and NEUR 475.

PHRM 511. Pharmacology Seminar Series. 0 - 1 Units.
Current topics of interest in the pharmacologist sciences.

PHRM 513. Structural Journal Club. 1 Unit.
Current topics of interest in structural biology, and protein biophysics. Offered as PHOL 513 and PHRM 513.
PHRM 520. Basic Cancer Biology and the Interface with Clinical Oncology. 3 Units.
This is a graduate-level introductory course in cancer biology taught through the Departments of Pharmacology and Pathology. This course will give students a broad overview of current basic cancer biology, highlight recent advances in cancer therapeutics, and provide a clinical perspective of the pathogenesis and treatment of common cancers. Classes will be of lecture and discussion format, and will also include student discussion of journal research articles to develop critical thinking in cancer research and experimental design as well as presentation/communication skills. About 1 to 3 students per class will be scheduled to lead the presentation and discussion of the selected journal articles. However, all students will be required to read the material in advance and be ready for discussion. Topics will cover growth factor action and signal transduction, oncogenes, tumor suppressor genes, DNA damage, apoptosis, cancer immunology, cancer stem cells, metastasis, angiogenesis, chemotherapy, radiation therapy, targeted therapeutics, photodynamic therapy, targeting cancer stem cells, chemoprevention, and clinical aspects of cancers of the breast, prostate, lymphatic tissue, and colon. Course grades for PHRM/PATH 520 (Ph.D. track): will be determined by class participation/presentation (40%), an original research grant proposal (35%) and written and oral critiques of two research proposals (25%). Course grades for PHRM/PATH 406 (M.S. and non-degree track): will be determined by class participation/presentation (40%), a literature review term paper (35%) and oral defense of term paper with course directors (25%). Presentations/Participation: Instructors will complete a standardized evaluation form to provide you uniform feedback in a timely manner. Required Reading: Assigned reviews, original articles (in blackboard) Recommended Reading: The Biology of Cancer (2nd Edition), by Robert A. Weinberg Garland Science, copyright 2014 Recommended Preparation: A course in Cell Biology. A course in Molecular Biology. Offered as PATH 406, PATH 520, PHRM 406 and PHRM 520.

PHRM 521. Special Topics in Cancer Biology and Clinical Oncology. 1 Unit.
This one credit hour course in Cancer Biology is intended to give students an opportunity to do independent literature research while enrolled in PHRM 520/PATH 520. Students must attend weekly Hematology/Oncology seminar series and write a brief summary of each of the lectures attended. In addition, students must select one of the seminar topics to write a term paper which fully reviews the background related to the topic and scientific and clinical advances in that field. This term paper must also focus on Clinical Oncology, have a translational research component, and integrate with concepts learned in PHRM 520/PATH 520. Pharmacology students must provide a strong discussion on Therapeutics, while Pathology students must provide a strong component on Pathophysiology of the disease. Recommended preparation: CBIO 453 and CBIO 455, or concurrent enrollment in PHRM 520 or PATH 520. Offered as PATH 521 and PHRM 521.

PHRM 525. Topics in Cell and Molecular Pharmacology. 0 - 18 Units.
Individual library research project under the guidance of a pharmacology sponsor. Projects will reflect the research interest of the faculty sponsor, including molecular endocrinology, neuropharmacology, receptor activation and signal transduction, molecular mechanisms of enzyme action and metabolic regulation.

PHRM 526. Grant Writing Tutorial. 1 - 3 Units.
Students will be expected to provide critiques of a grant proposal to bring to a workshop. At the workshop, a faculty review panel will discuss the grant proposal and provide critiques to illustrate the key components that are necessary for any grant proposal, and the specific items that enhance the quality of the proposal or detract from it. The students will be able to compare what they emphasized in their critiques to what the expert panel focused on. After completing the workshop, each student will prepare a proposal based on their thesis topic; this document will be scored, and the student will also be evaluated for an oral defense of the proposal.

PHRM 527. Pathways to Personalized Medicine. 3 Units.
This is a course of independent study designed to take the student from the bedside to the bench and back again. Students will select a problem from a list of important therapeutic issues related to variability in drug responsiveness and design a research program to elucidate its molecular, biochemical, genetic and pathophysiological basis. The resulting research proposal is expected to be multidimensional and include molecular, cellular, whole animal and clinical investigations. To guide the process students will assemble a mentoring group including at least one member of the Translational Therapeutics Track Faculty, a clinician working in the clinical realm in which the problem originates and a basic scientist with relevant experience. The written proposal will be defended orally. Recommended preparation: 1st year Pharm Graduate required courses.

PHRM 528. Contemporary Approaches to Drug Discovery. 3 Units.
This course is designed to teach the students how lead compounds are discovered, optimized, and processed through clinical trials for FDA approval. Topics will include: medicinal chemistry, parallel synthesis, drug delivery and devices, drug administration and pharmacokinetics, and clinical trials. A special emphasis will be placed on describing how structural biology is used for in silico screening and lead optimization. This component will include hands-on experience in using sophisticated drug discovery software to conduct in silico screening and the development of drug libraries. Each student will conduct a course project involving in silico screening and lead optimization against known drug targets, followed by the drafting of an inventory disclosure. Another important aspect of this course will be inclusion of guest lectures by industrial leaders who describe examples of success stories of drug development. Offered as BIOL 528, PHOL 528, PHRM 528, and SYBB 528.

PHRM 555. Current Proteomics and Bioinformatics. 3 Units.
This course is designed for graduate students across the university who wish to acquire a better understanding of fundamental concepts of proteomics and related bioinformatics as well as hands-on experience with techniques used in current proteomics. Lectures will cover protein/peptide separation techniques, protein mass spectrometry, and biological applications which include quantitative proteomics, protein modification proteomics, interaction proteomics, structural genomics and structural proteomics. Also, it will cover experimental design, basic statistical concept and issues related to high-dimensional data from high-throughput technologies. Laboratory portion will involve practice on the separation of proteins by two-dimensional gel electrophoresis, molecular weight measurement of proteins by mass spectrometry, peptide structural characterization by tandem mass spectrometry. It will also include bioinformatics tools for protein identification and protein-protein interaction networks. The instructors' research topics will also be discussed. Recommended preparation: CBIO 453, CBIO 455, and PQHS 431. Offered as PHRM 555 and SYBB 555.
PHRM 600. Preparation for Qualifying Exam. 1 Unit.
Students pursuing the M.S. or Ph.D. degrees in Pharmacology are required to prepare systematically for the comprehensive qualifying exam by reviewing the concepts of cellular and molecular biology and pharmacology. The qualifier is comprised of a two-part written exam administered simultaneously to all eligible students. It is designed to evaluate their understanding of concepts presented in the various core courses. It also assesses their skills in critical reading of research articles and design of experiments. The division into two parts allows each student to receive feedback on deficient areas and work toward improvement on the second segment. Eligibility: Students may register for the exam when they have fulfilled two criteria: (a) Successful completion (grade B or better) in all of the Core Courses, and an overall GPA of 3.0 or better. (b) Satisfactory performance in all research rotations and consistent research effort in the thesis laboratory as documented formally by the Ph.D. mentor. No student on probation may sit for the Qualifying Exam (Prelim I). Prereq: CBIO 453, CBIO 455, PHRM 401 and PHRM 402.

PHRM 601. Independent Study and Research. 1 - 18 Units.
(Credit as arranged.)

PHRM 651. Thesis M.S.. 1 - 18 Units.
(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

PHRM 701. Dissertation Ph.D.. 1 - 9 Units.
(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

Bart Jarmusch (bbj2@case.edu), Manager of Graduate Education

The Department of Physiology and Biophysics at Case is a multidisciplinary department that takes great pride in its history of conducting research and training graduate students. The department includes 20 Primary and 33 Secondary faculty members, more than 25 post-doctoral associates, and over 300 full-time PhD, MD/PhD, and Master of Science degree students. The training programs are designed to provide a mentored training environment that maximizes faculty-student interaction.

As outlined below, the department offers PhD, MD/PhD, and Master of Science degrees. These programs are tailored to prepare students for successful careers in biomedical, pharmaceutical and industrial research. The department offers multiple graduate-level programs, each of which uses state-of-the-art molecular, cell biology, and biophysical approaches to study physiological questions at a variety of different organizational levels. The goal is to provide an outstanding training opportunity. The major goals of the PhD and Tech Masters programs are to provide students with a broad knowledge base in organ systems and integrated physiology and in-depth expertise and outstanding research potential in the fields of cellular and molecular physiology and molecular and cellular biophysics. These goals are accomplished using a series of foundation and advanced topic courses, skill development courses, laboratory rotations and thesis research. The MS in Medical Physiology program is a post-baccalaureate program designed to help students prepare for admission to medical, dental, pharmacy, or veterinary school or for opportunities to work in the biotechnology industry.

Master's Degrees
The Master’s Program in Medical Physiology is designed for students with at least a bachelor’s degree in a chemical, physical, or biological science who are seeking advanced training in the physiological sciences, typically in preparation for admission to a professional medical program (e.g. Medical School, Dental School). The program is flexible in duration. It can take as little as 1 year (2 semesters, 9 months) to complete the required 30 credit hours of course work. However, students who wish to decompress the program can take 14 months or more to complete the requirements. Core courses and flexible electives allow students to focus their work in key areas of medical physiology, including Anatomy, Biochemistry, or Pharmacology. Graduates of the Medical Physiology Master’s Program also can pursue careers in basic and clinical research, research administration, teaching or management in academia, the pharmaceutical and biotechnology industries, private research institutions, government science or regulatory agencies, or medicine and health care.

MS Physiology - Type A Thesis Option
The Department of Physiology and Biophysics encourages research staff members to expand their critical research knowledge and skills by enrolling in our Master’s of Science in Physiology and Biophysics program. This Tech Master’s Program is specifically designed for staff working full time. Each employer has their own policy on allowing staff to take classes and enroll in graduate programs. CWRU’s policy is to allow staff, with their supervisor’s permission, to take up to 6 credit hours per term, with tuition being covered by CWRU as part of the employee benefits package. Staff are expected to make up the time they spend in class during the day, after hours.

**PhD in Physiology and Biophysics**

The Physiology and Biophysics Graduate Program provides comprehensive training leading to the PhD degree and MD/PhD degrees. This program has three tracks of study with emphasis on **Cell and Molecular Physiology, Structural Biology and Biophysics, and Organ Systems Physiology**. Admissions to the Physiology and Biophysics program may be obtained in the integrated Biomedical Sciences Training Program (http://casemed.case.edu/bstp/), by direct admission to the department or via the Medical Scientist Training Program (https://case.edu/medicine/admissions-programs/md-phd-program/).

To earn a PhD in Physiology and Biophysics, a student must complete rotations in at least three laboratories followed by selection of a research advisor, and complete Core and Elective coursework including responsible conduct of research as described in the course of study, below. Students who previously completed relevant coursework, for example with a MS, may petition to complete alternative courses. Each graduate program follows the overall regulations established and described in CWRU Graduate Studies and documented to the Regents of the State of Ohio. Completion of the PhD degree will require 36 hours of coursework (24 hours of which are graded) and 18 hours of PHOL 701 Dissertation Ph.D.

In addition, each student must successfully complete a qualifier examination for advancement to candidacy in the form of a short grant proposal with oral defense. The qualifier is generally completed in the summer after year two. During the dissertation period, students are expected to meet twice a year with the thesis committee, present seminars in the department, and fulfill journal publication requirements. At the completion of the program, successful defense of a doctoral dissertation is required. Throughout the doctoral training, students are expected to be enthusiastic participants in seminars, journal clubs, and research meetings in the lab and program.

Total Units in Sequence: 30-62

* After passing qualifying exam - full-time thesis research (701) - 18 total credit hours total
PHOL 401B. Physiology and Biophysics of Molecules and Cells. 2 Units. Physiology and Biophysics of Molecules and Cells is a graduate-level introductory course designed to provide the fundamental principles of modern physiology, protein science and structural biology, and to prepare students for advanced courses in the biomedical sciences. The course is divided into 2 blocks that can be taken independently as PHOL 401A or PHOL 401B (2 credit hrs each) during the Spring semester of each year. The first block will cover the structure and function of proteins and lipids, and the organization of cellular membranes. Topics will include primary, secondary, tertiary and quartenary protein structure and analysis, enzyme kinetics, allostery and cooperativity, lipid membrane organization and domain structure, and protein-protein and protein-lipid interactions. The second block will cover molecular pathways and processes critical for cellular homeostasis, function, and signaling. Topics will include molecular mechanisms of transport across biological membranes and cellular compartments, ionic basis of the resting membrane potential, action potential generation and propagation, osmosis and Gibbs-Donnan equilibria, regulation of voltage-gated channels and electrogenic transporters, cellular pH regulation, and the biophysics of epithelial transport. Format will be a combination of lecture, discussion-based problem sets, journal paper presentations, and computer lab exercises and demonstrations. Grading will be based on performance on two essay-type exams administered in the middle and at the end of each block (80%), and on class participation (20%).

PHOL 401C. Human Physiology: A Molecular Understanding of Organ System Function. 2 Units. This course is designed to integrate effectively with PHOL 401A and PHOL 401B, bringing the knowledge of the PhD students to the next level of integration and organ function. Structured on a 2 hour lecture per week, the course will cover the main molecular determinant and signaling components (e.g. neurotransmitters, hormones, adipokines, etc.) that regulate the integrated functioning of our main organ systems: respiratory, renal, cardiovascular, gastrointestinal, central and autonomic nervous systems, and integrated metabolism. The main topics relative to these 6 blocks will be covered in class through lectures, leaving ample opportunity for the students to engage in an interactive discussion with the instructor or among themselves throughout the lecture and at the end of it. Upon completion of each organ system, the students will elaborate on an assigned research article as part of their home-assignment. The intent of this 2-page essay is to assess the application of the knowledge provided in-class to the research topic discussed in the paper, and further integrate the student’s knowledge of the academic material discussed. The course will conclude with a final mini-essay exam. Prereq or Coreq: PHOL 401A and PHOL 401B.
PHOL 402A. Physiological Basis for Disease. 3 Units.
Physiological Basis for Disease is a graduate-level course designed to provide the fundamental physiology of a select group of organ systems and examples of how the molecular basis of disease affects physiological function of these systems. As such, PHOL402 will prepare students for future study in advanced biomedical sciences. The course is 3 credit hours and will be offered in the both the Fall (402A) and Spring (402B) semesters of each academic year. Course content of PHOL402 builds on knowledge learned in Medical Physiology– PHOL481 and PHOL482, and is designed to be taken concurrently or in series with Medical Physiology courses. Topics to be covered during the Fall (402A) semester include pathophysiology of cancer, and select diseases of the central nervous system, cardiovascular system, and urinary/renal system. Topics to be covered in the Spring (402B) semester include select diseases of the respiratory, gastrointestinal, and endocrine systems. The format will be a combination of lectures, in class discussions, and take-home problem sets to facilitate student-directed learning. Grading will be based on problem sets (30%) and weekly quizzes (70%). Due to the course format and large class size, this course is intended primarily for master’s students. PhD students that desire to take this course must first seek approval from their graduate program directors.

PHOL 402B. Physiological Basis for Disease. 3 Units.
Physiological Basis for Disease is a graduate-level course designed to provide the fundamental physiology of a select group of organ systems and examples of how the molecular basis of disease affects physiological function of these systems. As such, PHOL402 will prepare students for future study in advanced biomedical sciences. The course is 3 credit hours and will be offered in the both the Fall (402A) and Spring (402B) semesters of each academic year. Course content of PHOL402 builds on knowledge learned in Medical Physiology– PHOL481 and PHOL482, and is designed to be taken concurrently or in series with Medical Physiology courses. Topics to be covered during the Fall (402A) semester include pathophysiology of cancer, and select diseases of the central nervous system, cardiovascular system, and urinary/renal system. Topics to be covered in the Spring (402B) semester include select diseases of the respiratory, gastrointestinal, and endocrine systems. The format will be a combination of lectures, in class discussions, and take-home problem sets to facilitate student-directed learning. Grading will be based on problem sets (30%) and weekly quizzes (70%). Due to the course format and large class size, this course is intended primarily for master’s students. PhD students that desire to take this course must first seek approval from their graduate program directors.

PHOL 410. Basic Oxygen & Physiological Function. 3 Units.
On-line lecture only course which explores the significance and consequences of oxygen and oxygen metabolism in living organisms. Topics to be covered include transport by blood tissues, oxygen toxicity, and mitochondrial metabolism. Emphasis will be placed on mammalian physiology with special reference to brain oxidative metabolism and blood flow as well as whole body energy expenditure and oxidative stress related to disease. The course will cover additional spans of physiology, nutrition and anatomy. Offered as NTRN 410 and PHOL 410.

PHOL 412. Membrane Transport Processes. 3 Units.
Membranes and membrane transporters are absolutely required for all cells to take up nutrient, maintain membrane potential and efflux toxins. This course will consider the classification and structure of membrane transport proteins and channels, examine the common mechanistic features of all systems and the specific features of different classes of transporter. Understanding the physiological integration of transport processes into cell homeostasis and consideration of transporters and channels as drug targets will be a goal. Course format is minimal lecture, primarily student presentations of primary literature papers. Offered as PHOL 412 and PHRM 412. Prereq: CBIO 453 and CBIO 455.

PHOL 419. Applied Probability and Stochastic Processes for Biology. 3 Units.
Applications of probability and stochastic processes to biological systems. Mathematical topics will include: introduction to discrete and continuous probability spaces (including numerical generation of pseudo random samples from specified probability distributions), Markov processes in discrete and continuous time with discrete and continuous sample spaces, point processes including homogeneous and inhomogeneous Poisson processes and Markov chains on graphs, and diffusion processes including Brownian motion and the Ornstein-Uhlenbeck process. Biological topics will be determined by the interests of the students and the instructor. Likely topics include: stochastic ion channels, molecular motors and stochastic ratchets, actin and tubulin polymerization, random walk models for neural spike trains, bacterial chemotaxis, signaling and genetic regulatory networks, and stochastic predator-prey dynamics. The emphasis will be on practical simulation and analysis of stochastic phenomena in biological systems. Numerical methods will be developed using a combination of MATLAB, the R statistical package, MCell, and/or URDME, at the discretion of the instructor. Student projects will comprise a major part of the course. Offered as BIOL 319, ECSE 319, MATH 319, SYBB 319, BIOL 419, EBME 419, MATH 419, PHOL 419, and SYBB 419.

PHOL 430. Advanced Methods in Structural Biology. 1 - 6 Units.
The course is designed for graduate students who will be focusing on one or more methods of structural biology in their thesis project. This course is divided into 3-6 sections (depending on demand). The topics offered will include X-ray crystallography, nuclear magnetic resonance spectroscopy, optical spectroscopy, mass spectrometry, cryo-electron microscopy, and computational and design methods. Students can select one or more modules. Modules will be scheduled so that students can take all the offered modules in one semester. Each section is given in 5 weeks and is worth 1 credit. Each section covers one area of structural biology at an advanced level such that the student is prepared for graduate level research in that topic.

PHOL 451. Independent Study. 1 - 18 Units.
Guided program of study using physiology textbooks, research reviews, and original research articles. An independent laboratory research project may also be included.
PHOL 456. Conversations on Protein Structure and Function. 2 Units.
The goal of this course is to supplement the short and basic presentation of Proteins in C3MB by lectures and discussions for students with backgrounds in physical-chemical sciences or students who already have a good basic background in protein science. The course presents an overview of Protein structure/function. Following an introduction to the principles of protein structure, the physical basis of protein folding and stability, and a brief overview of structural and bioinformatics approaches to protein analysis is presented. Typically two lecture/discussion style presentations are followed by a student lead journal club on recent high profile papers. The way the Journal club is done is that one student presents a paper (background and figures in powerpoint slides) while presentation of the main figures is shared between the class. Papers and Figures will be assigned by instructor. Typically two papers will be presented per session. Offered as PHOL 456 and BIOL 457.

PHOL 466. Cell Signaling. 3 Units.
This is an advanced lecture/journal/discussion format course that covers cell signaling mechanisms. Included are discussions of neurotransmitter-gated ion channels, growth factor receptor kinases, cytokine receptors, G protein-coupled receptors, steroid receptors, heterotrimeric G proteins, ras family GTPases, second messenger cascades, protein kinase cascades, second messenger regulation of transcription factors, microtubule-based motility, actin/myosin-based motility, signals for regulation of cell cycle, signals for regulation of apoptosis. Offered as CLBY 466, PHOL 466 and PHRM 466.

PHOL 467. Topics in Evolutionary Biology. 3 Units.
The focus for this course on a special topic of interest in evolutionary biology will vary from one offering to the next. Examples of possible topics include theories of speciation, the evolution of language, the evolution of sex, evolution and biodiversity, molecular evolution. ANAT/ANTH/EEPS/PHIL/PHOL 467/BIOL 468 will require a longer, more sophisticated term paper, and additional class presentation. Offered as ANTH 367, BIOL 368, EEPS 367, PHIL 367, ANAT 467, ANTH 467, BIOL 468, EEPS 467, PHIL 467 and PHOL 467.

PHOL 475. Protein Biophysics. 3 Units.
This course focuses on in-depth understanding of the molecular biophysics of proteins. Structural, thermodynamic and kinetic aspects of protein function and structure-function relationships will be considered at the advanced conceptual level. The application of these theoretical frameworks will be illustrated with examples from the literature and integration of biophysical knowledge with description at the cellular and systems level. The format consists of lectures, problem sets, and student presentations. A special emphasis will be placed on discussion of original publications. Offered as BIOC 475, CHEM 475, PHOL 475, PHRM 475, and NEUR 475.

PHOL 477. Human Physiology. 4 Units.
This lecture/seminar experience is meant to enhance the student’s fundamental knowledge in human physiology with an emphasis on physiologic concepts in relationship to health, disease and illnesses. The course will provide students with an understanding of the function, regulation and integration of the major organ systems. Offered as PAST 477 and PHOL 477.

PHOL 478. Lifestyle Medicine. 3 Units.
While the current acute care model of medicine focuses on disease and treatment of individual organ systems by specialists, 50-60% of the public use complementary and alternative medicine (CAM), which focuses on prevention rather than disease. In CAM, damage caused by Western diets is avoided with low fat, vegetarian, or vegan diets, and with herbs and supplements. Damage mediated by emotional responses to stress is counteracted with relaxation practices such as yoga, meditation or hypnosis. In support of CAM, NIH-funded research performed over the past decade has shown that 70-90% of chronic diseases such as obesity, atherosclerosis, and cancer result from lifestyle. Moreover, mechanisms of lifestyle-induced disease as well as mechanisms by which these can be prevented or reversed by CAM practices have been described. This course examines interrelationships between lifestyle, health and disease and influences of CAM practices in terms of physiological health. Topics include evidence that Western diets, chronic emotional stress resulting from pervasive environmental, societal, workplace, financial, or relationship issues, and changes in circadian rhythms resulting from behaviors such as not getting enough sleep or working night-shifts facilitate disease by inducing cellular events that include epigenetic modification, changes in gene expression, and decreased telomere length. Mechanisms by which CAM practices prevent or reverse these lifestyle-mediated changes are also covered. In addition, the course considers the broader issue of how economic and political pressures are forcing rapid changes in healthcare and the influence that lifestyle-based approaches is likely to have on evolving delivery models, healthcare costs, and public health policies. The course is presented over a period of 8 weeks during the summer session. It is heavily discussion-based delivered in the form of slide presentations, discussions of the literature, video segments, and experiential relaxation instructions. Grading is based on class discussion and a written discussion paper.

PHOL 479. Clinical Reasoning: Applied Medical Physiology. 3 Units.
Physicians, detectives, scientists and mechanics all use deductive reasoning with multiple hypotheses to solve problems. The primary objective of this course is to help students apply their knowledge of medical physiology to solving clinical problems. The second objective is to develop an overall view of the clinical reasoning process as a problem-solving method. This will be done primarily through problem-based case studies of patients with cardiovascular, pulmonary and renal disease. Case studies will be supplemented by video presentations of patient history and physical exam, and student-led presentations. Prereq: PHOL 482 and PHOL 484.
PHOL 480. Physiology of Organ Systems. 4 Units.
Our intent is to expand the course from the current 3 hours per week (1.5 hour on Monday and Wednesday) to 4 hours per week (1.5 hours on Monday and Wednesday plus 1 hour on Friday). Muscle structure and function, Myasthenia gravis and Sarcopenia; Central Nervous System, (Synaptic Transmission, Sensory System, Autonomic Nervous System, CNS circuits, Motor System, Neurodegenerative Diseases, Paraplegia and Nerve Compression); Cardiovascular Physiology (Regulation of Pressure and flow; Circulation, Cardiac Cycle, Electrophysiology, Cardiac Function, Control of Cardiovascular function, Hypertension); Hemorrhage, Cardiac Hypertrophy and Fibrillation; Respiration Physiology (Gas Transport and Exchange, Control of Breathing, Acid/base regulation, Cor Pulmonaris and Cystic Fibrosis, Sleeping apnea and Emphysema); Renal Physiology (Glomerular Filtration, Tubular Function/transport, Glomerulonephritis, Tubulopathies); Gastro-Intestinal Physiology (Gastric motility, gastric function, pancreas and bile function, digestion and absorption, Liver Physiology; Pancreatitis, Liver Disease and cirrhosis); Endocrine Physiology (Thyroid, Adrenal glands, endocrine pancreas, Parathyroid, calcium sensing receptor, Cushioning and diabetes, Reproductive hormones, ecampsia); Integrative Physiology (Response to exercise, fasting and feeding, aging). For all the classes, the students will receive a series of learning objectives by the instructor to help the students address and focus their attention to the key aspects of the organ physiology (and physiopathology). The evaluation of the students will continue to be based upon the students' participation in class (60% of the grade) complemented by a mid-term and a final exam (each one accounting for 20% of the final grade). Offered as BIOL 480 and PHOL 480.

PHOL 481. Medical Physiology I. 6 Units.
Physiology is the dynamic study of life. It describes the vital functions of living organisms and their organs, cells, and molecules. For some, physiology is the function of the whole person. For many practicing clinicians, physiology is the function of an individual organ system. For others, physiology may focus on the cellular principles that are common to the function of all organs and tissues. Medical physiology deals with how the human body functions, which depends on how the individual organ systems function, which in turn depends on the interactions among subcellular organelles and countless molecules. Thus, it requires an integrated understanding of events at the level of molecules, cells, and organs. Medical Physiology I is a lecture course (3, 2 hr. lectures/week) taught by clinical and basic science faculty. The 2 hour lecture will be given Monday and Wednesday plus 1 hour on Friday. Muscle structure and function, Myasthenia gravis and Sarcopenia; Central Nervous System, (Synaptic Transmission, Sensory System, Autonomic Nervous System, CNS circuits, Motor System, Neurodegenerative Diseases, Paraplegia and Nerve Compression); Cardiovascular Physiology (Regulation of Pressure and flow; Circulation, Cardiac Cycle, Electrophysiology, Cardiac Function, Control of Cardiovascular function, Hypertension); Hemorrhage, Cardiac Hypertrophy and Fibrillation; Respiration Physiology (Gas Transport and Exchange, Control of Breathing, Acid/base regulation, Cor Pulmonaris and Cystic Fibrosis, Sleeping apnea and Emphysema); Renal Physiology (Glomerular Filtration, Tubular Function/transport, Glomerulonephritis, Tubulopathies); Gastro-Intestinal Physiology (Gastric motility, gastric function, pancreas and bile function, digestion and absorption, Liver Physiology; Pancreatitis, Liver Disease and cirrhosis); Endocrine Physiology (Thyroid, Adrenal glands, endocrine pancreas, Parathyroid, calcium sensing receptor, Cushioning and diabetes, Reproductive hormones, ecampsia); Integrative Physiology (Response to exercise, fasting and feeding, aging). For all the classes, the students will receive a series of learning objectives by the instructor to help the students address and focus their attention to the key aspects of the organ physiology (and physiopathology). The evaluation of the students will continue to be based upon the students' participation in class (60% of the grade) complemented by a mid-term and a final exam (each one accounting for 20% of the final grade). Offered as BIOL 480 and PHOL 480.

PHOL 482. Medical Physiology II. 6 Units.
Physiology is the dynamic study of life. It describes the vital functions of living organisms and their organs, cells, and molecules. For some, physiology is the function of the whole person. For many practicing clinicians, physiology is the function of an individual organ system. For others, physiology may focus on the cellular principles that are common to the function of all organs and tissues. Medical physiology deals with how the human body functions, which depends on how the individual organ systems function, which in turn depends on the interactions among subcellular organelles and countless molecules. Thus, it requires an integrated understanding of events at the level of molecules, cells, and organs. Medical Physiology II is a lecture course (3, 2 hr. lectures/week). It is the second of a two-part, comprehensive survey of physiology that is divided into five blocks: Block 5 covers the physiology of the urinary system; Block 6 covers the cardiovascular system; Block 7 covers the respiratory system; Block 8 covers reproduction; and Block 9 covers the physiology of everyday life. Grading in the course will be based on performance on multiple choice/short essay examinations administered at the end of each block with each examination weighted according to the number of lectures contained in that block.

PHOL 483. Translational Physiology I. 3 Units.
Physiology is the dynamic study of life, describing the vital functions of living organisms and their organs, cells, and molecules. For some clinicians, physiology is the function of an individual organ system. For others, it focuses on the cellular principles that are common to the function of all organs and tissues. Medical physiology deals with how the human body functions, which depends on how the individual organ systems function, which depends on cellular function, which in turn depends on molecular interactions. Translational Physiology I will explore examples of how the latest basic research in physiology and biophysics is being applied to the treatment of human disease. For example, while the students are studying the basic principles of cardiovascular physiology, they will also be investigating how these principles are being applied to treat/cure human cardiovascular disorders such as congestive heart failure, coronary artery disease, etc. Translational Physiology I is a lecture course (1, 2hr lecture/week, and 1, 1hr lecture/week) taught by clinical and basic science faculty. The 2 hour lecture will be given primarily by clinical faculty and is focused on applying physiological principles to clinical cases of pathophysiology. The 1 hour lecture will be given primarily by basic science faculty and will expose students to the process of translating fundamental basic science research to the clinic, that is bench-to-bedside. It is the first of a two-part course that follows the topics being simultaneously covered in the Medical Physiology I course. It is divided into 4 blocks: Block 1 covers the physiology of cells and molecules, signal transduction, basic electrophysiology, and muscle physiology; Block 2 covers the nervous system; Block 3 covers the cardiovascular system, and; Block 4 covers the respiratory system. Grading in the course will be based on performance on multiple choice examinations administered at the end of each block with each examination weighted according to the number of lectures contained in the block.
PHOL 484. Translational Physiology II. 3 Units.
Physiology is the dynamic study of life, describing the vital functions of living organisms and their organs, cells, and molecules. For some clinicians, physiology is the function of an individual organ system. For others, it focuses on the cellular principles that are common to the function of all organs and tissues. Medical physiology deals with how the human body functions, which depends on how the individual organ systems function, which depends on how the component cells function, which in turn depends on the interactions among subcellular organelles and countless molecules. Translational Physiology II will explore examples of how the latest basic research in physiology and biophysics is being applied to the treatment of human disease. For example, while the students are studying the basic physiology of the urinary system, they will also be investigating how these principles are being applied to treat/cure human kidney disorders such as renal failure, high blood pressure, glomerular disease, etc. Translational Physiology II is a lecture course (1, 2hr lecture/week, and 1, 1hr lecture/week) taught by clinical and basic science faculty. The 2 hour lecture will be given primarily by clinical faculty and is focused on applying physiological principles to clinical cases of pathophysiology. The 1 hour lecture will be given primarily by basic science faculty and will expose students to the process of translating fundamental basic science research to the clinic, that is bench-to-bedside. It is the second of a two-part course that focuses on the physiology of everyday life. Grading in the course will be based on performance on multiple choice examinations administered at the end of each block with each examination weighted according to the number of lectures contained in the block. Coreq: PHOL 482.

PHOL 485. Comparative & Evolutionary Physiology. 4 Units.
This course presents physiological concepts from the comparative and evolutionary perspective. Aspects of vertebrate and mammalian evolution will be considered with respect to the generation of adaptive advantages for organisms to changing environmental challenges since the Cambrian. Comparative physiological concepts include scaling, variations in nutrition, energy metabolism and work efficiency. The important influences of time, temperature, water and energy on mammalian biology will be presented. The course is a lecture based course that can be taken in person or on-line. Evaluations will be by regular quizzes, a mid-term and a final exam, all MCQ. Offered as PHOL 485 and ORIG 485.

PHOL 492. Clinical Reasoning II. 3 Units.
The objective of this course is to help students use principles of medical physiology to solve clinical problems. The second objective is to develop an overall view of clinical reasoning and improve critical thinking skills. The topics in Clinical Reasoning II are neurology, gastroenterology and endocrine/metabolic diseases. PHOL 479 Clinical Reasoning I, which covers cardiovascular, pulmonary and renal diseases, is not required. I anticipate that you will learn to: - Recognize physiologic mechanisms underlying abnormal physical findings, laboratory tests and imaging. - Use signs, symptoms, physical findings, laboratory tests and imaging to generate patient problem lists. - Develop and refine diagnostic hypotheses, i.e., differential diagnosis. - Understand the physiological basis of appropriate treatment plans. Prereq: PHOL 481.

PHOL 497A. Neurology Grand Rounds. 1 Unit.
This course is a weekly seminar series offered during the summer, fall, and spring. Seminars by the Department of Neurology at University Hospitals Case Medical Center. To earn a Passing grade in this course, students must attend at least 75% of the grand rounds offered by the Department of Neurology during the semester (signing in at the session) and submit to the course director within the week following the Grand Rounds, a one page report containing: 1) the name of the presenter and their professional affiliation; 2) the title of the presentation; 3) time and place of the Grand Rounds; 4) a one paragraph synopsis of the content of the presentation. Recommended Preparation: Pass the NBME Subject Exam in Physiology and Neurophysiology. Prereq: PHOL 481, PHOL 482, PHOL 483, PHOL 484, PHOL 498A and PHOL 498B.

PHOL 497B. Neurology Grand Rounds. 1 Unit.
This course is a weekly seminar series offered during the summer, fall, and spring. Seminars by the Department of Neurology at University Hospitals Case Medical Center. To earn a Passing grade in this course, students must attend at least 75% of the grand rounds offered by the Department of Neurology during the semester (signing in at the session) and submit to the course director within the week following the Grand Rounds, a one page report containing: 1) the name of the presenter and their professional affiliation; 2) the title of the presentation; 3) time and place of the Grand Rounds; 4) a one paragraph synopsis of the content of the presentation. Recommended Preparation: Pass the NBME Subject Exam in Physiology and Neurophysiology. Prereq: PHOL 481, PHOL 482, PHOL 483, PHOL 484, PHOL 498A and PHOL 498B.

PHOL 497C. Clinical Nephrology Conference. 1 Unit.
Clinical Nephrology Conference (CNC) at MetroHealth Medical Center, Dept. Medicine, Division of Nephrology. This course must be taken at least once and can be taken up to 2 times for a total of 2 credit hours. For the 15-week semester, students are responsible for attending and reporting on 12 of the scheduled CNC. For each CNC, the student must submit to the course director (Dr. Liedtke) within the week following the CNC, a one page report stating: a. The name of the presenter and their professional affiliation b. The title of the presentation c. Time and place of the CNC d. A one paragraph synopsis of the presentation. The course director is responsible for assigning the grades for this course. Prior or concurrent CITI training must be completed. Prereq: PHOL 481, PHOL 482, PHOL 483, PHOL 484, PHOL 498A and PHOL 498B.

PHOL 497D. Clinical Nephrology Conference. 1 Unit.
Clinical Nephrology Conference (CNC) at MetroHealth Medical Center, Dept. Medicine, Division of Nephrology. This course must be taken at least once and can be taken up to 2 times for a total of 2 credit hours. For the 15-week semester, students are responsible for attending and reporting on 12 of the scheduled CNC. For each CNC, the student must submit to the course director (Dr. Liedtke) within the week following the CNC, a one page report stating: a. The name of the presenter and their professional affiliation b. The title of the presentation c. Time and place of the CNC d. A one paragraph synopsis of the presentation. The course director is responsible for assigning the grades for this course. Prior or concurrent CITI training must be completed. Prereq: PHOL 481, PHOL 482, PHOL 483, PHOL 484, PHOL 498A and PHOL 498B.
PHOL 497E. Pulmonary Grand Rounds. 1 Unit.
Students are responsible for attending 10 of 15 sessions for that semester. Pulmonary Science Grand Rounds (adult pulmonology) and Pediatric Basic Science Seminar Series are convened Friday mornings at UH Case Medical Center at 8:00 am and 9:00 am, respectively. For each session attended, the student must submit to the course director (Dr. Liedtke) within the week following the session, a one page report stating: a. name of the presenter and their professional affiliation, b. title of the presentation, c. time and place of the session, and d. one paragraph synopsis of the presentation. The course director is responsible for assigning the grades for this course. Prereq: PHOL 481, PHOL 482, PHOL 483, PHOL 484, PHOL 498A, and PHOL 498B.

PHOL 497F. Pulmonary Grand Rounds. 1 Unit.
This course must be taken once and can be taken up to 2 times for a total of 2 credit hours. Students are responsible for attending 10 of 15 sessions for that semester. Pulmonary Science Grand Rounds (adult pulmonology) and Pediatric Basic Science Seminar Series are convened Friday mornings at UH Case Medical Center at 8:00 am and 9:00 am, respectively. For each session attended, the student must submit to the course director (Dr. Liedtke) within the week following the session, a one page report stating: a. name of the presenter and their professional affiliation, b. title of the presentation, c. time and place of the session, and d. one paragraph synopsis of the presentation. The course director is responsible for assigning the grades for this course. Prereq: PHOL 481, PHOL 482, PHOL 483, PHOL 484, PHOL 498A, and PHOL 498B.

PHOL 498A. Physiology and Biophysics Departmental Seminar. 1 Unit.
Weekly one-hour reviews by invited speakers of their research. Students present literature reviews or summaries of their research.

PHOL 498B. Physiology Seminar B (Spring Semester). 1 Unit.
Weekly one-hour reviews by invited speakers of their research. Offered spring semester.

PHOL 498C. Physiology and Biophysics Department Seminar for Medical Physiology Students. 1 Unit.
Weekly one-hour research reviews offered by various speakers, upon invitation. Students will present literature reviews or summaries of their own research throughout the course. Graded will be determined by quizzes based on the research presented.

PHOL 498D. Physiology MSMP Seminar B (Spring Semester). 1 Unit.
Weekly one-hour research reviews offered by various speakers, upon invitation. Students will present literature reviews or summaries of their own research throughout the course. Grades will be determined by quizzes based on the research presented. Offered spring semester.

PHOL 505. Laboratory Research Rotation. 1 Unit.
Six week experience in a selected faculty research laboratory designed to introduce the student to all aspects of modern laboratory research including the design, execution and analysis of original experimental work. Recommended preparation: Consent of instructor and scheduled laboratory.

PHOL 513. Structural Journal Club. 1 Unit.
Current topics of interest in structural biology, and protein biophysics. Offered as PHOL 513 and PHRM 513.

PHOL 514. Cardiovascular Physiology. 3 Units.
The goal of this course is to provide the student with a solid foundation in cardiovascular physiology and pathophysiology. The course will begin by providing a solid foundation in the structure, phenotype and function of cardiac and vascular muscle. In addition, electrophysiology and metabolism will be addressed. Both basic physiology and more advanced topics, such as pathophysiology, will be covered using a journal club format. (Twice weekly; 1.5 hrs/class.) Student participation is required.

PHOL 519. Cardio-Respiratory Physiology. 3 Units.
This course is designed to integrate systemic, cellular and molecular aspects of cardio-respiratory systems in physiological and pathophysiological states. The course requires prior knowledge of basic physiology of the cardiovascular systems. Extensive student participation is required. Instructors provide a brief overview of the topic followed by presentation and critical appraisal of recent scientific literature by students.

PHOL 528. Contemporary Approaches to Drug Discovery. 3 Units.
This course is designed to teach the students how lead compounds are discovered, optimized, and processed through clinical trials for FDA approval. Topics will include: medicinal chemistry, parallel synthesis, drug delivery and devices, drug administration and pharmacokinetics, and clinical trials. A special emphasis will be placed on describing how structural biology is used for in silico screening and lead optimization. This component will include hands-on experience in using sophisticated drug discovery software to conduct in silico screening and the development of drug libraries. Each student will conduct a course project involving in silico screening and lead optimization against known drug targets, followed by the drafting of an inventory disclosure. Another important aspect of this course will be inclusion of guest lectures by industrial leaders who describe examples of success stories of drug development. Offered as BIOC 528, PHOL 528, PHRM 528, and SYBB 528.

PHOL 530. Technology in Physiological Sciences. 3 Units.
This lecture/discussion/journal course focuses on techniques in the physiological sciences. Topics include spectroscopy, microscopy, and electrophysiology. The theory and practice are covered with an emphasis on examples taken from the scientific literature.

PHOL 537. Microscopy-Principles and Applications. 3 Units.
This course provides an introduction to various types of light microscopy, digital and video imaging techniques, and their applications to biological and biomedical sciences via lectures and hands-on experience. Topics covered include geometrical and physical optics; brightfield, darkfield, phase contrast, DIC, fluorescence and confocal microscopes; and digital image processing. Offered as GENE 537, MBIO 537, and PHOL 537.

PHOL 601. Research. 1 - 18 Units.
Cellular physiology laboratory research activities that are based on faculty and student interests.

PHOL 610. Oxygen and Physiological Function. 1 Unit.
Lecture/discussion course which explores the significance and consequences of oxygen and oxygen metabolism in living organisms. Topics to be covered include oxygen transport by blood tissues, oxygen toxicity, and mitochondrial metabolism. Emphasis will be placed on mammalian physiology with special reference to brain oxidative metabolism and blood flow as well as whole body energy expenditure and oxidative stress related to disease. The course will cover additional spans of physiology, nutrition and anatomy. Offered as ANAT 610, NTRN 610, and PHOL 610.
PHOL 614. Sleep Physiology - Neurobiology of Sleep/Wake. 3 Units.
Participants in this course will gain an understanding of the neural mechanisms contributing to the states of sleep and wakefulness. Contemporary theories regarding why humans need to sleep will be reviewed. We will also review how perturbations within specific neurotransmitter systems become manifest as sleep related disorders and the pharmacological interventions used to normalize activity within those neural pathways. Prereq: PHOL 481, PHOL 482, or requisites not met permission.

PHOL 620A. Clinical Observer: Neurology Service. 2 Units.
This course is a 2 week intensive experience offered summer, fall, and spring semesters on a schedule set by the Department of Neurology at University Hospitals Case Medical Center. Students are expected to be present and observe at all of the times set forth by the house staff and attending, generally a 40 hour week minimum. The Objective of the course is to provide the students with the experience of observing patient care provided by 3rd year medical students on a clinical rotation under direct supervision by house staff and attending on an active acute Neurology Service. The PGY-2 Neurology Resident and PGY-3 Chief Resident will always be available for immediate supervision. Students round as Clinical Observers with the CWRU medical students according to their daily schedule. They will learn the basics of neurological history-taking, neurological examination, neurodiagnostic studies, and neurological therapeutics. Didactic sessions covering a wide range of neurologic and neurosurgical topics are covered by faculty members from both departments. The lectures cover the gamut of neurological and neurosurgical disease processes and treatments. Neurosurgery lectures include such topics as cerebrovascular disease, brain tumors, hydrocephalus, spinal disorders, and head trauma as well as doctor-patient communication. Unlike the medical students on the rotation, a Clinical Observer will only observe procedures and will not actively take part in any health care. He/she will act strictly as an observer, but will act as a physiological consultant to the team responsible for providing basic science input to the clinical cases. Prereq: PHOL 481, PHOL 482, PHOL 483, PHOL 484, PHOL 498A, and PHOL 498B.

PHOL 620B. Clinical Observer: Stroke Service. 2 Units.
This course is a 2 week intensive experience offered summer, fall, and spring semesters on a schedule set by the Department of Neurology at University Hospitals Case Medical Center. Students are expected to be present and observe at all of the times set forth by the house staff and attending, generally a 40 hour week minimum. The Objective of the course is to provide the students with the experience of observing patient care provided by 3rd year medical students on a clinical rotation under direct supervision by house staff and attending on an active acute Neurology Service. The PGY-2 Neurology Resident and PGY-3 Chief Resident will always be available for immediate supervision. Students round as Clinical Observers with the CWRU medical students according to their daily schedule. They will learn the basics of neurological history-taking, neurological examination, neurodiagnostic studies, and neurological therapeutics. Didactic sessions covering a wide range of neurologic and neurosurgical topics are covered by faculty members from both departments. The lectures cover the gamut of neurological and neurosurgical disease processes and treatments. Neurosurgery lectures include such topics as cerebrovascular disease, brain tumors, hydrocephalus, spinal disorders, and head trauma as well as doctor-patient communication. Unlike the medical students on the rotation, a Clinical Observer will only observe procedures and will not actively take part in any health care. He/she will act strictly as an observer, but will act as a physiological consultant to the team responsible for providing basic science input to the clinical cases. Prereq: PHOL 481, PHOL 482, PHOL 483, PHOL 484, PHOL 498A, and PHOL 498B.

PHOL 620C. Clinical Observer: Epilepsy Service. 2 Units.
This course is a 2 week intensive experience offered summer, fall, and spring semesters on a schedule set by the Department of Neurology at University Hospitals Case Medical Center. Students are expected to be present and observe at all of the times set forth by the house staff and attending, generally a 40 hour week minimum. The Objective of the course is to provide the students with the experience of observing patient care provided by 3rd year medical students on a clinical rotation under direct supervision by house staff and attending on an active acute Neurology Service. The PGY-2 Neurology Resident and PGY-3 Chief Resident will always be available for immediate supervision. Students round as Clinical Observers with the CWRU medical students according to their daily schedule. They will learn the basics of neurological history-taking, neurological examination, neurodiagnostic studies, and neurological therapeutics. Didactic sessions covering a wide range of neurologic and neurosurgical topics are covered by faculty members from both departments. The lectures cover the gamut of neurological and neurosurgical disease processes and treatments. Neurosurgery lectures include such topics as cerebrovascular disease, brain tumors, hydrocephalus, spinal disorders, and head trauma as well as doctor-patient communication. Unlike the medical students on the rotation, a Clinical Observer will only observe procedures and will not actively take part in any health care. He/she will act strictly as an observer, but will act as a physiological consultant to the team responsible for providing basic science input to the clinical cases. Prereq: PHOL 481, PHOL 482, PHOL 483, PHOL 484, PHOL 498A, and PHOL 498B. Coreq: PHOL 620A, PHOL 620B, or PHOL 620C.
PHOL 621. Clinical Nephrology Observer. 4 Units.
This course is a total of 4 week intensive experience offered on the School of Medicine elective schedule. Students will round with fellow and Medicine residents rotating during the elective on a daily basis starting with morning work rounds. Attending rounds generally begin in the afternoon. The student is restricted to a total of 15 hrs/week on clinical rounds. The student is expected to read appropriate or assigned text, journal and internet resources for necessary background reading; the time spent on these resources do not count toward the 15 hrs/week for rounds. The fellow or attending physician on the service will recommend to the course director (Dr. Liedtke) whether the student earned a Pass or Fail in the course based upon attendance, professional demeanor, active participation, and knowledge of the area. The course director is responsible for assigning the grades for this course. CITI training must be completed prior to enrollment. Prereq: PHOL 481, PHOL 482, PHOL 483, PHOL 484, PHOL 498A, PHOL 498B.

PHOL 622. Pediatric Pulmonology Observation. 2 Units.
Pulmonology Observation (must be approved). 2 credit hours. Location: University Hospital, Rainbow Babies & Children Hospital. This course is an intensive experience with 2 weeks offered on the elective schedule detailed in Appendix A and 1 week with attending physician reading PFTs. For 2 weeks, students will round with attending staff and medical students according to their daily schedule at Rainbow Babies & Children Hospital, Pulmonary Division, starting with morning work rounds. Attending rounds generally begin in the afternoon. The student will not have direct patient contact. The student is expected to read appropriate or assigned text, journal and internet resources for necessary background reading. Students will journal their daily experience. Students will write a paper relating basic physiology to a case identified during rounds; the Director (Dr. Liedtke) will grade the paper. The attending physician on the service will recommend to the course director (Dr. Liedtke) based upon attendance, professional demeanor, active participation, and knowledge of the area. The course director is responsible for assigning the grades for this course. Dr. Ross Meyers will serve as the student’s mentor and assign students to services. Prereq: PHOL 481, PHOL 482, PHOL 483, PHOL 484, PHOL 498A, and PHOL 498B.

PHOL 623. Adult Pulmonology Observation. 2 Units.
Adult Pulmonology AOC (must be approved). 2 credit hours. Location: University Hospital and VA Hospital. This course is an intensive experience with 2 weeks offered on the elective schedule detailed in Appendix A and 1 week with attending physician reading PFTs to evaluate 25 adult PFT, 6 exercise tests, and 6 methacholine challenges. For 2 weeks, students will round with attending staff and medical students according to their daily schedule at University Hospital starting with morning work rounds. Attending rounds generally begin in the afternoon. The student will not have direct patient contact. The student is expected to read appropriate or assigned text, journal and internet resources for necessary background reading. Students will journal their daily experience. Students will write a paper relating basic physiology to a case identified during rounds; the Director (Dr. Liedtke) will grade the paper. The attending physician on the service will recommend to the course director (Dr. Liedtke) based upon attendance, professional demeanor, active participation, and knowledge of the area. The course director is responsible for assigning the grades for this course. Dr. (TBN) will serve as the student’s mentor and assign students to services. Prereq: PHOL 481, PHOL 482, PHOL 483, PHOL 484, PHOL 498A, and PHOL 498B.

PHOL 631. Medical Physiology for Clinicians I. 1 - 15 Units.
This course is for MD students to get credit for medical school curriculum.

PHOL 632. Medical Physiology for Clinicians II. 0 - 15 Units.
This course is for MD students to get credit for medical school curriculum.

PHOL 633. Medical Physiology for Clinicians III. 0 - 15 Units.
This course is for MD students to get credit for medical school curriculum.

PHOL 634. Medical Physiology for Clinicians IV. 0 - 5 Units.
This course is for MD students to get credit for medical school curriculum.

PHOL 651. Thesis M.S.. 1 - 18 Units.
(Credit as arranged.)

PHOL 701. Dissertation Ph.D.. 1 - 9 Units.
(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

Population and Quantitative Health Sciences
Room W-G57, School of Medicine
http://pqhs.case.edu/
Phone: 216.368.5957
Jonathan Haines, PhD, Chair
jonathan.haines@case.edu

The Department of Population and Quantitative Health Sciences (http://epibiwww.case.edu) (formerly the Department of Epidemiology and Biostatistics) is a multidisciplinary department offering a range of educational programs rooted in Epidemiology, Biostatistics, Biomedical and Health Informatics, Clinical Research and Public Health. These programs include an undergraduate minor, 2 graduate certificates, 4 Master’s degrees, and 3 PhD degrees. Our graduates develop the knowledge, skills, and competencies needed to assume positions of leadership with the ultimate goal of advancing the public’s health. Through challenging coursework, independent and collaborative research opportunities, and internships students will develop a thorough understanding of the multiple determinants of population health outcomes and the research and analytic skills to answer today’s complex health problems.

The Department of Population and Quantitative Health Sciences offers the following degrees:

- Doctor of Philosophy (PhD)
  - Epidemiology & Biostatistics (p. 930)
  - Biomedical & Health Informatics (p. 929)
  - Clinical and Translational Science (p. 834)

- Master of Science (MS)
  - Biostatistics (p. 922)
  - Biomedical & Health Informatics (p. 928)
  - Clinical Research (p. 834)

- Master of Public Health (MPH) (p. 924)

- Graduate Certificate
  - Health Informatics (p. 931)
  - Clinical Research (http://bulletin.case.edu/schoolofmedicine/generalmedicalsciences/#globalhealthcertificatext)

- Undergraduate Minor
  - Public Health (p. 923)
Faculty and Research
Department faculty are nationally recognized and have more than $12 million in grants that support projects including HIV/TB research in Uganda, the search for genes that cause disease, cancer prevention and control, studies of interventions to change human behaviors that promote good health, design of clinical trials, studies to change high-risk behaviors related to AIDS, studies of public policies concerning the health of the elderly, and cost/benefit studies of medical interventions. Many research projects are performed in collaboration with the four affiliated hospitals; the University Hospitals, Metro Health, the Cleveland Clinic and the Louis Stokes Cleveland VA Medical Center. Faculty members work closely with our local health departments and serve on many community task forces. The department has offices in multiple locations at the university, (Wood Building and Wolstein Research Building) and in the Prevention Research Center for Healthy Neighborhoods (PRHCN). The department maintains two scientific computer centers comprised of 14 lab computers and over a dozen servers. Several very large national health care and demographic databases are stored on these servers and are used for faculty and student research and educational projects.

Master of Science in Biostatistics
Questions and Information:
Nickalaus Koziura, EdM

Master of Science - Biostatistics Program
Case Western Reserve University
10900 Euclid Avenue, W-G74
Cleveland, Ohio 44106-4945
216.368.5957 - phone
ms-biostatistics@case.edu

The Department of Population and Quantitative Health Sciences offers a revolutionary new, Master of Science (MS) Program in Biostatistics (and a BS/MS paired with any BS major), a discipline in high and exploding demand. The program can be done intensively in 11 months, or at a slower pace to finish in 1.5 or 2 years. The program was designed after extensive interviews were conducted with a wide array of potential employers to make sure our graduates will have the edge in a marketplace that has been rapidly changing, while also prepared to continue in a PhD program. More and more, biostatisticians are expected to have familiarity with the area of application. The CWRU MS Biostatistics program reflects these new needs. Students may elect to take the program part-time and complete it at their own pace.

Picture yourself saving and improving lives:

- Analyzing data from health studies to determine the best treatment
- Working with data from millions of patients
- Identifying genes linked to specific diseases
- Using data to develop instruments to measure latent constructs like psychosocial well-being

There are four tracks our students can choose from Biostatistics, Genomics & Bioinformatics, Health Care Analytics, and Social & Behavioral Science.

Students do internships at leading academic medical centers and research centers, at the National Institutes of Health and in industry. Graduates are going on to jobs at leading health institutions and getting funded PhD slots at top Universities.

Biostatistics Track:
The biostatistics-track students will receive a carefully designed balanced training in biostatistical theories, methods, and biomedical applications. This track student will gain mastery of basic probability theory and statistical inference, learn the methods of survival and longitudinal data analysis, and still have the flexibility to choose an elective from advanced courses. The didactic methods and theory, and hands-on analytical training would lead to either the pursuit of an advanced relevant degree and/or work as a master’s level biostatistician in various settings, e.g. academia, industry, hospitals, Pharmaceutical companies or government agencies.

Genomics and Bioinformatics Track:
Students will be trained to work in genomics and bioinformatics areas. In addition to the basics in biostatistics, they will learn the designs, methods, techniques, and tools that are commonly used in genetic epidemiology, statistical genomics, and bioinformatics research. Big Data methods of data mining and machine learning are also required in this track. Target job positions are analyst, statistician and bioinformatics in genomics or genetic epidemiology research team in a research institute/university, pharmaceutical or biotech company.

Track Leader:
Fredrick Schumacher
Email: frs2@case.edu
teams in community-practice / biomedical settings, with a focus on developmental, social/behavioral, cognitive, and/or mental health outcomes. This track is intended for students whose undergraduate work involved a major or minor in one of the social and behavioral sciences. It was created to serve the needs of social and behavioral science researchers who need research analysts trained in statistics, but with an understanding of their field and familiarity with qualitative and mixed methods as well. Target job positions are in academia, government, and research institutes.

**Track Leader:**

Arin Connell, PhD  
Email: arin.connell@case.edu  
Phone Number: 216.368.1550

**Required Track Courses (12 Credits)**

- PQHS 459 Longitudinal Data Analysis 3
- MPH 482 Qualitative and Mixed Methods in Public Health 3
- NURS 632 Advanced Statistics: Structural Equation Modeling 3
- PSCL 412 Measurement of Behavior 3

Graduates from accredited universities and colleges will be considered for admission to the department. All applicants must satisfy both CWRU and department requirements for graduate admission. The MS program in Biostatistics consists of a 16-credit core curriculum, plus a 12 credit major and a 3 credit internship or practicum.

**General Requirements**

Students must satisfy the requirements of the School of Graduate Studies as stated here, as well as those outlined by the Biostatistics program. The MS program in Biostatistics offers “Plan B”, as defined by the CWRU School of Graduate Studies. For Plan B, the student must successfully submit and pass their written internship/practicum project.

**Minor in Public Health**

Questions and Information:

Nickalaus Koziura, EdM  
Undergraduate Minor in Public Health  
Case Western Reserve University  
10900 Euclid Avenue, W-G74  
Cleveland, Ohio 44106-4945  
216.368.5957 - phone  
ph-minor@case.edu

The impact of public health and the need for the general public to know more is periodically highlighted by the impact of opioid addiction being the leading cause of death of Ohioans under age 55, obesity being the leading cause of death, and during crises such as epidemics and pandemics like Zika, Ebola, and Avian Flu. Education in public health is not only necessary for those entering the public health workforce, but is a critical complementary subject for all those considering a career in a health-related field.

The Undergraduate Minor in Public Health is a 15 credit program that exposes students to the field of public health. This minor is designed to equip students with the core concepts of Public Health and is highly collaborative with many departments to provide a robust option for
students who are pre-health or pursuing medical anthropology, medical sociology, mental health, global health, or nutrition and health promotion.

Courses for the Minor may be double-counted from Majors.

mph-info@case.edu

A Master of Public Health degree is designed to prepare students to address the broad mission of public health, defined as “enhancing health in human populations, through organized community effort,” utilizing education, research and community service. Public health practitioners are prepared to identify and assess the health needs of different populations, and then to plan, implement and evaluate programs to meet those needs. It is the task of the public health practitioner to protect and promote the wellness of humankind. The master of public health program prepares students to enhance health in human populations through organized community effort. Graduates are qualified to work in local and state health departments, universities and colleges, hospitals, ambulatory medical centers, non-profit organizations, and the insurance and pharmaceutical industries. The program seeks to attract a rich mix of students, including those pursuing degrees in medicine, nursing, dentistry, law, social work, anthropology, bioethics, management and other fields, as well as students holding undergraduate degrees.

Students in the MPH program can complete the program using one of two plans of study: Common Core and Intensive Research Pathway. The Common Core is the standard plan of study for MPH Students and the Intensive Research Pathway (IRP) is an alternative plan of study that allows students to gain exposure to more quantitative coursework. Students can complete any concentration regardless of their plan of study. Previous experience or education pertaining to public health may increase the student’s flexibility in course selection. Students may also enroll part-time and take courses over a three to five-year period.

Both the Common Core and the IRP address and meet all Foundational Knowledge and Core Competencies. Regardless of plan of study, all
MPH students will complete the same Applied Practical Experience and Integrated Learning Experience requirements. Below is a direct plan of study comparison between the Common Core and the IRP.

**Common Core Course Requirements:**

**Core required courses (18 credits)**

**Total Units**

| Total Units | 42    |

**Concentrations**

Currently, five different concentrations are offered by the CWRU MPH Program: **Population Health Research**, **Global Health**, **Health Policy & Management**, **Health Promotion & Disease Prevention**, and **Health Informatics**. Each concentration has two required courses (in addition to the core required courses), plus selective offerings to be combined for a total of 9 credit hours in concentration coursework. Students develop a Capstone project relevant to the concentration area to expand and apply the knowledge of the subject. Individual emphasis will differ from student to student within each concentration.

MPH students can also choose to expand the emphasis and depth of their program of study by electing to do a double concentration plan of study. For the double concentration, the student chooses two areas (two concentrations) of equal emphasis. The student's Capstone project must embrace and integrate both emphases. Students choosing to do the double concentration plan of study should also work closely with an advisor to ensure optimal course selection and foster the evolution of a successful Capstone project.

**Population Health Research Concentration**

Coordinator - Mendel Singer, PhD, MPH

**Concentration Competencies:**

- Construct a conceptual model and choose an appropriate existing data set, such as electronic health records, Medicare/Medicaid, Medical Expenditure Panel Survey, Health Care Utilization Project and Health and Retirement Study, to address a specific population health research question.
- Design and perform a study consisting of a retrospective analysis of an existing data set to address a population health research question of interest
- Design efficient computer programs for data management and manipulation, statistical analysis, as well as presentation using R (or another statistical programming language, such as SAS)
- Apply advanced statistical methods for analyzing count data, categorical data, and time to event data: specifically, Poisson regression models, multinomial and ordinal logistic regression models, and Cox proportional hazard models
- Perform predictive modeling employing different strategies for model selection (best subsets and shrinkage approaches), imputation of missing values, and splitting data into training and test data sets

Global Health Concentration
Coordinator - Peter Zimmerman, PhD

Concentration Competencies:
- Describe the relationships among agencies focused on colonial health, tropical medicine, international health and global health in a historical context
- Prioritize diseases of global health importance and their epidemiological context
- Apply methods for strengthening and focusing existing capacities and resources for health program sustainability and enhancement
- Contrast application of technology to impact priority diseases with addressing the underlying social and economic determinants of global health linked to health care delivery systems
- Apply the fundamental international principles and standards for the protection of human research subjects in diverse cultural settings

Required Concentration Courses (6 Credits)
INTH 401 Fundamentals of Global Health 3
MPHP 484 Global Health Epidemiology 3

Concentration Electives (3 Credits)
MPHP 510 Health Disparities 3
ANTH 461 Urban Health 3
ANTH 480 Medical Anthropology and Global Health I 3
ANTH 511 Seminar in Anthropology and Global Health: Topics 3
LAWS 4101 International Law 3
LAWS 5123 Trade Law 3
MGMT 460 Managing in a Global Economy 3

Health Care Policy & Management Concentration
Coordinator - Kate Nagel, DrPH

Concentration Competencies:
- Apply the principles of program development, planning, budgeting, and resource management in organizational or community initiatives
- Describe how policy impacts healthcare delivery and outcomes
- Apply a continuous quality and performance improvement framework to address organizational coordination and performance
- Identify methods for decision making using evidence-based, systems thinking, and data-driven approaches to health policy and management
- Identify how access, quality, and cost are influenced by organizational or financial structures

Required Concentration Course (6 Credits)
MPHP 468 The Continual Improvement of Healthcare: An Interdisciplinary Course 3
MPHP 421 Health Economics and Strategy 3
OR
MPHP 456 Health Policy and Management Decisions 3

Concentration Elective (3 Credits)
BETH 417 Introduction to Public Health Ethics 3
HSMC 420 Health Finance 3

LAWS 5205 Public Health Law 2
MPHP 433 Community Interventions and Program Evaluation 3
MPHP 467 Comparative and Cost Effectiveness Research 1
MPHP 475 Management of Disasters Due to Nature, War, or Terror 3
MPHP 510 Health Disparities 3
MPHP 532 Health Care Information Systems 3
POSC 483 Health Policy and Politics in the United States 3

Health Informatics Concentration
Coordinator - Siran Koroukian, PhD

Concentration Competencies:
- Understand the fundamentals of using biomedical ontologies for integration of biomedical and health data
- Differentiate between standard health data exchange formats and vocabularies
- Explain how clinical data originating from different systems are collected and coded and how they are normalized, aggregated, and analyzed
- Describe how biomedical terminological systems are used in natural language processing workflow for unstructured biomedical text
- Describe the ethical, regulatory, managerial, financial, and practical aspects of data security

Required Concentration Courses (6 Credits)
PQHS 416 Introduction to Computing in Biomedical Health Informatics 3
IIME 473 Fundamentals of Clinical Information Systems 3

Concentration Elective (3 Credits)
HSMC 432 Health Care Information Systems 3
HSMC 446 Models of Health Care Systems 1.5
HSMC 457 Health Decision Making & Analytics 3
MPHP 432 Statistical Methods II 3
NUND 510 Application of Health Information Technology and Systems 1
PQHS 515 Secondary Analysis of Large Health Care Data Bases 3

Health Promotion & Disease Prevention Concentration
Coordinator - Erika Trapl, PhD

Concentration Competencies:
- Assess needs for health interventions for the general public as well as at-risk populations
- Systematically evaluate health promotion strategies across typologies of evidence
- Apply system complexity concepts in the context of nested individuals, social networks, organizations, and communities (i.e., systems nested within systems) in the analysis of public health problems and solutions

Required Concentration Course (6 Credits)
MPHP 468 The Continual Improvement of Healthcare: An Interdisciplinary Course 3
MPHP 421 Health Economics and Strategy 3
OR
MPHP 456 Health Policy and Management Decisions 3

Concentration Elective (3 Credits)
BETH 417 Introduction to Public Health Ethics 3
HSMC 420 Health Finance 3
• Develop health education/health promotion strategies that create an understanding of and respect for the importance of culture in practice and policy

• Apply social and behavioral theory and planning models and evidence-based health promotion strategies for a variety of populations in the development of a health education/health promotion plan

**Dual Degree Options**

Because of the breadth of the field of public health, the MPH Program is an ideal degree to integrate with other professional schools and graduate programs at Case. University leadership has recognized collaboration as one of the priorities for the future of the university and has approved 11 MPH dual degree programs. They are:

- JD/MPH (School of Law)
- MA or PhD/MPH (Department of Anthropology, School of Graduate Studies)
- MA/MPH (Department of Bioethics, School of Medicine)
- MBA/MPH (Weatherhead School of Management)
- MD/MPH (School of Medicine)
- MS/MPH (Department of Nutrition)
- MSN/MPH (School of Nursing)
- MSSA/MPH (Social Administration, Mandel School of Applied Social Sciences)
- DMD/MPH (School of Dentistry)
- BA/MPH (Integrated Graduate Studies (IGS) Program)
- MSC-HC (Weatherhead School of Management)

Generally, dual degree students complete both degrees by adding one year of study to the partner degree. For example, an MD student could add one year to the four-year MD Program to complete his/her MD/MPH dual degree in five years. In addition to the requirements for the partner degree program, all dual degree students will complete 27 credits of core MPH requirements (18 core credits plus 9 Culminating Experience credits). Of the remaining 15 credits, it is anticipated that 9 will be selected from courses taught by the Department of Population and Quantitative Health Sciences. The remaining 6 credits can be selected from the list of approved courses in the partner program. Students wishing to take courses not previously approved in the dual degree plan may petition to do so in writing to both partner programs. In most cases, it will be assumed that dual degree students will adopt an area of concentration specific to their shared degree area.

Dual degree students should have academic advisors from both the MPH Program and the partner program faculty. Advisors of dual degree students are encouraged to develop dialogues with their partner advisors and collaborate on students’ programs of study. This dialogue should be accomplished by a minimum of one annual group meeting of both advisors with the student to be arranged by the student. During the initial meeting, before the end of the student’s first semester, a Planned Program of Study (PPOS) is developed. The PPOS can be revised later, also with the approval of both advisors. Academic performance issues, or any other issues, are presented by the advisors to the MPH Dual Degree Partners Committee for final disposition. The MPH Dual Degree Partners Committee will adjudicate any difference in opinion between advisors.

The Director of the MPH Program, assisted by the Administrative Director, is the coordinator of the dual degree programs and provides services for student support, including special events and publications dedicated to serving the needs of dual degree students and building their sense of scholarship and community as a group.

Nickalaus Koziura, EdM

Master of Science - Biomedical & Health Informatics Program
Case Western Reserve University
10900 Euclid Avenue, W-G74
Cleveland, Ohio 44106-4945
216.368.5957 - phone
informatics@case.edu

The Master of Science in Biomedical and Health Informatics (BHI) program offers non-thesis and thesis-based options. While the usual time to completion with a full-time schedule is 16 months, students have the option of doing the non-thesis program intensively in 11 months.

The BHI program offers pragmatic, interdisciplinary areas of study immediately relevant in contemporary health systems or research enterprises. Our Master’s degree program is unique in that it encompasses both biomedical research and clinical care informatics with applications to precision medicine, accountable care organizations, and reproducible science. Our program provides grounding across multiple disciplines and will be of interest if you seek a career in which you:

- Analyze patient diagnoses, treatments and outcomes, based on electronic health records, to inform best practices in clinical care
- Design or manage studies in the clinical setting to inform quality and safety process improvements
- Collaborate in biomedical research, including the analysis of large genetic and various “omics” studies, integrated with clinical or population data, to advance the understanding of diseases
- Design and manage studies that draw from clinical, cohort or population data to inform the assessment and development of devices, therapeutics or other interventions

We bring together a diverse group of faculty from across Case Western Reserve University – the School of Medicine, clinical faculty from our affiliated hospitals, the Weatherhead School of Business, and the School of Engineering – for a cross-disciplinary approach that offers the opportunity to craft tailored areas of study grounded in core competencies:

- Data analytics
- Biomedical, clinical and/or population health research
- Computational and systems research design

Non-Thesis Program (with 11-month intensive option)
27 credits of course work and a 3 credit project or internship/practicum, with a report that is evaluated by the student’s mentorship/advisory committee.

Thesis Program (no intensive option)
This is for students who may want to continue into a PhD program. It requires 24 credits of course work and six credits developing and presenting a thesis, evaluated by the mentoring/advisory committee.

The purpose of a rotation is to provide students with exposure to the research rotations chosen from an approved list of potential mentors. In addition to coursework in their first year, all students will do three grants (research and training) held by their research mentor.

After the conclusion of their first year, students will be supported by All first-year full-time students in the PhD program are fully funded by the program requirements.

The PQHS faculty team is dedicated to mentoring PhD students in developing a career grounded in research that can be applied across many areas of biomedical, clinical and population health, and bioinformatics. We take time getting to know candidates and in cultivating junior colleagues who can expect that our interdisciplinary approach will offer a solid intellectual grounding for a future career.

The PQHS BHI program builds on the BHI Master’s – or Master’s programs from other institutions – and offers a focus on core domain areas:

- Data analytics
- Biomedical, clinical and/or population health research
- Computational and system research design

The PhD program is a full-time, research oriented program, based in Cleveland, that typically takes four years (post-Master’s) to complete. PhD candidates take core requirements intended to support capabilities essential to the interdisciplinary research that this program advances. Additionally, there are courses at the 400 level and higher across these domain areas available for a tailored program, based on recommendations from the student's mentorship/advisory committee and the student's areas of interest. In total, there are 36 credits of coursework plus 18 of dissertation research, all in line with CWRU PhD program requirements.

All first-year full-time students in the PhD program are fully funded by the School of Medicine (Stipend, Tuition, and Health Insurance are included). After the conclusion of their first year, students will be supported by grants (research and training) held by their research mentor.

In addition to coursework in their first year, all students will do three research rotations chosen from an approved list of potential mentors. The purpose of a rotation is to provide students with exposure to the laboratory/scientific culture pervasive in that discipline and research group, and to determine if the student-mentor fit is appropriate. Faculty members conduct their independent research, and run their laboratories using a variety of styles. The rotation gives the student and faculty member an opportunity to determine if they have similar work styles, and if the scientific culture and training will lead to successful training of the student. By the end of the first year, all students will choose a mentor and a lab in which to do their dissertation work.

Students will master the rigorous scientific and analytic methods necessary to be at the forefront of efforts to not only describe, but also effectively evaluate and improve health. Exposure to cutting edge research will be facilitated by our department-wide seminar that includes talks by world-leading experts both from off- and on-campus. As part of their training, all students will participate in these seminars, including as speakers. This will help develop the necessary communication skills that are expected of successful researchers.

The PhD in Biomedical Health Informatics welcomes applicants from a diverse field of backgrounds and training experiences. Graduates from accredited universities and colleges will be considered for admission to the department. Applicants may apply straight from baccalaureate training, from advance degree programs (MS, MPH, MD), or from the professional field. All applicants must satisfy both CWRU and department requirements for graduate admission.

**Core Curriculum**

All incoming PhD students take a required common core curriculum supplemented by additional coursework as determined by their mentoring or dissertation committees.

**Required Core Courses (12 Credits)**

- MPHP 532 Health Care Information Systems 3
- PQHS 416 Introduction to Computing in Biomedical Health Informatics 3
- PQHS 431 Statistical Methods I 3
- PQHS 432 Statistical Methods II 3

**Biomedical and Health (3 Credits)**

Choose one of the following:

- EBME 410 Medical Imaging Fundamentals 3
- MPHP 406 History and Philosophy of Public Health 3
- PQHS 440 Introduction to Population Health 3
- PQHS 451 A Data-Driven Introduction to Genomics and Human Health 3
- PQHS 465 Design and Measurement in Population Health Sciences 3
- PQHS 490 Epidemiology: Introduction to Theory and Methods 3

**Computation and System Design (3 Credits)**

Choose one of the following:

- CSDS 410 Analysis of Algorithms 3
- CSDS 433 Database Systems 3
- CSDS 458 Introduction to Bioinformatics 3
- CSDS 477 Advanced Algorithms 3
- CSDS 493 Software Engineering 3
- PQHS 471 Machine Learning & Data Mining 3

**Data Analytics (3 Credits)**

Choose one of the following:
The mission of the Doctoral Program in Epidemiology and Biostatistics is to train students to define important, unanswered questions and design appropriate strategies to solve our pressing health problems, locally, nationally and globally. In addition, the program in Epidemiology and Biostatistics is committed to developing the skills necessary for lifelong learning as we recognize this as being key to continued success.

The program is designed to train students to address critical research questions to advance human and population health utilizing a wide variety of research tools and trans-disciplinary collaborations. This is distinct from historical training in a single discipline (e.g., statistics or genetics) or expertise in a small number of technical skills. The educational mission of the PhD Program in Epidemiology & Biostatistics is to train students using an integrated approach that draws broadly from the population and quantitative health sciences. These include global, population, public, and community health, biostatistics, epidemiology, health behavior and prevention, genomic epidemiology, bioinformatics, and computational biology. This training provides the foundation for trainees to play integral roles in successfully solving our most pressing health problems.

Through rigorous coursework, exposure to discussion of important health related issues, and their research experiences during graduate training, students will develop into junior colleagues of the faculty who will develop the capacity to work independently. To develop into the research leaders expected of our graduates, each student will take a common set of first and second-year courses that provides extensive exposure to each of the areas noted above. By the end of their first-year students will choose a mentor and laboratory in which to do their dissertation work. Research areas span all of the above and often combine these approaches with the expectation that cross-disciplinary studies will result in broader and more complete solutions to complex public health problems.

Exposure to cutting edge research will be facilitated by our department-wide seminar that includes talks by world-leading experts both from off- and on-campus. As part of their training all students will participate in these seminars, including as speakers. This will help develop the necessary communication skills that is expected of successful researchers.

Graduates from accredited universities and colleges will be considered for admission to the department. All applicants must satisfy both CWRU and department requirements for graduate admission. Upon acceptance into the PhD program, each student will be assigned an academic advisor, who will guide the student through department and graduate school regulations, assist him or her in designing the initial planned program of study, and track the student’s progress toward degree completion.

Research and training will be guided by a committee of faculty including the student’s research advisor. The research advisor will have the major responsibility for facilitating, guiding, and advising the student in his or her research, but this will be done in consultation with the faculty committees. A Mentoring Committee, selected after first year of PhD training, will help students select courses and educational goals most useful for their research interests. This committee will be replaced at the end of the second year by a Dissertation committee that will play an important role in guiding the student’s research project.

On completion of all Core Curriculum course requirements, students take a qualifying examination that is necessary to remaining and advancing in
the program. Exceptions to required courses based on prior course work will be decided on a case by case basis.

Curriculum

The Doctor of Philosophy degree in Epidemiology and Biostatistics in the Department of Population and Quantitative Health Sciences comprises 42 credits from the following components:

- Core Curriculum (22 credits)
- Electives (20 credits)
- Department Research Seminar (6 semesters)
- Passing the Qualifying Exam
- Dissertation Research (18 credits)

Core Curriculum

The Core Curriculum is designed to provide PhD students with a strong foundation in epidemiology and biostatistics and related areas - the fields that comprise population and quantitative health sciences - and the methodological and analytic training to conduct rigorous, high quality research in the student's selected specialization or concentration.

Core required courses include:

<table>

Electives

Electives are chosen in consultation with the student’s mentor and mentoring committee.

Seminars (0 credits)

Attending research seminars is integral to our graduate program and student’s professional development. Students are required to attend weekly research seminars. These seminars provide a forum for students to develop skills in scientific presentation, thought and communication, and balance general and concentration-specific speakers and topics.

Meeting locations may vary from week to week depending upon the speaker. Each student is required to attend in person six semesters of seminars. All students are required to present once a year during research seminars after their first year in the program.

Qualifying Exam

Following the completion of the core required courses at the end of their second year, students will take an oral exam based on required coursework that involves analyses of a novel data set. This will include a description of the results, their interpretation and a short proposal on alternative or future research directions based on these findings. Students will be given two attempts to pass this examination. A second failure will result in dismissal from the program.

Dissertation (18 credits)

After passing the qualifying examination and completing second-year course work, students will select a dissertation committee and develop a thesis proposal, based on anticipated research for their dissertation. This will be presented to the student’s Dissertation committee that will evaluate the written document and an oral defense of the document. This will be completed no later than the end of the fall semester of the third year. Successful completion of this exam will move the student to candidacy. Each student will be allowed two attempts to pass the oral defense of the proposal.

Students are required to complete 18 credits of dissertation (PQHS 701 Dissertation Ph.D.) prior to graduation.

Health Informatics Certificate

Questions and Information:

Nickalaus Koziura, EdM

Graduate Certificate in Health Informatics
Case Western Reserve University
10900 Euclid Avenue, W-G74
Cleveland, Ohio 44106-4945
216.368.5957 - phone
informatics@case.edu

Students who want to explore Biomedical and Health Informatics without – or before – committing to a Master’s, can take a series of four or five courses that provide an overview and grounding in the fundamentals with practical applications in research, clinical care and population health. If you choose to continue to a Master’s program within our department, all courses are transferable.

A 12-credit or 15-credit certificate is available, taking from one year to two-and-a-half years to complete, depending on a student’s chosen pace. Certificate are granted from the CWRU School of Medicine, Department of Population and Health Information Sciences. Only the 15-credit certificate will show on an official CWRU transcript. The Graduate Certificate in Health Informatics requires students to complete 6 credits of required courses and 6-9 credits of courses in a concentration.

Required Courses for the Certificate

### MPH Courses

#### MPH 101. Introduction to Public Health. 3 Units.

The purpose of this course is to introduce students to the science and art of public health through understanding historical and current issues through public health case histories and controversies. Students will be introduced to social, behavioral, cultural, and environmental influences on population health. Emphasis is placed on social justice as a central component of public health, with an overview of health inequity and commitment to vulnerable populations. Core public health practices relating to health promotion program design, community assessment and improvement planning, health communication, health policy and enforcement, and health behavior change will be featured. The course will promote understanding of health care and public health systems domestically and globally, including preparedness for and response to public health emergencies.

#### MPH 301. Introduction to Epidemiology. 3 Units.

This course begins with the exploration of the history, philosophy and uses of epidemiology. It then moves to the basic descriptive functions of epidemiology such as condition, frequency and severity. Data is used to describe qualitatively and quantitatively diseases and injuries in a population. Applications include identifying patterns of disease and injury over time and geography. The course then moves to analytical epidemiology with focus on estimation, inference, bias, confounding and adjustment in the determination of what factors are associated with, or cause disease or injury. The different kinds of study designs are introduced including ecologic, cross-sectional, case-control, retrospective and prospective cohort, and experimental designs such as clinical trials. Students are introduced to evidence-based public health with analysis of harm, benefit and cost, and intervention effectiveness. The course concludes with applications to policy, covering outbreak investigation/testing/screening, public health policy and special epidemiologic applications including molecular and genetic epidemiology, environmental health and safety, unintentional injury and violence prevention and behavioral sciences. Recommended preparation: A course in statistics taken before or concurrently with MPH 301.

#### MPH 306. History and Philosophy of Public Health. 3 Units.

The purpose of this course is to introduce students to the science and art of public health through an understanding of the history and philosophies that represent its foundation. Students will learn about the essentials of public health and applications of those precepts throughout history and in the present. The course will examine public health case histories and controversies from the past and present, in order to better understand solutions for the future. Offered as MPH 306 and MPH 406. Prereq: Enrollment limited to juniors and seniors only.

#### MPH 313. Health Education, Communication, and Advocacy. 3 Units.

Historical, sociological, and philosophical factors that have influenced definitions and the practice of health education and health promotion are studied. Advanced concepts in health communication theory will also be explored. This course is designed to educate, motivate, and empower undergraduate and graduate students to become advocates for their own health, the health of their peers, and the health of the community. Offered as MPH 313 and MPH 413.

#### MPH 405. Statistical Methods in Public Health. 3 Units.

This one-semester survey course for public health students is intended to provide the fundamental concepts and methods of biostatistics as applied predominantly to public health problems. The emphasis is on interpretation and concepts rather than calculations. Topics include descriptive statistics; vital statistics; sampling; estimation and significance testing; sample size and power; correlation and regression; spatial and temporal trends; small area analysis; statistical issues in policy development. Examples of statistical methods will be drawn from public health practice. Use of computer statistical packages will be introduced. Prereq: Enrollment limited to MPH students (Plan A or Plan B) and EPBI students only. All others require instructor consent.

#### MPH 406. History and Philosophy of Public Health. 3 Units.

The purpose of this course is to introduce students to the science and art of public health through an understanding of the history and philosophies that represent its foundation. Students will learn about the essentials of public health and applications of those precepts throughout history and in the present. The course will examine public health case histories and controversies from the past and present, in order to better understand solutions for the future. Offered as MPH 306 and MPH 406. Prereq: Enrollment limited to MPH students (Plan A or Plan B) and EPBI students or instructor consent.
MPHP 411. Introduction to Health Behavior. 3 Units.
Using a biopsychosocial perspective, an overview of the measurement and modeling of behavioral, social, psychological, and environmental factors related to disease prevention, disease management, and health promotion is provided. Offered as PQHS 411 and MPHP 411. Prereq: Enrollment limited to MPH students (Plan A or Plan B) and EPBI students or consent.

MPHP 413. Health Education, Communication, and Advocacy. 3 Units.
Historical, sociological, and philosophical factors that have influenced definitions and the practice of health education and health promotion are studied. Advanced concepts in health communication theory will also be explored. This course is designed to educate, motivate, and empower undergraduate and graduate students to become advocates for their own health, the health of their peers, and the health of the community. Offered as MPHP 313 and MPHP 413.

MPHP 421. Health Economics and Strategy. 3 Units.
The purpose of this course is to develop the analytical skills necessary for understanding how the U.S. health care sector operates, how it has evolved, the forces at work behind perceived deficiencies (in quality and cost control), and the impact of alternative policy proposals. Special attention is given to recent developments in the healthcare marketplace, and the strategic considerations they create for providers and insurers. These issues are addressed through the lens of microeconomic theory. Under this framework, outcomes result from the interaction of decisions made by participants in the healthcare economy (e.g., patients, providers, insurers, government), with those decisions governed by the preferences, incentives and resource constraints facing each decision-maker. Principles of microeconomics will be reviewed as necessary to ensure consistent understanding of basic concepts. The course is designed to appeal to a broad audience, particularly students interested in healthcare management, public health, medical innovation, health law, and public policymaking. Offered as HSMC 421 and MPHP 421.

MPHP 426. An Introduction to GIS for Health and Social Sciences. 3 Units.
This course is designed to give students a first exposure to understanding how GIS is integral to understanding a wide variety of public health problems. It introduces students to current spatial approaches in health research and provides a set of core skills that will allow students to apply these techniques toward their own interests. Subject matter will include chronic diseases, infectious diseases, and vector-borne diseases examples. Other topics related to social determinants of health and current events (e.g., violence, overdoses, disaster and homelessness) will also be incorporated. Students will be exposed to different types of data and different applications of these data (for example, hospitals, police departments), enabling them to think "outside the box" about how GIS can be utilized to solve real-world problems. Students will learn classic mapping and hotspot techniques. In addition, they will be introduced to novel ways to collect geospatial field data using online sources (Google Street View), primary data collection (spatial video) and mixed method approaches (spatial video geonarratives), all of which represent the cutting edge of spatial epidemiology. Offered as MPHP 426 and PQHS 426.

MPHP 429. Introduction to Environmental Health. 3 Units.
This survey course will introduce students to environmental and occupational health topics including individual, community, population, and global issues. Students will develop an understanding of the human health impacts of physical, biological, and chemical agents in the environment and workplace including basic principles of toxicology. Presentation of concepts including risk assessment, communication and management as well as discussion of environmental and occupational practices, policies and regulations that promote public and population health is included.

MPHP 431. Statistical Methods I. 3 Units.
Application of statistical techniques with particular emphasis on problems in the biomedical sciences. Basic probability theory, random variables, and distribution functions. Point and interval estimation, regression, and correlation. Problems whose solution involves using packaged statistical programs. First part of year-long sequence. Offered as ANAT 431, BIOL 431, CRSP 431, PQHS 431 and MPHP 431.

MPHP 432. Statistical Methods II. 3 Units.
Methods of analysis of variance, regression and analysis of quantitative data. Emphasis on computer solution of problems drawn from the biomedical sciences. Design of experiments, power of tests, and adequacy of models. Offered as BIOL 432, PQHS 432, CRSP 432 and MPHP 432. Prereq: PQHS/EPBI 431 or equivalent.

MPHP 433. Community Interventions and Program Evaluation. 3 Units.
This course prepares students to design, conduct, and assess community-based health interventions and program evaluation. Topics include assessment of need, evaluator/stakeholder relationship, process vs. outcome-based objectives, data collection, assessment of program objective achievement based on process and impact, cost-benefit analyses, and preparing the evaluation report to stakeholders. Recommended preparation: PQHS/EPBI 490, PQHS/EPBI 431, or MPHP 405. Offered as PQHS 433 and MPHP 433. Prereq: MPHP 411.

MPHP 439. Public Health Management and Policy. 3 Units.
This course is designed to introduce students to the basics of health policy-making and includes a background on the basic structure and components of the US Health Care System (such as organization, delivery and financing). It will also cover introductory concepts in public health management, including the role of the manager, organizational design and control, and accountability. We will address relevant legal, political and ethical issues using case examples. At the end of the course, students will understand how health policy is developed and implemented in various contexts, and the challenges facing system-wide efforts at reform. This is a required course for the MPH degree. Grades will be based on a series of assignments. Prereq: Enrollment limited to MPH students (Plan A or Plan B) and EPBI Students or instructor consent.

MPHP 450. Clinical Trials and Intervention Studies. 3 Units.
Issues in the design, organization, and operation of randomized, controlled clinical trials and intervention studies. Emphasis on long-term multicenter trials. Topics include legal and ethical issues in the design; application of concepts of controls, masking, and randomization; steps required for quality data collection; monitoring for evidence of adverse or beneficial treatment effects; elements of organizational structure; sample size calculations and data analysis procedures; and common mistakes. Recommended preparation: PQHS/EPBI 431 or consent of instructor. Offered as PQHS 450 and MPHP 450.
MPHP 451. A Data-Driven Introduction to Genomics and Human Health. 3 Units.
This course introduces the foundational concepts of genomics and genetic epidemiology through four key principles: 1) Teaching students how to query relational databases using Structure Query Language (SQL); 2) Exposing students to the most current data used in genomics and bioinformatics research, providing a quantitative understanding of biological concepts; 3) Integrating newly learned concepts with prior ones to discover new relationships among biological concepts; and 4) providing historical context to how and why data were generated and stored in the way they were, and how this gave rise to modern concepts in genomics. Offered as PQHS 451, GENE 451, and MPHP 451.

MPHP 456. Health Policy and Management Decisions. 3 Units.
This seminar course combines broad health care policy issue analysis with study of the implications for specific management decisions in organizations. This course is intended as an applied, practical course where the policy context is made relevant to the individual manager. Offered as HSMC 456 and MPHP 456.

MPHP 464. Obesity and Cancer: Views from Molecules to Health Policy. 3 Units.
This course will provide an overview of the components of energy balance (diet, physical activity, resting metabolic rate, dietary induced thermogenesis) and obesity, a consequence of long term positive energy balance, and various types of cancer. Following an overview of energy balance and epidemiological evidence for the obesity epidemic, the course will proceed with an introduction to the cellular and molecular biology of energy metabolism. Then, emerging research on biologically plausible connections and epidemiological associations between obesity and various types of cancer (e.g., colon, breast) will be presented. Finally, interventions targeted at decreasing obesity and improving quality of life in cancer patients will be discussed. The course will be cooperatively-taught by a transdisciplinary team of scientists engaged in research in energy balance and/or cancer. Didactic lectures will be combined with classroom discussion of readings. The paper assignment will involve application of course principles, lectures and readings. Offered as PQHS 464 and MPHP 464.

MPHP 466. Promoting Health Across Boundaries. 3 Units.
This course examines the concepts of health and boundary spanning and how the synergy of the two can produce new, effective approaches to promoting health. Students will explore and analyze examples of individuals and organizations boundary spanning for health to identify practice features affecting health, compare and contrast practices and approaches, and evaluate features and context that promote or inhibit boundary spanning and promoting health. Offered as MPHP 466, PQHS 466, SOCI 466, NURS 466 and BETH 466. Prereq: Graduate student status or instructor consent.

MPHP 467. Comparative and Cost Effectiveness Research. 1 Unit.
Comparative effectiveness research is a cornerstone of healthcare reform. It holds the promise of improved health outcomes and cost containment. This course is presented in a convenient 5-day intensive format in June. There are reading assignments due prior to the 1st session. Module A, Days 1-2: Overview of comparative effectiveness research (CER) from a wide array of perspectives: individual provider, institution, insurer, patient, government, and society. Legal, ethical and social issues, as well as implications for population and public health, including health disparities will also be a component. Module B, Day 3: Introduction to the various methods, and their strengths, weaknesses and limitations. How to read and understand CER papers. Module C, Days 4-5: Cost-Effectiveness Analysis. This will cover costing, cost analysis, clinical decision analysis, quality of life and cost-effectiveness analysis for comparing alternative health care strategies. Trial version of TreeAge software will be used to create and analyze a simple cost-effectiveness model. The full 3-credit course is for taking all 3 modules. Modules A or C can be taken alone for 1 credit. Modules A and B or Modules B and C can be taken together for a total of 2 credits. Module B cannot be taken alone. If taking for 2 or 3 credits, some combination of term paper, project and/or exam will be due 30 days later. Offered as PQHS 467 and MPHP 467.

MPHP 468. The Continual Improvement of Healthcare: An Interdisciplinary Course. 3 Units.
This course prepares students to be members of interprofessional teams to engage in the continual improvement in health care. The focus is on working together for the benefit of patients and communities to enhance quality and safety. Offered as PQHS 468, MPHP 468, and NURS 468.

MPHP 475. Management of Disasters Due to Nature, War, or Terror. 3 Units.
The purpose of this course is to make participants aware of the special needs of children and families in disaster situations and understand public health approaches to address these needs. The learning objectives for this course are: 1) Identify the most important problems and priorities for children in disaster situations, 2) Identify the organizations most frequently involved in providing assistance in disaster situations and define their roles and strengths, 3) Describe the reasons why children are among the most vulnerable in disaster events, 4) Conduct emergency nutritional assessments for children, 5) Develop health profiles on displaced children and plan interventions based on results, 6) Define common psychosocial issues of children and the means to address them, 7) List basic points of international law including the Geneva Convention that relate to all persons involved in disaster situations, 8) List important security issues, 9) Appreciate ethical issues involved in disaster situations and employ skills of cross cultural communication, 10) Recognize and respond to special issues for children involved in biological and chemical terrorist attacks.
MPHP 477. Internship at Health-Related Government Agencies. 3 Units.
This independent study course will incorporate a one-semester-long internship at health-related government agencies (Ohio Department of Health, Ohio Department of Job and Family Services, or Cleveland City Health Department). The choice of the agency will depend on the student's academic interests and research goals. The objective is to develop a level of familiarity with the organizational and operational aspects of such agencies, and to gain an understanding of agencies' and bureaus' interactions with the legislative body, as well as the processes of developing, implementing, managing, and monitoring health initiative. The instructor and the liaison persons at the agencies will be responsible for planning structured encounters of interns with key administrators and policy makers, and to select a research project, based on the intern's research interests and the agencies' research priorities. Interns will be required to submit a draft of the report to the instructor at the end of the semester. The approved, final report will be submitted to the agency. The project will be evaluated for its methodological soundness and rigor. Students will be required to be at the agency one day a week. Recommended preparation: PQHS/EPBI 515.

MPHP 482. Qualitative and Mixed Methods in Public Health. 3 Units.
Understanding complex public health issues requires both qualitative and quantitative inquiry. The exploration of the perceptions and experiences of people is as essential as analyzing the relationships among variables. Often, the integration of the two methods is required in order to effectively address the significant health issues faced by today's society. It is the purpose of this course to facilitate a meaningful and substantive learning process around engaging in, and critically analyzing, qualitative and mixed methods research in public health. This includes gaining first-hand experience in research design and collecting, managing, analyzing, and interpreting data for the purposes of making data-driven program and policy recommendations. In addition, students will have the opportunity to engage with local professionals engaged in qualitative and mixed methods research.

MPHP 483. Introduction to Epidemiology for Public Health Practice. 3 Units.
This course is designed to introduce the basic principles and methods of epidemiology. Epidemiology has been referred to as the basic science for public health. Application of epidemiologic principles is critical to disease prevention, as well as in the development and evaluation of public policy. The course will emphasize basic methods (study design, measures of disease occurrence, measures of association, and causality) necessary for epidemiologic research. It is intended for students who have a basic understanding of the principals of human disease as well as statistics. Prereq: Must be an MPHP Plan A or MPHP Plan B, or EPBI student in order to enroll in the course.

MPHP 484. Global Health Epidemiology. 1 - 3 Units.
This course provides a rigorous problem-centered training in the epidemiology, prevention, treatment, and control of infectious diseases and, more generally, global health. This is an advanced epidemiology that embraces an active learning environment. Students are expected to invest time out of the classroom reading and working with classmates. Classes will be conducted with discussions, debates, group projects, and group presentations. By taking this course, students will develop a framework for interpreting, assessing, and performing epidemiologic research on issues of global importance. The course will be divided into three modules: 1) Global Health Epidemiology 2) Helminth Epidemiology, and 3) Epidemiology of Disease Elimination. Each module is worth 1 credit hour and may be taken separately. Each module will have a separate project and/or exam. The final exam time will be used for group presentations and panel discussion. Active class participation is required through discussions, case studies, and group projects. Offered as PQHS 484, INTH 484, and MPHP 484.

MPHP 485. Adolescent Development. 3 Units.
Adolescent Development can be viewed as the overriding framework for approaching disease prevention and health promotion for this age group. This course will review the developmental tasks of adolescence and identify the impact of adolescent development on youth risk behaviors. It will build a conceptual and theoretical framework through which to address and change adolescent behavior to promote health.

MPHP 490. Epidemiology: Introduction to Theory and Methods. 3 Units.
This course provides an introduction to the principles of epidemiology covering the basic methods necessary for population and clinic-based research. Students will be introduced to epidemiologic study designs, measures of disease occurrence, measures of risk estimation, and casual inference (bias, confounding, and interaction) with application of these principles to specific fields of epidemiology. Classes will be a combination of lectures, discussion, and in-class exercises. It is intended for students who have a basic understanding of the principals of human disease and statistics. Offered as PQHS 490 and MPHP 490. Prereq or Coreq: PQHS/EPBI 431 or Requisites Not Met permission.

MPHP 496. The Evolution of Public Health into Global Health Practice. 3 Units.
This short course will use readings and case studies to explore the motivating factors in the emergence of global health interventions over the last 200 years, with a focus on its roots in public health practice, its expanding scope in the early to mid-20th century, and the strengths and weaknesses of modern global health interventions. Readings and seminar discussions will involve consideration of the changing definitions of "public health", and of the spaces in which public health interventions are expected to occur.
MPHP 499. Independent Study. 1 - 18 Units.

MPHP 510. Health Disparities. 3 Units.
This course aims to provide theoretical and application tools for students from many disciplinary backgrounds to conduct research and develop interventions to reduce health disparities. The course will be situated contextually within the historical record of the United States, reviewing social, political, economic, cultural, legal, and ethical theories related to disparities in general, with a central focus on health disparities. Several frameworks regarding health disparities will be used for investigating and discussing the empirical evidence on disparities among other subgroups (e.g., the poor, women, uninsured, disabled, and non-English speaking populations) will also be included and discussed. Students will be expected to develop a research proposal (observational, clinical, and/or intervention) rooted in their disciplinary background that will incorporate materials from the various perspectives presented throughout the course, with the objective of developing and reinforcing a more comprehensive approach to current practices within their fields. Offered as CRSP 510, PQHS 510, MPHP 510, NURS 510, and SASS 510.

MPHP 532. Health Care Information Systems. 3 Units.
This course covers concepts, techniques and technologies for providing information systems to enhance the effectiveness and efficiency of health care organizations. Offered as HSMC 432 and MPHP 532.

MPHP 540. Operational Aspects of Global Health and Emergency Response. 3 Units.
Among professional in the medical field and the field of public health, there is a gap in knowledge, structure and research in best practices surrounding emergency response. This gap results from the limited number of training programs in the United States that focus on this very specialized field and the limited number of academic partnerships with international non-governmental organizations (NGOs). This course helps remedy this gap by introducing public health students and international emergency medicine fellows to the overall structure and operations of international humanitarian coordination systems, types of emergency response, morbidity and mortality associated with various emergencies, and the actors and institutions involved. The course highlights, through reading, workshops, and examples, the real world issues that must be faced and overcome in the field during emergency response operations.

MPHP 650. Public Health Practicum. 1 - 3 Units.
The Public Health Practicum is an integral component of the MPH curriculum, allowing students to apply, develop, and refine their conceptual knowledge and skills as part of a planned, supervised, and evaluated community-based experience. The Practicum is designed to move students beyond the walls of academia, to understand the political, economic, social, and organizational contexts within which public health activities are conducted. To complete the Practicum, students must complete three credits of MPHP 650, dedicating at least 120 hours to a substantial public health experience, and attend Community Health Research and Practice (CHRP) group meetings. Prereq: Complete at least 9 credit hours in the MPH program and be in good academic standing.

MPHP 652. Public Health Capstone Experience. 1 - 9 Units.
Public health field practicum, involving a placement at a community-based field site, and a Master's essay. The field placement will provide students with the opportunity to apply the knowledge and skills acquired through their Master of Public Health academic program to a problem involving the health of the community. Students will learn to communicate with target groups in an effective manner; to identify ethical, social, and cultural issues relating to public health policies, research, and interventions; to identify the process by which decisions are made within the agency or organization; and to identify and coordinate use of resources at the placement site. The Master's essay represents the culminating experience required for the degree program and may take the form of a research thesis, an evaluation study, or an intervention study. Each student is required to formally present the experience and research findings. In any semester in which a student is registered for MPHP 652 credit, it is required that the student attend the Community Health Research and Practice (CHRP) group at a minimum of two sessions per 3 credits. CHRP is held once a week for approximately an hour and a half for the duration of fall, spring, and summer semesters. MPHP 652 credit is available only to Master of Public Health students.

MPHP 655. Public Health Capstone Experience. 1 - 6 Units.
The Public Health Capstone is a multi-semester project intended to provide students with the opportunity to develop a broad understanding of their chosen topic area, the ability to communicate effectively with target groups and professionals, and develop skills necessary for scientific investigation. The Public Health Capstone provides students with the opportunity to apply the knowledge and skills acquired through their Master of Public Health academic program to a problem involving the health of the community. Students work in conjunction with a community organization; therefore, the Capstone is expected to be mutually beneficial to both the student's educational goals as well as the host organization. At the conclusion of the Capstone experience, students are required to submit a capstone essay, which represents the culminating experience required for the degree program and may take the form of a research thesis, an evaluation study, or an intervention study. Each student is required to formally present the experience and research findings. While engaged in the Public Health Capstone, students are expected to attend the Community Health Research and Practice (CHRP) seminar, held weekly on Tuesdays at 12:00pm. Counts as SAGES Senior Capstone.

MPHP 655. Dual Degree Field Practicum II. 3 Units.
This course is designed to be taken by MSSA/MPH joint degree students as the second field period of their master's program. It consists of a field practicum and participation in professional development opportunities. The Field Practicum is an integral component of the MSASS and MPH curriculums, allowing students to apply, develop, and refine their conceptual knowledge and skills as part of a planned, supervised, and evaluated community-based experience. The Practicum is designed to move students beyond the walls of academia, to understand the political, economic, social, and organizational contexts within which social work and public health activities are conducted. These collective experiences provide students with a forum to develop skills, integrate and operationalize the values and ethics inherent in professional practice, and confront social injustice as self-reflective, competent developing practitioners. (EPAAS Program Objective M6 and EPAAS Content Area 4.7) The overall goal of this course is to provide graduate level MSSA/MPH joint degree students with field related opportunities to continue to develop foundation level competencies in the eight MSSAS abilities by helping students apply knowledge of social work and public health theory, skills, values and ethics acquired in the classroom in an agency setting. Offered as MPHP 655 and SASS 655.
MPHP 656. Dual Degree Field Capstone III. 3 Units.
The Public Health Capstone Project is an integral component of the MPH curriculum, allowing students to apply, develop, and refine their conceptual knowledge and skills as part of a planned, mentored, and evaluated public health scholarly project. This course is designed to be taken by advanced level students. It consists of a 288 hour field based Capstone experience and participation in 12 hours of professional development opportunities. The overall goal of this course is designed to move students beyond the walls and constraints of the classroom, to understand the political, economic, social, and organizational contexts within which public health and social work activities are conducted. It is also designed to provide graduate level dual degree students with field related opportunities to begin to develop advanced level competencies in the eight abilities by helping students apply knowledge of social work theory, skills, values and ethics acquired in the classroom in an agency setting. These collective experiences provide students with a forum to continue to develop and hone social work skills, integrate and operationalize the values and ethics inherent in professional practice, and confront social injustice as self-reflective, competent developing practitioners. (EPAS Program Objective M6 and EPAS Content Area 4.7) Offered as SASS 656 and MPHP 656. Prereq: MPHP 655.

MPHP 657. Dual Degree Field Capstone IV. 3 Units.
The Public Health Capstone Project is an integral component of the MPH curriculum, allowing students to apply, develop, and refine their conceptual knowledge and skills as part of a planned, mentored, and evaluated public health scholarly project. This course is designed to be taken by advanced level students. It consists of a 288 hour field based Capstone experience and participation in 12 hours of professional development opportunities. The overall goal of this course is designed to move students beyond the walls and constraints of the classroom, to understand the political, economic, social, and organizational contexts within which public health and social work activities are conducted. It is also designed to provide graduate level dual degree students with field related opportunities to begin to develop advanced level competencies in the eight abilities by helping students apply knowledge of social work theory, skills, values and ethics acquired in the classroom in an agency setting. Offered as SASS 657 and MPHP 657.

PQHS Courses

PQHS 411. Introduction to Health Behavior. 3 Units.
Using a biopsychosocial perspective, an overview of the measurement and modeling of behavioral, social, psychological, and environmental factors related to disease prevention, disease management, and health promotion is provided. Offered as PQHS 411 and MPHP 411. Prereq: Enrollment limited to MPH students (Plan A or Plan B) and EPBI students or consent.

PQHS 414. Data Management and Statistical Programming. 3 Units.
This is an online course that offers no in-person meetings. This course serves as a general introduction to the use of computer systems in epidemiologic investigations and biostatistical applications. Students will develop a conceptual understanding of data types, basic data structures, relational database systems and data normalization, data warehousing, control statements, and programming logic. Further, students will develop basic scripting skills and will learn to read in, manipulate, and perform basic descriptive analyses on research data using the SAS programming language. Primary emphasis in this course is on developing the knowledge and familiarity required to work with data in a statistical programming context. Basic familiarity with statistics is beneficial, as this course does not teach inferential statistical analysis in detail, but it is not vital to learning the course material.

PQHS 415. Statistical Computing and Data Analytics. 3 Units.
Statistical computing is an essential part of modern statistical training. This course emphasizes on statistical and data analytic problem solving skills, covers elements of statistical computing, and special topics in modern data analytics. This includes numerical methods for statistics, stochastic simulation, symbolic and graphical computation, plus special topics in resampling methods, EM algorithms, Gibbs Sampling/MCMC, projection pursuit, Laplace approximation, parallel computing, and selected methods for big and high dimensional data. The course will use R/Splus predominantly. However, interface of R with another high level programming language such as C, C++, Fortran, JAVA or Python will be essential for Big Data and intensive computation. Some Matlab, Mathematica, and graphviz will be used for symbolic and graphical computation. Prerequisite: Knowledge in statistics, equivalent to that in either STAT 325/425, or STAT 345/445, or PQHS/EPBI 481, or PQHS/EPBI 431, or by permission. Experience with at least one programming language is required: R/Splus, Matlab, C/C++, Fortran, JAVA, or Python. Prereq: STAT 312, STAT 325, STAT 425, STAT 345, STAT 445, PQHS/EPBI 431 or PQHS/EPBI 481.

PQHS 416. Introduction to Computing in Biomedical Health Informatics. 3 Units.
The goals of this course are to provide students with a survey of the computational technique that underpin biomedical and health informatics. The course will cover methods in computational system development, including biomedical terminologies, ontologies, natural language processing (NLP), logic, Electronic Health Record (EHR) system architecture as well as applications, and topics related to health information systems. This course is intended for students interested in learning the computational foundations of biomedical and health informatics. Students should have at least a bachelor of science level educational background and an understanding of the fields of biomedical and clinical/translational.

PQHS 426. An Introduction to GIS for Health and Social Sciences. 3 Units.
This course is designed to give students a first exposure to understanding how GIS is integral to understanding a wide variety of public health problems. It introduces students to current spatial approaches in health research and provides a set of core skills that will allow students to apply these techniques toward their own interests. Subject matter will include chronic diseases, infectious diseases, and vectored diseases examples. Other topics related to social determinants of health and current events (e.g., violence, overdoses, disaster and homelessness) will also be incorporated. Students will be exposed to different types of data and different applications of these data (for example, hospitals, police departments), enabling them to think "outside the box" about how GIS can be utilized to solve real-world problems. Students will learn classic mapping and hotspot techniques. In addition, they will be introduced to novel ways to collect geospatial field data using online sources (Google Street View), primary data collection (spatial video) and mixed method approaches (spatial video geonarratives), all of which represent the cutting edge of spatial epidemiology. Offered as MPHP 426 and PQHS 426.

PQHS 431. Statistical Methods I. 3 Units.
Application of statistical techniques with particular emphasis on problems in the biomedical sciences. Basic probability theory, random variables, and distribution functions. Point and interval estimation, regression, and correlation. Problems whose solution involves using packaged statistical programs. First part of year-long sequence. Offered as ANAT 431, BIOL 431, CRSP 431, PQHS 431 and MPHP 431.
PQHS 432. Statistical Methods II. 3 Units.
Methods of analysis of variance, regression and analysis of quantitative data. Emphasis on computer solution of problems drawn from the biomedical sciences. Design of experiments, power of tests, and adequacy of models. Offered as BIOL 432, PQHS 432, CRSP 432 and MPH 432. Prereq: PQHS/EPBI 431 or equivalent.

PQHS 433. Community Interventions and Program Evaluation. 3 Units.
This course prepares students to design, conduct, and assess community-based health interventions and program evaluation. Topics include assessment of need, evaluator/stakeholder relationship, process vs. outcome-based objectives, data collection, assessment of program objective achievement based on process and impact, cost-benefit analyses, and preparing the evaluation report to stakeholders. Recommended preparation: PQHS/EPBI 490, PQHS/EPBI 431, or MPH 405. Offered as PQHS 433 and MPH 433.

PQHS 435. Survival Data Analysis. 3 Units.
Basic concepts of survival analysis including hazard function, survival function, types of censoring; non-parametric models; extended Cox models: time dependent variables, piece-wise Cox model, etc.; sample size requirements for survival studies. Prereq: PQHS/EPBI 432.

PQHS 440. Introduction to Population Health. 3 Units.
Introduces graduate students to the multiple determinants of health including the social, economic and physical environment, health services, individual behavior, genetics and their interactions. It aims to provide students with the broad understanding of the research development and design for studying population health, the prevention and intervention strategies for improving population health and the disparities that exist in morbidity, mortality, functional and quality of life. Format is primarily group discussion around current readings in the field; significant reading is required.

PQHS 444. Communicating in Population Health Science Research. 1 Unit.
Doctoral seminar on writing journal articles to report original research, and preparing and making oral and poster presentations. The end products are ready-to-submit manuscripts and related slide and poster presentations for the required first-year research project in the PhD program in the Department of Epidemiology and Biostatistics. While this course provides a nucleus for this endeavor, students work intensively under the supervision of their research mentors, who guide all stages of the work including providing rigorous editorial support. Seminar sessions are devoted to rigorous peer critiques of every stage of the projects and to in-depth discussions of assigned readings. Recommended preparation: PhD students in the Department of Biostatistics and Epidemiology. Non-PhD EPBI students permitted if space available. Fluency in English writing (e.g. in accord with the Harbrace College Handbook). Prereq: PQHS/EPBI 431 and PQHS/EPBI 490. Coreq: PQHS/EPBI 432.

PQHS 445. Research Ethics in Population Health Sciences. 0 Unit.
This zero credit course is a required add-on for PhD students in EPBI. Students will register and fulfill all requirements for IBMS 500 "Being a Professional Scientist". The purpose of PQHS 445 is to address specialized population health topics not covered by IBMS 500, including international research, human genomics, and/or big data/electronic medical records. There will be no meetings/lectures for this course. Students will complete a short written assignment due at the end of the semester.

PQHS 450. Clinical Trials and Intervention Studies. 3 Units.
Issues in the design, organization, and operation of randomized, controlled clinical trials and intervention studies. Emphasis on long-term multicenter trials. Topics include legal and ethical issues in the design; application of concepts of controls, masking, and randomization; steps required for quality data collection; monitoring for evidence of adverse or beneficial treatment effects; elements of organizational structure; sample size calculations and data analysis procedures; and common mistakes. Recommended preparation: PQHS/EPBI 431 or consent of instructor. Offered as PQHS 450 and MPH 450.

PQHS 451. A Data-Driven Introduction to Genomics and Human Health. 3 Units.
This course introduces the foundational concepts of genomics and genetic epidemiology through four key principles: 1) Teaching students how to query relational databases using Structure Query Language (SQL); 2) Exposing students to the most current data used in genomics and bioinformatics research, providing a quantitative understanding of biological concepts; 3) Integrating newly learned concepts with prior ones to discover new relationships among biological concepts; and 4) providing historical context to how and why data were generated and stored in the way they were, and how this gave rise to modern concepts in genomics. Offered as PQHS 451, GENE 451, and MPHP 451. Prereq: PQHS/EPBI 431 and PQHS/EPBI 490 or Requisites Not Met permission.

PQHS 452. Statistical Methods for Genetic Epidemiology. 3 Units.
Analytic methods for evaluating the role of genetic factors in human disease, and their interactions with environmental factors. Statistical methods for the estimation of genetic parameters and testing of genetic hypotheses, emphasizing maximum likelihood methods. Models to be considered will include such components as genetic loci of major effect, polygenic inheritance, and environmental, cultural and developmental effects. Topics will include familial aggregation, segregation and linkage analysis, ascertainment, linkage disequilibrium, and disease marker association studies. Recommended preparation: PQHS/EPBI 431 and PQHS/EPBI 451.
PQHS 453. Categorical Data Analysis. 3 Units.
Categorical data are often encountered in many disciplines including the fields of clinical and biological sciences. Analysis methods for analyzing categorical data are different from the analysis methods for continuous data. There is a rich a collection of methods for categorical data analysis. The elegant "odds ratio" interpretation associated with categorical data is a unique one. This online course will cover cross-sectional categorical data analysis theories and methods. From this course students will learn standard categorical data analysis methods and its applications to the biomedical and clinical studies. This particular course will focus mostly on statistical methods for categorical data analysis arising from various fields of studies including clinical studies; those who take it will come from a wide variety of disciplines. The course will include video lectures, group discussion and brainstorming, homework, simulations, and collaborative projects on real and realistic problems in human health tied directly to the student's own professional interests. Focus will be given to logistic regression methods. Topics include (but not limited to) binary response, multi-category response, count response, model selection and evaluation, exact inference, Bayesian methods for categorical data, and supervised statistical learning methods. This course stresses how the core statistical principles, computing tools, and visualization strategies are used to address complex scientific aims powerfully and efficiently, and to communicate those findings effectively to researchers who may have little or no experience in these methods. Recommended preparation: Advanced undergraduate students, and graduate students in Biostatistics or other quantitative sciences with a background in statistical methods (at least one statistics course, equivalent to the PQHS/EPBI 431 course experience).

PQHS 457. Current Issues in Genetic Epidemiology: Design and Analysis of Sequencing Studies. 3 Units.
Statistical methods to deal with the opportunities and challenges in Genetic Epidemiology brought about by modern sequencing technology. Some computational issues that arise in the analysis of large sequence data sets will be discussed. The course includes hands-on experience in the analysis of large sequence data sets, in a collaborative setting. Prereq: PQHS/EPBI 451 and PQHS/EPBI 452.

PQHS 459. Longitudinal Data Analysis. 3 Units.
This course will cover statistical methods for the analysis of longitudinal data with an emphasis on application in biological and health research. Topics include exploratory data analysis, response feature analysis, growth curve models, mixed-effects models, generalized estimating equations, and missing data. Prereq: PQHS/EPBI 432.

PQHS 464. Obesity and Cancer: Views from Molecules to Health Policy. 3 Units.
This course will provide an overview of the components of energy balance (diet, physical activity, resting metabolic rate, dietary induced thermogenesis) and obesity, a consequence of long term positive energy balance, and various types of cancer. Following an overview of energy balance and epidemiological evidence for the obesity epidemic, the course will proceed with an introduction to the cellular and molecular biology of energy metabolism. Then, emerging research on biologically plausible connections and epidemiological associations between obesity and various types of cancer (e.g., colon, breast) will be presented. Finally, interventions targeted at decreasing obesity and improving quality of life in cancer patients will be discussed. The course will be cooperatively-taught by a transdisciplinary team of scientists engaged in research in energy balance and/or cancer. Didactic lectures will be combined with classroom discussion of readings. The paper assignment will involve application of course principles, lectures and readings. Offered as PQHS 464 and MPH 464.

PQHS 465. Design and Measurement in Population Health Sciences. 3 Units.
This course focuses on common design and measurement approaches used in population health sciences research. This course covers the preliminary considerations used in selecting qualitative, quantitative and mixed methods research approaches including an understanding of different philosophical worldviews, strategies of inquiry and methods and procedures for each approach. The course also includes an introduction to survey design and related concepts of latent variables, factor analysis and reliability and validity. Students will develop an in-depth knowledge of these design and measurement approaches through readings, lectures, group discussions and written and oral project presentations. Prereq: PQHS/EPBI 440, PQHS/EPBI 431, PQHS/EPBI 490, PQHS/EPBI 432, PQHS/EPBI 460, PQHS/EPBI 444 and PQHS/EPBI 445.

PQHS 466. Promoting Health Across Boundaries. 3 Units.
This course examines the concepts of health and boundary spanning and how the synergy of the two can produce new, effective approaches to promoting health. Students will explore and analyze examples of individuals and organizations boundary spanning for health to identify practice features affecting health, compare and contrast practices and approaches, and evaluate features and context that promote or inhibit boundary spanning and promoting health. Offered as MPH 466, PQHS 466, SOCI 466, NURS 466 and BETH 466. Prereq: Graduate student status or instructor consent.
PQHS 473. Integrated Thinking in Population and Quantitative Health Sciences II. 2 Units.

The determinants of common disease are multifactorial and may involve complex interactions among factors, both known and unknown. These risk factors span domains as diverse as social determinants to biochemical lesions. The goal of this course is to teach students to recognize and define explicit and implicit assumptions about studies of disease and to understand how one may integrate different domains of knowledge to improve our understanding of disease etiology and ultimately prevention and treatment efforts. This is the second of a two course sequence required of all PhD in Epidemiology and Biostatistics students. PQHS 472 is the first course in the sequence and is a required prerequisite. This course meets weekly and in-person. Prereq: PQHS 472.

PQHS 480. Introduction to Mathematical Statistics. 3 Units.

An introduction to statistical inference at an intermediate mathematical level. The concepts of random variables and distributions, discrete and continuous, are reviewed. Topics covered include: expectations, variance, moments, the moment generating function; Bernoulli, binomial, hypergeometric, Poisson, negative binomial, normal, gamma and beta distribution; the central limit theorem; Bayes estimation, maximum likelihood estimators, unbiased estimators, sufficient statistics; sampling distributions (chi-square, t) confidence intervals, Fisher information; hypothesis testing, uniformly most powerful tests and multi-decision problems. Prereq: MATH 122, MATH 124 or MATH 126.

PQHS 481. Theoretical Statistics I. 3 Units.

Topics provide the background for statistical inference. Random variables; distribution and density functions; transformations, expectation. Common univariate distributions. Multiple random variables; joint, marginal and conditional distributions; hierarchical models, covariance. Distributions of sample quantities, distributions of sums of random variables, distributions of order statistics. Methods of statistical inference. Offered as STAT 345, STAT 445, and PQHS 481. Prereq: MATH 122 or MATH 223 or Coreq: PQHS/EPBI 431.

PQHS 482. Theoretical Statistics II. 3 Units.

Point estimation: maximum likelihood, moment estimators. Methods of evaluating estimators including mean squared error, consistency, "best" unbiased and sufficiency. Hypothesis testing; likelihood ratio and union-intersection tests. Properties of tests including power function, bias. Interval estimation by inversion of test statistics, use of pivotal quantities. Application to regression. Graduate students are responsible for mathematical derivations, and full proofs of principal theorems. Offered as STAT 346, STAT 446 and PQHS 482. Prereq: STAT 345 or STAT 445 or PQHS/EPBI 481.

PQHS 484. Global Health Epidemiology. 1 - 3 Units.

This course provides a rigorous problem-centered training in the epidemiology, prevention, treatment, and control of infectious diseases and, more generally, global health. This is an advanced epidemiology that embraces an active learning environment. Students are expected to invest time out of the classroom reading and working with classmates. Classes will be conducted with discussions, debates, group projects, and group presentations. By taking this course, students will develop a framework for interpreting, assessing, and performing epidemiologic research on issues of global importance. The course will be divided into three modules: 1) Global Health Epidemiology 2) Helminth Epidemiology, and 3) Epidemiology of Disease Elimination. Each module is worth 1 credit hour and may be taken separately. Each module will have a separate project and/or exam. The final exam time will be used for group presentations and panel discussion. Active class participation is required through discussions, case studies, and group projects. Offered as PQHS 484, INTH 484, and MPHP 484.
PQHS 490. Epidemiology: Introduction to Theory and Methods. 3 Units.
This course provides an introduction to the principles of epidemiology covering the basic methods necessary for population and clinic-based research. Students will be introduced to epidemiologic study designs, measures of disease occurrence, measures of risk estimation, and casual inference (bias, confounding, and interaction) with application of these principles to specific fields of epidemiology. Classes will be a combination of lectures, discussion, and in-class exercises. It is intended for students who have a basic understanding of the principals of human disease and statistics. Offered as PQHS 490 and MPHP 490. Prereq or Coreq: PQHS/EPBI 431 or Requisites Not Met permission.

PQHS 499. Independent Study. 1 - 18 Units.

PQHS 500. Design and Analysis of Observational Studies. 3 Units.
An observational study investigates treatments, policies or exposures and the effects that they cause, but it differs from an experiment because the investigator cannot control assignment. We introduce appropriate design, data collection and analysis methods for such studies, to help students design and interpret their own studies, and those of others in their field. Technical formalities are minimized, and the presentations will focus on the practical application of the ideas. A course project involves the completion of an observational study, and substantial use of the R statistical software. Topics include randomized experiments and how they differ from observational studies, planning and design for observational studies, adjustments for overt bias, sensitivity analysis, methods for detecting hidden bias, and focus on propensity score methods for selection bias adjustment, including multivariate matching, stratification, weighting and regression adjustments. Recommended preparation: a working knowledge of multiple regression, some familiarity with logistic regression, with some exposure to fitting regression models in R. Offered as CRSP 500 and PQHS 500.

PQHS 501. Research Seminar. 0 Unit.
This seminar series includes faculty and guest-lecturer presentations designed to introduce students to on-going research at the University and elsewhere. Seminars will emphasize the application of methods learned in class, as well as the introduction of new methods and tools useful in research.

PQHS 502. Introduction to Statistical Consulting. 1 Unit.
What challenges are faced by a Biostatistician working in a collaborative and consulting environment? In order to successfully interact with a client, in addition to a solid foundation in statistical methods, the consultant needs to be prepared to deal with issues such as ill-posed research questions, unrealistic expectations on the part of a client, difficulty in understanding the subject of the consultation, thorny ethical issues, and many others. Courses on statistical consulting are essential components of graduate programs in Statistics. Other courses teach students statistical methods and how to use them to address various problems, but those problems are presented by course instructors who typically have as the goal teaching the appropriate choice and utilization of available statistical tools. This course prepares students to the challenges involved in 'real life' consulting situations, exposing the students to different encounter types, while honing their communication and statistical skills and raising their awareness of their professional responsibilities.

PQHS 505. Seminar in Global Health Epidemiology. 0 Unit.
This seminar series examines a broad range of topics related to infectious disease research in international settings. Areas of interest are certain to include epidemiology, bioethics, medical anthropology, pathogenesis, drug resistance, vector biology, cell and molecular biology, vaccine development, diagnosis, and socio-cultural factors contributing to or compromising effective health care delivery in endemic countries. Speakers will include a diverse group of regional faculty and post-doctoral trainees, as well as visiting colleagues from around the world. Students will be asked to read a journal article written by the speaker and then discuss this article with the speaker after their seminar.

PQHS 510. Health Disparities. 3 Units.
This course aims to provide theoretical and application tools for students from many disciplinary backgrounds to conduct research and develop interventions to reduce health disparities. The course will be situated contextually within the historical record of the United States, reviewing social, political, economic, cultural, legal, and ethical theories related to disparities in general, with a central focus on health disparities. Several frameworks regarding health disparities will be used for investigating and discussing the empirical evidence on disparities among other subgroups (e.g., the poor, women, uninsured, disabled, and non-English speaking populations) will also be included and discussed. Students will be expected to develop a research proposal (observational, clinical, and/or intervention) rooted in their disciplinary background that will incorporate materials from the various perspectives presented throughout the course, with the objective of developing and reinforcing a more comprehensive approach to current practices within their fields. Offered as CRSP 510, PQHS 510, MPHP 510, NURS 510, and SASS 510.

PQHS 515. Secondary Analysis of Large Health Care Data Bases. 3 Units.
Development of skills in working with the large-scale secondary data bases generated for research, health care administration/billing, or other purposes. Students will become familiar with the content, strength, and limitations of several data bases; with the logistics of obtaining access to data bases; the strengths and limitations of routinely collected variables; basic techniques for preparing and analyzing secondary data bases and how to apply the techniques to initiate and complete empirical analysis. Recommended preparation: PQHS/EPBI 414 or equivalent; PQHS/EPBI 431 or PQHS/EPBI 460 and PQHS/EPBI 461 (for HSR students).
PQHS 550. Meta-Analysis & Evidence Synthesis. 2 - 3 Units.
Systematic reviews use reproducible methods to systematically search the literature and synthesize the results of a specific topic area. Meta-analysis is a specific analytic technique used to pool results of individual studies. Systematic reviews are useful ways to establish one’s knowledge in a particular field of study, and can highlight gaps in research which can be pursued in future work. They can also inform the background of a grant. This course is designed to introduce students to the methods of conducting a high quality systematic review and meta-analysis of intervention studies. We will cover the design, methods, and analytic techniques involved in systematic reviews. These concepts will prepare students to conduct their own systematic review or evaluate the systematic reviews of others. Sessions will be lectures, labs, and presentations. Topics include developing a search strategy, abstracting key data, synthesizing the results qualitatively, meta-analytic techniques, grading the quality of studies, grading the strength of the evidence, and manuscript preparation specific to systematic reviews and meta-analysis of intervention studies. Caveat: If you would like to conduct a systematic review of your own that can be published after the course ends, you will need to have several other class members or colleagues willing to work with you on the project. The systematic review should be on a topic where you expect no more than 20-30 included studies in order to be able to complete the review soon after the course ends. Offered as CRSP 550 and PQHS 550. Prereq: CRSP 401, PQHS/EPBI 431, MPHP 405, NURS 532 or Requisites Not Met permission.

PQHS 601. Master's Project Research. 1 - 18 Units.

PQHS 602. Practicum. 3 Units.
This course focuses on gaining experience as a biostatistician and enhancing the skills needed to become an effective biostatistician, serving as consultant and collaborator. The objectives of this mentored experience course are: to learn the role of the consulting biostatistician and the accompanying responsibilities, experience the life cycle of a project, develop and apply the interpersonal and communications skills required for a biostatistician, strengthen skills learned in the program, and often to enhance the skill set of the student, as well as to gain insight into the life and career of a biostatistician. This experience helps prepare the student for future job interviews and jobs, and may lead directly to a job. The deliverable is a professionally written report in the format of a report to a client or a research paper.

PQHS 651. Thesis M.S.. 1 - 18 Units.
(Credit as arranged.)
PQHS 701. Dissertation Ph.D.. 1 - 9 Units.
(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

WEATHERHEAD SCHOOL OF MANAGEMENT

Peter B. Lewis Building  
http://weatherhead.case.edu/  
Phone: 216.368.2030

Weatherhead School of Management spans the entire spectrum of research and learning from Appreciative Inquiry (AI) to Artificial Intelligence (AI). Weatherhead's more than 1,400 students study undergraduate, graduate and doctoral programs in the Peter B. Lewis Building. Weatherhead's Executive Education programs engage more than 3,000 people annually and offer the latest in leadership development programs to help individuals at all stages of their careers grow in their profession. Our Fowler Center for Business as an Agent of World Benefit brings students together with an international network of educators, researchers and practitioners who incorporate social and global issues into business innovation and social entrepreneurship.

Through innovative curriculum in data-driven management, Weatherhead continues to position graduates for high-demand jobs that connect business with analytics and technology in a rapidly changing world. STEM Masters degrees for MBA, Accounting, Business Analytics, Finance and Operations Research/Supply Chain immerse students with in-demand technical knowledge, such as big data, artificial intelligence and blockchain technology, that is essential for a competitive business career.

As a management school within a top research university, Weatherhead's faculty members are committed to expanding knowledge and contributing to global scholarship through their research. Weatherhead faculty pioneered concepts in Appreciative Inquiry, Emotional Intelligence competencies, Intentional Change Theory and Manage by Designing. Our faculty have extensive, real-world business experience and connections to business leaders which they leverage to help students learn and develop networks. Students have unique opportunities to work closely with our world-class faculty members.

Mission Statement

The Weatherhead School of Management has an enduring impact on business and society through cutting edge research and innovative teaching that prepares professionals for the marketplace of the future.

Vision

The Weatherhead School of Management is a leader in data driven, experiential, and market-based management education and research. We leverage our strengths from Appreciative Inquiry to Artificial Intelligence (AI to AI), empowering our graduates to solve complex problems and lead thriving organizations that do well by doing good.

Values

The Weatherhead School of Management proudly embraces our student-centered culture of excellence that promotes collaboration, inclusion, and diversity in all that we do.

- Student-Centered – We believe in our students and alumni being our true north, and promote their development, growth, and well-being.
- Excellence with Integrity– We act ethically and transparently with all our internal and external stakeholders to promote and reward a culture of inquiry and discovery that is driven by evidence-based

innovation in our research, in our classroom experience, and in our community endeavors.
- Collaboration in Action – We act collegially within our WSOM community, the University, and with external partners to develop enduring and transformational knowledge across disciplines.
- Diversity with Inclusion – We value diversity of ideas, culture, and people to foster an inclusive, respectful, and supportive community of lifelong learners.

Brief History

In 1952, Western Reserve University established the School of Business by combining the Cleveland College Division of Business Administration and the Graduate School Division of Business Administration, and from its founding until 1988, the activities of the School of Business were divided among a number of buildings both in downtown Cleveland and in University Circle. In 1967, the merger of Case Institute of Technology and Western Reserve University created Case Western Reserve University, and the Western Reserve University School of Business absorbed Case's Division of Organizational Sciences to become the School of Management in 1970. Just six years later, the School of Management launched its full-time MBA.

In 1980, the School of Management was renamed in honor of Albert J. Weatherhead III, a Cleveland businessman and industrialist who represented the fourth generation of his family to carry on the Weatherhead name and values, including cultural and educational leadership. By 1999, the Weatherhead School of Management had developed a strong identity, growing out of its space in Enterprise Hall and requiring new construction. Funded by the philanthropist and entrepreneur whose name it bears, the Peter B. Lewis building, designed by renowned contemporary architect Frank Gehry and completed in 2002, was the answer. Located across the street from the George S. Dively Building, which houses Weatherhead Executive Education programs, the Lewis Building, featuring Gehry's unmistakable sculptural profile and gleaming stainless steel roof, both sets the school apart from its surroundings and, quite literally, reflects the prestigious neighborhood of the school. Gehry redefined the way a business school should look, just as Weatherhead redefines the way management education should take place.

Accreditation

The programs of the Weatherhead School of Management have been fully accredited by the Association to Advance Collegiate Schools of Business (AACSB) International since 1958.

Administration

Manoj K. Malhotra, PhD  
(Ohio State University)  
Dean, Weatherhead School of Management; Albert J. Weatherhead III Professor of Management; Professor, Operations

Gregory Jonas, PhD, CMA  
(Virginia Commonwealth University)  
Senior Associate Dean, Academics and Graduate Programs; Associate Professor, Accountancy

Leonardo Madureira, PhD  
(University of Pennsylvania)  
Associate Dean, Research and Faculty; Deborah and David Daberko Fellow; Professor, Banking and Finance
Jennifer Johnson, MBA  
*Associate Dean, Undergraduate and Integrated Programs; Associate Professor, Design & Innovation*

Sharon Martin, MBA, CPA  
*Associate Dean, Finance and Administration; Associate Professor, Accountancy*

Shirley Leonard, MBA  
*Associate Dean, External Relations*

Jim Hurley, MEd, MSEd  
*Assistant Dean, Undergraduate and Integrated Programs*

Tiffany Schwendeman, MAcc, MBA  
*Assistant Dean, Curriculum and Administration, Master of Accountancy*

Deborah Bibb, MBA  
*Executive Director Enrollment, Career Development and Student Experience*

Anna Frolova-Levi, MBA  
*Executive Director, Recruitment and Placement*

Christine Kush, MBA, MPA  
*Executive Director, Executive Education*

**Undergraduate Programs**

**DEGREES AND MAJORS**

- BS Accounting
- BA Economics
- BS Management with Major(s) in:
  - Business Management
  - Finance
  - Marketing
  - Dean’s Approved Bachelor of Science (BS) in Accounting

The accounting profession demands a high degree of technical training, similar to the professions of architecture, law, engineering and medicine, and a broad knowledge of the fundamentals of economics and business with a commitment to public well-being. Career opportunities in accounting include the public, corporate, government, nonprofit and healthcare sectors. The undergraduate program in accountancy is designed to prepare students for entrance into these careers and to provide a foundation for the examination to become a CPA or to achieve other professional certifications. Each state Board of Accountancy (https://www.nasba.org/stateboards/) has its own eligibility requirements for taking the CPA exam. Students pursuing a BS in Accounting should consult the Board of Accountancy (https://www.nasba.org/stateboards/) website for the state in which they plan to sit for the CPA examination in order to determine specific course requirements.

As part of the sequence of courses leading to the BS in Accounting offered through Weatherhead, the student takes required and elective courses in related fields of banking and finance, economics, marketing, organizational behavior and operations.

**Integrated Study Program in Accountancy**

Undergraduate students at Case Western Reserve University have the unique opportunity to pursue both the Bachelor of Arts (BA) or Bachelor of Science (BS) and the Master of Accountancy through the BA/BS and Master of Accountancy Integrated Study Program. The Integrated Study program allows students to complete both degrees in four or five years. For students majoring in accounting, both degrees are most commonly completed in four-and-a-half years or nine academic semesters. All Case Western students must apply for and be admitted to the MAcc program, although certain requirements are waived, such as the Graduate Management Admission Test (GMAT) or the Graduate Record Examinations (GRE). Because of the necessity for proper planning of coursework, undergraduate students are strongly encouraged to apply for the MAcc in their junior year.

The Integrated Study program is strongly recommended for those individuals planning to obtain professional certification as a certified public accountant (CPA). CPA candidates must have completed 150 semester hours of study at the university level in order to qualify to sit for the CPA examination. The integrated program saves qualified students both time and money while equipping students with the skills and knowledge attractive to top accounting firms.

For more information, contact Tiffany Schwendeman (tiffany.schwendeman@case.edu), assistant dean of undergraduate and integrated study programs, at 216.368.2058.

**Early Admission to the Integrated Study Program in Accountancy**

Each year, approximately 10 to 15 exceptionally well-qualified high school seniors who plan to pursue careers in accountancy will be offered Early Admission to the Integrated Study Program in Accountancy (https://weatherhead.case.edu/degrees/undergraduate/academics/accounting/integrated-program/) at Case Western Reserve University. Early admits receive a conditional commitment of admission to the Weatherhead School of Management Master of Accountancy (https://weatherhead.case.edu/degrees/masters/m-accountancy/) program and a scholarship package covering a minimum of 50% of an academic year’s tuition cost to be honored when students formally enroll as a graduate student. Students are required to maintain a minimum undergraduate GPA of 3.2 overall and in accountancy courses. Those who achieve higher grade point averages will be eligible for greater scholarship amounts.
Practicum Program

The practicum program ([https://case.edu/postgrad/experiential-education/practicum/) is a planned, structured, supervised workplace experience at an approved “site” organization. The practicum is an experiential learning arrangement between the student, the employer and the practicum adviser in conjunction with the Office of Post-Graduate Planning and Experiential Education. Employers provide appropriate supervision and work-related learning while the practicum adviser guides and evaluates the student’s experience. The primary goal of this active learning experience is the intellectual, personal and professional growth of the student in an area related to the student’s academic goals. The practicum should provide the student with new skills, insights and experiences that are transferable to the academic setting.

Students apply to the Office of Post-Graduate Planning and Experiential Education in the semester preceding the work assignment and may participate in up to two practicums. All practicums developed through the University Career Center must be taken for transcript notation, and students must have a faculty member serve as a practicum advisor. If a student elects to work in an internship/practicum without enrolling in the course for academic notation, he or she will not have the benefits of full-time student status. Additionally, he or she will not represent the practicum program in any official capacity.

Bachelor of Arts (BA) in Economics

(College of Arts and Sciences)

The BA in Economics is a 120-credit-hour, structured program in which students learn to analyze problems of resource allocation and decision making and to understand the influence of these factors on economies and societies. Our highly regarded major attracts some of the best students on campus. Students have the opportunity to assist Weatherhead faculty in their research activities and to participate in independent research projects.
Bachelor of Arts (BA) in Economics concentration in Quantitative Methods  
*(College of Arts and Sciences)*

This major option (120-hours) emphasizes mathematical and empirical methods in economics, including development of strong quantitative and programming skills. The Quantitative Methods concentration is especially recommended for students who are highly interested in research and advanced study in Economics.

**General Degree Requirements**

Students are required to complete the Arts and Sciences General Education Requirements (*p.*).

Students who desire a Secondary Major in Economics should consult with a Weatherhead academic advisor.

**Major Requirements: Economics**

**NOTE:** ECON 395 and ECON 398 do not count towards electives (See information below on SAGES Senior Capstone).

**SAGES Senior Capstone: Economics**

The basic Economics major does not require a capstone as part of the major. However, students need to complete a capstone as part of the SAGES requirement. The Economics Department offers the following courses for a capstone.

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>ECON 398</td>
<td>Honors Research II</td>
<td>3</td>

<td>3-6</td>
</tr>
</tbody>
</table>
SAGES Senior Capstone: Economics concentration in Quantitative Methods

Required - 3 units:

ECON 395  The Economy in the American Century 3
or ECON 398  Honors Research II

For more information, contact Teresa Kabat (teresa.kabat@case.edu), department administrator, at 216.368.4110.

Bachelor of Science (BS) in Management

Graduates of the BS in Management degree program obtain a broad education that enables them to bring an unusual degree of analytical capability to the problems of management and business. Each student is required to complete an approved major program of study from the options outlined below. In addition, each student must consult with an advisor in the Office of Undergraduate and Integrated Study Programs at Weatherhead.

General Education Requirements

Core Requirements

| BAFI 355 Corporate Finance                      | 3     |
| MGMT 201 Contemporary Business and Communication | 3     |
| MIDS 301 Introduction to Information: A Systems and Design Approach | 3     |
| MKMR 201 Marketing Management                   | 3     |
| OPRE 301 Operations Research and Supply Chain Management | 3     |
| ORBH 250 Leading People (LEAD I)                | 3     |
| ORBH 251 Leading Organizations (LEAD II)        | 3     |
| PLCY 399 Business Policy                       | 3     |
| MGMT 395 Advanced Seminar (*MGMT 395-one credit hour seminar; each student must complete three) | 3     |

Open Electives

Electives 15-24

Total Units 57-66

Major Requirements

Students must complete an 18-credit-hour major in Business Management, Finance, Marketing or a Dean’s Approved Major. Students who desire a Secondary Major in one of these areas should consult with a Weatherhead academic advisor.

Business Management Major Requirements

1) Complete three courses from within one of the concentrations below. 9

2) Complete one of the following analytics courses: 3-4

| BAFI 361 Empirical Analysis in Finance |       |
| ECON 326 Econometrics                  |       |
| MKMR 310 Marketing Analytics           |       |

3) Complete two additional Weatherhead electives. 6

Total Units 18-19

Business Management Concentrations

Business Information Technology

Required Course:

| DESN 210 Introduction to Programming for Business Applications |       |

Elective Courses (complete two of the following):

| ACCT 306 Accounting Information Systems - Basic |       |
| BAFI 335 Introduction to Fintech                |       |
| MKMR 348 Strategic Internet Marketing           |       |
| OPMT 377 Enterprise Resource Planning in the Supply Chain |       |

Healthcare Management

Required Course:

| ECON 378 Health Care Economics                  |       |

Elective Courses (complete two of the following):

| ECON 342 Public Finance                         |       |
| HSMC 412 Lean Services Operations               |       |
| HSMC 420 Health Finance                         |       |
Or alternative, approved HSMC or other WSOM course chosen in consultation with advisor.

### Innovation and Entrepreneurship

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
</tr>
</thead>
<tbody>
<tr>
<td>BLAW 331</td>
<td>Legal Environment of Management</td>
</tr>
<tr>
<td>ECON 364</td>
<td>Economic Analysis of Business Strategies</td>

</tr>
<tr>
<td>ECON 373</td>
<td>International Trade</td>
</tr>
<tr>
<td>ECON 375</td>
<td>Economics of Developing Countries</td>
</tr>
<tr>
<td>ECON 376</td>
<td>Inside Financial Crises</td>
</tr>
<tr>
<td>MGMT 315</td>
<td>International Management Institute</td>
</tr>
<tr>
<td>ORBH 391</td>
<td>Leadership in Diversity and Inclusion: Towards a Globally Inclusive Workplace</td>
</tr>
</tbody>
</table>

**NOTE:** MGMT 315 is required for this concentration. If a student wishes to substitute a course from another study abroad experience, he/she must receive prior approval from an academic advisor.

### Organizational Leadership

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORBH 303</td>
<td>Leading Teams through Interpersonal Relationships</td>
</tr>
<tr>
<td>ORBH 330</td>
<td>Quantum Leadership: Creating Value for You, Business, and the World</td>
</tr>
<tr>
<td>ORBH 360</td>
<td>Independent Study</td>
</tr>
<tr>
<td>ORBH 370</td>
<td>Navigating Gender in Organizations</td>
</tr>
<tr>
<td>ORBH 380</td>
<td>Managing Negotiations</td>
</tr>
<tr>
<td>ORBH 391</td>
<td>Leadership in Diversity and Inclusion: Towards a Globally Inclusive Workplace</td>
</tr>
</tbody>
</table>

**NOTE:** Students completing an Organizational Leadership concentration may not complete a Leadership minor.

### Supply Chain Management

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPMT 350</td>
<td>Project Management</td>
</tr>
<tr>
<td>OPMT 377</td>
<td>Enterprise Resource Planning in the Supply Chain</td>
</tr>
<tr>

<td>Lean Operations</td>
</tr>
<tr>
<td>OPMT 475</td>
<td>Supply Chain Logistics</td>
</tr>
<tr>
<td>OPRE 332</td>
<td>Computer Simulation</td>
</tr>
</tbody>
</table>

### Finance Major Requirements

**Required Courses:**

- BAFI 356 Investments
- BAFI 357 Financial Modeling, Analysis and Decision Making
- BAFI 361 Empirical Analysis in Finance

**Elective Courses (complete three of the following six):**

- BAFI 335 Introduction to Fintech
- BAFI 341 Money and Banking
  or ECON 341 Money and Banking
- BAFI 358 Intermediate Corporate Finance
- BAFI 359 Cases in Finance
- BAFI 362 Advanced Financial Analytics
- BAFI 365 Options and Other Derivatives

**Total Units:** 18

### Marketing Major Requirements

**Required Courses:**

- MKMR 304 Brand Management
- MKMR 308 Measuring Marketing Performance
- MKMR 310 Marketing Analytics
- MKMR 311 Customer Relationship Management
- MKMR 312 Selling and Sales Management
- MKMR 348 Strategic Internet Marketing

**Total Units:** 18

### Dean’s Approved Major Requirements

A student may consult with an advisor to develop a proposal for individualized study in an area of interest, subject to approval by the Weatherhead Undergraduate Executive Committee.

1. Complete five courses around a common interest, selected in conjunction with a major advisor.

2. Complete one of the following analytics courses:

   - BAFI 361 Empirical Analysis in Finance
   - ECON 326 Econometrics
   - MKMR 310 Marketing Analytics

**Total Units:** 18-19

### Total Credit Hours for Degree: 122

**Students must complete one university-approved SAGES Senior Capstone. It is not required that students complete a Weatherhead-specific capstone. However, the vast majority of students take MGMT 398 Action Learning. Highly motivated students with a keen interest in a particular business topic may complete an individual research project via MGMT 397, subject to approval by the Weatherhead Undergraduate Executive Committee.**

Students pursuing a BS in Management are advised to take the ORBH 250 Leading People (LEAD I) and ORBH 251 Leading Organizations (LEAD II) sequence in the second year.
For more information, contact Jim Hurley (james.hurley@case.edu), assistant dean of undergraduate and integrated study programs at 216.368.3856.

Jim Hurley (james.hurley@case.edu), assistant dean of undergraduate and integrated study programs, 216.368.3856; or Tiffany Schwendeman (tiffany.schwendeman@case.edu), assistant dean of undergraduate and integrated study programs, 216.368.2058.

Weatherhead's Integrated Study Programs allow undergraduate students the unique opportunity to pursue a bachelor’s degree and a master’s degree at the same time, completing both degrees in as little as four years. These programs are open to all Case Western undergraduates, regardless of major, but certain prerequisite courses may be required in order to complete the master’s degree. Each program has its own set of admission criteria, course timelines and considerations, so it is best to speak with a program representative as early as possible.

Master of Business Administration (MBA)

Full-Time MBA

The full-time MBA program is a four-semester, 60-credit-hour program that provides students with the strong foundation necessary to be a leader in management while allowing opportunities for students to pursue their passions and customize their experience. In partnership with faculty and staff, students create a personalized learning plan with distinct concentrations by choosing electives that comprise half of the program thereby enabling specialization within their MBA.

Distinctive courses in Weatherhead's MBA program help students assess their strengths and develop a learning plan to meet their career goals. Upon enrolling in the MBA, students take Leading People and Organizations, which facilitates the discovery of individual strengths and weaknesses through a series of self-assessments, experiential activities and case studies focused on teamwork. Students then develop core management skills (accounting, finance, marketing, operations/supply chain management, strategy, economics, statistics and analytics) in the first year of the program. In the second year of the MBA program, students choose electives based on their choice of concentration(s) and complete the required core strategy class.

The Weatherhead School of Management offers two tracks in the MBA program.

STEM MBA track - offers three concentrations:
- Financial Analytics
- Operations Analytics
- Business Analytics

Standard MBA track - offers seven concentrations:
- Finance
- Marketing
- Operations
- Business Analytics
- Organizational Leadership
- Entrepreneurship & Design & Innovation
- Healthcare Management

Independent Study

MBA students are limited to three credit hours of elective credit as independent study with the approval of the full-time MBA faculty program director.

Other courses at the university may be eligible for MBA elective credit, subject to approval from associate dean for academic affairs Gregory Jonas (gregory.jonas@case.edu).

Curriculum

All of the core courses in the following tables are required.

Total Units in Sequence: 60

Electives

The program provides space for taking 10 elective courses. Students must choose four electives in a concentration (a concentration is required). Students must complete eight STEM-approved electives to complete the requirements of the STEM MBA track.

For additional information about this program, contact Radhika Ramamurthi (rxe73@case.edu), program manager, 216.368.2144, or Stephen Scheidt (sxs1507@case.edu), director of admissions, 216.368.6208.

Part-Time MBA

The part-time MBA is a 48-credit-hour, cohort-based program that combines a core of fundamental business classes with elective options to create an integrated experience focused on honing general management skills. Students develop a personalized learning plan through the MBAP 401 (LEAD) course.

The first summer semester begins with the intensive offering of LEAD and an online introduction to statistics MBAP 400. The rest of the core offerings are covered within the first two years of the program. Core classes typically meet one evening a week. Summer semesters include more intensive formats. The majority of the third year is devoted to electives. The part-time MBA program is designed to be a three-year program, but the 48 credit hours can be completed in as little as 2.5 years based on a customized curriculum plan. All degree requirements must be completed within six years.

Open Electives

Students in the part-time MBA program have the opportunity to choose five electives. Students determine their own focus areas and, with the help of our Career Management Office, learn how to best position themselves for post-MBA career advancement.
For additional information about this program, contact Radhika Ramamurthi (rxe73@case.edu), program manager, 216.368.2144, or Stephen Schiedt (sxs1507@case.edu), director of admissions, 216.368.6208.

Executive MBA (EMBA)
The Executive MBA (EMBA) and the Cleveland Clinic-Weatherhead Executive MBA are tailored to those poised to move into a more prominent leadership role. Weatherhead’s renowned Organizational Behavior Department structured the EMBA around an exploration of the four levels of leadership, amplifying students’ ability to effect change at the personal, team, organization and societal levels. Classes are held during periodic residencies in the company of intimate cohort groups.

Curriculum
The 48-credit-hour program takes place over 16 brief residencies. The curriculum is delivered over five semesters or 21 months. Both fall and spring semesters are comprised of four three-day residencies (Thursday, Friday, Saturday), with additional track-specific site visits during one residency in the spring semester. The summer semester includes the 10-day international study tour as part of the international business course EMBA 475. Although individual study habits vary, students should anticipate spending 15-20 hours per week to study outside of classes.

The Weatherhead EMBA is a lock-step cohort program. Participants self-select learning teams that represent essential study partnerships over the course of the program as well as invaluable resources for networking and organizational support. Learning teams meet weekly outside of the classroom, either face-to-face or remotely, to achieve course objectives and enhance the learning experience. In addition, faculty often host optional study and review sessions, which are also recorded for virtual access.

EMBA Nonprofit Certificate
In addition to earning the Master of Business Administration degree, nonprofit professionals who complete the EMBA can earn the EMBA Nonprofit Certificate at the same time. The EMBA certificate program fosters mutually beneficial dialogue between professionals from nonprofit and for-profit backgrounds. As a participant in the EMBA Nonprofit Certificate program, you will build new and lasting partnerships with other nonprofit and for-profit organizations in Greater Cleveland.

Cleveland Clinic-Weatherhead Executive MBA
The Cleveland Clinic-Weatherhead Executive MBA at Case Western Reserve University combines Weatherhead’s breakthrough business concepts of leadership in management with Cleveland Clinic’s innovation in healthcare to make this EMBA the premier option for experienced professionals in the healthcare profession. Participants in the Cleveland Clinic-Weatherhead EMBA join students in the traditional EMBA track to provide cross-pollination of ideas from a multitude of industries and experiences. Several healthcare-specific curriculum differences are noted in the plan of study below.

Master’s Programs

Master of Accountancy (MAcc)

The Master of Accountancy program at Weatherhead is a 30-credit-hour specialized master’s degree designed to build upon the skills and knowledge acquired in an undergraduate accountancy program. Based upon a student’s professional interests, they will choose between two tracks, the Professional Track or the Analytics Track, that are specifically tailored to develop their ability to prepare, interpret and communicate accounting information as required by that profession. Through a common set of courses, the program enhances a student’s critical thinking and communication skills, positioning graduates for long-term success in careers that span business, government and non-profit organizations.

Upon completion of Weatherhead’s MAcc program, graduates will have satisfied the accounting educational requirements to sit for the CPA examination in the state of Ohio. Depending on a student’s previous studies, they may or may not satisfy the general business educational requirements. If students wish to sit for the examination in a state other than Ohio, they are encouraged to review the educational requirements before beginning their studies in order to plan accordingly.

Undergraduate Opportunities

Undergraduate students at Case Western Reserve University have the opportunity to pursue a bachelor’s degree and the MAcc at the same time through the BA/BS and Master of Accountancy Integrated Study Program (https://weatherhead.case.edu/degrees/undergraduate/academics/accounting/integrated-program/). The Integrated program is open to students pursuing any undergraduate major, although students majoring in or with a secondary major in accounting are able to complete both degrees in the shortest amount of time, typically nine or 10 semesters. A select number of exceptionally well-qualified high school seniors who plan to study accounting are offered places in the Early Admission to the Integrated Study Program in Accountancy (https://bulletin.case.edu/weatherheadschoolofmanagement/undergradprograms/#accountingtext) (p. 1057) and may obtain both degrees in eight semesters.

Eligibility to Apply

Applicants to the MAcc program must have earned, or are in the process of earning, a bachelor’s degree from an accredited institution. A bachelor’s degree in accounting is not required to apply to the MAcc. Students interested in the Analytics Track must have completed two semesters of college calculus (including exposure to multivariate functions) and have a basic understanding of linear algebra (high-level knowledge of vectors and matrices plus what’s involved in adding and multiplying them).

Prerequisite Courses

In addition to earning a bachelor’s degree, applicants must have earned a grade of C or better in the following courses or their equivalents. Students who have not completed these courses must fulfill these requirements at CWRU or at an approved substitute institution.

<table>

1 Students may waive the Excel course by passing a proficiency examination.
2 Students may take the graduate level U.S. Business Law course (BLAW 417 Legal Environment for Managers) and double count it as an elective for the MAcc.

Curriculum

The MAcc program requires completion of 30 credit hours of graduate study, typically comprised of ten 3-credit hour courses. The program offers two tracks: (i) a Professional Track for students interested in careers in audit, tax or management accounting; and (ii) a STEM-designated Analytics Track for students interested in combining accounting with data analysis tools. Completion of either track will meet
the accounting educational requirements to sit for the CPA exam in the state of Ohio.

Total Units: 15

* All students must select a 3-credit hour graduate-level elective course that complements an accountancy career. Students completing the Analytics Track track must choose an elective with a STEM-related focus. A list of approved graduate supporting electives will be provided each semester.

For more information about the MAcc, contact Tiffany Schwendeman (tiffany.schwendeman@case.edu), assistant dean, undergraduate and integrated study programs, at 216.368.2058; or Ashley Lu (ashley.lu@case.edu), program manager, MAcc, at 216.368.5376.

Master of Science in Management-Business Analytics (MSM-Business Analytics)

The Master of Science in Management-Business Analytics (MSM-Business Analytics) degree is a 16-month, 36-credit-hour, full-time program for students interested in learning advanced data analytics skills for application in general business areas, focusing specifically on both marketing and operations. The program prepares students to analyze big data for smart insights for executive decision making. The program includes three interlocking modules:

- Business core (10.5 credit hours),
- Analytics core (13.5 credit hours)
- Applied Business analytics (12 credit hours)

The Business Core provides students with a holistic understanding of the underlying business context necessary for succeeding in any industry. The Analytics Core equips students with the general data handling, data presentation and analysis skills. The courses in Applied Business Analytics build from these general skills to improve the students’ ability to make decisions in the two focus application areas: marketing and operations.

The overlapping areas emphasize our program’s goals:

- Learning the language of business
- Building analytical skills
- Applying appropriate analytical tools to today’s business data

The program is delivered through a range of open source and commercial statistical software (e.g., R, Python, SPSS, SAS), preparing students with the necessary user expertise to excel in analyst positions across industries.

Prerequisites

Students are required to have taken two calculus courses at the college level and one course in linear algebra. Students who do not satisfy linear algebra prerequisites will be required to take a one credit preparatory course. A course in statistics is strongly preferred.
