ABOUT

The University
Case Western Reserve University (http://case.edu/) is one of the nation’s leading independent research universities. With programs encompassing the arts and sciences, engineering, the health sciences, law, management, and social work, our community works every day to think beyond the possible.

Brief History
Case Western Reserve University’s origins date back nearly two centuries to 1826, the year of Western Reserve College’s founding.

Originally located in Hudson, Ohio, the college was renamed Western Reserve University in 1884 and moved to what is now University Circle. After adding a new medical school alongside its undergraduate programs, the college found a neighbor in the Case School of Applied Science, an institution founded in 1880 through the bequest of Leonard Case Jr., a leading benefactor and Cleveland civic leader.

The Case School changed names to Case Institute of Technology in 1947 to reflect its growing stature in the sciences and engineering, but this name change was not its last. In 1967, Western Reserve University joined with Case Institute of Technology to form Case Western Reserve University, thus becoming a leading institution for academics and research worthy of national and international distinction.

Today, Case Western Reserve is a top-ranked national research university with approximately 12,000 students, nearly 7,000 faculty and staff members, and more than 110,000 alumni. The university comprises seven schools and a college:

- Case School of Engineering
- College of Arts and Sciences
- Frances Payne Bolton School of Nursing
- Jack, Joseph and Morton Mandel School of Applied Social Sciences
- School of Dental Medicine
- School of Law
- School of Medicine
- Weatherhead School of Management

To learn more, visit the university’s history page (https://case.edu/about/history.html).

Mission and Vision

University Mission
Case Western Reserve University improves and enriches people’s lives through research that capitalizes on the power of collaboration and education that dramatically engages our students.

We realize this goal through:

- Scholarship and creative endeavor that draws on all forms of inquiry
- Learning that is active, creative and continuous
- Promotion of an inclusive culture of global citizenship

University Vision
We aim to be recognized internationally as an institution that imagines and influences the future.

Toward that end, we will:

- Support advancement of thriving disciplines as well as new areas of interdisciplinary excellence.
- Provide students with the knowledge, skills and experiences necessary to become leaders in a world characterized by rapid change and increasing interdependence.
- Nurture a community of exceptional scholars who are cooperative and collegial functioning in an atmosphere distinguished by support, mentoring and inclusion.
- Pursue distinctive opportunities to build on our special features including our relationships with world-class health care, cultural, educational, and scientific institutions in University Circle and across greater Cleveland.

Administration

Eric W. Kaler
President

Ben Vinson III
Provost and Executive Vice President

Richard W. Bischoff
Vice President for Enrollment

Katie Brancato
Chief of Staff, Office of the President

Lisa A. Camp
Chief of Staff, Office of the Provost

Stephen M. Campbell
Senior Vice President for Campus Planning and Facilities Management

Jonathan S. Carlson
Vice President for Financial Planning

Mitchell Drumm
Interim Vice President for Research and Technology Management

Donald L. Feke
Vice Provost for Undergraduate Education and Academic and Faculty Affairs

David Fleshler
Vice Provost for International Affairs

Carolyn Gregory
Vice President for Human Resources

Arnold Hirshon
Vice Provost and University Librarian

Richard J. Jamieson
Vice President for Campus Services
Elizabeth J. Keefer
Sr. Vice President for Administration
Patricia L. Kost
Controller
Jennifer Kuhel
Assistant Chief of Staff for Presidential Communications and Special Projects
Michael J. Lee
Treasurer
Thomas B. Matthews
Associate Provost, Student Success
Timothy R. Milanich
Chief Investment Officer
Carol L. Moss
Senior Vice President for University Relations and Development
Peter M. Poulos
General Counsel, Chief Risk Management Office and Secretary of the Corporation
Tyler Reimschisel
Associate Provost, Interprofessional Education, Research & Collaborative Practice
Robert Solomon
Vice President for Inclusion, Diversity, and Equal Opportunity
Chris Sheridan
Vice President for University Marketing and Communications and Senior Advisor to the President
John F. Sideras
Senior Vice President for Finance and Chief Financial Officer
Louis W. Stark
Vice President for Student Affairs
Sue B. Workman
Vice President for University Technology and Chief Information Officer
Victoria Wright
Senior Associate Vice President for University Planning and Administration
Manoj K. Malhotra
Dean of the Weatherhead School of Management
Sharon E. Milligan
Interim Dean of the Jack, Joseph and Morton Mandel School of Applied Social Sciences
Carol M. Musil
Dean of the Frances Payne Bolton School of Nursing
Charles E. Rozek
Vice Provost for Graduate Education and Academic and Faculty Affairs
Michael P. Scharf
Dean of the School of Law
Joy K. Ward
Dean of the College of Arts and Sciences
Jeffrey Wolcowitz
Dean of Undergraduate Studies

Board of Trustees, Officers
Fredrick D. DiSanto
Chair of the Board of Trustees
Timothy J. Callahan
Vice Chair of the Board of Trustees
Julie L. Gerberding
Vice Chair of the Board of Trustees
Donald J. Richards
Vice Chair of the Board of Trustees

Accreditation
Case Western Reserve University is accredited at the institutional level by the Higher Learning Commission (https://www.hlcommission.org/). In addition, many of Case Western Reserve's individual programs are accredited by nationally recognized professional associations, including:

• Accreditation Commission for Midwifery Education (nurse midwifery)
• Accreditation Council for Cooperative Education (cooperative education programs)
• Accreditation Review Commission on Education for the Physician Assistant (physician assistant)
• American Bar Association (law)
• American Board of Genetic Counseling (genetic counseling)
• American Chemical Society (chemistry)
• American Dental Association (dentistry)
• American Medical Association and Association of American Medical Colleges, Liaison Committee on Medical Education (medicine)
• American Psychological Association (clinical psychology)
• American Speech-Language-Hearing Association (speech pathology)
• Association to Advance Collegiate Schools of Business (accountancy and business)
• Commission on Accreditation for Dietetics Education, American Dietetic Association (didactic program in dietetics, dietetic internship)
• Commission on Accreditation of Allied Health Education Programs (anesthesiologist assistant)
• Commission on Collegiate Nursing Education (Bachelor of Science in Nursing, Master in Nursing, Master in Science of Nursing, Post Graduate APRN Certificate and Doctor of Nursing Practice programs)
• Computing Accreditation Commission of ABET, www.abet.org (http://www.abet.org/), (BS degree program in computer science)
• Council for the Accreditation of Education Preparation (teaching licensure)
• Council on Accreditation of Nurse Anesthesia Educational Programs (nurse anesthesia)
• Council on Education for Public Health (public health)
• Council on Social Work Education (social work)
• Engineering Accreditation Commission of ABET, www.abet.org (http://www.abet.org/), (all BS degree programs in engineering, not including the general engineering degree program and the data science & analytics program)
• National Association of Schools of Music (music)
• Ohio Department of Education, Division of Teacher Education and Licensure (art education and music education)
• Teacher Education Accreditation Council (art education and music education)

Chartered as an educational institution under the laws of the State of Ohio, Case Western Reserve University also holds a Certificate of Authorization (https://www.ohiohighered.org/sites/ohiohighered.org/files/uploads/COA/Case%20Western%20Reserve%20University_COA_amended%20June%202016.pdf) from the Ohio Department of Higher Education (https://www.ohiohighered.org/).

For more information on the University's various accreditations and a full list of Accredited Programs (https://case.edu/assessment/about/accredited-programs/), contact the Office of Institutional Research (https://case.edu/ir/).

**Philosophy Statement on Educational Outcome Assessment**

Case Western Reserve University is committed to maintaining a comprehensive educational outcome assessment program. This program measures how our students have changed, what knowledge they have gained, and what competencies they have developed. Using these measures, we not only assess how well we are achieving our objectives, but also identify what types of programs and experiences have the most powerful impacts. Our ultimate goal is to incorporate ongoing evaluations into our educational culture to ensure we continually improve our programs and enhance the distinctiveness of our university.

Education outcome assessments are based on the core vision and mission of each school and the university as a whole. The faculty, empowered by adequate resources and support to carry out assessment activities, accepts that educational outcome assessments are a part of their academic duties. These assessments serve as a means by which faculty can improve teaching and learning, and also provide evidence of teaching effectiveness for institutional purposes.

**Cleveland**

Ranked as one of the country’s most livable cities, Cleveland, Ohio, is a mid-sized metropolis with a big impact. The city serves as headquarters for many large corporations and is a major banking center, hosting one of 12 Federal Reserve Banks in the United States.

Thriving health care and biotechnology industries position Cleveland as a health care hub. Here, you’ll find dozens of hospitals and medical centers including Cleveland Clinic, University Hospitals, Louis Stokes Cleveland VA Medical Center and the MetroHealth Medical Center, which are internationally recognized for outstanding patient care and contributions to medical research.

Home to nearly 3 million people, Northeast Ohio is known for its low cost of living, lively arts and culture scene, and professional sports teams. Extensive dining options can be found across the city’s unique neighborhoods, lending Cleveland a reputation as a dining destination.

On the shores of Lake Erie, Cleveland’s four-season climate and easy access to the 24,000-acre Metropark system make it the perfect location for those who love the outdoors. More than 60 ethnic groups live in Cleveland, contributing to seasonal festivals with traditions brought to the region from around the world.

**University Circle**

Case Western Reserve University is located in the heart of University Circle (http://www.universitycircle.org/), one of the city’s most energetic and culturally robust communities. Just minutes away from downtown Cleveland, University Circle comprises 550 park-like acres in a vibrant urban environment. Of the 40 cultural, medical, educational, religious, and social service institutions that call University Circle home, Case Western Reserve is the largest.

Our campus community is within walking distance of outstanding destinations like Severance Hall, home of the world-famous Cleveland Orchestra; the Cleveland Museum of Art, housing one of the nation’s finest collections; the Cleveland Institute of Music; the Cleveland Institute of Art; the Western Reserve Historical Society; the Cleveland Botanical Garden; the Cleveland Museum of Natural History; and many others.

University Circle attracts visitors from throughout the region and around the world to its concerts, theater performances, athletic events, art shows, public lectures, exhibits, and restaurants. Housing, shopping, and recreational facilities are all located in the area.

1. Available only as a second major
2. The Medical Scientist Training Program
3. Combined degree by special arrangement for selected students who hold acceptances in the School of Medicine
4. Available as the undergraduate portion of the Bachelor of Science in Engineering/Master of Science program
5. Available as the graduate portion of the Bachelor of Science in Engineering/Master of Science program
6. Dual degree five-year Doctor of Medicine/Master of Science
7. The Biomedical Investigation Program
8. Program not admitting students for the current academic year
9. Masters offered only to current doctoral students or through the Integrated Graduate Studies program (IGS)
10. Available online
11. Available as the graduate portion of the Bachelor of Science in Engineering/Master of Engineering program
Engineering seeks to create new processes, products, methods, materials, or systems that impact and are beneficial to our society. To enable its graduates to lead the advancement of technology, the Case School of Engineering offers fourteen degree programs at the undergraduate level (twelve engineering degrees, plus the BS in computer science and the BS in data science and analytics). At the postgraduate level, the School of Engineering offers Master of Science programs and the Doctor of Philosophy for advanced, research-based study in engineering. The Case School of Engineering offers two specialized degrees at the master’s level: a Master of Engineering specifically for practicing engineers, and an integrated Master of Engineering and Management jointly administered with the Weatherhead School of Management. The Case School of Engineering also offers two dual degrees at the graduate level jointly administered with the School of Medicine: a Doctor of Medicine/Master of Science and a Doctor of Medicine/Doctor of Philosophy. The faculty and students participate in a variety of research activities offered through the departments and the interdisciplinary research centers of the university.

At the core of its vision, the Case School of Engineering seeks to set the standards for excellence, innovation, and distinction in engineering education and research prominence.

Statement of Educational Philosophy

The Case School of Engineering prepares and challenges its students to take positions of leadership in the professions of engineering and computer science. Recognizing the increasing role of technology in virtually every facet of our society, it is vital that engineering students have access to progressive and cutting-edge programs stressing five areas of excellence:

- Mastery of fundamentals
- Creativity
- Societal awareness
- Leadership skills
- Professionalism

Emphasizing these core values helps ensure that tomorrow’s graduates are valued and contributing members of our global society and that they will carry out the tradition of engineering leadership established by our alumni.

The undergraduate program aims to create life-long learners by emphasizing engineering fundamentals based on mathematics, physical, and natural sciences. Curricular programs are infused with engineering innovation, professionalism (including engineering ethics and the role of engineering in society), professional communications, and multidisciplinary experiences to encourage and develop leadership skills. To encourage societal awareness, students are exposed to and have the opportunity for in-depth study in the humanities, social sciences, and business aspects of engineering. Undergraduate students are encouraged to develop as professionals. Opportunities include the Cooperative Education Program, on-campus research activities, and participation in the student chapters of professional societies. Graduates are prepared to enter the workforce and be strong contributors as practicing engineers or continue for advanced study in engineering.

At the graduate level, the Case School of Engineering combines advanced classroom study with a rigorous independent research experience leading to significant results appropriate for publication in archival journals and/or presentation at leading technical conferences. Scientific integrity, engineering ethics, and communication skills are emphasized throughout the program.

Brief History

The Case School of Engineering was established on July 1, 1992, by an action of the Board of Trustees of Case Western Reserve University as a professional school dedicated to serving society and meeting the needs of industry, government and academia through programs of teaching and research.

The Case School of Engineering continues the tradition of rigorous programs based on fundamental principles of mathematics, science and engineering that have been the hallmark of its two predecessors, the Case School of Applied Science (1880) and the Case Institute of Technology (1947). The formation of the Case School of Engineering is a re-commitment to the obligations of the gift of Leonard Case, Jr., to serve the citizens of Northern Ohio. The Case School of Engineering has been a leader in many educational programs, being the first engineering school to offer undergraduate programs in computer engineering, biomedical engineering, polymer engineering, and systems and control engineering.

Administration
Venkataramanan Balakrishnan, PhD (Stanford University)
Charles H. Phipps Dean of the Case School of Engineering

Daniel J. Lacks, PhD (Harvard University)
Associate Dean of Academics

Christian A. Zorman, PhD (Case Western Reserve University)
Associate Dean of Research

Sunniva Collins, PhD (Case Western Reserve University)
Associate Dean of Professional Graduate Programs

Daniel Ducoff, MS (University of California, Berkeley)
Vice Dean for External Relations of the Case School of Engineering

Cena Hilliard, MS (University of Wisconsin-Madison), MBA (CWRU)
Associate Dean of Finance, Administration, and Business Operations

Deborah J. Fatica, MA (Bowling Green State University)
Assistant Dean of the Division of Engineering Leadership and Professional Practice

Kurt R. Rhoads, PhD, PE (Stanford University)
Faculty Director of the First-Year Engineering Experience

Bachelor of Arts
The Bachelor of Arts in Computer Science (p. 88) is granted by the College of Arts and Sciences and administered by the Department of Computer and Data Sciences.

Bachelor of Science
The Bachelor of Science degree is available with the following majors:

- Computer Science (p. 88)
- Data Science and Analytics (p. 88)

Bachelor of Science in Engineering
Majors are available in the following subjects, and the curricular requirements for the major are given in the links.

- Aerospace Engineering (p. 192)
- Biomedical Engineering (p. 44)
- Chemical Engineering (p. 63)
- Civil Engineering (p. 75)
- Computer Engineering (p. 116)
- Electrical Engineering (p. 112)
- Engineering Physics (p. 148)
- General Engineering (p. 33)
- Materials Science and Engineering (p. 170)
- Mechanical Engineering (p. 192)
- Polymer Science and Engineering (p. 154)
- Systems and Control Engineering (p. 116)

In addition to the major department requirements, each engineering undergraduate degree program includes the Engineering Core (Engineering General Education Requirements), which provides
a foundation in mathematics and sciences as well as aspects of engineering fundamentals for programs in engineering. The Engineering Core is also designed to develop communication skills and to provide a body of work in areas of study outside of engineering, science, and mathematics. Requirements of the Engineering Core can be found in the Undergraduate Studies (p. 1292) section of this bulletin.

Students enrolled in other majors may elect to pursue a minor. The minor program advisor's approval is required. The successful completion of a minor will be indicated on a student's transcript. Minors are available in all of the subjects listed above except General Engineering and Engineering Physics, and the curricular requirements for the minor are given in the links above. In addition, minors are available in the following subjects:

- Artificial Intelligence (p. 88)
- Applied Data Science (p. 170)
- Biomolecular Engineering (p. 63)
- Computer Gaming (p. 116)
- Electrochemical Engineering (p. 63)
- Mechanical Design and Manufacturing (p. 192)

For a full list of engineering and university minors, go to the Office of Undergraduate Studies (https://case.edu/ugstudies/programs-requirements/majors-minors/) website.

**Bachelor of Science in Engineering/ Master of Science**

The integrated BS/MS program is intended for highly motivated and qualified undergraduate students who wish to pursue an advanced degree. Students admitted to the program may, in the senior year, take up to nine credits of graduate courses that will count toward both BS and MS requirements.

**Bachelor of Science in Engineering/ Master of Engineering**

Students who have received a BS degree in engineering or computer science from the Case School of Engineering, and who are accepted for admission into the Master of Engineering (ME) degree program within a period of 24 months after graduation, are entitled to transfer up to 6 credit hours of course work from their BS degree to their ME degree program.

The courses to be considered for transfer should be specified at the time of application to the ME program, and require approval by the director of the Master of Engineering Program and the Dean of Engineering. Once approved, a request for an internal transfer of credit will be sent to the Registrar, and these courses will be included in the student’s Academic Program for the ME degree.

**Master of Engineering**

The Master of Engineering Program is a graduate degree program that targets engineers currently employed in industry. The objective of this program is to provide engineers in industry with technical as well as business, management, and teamwork skills. The program differs from a traditional Master of Science degree in engineering by combining core courses that focus on the engineering-business environment and technical elective courses that concentrate on contemporary industrial practice rather than on research.

- More details on the Master of Engineering (p. 33)
- For more details about the exclusively online Master of Engineering degree program, visit online-engineering.case.edu/masters/ (http://online-engineering.case.edu/masters/).

**Master of Engineering and Management**

The Master of Engineering and Management (MEM) program provides business acumen and leadership skills to uniquely position graduates for rapid advancement in technology-oriented organizations. The MEM curriculum is the result of nearly 20 years of ongoing research and interviews with hundreds of industrial stakeholders and more than 600 graduates in our thriving alumni network. This interdisciplinary, joint degree program combines the analytical expertise and rigor from the Case School of Engineering and the organizational insights of the Weatherhead School of Management. MEM is a 1 year, cohort program that starts every year in June. This program is designed for undergraduate engineering majors and is focused on developing high-impact talent, which companies are actively seeking. Students can enter this program after their junior year or upon graduation.

- More details on the Master of Engineering Management (p. 34)

**Master of Science**

The Master of Science degree is available with the following majors:

- Aerospace Engineering (p. 196)
- Biomedical Engineering (p. 50)
- Chemical Engineering (p. 67)
- Civil Engineering (p. 80)
- Computer Engineering (http://bulletin.case.edu/schoolofengineering/elecengcompsci/#graduatetext)
- Computing and Information Science (p. 97)
- Electrical Engineering (p. 124)
- Engineering (Undesignated) (p. 35)
- Macromolecular Science and Engineering (p. 158)
- Materials Science and Engineering (p. 175)
- Mechanical Engineering (p. 196)
- Systems and Control Engineering (p. 124)

Recognizing the different needs and objectives of resident and non-resident graduate students pursuing the master's degree, three different tracks are offered. In all plans, transfer of credit from another university is limited to six hours of graduate-level courses, taken in excess of the requirements for an undergraduate degree, approved by the student’s advisor, the department chair, and the dean of graduate studies.

By the end of the second semester of enrollment, all Master of Science degree programs require an approved Planned Program of Study or a defined Academic Requirements Report, hereafter referred to as the student’s Academic Program, via the Student Information System. Revisions must be submitted and approved via the Student Information System when any change in the Academic Program occurs.
A cumulative quality point average of 3.0 or above in all courses taken for credit as a graduate student at Case Western Reserve University (excluding grades in thesis research and grades of R) is required for the award of the master's degree.

The University requires all foreign applicants to show English Proficiency by achieving a TOEFL score of at least 90 on the internet-based exam for a thesis-focused or a project-focused track. For a course-focused track, a minimum TOEFL score of 80 is required. If there is any professional student-to-student interaction, e.g. as a teaching assistant, a lab instructor, or a tutor, then a minimum TOEFL score of 90 is required.

**Master’s Thesis-Focused Track**

Minimum requirements for the degree of Master of Science in a major field under this plan include a total of 30 hours of coursework and thesis work with the:

1. Completion of at least 18 hours of graduate coursework at the 400 level or higher. The courses must be approved by the department offering the degree.
2. Completion of at least 9 hours of thesis work culminating in a thesis examination given by at least three professors, plus approval by the chair of the department offering the degree. A student with research experience equivalent to a thesis may petition the Graduate Committee of the Case School of Engineering for substitution of nine hours of coursework for the thesis requirement. In this case, the thesis examination above is replaced by a similar examination covering the submitted research work and publications. Additional requirements may be specified by individual degree programs.

**Master’s Project-Focused Track**

Completion of 30 hours of approved coursework including three to six hours of Special Problems. At least 18 (21) hours must be at the 400 level or higher corresponding to a 6 (3) hour Special Problems course work. Special Problems course work must consist of an engineering project approved by the chair of the department offering the degree and may be carried out at the student’s place of employment with nominal supervision by a faculty advisor or in the school’s laboratories under direct supervision. The project must culminate in a written report and examination by at least three professors plus approval by the chair of the department offering the degree. The Special Problems course may be waived for students who have had industrial design or research experience and who submit sufficient evidence of this experience in the form of a publication or internal report. For these students, a minimum of 30 hours of coursework and the final oral examination covering the submitted publications or reports as well as related course material will be required for the master's degree.

**Master’s Course-Focused Track**

Completion of 30 hours of approved coursework. At least 24 hours must be at the 400 level or higher, satisfactory completion of the culminating course-focused experience, i.e. passing the course ENGR 600 with requirements defined by the student’s curricular program, and additional requirements as specified by the program. Students should consult with their academic advisor and/or department to determine the detailed requirements within this framework.

**Online MS Degree Options**

The Case School of Engineering offers three MS degree programs exclusively online, giving working engineers the opportunity to advance their careers from anywhere:

- Master of Science in Biomedical Engineering (https://online-engineering.case.edu/biomedical/)
- Master of Science in Mechanical Engineering (https://online-engineering.case.edu/mechanical/)
- Master of Science in Systems & Control Engineering (https://online-engineering.case.edu/systems/)

The programs are designed for working professionals and can be completed in less than two years. All courses are taught by the same faculty who teach graduate students on campus. With the same in-depth, rigorous content delivered in a convenient online format, students who participate in the online programs receive the same robust education and training as traditional on-campus master’s students.

Learn more and apply. (https://online-engineering.case.edu/)

**Additional Distance Learning Opportunities**

In addition to the online-exclusive programs, the Case School of Engineering offers select classes in its campus-based graduate degree programs in a convenient online format designed for students who need additional flexibility.

Learn more about available online courses. (http://engineering.case.edu/current-students/distance-learning/registration/)

**Doctor of Medicine/Master of Science**

Medicine is undergoing a transformation based on the rapid advances in science and technology that are combining to produce more accurate diagnoses, more effective treatments with fewer side effects, and improved ability to prevent disease. The goal of the MD/MS in Engineering is to prepare medical graduates to be leaders in the development and clinical deployment of this technology and to partner with others in technology-based translational research teams. For further information, see the MD/MS Program in the Biomedical Engineering graduate section of this bulletin (p. 50). Interested students should apply through the biomedical engineering department.

**Doctor of Philosophy**

The Doctor of Philosophy degree is available with the following majors:

- Aerospace Engineering (p. 196)
- Biomedical Engineering (p. 50)
- Chemical Engineering (p. 67)
- Civil Engineering (p. 80)
- Computer Engineering (http://bulletin.case.edu/schoolofengineering/elecengcompsci/#graduatetext)
- Computing and Information Science (p. 97)
- Electrical Engineering (p. 124)
- Macromolecular Science and Engineering (p. 158)
- Materials Science and Engineering (p. 175)
- Mechanical Engineering (p. 196)
- Systems and Control Engineering (p. 124)

The student’s PhD program should be designed to prepare him or her for a lifetime of creative activity in research and in professional engineering practice. This may be coupled with a teaching career. The mastery of a significant field of knowledge required to accomplish this purpose is demonstrated by an original contribution to knowledge embodied
in a thesis and by satisfactory completion of a comprehensive course program which is intensive in a specific area of study and includes work in other areas related to, but not identical with, the major field. The necessity for breadth as well as depth in the student’s education cannot be overemphasized. To this end, any engineering department may add additional requirements or constraints to ensure depth and breadth appropriate to its field.

No student may be admitted to candidacy for the PhD degree before approval of his or her Academic Program via the Student Information System. After this approval has been obtained, it is the responsibility of the student’s department to notify the dean of graduate studies of his or her admission to candidacy after the student has fulfilled any additional departmental requirements. Minimal requirements in addition to the university requirements are:

1. The minimum course requirement beyond the BS level is 36 credit hours of courses taken for credit, at least 18 hours of which must be taken at Case Western Reserve University. The following courses taken for credit will be acceptable for a PhD program of study:
   i.  All 400-, 500-, and 600-level courses
   ii. Approved graduate-level courses taken at other institutions
2. A minimum depth in basic science equivalent to six semester hours (for credit) is required. This requirement is to be satisfied by courses that have been previously approved by the faculty of the department in which the student is enrolled.
3. The requirement for breadth is normally satisfied by a minimum of 12 semester hours of courses (for credit) outside the student’s major area of concentration as defined by the student’s department and does not include courses taken to fulfill the basic science requirement.
4. A minimum of three teaching experiences as defined by the student’s department. All programs of study must include departmental 400T, 500T, and 600T courses to reflect this requirement. All students fulfilling teaching duties must complete UNIV 400A or UNIV 400B.
5. The minimum requirement for research is satisfied by at least 18 hours of thesis (701) credits.
6. A cumulative quality point average of 3.0 or above in all courses taken for credit as a graduate student at Case Western Reserve University (excluding grades in thesis research and grades of R) is required for the award of the doctoral degree.

Qualifying Examination
The student must pass a qualifying examination relevant to his or her area of study as designated by the curricular department with which he or she is affiliated. For students who obtain the MS degree from Case Western Reserve University, the qualifying examination should be taken preferably before the end of the student’s fourth semester of graduate study but no later than the end of the fifth semester at the university. For students entering with the master’s degree, the examination should be taken no later than the end of the third semester at the university.

Program of Study
Before registering for the last 18 credit hours of the program, all Doctor of Philosophy degree programs require an approved Planned Program of Study or a defined Academic Requirements Report, hereafter referred to as the student’s Academic Program, via the Student Information System. Revisions must be submitted and approved via the Student Information System when any change in the Academic Program occurs.

If the student is pursuing the PhD degree without acquiring the MS degree, a petition to waive the requirement of the MS degree should be approved by the departmental advisor and the chair and submitted to the dean of graduate studies. All required courses taken at the university beyond the BS degree should be shown on the Academic Program with the grade if completed. If the requirements are to be fulfilled in ways other than the standard described above, a memorandum requesting approval should be submitted to the dean of graduate studies.

The Academic Program must be submitted within one semester after passing the qualifying examination.

Doctor of Medicine/Doctor of Philosophy
Students with outstanding qualifications may apply to the MD/PhD program (http://mstp.case.edu/). Students interested in obtaining a combined MD/PhD, with an emphasis on basic research in biomedical engineering are strongly encouraged to explore the Medical Scientist Training Program (https://case.edu/medicine/admissions-programs/md-phd-program/)(MSTP), administered by the School of Medicine. For further information, please see the Medical Scientist Training Program(MSTP) section of this bulletin (http://bulletin.case.edu/schoolofmedicine/dualdegreeprograms/#medicalsciencestrainingprogramtext). Interested students should apply through the MSTP office (mstp@case.edu) in the School of Medicine. The Doctor of Medicine/Doctor of Philosophy program is available with PhD majors in Biomedical Engineering and Mechanical Engineering.

Interdisciplinary Research Centers
Interdisciplinary research centers act as intensive incubators for students and faculty doing research and studying applications in specialized areas. Research centers and research programs at the Case School of Engineering have been organized to pursue cutting-edge research in collaboration with industrial and government partners. The transfer of technology to industry is emphasized in all the centers.

The educational programs of these centers encompass the training of graduate students in advanced methods and strategies, thus preparing them to become important contributors to industry after graduation; the involvement of undergraduates in research; the presentation of seminars that are open to interested members of the community; and outreach to public schools to keep teachers abreast of scientific advances and to kindle the interest of students in seeking careers in engineering.

Advanced Manufacturing and Mechanical Reliability Center (AMMRC)
White Building (7205)
Phone: 216.368.4234
John J. Lewandowski, Director
john.lewandowski@case.edu

Website: http://ammrc.case.edu
The Advanced Manufacturing and Mechanical Reliability Center (AMMRC) was established to provide advanced manufacturing (e.g. deformation processing, extrusion, forming, etc.) and mechanical characterization (e.g. mechanical testing, reliability testing, fatigue, etc.) expertise to the CWRU campus, medical, industrial, legal, outside university, and government laboratory communities. The center, housed in the Charles M. White Metallurgy building, currently maintains equipment...
valued in excess of $4.5M and has been accessed by the local, national, and international communities. The CWRU campus community can access the facility via the use of a valid CWRU university account number that will be charged at an internal rate for machine time, including set up and any technician time involved. Long-term testing can be provided at pro-rated charges in consultation with the center directors. Arrangements can be made to train users on the equipment and reserve time for equipment use by contacting the center co-director. Outside (i.e. non-CWRU) users can access the facility via a number of different mechanisms by contacting the center director.

In general, the center is capable of mechanically evaluating and deformation processing materials that range in size scale from the micrometer range up through bulk quantities. This unique facility enables mechanical characterization at loading rates as low as one micrometer/hour (i.e. rate of fingernail growth) up through impact (e.g. 3-4 meters/sec) at temperatures ranging from -196C (i.e. liquid nitrogen) up to 1400C. Hot microhardness testing up to 1000C is available. Monotonic as well as cyclic fatigue testing is possible in addition to evaluations of mechanical behavior and processing with superimposed pressures up to 2 GPa. Novel high-rate and multiple-deformation sequence forging simulations are possible with the use of a multi-actuator forging simulator, in addition to sheet metal forming experimentation with independent control of forming rate and blank hold down force. Hot extrusion is also possible at temperatures up to 900C on 0.5" diameter billets. Materials systems that have been investigated span the range of organic and inorganic materials, including metals, ceramics, polymers, composites, electronic materials, and biomedical materials systems. Descriptions of specific equipment and capabilities are provided with the website link.

Advanced Platform Technology (APT) Center
Louis Stokes Cleveland VA Medical Center
10701 East Boulevard, Mail Stop 151 W/APT
Cleveland, Ohio 44106
Phone: 216.707.6421 Fax: 216.707.6420
Ronald J. Triolo, Executive Director
ronald.triolo@case.edu

The Advanced Platform Technology (APT) Center at the Louis Stokes Cleveland VA Medical Center is a designated Center in the Rehabilitation Research and Development (RR&D) Service. Established in 2005 as a collaboration between the Cleveland VA Medical Center and Case Western Reserve University (CWRU), the APT Center focuses on addressing the medical needs of veterans with sensorimotor dysfunction, cognitive impairment, or limb-loss through the application of cutting-edge technologies or rehabilitation techniques and translating them from proof of concept to viable clinical options. The APT Center captures advances in material science, microfabrication and microsystem design, neural engineering, mechanics, and communications that are organized into four thematic clinical Application Areas: Neuroprosthetics & Orthotics, Health Monitoring & Maintenance, Neural Interfaces, and Activity-Based Neurorehabilitation. Over 50 engineers and clinician scientists at the APT Center carry out projects with federal and industrial support are carried out by teams of faculty, graduate, and undergraduate students. Computer Aided Design, flow and solidification simulation, and rapid prototyping tools are used to optimize our casting process. Sand and permanent mold castings are available on a moderate scale to 1500 lbs) using our induction melters. Our facility provides hands-on experiential learning opportunities for engineering students in laboratory classes and summer research programs.

Facilities
• Industrial UBE 350 Ton Vertical Squeeze casting machine (with preheatable tooling for manufacturing of high integrity parts)
• Induction melting furnaces with a 350 kW/1000 Hz Inductotherm power supply (up to 1500 lb. steel capacity)

Breakthrough Electrolytes for Energy Storage Energy Frontier Research Center
Phone: 216.368.1636
Robert F. Savinell, Director
robert.savinell@case.edu

The Center for Breakthrough Electrolytes for Energy Storage is a DOE Office of Science EFRC center intended to identify new battery chemistries with the potential to provide large, long-lasting energy storage solutions for facilitating the introduction of intermittent renewable energy and for enhancing power grid efficiency. The research of the BEES focuses on understanding the fundamental underpinnings of electrochemistry, structure, and transport properties of several new classes of materials that can be tailored to give optimal properties. The EFRC BEES is led by CWRU and collaborates with several other universities and two National Labs.

Case Metal Processing Laboratory (CMPL)
Case Metal Processing Laboratory (CMPL)
105 White Building
Phone: 216.368.5070 Fax 216.368.3209
Matthew A. Willard, Faculty Director
matthew.willard@case.edu

The CMPL houses state-of-the-art, melting and casting capabilities for a wide range of ferrous and non-ferrous alloys. The facility has a unique combination of laboratory and industrial scale equipment. Research projects with federal and industrial support are carried out by teams of faculty, graduate, and undergraduate students. Computer Aided Design, flow and solidification simulation, and rapid prototyping tools are used to optimize our casting process. Sand and permanent mold castings are available on a moderate scale (to 1500 lbs) using our induction melters. Our facility provides hands-on experiential learning opportunities for engineering students in laboratory classes and summer research programs.

Facilities
• Induction melting furnaces with a 350 kW/1000 Hz Inductotherm power supply (up to 1500 lb. steel capacity)
• Vacuum induction melting and casting furnace using a 35 kW/10 kHz Inductotherm power supply (up to 50 lb. capacity)
• Lindberg 75 kW electrical melting furnace (up to 800 lb. of aluminum capacity)
• Thermal Fatigue Testing Unit for die material qualification in molten aluminum (a.k.a. Dunkers)
• Permanent molds for casting test bars and evaluation of molten metal quality
• Sand molding and sand testing equipment
• Equipment for melting and casting magnesium alloys
• Computer modeling workstation with flow and heat transfer finite element software

Back to top (p. )

Center for Advanced Polymer Processing (CAPP)
Kent Hale Smith Building, 3rd floor
Phone: 216.368.6372 Fax 216.543.4202
Joao Maia, Director
joao.maia@case.edu

CAPP is a state-of-the-art center for advanced polymer blending and compounding and reactive extrusion at CWRU able to perform basic research and applied research and development in support of the Ohio and US plastics industry. The main tools of CAPP are:

• State-of-the-art sensors that allow multiple rheological, physical, chemical and morphological quantities to be measured along the screw axis of twin-screw extruders;
• Advanced multi-scale computational simulation capabilities to build physical-chemical-structural models of polymer systems under flow in realistic polymer transformation processes;
• Integration of on-line sensors and multi-scale softwares to develop new advanced and functional multiphase complex materials or optimize the performance of existing ones.

Center for Biomaterials
202 Wickenden Building (7207)
Phone: 216.368.4564
Steven J. Eppell, Director
Associate Professor, Department of Biomedical Engineering
steven.eppell@case.edu
Anirban Sen Gupta, PhD, Associate Director
Professor, Department of Biomedical Engineering
anirban.sengupta@case.edu

The Center for Biomaterials carries out research and development projects to investigate new biomaterials, tissue engineered materials, and targeted drug delivery systems for use in cardiovascular applications and implants. The Center for Biomaterials also provides researchers access to shared use facilities, which includes high-resolution microscopy such as AFM, molecular spectroscopies, surface analysis, and polymer and peptide synthesis capabilities. The chemical and mechanical interface between the biomaterial and the host tissue are the focus of major study, with the goals being to improve biologic function and biocompatibility in the response of the human body to implants. Current projects include investigation of thrombosis (blood clotting) and infection mechanisms due to cardiovascular prosthesis, biomimetic design of novel biomaterials for cardiovascular and neural implants; and cardiovascular and neural tissue engineering based on biomimetic designs. Studies at the cell and molecular level assist our understanding of the underlying mechanisms so that novel biomedical materials may be designed, prepared, and characterized.

Center for Computational Imaging and Personalized Diagnostics (CCIPD)
Wickenden Building Room 523
Phone: 216.368.8519
Anant Madabhushi, Director
anant.madabhushi@case.edu

The Center of Computational Imaging and Personalized Diagnostics at Case Western Reserve University is involved in various different aspects of developing, evaluating and applying novel artificial intelligence, quantitative image analysis, computer vision, signal processing, segmentation, multi-modal co-registration tools, pattern recognition, and machine learning tools for disease diagnosis, prognosis, and theragnosis in the context of more than 13 disease areas including cardiovascular, kidney, and eye disease; and multiple cancers: breast, prostate, lung, head and neck, brain tumors, colorectal, and others. The group is also exploring the utility of these methods in studying correlations of disease markers across multiple length scales, modalities, and functionalities -from gene and protein expression to spectroscopy to digital pathology and to multi-parametric MRI and CT. Utilization of multi-modal methodologies demonstrates that mined image biomarkers can be combined with multi-omics data and interrelated health variables to differentiate disease among diverse populations for precision medicine.

The Center’s goals in precision medicine are to have societal impact, reduce health disparities, and improve global health, especially in low- and middle-income countries. The Center has a team of more than 65 (faculty, staff, and students) with more than 400 publications, more than 100 patents issued or pending, 16 patents licensed, $60 million in funding since its founding in 2012, and 40 active research, industry, and pharmaceutical collaborations on six continents.

Center for Dielectrics and Energy Storage (CDES)
312 Kent Hale Smith Building
Phone: 216.368.5861
Lei Zhu, Director
lxz121@case.edu

CDES mission is to discover, develop, and translate novel dielectric technologies for energy storage and capacitor applications. Researching high energy density, high temperature, and low loss dielectric film capacitors, we integrate these innovations with storage devices, hybrid electric vehicles, multi-megawatt power conditioning, pulsed power, and high energy physics applications. Originating from the Center for Layered Polymeric Systems (CLiPS), a National Science Foundation Science and Technology Center focuses on research, innovation, and education through a unique multilayer film technology, CDES extends this technology into new energy frontiers.
CDES has access to state-of-the-art equipment, which includes process equipment for fabricating, stretching, and testing dielectric films, including:

- Novocontrol Concept 80 Broadband Dielectrics Spectrometer
- Radiant Premier II Ferroelectric Tester

In addition to research, CDES plays a significant role in educating undergraduate students, graduate students, and post-doctoral associates to work in advanced energy material fields.

**Center for the Evaluation of Implant Performance**

Wean Building Room 511  
Phone: 216.844.1745  
Clare Rimnac, Director  
clare.rimnac@case.edu

The mission of the Center for the Evaluation of Implant Performance is to pursue engineering, scientific, and economic analyses of joint replacement procedures, to evaluate the performance of implant devices during patient use, and to assess the medical and economic outcomes of joint reconstruction and related patient care. This mission is achieved in part through IRB-approved collection, maintenance, and protection of clinical and radiographic information and total joint replacement components obtained at revision or removal surgery. The primary goals are to advance the science of joint replacement surgery by improving the performance and durability of joint replacement devices through advances in implant materials and design and to innovate improvements in patient care processes that result in improved patient outcomes. To this end, the Center for the Evaluation of Implant Performance works in close partnership and collaboration with the Center for Joint Replacement and Preservation at University Hospitals Cleveland Medical Center.

**Center for Layered Polymeric Systems (CLiPS)**

NSF Science and Technology Center  
420 Kent Hall Smith Building (7202)  
Phone: 216.368.4203 Fax 216.368.6329  
Eric Baer, Director  
eric.baer@case.edu

CLiPS researchers and educators work together to accomplish the Center’s mission of advancing the nation’s science and technology agenda through development of new materials systems and for educating a diverse American workforce through interdisciplinary education programs.

CLiPS research focuses on exploration of multilayered polymeric systems at the micro- and nano-layer levels and has revealed unique properties and capabilities that are different, and often not predicted, from systems involving the same materials on a larger scale. Technology refined within CLiPS allows the production of films and membranes composed of hundreds or thousands of layers. These extremely thin layers promote interactions approaching the molecular level between the materials used in the process.

The research activities are organized to exploit the microlayer and nanolayer structures including the combination of rheologically dissimilar materials to create new polymer-based structures; science and technology initiatives that probe a fundamental understanding and explore new opportunities for layered structures; optical and electronic systems based on advanced layered materials; new combinations of polymeric materials that advance packaging options and address the need for sustainability; new combinations of polymeric materials created specifically for military and national security needs.

CLiPS was established in 2006 with funding by the National Science Foundation as a Science and Technology Center. It is the first NSF STC ever to be established at Case Western Reserve University. CLiPS is an evolving, multi-disciplinary center involving close partnerships with the Army Research Laboratory, the Naval Research Laboratory, and Université de Savoie in France.

**Cleveland Functional Electrical Stimulation Center (FES)**

10701 East Boulevard, Cleveland, Ohio 44106  
Phone: 216.231.3257 Fax: 216.231.3258  
Robert J. Kirsch, Executive Director  
info@FEScenter.org

Functional electrical stimulation (FES) is the use of small, artificially generated electrical currents that are safely and selectively applied to the central or peripheral nervous system to replace the actions of neurons that have been damaged by injury or disease. FES can produce and control the movement of otherwise paralyzed limbs, for standing and hand grasp, activate visceral bodily functions such as micturition, create perceptions such as skin sensibility, arrest undesired activity, such as pain or spasm, facilitate natural recovery, and accelerate motor relearning. The FES Center is the most comprehensive and cohesive program in the world performing FES investigation that spans from basic to applied, and the investigators work on many different applications within five research thrusts:

- **Movement Restoration**: Restoring limb and other body movements
- **Brain Health**: Brain stimulation for movement disorders, stroke and traumatic brain injuries, epilepsy and neuropsychiatric disorders
- **Pain**: Pain mitigation through stimulation of peripheral nerves and the spinal cord
- **Autonomic System**: Autonomic nervous system stimulation for restoration and/or regulation of internal body and visceral functions
- **Tools & Technology**: Development of implantable systems and electrodes, modeling & simulation tools and other rehabilitation approaches complementary to FES

The FES Center was established as a VA RR&D Center of Excellence in 1991 and is based at the Louis Stokes Cleveland VA Medical Center. The center is a consortium of five nationally recognized institutions: Louis Stokes Cleveland VA Medical Center, MetroHealth Medical Center, Case Western Reserve University, University Hospitals of Cleveland, and the Cleveland Clinic Neurological Institute. The FES Center strives to create an inquisitive and collaborative environment from which researchers, engineers and clinicians work in a unique alliance to develop innovative, patient-centric solutions that improve the quality of life of individuals with neurological or other musculoskeletal impairments. Through the use of neurostimulation and neuromodulation research and applications, the Cleveland FES Center leads the translation of this technology into clinical deployment.
Control and Energy Systems Center (CESC)
Olin Building, 6th Floor
Phone: 216.368.5122
Mario Garcia-Sanz, Director
mario@case.edu
Website: http://cesc.case.edu

With an interdisciplinary and concurrent engineering approach, the Control and Energy Systems Center (CESC) focuses on bridging the gap between fundamental research and applied industrial projects in Advanced Control and Systems Engineering, with special emphasis in energy innovation, wind energy, power systems, water treatment plants, sustainability, spacecraft, environmental and industrial applications. Fundamental research is conducted to gain knowledge and understanding on multi-input-multi-output systems, distributed parameter systems and nonlinear plants with uncertainty, and to develop new methodologies to design quantitative robust controllers to improve the efficiency and reliability of such systems.

The CESC’s expertise has been applied to real-world problems with industrial partners and space agencies in the following main areas:

- Multi-Megawatt Onshore and Offshore Wind Turbines
- Airborne Wind Energy Systems
- Renewable Energy Plants, Advanced Energy Systems
- Power System Dynamics and Control, Grid Integration, Energy Storage
- Large Radio Telescope Control, Optical Telescope Control
- Formation Flying Spacecraft, Satellites with Flexible Appendages
- Wastewater Treatment Plants, Desalination Systems
- Heating Systems, Fluid Dynamics
- Robotics, Parallel Kinematics

The CESC’s capabilities and equipment include:

- Fully instrumented wind tunnel to test prototypes at wind speeds up to 20 m/s
- Lab-scale wind turbine blade manufacturing units
- State-of-the-art computer programs for commercial wind turbine design
- Aerodynamics, Solid Modeling, and Electrical Design CAD/CAE software
- Advanced software to design robust QFT control systems
- Software for analysis and simulation of dynamic systems
- Multiple laboratory scale wind turbines with a variety of collinear and orthogonal rotors, electrical generators, gearboxes, sensors, actuators and hierarchical real-time torque/pitch/yaw control systems
- Lab-scale wind farms with flexible configurations
- Fully-controlled 6-DOF Stewart platform for lab-scale Floating Wind Turbine experimentation
- Laboratory helicopter to test advanced control systems

Electronics Design Center (EDC)
112 Bingham (7200)
Phone: 216.368.2935
Chung-Chiu Liu, Director
chung-chiu.liu@case.edu
Website: https://engineering.case.edu/edct/
iLab site: https://cwru.corefacilities.org/service_center/show_external/5609

The Electronics Design Center (EDC) is a multi-disciplinary educational and research center focusing on the applications of microfabrication processing to the advancement of chemical and biological micro systems specializing in application-oriented electrochemical-based biosensors. The center has complete thick film and thin film processing facilities, including screen printing, inkjet printing, and sputtering equipment. Other facilities supporting the microfabrication processing are also readily available. The EDC is a resource for industrial and academic researchers, offering access to equipment, laboratories, and trained staff.

Great Lakes Energy Institute (GLEI)
219 Olin Building (7074)
Phone: 216.368.0748
Rohan Akolkar, Faculty Director
rohan.akolkar@case.edu

The Great Lakes Energy Institute empowers faculty, students, and partners to catalyze breakthroughs in energy sustainability that address the most pressing problems facing our world. Since 2008, GLEI has helped catalyze a five-fold increase in energy research, won awards from NSF, DOE, (ARPA-E, EERE, OE), Ohio Third Frontier and other organizations, attracted over $110 million in awards, worked with over 100 different industry partners, and encouraged multidisciplinary proposals throughout the university. At the heart of these efforts are over 90 engaged faculty, hailing from engineering, arts & sciences, management, and law. And while GLEI’s work supports all types of energy, the focus lies in five priority areas:

Energy Storage - Storage research builds on historical strengths in electrochemistry, materials and lifetime and degradation science. Recent research awards include ARPA-E and DOE.

Energy Materials - Research spans topics in areas of interest to industry and the U.S. Department of Energy, to include materials reuse and recycling, rare earths and critical materials, and materials use in renewable energy. A particular focus is on next-generation photovoltaics (PV), focused on organics and lifetime and degradation science, stemming from a strong reputation in materials, research, and development.

Future Power - CWRU’s energy program is underpinned by research in power systems. Strengths in controls, sensors, and electronics provide a core foundation for smart grid connectivity of energy and storage.

Wind Energy - Wind energy emphasizes offshore deployment and is founded on wind and ice measurement, controls, power management, and grid interface expertise. Much of this work is supported by DOE awards and the State of Ohio.

Oil and Gas - Research focuses on technologies that enhance safe extraction, transport, and processing of shale gas and oil in Ohio. Strengths are present in macromolecules, sensors, corrosion-resistant casings, cementious materials, and modeling and simulation of hydro-fracking process and its impact on the subsurface.
The role of CWRU in energy also touches economic development and education. Through research and investment, university spin-outs are poised to contribute to a new energy economy while working toward a clean and sustainable future. Students undertake key roles in the research and commercialization of the energy technologies contributing to worldwide impact.

**Industrial Assessment Center (IAC)**

110 Glennan Building  
Phone: 216.368.5191  
Chris Yuan, Operations Director  
chris.yuan@case.edu

The Industrial Assessment Center (IAC) at Case Western Reserve University (CWRU), funded by the US Department of Energy, was established in 1979. The mission of the IAC is to improve energy efficiency, reduce wastes and enhance productivity at small and medium-sized manufacturing companies and water treatment plants in Northeast Ohio, part of the lower peninsulas of Michigan, and Western Pennsylvania.

The IAC is led by a multidisciplinary team including six faculty members from three Engineering departments (Mechanical and Aerospace Engineering, Electrical, Computer, and Systems Engineering; and Materials Science and Engineering). We work closely with many established partner organizations and stakeholders in the region, including utility companies, governmental agencies, industrial associations and Chambers of Commerce. Every year, the IAC works with 10-12 manufacturing companies/water plants, trains 6-10 engineering students on industrial energy efficiency, and graduate 2-4 of them as energy engineers.

The Industrial Assessment Centers program, formerly known as Energy Analysis and Diagnostic Centers, was created by the Department of Commerce in 1976. Today, the IAC program is managed through the Advanced Manufacturing Office under the Office of Energy Efficiency and Renewable Energy at the Department of Energy. Including the IAC at Case Western Reserve, there are 31 centers established at different universities all over the US.

Website: [https://engineering.case.edu/research/centers/industrial-assessment-center/](https://engineering.case.edu/research/centers/industrial-assessment-center/)

**Microfabrication Laboratory (MFL)**

342 Bingham Building (7200)  
Phone: 216.368.6117  
Fax: 216.368.6888  
Christian Zorman, Director  
christian.zorman@case.edu

MFL houses a state-of-the-art facility that provides the latest in microfabrication and micromachining processes. The laboratory focuses on the applications of microfabrication and micromachining technology to a wide range of sensors, actuators, and other microelectromechanical (MEMS) systems. In addition to silicon-based technology, the laboratory has a unique strength in silicon carbide micromachining that is particularly valuable for applications in harsh environments. To support the development of flexible microsystems, polymer micromachining is also available. Undergraduate students, graduate students, and post-doctoral assistants use the laboratory’s facilities to carry out their research or special projects.

Researchers not affiliated with CWRU can also use the laboratory through a facilities use agreement.

**National Center for Space Exploration Research (NCSER)**

21000 Brookpark Rd., MS 110-3  
Phone: 216.433.5031  
Mohammad Kassemi, Director  
mohammad.kassemi@case.edu

The National Center for Space Exploration Research (NCSER) is an advanced research collaborative partnership between Case Western Reserve University (CWRU), Universities Space Research Association (USRA), HX5 Defense & Space, LLC, and NASA Glenn Research Center (GRC). Under the umbrella of the NASA Glenn Engineering & Research Support (GEARS) contract, NCSER provides NASA Glenn Research Center (GRC) with specialized science and technology development capabilities essential to sustaining its leadership role in NASA’s Space Exploration and Space Science Missions. In particular, the center provides fundamental scientific and research support to NASA’s Biological and Physical Sciences (BPS) Division in the NASA Science Mission Directorate (SMD) to perform microgravity experiments aboard the International Space Station (ISS) National Laboratory. Scientific and engineering expertise resident at NCSER include: reduced gravity fluid mechanics and combustion processes, heat and mass transfer, physiochemical fluid processes, multiphase flows, micro-fluidics, phase change and interfacial phenomena, Computational Fluid Dynamics (CFD), and multiscale fluid-structural-interaction modeling of human physiological systems. These expertise have been applied to numerous areas and research interests including:

- Microgravity thermal and fluid systems management and control
- Cryogenic fluid management
• Microgravity flow and pool boiling
• Microgravity combustion
• Spacecraft fire safety
• Energy storage
• Environmental systems monitoring/control
• On-orbit repair of electronics
• Astronaut life support systems
• Astronaut health and space disorder countermeasures
• ISS Integrated system health monitoring
• Performance of human cardiovascular, vestibular, musculoskeletal and renal physiologies in space
• Bio-Fluid mechanics
• Bio-Systems modeling
• Dust mitigation and management
• Planetary surface mobility
• In-situ resource utilization
• Materials synthesis

Neural Engineering Center (NEC)
112 Wickenden (7207)
Phone: 216.368.3974 Fax: 216.368.4872
Dominique Durand, Director
dominique.durand@case.edu

The research mission of the center is to bring to bear combined tools in physics, mathematics, chemistry, engineering, and neuroscience to analyze the mechanisms underlying neuronal function and to solve the clinical problems associated with neuronal dysfunction. Research areas include: Neuromodulation, Neuroprostheses, Quantitative Neurophysiology, Neural Dynamics, Neuro-Mechanical Systems, Neural Regeneration, Neural Interfacing, Neural Imaging and Molecular Sensing, Neuro-Magnetism, and Systems Neuroscience. The education mission of the center is to provide engineers and scientists with an integrated knowledge of engineering and neuroscience capable of solving problems in neuroscience ranging from the molecules to the clinic. The center is also an outlet for technology transfer of new ideas to be commercialized by industrial partners. The center’s goals are accomplished by fostering interdisciplinary research between clinicians, scientists, students and local industry, educational experiences including didactic material, laboratory experience, and clinical exposure, and close ties to industrial partners.

Nitinol Commercialization Accelerator (NCA)
White Building (7205)
Phone: 216.368.4234
John J. Lewandowski, Director
john.lewandowski@case.edu
Matthew A. Willard, Co-Director
matthew.willard@case.edu
Website: http://ammrc.case.edu/node/51/

The Ohio Third Frontier Wright Projects Program has funded the Nitinol Commercialization Accelerator (NCA), a collaborative effort between the Cleveland Clinic, CWRU, University of Toledo, NASA Glenn Research Center, and Norman Noble, Inc. in order to develop a better understanding of the metallurgical processing and mechanical characterization of nitinol for use in biomedical and aerospace applications. Biomedical applications range from orthodontia to implantable devices while higher temperature shape memory alloys are of interest for aerospace. The collaboration is designed to create synergy amongst collaborators in the research and development of nitinol products.

The laboratory housed at CWRU’s Material Science and Engineering Department contains processing and characterization (thermal and mechanical) equipment that allows for the manufacture and analysis of nitinol products. Processing equipment includes a vacuum arc casting unit, vacuum heat treatment system, and hot extrusion capabilities. Thermal characterization equipment includes a high-temperature Differential Scanning Calorimeter (DSC) while mechanical characterization equipment for testing wire/foil includes a number of flex bending fatigue machines, rotary bending fatigue machines, and tabletop tension testing machines.

The Cleveland Clinic and NASA Glenn Research Center also house equipment associated with the NCA program including Raydiance-Rofin Femtosecond Laser, Techne FB-08 Precision Calibration Bath, MTS Cryochamber and Grips, and an Aramis/Optotrak Certus 3D Strain Mapping system.

SDLE Research Center
SDLE Research Center Labs: White Building, 5th Floor / Sun Farm: CWRU West Campus
Phone: 216.368.3655/216.368.0374
Roger H. French, Director
roger.french@case.edu
Jonathan Steirer, Operations Director
jonathan.steirer@case.edu (http://bulletin.case.edu/schoolofengineering/jonathan.steirer@case.edu)

The SDLE Research Center was established in 2011 as a Wright Project Center with funding from Ohio Third Frontier and is dedicated to advancing the fields of lifetime and degradation science using data science. The research center activities have expanded to include research focused on the durability and degradation of environmentally exposed, long-lived materials and technologies such as photovoltaics (PV), coatings, energy efficient lighting, and building envelope applications, as well as broad-based collaborations in materials data science in reliability and degradation, carbon capture and storage, and geothermal energy applications.

A data science approach is needed to handle large scale data on materials, components, systems, modules, commercial power plants, and the grid. These approaches involve data ingestion into nonrelational data warehouses and data-driven modeling with a foundation in the underlying physics and chemistry of degradation and lifetime performance. Assembling FAIR (Findable, Accessible, Interoperable, Reusable) data and other data, developing and sharing codes and tools, and reporting research results along a materials value chain is a key component of the Center. The SDLE Research Center facilitates complex data-driven modeling, including geostatistical, geospatiotemporal modeling, graph network modeling, and degradation network models. The data analytics platform (CRADLE), an integrated distributed and high performance computing cluster, was developed in the center to facilitate large data storage and analysis with ease of access to team members enabling fleets of high performance computing jobs for improved data analytics.

The SDLE Center has developed a method to enable large-scale distributed analysis of commercial fleet scale photovoltaic (PV) power
plants for both performance loss rate (PLR) determination and power forecasting. This study includes a set of 4,000 PV plant inverters and determines the data quality of these plants in relation to prediction of PLR. Additionally, a multi-year benchmarking and review of the impact of data quality and filtering, power prediction algorithms, and PLR determination methods have defined the challenges in PLR determination. The data quality, data gaps, and filtering of timeseries data of commercial fleets of PV plants restrict which algorithms analyses can use and can bias results and reduces their accuracy. Data quality and data gaps can be improved with spatio-temporal graph neural network (st-GNN) models of PV power plant data including satellite weather data and autoencoders for data imputation of missing data. FAIR data principles are used to make FAIR data and models in order to improve transferability of data and models.

The SDLE Center has a focus on materials science in relation to long-lived materials. This work determines the degradation mechanisms in material systems, which can be mitigated to optimize lifetime performance of materials, components, and devices. Understanding these key degradation mechanisms in relation to the stress and stress level is fundamental to lifetime and degradation science (L&D). By encompassing the knowledge from the experimental insights of the degradation of materials, the lifetime of materials can be predicted under multiple different stress conditions. Thus far traditional materials reliability has been flawed with costly failures in applications such as polyamide backsheet failure in photovoltaic (PV) modules. The Center has developed an epidemiological approach to understanding materials degradation which provides more scientific value by giving information on the standard deviation within a population. Additionally, by combining standard and modified accelerated exposures with real-world exposures, degradation can be more accurately predicted on a variety of different grades of materials or component structure. Then data-driven or network modeling provides insights into the impact of stress conditions on degradation and performance. Real-world degradation gives the information on the complex and synergistic nature of materials degradation compared to single or even combinational accelerated stressors. The unique environment that material exists in the real-world or in-use conditions is varied due to specific microstressors as well as the impact of climate change on climate zones.

Geostatistical geospatiotemporal modeling is an active area of research within SDLE which is a quantitative method for mapping phenomena that are inherently tied to geographic and/or temporal space. The method provides for estimating at unsampled locations and for simulating multiple equally probable realizations to assess the space of uncertainty in the subsurface, surface, or near surface environment. Applications include environmental, mineral resources, geothermal, hydrology, agriculture, climate, forestry, soil, air, and more.

The SDLE Research Center's Core Facility has capabilities and equipment including:

- Outdoor solar exposures: SunFarm with 14 dual-axis solar trackers with multi-sun concentrators, and power degradation monitoring
- Solar simulators for 1-1000X solar exposures
- Multi-factor environmental test chambers with temperature, humidity, freeze/thaw, and cycling
- A full suite of optical, interfacial, thermo-mechanical, and electrical evaluation tools for materials, components, and systems

- CRADLE: two nonrelational data warehouses based on Cloudera's distribution of Apache's Hadoop, Hbase, and Spark
- High Performance Compute Cluster for data analytics

Microcharacterization: Swagelok Center for Surface Analysis of Materials

SCSAM, the Swagelok Center for Surface Analysis of Materials, is a multi-user facility providing cutting-edge major instrumentation for microcharacterization of materials. SCSAM is administered by the CSE (Case School of Engineering) and is central to much of the research carried out by CSE's seven departments. The facility is also extensively used by the CAS (College of Arts and Sciences) Departments of Physics, Chemistry, Biology, and Earth, Environmental, and Planetary Sciences, as well as many departments within the School of Medicine and the School of Dental Medicine. Typically, more than 200 users, mostly academic, utilize the facility per year.

SCSAM's instruments encompass a wide and complementary range of characterization techniques, which provide a comprehensive resource for high-resolution imaging, diffractometry, and spatially-resolved compositional analysis.

Current capabilities for high-resolution imaging include: an AFM (atomic force microscope) which can optionally be operated with an imaging nanoindenter scan head or a stand-alone automated nanoindenter; a Keyence optical microscope providing the next-generation of optical microscopy with a large depth-of-field and advanced measurement capabilities for inspection and failure analysis; two scanning electron microscopes, one equipped for FIB (focused ion beam) micromachining, and both equipped with XEDS (X-ray energy-dispersive spectrometry), TSEM (transmission scanning electron microscopy), and EBSD (electron backscatter diffraction) detectors.

For XRD (X-ray diffractometry), SCSAM provides two diffractometers with 1D and 2D detectors to allow for phase identification, phase fraction determination, crystal structure refinements, as well as stress and strain measurements of crystalline solids.

SCSAM's surface analysis suite of instruments includes an instrument for ToF-SIMS (time-of-flight secondary-ion mass spectrometry), a SAM (scanning Auger microprobe) for spatially resolved AES (Auger electron spectroscopy), and an instrument for XPS (X-ray photoelectron spectroscopy, also known as ESCA, electron spectrometry for chemical analysis), that accomplishes high spatial resolution by operating with a focused X-ray beam.

SCSAM's instruments are housed in a centralized area allowing users convenient access to state-of-the-art tools for their research. For more information, please visit the center's website: https://engineering.case.edu/centers/scsam/
Educational Facilities

MyApps
MyApps (https://myapps.case.edu/) provides a virtual desktop environment with access to all of the software licensed to any CWRU community member based on program of study, course enrollment or role at the university, without the need for installation on a computer. MyApps is available to all current CWRU students, faculty and staff members. Users of MyApps can stream software instantly without having to install it from any device, even public computers, through the MyApps portal.

MyApps is compatible with Windows, Mac, iOS, Android, ChromeOS, and major Linux distributions and can be accessed via a computer running an up-to-date web browser (Google Chrome, Mozilla Firefox, Microsoft Edge, Safari). MyApps can also be accessed from any mobile device, such as an iOS or Android device, by installing the Citrix Workspace app from that device's app store.

https://myapps.case.edu
To begin using MyApps, go to https://myapps.case.edu.
For more information visit https://case.edu/utech/services/myapps/.

Nord Computer Laboratory
The Nord Computer Laboratory is a general purpose computer facility, provided by the Case School of Engineering, open 24 hours a day, available to all CWRU students. The lab contains 56 Thin Clients that connect to a Windows environment.

Larry Sears and Sally Zlotnick Sears think[box]
Housed in the Richey Mixon Building, the Larry Sears and Sally Zlotnick Sears think[box] (http://thinkbox.case.edu) houses all the resources budding innovators and makers need to bring their ideas to life. At 50,000 square feet, this maker space and innovation center is one of the largest such facilities at any university in the world. Six floors are now open, each dedicated to a specific stage of the innovation process, including open areas and meeting spaces for interaction, prototyping tools and equipment, a fabrication machine shop and project space, in addition to an incubator where students receive guidance as they start new ventures.

Vision
Inspiring, educating, and empowering an inclusive community to explore, innovate, and solve problems

Mission
The mission of Sears think[box] is to:

- Support people learning, refining, and utilizing skills to achieve their desired goal(s) in innovation, entrepreneurship, and making
- Cultivate and welcome a diverse community
- Create a culture that encourages persistence and values resilience

Think[box] is available to instructors from across the university to assist in their development and delivery of credit-bearing courses. In addition, think[box] resources can be accessed by undergraduate and graduate students pursuing course-related, research, or independent projects. In order to ensure accessibility, think[box] staff regularly offer training associated with the operation of specific equipment. Requests for custom training will be considered.

ENGR (ENGR)

ENGR 101. Engineering for Non-Engineers. 3 Units.
This course is an introduction to basic principles used in engineering and the application of these principles to the technology in the world around us. You will also explore social, economic, and political implications of this technology. The course is specifically geared to non-engineers. Mathematical concepts and tools that are needed to represent and analyze the scientific and engineering principles in the course will be developed in class. You will have the opportunity to learn about engineering principles, apply them in experiments, and then see how they are used in current technology. This is partly a lecture class, partly a discussion class, but largely a hands-on course. You learn about engineering by working with actual devices. Counts for CAS Quantitative Reasoning Requirement.

ENGR 131. Elementary Computer Programming. 3 Units.
Students will learn the fundamentals of computer programming and algorithmic problem solving. Concepts are illustrated using a wide range of examples from engineering, science, and other disciplines. Students learn how to create, debug, and test computer programs, and how to develop algorithmic solution to problems and write programs that implement those solutions. Matlab is the primary programming language used in this course, but other languages may be introduced or used throughout. Counts for CAS Quantitative Reasoning Requirement.

ENGR 131B. Introduction to Engineering and Programming. 3 Units.
Students will learn the fundamentals of engineering analysis and computer programming using a hands-on, project-based approach. During each project, students will apply engineering skills, such as data analysis or prototyping, in addition to programming, to complete a given task. MATLAB will be the primary coding language. Potential projects include building a motor, balancing a ball on a beam, and creating a water filter. In addition, students will learn about the engineering profession and practice presentation skills.

ENGR 145. Chemistry of Materials. 4 Units.
Application of fundamental chemistry principles to materials. Emphasis is on bonding and how this relates to the structure and properties in metals, ceramics, polymers and electronic materials. Application of chemistry principles to develop an understanding of how to synthesize materials. Prereq: CHEM 111 or equivalent.

ENGR 200. Statics and Strength of Materials. 3 Units.
An introduction to the analysis, behavior and design of mechanical/structural systems. Course topics include: concepts of equilibrium; geometric properties and distributed forces; stress, strain and mechanical properties of materials; and, linear elastic behavior of elements. Prereq: PHYS 121.

ENGR 200S. Statics and Strength of Materials - Supplemental. 0 - 1 Units.
This course allows students who are seeking transfer credit for ENGR 200 for a Statics course taken an another educational institution to obtain missing content in the area of Strength of Materials and to show passing proficiency in this content.

ENGR 200T. Statics and Strength of Materials (in Tianjin, China). 3 Units.
An introduction to the analysis, behavior and design of mechanical/structural systems. Course topics include: concepts of equilibrium; geometric properties and distributed forces; stress, strain and mechanical properties of materials; and, linear elastic behavior of elements. Prereq: PHYS 121.
ENGR 210. Introduction to Circuits and Instrumentation. 4 Units.

ENGR 210S. Introduction to Circuits and Instrumentation - Supplemental. 1 - 3 Units.
This course allows students who are seeking transfer credit for ENGR 210 for a Circuits course taken at another educational institution to obtain missing Laboratory content and to show passing proficiency in this content.

ENGR 225. Thermodynamics, Fluid Dynamics, Heat and Mass Transfer. 4 Units.
Elementary thermodynamic concepts: first and second laws, and equilibrium. Basic fluid dynamics, heat transfer, and mass transfer: microscopic and macroscopic perspectives. Prereq: PHYS 121 or PHYS 123. Prereq or Coreq: MATH 223 or MATH 227.

ENGR 225B. Thermodynamics, Fluid Mechanics, Heat and Mass Transfer (abroad). 4 Units.
Elementary thermodynamic concepts: first and second laws, and equilibrium. Basic fluid dynamics, heat transfer, and mass transfer: microscopic and macroscopic perspectives. The course is taught as a faculty-led study abroad course, and engineering applications are discussed in the context of regional issues specific to the host country. Prereq: CHEM 111, ENGR 145, and PHYS 121. Coreq: MATH 223.

ENGR 225S. Thermodynamics, Fluid Dynamics, Heat and Mass Transfer - Supplemental. 0 - 2 Units.
This course allows students who are seeking transfer credit for ENGR 225 for a Thermodynamics course taken at another educational institution to obtain possible missing content in the area of fluid dynamics, heat, or mass transfer and to show passing proficiency in this content.

ENGR 350U. Global Health Design in Uganda. 1 - 3 Units.
The CWRU Anthropology-Engineering Collaborative (AEC) offers this unique course applying social science and engineering skills and expertise to address global health issues in Uganda. The AEC is part of a longstanding collaboration between CWRU and Makerere University in Kampala, Uganda. Students collaborate with students at Makerere University in Kampala, Uganda and the CWRU student group, Global Health Design Collaborative (GHDC), to design and implement solutions to specific health issues in Luwero, Uganda. Students meet weekly during the semester to learn about global health technology design and anthropology. Students work with GHDC and program faculty on specific projects; activities may include conducting needs assessment, prototype development, design validation and verification, and preparation of a project report. Current projects focus on designing a pediatric pulse oximeter; identifying means to preserve the cold chain for vaccine outreach and improving medical waste disposal. In Uganda, students and their Makerere University counterparts travel together to Luwero district where they visit health centers to collaborate with local staff to review current design prototypes and issues. Activities include: talking to health center staff at different levels of the health care system, observing a community health outreach, and meeting with diverse stakeholders in Luwero and Kampala. Students gain hands-on experience in engineering design, social science methods, and working in transnational, interdisciplinary teams and contribute directly to ongoing efforts to address global health issues in Uganda. Students are encouraged to contribute to the projects through ongoing work with GHDC. The course may be taken as either ENGR 350U or ANTH 300. The course fee covers travel and on-the-ground expenses. The class is open to all majors but enrollment is by application and instructors’ consent. Students who enroll in 3 credits may count the class for the CSE humanities/social science requirement and/or the CAS Global and Cultural Diversity requirement. Offered as ENGR 350U and ANTH 300.

ENGR 390. Basic Visual Communication. 2 Units.
This course is focused on fundamental visual communication techniques for product development. Students will learn to explore and present their ideas through sketching, rendering, orthographic drawing and physical modeling. Drawing and modeling skills in this course will be practiced manually rather than digitally (i.e., pen and paper, hand-built models). Studio time will include group demos, in-class assignments and exercises, and one-on-one instruction. Coursework is tailored for Case students, however attempts will be made to align this course with the standard Industrial Design Communication Skills Course at The Cleveland Institute of Art (CIA). This will allow opportunities for networking and collaboration with CIA students. Prereq: Must be a Sophomore or above or in a declared Engineering major.

ENGR 395. Community-engaged, Interdisciplinary Team-based Design Projects. 1 - 3 Units.
Interdisciplinary, team-based design projects under faculty guidance and with professional mentorship as appropriate. Each enrolled student will be part of a project team. Class will meet weekly for training, design reviews and progress updates. Teams will additionally meet outside of class time. Engagement with community partner (customer) is expected. Projects may be long term, possibly preceding and extending beyond the engagement time of individual students. Team members will have individual roles and responsibilities. Course may be taken for 1-3 credits, and level of responsibility will be proportional. Course deliverables will include rigorous maintenance of project documentation, including a transition report, and oral presentations. Intended for second-year students and above. Students in all disciplines are welcome. Projects may involve international partnerships, but travel is not mandatory.
ENGR 397. Interdisciplinary Solutions to Global Health Issues. 3 Units.
This unique course brings together the expertise of engineers and social scientists to address global health issues through a combination of classroom-based learning and experiential learning through team-based design projects and field-based community assessments. Students will experience the process of engineering design by participating in teams organized around solutions to real-world health problems in the developing world. Methods from social sciences will be practiced and brought to bear in the process, including assessment of global health needs, and evaluation of success of interventions. Students will study and discuss current key issues in global health, and ethics surrounding health care, disparity, methods of intervention, and develop skills in how to define and frame problems and communicate effectively across disciplines. The course is organized around ongoing projects that seek to design technical solutions to global health issues, with a focus on Uganda. The teams will also work and learn with students and faculty of Biomedical Engineering and Social Sciences at Makerere University of Kampala (MUK), Uganda. Examples of interactions with MUK will include discussion of common readings, peer-review, and joint planning, implementation, and review of fieldwork. Students enrolled in ANTH 303/ ENGR 397 are eligible to travel to Uganda to participate in project activities over Spring Break. Travelers must be enrolled in ENGR 350U. This course is an approved SAGES Departmental Seminar. A student in the Case School of Engineering may use this course to meet an Engineering Core Breadth requirement, either in place of ENGL 398 and ENGR 398, or as a Social Science course (ANTH 303 cross-list). No student may count the course to satisfy both of these requirements. Offered as ANTH 303 and ENGR 397. Counts as SAGES Departmental Seminar. Counts for CAS Global & Cultural Diversity Requirement. Prereq: Passing letter grade in a first year seminar in FSCC, FSSO, FSSY, FSNA, FSCS or FSTS.

ENGR 398. Professional Communication for Engineers. 1 Unit.
Students will attend lectures on global, economic, environmental, and societal issues in engineering, which will be the basis for class discussions, written assignments and oral presentations in ENGL 398. Recommended preparation: ENGL 150 or FSCS 100 or equivalent and concurrent enrollment in ENGL 398 (ENGL 398 and ENGR 398 together form an approved SAGES departmental seminar). Counts as SAGES Departmental Seminar. Counts for CAS Global & Cultural Diversity Requirement. Prereq: Coreq: ENGL 398. Prereq: Prereq: 100 level first year seminar in FSCC, FSNA, FSSO, FSSY, FSTS, or FSCS.

ENGR 400C. Graduate Cooperative Education. 0 Unit.
An academic opportunity designed for graduate students to enhance their classroom, laboratory, and research learning through participation and experience in various organizational/industrial environments where theory is applied to practice. Graduate Cooperative Education experiences may be integrated with the student’s thesis or research project areas, or be solely for the purpose of gaining professional experience related to the student’s major field of study. Registration in this course will serve to maintain full-time student status for the period of time that the student is on a co-op assignment. Prereq: ENGR 400C.

ENGR 401C. Graduate Cooperative Education. 0 Unit.
An academic opportunity designed for graduate students to enhance their classroom, laboratory, and research learning through participation and experience in various organizational/industrial environments where theory is applied to practice. Graduate Cooperative Education experiences may be integrated with the student’s thesis or research project areas, or be solely for the purpose of gaining professional experience related to the student’s major field of study. Registration in this course will serve to maintain full-time student status for the period of time that the student is on a co-op assignment. Prereq: ENGR 400C.
ENGR 420C. Artificial Intelligence: Sequential Decision Making. 2 Units.
This introduces advanced AI models in the areas of computer vision and natural language processing as well as reinforcement learning techniques along with their implementation for industrial applications. The primary focus is on deep learning based modeling with a brief introduction to traditional computer vision and NLP techniques. The course begins with introduction to ‘tensorflow’ a scalable and deployable programming platform for building neural network architectures. The first theory lecture introduces to the world of computer vision along with traditional approaches and a comparison is drawn between traditional methods and DL for computer vision. In the following lectures multiple advanced neural network architectures are taught along with their application usages (visual inspection, medical imaging, object detection, OCR, Face recognition, video analysis, etc.). Computer vision is followed by introduction to NLP and traditional techniques like HMMs and CRFs followed by DL architectures for sequence (text, video, audio, speech etc.) modeling. Different application usages (NER, language modeling, speech recognition, etc.) along with required theory are presented. Introduction to reinforcement learning and its combination with deep learning is presented towards the end of the course. During the labs all steps of building an application, from the training of the model to its deployment, are discussed. How to combine traditional methods with DL and possible usages are also discussed. The objective of the course is to make the participants familiar with the state-of-the-art DL and RL techniques for real world problems along with the knowledge to implement solution pipelines. The participants are expected to have very good knowledge of programming platforms like Python (or others) and they must be familiar with machine learning, basic DL techniques (MLP, CNN, RNN and LSTM). Prereq: ENGR 420B, ENGR 420E, and ENGR 420F.

ENGR 420D. Introduction to Contemporary Issues in Data Mining and Big Data. 3 Units.
Eighty percent of the data available in the world since the dawn of Humanity has been generated in the last five years and it is not just structured but there is a variety to it (like, text, images, audio, video, etc.). Vast amount of data is being collected in medical and social research and in many industries. Such big data generates a demand for efficient and practical tools to analyze the data and to identify unknown patterns. This has created a lot of issues in building effective Data Mining and Data Science solutions. Hadoop technology platform deals with massive volumes/varieties and fast-growing data have come up in recent years to deal with such contemporary issues. Apache Spark, the unified analytics engine, has seen rapid adoption by enterprises across a wide range of industries. Data scientists, analysts, and general business intelligence users rely on interactive SQL queries for exploring data, deal with streams of data, build Machine Learning models to use the predictive power and draw business insights. This course will help students handle such issues in data science through use of Big data techniques and tools. Prereq: ENGR 420B, ENGR 420E, and ENGR 420F.

ENGR 420E. Introduction to Data Mining and Visualization Techniques. 3 Units.
Industry today is looking for someone who can develop data science solutions using open source tools and technologies. The languages such as “R” and “Python” play a significant role facilitating the building of statistical and data science models and approaches to visualize data and making predictions to support decisions. The languages are taught from basics such as objects, data types, functions, control structures, etc., that are essential to read and manipulate a lot of structured data. Some of the basic skills like data acquisition, analysis, dealing with inconsistencies within the data and cleansing, transforming the data as required for further modeling and several other traits to prepare the data will be taught. It is also a common practice to begin the data analysis by visualizing the data in addition to computing summary descriptive statistics. Well-designed visualization techniques can decrease cognitive workload, provide simpler perceptual inferences and improve comprehension of large sets of data to facilitate decision making. Techniques and algorithms for creating effective visualizations will be covered along with the required basics of R, Python and Tableau to generate descriptive statistics, run experiments and draw inferences, visualize the data and present a data story.

ENGR 420F. Introduction to Methods and Algorithms for Machine Learning. 3 Units.
Traditional statistical methods and Machine learning methods coexist, and it is essential for every Data Science enthusiast to learn both and exploit them as they deem fit. Machine Learning is an algorithm that can learn from data without relying on rules-based programming. In this course a variety of machine learning techniques (supervised learning and unsupervised learning), with data examples from biomedical and social research will be covered. Specifically, prediction model building and model-based feature selections, classification (tree-based methods, bagging, random forests, boosting, support vector machines, association rules, clustering and hierarchical clustering, k-nearest neighbors will be covered. Industry case studies will be used to provide students an overview of how a data science project is executed and help them learn all the components of the data science pipeline, and to carry out descriptive, predictive and prescriptive analytics. For a given use case, we teach how to choose between a variety of tools and techniques that suit the problem statement and at every stage how to validate the choice and tune the model performance. When it comes to solving real-world problems for any industry it is equally important to know how to work with all the stakeholders in the organization and build plugins that the business can use. Some of the important aspects like architecting a solution, production deployment and how to deal with challenges and some best practices will be covered. Additionally, this course is designed to broaden the learning horizons and introduce students to unstructured data (Natural Language and computer vision). Some of the state-of-the-art tools and techniques to build supervised and unsupervised approaches to build systems that can-do intelligent things will be introduced. It includes ANN, Deep learning, Convolution nets, RNN and LSTMs. The course goes into details of architecture, implementation and mathematical background of SOTA NLP and computer vision techniques and then build several interesting applications. This program provides a good overview of how learned techniques can be used to build interesting commercial applications in healthcare, medicine, biometrics, speech, OCR, etc. We also dive deep into the engineering aspects and enable participants to think of possibilities in other domains as well. Additionally, another branch of mathematical models, namely Optimization techniques will be covered to build intelligent systems. Recommended preparation: ENGR 420B or concepts covered in that class.
ENGR 600. M.S. Engineering Culminating Experience. 0 Unit.
Culminating experience for MS course focused track in engineering. Prereq: M.S. student in Engineering - course focused track.

EPOM (EPOM)

EPOM 400. Leadership and Interpersonal Skills. 3 Units.
This course is designed as an experience based process to increase understanding of Communication, Emotional Intelligence and behavioral based communication needs in the work environment. To increase understanding, students will learn to recognize, manage and leverage these in business relationships as well as in team and group processes to develop effective Leadership style. Students will work in teams to examine the topics from the perspective of team members and leaders and will formulate strategies to reach desired goals or outcomes.

EPOM 401. Introduction to Business for Engineers. 3 Units.
This course provides an introduction to the business environment for practicing engineers. The course emphasizes the interplay between business and engineering in the context of the competitive marketplace (economics), how engineering proposals are evaluated (finance), the relationship between product and customer (marketing), making effective use of micro-disciplinary teams (organizational behavior), and the manufacturing and production process (operations).

EPOM 403. Product and Process Design and Implementation. 3 Units.
The course is taught through a series of lectures, class discussions, group projects and case studies. The course aim is to provide a solid understanding of the many aspects of the engineering design process and the management of technology. The course focuses on the engineering and management activities used to develop and bring to market new products and processes. The first part of the course focuses on the techniques used to develop new ideas, the second part focuses on the management of technology and innovation. Recommended preparation: EPOM 401.

EPOM 405. Applied Engineering Statistics. 3 Units.
In this course a combination of lectures, demonstrations, case studies, and individual and group computer problems provides an intensive introduction to fundamental concepts, applications and the practice of contemporary engineering statistics. Each topic is introduced through realistic sample problems to be solved first by using standard spreadsheet programs and then using more sophisticated software packages. Primary attention is given to teaching the fundamental concepts underlying standard analysis methods. Offered as EPOM 405 and ECSE 411.

In this course, money and profit as measures of "goodness" in engineering design are studied. Methods for economic analysis of capital investments are developed and the financial evaluation of machinery, manufacturing processes, buildings, R&D personnel development, and other long-lived investments is emphasized. Optimization methods and decision analysis techniques are examined to identify economically attractive alternatives. Basic concepts of cost accounting are also covered. Topics include: economics criteria for comparing projects: present worth, annual worth analysis; depreciation and taxation; retirement and replacement; effect of inflation and escalation on economic evaluations; case studies; use of optimization methods to evaluate many alternatives; decision analysis; accounting fundamentals: income and balance sheets; cost accounting. Offered as ECSE 407 and EPOM 407.

EPOM 409. Master of Engineering Capstone Project. 3 Units.
This is the capstone course for the Master of Engineering Program providing students with the opportunity to integrate the Program's topics through an intensive case study project. Interdisciplinary teams are assigned a major engineering project that covers the stages from design concept through development to final manufacture, including business and engineering decision making to maximize market penetration. Topics also include safety, environmental issues, ethics, intellectual property, product liability and societal issues. Recommended preparation: EPOM 401, EPOM 403, EPOM 405, and EPOM 407.

EPOM 410. Intellectual Property Management and Opportunity Assessment. 3 Units.
The goal of this course is to address issues relating to the commercialization of scientific inventions by exposing graduate students to the challenges and opportunities encountered when attempting to develop meaningful intellectual property from the point of early discovery to the clinic and market. Specifically, this course seeks to provide students with the ability to value a given technological advance or invention holistically, focusing on issues that extend beyond scientific efficacy and include patient and practitioner value propositions, legal and intellectual property protection, business modeling, potential market impacts, market competition, and ethical, social, and healthcare practitioner acceptance. These issues transcend disciplinary boundaries, requiring the integration of expertise in the fields of law, business, and biomedical research disciplines. For instance, comprehending the intricacies involved in the evolution of an upstream product from the lab to the marketplace requires an understanding of intellectual property management, namely the identification of optimal appropriability mechanisms, constructing an intellectual property portfolio (e.g., patents, trademarks, and trade secrets), and leveraging this portfolio in a competitive fashion. An emphasis of this course is to help students understand that intellectual property strategy is business strategy, and that IP is a strategic business asset that can be leveraged to create value and intellectual asset formation in the marketplace.

EPOM 411. Innovation - the Confluence of Need, Requirements and Creativity. 3 Units.
Innovation - the Confluence of Need, Requirements and Creativity: The Purpose of this course is to familiarize students with tools and methods of facilitation necessary to move from a simple idea, to a validated development concept with commercial potential. Drawing from fundamentals of a range of programs, including Stanford's BioDesign, Lean Launch, Requirements by Design and others, the course will lead students through the process of developing detailed perspectives on unmet need, validated design requirements, intellectual property analysis and commercialization fundamentals.

EPOM 412. Technology Transfer and Collaboration. 3 Units.
The overall goal of this course is to address the process of technology transfer. The course will build on an understanding of IP Management and Commercialization activities that follow a new discovery, and examine specific approaches to commercializing technology through the process of technology transfer both in the context of academic research and industry research and development. An overview of the drivers governing relevant industry standards will be discussed, along with specific tools that include sponsored research, licensing, and startup formation. The course will include hands-on assessments of two case studies that present applications of law and policy in the context of collaborative technology development, where each student team will provide a critique and overview of how they would handle the circumstances of the given case. Prereq: EPOM 410.
EPOM 413. Innovation, Strategy & Leadership: Contemporary Approach to Future Growth. 3 Units.
The overall goal of this course is to address the process of innovating in an enterprise context. Outside of the enterprise, global shifts, economic developments and technological evolutions all present opportunities and challenges for innovation-based organizations. Inside the enterprise, company culture, acceptable risk/reward profiles and strategic mindsets will all influence the effectiveness of valuable innovation. Building on an understanding of IP Management and Commercialization activities that follow a new discovery (see, e.g., EPOM 410), and needs-based innovation and design (see, e.g., EPOM 411) this course examines specific approaches and factors related to effectively responding to the challenge of innovation from strategic and leadership perspectives. This course will examine approaches to strategic leadership relative to innovative challenges, building an understanding of successful endeavors, flops that "should have worked" and an embrace of the myriad choices and factors that underlie competitive innovation. The course is three credit hours. During the semester, students will work individually, focusing on issues of the process of structuring innovation, applying tools and methodologies presented during the course. Course leaders and presenters will be drawn from across the university and industry. Analytical and philosophical understanding will be enhanced by hands-on assessments of two case studies that present applications of law and policy in the context of strategic technology innovation and leadership. The goal of each student team is to provide a critique and overview of what factors drove the circumstances and outcomes of the given case. The ultimate objective is to deliver a working understanding of the strategic options available when attempting to lead an innovative enterprise through the process of converting innovative potential to strategically competitive solution.

IIME (IIME)

IIME 400. Leadership Assessment and Development (LEAD). 3 Units.
The goal of the course is to help students learn methods for assessing their knowledge, abilities, and values relevant to engineering and management, and for the acquiring of new professional knowledge and skills throughout their career. Recommended preparation: Senior status in engineering.

IIME 405. Project Management. 3 Units.
Project Management is concerned with the management and control of a group of interrelated tasks required to be completed in an efficient and timely manner for the successful accomplishment of the objectives of the project. Since each project is usually unique in terms of task structure, risk characteristics and objectives, the management of projects is significantly different from the management of repetitive processes designed to produce a series of similar products or outputs. Large-scale projects are characterized by a significant commitment of organizational and economic resources coupled with a high degree of uncertainty. Thus, the objective of the course is to understand what are the main issues and problems in the management of projects and to have a thorough knowledge of the conceptual models and techniques available to deal with them. Recommended preparation: Senior status in engineering.

IIME 410. Accounting, Finance, and Engineering Economics. 3 Units.
This class uses a combination of class lecture and discussion, in combination with problem-type and case-type assignments, to introduce you to key concepts and tools of financial economics. You are expected to use the resources at your disposal, such as the textbook or the accounting dictionary, to help you understand any unfamiliar concepts. Normally, each class will be divided into two sections. The first part of each class session will be devoted to discussions of selected problems and cases, with focus on the specific topics being covered. The second part of each class will be devoted to prepare you for the following session class assignments. Recommended preparation: Senior status in engineering.

IIME 411. New Venture Finance. 3 Units.
This course explores the financing and financial management of entrepreneurial new ventures. The course will focus on issues of financial management of new ventures (forecasting cash flows, cash flow management, valuation, capital structure) and the various financial methods and mechanisms available to entrepreneurs (bootstrapping, angel investors, venture capitalists, IPOs). This course is highly complementary to the existing IIME 410 Finance course which only briefly covers venture finance.

IIME 413. Strategic Intelligence for Technology Commercialization. 3 Units.
The accelerating rate at which major corporations are failing evidences the fact that longstanding assumptions regarding successful strategic planning are being challenged by the increasing rate of disruptive technological innovation. This course unpacks a toolbox of strategic planning methodologies to help students understand how to identify the core requirements of a durable business strategy from which investment (BAFI 460) and corporate risk management (MSFC 432) strategies would follow. The course focuses on the particular challenges faced by established corporations as opposed to entrepreneurial startups. It uses workshops to provide hands on experience in applying the tools to real world problems corporations are facing today.

IIME 415. Materials and Manufacturing Processes. 3 Units.
A survey course on contemporary and modern materials and their processing, the course begins with a review of traditional materials, including metals, ceramics, plastics, and composites. The evolution of the materials will be traced from their beginnings as raw resources and precursors to finished products. Topics will emphasize modern manufacturing methods and materials. Traditional and modern tools for materials and process characterization will be an important part of the course. Special attention will be directed to examples of statistical methodology and information technology. Visits to local industries and presentations by participating companies will reinforce the information presented in the classroom. Recommended preparation: Senior status in engineering.

IIME 418. Graduate Practicum. 0 Unit.
The General Practicum is designed for MEM students who graduate in December from their BS degree so that the student’s records can stay actively at the University and register for their MEM fall classes when they return in the fall semester to complete the master’s degree.

IIME 419. Entrepreneurship and Personal Wealth Creation. 3 Units.
Course explores the accumulation of personal wealth utilizing entrepreneurial strategies. The underlying competencies of successful entrepreneurs are identified and applied to individual lives of students. Active entrepreneurs will be studied, and original case studies of start-ups and acquisitions provide the basis for class exercises. Offered as DESN 419 and IIME 419. Prereq: Enrolled in the Master of Engineering and Management program.
IIME 420. Information, Design and Systems. 3 Units.
Everything about a business is designed, including the ways in which the organization uses information and the systems it uses to create and deliver its products and services, its supply chains, its ways of accounting for its use of resources, how it relates to its employees, industry and customers, and more. Understanding general principles that guide the design and use of systems, using systems effectively, and redesigning them to address changing circumstances are the foci of this course. This course will use readings, discussion, projects and occasional lectures to explore principles, methods, attitudes and tools that can be helpful to managers.

IIME 424. Chief Executive Officer. 3 Units.
This course will take the perspective of the CEO in deciding the actions that lead to sustainable competitive advantage. We will study decisions that span from starting a small business to expanding beyond the core using mergers and acquisitions. We will also study how CEOs decide to exit a market. The successful CEO not only has to design the strategy for success but has to also design an execution plan. As the organization grows the importance of delegation to the right subordinates becomes increasingly critical. The course material includes case studies, decision briefs and presentations (virtual and in person) by senior executives. Decision briefs are short notes that have the same information that the CEOs had when starting the business. You will develop the strategy based on these decision briefs and will compare your suggestions to what was actually done by both successful and unsuccessful CEOs. Offered as DESN 425 and IIME 424. Prereq: Enrolled in the Master of Engineering and Management program.

IIME 425. Understanding People and Change in Organizations. 3 Units.
This course is intended to help students assess events occurring in organizations from a behavioral and human resources perspective and to help them develop strategies for managing these events. The course applies knowledge from the fields of organizational behavior and human resource management to provide an understanding and the skills needed to be effective in organizations. The fields of Organizational Behavior and Human Resource Management are devoted to the study of how human beings act in organized settings and how organizations can affect human behavior through a variety of policies, practices, structures, and strategies. In today’s environment, organizations are faced with high levels of international competition and an increasing pace of technological, market, and social changes. As an organizational member, you are expected to successfully operate within these increasingly complex demands as well as help create and guide change. The purpose of this course is to provide you with the framework and tools needed to analyze and operate in the changing organization. We will examine some of the features that characterize an emerging organizational form and contrast this to its traditional predecessor. The focus of the course will be on the skills you will need to operate in the "new" organization including skills for being a change agent working in entry level and early career managerial roles. Recommended preparation: Accredited Bachelor’s in Engineering plus summer job experience. Prereq: Enrolled in the Master of Engineering and Management program.

IIME 430A. Product Design and Development I. 3 Units.
An integrated approach to the teaching of the complex relationship of customer to designer and to manufacturer, this course will be team taught by faculty from WSOM and CSE, with participation of corporate representatives sponsoring projects for the teams. The course will be built on a series of projects, each emphasizing different aspects of the product/process design experience, selected to provide exposure to a wide variety of entrepreneurial activities. The project activities are expected to promote the development of realistic activities of cross-functional teams. Recommended preparation: Accredited Bachelor’s in Engineering plus summer job experience. Prereq: Enrolled in the Master of Engineering and Management program.

IIME 430B. Product and Process Design, Development, and Delivery II. 3 Units.
An integrated approach to the teaching of the complex relationship of customer to designer and to manufacturer, this course will be team taught by faculty from WSOM and CSE, with participation of corporate representatives sponsoring projects for the teams. The course will be built on a series of projects, each emphasizing different aspects of the product/process design experience, selected to provide exposure to a wide variety of entrepreneurial activities. The project activities are expected to promote the development of realistic activities of cross-functional teams. Recommended preparation: IIME 430A.

IIME 432. Operations Research and Supply Chain Management. 3 Units.
This course is an introduction to Operations Research, and then focusing on applying Operations Research tools to manage business and organizations’ Supply Chain Operations. Operations Research (also called Management Science) is the discipline of applying advanced mathematical methods to help make better decisions. By using techniques such as mathematical modeling to analyze complex situations, Operations Research gives executives the power to make more effective decisions and build more productive systems based on considerations of all available options, careful predictions of outcomes and estimates of risk, and the latest decision tools and techniques. Operations Research solves problems that arise in every business function (e.g., operations, finance, marketing, accounting, HR), every economy sector (e.g., financial, healthcare, industrial goods, technology, utilities), and every business type (e.g., for-profit and non-profit, start-ups and Fortune 500 companies), even government.

IIME 435. Enterprise Resource Planning in the Supply Chain. 3 Units.
Enterprise resource planning is the dominant system by which companies translate the needs from their customers into the detailed plans that the company must perform to meet the customer needs, and the resulting support the company will need from its suppliers. As such, it is a central player in the process of supply chain management. In this course, we study both the quantitative and qualitative concepts and techniques to help manage a company's operations to perform these important translation and planning tasks in order to help the company be successful. The quantitative analysis will be supported by microcomputer software available in the Weatherhead computer lab. Student teams complete a series of integrated case studies from the same company to vividly see the relationships between various planning and control activities. A major emphasis during the course is the design of processes and procedures (algorithms) for solving very complex (wicked) problems as part of both class discussions and while working on case studies, as well as critiquing the designs so as to clearly understand their limitations.
IIME 440. Six Sigma and Quality Management. 3 Units.
The Six Sigma process is the standard for quality improvement in organizations around the globe. In this course, we study the details of the five steps in the Six Sigma process: DEFINE, MEASURE, ANALYZE, IMPROVE, and CONTROL (DMAIC). We introduce the concept of sustainability into the criteria to use to evaluate proposed solutions during the Six Sigma process. Many tools, concepts, and processes that are often an integral part of Six Sigma projects in companies are included in the course content. They range from the very basic tools of quality (such as cause-and-effect diagrams for brainstorming) to complete processes (such as benchmarking, quality function deployment, failure mode and effects analysis-FMEA). Statistical concepts that are central to Six Sigma including statistical process control and introduction design of experiments are also included. Once the Six Sigma process and its various components are understood, we study quality management including quality control, quality planning, quality improvement, strategic quality management, and quality strategy. Students meeting the required standards of performance will earn a Green Belt Certification in Six Sigma and Quality Management from the Weatherhead School of Management. Prereq: Enrolled in the Master of Engineering and Management program.

IIME 446. Models of Health Care Systems. 1.5 Unit.
This course is for professionals who will pursue their careers in, or associated with, the health care industry; and therefore, need to understand the structure, operations and decision influences in the health care delivery system. The course is intended to develop competence and confidence in the participant’s ability to understand and operate in the industry. the largest and, perhaps, the most complex in the United States. It is applicable to the private and public, profit and not-for-profit sectors. In this course students are introduced to: the different systems of care delivery; their organization and operations; their markets and the nature of the demand for their services; and the dynamics of their interoperation among themselves and with other entities in the industry (e.g., payors/insurers, regulators and accreditors, technology and pharmaceuticals suppliers). Offered as HSMC 446 and IIME 446.

IIME 447. Regulatory Affairs for the Biosciences. 1.5 Unit.
This mini-course introduces students to the Food and Drug Administration (FDA) and the laws and regulations it enforces. A scientific regulatory agency with far reaching enforcement authority, FDA is the most powerful consumer protection agency in the world. This course will familiarize students with FDA’s mission, philosophy and organizational structure, as well as policy and procedure it uses to ensure the safety and effectiveness of the food, drugs, biologics, cosmetics, medical devices and radiation-emitting products it regulates. Recommended preparation: Enrollment in the MEM Biomedical Entrepreneurship Track. Offered as BIOS 447, HSMC 447, and IIME 447.

IIME 450. Engineering Entrepreneurship. 3 Units.
Entrepreneurship is an area of importance to business leaders, educators, politicians, and individual members of the society. It is a driver of economic development and wealth creation in organizational units ranging in size from the individual company to entire nations. Technology-based entrepreneurship is particularly important to economic development due to its impact on productivity (innovations in action) and its potential for exponential growth. This course will emphasize and explore a variety of issues related to innovation and entrepreneurship, demonstrating that there are not many “absolute truths,” but there are numerous best practices. Successful students will conclude this course with new knowledge about opportunity analysis and insight on entrepreneurship & innovation, as well as having demonstrated measurable improvement in their critical thinking skills. This course is one-semester version of a course taught alternatively as a two-semester course. Recent growth in CWRU curricula centered on entrepreneurship and related subjects enables students to specialize in, say, wealth creation, leadership, and finance topics once included under the broader two-semester umbrella. The current Fall version of the course culminates with student projects and presentations on opportunity analysis.

IIME 450A. Technology Entrepreneurship: Market Opportunity Analysis. 3 Units.
The nature and importance of entrepreneurship is an area of importance to business leaders, educators, politicians, and individual members of the society. It is a driver of economic development and wealth creation in organization units ranging in size from the individual company to entire nations. Technology-based entrepreneurship is particularly important to economic development due to its impact on productivity and its potential for exponential growth. To create something new and of value to both the organization and the market requires a technical individual who is willing to assume the social, psychic, and financial risks involved and achieve the resulting rewards whether these be monetary, personal satisfaction, or independence. This can occur while starting an enterprise (i.e., entrepreneurship) or while driving innovation in an existing organization (intrapreneurship). This course will also take students through a variety of issues related to enhancing innovation in the context of a technology-based organization. This is sometimes termed intrapreneurship and includes innovating new products and services within an organization. This is a very complex field and relatively young. Students will learn that there are not many “absolute truths,” but there are numerous best practices and benchmarks that can assist the intrapreneur. Recommended preparation: Accredited Bachelor’s in Engineering plus summer job experience. Prereq: Enrolled in the Master of Engineering and Management program.

IIME 470. Independent Projects. 3 Units.
This course is designed for students wishing to expand experiential learning opportunities at the interface of engineering and management. Preferred focus areas in entrepreneurship and opportunity assessment, product design and development, and manufacturing planning and management. Project ideas along with milestone, deliverables, and potential corporate clients need to be arranged in advance.
IIME 472. BioDesign. 3 Units.
Medical device innovations that would have been considered science fiction a decade ago are already producing new standards of patient care. Innovation leading to lower cost of care, minimally invasive procedures and shorter recovery times is equally important to healthcare business leaders, educators, clinicians, and policy-makers. Innovation is a driver of regional economic development and wealth creation in organizational units ranging in size from the start-up to the Fortune 500 companies. In a broader context, the pace of translational research leading to product and service innovation is highly interdisciplinary, thus, new products and services result from team efforts, marked by a systematic, structured approach to bringing new medical technologies to market and impacting patient care. In this course we examine medical technology innovations in the context of (A) addressing unmet clinical needs, (B) the process of inventing new medical devices and instruments, and (C) subsequent implementation of these advances in patient care. In short, the student learns the process of "identify, invent, implement" in the field of BioDesign. Offered as EBME 472, IIME 472 and SYBB 472.

IIME 473. Fundamentals of Clinical Information Systems. 3 Units.
Technology has played a significant role in the evolution of medical science and treatment. While we often think about progress in terms of the practical application of, say, imaging to the diagnosis and monitoring of disease, technology is increasingly expected to improve the organization and delivery of healthcare services, too. Information technology plays a key role in the transformation of administrative support systems (finance and administration), clinical information systems (information to support patient care), and decision support systems (managerial decision-making). This introductory graduate course provides the student with the opportunity to gain insight and situational experience with clinical information systems (CIS). Often considered synonymous with electronic medical records, the "art" of CIS more fundamentally examines the effective use of data and information technology to assist in the migration away from paper-based systems and improve organizational performance. In this course we examine clinical information systems in the context of (A) operational and strategic information needs, (B) information technology and analytic tools for workflow design, and (C) subsequent implementation of clinical information systems in patient care. Legal and ethical issues are explored. The student learns the process of "plan, design, implement" through hands-on applications to select CIS problems, while at the same time gaining insights and understanding of the impacts placed on patients and health care providers. Offered as EBME 473, IIME 473 and SYBB 421.

IIME 475. Technology Marketing Strategy. 3 Units.
High technology products and services are unique in the levels of ambiguity and risk that challenge a manager’s ability to craft a marketing strategy. Understanding the customer, reading market trends, creating a compelling vision of value, and launching marketing programs (already foreboding tasks in traditional marketing situations) have a heightened sense of uncertainty in the context of high technology platforms such as nanotechnology and regulated medical devices. This course draws on contemporary ideas in literature by thought leaders in technology marketing. We work though several marketing models and methods in practice today to assist students synthesize and build appropriate conceptual and managerial frameworks for technology marketing practice.

IIME 476. Applied Statistics for Decision Support in Data Science. 3 Units.
In this intense summer application-oriented course, the goal is to bridge traditional statistical tools with the R language to prepare beginning graduate students for further study in data science. Managerial decision support involves the collection, analysis, and interpretation of data for understanding uncertainty and risk in decision-making; quite simply, decision support requires statistics! The "R" language plays a significant role facilitating the building of statistical and data science models and approaches to visualizing data and making predictions to support decisions, but absent a foundational knowledge in probability and statistics the impact of the tools and their use may not be fully realized. The course is project-based to provide direct application of probability and statistics to the extraction of knowledge from data. Prereq: Graduate level standing.
General Engineering

500 Nord Hall (7220)
Phone: 216.368.4436
Daniel J. Lacks, Associate Dean of Engineering
cseinfo@case.edu

Bachelor of Science in General Engineering

The primary purpose of the General Engineering major is to serve the needs of students who have multiple areas of interest in technical fields or who do not wish to pursue pure engineering careers but are looking to expand their technological background to include non-technical pursuits, such as, for example, in business, psychology, history, or art. Thus wanting to pursue an academic curriculum that includes a combination of basic engineering and a variety of courses in both chemical engineering and electrical engineering, but not desiring a dual major, might be a valid reason to choose a General Engineering major. Alternatively, wanting to pursue a combination of basic engineering courses and business courses might be another reason to choose this major. This is not an ABET accredited program.

A student choosing to pursue a General Engineering major must work with the Associate Dean of Academics in the School of Engineering to develop and submit a clear statement of career goals. These should be supported by a detailed course curriculum and sample schedule with a written justification for the selections. The program must then be approved by a committee consisting of the Associate Dean of Academics and two additional faculty members in the School of Engineering. A total of at least 129 semester credits are required for graduation.

As each student’s program is unique, no typical curriculum can be shown. Every program must fulfill the requirements described below.

In addition to Engineering Core (p. 1292) and CWRU General Education (p. 1212) requirements, the program requires the following:

30 cr Engineering courses chosen in consultation with the Associate Dean (including a 3-cr hr capstone)
18 cr Courses chosen in consultation with the Associate Dean
9 cr Open elective courses

Hours required for graduation: 129

The chosen courses should be approved by a committee consisting of the Associate Dean of Academics and at least two additional faculty members.

Cooperative Education

Opportunities are available for students to alternate studies with work in industry or government as a co-op student, which involves paid full-time employment over seven months (one semester and one summer). Students may work in one or two co-ops, beginning in the third year of study. Co-ops provide students the opportunity to gain valuable hands-on experience in their field by completing a significant engineering project while receiving professional mentoring. During a co-op placement, students do not pay tuition but maintain their full-time student status while earning a salary. Learn more at engineering.case.edu/coop (http://engineering.case.edu/coop/). Alternatively or additionally, students may obtain employment as summer interns.

Five-Year Combined BS/MS Program

This program offers outstanding undergraduate students the opportunity to obtain an MS degree in one additional year of study beyond the BS degree. (Normally, it takes two years beyond the BS to earn an MS degree.) In this program, an undergraduate student can take up to 9 credit hours that simultaneously satisfy undergraduate and graduate requirements. Students in this program can begin their research leading to the MS thesis in the fall semester of the senior year. The BS degree is generally awarded at the completion of the senior year.

Application for admission to the five year BS/MS program is made after completion of five semesters of course work. Minimum requirements are a 3.2 grade point average and the recommendation of the Associate Dean of Academics. Interested students should contact Associate Dean Daniel Lacks. Review the Office of Undergraduate Studies BS/MS program requirements here (p. 1298).

Master of Engineering

The Master of Engineering Program is a graduate degree program that targets engineers currently employed in industry. The objective of this program is to provide engineers in industry with technical as well as business, management, and teamwork skills. The program differs from a traditional Master of Science degree in engineering by combining core courses that focus on the engineering-business environment and technical elective courses that concentrate on contemporary industrial practice rather than on research.

The Master of Engineering Program prepares students to enhance their role as corporate leaders and provides an environment in which practicing engineering professionals can address the increasingly wide range of technical, management, financial and interpersonal skills demanded by an ever-expanding and diverse global industry base.

The Master of Engineering Program requires 30 credit hours of coursework that include 18 credit hours of online core courses and 12 credit hours of technical electives, taken either online or on-campus, that are chosen from focus areas (see below). It is possible to complete the Master of Engineering degree program within a two-year (six semester), part-time, program of study, although most students choose to complete the program over a seven to nine semester period.

The program is composed of online and traditional on-campus classes, with core courses aimed at equipping participants with knowledge on how engineering is practiced in contemporary industry, and technical electives that provide depth in a chosen specialty area. All core courses are provided in an exclusively online format. The technical elective sequences for Applied Data Science (ADS), Biomedical Engineering (EBME), Engineering Innovation, Management and Leadership (EIML), Mechanical Engineering (EMAE) and Systems & Control Engineering (SCS) are also in an online format. Other technical elective courses are held on campus in the late afternoon or evening hours, and in an online distance-learning format to minimize disruption at the workplace and home. Because the program makes extensive use of computers, participants need to have access to computer facilities.

For more details about the exclusively online Master of Engineering degree program, visit online-engineering.case.edu/masters/ (http://online-engineering.case.edu/masters/).
For local students wanting to take on-campus technical electives, please contact the Program Director, Sunniva Collins (Sunniva.Collins@case.edu) (skr@case.edu).

Curriculum
The program consists of a set of six core courses and a four-course technical elective sequence (a total of 30 credit hours are required). The core courses provide a common base of study and experience with problems, issues, and challenges in the engineering business environment. The technical elective sequence provides an opportunity to update disciplinary engineering skills and to broaden interdisciplinary skills. Up to six transfer credits may be approved for graduate-level courses taken at Case Western Reserve or another accredited university.

Core Courses
- EPOM 400 Leadership and Interpersonal Skills (3)
- EPOM 401 Introduction to Business for Engineers (3)
- EPOM 403 Product and Process Design and Implementation (3)
- EPOM 405 Applied Engineering Statistics (3)
- EPOM 407 Engineering Economics and Financial Analysis (3)
- EPOM 409 Master of Engineering Capstone Project (3)

Total Units: 18

Technical Electives
Four courses are chosen from concentration areas.

Concentration in Biomedical Engineering
- EBME 401D Biomedical Instrumentation and Signal Processing (3)
- EBME 406 Polymers in Medicine (3)
- EBME 410 Medical Imaging Fundamentals (3)
- EBME 421 Bioelectric Phenomena (3)
- EBME 432 Quantitative Analysis of Physiological Systems (3)
- EBME 440 Translational Research for Biomedical Engineers (3)
- EBME 451 Molecular and Cellular Physiology (3)
- EBME 471 Principles of Medical Device Design and Innovation (3)

Concentration in Mechanical Engineering
- EMAE 450 Advanced Mechanical Engineering Analysis (3)
- EMAE 456 Micro-Electro-Mechanical Systems in Biology and Medicine (BioMEMS) (3)
- EMAE 460 Theory and Design of Fluid Power Machinery (3)
- EMAE 480 Fatigue of Materials (3)
- EMAE 481 Advanced Dynamics I (3)
- EMAE 487 Vibration Problems in Engineering (3)
- EMAE 494 Energy Systems (3)

Concentration in Systems & Control Engineering
- ECSE 401 Digital Signal Processing (3)
- ECSE 404 Digital Control Systems (3)
- ECSE 408 Introduction to Linear Systems (3)
- ECSE 416 Convex Optimization for Engineering (3)
- ECSE 468 Power System Analysis I (3)

Master of Engineering and Management
The Master of Engineering and Management (MEM) program provides business acumen and leadership skills to uniquely position graduates for rapid advancement in technology-oriented organizations. The MEM curriculum is the result of nearly 20 years of ongoing research and interviews with hundreds of industrial stakeholders and more than 600 graduates in our thriving alumni network. This interdisciplinary, joint degree program combines the analytical expertise and rigor from the Case School of Engineering and the organizational insights of the Weatherhead School of Management. MEM is a 1 year, cohort program that starts every year in June. This program is designed for undergraduate engineering majors and is focused on developing high-impact talent, which companies are actively seeking. Students can enter this program after their junior year or upon graduation.

Curriculum
The program includes 36 credit hours of graded coursework. The 10-course core sequence makes up 30 of the required credit hours. For the remaining 6 credit hours, students can choose from any 400 level Case School of Engineering course for which prerequisites are met or select Weatherhead School of Management courses. Below is the list of required core courses and a representative sample of elective courses.

Required Core Courses (30 credit hours)
- IIME 400 Leadership Assessment and Development (LEAD) (3)
- IIME 410 Accounting, Finance, and Engineering Economics (3)
- IIME 425 Understanding People and Change in Organizations (3)
- IIME 430A Product Design and Development I (3)
- IIME 430B Product and Process Design, Development, and Delivery II (3)
- IIME 432 Operations Research and Supply Chain Management (3)
A student working toward a Master of Science in Engineering, undesignated must select a department. The student is responsible for submitting an Academic Program via the Student Information System where it will be routed for appropriate approvals. The Academic Program must contain a minimum of 9 semester hours of course work in the department approving the program. A minimum of 18 semester hours of course work for the degree must be at the 400 level or higher. The student must also meet all the requirements of the designated Master of Science degree in engineering.

**Department of Biomedical Engineering**

340 Wickenden Building
http://bme.case.edu
Phone: 216.368.4063; Fax: 216.368.4969
Robert F. Kirsch, Chair
bmedept@case.edu

The Department of Biomedical Engineering was established in 1968 at Case Western Reserve University, founded on the premise that engineering principles provide an important basis for innovative and unique solutions to a wide range of biomedical and clinical challenges. As one of the pioneering programs in the world, the department has established rigorous yet flexible educational programs that are emulated by many other institutions and is a national leader in cutting-edge research in several important areas. The cornerstone of the program is quantitative engineering and analytic methods for biomedical applications, a feature that distinguishes Biomedical Engineering from other biomedical science programs. The department’s educational programs provide training in cellular and subcellular mechanisms for understanding fundamental physiological processes, in dealing with biomedical problems at the tissue and organ system level, and in integrating this knowledge in systems approaches to solving clinical problems.

Current degree programs include the BSE, MS, ME, combined BS/MS, PhD, MD/MS, and MD/PhD in Biomedical Engineering. In all of the BME programs at Case, the goal is to educate engineers who can apply engineering methods to problems involving living systems. The Case School of Engineering and the School of Medicine are in close proximity on the same campus, and Biomedical Engineering faculty members carry joint appointments in both of these two schools, participating in the teaching, research, and decision-making committees of both. The department is also tightly linked with several major medical centers (University Hospitals, Cleveland Clinic, VA Medical Center, and MetroHealth Medical Center) that are nearby. As a result, there is an exceptional free flow of academic exchange and collaboration in research and education among the two schools and the four medical institutions. All of Case Western Reserve’s BME programs take full advantage of these close relationships, which adds significant strength to the programs.

**Mission**

To educate leaders who will integrate principles of both engineering and medicine to create knowledge and discoveries that advance human health and well-being. Our faculty and students play leading roles ranging from basic science discovery to the creation, clinical evolution, and commercialization of new technologies, devices, and therapies. In short, we are "Engineering Better Health.”

**Background**

Graduates in biomedical engineering are employed in industry, hospitals, research centers, government, and universities. Biomedical engineers also use their undergraduate training as a basis for careers in business, medicine, law, consulting, and other professions.

**Research**

Several research thrusts are available to accommodate various student backgrounds and interests. Strong research collaborations with clinical and basic science departments of the university and collaborating
medical centers bring a broad range of opportunities, expertise, and perspective to student research projects.

**Biomaterials/Tissue Engineering/Drug and Gene Delivery**
Fabrication and analysis of materials for implantation, including neural, orthopaedic, and cardiovascular tissue engineering, biomimetic materials, liposomal and other structures for controlled, targeted drug delivery, and biocompatible polymer surface modifications. Analysis of synthetic and biologic polymers by AFM, nanoscale structure-function relationships of biomaterials. Applications in the nervous system, the cardiovascular system, the musculoskeletal system, and cancer.

**Biomedical Imaging**
MRI, PET, SPECT, CT, ultrasound, acoustic elastography, optical coherence tomography, cardiac electrical potential mapping, human visual perception, image-guided intervention, contrast agents. In vivo microscopic and molecular imaging, and small animal imaging.

**Biomedical Sensing**
Optical sensing, electrochemical and chemical fiber-optic sensors, chemical measurements in cells and tissues, endoscopy. Wearable sensor systems analytics and machine learning algorithm development for sports health and cardiovascular applications. Internet of Things (IoT) smart sensor and smart speaker systems translational research in support of medication management, dementia, and related patient care.

**Big Data Analytics and Health Informatics**
Radiomics, Radiogenomics, computer-assisted diagnosis, digital pathology, co-registration, cancer detection, decision making, precision medicine, bioinformatics, image informatics, machine learning, pattern recognition, artificial intelligence, deep learning.

**Neural Engineering and Neural Prostheses**
Neuronal mechanisms; neural interfacing for electric and magnetic stimulation and recording; neural dynamics, ion channels, second messengers; neural prostheses for control of limb movement, bladder, bowel, and respiratory function; neuromodulation systems for movement disorders, epilepsy, pain mitigation, visceral functions; computational modeling and simulation of neural structures.

**Transport and Metabolic Systems Engineering**
Modeling and analysis of tissue responses to heating (e.g., tumor ablation) and of cellular metabolism related to organ and whole-body function in health (exercise) and disease (cardiac).

**Biomechanical Systems**
Computational musculoskeletal modeling, bone biomechanics, soft tissue mechanics, control of neuroprostheses for motor function, neuromuscular control systems, human locomotion, cardiac mechanics.

**Cardiovascular Systems**
Normal cardiac physiology, pathogenesis of cardiac diseases, cardiac development, therapeutic technologies, including cardiac regeneration, electrophysiological techniques, imaging technologies, mathematical modeling, gene regulation, molecular biology techniques, cardiac bioelectricity, and cardiac biomechanics.

### Primary Appointments

<table>
<thead>
<tr>
<th>Name</th>
<th>Institution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Robert F. Kirsch, PhD</td>
<td>(Northwestern University)</td>
</tr>
<tr>
<td><strong>Professor and Chair, Executive Director, Functional Electrical Stimulation Center</strong></td>
<td></td>
</tr>
<tr>
<td>Restoration of movement using neuroprostheses; neuroprosthesis control system design; natural control of human movements; brain-computer interfacing; biomechanics of movement; computer-based modeling; and system identification.</td>
<td></td>
</tr>
<tr>
<td>A. Bolu Ajiboye, PhD</td>
<td>(Northwestern University)</td>
</tr>
<tr>
<td><strong>Elmer Lincoln Associate Professor; Associate Chair-Undergraduate Programs</strong></td>
<td></td>
</tr>
<tr>
<td>Development and control of brain-computer-interface (BCI) technologies for restoring function to individuals with nervous system injuries.</td>
<td></td>
</tr>
<tr>
<td>Jay Alberts, PhD</td>
<td>(Arizona State University)</td>
</tr>
<tr>
<td><strong>Assistant Professor</strong></td>
<td></td>
</tr>
<tr>
<td>Research into how the brain controls skilled movements and how changes in brain function affect movement performance.</td>
<td></td>
</tr>
<tr>
<td>James M. Anderson, MD</td>
<td>(Case Western Reserve University), PhD (Oregon State University)</td>
</tr>
<tr>
<td><strong>Professor of Pathology, Macromolecular Science and Biomedical Engineering; Distinguished University Professor</strong></td>
<td></td>
</tr>
<tr>
<td>Blood and tissue/material interactions as they relate to implantable devices and biomaterials.</td>
<td></td>
</tr>
<tr>
<td>Suneel Apte, PhD</td>
<td>(Bombay University &amp; University of Oxford)</td>
</tr>
<tr>
<td><strong>Associate Professor</strong></td>
<td></td>
</tr>
<tr>
<td>Examine how mutations in ADAMTS proteases cause birth defects that affect the heart, blood vessels, neural tube, eyes, palate and limbs.</td>
<td></td>
</tr>
<tr>
<td>James P. Basilion, PhD</td>
<td>(The University of Texas)</td>
</tr>
<tr>
<td><strong>Professor of Biomedical Engineering and Radiology</strong></td>
<td></td>
</tr>
<tr>
<td>High resolution imaging of endogenous gene expression; definition of &quot;molecular signatures&quot; for imaging and treatment of cancer and other diseases; generating and utilizing genomic data to define informative targets; strategies for applying non-invasive imaging to drug development; and novel molecular imaging probes and paradigms.</td>
<td></td>
</tr>
<tr>
<td>Jillian Beveridge, PhD</td>
<td>(University of Calgary)</td>
</tr>
<tr>
<td><strong>Assistant Professor</strong></td>
<td></td>
</tr>
<tr>
<td>Investigate joint biomechanics and injury, especially anterior cruciate ligament tear, with a combination of traditional marker-based motion capture, force data, and electromyography.</td>
<td></td>
</tr>
<tr>
<td>Jeffrey Capadona, PhD</td>
<td>(Georgia Institute of Technology)</td>
</tr>
<tr>
<td><strong>Leonard Case, Jr. Professor in Engineering; Associate Chair-Graduate Programs</strong></td>
<td></td>
</tr>
<tr>
<td>Advanced materials for neural interfacing; biomimetic and bio-inspired materials; host-implant integration; anti-inflammatory materials; and novel biomaterials for surface modification of cortical neuroprostheses.</td>
<td></td>
</tr>
</tbody>
</table>
Margot Damaser, PhD  
(University of California at Berkeley)  
Professor  
Conduct regenerative medicine, tissue engineering and device development research aimed at improving the health of individuals with pelvic floor dysfunction, including urinary and fecal incontinence and pelvic organ prolapse

Kathleen Derwin, PhD  
(University of Michigan)  
Assistant Professor  
Investigating the factors that influence clinical outcomes following rotator cuff repair, including extracellular matrix scaffold technologies to enhance healing

Colin Drummond, PhD (Syracuse University), MBA (Case Western Reserve University)  
Professor and Assistant Chair  
Medical device design; wearable sensor systems in sports health, urology and cardiology; advanced simulation for clinical decision support systems; and, clinical information systems for patient-centered care.

Dominique M. Durand, PhD  
(University of Toronto, Canada)  
Elmer Lincoln Lindseth Professor and Distinguished University Professor; Associate Chair-MS Program Development; Director, On-line MS Programs; Director, Neural Engineering Center  
Neural engineering; neural interfacing with peripheral nervous system; electric and magnetic field interaction with neurons; neural prostheses for restoring motor function; neurophysiology and computational neuroscience of neural activity generation and propagation; neuromodulation; electrical stimulation and control of epilepsy; bioelectric medicine.

Steven J. Eppell, PhD  
(Case Western Reserve University)  
Associate Professor  
Biomaterials; instrumentation; nanoscale structure-function analysis of orthopaedic biomaterials; and scanning probe microscopy and spectroscopy of skeletal tissues

Ahmet Erdemir, PhD  
(Pennsylvania State University)  
Assistant Professor  
Developing state-of-the-art computational representation of the human body to determine how movement patterns and loads on the joints affect tissues and cells

Stephen Fening, PhD  
(Ohio University)  
Associate Professor  
Patient care through translational research and commercialization

Aaron Fleischman, PhD  
(Case Western Reserve University)  
Assistant Professor  
Research into the application of micro and nano technology, including how to shrink high-functioning large systems into small computer-like chips for implantation or minimally invasive procedures

Kiyotaka Fukamachi, PhD  
(Kyushu University)  
Professor  
Pioneering surgical and device treatments for heart failure; investigating mechanical support devices, such as implantable heart pumps, the total artificial heart, and advanced heart valves

Emily L. Graczyk, PhD  
(Case Western Reserve University)  
Assistant Professor  
Cortical and peripheral neurostimulation to restore and augment human sensation; brain-computer interfacing; cognitive neuroscience; sensory neuroscience; computational modeling of neurostimulation; neuroprostheses for upper limb sensorimotor function

Linda Graham, MD  
(University of Michigan)  
Professor  
Investigating how oxidized lipids contribute to the build-up of scar tissue and block the movement of endothelial cells into an area of injury or onto a bypass graft

Miklos Gratzl, PhD  
(Technical University of Budapest, Hungary)  
Associate Professor  
Biomedical sensing and diagnostics in vitro and in vivo; electrochemical and optical techniques; BioMEMS for cellular transport; cancer multidrug resistance at the single cell level; and silver sensor for multi-analyte patient monitoring

Kenneth Gustafson, PhD  
(Arizona State University)  
Associate Professor  
Neural engineering; neural prostheses; neurophysiology and neural control of genitourinary function; devices to restore genitourinary function; and functional neuromuscular stimulation

Vincent Hascall, PhD  
(Rockefeller University)  
Professor  
Investigate how the sugar molecule hyaluronan forms normal and abnormal matrices that are required everywhere, from successful fertilization, to the protection and repair of tissues, to cancer development

Peter S. Hovmand, PhD, MSW  
(Michigan State University)  
Pamela B. Davis MD PhD Professor of Medicine  
Computer modeling and simulation of multiscale nonlinear feedback systems; model equivalence; community engaged system design; implementation science; structural violence (gender based violence, structural racism)

Michael Jenkins, PhD  
(Case Western Reserve University)  
Associate Professor, Pediatrics, Biomedical Engineering  
Development of new technology and therapies for investigating and treating autonomic dysfunction and congenital heart defects. Advancements fall into several categories - infrared neuromodulation, imaging, and drug development.
Efstathios (Stathis) Karathanasis, PhD  
(University of Houston)  
Associate Professor, Associate Chair School of Medicine  
Fabricating multifunctional agents that facilitate diagnosing; treating and monitoring of therapies in a patient-specific manner

Vijay Krishna, PhD  
(University of Florida)  
Assistant Professor  
Leveraging nanotechnology to design next-generation nano-engineered materials for non-invasive therapies and prevention of cancer, especially skin cancer

Vinod Labhasetwar, PhD  
(Nagpur University)  
Professor  
Explore the use of nanotechnology, such as nanoparticles that can find their way into specific cells or tissues to treat various diseases, including cancer, stroke, and cardiovascular conditions

Xiaojuan Li, PhD  
(University of California at Berkeley)  
Professor  
Exploring and developing advanced musculoskeletal imaging techniques to be applied in a range of orthopaedic and rheumatologic disorders

Zheng-Rong Lu, PhD  
(Lanzhou Institute of Chemical Physics, Chinese Academy of Sciences)  
M. Frank Rudy and Margaret Domiter Rudy Professor of Biomedical Engineering; Director, Case Center for Biomolecular Engineering  
Drug delivery and molecular imaging; novel targeted imaging agents for molecular imaging; novel MRI contrast agents; image-guided therapy and drug delivery; drug delivery systems; multi-functional delivery systems for nucleic acids; non-viral gene therapy

Dan Ma, PhD  
(Case Western Reserve University)  
Assistant Professor  
Magnetic Resonance Imaging (MRI); Magnetic Resonance Fingerprinting; Quantitative MR; MR Acquisition and Modeling; Neuroimaging

Anant Madabhushi, PhD  
(University of Pennsylvania)  
Donnell Institute Professor; Director, Center for Computational Imaging & Personalized Diagnostics  
Quantitative image analysis; Multi-modal, multi-scale correlation of massive data sets for disease diagnostics, prognostics, theragnostics; cancer applications, health disparities, computational pathology, radiomics, pathomics, digital pathology, radiogenomics, oncology, cardiovascular, nephrology, ophthalmology

Paul Marasco, PhD  
(Vanderbilt University)  
Investigating sensory integration with prosthetic devices to develop translational approaches for providing natural touch and movement feedback for artificial limbs

Edward Maytin, MD, PhD  
(University of Rochester)  
Associate Professor  
Study wound healing to learn how the extracellular matrix can regulate inflammation and fibrosis in healing wounds; also study skin cancer to improve photodynamic therapy for thicker and more serious skin cancers

Debra McGivney, PhD  
(Case Western Reserve University)  
Assistant Professor  
Magnetic resonance imaging, magnetic resonance fingerprinting, mathematical modeling, inverse problems.

George F. Muschler, MD  
(Northwestern University)  
Professor  
Focus is on advancing the field of tissue engineering through development of new strategies for preservation, repair, regeneration, augmentation, or replacement of musculoskeletal tissues

Ela Plow, PhD  
(University of Minnesota)  
Assistant Professor  
Utilize functional neuroimaging to discern substrates of movement control and movement relearning-related plasticity in the healthy vs. post-stroke brain for rehabilitation

Andrew M. Rollins, PhD  
(Case Western Reserve University)  
Professor; Faculty co-director, Center for Engineering Action  
Biomedical optics; biomedical optical imaging; optical coherence tomography; cardiovascular and ophthalmic applications

Gerald M. Saidel, PhD  
(The Johns Hopkins University)  
Professor; Director, Center for Modeling Integrated Metabolic Systems  
Mass and heat transport and metabolism in cells, tissues, and organ systems; mathematical modeling and simulation of dynamic and spatially distributed systems; optimal nonlinear parameter estimation and design of experiments

Anirban Sen Gupta, PhD  
(The University of Akron)  
Professor  
Targeted drug delivery; targeted molecular imaging; image-guided therapy; platelet substitutes; novel polymeric biomaterials for tissue engineering scaffolds

Sam Senyo, PhD  
(University of Illinois)  
Assistant Professor  
Cardiovascular regeneration; microenvironment; stable isotopes; biomaterials, microfabrication; and drug delivery

Andrew Shoffstall, PhD  
(Case Western Reserve University)  
Assistant Professor  
Development of minimally invasive neural interfaces; biomaterials; drug delivery; blood-brain barrier permeability
Pallavi Tiwari, PhD  
(Rutgers University)  
Assistant Professor  
Developing Image Analysis and Machine Learning Tools for Neuroimaging applications

Ronald J. Triolo, PhD  
(Drexel University)  
Professor, Orthopaedics, University Hospitals-Case Medical Center, VA Medical Center, MetroHealth Medical Center  
Neural prostheses, rehabilitation engineering and restoration of lower extremity function, biomechanics of human movement quantitative analysis and control of gait, standing balance and seated posture

Dustin J. Tyler, PhD  
(Case Western Reserve University)  
Kent Hale Smith Professor for the Case School of Engineering II  
Neuromimetic neuroprostheses; laryngeal neuroprostheses; clinical implementation of nerve electrodes; cortical neuroprostheses; minimally invasive implantation techniques; and modeling of neural stimulation and neuroprostheses

D. Geoffrey Vince, PhD  
(University of Liverpool)  
Professor  
Developing a tool that will predict which patients are at increased risk of stroke to help physicians determine the best treatment approach

Satish Viswanath, PhD  
(Rutgers University)  
Assistant Professor  
Medical image analysis, radiomics, and machine learning schemes for imaging data. Focused on designing unique image analytics tools that capture biologically relevant measurements and conducting cross-scale associations across imaging, pathology, and -omics. Applications explored in computer-aided diagnosis & disease characterization, decision support for treatment and targeting, as well as quantitative evaluation of response to treatment in vivo; for gastrointestinal cancers and digestive diseases.

Horst A. von Recum, PhD  
(University of Utah)  
Professor and Executive Vice Chair  
Affinity-based delivery of small molecule drugs and biomolecules for applications in device infection, HIV, orthopedics, cardiovascular, ophthalmology and cancer; directed differentiation of stem cells for tissue engineering applications, such as endothelial cells, cardiomyocytes, motor neurons and T-cells

Matthew R. Williams, PhD  
(Case Western Reserve University)  
Assistant Professor  
Experiential education including engineering design, programming, and fabrication; control of prosthetics and assistive technology for stroke and spinal cord injury

David L. Wilson, PhD  
(Rice University)  
Robert J. Herbold Professor of Biomedical Engineering  
Biomedical image processing; machine/deep learning; multiple modalities including OCT, CT, MRI, microscopy, and ultrasound; applications in cardiology, ophthalmology, and cancer

Xin Yu, ScD  
(Harvard-MIT)  
F. Alex Nason Professor II  
Development and application of magnetic resonance imaging and spectroscopy methods for understanding cardiovascular and metabolic diseases, including diabetes, stroke, and cardiomyopathy.

Maciej Zborowski, PhD  
(Warsaw University)  
Associate Professor  
Investigating novel methods of cell separation for medical applications, including rapid screening for cancer cells in blood and isolation of blood-forming stem cells

Secondary Appointments

Ozan Akkus, PhD  
(Case Western Reserve)  
Professor, Mechanical Aerospace Engineering  
Development of novel biomaterials that will substitute bone and soft tissues, bioinspired from the synthesis of bone such that ductile biocompatible polymer matrices are subjected to mineralization. Tendon replacement strategy involves alignment of collagen monomers by a novel electrochemical method to obtain strong bundles

Harihara Baskaran, PhD  
(Pennsylvania State University)  
Professor, Chemical and Biomolecular Engineering  
Biotransport, Tissue/Cell metabolism, Cell transport, Microvascular tissue engineering, Cartilage tissue engineering

Jonathan Baskin, MD  
(New York University)  
Associate Professor, Section Chief Otolaryngology-Head & Neck Surgery, Cleveland VA Medical Center and faculty, University Hospitals-Cleveland Medical Center  
Peripheral Neuromodulation, Bioengineering of bone substitutes using nanotechnology

Martin Bocks, MD  
(Wayne State University School of Medicine)  
Associate Professor, Pediatrics, Division of Pediatric Cardiology  
Pediatric medical device development, including bioresorbable stents, wireless implantable pressure sensors, pediatric ECMO cannula

Kath Bogie, D.Phil  
(Oxford University)  
Associate Professor, Orthopaedics  
Primary and secondary prevention of chronic wounds through novel clinically-focused approaches. Translational clinical research includes studies to determine why some people experience a continuous cycle of pressure injuries while others remain pressure injury free, looking at both biomarkers and bioinformatics, complemented with smart technology development to address these issues.

Dennis Bourbeau, PhD  
(University of Pittsburgh)  
Assistant Professor, Physical Medicine and Rehabilitation, MetroHealth System  
Neuroprosthetics for restoring bladder and bowel function after spinal cord injury
Arnold Caplan, PhD  
(Johns Hopkins University)  
**Professor, Biology**  
Development and medical use of the technology involving the mesenchymal stem cell (MSC), now called Medicinal Signaling Cells

M. Cenk Cavusoglu, PhD  
(University of California, Berkeley)  
**Nord Professor of Engineering in Electrical, Computer, and Systems Engineering**  
Robotics, systems and control theory, human-machine interfaces emphasizing medical robotics, haptics, virtual environments, surgical simulation, and bio-system modeling and simulation

John Chae, MD  
(Rutgers University - New Jersey Medical School)  
**Professor and Chair, Physical Medicine and Rehabilitation, VP for Research and Sponsored Programs, MetroHealth System**  
Neuromuscular Electrical Stimulation for motor relearning and neuroprosthesis in stroke; peripheral nerve stimulation for musculoskeletal pain; stroke rehabilitation

Hillel J. Chiel, PhD  
(Massachusetts Institute of Technology)  
**Professor, Biology**  
Biomechanical and neural basis of feeding behavior in the marine mollusk Aplysia californica, neuromechanical system modeling, analysis of neural network dynamics

Isabelle Deschenes, PhD  
(Laval University)  
**Professor, Cardiology, MetroHealth Medical Center**  
Molecular mechanisms of cardiac arrhythmias, ion channels structure-function

William J. Dupps, Jr., MD, PhD  
(The Ohio State University)  
**Professor, Ophthalmology, Cleveland Clinic's Lerner College of Medicine**  
Corneal and ocular biomechanics, finite element modeling of the eye, simulation-based medicine

Agata Exner, PhD  
(Case Western Reserve University)  
**Professor, Radiology, University Hospitals-Case Medical Center**  
Development of contrast agents for ultrasound molecular imaging and image-guided drug delivery.

Christopher Flask, PhD  
(Case Western Reserve University)  
**Professor, Radiology**  
Develops quantitative MRI techniques for both basic science and translation imaging research in multiple diseases including cancer, neurological diseases, cystic fibrosis, and chronic kidney and liver diseases

Roger French, PhD  
(Massachusetts Institute of Technology)  
**Professor, Materials Science and Engineering, Macromolecular Science and Engineering, Physics**  
Lifetime and degradation science, photovoltaics, OLED and LED lighting and displays, polymer degradation

Michael J. Fu, PhD  
(Case Western Reserve University)  
**Assistant Professor, Dept. of Electrical, Computer, and Systems Engineering**  
Virtual environments, human-computer interfaces, and functional electrical stimulation for neurorehabilitation

Mark Griswold, PhD  
(University of Wuerzburg, Germany)  
**Professor, Radiology, University Hospitals-Case Medical Center**  
Rapid magnetic resonance imaging, image reconstruction and processing and MRI hardware/instrumentation

Umut A Gurkan, PhD  
(Purdue University)  
**Warren E. Rupp Associate Professor, Mechanical and Aerospace Engineering, Orthopaedics**  
Micro/nano engineered systems, biosensing, clinical Microfluidics, point-of-care diagnostics, microcirculation, sickle cell disease

Alex Y. Huang, MD, PhD  
(Johns Hopkins University)  
**Professor, Pediatrics, Pathology, General Medical Sciences, University Hospitals Cleveland Medical Center/UH Rainbow Babies & Children's Hospital**  
Tumor Immunity, immune landscape and behavior in tissue microenvironment, cellular adhesion and migration

Michael W. Keith, MD  
(The Ohio State University)  
**Professor, Orthopaedic Surgery, Physical Medicine and Rehabilitation, MetroHealth Medical Center**  
Restoration of motor function in hands

Kevin L. Kilgore, PhD  
(Case Western Reserve University)  
**Peckham & Picha Professor, Orthopaedics and Physical Medicine and Rehabilitation, MetroHealth System**  
Neuroprosthetics for spinal cord injury and electrical nerve conduction block.

Shanina C. Knighton, PhD, RN  
(Case Western Reserve University)  
**Instructor**  
Co-instructs multidisciplinary BioDesign course, senior advisor to undergraduate and graduate biomedical engineering students, research interests in technology-based self-management interventions and wearable sensors

Kandice Kottke-Marchant, MD, PhD  
(Case Western Reserve University)  
**Professor and Chair, Molecular Medicine, Cleveland Clinic Lerner College of Medicine (Lerner Research Institute)**  
Thrombosis, hemostasis and vascular disease, hypercoagulable states, bleeding disorders, endothelial cell function, atherosclerosis

Kenneth R. Laurita, PhD  
(Case Western Reserve University)  
**Associate Professor, Cardiology, MetroHealth Medical Center**  
Determining mechanisms of and therapy for cardiac arrhythmias, using innovative optical and electrical technologies
Zhenghong Lee, PhD
(Case Western Reserve University)
Professor, Radiology, University Hospitals Cleveland Medical Center
Quantitative PET and SPECT imaging, molecular and cellular imaging of
cancer, metabolism, infectious diseases and cell-based therapies

Kenneth Loparo, PhD
(Case Western Reserve University)
Arthur L. Parker Professor, Electrical, Computer and Systems Engineering
Faculty Director, ISSACS: Institute for Smart, Secure and Connected Systems
Stability and control of nonlinear and stochastic systems; physiological
data analysis and signal processing

Andrei Maiseyeu, PhD
(M. V. Lomonosov Moscow State University, Russia)
Assistant Professor, Medicine & Biomedical Engineering
Cardiovascular drug development and delivery, immunometabolism,
mechanisms of metabolic disease, imaging of atherosclerosis, MRI
contract agents, controlled release nanomaterials, microfluidics

Mehran Mehregany, PhD
(Massachusetts Institute of Technology)
Professor, Electrical Engineering & Computer Science
Micro/nano-electromechanical systems, silicon carbide semiconductor
technology and microsystems, wireless health

Pedram Mohseni, PhD
(University of Michigan)
Goodrich Professor of Engineering Innovation, Electrical, Computer, and
Systems Engineering
Biomicrosystems, microelectronics for neurotechnology, wireless
integrated sensing/actuating systems, point-of-care diagnostic platforms for
personalized health

Raymond F. Muzic, Jr., PhD
(Case Western Reserve University)
Professor, Radiology, Biomedical Engineering, Oncology; University Hospitals-
Case Medical Center
Quantitative analysis of biomedical imaging data, physiologic modeling,
optimal experiment design, assessment of new radiopharmaceuticals,
imaging response to therapy, radiation oncology applications of imaging,
and artificial intelligence

Tarun Podder, PhD
(University of Hawaii)
Professor, Radiation Oncology
Medical robotics; medical device design; system dynamics and
control; image-guided radiotherapy; stereotactic body radiotherapy;
brachytherapy; image-guided surgical intervention; application of AI in
radiation therapy

Julie Renner, PhD
(Purdue University)
Assistant Professor
Development of protein engineered materials for use in and study of
electrochemical systems

Clare Rimnac, PhD
(Lehigh University)
Distinguished University Professor, Mechanical and Aerospace Engineering
Orthopaedic implant performance and design, mechanical behavior of
hard biological tissues

Steve Schomisch, PhD
(Cleveland State University)
Assistant Professor, Surgery
Minimally Invasive Surgical Innovation

Aasef G. Shaikh, MD (Maharaja Sayajirao University), PhD (Wayne State
University)
Associate Professor, Penni and Stephen Weinberg Chair in Brain Health and
Vice Chair for Research, Department of Neurology, University Hospitals and
Case Western Reserve University
Balance and Visuo-spatial navigation, Visual canning patterns, Cerebellar
disorders, Deep Brain Stimulation for Parkinson's Disease, tremor and
dystonia

Dawn Taylor, PhD
(Arizona State University)
Associate Professor, Molecular Medicine, Cleveland Clinic Lerner College of
Medicine (Lerner Research Institute)
Brain-controlled neuroprosthetics; Deep brain stimulation for Parkinson's
disease; Neural signal processing

Jeffrey Ustin, MD
(Stanford University School of Medicine)
Assistant Professor, Anesthesiology, University Hospitals
Synthetic platelet technology, robot assisted atrial fibrillation ablation,
endotracheal tube technology

Albert L. Waldo, MD
(State University of New York College of Medicine, Downstate)
Walter H. Pritchard Professor of Cardiology, Professor of Medicine, University
Hospitals-Cleveland Medical Center
Cardiac electrophysiology and cardiac excitation mapping

Russell Wang, DDS, MSD
(Indiana University)
Professor, Comprehensive Care, School of Dental Medicine
Dental implant design, instrumentation, bone regeneration, 3D printing
of biomaterials, biomechanics of bone fracture, biomaterials for
maxillofacial reconstruction

Gary Wnek, PhD
(University of Massachusetts, Amherst)
Professor and Chair, Macromolecular Science and Engineering
Bio-mimicking macromolecular constructs with attention to the
design and irritable systems; Artificial cells; Advanced films and smart
packaging systems; New approaches to impart fire resistance to
common polymers

Nicholas P. Ziats, PhD
(Case Western Reserve University)
Professor, Pathology, Biomedical Engineering & Anatomy
Biomaterials and Biocompatibility, Biomaterial Implant Retrieval and
Analysis, Cardiovascular Disease and Devices, Vascular Biology
Christian Zorman, PhD
(Case Western Reserve University)

Leonard Case Jr Professor of Electrical Engineering & Computer Science
Development of enabling materials and processing techniques for micro- and nanosystems

Research Appointments

Mehdi Alilou, PhD
(Case Western Reserve University)
Research Assistant Professor
Development of machine learning and computer vision tools for detection, quantification, diagnosis and prognosis of lung cancer on chest CT scans

Musa L. Audu, PhD
(Case Western Reserve University)
Research Professor
Human musculoskeletal modeling and development of control systems for rehabilitation of individuals with spinal cord injury and other balance disorders, design of rehabilitation devices for physically challenged individuals

Hamid Charkhkar, PhD
(George Mason University)
Research Assistant Professor
Neuroprostheses to restore sensorimotor function in people with limb loss or neuromusculoskeletal impairment; Sensory-enabled assistive devices to improve balance; Translational Neuroengineering

Andrew Janowczyk, PhD
(Case Western Reserve University)
Assistant Research Professor

Cheng Lu, PhD
(University of Alberta, Canada)
Research Assistant Professor
Development of histomorphometric and path-genomics tools for prognosis, prediction in the context of Breast cancer, Lung cancer, and Head & neck cancer

Grant A. McCallum, PhD
(Case Western Reserve University)
Research Assistant Professor
Neural engineering; neural interfacing; neuromodulation; neurophysiology, application specific integrated circuits (ASICs) and wireless implantable systems

Rakesh Shiradkar, PhD
(National University of Singapore)
Research Assistant Professor
Development of Artificial Intelligence assisted cancer diagnostic and prognostic tools with Medical Imaging modalities

Amita Vaidya, PhD
(University of Rochester)
Research Assistant Professor
Development of theranostic strategies by integrating biomarker-based molecular imaging, molecular characterization of tumors, and adaptive gene therapy interventions for neoplastic indications

Xinning Wang, PhD
(The Chinese University of Hong Kong)
Research Assistant Professor
Development of novel molecular image probes for the diagnosis of cancer, development of molecular cancer therapeutic approaches

Mei Zhang, PhD
(Wuhan University)
Research Scientist, School of Medicine
Nanotechnology for cancer diagnosis and treatment, imaging and manipulation of tumor microenvironment, cancer immunotherapy, adoptive T-cell immunotherapy

Adjunct Faculty

Eben Alsberg, PhD
(University of Michigan)
Adjunct Professor (University of Illinois, Chicago)
Innovative biomaterials, microenvironments and bioactive factor delivery vehicles for functional tissue engineering, regenerative medicine and disease therapeutics; control of stem cell fate decision; precise temporal and spatial presentation of signals to regulate cell function; mechanotransduction and the influence of mechanics on cell behavior and tissue formation; organoids and organogenesis; therapeutic angiogenesis; and cell-cell interactions

Kenneth B. Baker, PhD
(University of Arizona)
Adjunct Assistant Professor (Lerner Research Institute, Cleveland Clinic)
Neuromodulation, Deep Brain Stimulation, Neurophysiology, Neural plasticity, Stroke, Parkinson's disease

Niloy Bhadra, MD, PhD
(Case Western Reserve University)
Associate Professor (PM&R, MetroHealth Medical Center)
Experimental and computational studies of high frequency waveforms for reversible conduction block of peripheral nerves, design, testing and implementation of neuroprosthetic systems for the upper limb

Michael Bruckman, PhD
(University of South Carolina)
Adjunct Assistant Professor (Haima Therapeutics LLC)
Instructor for Masters of Engineering and Management (MEM) program

Scott Bruder, MD, PhD
(Case Western Reserve University)
Adjunct Professor
Product Development and Regulatory Affairs in Regenerative Medicine, and Advising Students Regarding Careers in Industry
Richard C. Burgess, MD, PhD  
(Case Western Reserve University)  
Adjunct Professor of Biomedical Engineering (Neurological Computing, Cleveland Clinic)  
Magnetoencephalography, electrophysiological monitoring, EEG processing, medical informatics

Andrew Cornwell, PhD  
(Case Western Reserve University)  
Adjunct Assistant Professor  
Education and training for faculty, staff, and students of commercializing research technology through startups or licensing

Evon Ereifej, PhD  
(Wayne State University)  
Adjunct Associate Professor of Biomedical Engineering (VA Medical Center)  
University of Michigan  
Improved integration of cortical prosthetics and brain tissue; nano-architecture approaches for neural interfacing, understanding of neuroinflammatory mechanisms and advanced mitigation strategies

Hossein Ghassemi, PhD  
(McGill University)  
Adjunct Assistant Professor  

Vikas Gulani, MD, PhD  
(University of Illinois)  
Adjunct Professor (University of Michigan)  
Diffusion tensor imaging and diffusion anisotropy, MRI microscopy, body MRI, and functional MRI

Elizabeth C. Hardin, PhD  
(University of Massachusetts)  
Adjunct Assistant Professor of Biomedical Engineering, (VA Medical Center)  
Gait mechanics and performance in health and disability, virtual reality, rehabilitation, prosthetics and orthotics, neural prostheses, modeling and simulation

Thomas Hering, PhD  
(Case Western Reserve University)  
Adjunct Associate Professor  
Cartilage biochemistry and molecular biology, alternative mRNA splicing, proteoglycans and neurotrauma

Allison Hess-Dunning, PhD  
(Case Western Reserve University)  
Adjunct Assistant Professor (Louis Stokes VA Medical Center)  
Micro- and nano-fabrication strategies for developing advanced neural interfaces aimed at long-term functionality

Joseph Jankowski, PhD, MBA  
(Case Western Reserve University)  
Adjunct Professor  
Administration of multi-party translation and commercialization programs, intellectual property management, technology-based opportunity assessment, commercialization

Fehmida Kapadia, PhD  
(The Ohio State University)  
Adjunct Assistant Professor  
Teaching innovation and commercialization, strategy and business development

Nicola Lai, PhD  
(University of Pisa, Italy)  
Adjunct Associate Professor (University of Cagliari)  
Quantitative understanding of regulation of energy transfer and metabolism

Mary Laughlin, MD  
(State University of New York)  
Adjunct Professor (Cleveland Cord Blood Center)  
Development of monocytes, hematopoietic stem cells

Yajuan Li, PhD  
(University of Rhode Island)  
Adjunct Assistant Professor  
Research, development and commercialization of peptide-based pharmaceutical imaging drugs and therapeutics, regulatory affairs, formulation development.

John McDaniel, PhD  
(University of Utah)  
Adjunct Associate Professor, Kent State University  
Vascular health and blood flow regulation in individuals with spinal cord injuries

Matthew Moorman, (Colonel), MD, MBA  
(Ohio State University)  
Adjunct Assistant Professor (Clinical Associate Professor of Surgery, Clinical Assistant Professor, Medical Sciences, Case Western Reserve University School of Medicine)  
Trauma resuscitation, emergency surgery, and critical care, focusing on implementing quality, safety, and high-reliability health care behaviors in the early years of medical training. Special interest in high-fidelity, simulation-based medical education.

Aaron S. Nelson, MD  
(Medical College of Ohio)  
Adjunct Assistant Professor, Chief Medical Officer, MIM Software Inc.  
Multimodality and quantitative imaging for neurologic and cardiac disorders, oncology and radiation oncology

Marc Penn, MD, PhD, FACC  
(Case Western Reserve University)  
Adjunct Professor (Director of Research, Summa Cardiovascular Institute, Summa Health System)  
Strategies for cardiovascular cell therapy to treat cardiac dysfunction

Suguna Rachakonda, PhD, MBA  
(University of Hyderabad)  
Adjunct Assistant Professor, Cleveland Global Cardiovascular Innovation Center  
Consultation on technology commercialization

Todd Ritzman, MD  
(The Ohio State University)  
Adjunct Associate Professor  
Pediatric orthopaedic surgery
Akhil Saklecha, MD, MBA  
(Northeastern Ohio University of Medicine)  
Adjunct Professor  
Consultation in technology commercialization, Teaching, Student mentoring, Faculty collaboration

Ahlam Salameh, PhD  
(Case Western Reserve University)  
Adjunct Assistant Professor (Clinic Res. Association)  
Two major thrusts: [1] exploring the therapeutic effect of implementing a myoelectrically controlled arm orthosis into acute stroke rehabilitation programs on the clinical outcomes of subjects with severe arm deficit and [2] understanding the underlying neuroplastic mechanisms that guide the improvement in upper limb motor control during acute stroke rehabilitation. Also involved in research to enhance gait motor control for subject with chronic stroke by combining virtual reality with non-invasive brain stimulation

Nicole Seiberlich, PhD  
(Universitat Wurzburg, Germany)  
Associate Professor, Radiology, University of Michigan  
Quantitative MRI, image reconstruction, pulse sequence development, cardiac imaging

Robert T. Ssekitoleko, EngD  
(University of Strathclyde, Glasgow)  
Adjunct Assistant Professor, Dept. of Biomedical Engineering (Lecturer and Biomedical Engineering Program Lead in College of Health Sciences at Makerere University)  
Advisor to the student design teams in the CWRU Global Health Design Collaborative. Hosts CWRU’s study abroad course in Uganda, Global Health Design. Collaborates on research with BME faculty

Antonie van den Bogert, PhD  
(University of Utrecht)  
Adjunct Associate Professor (Cleveland State University)  
Biomechanics, Mechanics, and control of human motion

Tina Vrabec, PhD  
(Case Western Reserve University)  
Adjunct Assistant Professor (Physical Medicine and Rehabilitation MetroHealth)  
Novel waveforms, electrode designs, and electrode materials for control of the nervous system as applied to motor block, pain, and the autonomic system

Sean Zuckerman, PhD  
(University of Wisconsin-Madison)  
Adjunct Instructor  
Teaching, mentoring students, early stage commercialization and product development

Fredy R. Zypman, PhD  
(Case Western Reserve University)  
Adjunct Professor (Professor and Chairman, Department of Physics, Yeshiva University, New York)  
Theoretical and computational applied physics, reconstruction of forces at the nanoscale from experimental atomic force microscopy measurements, and applications to electric and mechanical phenomena in soft matter including interactions in electrolytes; friction at the nanoscale; random systems

Emeritus Faculty

Patrick E. Crago, PhD  
(Case Western Reserve PhD)  
Professor Emeritus  
Control of neuroprostheses for restoration of motor function; neuromechanics; and modeling of neuromusculoskeletal systems

J. Thomas Mortimer, PhD  
(Case Western Reserve University)  
Professor Emeritus  
Neural control and prostheses; electrical activation of neural tissue; and membrane properties and electrodes

W. Sanford Topham, PhD  
(University of Utah)  
Professor Emeritus  
Rehabilitation engineering in spinal cord injury; neural prostheses; and functional electrical stimulation and technology transfer

Undergraduate Programs

The Case Western Reserve undergraduate program leading to the Bachelor of Science in Engineering degree program with a major in Biomedical Engineering was established in 1972 and has been accredited since its inception.

Some BS graduates are employed in industry and medical centers. Others continue graduate or professional studies in biomedical engineering and other fields. Students with strong quantitative skills and an interest in medicine may consider the undergraduate biomedical engineering program as an exciting alternative to conventional premedical programs. In addition to the University general education requirements, the undergraduate program has three major components: (1) Engineering Core, (2) BME Core, and (3) An ability to identify, formulate, and solve complex engineering problems by applying principles of engineering, science, and mathematics

• BME Specialty Tracks. The Engineering Core provides a fundamental background in mathematics, physics, chemistry, and engineering. The BME Core provides fundamentals in biology and integrates engineering with biomedical science to solve medical problems. Hands-on experience in BME is developed through undergraduate laboratory and project courses. In addition, by choosing a BME Track, the student can study a specific area of interest in depth. Appropriate choice of elective courses can lead to a minor in a related engineering discipline without taking extra classes beyond those needed for the BME major. This integrated program is designed to ensure that BME graduates are competent engineers with credentials that are well recognized by potential employers.

The Bachelor of Science in Engineering degree program with a major in Biomedical Engineering is accredited by the Engineering Accreditation Commission of ABET, http://www.abet.org.
Program Educational Objectives
At the undergraduate level, we direct our efforts toward two educational objectives that describe the performance of alumni 3-6 years after graduation.

a. Our graduates will successfully enter and complete postbaccalaureate advanced degree programs, including those in biomedical engineering.

b. Our graduates will obtain jobs in the biomedical arena and advance to positions of greater responsibility.

Student Outcomes
As preparation for achieving the above educational objectives, the Bachelor of Science in Engineering with a major in Biomedical Engineering is designed so that students attain:

- An ability to identify, formulate, and solve complex engineering problems by applying principles of engineering, science, and mathematics
- An ability to apply engineering design to produce solutions that meet specified needs with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors
- An ability to communicate effectively with a range of audiences
- An ability to recognize ethical and professional responsibilities in engineering situations and make informed judgments, which must consider the impact of engineering solutions in global, economic, environmental, and societal contexts
- An ability to function effectively on a team whose members together provide leadership, create a collaborative and inclusive environment, establish goals, plan tasks, and meet objectives
- An ability to develop and conduct appropriate experimentation, analyze and interpret data, and use engineering judgment to draw conclusions
- An ability to acquire and apply new knowledge as needed, using appropriate learning strategies.

Bachelor of Science in Engineering
Major in Biomedical Engineering
In addition to engineering general education requirements (p. 1292) and university general education requirements (p. 1212), the major requires the following courses:

Required Courses
Major Courses

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>EBME 201</td>
<td>Physiology-Biophysics I</td>
<td>3</td>
</tr>
<tr>
<td>EBME 202</td>
<td>Physiology-Biophysics II</td>
<td>3</td>
</tr>
<tr>
<td>EBME 306 &amp; EBME 356</td>
<td>Introduction to Biomedical Materials and Introduction to Biomaterials Engineering - Laboratory</td>
<td>4</td>
</tr>
<tr>
<td>EBME 308 &amp; EBME 358</td>
<td>Biomedical Signals and Systems Laboratory</td>
<td>4</td>
</tr>
<tr>
<td>EBME 309 &amp; EBME 359</td>
<td>Modeling of Biomedical Systems and Biomedical Computer Simulation Laboratory</td>
<td>4</td>

<tr>
<td>EBME 380</td>
<td>Biomedical Engineering Design Experience</td>
<td>3</td>
</tr>
<tr>
<td>Plus one Engineering, Mathematics or Natural Science Elective</td>
<td></td>
<td>3</td>
</tr>
<tr>
<td>Plus 8 Specialty Track Specialization Courses (see below)</td>
<td></td>
<td>24-26</td>
</tr>
</tbody>
</table>

Total Units 55-57

Natural Sciences, Mathematics or Statistics Elective
Candidates for the Bachelor of Science in Engineering degree must fulfill a Natural Sciences, Mathematics or Statistics requirement as part of the Engineering Core, which is designated by the major department. Note that this is distinct from the engineering, mathematics or natural science elective required by the BME major and mentioned above. Biomedical Engineering majors may meet this requirement by taking one of the following statistics courses:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>STAT 312</td>
<td>Basic Statistics for Engineering and Science</td>
<td>3</td>

<tr>
<td>STAT 332</td>
<td>Statistics for Signal Processing</td>
<td>3</td>
</tr>
<tr>
<td>STAT 333</td>
<td>Uncertainty in Engineering and Science</td>
<td>3</td>
</tr>
</tbody>
</table>

Biomedical Engineering Specialty Tracks
Majors in Biomedical Engineering choose a specialization track, with track specific courses.

Required courses for these tracks are presented in the tables below. These tracks provide the student with a solid background in a well-defined area of biomedical engineering. To meet specific educational needs, students may choose alternatives from among the suggested electives or design unique specializations. These options are flexible and subject to departmental guidelines and faculty approval.

Approval of technical electives (TE): Pre-approved TE (listed below) need no further approval. 300-400 level courses offered by a department in the Case School of Engineering may be approved as a TE by a student’s academic advisor. Any other course must be approved by petition to the BME Undergraduate Education Committee. Transfer and study abroad courses must be approved by the BME Program Academic Representative. In all cases, courses should be chosen as TE’s that are consistent with the track and are consistent with student’s career plans. Students are encouraged to choose electives that form a thematic depth.

Conjoiner course: choose one of the following courses:
EBME 320  Biomedical Imaging
EBME 327  Bioelectric Engineering

The following courses are pre-approved, technical electives for the Biomedical Devices and Instrumentation track.

**Electronics:**
- ECSE 321  Semiconductor Electronic Devices
- ECSE 322  Integrated Circuits and Electronic Devices
- ECSE 371  Applied Circuit Design

**Software:**
(note many of these courses require CSDS 132 instead of ENGR 131)
- CSDS 233  Introduction to Data Structures
- ECSE 313  Compiler Design
- CSDS 338  Intro to Operating Systems and Concurrent Programming
- ECSE 351  Communications and Signal Analysis
- ECSE 354  Digital Communications

**Modeling/Simulation:**
- ECSE 324  Modeling and Simulation of Continuous Dynamical Systems
- ECSE 346  Engineering Optimization
- EBME 478  Computational Neuroscience

**Other:**
- EBME 401D  Biomedical Instrumentation and Signal Processing
- EBME 407  Neural Interfacing
- EBME 421  Bioelectric Phenomena
- EBME 307  Biomechanical Prosthetic Systems
- EBME 320  Biomedical Imaging
- EBME 421  Bioelectric Phenomena
- ECSE 304  Control Engineering I with Laboratory
- CSDS 341  Introduction to Database Systems
- CSDS 313  Introduction to Data Analysis

**Approved Tech. Elective:** 3
**Approved Tech. Elective:** 3

Conjoiner course: choose one of the following courses: 3
- EBME 316  Biomaterials for Drug Delivery
- EBME 325  Introduction to Tissue Engineering
- EBME 305  Materials for Prosthetics and Orthotics

The following courses are pre-approved, technical electives for the Biomaterials track.

- EMAC 276  Polymer Properties and Design
- EMAC 355  Polymer Analysis Laboratory
- EMAC 370  Polymer Chemistry
- EMAC 376  Polymer Engineering
- EMAC 377  Polymer Processing
- EMAC 476  Polymer Engineering
- EBME/EMAC 303  Structure of Biological Materials
- EBME 305  Materials for Prosthetics and Orthotics
- EBME 350  Quantitative Molecular, Cellular and Tissue Bioengineering
- EBME 406/ EMAC 471  Polymers in Medicine
- EBME 325  Introduction to Tissue Engineering
- EBME 416  Biomaterials for Drug Delivery
- EBME 425  Tissue Engineering and Regenerative Medicine
- EMAE 160  Mechanical Manufacturing
- EMSE 220  Materials Laboratory I
- EMSE 276  Materials Properties and Design
- EMSE 327  Thermodynamic Stability and Rate Processes
- EMSE 335  Strategic Metals and Materials for the 21st Century
- EBME 316  Biomaterials for Drug Delivery
- EMSE 345  Engineered Materials for Biomedical Applications
- EMSE 372  Structural Materials by Design
- EMSE 435  Strategic Metals and Materials for the 21st Century
- EBME 426  Nanomedicine
- ECHE 355  Quantitative Molecular, Cellular and Tissue Bioengineering
- ECHE 474  Biotransport Processes
- ECHE 340  Biochemical Engineering
- ECHE 360  Transport Phenomena for Chemical Systems
- ECHE 364  Chemical Reaction Processes
- ECHE 386  Protein Engineering
- EMAC 376  Polymer Engineering
- EBME 398  Biomedical Engineering Research Experience I ((with approval))

Please click here to download the example program of study for the Devices and Instrumentation Track. (http://bulletin.case.edu/schoolofengineering/biomedicalengineering/ Devices_Track_Template_2018.xls)

*Requirements for a minor in Electrical Engineering can be found here (p. 116). These can usually be satisfied by judiciously selecting technical electives. Consult your advisor.

**Biomaterials Track**
- CHEM 223  Introductory Organic Chemistry I
- EMAC 270  Introduction to Polymer Science and Engineering
- EMAC 351  Physical Chemistry for Engineering
- EMAC 352  Polymer Physics and Engineering

### Total Units in Sequence: **133**

* University general education requirement
** Engineering general education requirement
^a This optional course is limited to first-year students and is not required.
^b Courses chosen depending on the BME specialty track as listed above
^c At least one engineering, math or natural science elective
^d SAGES BME Department Seminar, ENGL 398 Professional Communication for Engineers Professional Communication for Engineers and ENGR 398 Professional Communication for Engineers Professional Communication for Engineers must be taken together
^e STAT 312 Basic Statistics for Engineering and Science, STAT 313 Statistics for Experimenters, STAT 332 Statistics for Signal Processing, STAT 333 Uncertainty in Engineering and Science fulfill the statistics requirement. Consult your advisor to determine the most appropriate class. This course satisfies the Natural Sciences, Mathematics, or Statistics Requirement of the Engineering Core.
^f Biomedical Computing and Analysis track requires CSDS 132 Introduction to Programming in Java
^g There are four required Breadth Electives. Depending on the specific specialty track, a fifth Breadth Elective may be taken.

### Co-op and Internship Programs

Opportunities are available for students to alternate studies with work in industry or government as a co-op student, which involves paid full-time employment over seven months (one semester and one summer). Students may work in one or two co-ops, beginning in the third year of
study. Co-ops provide students the opportunity to gain valuable hands-on experience in their field by completing a significant engineering project while receiving professional mentoring. During a co-op placement, students do not pay tuition but maintain their full-time student status while earning a salary. Learn more at engineering.case.edu/coop (http://engineering.case.edu/coop/). Alternatively or additionally, students may obtain employment as summer interns.

BS/MS Program

The BS/MS program is designed to allow highly qualified undergraduate students from the Case BME program to integrate BS courses and project work with MS courses and research. Nominally, the combined program can be completed in 5 years including 3 summers starting after the junior year. The BS/MS program can reduce the time required to receive an MS degree because up to three courses taken during the undergraduate program at Case can be “double counted” towards MS requirements and because a research project can begin before the completion of the BS degree. Review the Office of Undergraduate Studies BS/MS program requirements here (p. 1298).

Admission to the BS/MS program is typically open to BME juniors from Case with a grade point average of 3.2 or higher. Students with slightly lower GPA but with significant research experience and a strong faculty champion can petition the GEC for admission. To be most effective, applications to the BS/MS program should be submitted before the end of Spring semester in the junior year. The final deadline for BS/MS admissions is August 1 before the senior year. This will enable the GEC sufficient time to review the application and allow students to make any required changes to their program of study for fall semester.

In general, the following steps should be taken to apply to the BS/MS program:

1. See Advisor to discuss interests (typically in junior year or earlier).
2. Contact Navigator to discuss intentions.
3. Complete a School of Graduate Studies application and submit to the Graduate Studies office for the program of interest (BME).
4. Complete a BS/MS Planned Program of Study (PPOS) form.

Additional information for BME students:

1. An eligible BME faculty member (primary or secondary) must agree to serve as the MS research advisor and a primary BME faculty member (who might be the same person as the research advisor) must agree to be the academic advisor. Obtaining this agreement is the responsibility of the applying student. The BS/MS application must include letters of recommendation from both the research and academic advisor that states that they agree to serve in these roles and that they support the BS/MS application.

2. The BME department does not guarantee financial support during the MS portion of this program. However, the GEC requires students and potential research advisors to discuss and agree to some financial arrangement. The letter of recommendation from the proposed research advisor must, therefore, indicate that the issue of financial support has been discussed and that some arrangement has been agreed upon. The details of this arrangement do not need to be included in the letter.

3. Complete a standard application to the School of Graduate Studies via the online application system.

4. Complete the BS/MS Planned Program of Study (PPOS) form. Make sure to check the “BS/MS” box and to indicate which courses are to be double-counted (by checking the “double count” box next to the relevant courses on the POS).

5. Obtain an approval signature from the School of Undergraduate Studies on the proposed POS prior to submitting the package (below) to the department.

6. Prepare the application package that includes the following:

   • A current transcript
   • The proposed MS Program of Study. Make sure that the Program of Study specifies both the academic and research advisors and includes both of their signatures. This form also needs to indicate the courses that are intended to be “double counted”.
      • Only graduate-level courses (400 or higher) can be double counted. This typically means that students should register for 400 level courses to satisfy undergraduate technical electives.
      • It is possible to “double count” three credit hours of EBME 398 Biomedical Engineering Research Experience I. To do this, three credit hours of EBME 651 Thesis M.S. (Thesis-Focused Track) or EBME 695 Project M.S. (Project-Focused Track) should replace EBME 398 Biomedical Engineering Research Experience I in the fall or spring of the senior year. You should register for EBME 651 Thesis M.S. or EBME 695 Project M.S. (but NOT EBME 398 Biomedical Engineering Research Experience I). However, you must attend the meetings of EBME 398 Biomedical Engineering Research Experience I and also fulfill all of the course requirements for EBME 398 Biomedical Engineering Research Experience I.
      • A maximum of nine (9) credit hrs can be double counted. Typically, these are two 3-credit courses (400 level or high) + 3 credits of EBME 651 Thesis M.S. or EBME 695 Project M.S. (in place of EBME 398 Biomedical Engineering Research Experience I).
      • Three (3) reference reports (in sealed envelopes), including letters from your proposed academic and research advisor(s).

7. Submit the proposed POS, transcript, and letters of recommendation to the BME Graduate Coordinator.

No admission decision will be made until the POS is approved by the GEC. After a positive recommendation by the GEC, a letter of conditional admission will be sent. The condition for admission is the submission of GRE scores within 2 months of completing the BS requirements. The student cannot graduate from the BS/MS program without official GRE scores. This is a BME requirement and not a CSE requirement. Note that it is strongly recommended that students plan to take the GRE exam in the Fall semester of their senior year to be eligible for pre-doctoral fellowships from the National Science Foundation or other sources.

BS-MS Thesis-Focused Track
21-hrs of course work and 9-hrs of EBME 651 Thesis M.S.

Requirement for completion: 30-hrs and thesis defense / school of graduate studies/academic requirements/ (p. 1333)

Students can double count 9 credits (up to 3 credits can be at the 300 level)

BS-MS Non-Thesis Options

1. BS-MS Course-Focused Track

   30-hrs of course work

   Requirement for completion: 30-hrs and ENGR 400

   Students can double count 9 credits (up to 3 credits can be at the 300 level)

2. BS-MS Project-Focused Track

   24 to 27-hrs of course work and 3 to 6-hrs of EBME 695 Project M.S.

   Students can double count 9 credits (up to 3 credits can be at the 300 level)

3. BS-ME Practice Oriented Option

   18-hrs in engineering (5 courses and capstone projects)

   EPOM 400 Leadership and Interpersonal Skills
   EPOM 401 Introduction to Business for Engineers
   EPOM 403 Product and Process Design and Implementation
   EPOM 405 Applied Engineering Statistics (can be double-counted)
   EPOM 407 Engineering Economics and Financial Analysis
   EPOM 409 Master of Engineering Capstone Project

   12-hrs (4 BME technical Courses)

   Graduation requirement: 30-hrs and a comprehensive examination

   Students can double-count 9 credits (up to 3 credits can be at the 300 level)

Minor in Biomedical Engineering

A minor in biomedical engineering is offered to students who have taken the Engineering (technical) Core requirements. The minor consists of an approved set of five BME courses.

Required Courses

<table>
<thead>
<tr>

Total Units 15

** EBME 306 Introduction to Biomedical Materials, EBME 308 Biomedical Signals and Systems (Coreq: EBME 358 Biomedical Signals and Systems Laboratory), EBME 309 Modeling of Biomedical Systems (Coreq: EBME 359 Biomedical Computer Simulation Laboratory), EBME 310 Principles of Biomedical Instrumentation (Coreq: EBME 360 Biomedical Instrumentation Laboratory)

** If a student has credit for ECSE 246 Signals and Systems Signals and Systems, EBME 308 Biomedical Signals and Systems (Coreq: EBME 358 Biomedical Signals and Systems Laboratory) will not satisfy a BME minor requirement.

Graduate Programs

The objective of the graduate program in biomedical engineering is to educate biomedical engineers for careers in industry, academia, health care, and government and to advance research in biomedical engineering. The department provides a learning environment that encourages students to apply biomedical engineering methods to advance basic scientific discovery; integrate knowledge across the spectrum from basic cellular and molecular biology through tissue, organ, and whole-body physiology and pathophysiology; and to exploit this knowledge to design diagnostic and therapeutic technologies that improve human health. The unique and rich medical, science, and engineering environment at Case enables research projects ranging from basic science through engineering design and clinical application.

Numerous fellowships and research assistantships are available to support graduate students in their studies.

Master of Science in Engineering

The MS program in biomedical engineering provides breadth in biomedical engineering and biomedical sciences with depth in an engineering specialty. In addition, students are expected to develop the ability to work independently on a biomedical research or design project. While there is no set of core required courses, the MS requires a minimum of 30 credit hours. Every program of study must be approved by the graduate education committee.

With an MS Thesis-Focused Track, a minimum of 18 to 21 credits hours is needed in regular course work and 9 to 12 hours of thesis research (EBME 651 Thesis M.S.), is needed.

With an MS Project-Focused Track a minimum of 24 to 30 credit hours is needed in regular course work, and 0 to 6 hours of project research (EBME 695 Project M.S.) is needed.
The MS Course-Focused Track requirements consist of the completion of 30 hours of approved coursework at the 400 level or higher, including satisfactory completion of the culminating course focused experience such as:

- EBME 471: Principles of Medical Devices Design and Innovation
- ENGR 600: Independent Study

Students should consult with their academic advisor and/or department to determine the detailed requirements within this framework.

Online Master Degree in Biomedical Engineering
The BME department offer BME MSc entirely on-line:

https://case.edu/online-learning/courses-and-programs/online-masters-degrees-and-certificate-engineering

The online program is course-only or project-focused and must include:

- EPOM 400: Leadership and interpersonal skills
- Capstone course:
  - EBME 695: Project M.S.
  - or EBME 471: Principles of medical device design and innovation
  - or ENGR 600: Independent study

Visit http://online-engineering.case.edu/biomedical for more details.

Master of Science in Engineering with Specialization in Translational Health Technology
This Master’s degree in Biomedical Engineering is designed to develop expertise in translating biomedical ideas into clinical implementation. This degree can be completed in one year for full-time students. It is offered by the Biomedical Engineering department in the Case School of Engineering and takes advantage of the large pool of expertise in Biotechnology on the campus of Case Western Reserve University. It combines aspects of bioengineering, marketing, entrepreneurship, and bioregulatory affairs with ethics and experimental design. The program will require students to take a minimum of 30 credits including a design project.

Visit http://engineering.case.edu/Translational-Health-Technology/program-features/

Prerequisite: Biomedical Engineering Degree or equivalent or consent of program director.

Special Features:
- 26 credit hours plus 4 hours of project
- Portions available through Distance Learning
- Flexible program to accommodate a professional’s schedule
- Lock-Step Program; Duration 1 year: August to August
- Projects can be done within the place of work

Course curriculum is as follows:

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>

Total Units: 24

For the remaining 6 credit hours, students can choose from any 400 level engineering course or biomedical engineering course for which prerequisites are met and approved by the student’s advisor or a program director.

MD/MS Program
The MD/MS program is available to qualified medical students from the Case School of Medicine and the Cleveland Clinic Lerner College of Medicine of Case Western Reserve University. Students in this program receive some credit for their medical school studies in completing the MS degree. There are specific admission requirements.

The MD/MS degree is open to Case School of Medicine students in the Cleveland Clinic Lerner College of Medicine (CCLCM) or the University Program (UP), which will award the MD component of the dual degree. An undergraduate degree in engineering is desirable for students entering this program, but other students with adequate undergraduate preparation (calculus with differential equations, physics, chemistry, and electronic circuits) will be considered. Additional undergraduate courses in instrumentation and signals/systems would be helpful. Students with an insufficient background will be admitted conditionally until they take the remedial undergraduate courses. Remedial courses will not count toward the MS requirements.

Interested students should submit their applications through the BME department, as the department taking responsibility for program management. Students will normally apply to the program during their first year of medical school. Students should submit their medical school application instead of a separate graduate school application, including MCAT scores instead of GRE scores. The application should include a letter specifying the intended track, the department/major field designation, and a statement of purpose for seeking the combined degree.

The MS requirements are the same as the rest of the Case School of Engineering Thesis-Focused Track MS degree, i.e., 30 credit hours including nine to twelve hours of thesis registration (EBME 651 Thesis M.S.). Please note that only the Thesis-Focused Option is available to MS/MD students. Students must complete the normal MD requirements in either the UP or CCLCM Program. Portions of the medical school curriculum earn graded credit toward the MS portion of this degree. Specifically, students in the University Program register for Integrated Biological Science courses (IBIS 401 Integrated Biological Sciences I), as in the MD/PhD program. Students in the CCLCM Program enroll in the 6-credit IBIS 434 Integrated Biological Sciences in Medicine Process of Discovery course in the second year of the CCLCM curriculum. Six credit hours of these medical school courses are applied to the MS component.
of the dual degree. The balance of required formal courses (12-15 hours or 4-5 courses) must be graduate level engineering concentration courses that provide rigor and depth in a field of engineering relevant to the area of research. All courses must be listed on the BME Program of Study, which must be submitted and formally approved by the BME Graduate Education Committee and subsequently transmitted to the School of Graduate Studies. The Program of Study must be approved prior to registration for the second engineering course. Students must earn a minimum of a B grade in each graduate engineering course, and have a minimum overall GPA of 3.25.

Summary of the requirements

6 hrs Life science courses (medical school curriculum)

12 hrs (4 courses) in biomedical engineering

12 hrs of thesis research (EBME 651 Thesis M.S.)

Graduation requirement: 30 hrs, Thesis defense

http://engineering.case.edu/ebme/academics/graduate/current-students/

For more detailed information on this program, please see

http://casemed.case.edu/admissions/education/dual_programs.cfm?program_id=11

PhD Program in Biomedical Engineering

The PhD program requires a minimum of 36 credit hours of courses beyond the BS degree. A student's overall Program of Study must clearly demonstrate adequate depth in a field of biomedical engineering relevant to the student's research area. There are 11 credit hours of required core courses, which include the following:

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>EBME 401D</td>
<td>Biomedical Instrumentation and Signal Processing</td>
<td>3</td>
</tr>

</tr>
</tbody>
</table>

The remaining courses can be chosen with significant flexibility to meet the career goals of the student and to satisfy the departmental requirements of depth and breadth. Programs of study must include one graduate level course in biomedical sciences and one course whose content is primarily mathematical, in addition to at least two courses with significant engineering content. More details on these requirements and accepted depth and breadth courses can be found in the Department of Biomedical Engineering's Graduate Education Committee Handbook.

Eighteen hours of EBME 701 Dissertation Ph.D.: are also required. PhD programs of study are reviewed and must be accepted by the Graduate Education Committee, the department chair and the School of Graduate Studies.

MD/PhD Programs

Students with outstanding qualifications may apply to either of two MD/PhD programs. Students interested in obtaining a combined MD/PhD, with an emphasis on basic research in biomedical engineering, are strongly encouraged to explore the Medical Scientist Training Program (MSTP), administered by the School of Medicine. The MD/PhD programs require approximately 7-8 years of intensive study after the BS. Interested students should apply through the MSTP office in the Medical School.

Facilities

The Department of Biomedical Engineering has major facilities in both the Case School of Engineering and the School of Medicine. In the Case School of Engineering, the Wickenden Building provides office space for the majority of faculty, as well as extensive non-clinical research laboratories and centers. Also, a number of faculty have their offices and laboratories in the School of Medicine in the Biomedical Research Building and the Wolstein Building. In addition, many faculty also have major laboratory activities in the various medical centers in Cleveland.

Major interdisciplinary centers include: the Neural Engineering Center, the Center for Imaging Research (CCIR), the Center for Biomaterials, and the Center for Computational Imaging & Personalized Diagnostics. The Neural Engineering Center is a major facility for basic research and preclinical testing, with a focus on neural recording and controlling neural activity to increase our understanding of the nervous system and to develop neural prostheses. The Case Center for Imaging Research, located in the Department of Radiology at University Hospitals, has capabilities in imaging structure and function from the molecular level to the tissue-organ level, using many modalities, including ultrasound, MRI, CT, PET, SPECT, bioluminescence, and light. The CCIR has the ability for full translation of discoveries along a continuum from molecules to mice to man. The Center for Biomaterials includes laboratories for biomaterials microscopy, biopolymer and biomaterial interfaces, and molecular
simulation. The Center for Computational Imaging & Personalized Diagnostics develops, evaluates, and applies novel quantitative image analysis, computer vision, signal processing, segmentation, multi-modal co-registration tools, pattern recognition, and machine learning tools for disease diagnosis, prognosis, and theragnosis in the context of breast, lung, prostate, head and neck, and brain tumors. The center is also developing new radiogenomic and radio-path-omic approaches to study correlations of disease markers across multiple length scales, modalities, and functionalities - from gene and protein expression to spectroscopy to digital pathology and to multi-parametric radiographic imaging. Also available are biomedical sensing laboratories that include facilities for electrochemical sensing, chemical measurements in individual cells, and minimally invasive physiological monitoring. High-fidelity patient simulation and clinical decision-making research are done in collaboration with the School of Nursing’s simulation center.

The FES (Functional Electrical Stimulation) Center, with laboratories at CWRU and in three medical centers, develops techniques for restoration of movement in paralysis, control of the nervous system, and implantable technology. The APT (Advanced Platform Technology) Center develops advanced technologies that serve the clinical needs of veterans and others with motor and sensory deficits, limb loss, and other disabilities.

The Case-Coulter Translational Research Partnership (CCTRP) is an endowed program that promotes translational research and supports collaborative translational research projects to address unmet or poorly met clinical needs. The overarching goal of the program is to improve patient care and accelerate the delivery of healthcare technology from academia to the marketplace. The CCTRP, in particular, fosters collaborations between clinicians and the CWRU Biomedical Engineering faculty to achieve its goals.

The Biomedical Engineering faculty and students have access to the many facilities and major laboratories of both the Case School of Engineering and School of Medicine. In addition, faculty have numerous collaborations at University Hospitals, MetroHealth Medical Center, Louis Stokes Cleveland VA Medical Center, and the Cleveland Clinic. These provide extensive research resources in a clinical environment for both undergraduate and graduate students.

Courses

**EBME 201. Physiology-Biophysics I. 3 Units.**
Fundamental concepts of physiology from the cells to organ systems. Cell structure and function: DNA-RNA related enzyme/protein synthesis, membrane permeation (receptors/channels/gates), cellular biochemistry and energetic metabolic functions. Essential systems-level concepts include endocrinology, immunology, cellular/capillary/interphase transport, regulation of fluid volume, solutes, and pH. Liver, renal and respiratory physiology. Basic concepts in thermodynamics, transport and kinetics provide a framework for quantitative analysis and modeling of systems physiology. Prereq: Must have declared major or minor in Biomedical Engineering.

**EBME 202. Physiology-Biophysics II. 3 Units.**
This course is an extension of EBME 201 that will include structure and function of (1) the nervous system, including vision, somatic and proprioceptive sensation, and control of movement, (2) skeletal and smooth muscle, (3) cardiac muscle and the cardiovascular system, and (4) the metabolic system. The material will be taught from a quantitative and functional perspective, with some examples of human pathophysioloogy. Prereq: EBME 201.

**EBME 300. Dynamics of Biological Systems: A Quantitative Introduction to Biology. 3 Units.**
This course will introduce students to dynamic biological phenomena, from the molecular to the population level, and models of these dynamical phenomena. It will describe a biological system, discuss how to model its dynamics, and experimentally evaluate the resulting models. Topics will include molecular dynamics of biological molecules, kinetics of cell metabolism and the cell cycle, biophysics of excitability, scaling laws for biological systems, biomechanics, and population dynamics. Mathematical tools for the analysis of dynamic biological processes will also be presented. Students will manipulate and analyze simulations of biological processes, and learn to formulate and analyze their own models. This course satisfies a laboratory requirement for the biology major. Offered as BIOL 300 and EBME 300.

**EBME 303. Structure of Biological Materials. 3 Units.**
Structure of proteins, nucleic acids, connective tissue and bone, from molecular to microscopic levels. An introduction to bioengineering biological materials and biomimetic materials, and an understanding of how different instruments may be used for imaging, identification and characterization of biological materials. Recommended preparation: EMAC 270. Offered as: EBME 303 and EMAC 303. Prereq: EBME 201, EBME 202, and EBME 306.

**EBME 305. Materials for Prosthetics and Orthotics. 3 Units.**
A synthesis of skeletal tissue structure and biology, materials engineering, and strength of materials concepts. This course is centered on deepening the concept of biocompatibility and using it to pose and solve biomaterials problems. We cover: fundamental concepts of materials used for load bearing medical applications, wear, corrosion, and failure of implants. Structure and properties of hard tissues and joints are presented using a size hierarchy motif. Tools and analysis paradigms useful in the characterization of biomaterials are covered in the context of orthopedic and dental applications. Prereq: EBME 306 and EBME 370 or Requisites Not Met permission.

**EBME 306. Introduction to Biomedical Materials. 3 Units.**
Biomaterials design and application in different tissue and organ systems. The relationship between the physical and chemical structure of biomaterials, functional properties, and biological response. Prereq: EBME 201 and EBME 202.
EBME 307. Biomechanical Prosthetic Systems. 3 Units.
Introduction to the basic biomechanics of human movement and applications to the design and evaluation of artificial devices intended to restore or improve movement lost due to injury or disease. Measurement techniques in movement biomechanics, including motion analysis, electromyography, and gait analysis. Design and use of upper and lower limb prostheses. Principles of neuroprostheses with applications to paralyzed upper and lower extremities. Recommended preparation: Consent of instructor and senior standing. Prereq: EBME 308.

EBME 308. Biomedical Signals and Systems. 3 Units.

EBME 309. Modeling of Biomedical Systems. 3 Units.
Mathematical modeling and computational methods applied to biomedical systems. Spatially lumped and distributed models of electrical, mechanical, and chemical processes applied to cells, tissues, organ, and whole-body systems. Prereq: EBME 202 and EBME 308. Coreq: EBME 359.

EBME 310. Principles of Biomedical Instrumentation. 3 Units.
Physical, chemical, and biological, and system principles for biomedical measurements. Modular blocks and system integration. Sensors for displacement, force, pressure, flow, temperature, biopotentials, chemical composition of body fluids and biomaterial characterization. Patient safety related to instrumentation will also be covered. Prereq: EBME 308. Coreq: EBME 360.

EBME 316. Biomaterials for Drug Delivery. 3 Units.
The teaching objective is to provide students with a basic understanding of the principles of design and engineering of well-defined molecular structures and architectures intended for applications in controlled release and organ-targeted drug delivery. The course will discuss the therapeutic basic of drug delivery based on drug pharmacodynamics and clinical pharmacokinetics. Biomaterials with specialized structural and interfacial properties will be introduced to achieve drug targeting and controlled release. Offered as EBME 316 and EBME 416. Prereq: EBME 306.

EBME 317. Fundamentals of Biomechanics. 3 Units.
Fundamentals of biomechanics will teach students how to apply basic principles of mechanics to understand, explain and model biological processes at across the relevant length-scales (cell-tissue-organ-organism), and over a broad range of physiological systems (respiratory, ocular, circulatory, and musculoskeletal). Physiology of organs and tissues that are involved in biomechanical functions will also be covered. Offered as EMAE 307 and EBME 317. Prereq: ENGR 200.

EBME 318. Biomedical Engineering Laboratory. 1 Unit.
Experiments for measurement, assisting, replacement, or control of various biomedical systems. Students choose a few lab experiments from a large number of offerings relevant to all BME sequences. Experiments are conducted primarily in faculty labs with 3-8 students participating. Recommended preparation: ENGR 210. Prereq: BME Major, EBME 201, EBME 202 and Prereq or Coreq: EBME 308.

EBME 320. Biomedical Imaging. 3 Units.
General principles, instrumentation, and applications of biomedical imaging. Topics include: x-ray, ultrasound, computed tomography, magnetic resonance imaging, nuclear imaging, image reconstruction, and image quality. Recommended preparation: ENGR 210 and EBME 202 or equivalent. Prereq: EBME 308 or EECS 246.

EBME 325. Introduction to Tissue Engineering. 3 Units.
The goal of this course is to present students with a firm understanding of the primary components, design principles, and engineering concepts central to the field of tissue engineering. First, the biological principles of tissue formation during morphogenesis and wound repair will be examined. The cellular processes underlying these events will be presented with an emphasis on microenvironment regulation of cell behavior. Biomimetic approaches to controlling cell function and tissue formation via the development of biomaterial systems will then be investigated. Case studies of regeneration strategies for specific tissues will be presented in order to examine the different tissue-specific engineering strategies that may be employed. Special current topics in tissue engineering will also be covered. Recommended preparation: EBME 306, BIOL 362, and CHEM 223.

EBME 327. Bioelectric Engineering. 3 Units.

EBME 328. Biomedical Engineering R&D Training. 1 Unit.
This course will provide research and development in the laboratory of a mentoring faculty member. Varied R&D experiences will include activities in biomedical instrumentation, tissue engineering, imaging, drug delivery, and neural engineering. Each Student must identify a faculty mentor, and together they will create description of the training experience prior to the first class. Prereq: EBME 201 and EBME 202.

EBME 329. Tissue Biomechanics. 3 Units.
Building on prior coursework in the mechanical behavior of skeletal biological tissues and systems, this course will expand students’ understanding of the biomechanics of tissue and the influence of material properties on the structure and function of organs and organisms. Specific course topics will include structure and functional relationships in tissues and organs; the response of the heart, vasculature, and tissue scaffolds to mechanical loads, including characteristics such as nonlinearity, viscoelasticity, and orthotropy. Emphasis is placed on integrating basic analytical, experimental, and computational methods for a more complete understanding of the biomechanics of organs and tissues. Prereq: EBME 201 and EBME 202.

EBME 330. Clinical Correlates in Biomedical Engineering. 1 Unit.
Clinical correlations in biomedical engineering enable synthesis of basic engineering concepts around applications in medical practice. In course, students will draw upon prior training in biophysics, anatomic structure and function, and mathematical modeling of physiologic systems in a weekly case-based critical care scenario. Blending engineering and clinical concepts in this fashion will expand student’s medical expertise. This eight-week course will feature six critical care cases designed to associate and translate engineering concepts into relevant medical knowledge. Course didactic components will be posted on Canvas, and students will be expected to read and prepare arguments for each case to be discussed in class. Successful students will conclude this course with enhanced systems thinking and insight on prior biomedical knowledge and innovation, as well as having demonstrated measurable improvement in their critical thinking skills in the field of medicine. Prereq: EBME 202.
EBME 350. Quantitative Molecular, Cellular and Tissue Bioengineering. 3 Units.

EBME 356. Introduction to Biomaterials Engineering - Laboratory. 1 Unit.
This is a core BME Laboratory course directed at providing Biomedical Engineering undergraduate students 'hands on' experience in a component of biomaterials engineering, specifically, biocompatibility. To that end, the course will focus on blood compatibility (hemocompatibility) of biomaterials, by teaching students how to analyze the interaction of blood components (proteins, platelets, RBCs) on biomedical relevant coated versus uncoated polymer surfaces. The students will learn important characterization techniques like contact angle measurement, UV-Vis spectroscopy and optical microscopy in the context of characterizing blood interactions with materials. Prereq: EBME 201 and EBME 202. Prereq or Coreq: EBME 306.

EBME 358. Biomedical Signals and Systems Laboratory. 1 Unit.
Computational laboratory experiences with biomedical applications. Numerical methods with MATLAB applications in biomedical engineering. Coreq: EBME 308.

EBME 359. Biomedical Computer Simulation Laboratory. 1 Unit.

EBME 360. Biomedical Instrumentation Laboratory. 1 Unit.
A laboratory which focuses on the basic components of biomedical instrumentation and provides hands-on experience for students in EBME 310, Biomedical Instrumentation. The purpose of the course is to develop design skills and laboratory skills in analysis and circuit development. Coreq: EBME 310.

EBME 361. Biomedical Image Processing and Analysis. 3 Units.
Principles of image processing and analysis with applications to clinical and biomedical research. Topics include image filtering, registration, morphological processing, segmentation, classification, and 3D image visualization. There will be interesting, realistic computer projects in Matlab. Offered as EBME 361 and EBME 461. Prereq: EBME 308.

EBME 370. Principles of Biomedical Engineering Design. 3 Units.
Students learn and implement the design process to produce working prototypes of medical devices with potential commercial value to meet significant clinical needs. Critical examination of contemporary medical problems is used to develop a specific problem statement. The class is divided into teams of 3 to 4 students. Each team integrates their knowledge and skills to design a device to meet their clinical need. Project planning and management, including resource allocation, milestones, and documentation, are required to ensure successful completion of projects within the allotted time and budget. Formal design reviews by a panel of advisors and outside medical device experts are required every four weeks. Every student is required to give oral presentations at each formal review and is responsible for formal documentation of the design process, resulting in an executive summary and complete design history file of the project. The course culminates with a public presentation of the team's device to a panel of experts. This course is expected to provide the student with a real-world, capstone design experience. Recommended preparation: EBME 310 Prereq: Senior standing or requisites not met permission.

EBME 380. Biomedical Engineering Design Experience. 3 Units.
This course is the culmination of the BME educational experience in which the student will apply acquired skills and knowledge to create a working device or product to meet a medical need. Students will learn how to apply engineering skills to solve problems and physically realize a project design. The course structure includes regular meetings with a faculty project advisor, regular reports of accomplished activity, hands on fabrication of devices, and several lectures from leading engineers from industry and academia that have first hand experience in applying the principles of design to Biomedical Engineering. Students will also provide periodic oral progress reports and a final oral presentation with a written design report. Counts as SAGES Senior Capstone. Prereq: EBME 370 and Senior standing or requisites not met permission.

EBME 398. Biomedical Engineering Research Experience I. 1 - 3 Units.
Biomedical engineering students doing independent research in a laboratory of a Primary or Adjunct BME Faculty may obtain credit for their research effort if they register for EBME 398 before they begin their research. The total number of credits is limited to three with a minimum of 1 credit per semester. Earning one credit requires about 4 hours of work per week. This is split between actual research in the lab (2-3 hours) and communication of results (1-2 hours). The communication component requires preparation of oral presentations and written reports. Grades are jointly determined by the research supervisor and the instructor. Students are encouraged to work with others in the faculty laboratory, but they must make a major contribution to the project. A research project is expected to include a significant engineering component, such as design and/or analysis. A design project must include a significant research component, such as applying the developed design to solve an actual biomedical problem. In advance of registration, all students must submit a course proposal (see FORMS on the BME web site). This proposal must be approved by their research mentor and submitted via email for approval by the course instructor. This course can qualify as a technical elective if the project includes material pertinent to the student's BME track and is approved in advance by the BME faculty member responsible for the BME track. To be approved as a technical elective, the project proposal should identify the new technical material the student will master, and a plan for assessing mastery.

EBME 399. Biomedical Engineering Research Experience II. 1 - 3 Units.
The project can be a continuation of the EBME 398 project but performed more independently, or a new project that is more challenging than the first project. As with EBME 398, the course may be taken for 1-3 credits, and repeated up to a total of 3 credits. Consent of Instructor is required. Prereq: EBME 398.

EBME 400T. Graduate Teaching I. 0 Unit.
This will provide the Ph.D. candidate with experience in teaching undergraduate or graduate students. The experience is expected to consist of direct student contact, but will be based upon the specific departmental needs and teaching obligations. This teaching experience will be conducted under the supervision of the faculty member who is responsible for the course, but the academic advisor will assess the educational plan to ensure that it provides an educational opportunity for the student. Recommended preparation: UNIV 400, BME Ph.D. student.

EBME 401D. Biomedical Instrumentation and Signal Processing. 3 Units.
Graduate students with various undergraduate backgrounds will learn the fundamental principles of biomedical measurements that integrate instrumentation and signal processing with problem-based hands-on experience. Recommended preparation: Undergraduate circuit and signal processing class.
EBME 401L. Biomedical Instrumentation and Signal Analysis Laboratory. 1 Unit.
This course accompanies EBME 401D, Biomedical Instrumentation and Signal Analysis, an introductory graduate course for MS and PhD BME students. Students in the PhD section are required to take this course to gain hands-on experience with each of the three areas of this course: measurement circuits/electronics, signal analysis, and transducers. The course involves the design, realization and testing of a device proposed by each student team. A final oral presentation and report on the results of the projects are graded and combined in one letter grade. Coreq: EBME 401D.

EBME 402. Organ/Tissue Physiology and Systems Modeling. 4 Units.
Graduate students with various undergraduate backgrounds will learn the fundamental principles of organ and tissue physiology as well as systems modeling. Prereq: Graduate Status.

EBME 406. Polymers in Medicine. 3 Units.
This course covers the important fundamentals and applications of polymers in medicine, and consists of three major components: (i) the blood and soft-tissue reactions to polymer implants; (ii) the structure, characterization and modification of biomedical polymers; and (iii) the application of polymers in a broad range of cardiovascular and extravascular devices. The chemical and physical characteristics of biomedical polymers and the properties required to meet the needs of the intended biological function will be presented. Clinical evaluation, including recent advances and current problems associated with different polymer implants. Recommended preparation: EBME 306 or equivalent. Offered as EBME 406 and EMAC 471. Prereq: Graduate Standing.

EBME 407. Neural Interfacing. 3 Units.
Neural interfacing refers to the principles, methods, and devices that bridge the boundary between engineered devices and the nervous system. It includes the methods and mechanisms to get information efficiently and effectively into and out of the nervous system to analyze and control its function. This course examines advanced engineering, neurobiology, neurophysiology, and the interaction between all of them to develop methods of connecting to the nervous system. The course builds on a sound background in Bioelectric Phenomenon to explore fundamental principles of recording and simulation, electrochemistry of electrodes in biological tissue, tissue damage generated by electrical stimulation, materials and material properties, and molecular functionalization of devices for interfacing with the nervous system. Several examples of the state-of-art neural interfaces will be analyzed and discussed. Recommended preparation: EBME 401. Prereq: Graduate standing or Undergraduate with Junior or Senior standing and a cumulative GPA of 3.2 or above.

EBME 410. Medical Imaging Fundamentals. 3 Units.
Physical principles of medical imaging. Imaging devices for x-ray, ultrasound, magnetic resonance, etc. Image quality descriptions. Patient risk. Recommended preparation: EBME 308 and EBME 310 or equivalent. Prereq: Graduate standing or Undergraduate with Junior or Senior standing and a cumulative GPA of 3.2 or above.

EBME 411. Underpinnings of the Extracellular Matrix. 3 Units.
Collagen is the most plentiful protein in the body. Every tissue that lays down basement membrane utilizes collagen to attach cells to the extracellular matrix. Collagen is a primary structural element of tissues ranging from bone, cartilage and tendon to arterial wall, sclera and skin. Many of the mechanisms currently under consideration to describe how mechanical forces are transduced into cellular activity require the forces to travel through collagenous structures on their way to the cells. Fundamentals of collagenous tissues are presented in a combined lecture/seminar format. Details at the molecular, fibrillar and whole tissue levels are presented. Applications ranging from how to obtain collagen molecules, to synthesizing gels for use in tissue engineering, to design and creation of collagen based materials for replacement and/or augmentation of several tissues are presented. A series of guest lectures by researchers currently using and/or developing collagen based materials are presented. The course concludes with a series of in-class presentations by the students who pick a specific application of interest to them and then demonstrate how the fundamentals presented in the first portion of the class play out in their application. While not required, it is recommended that students have an undergraduate course in biomaterials, two semesters of undergraduate biology, and organic chemistry. Prereq: Graduate Student standing.

EBME 416. Biomaterials for Drug Delivery. 3 Units.
The teaching objective is to provide students with a basic understanding of the principles of design and engineering of well-defined molecular structures and architectures intended for applications in controlled release and organ-targeted drug delivery. The course will discuss the therapeutic basic of drug delivery based on drug pharmacodynamics and clinical pharmacokinetics. Biomaterials with specialized structural and interfacial properties will be introduced to achieve drug targeting and controlled release. Offered as EBME 316 and EBME 416. Prereq: EBME 306 and PHRM 309 or graduate standing.

EBME 419. Applied Probability and Stochastic Processes for Biology. 3 Units.
Applications of probability and stochastic processes to biological systems. Mathematical topics will include: introduction to discrete and continuous probability spaces (including numerical generation of pseudo random samples from specified probability distributions), Markov processes in discrete and continuous time with discrete and continuous sample spaces, point processes including homogeneous and inhomogeneous Poisson processes and Markov chains on graphs, and diffusion processes including Brownian motion and the Ornstein-Uhlenbeck process. Biological topics will be determined by the interests of the students and the instructor. Likely topics include: stochastic ion channels, molecular motors and stochastic ratchets, actin and tubulin polymerization, random walk models for neural spike trains, bacterial chemotaxis, signaling and genetic regulatory networks, and stochastic predator-prey dynamics. The emphasis will be on practical simulation and analysis of stochastic phenomena in biological systems. Numerical methods will be developed using a combination of MATLAB, the R statistical package, MCell, and/or URDME, at the discretion of the instructor. Student projects will comprise a major part of the course. Offered as BIOL 319, ECSE 319, MATH 319, SYBB 319, BIOL 419, EBME 419, MATH 419, PHOL 419, and SYBB 419.
EBME 421. Bioelectric Phenomena. 3 Units.
The goal of this course is to provide working knowledge of the theoretical methods that are used in the fields of electrophysiology and bioelectricity for both neural and cardiac systems. These methods will be applied to describe, from a theoretical and quantitative perspective, the electrical behavior of excitable cells, the methods for recording their activity and the effect of applied electrical and magnetic fields on excitable issues. A team modeling project will be required. Recommended preparation: differential equations, circuits. Prereq: Graduate standing or Undergraduate with Junior or Senior standing and a cumulative GPA of 3.2 or above.

EBME 425. Tissue Engineering and Regenerative Medicine. 3 Units.
This course will provide advanced coverage of tissue engineering with a focus on stem cell-based research and therapies. Course topics of note include stem cell biology and its role in development, modeling of stem cell function, controlling stem cell behavior by engineering materials and their microenvironment, stem cells’ trophic character, and state-of-the-art stem cell implementation in tissue engineering and other therapeutic strategies. Prereq: PhD student in an engineering program or EBME 325 or requisites not met permission.

EBME 426. Nanomedicine. 3 Units.

EBME 427. Movement Biomechanics and Rehabilitation. 3 Units.
Introduction to the basic biomechanics of human movement and applications to the design and evaluation of artificial devices intended to restore or improve movement lost due to injury or disease. Measurement techniques in movement biomechanics, including motion analysis, electromyography, and gait analysis. Design and use of upper and lower limb prostheses. Principles of neuroprostheses with applications to paralyzed upper and lower extremities. Term paper required. Recommended preparation: Consent of instructor and graduate standing. Prereq: Graduate standing or Undergraduate with Junior or Senior standing and a cumulative GPA of 3.2 or above.

EBME 431. Physics of Imaging. 3 Units.
Description of physical principles underlying the spin behavior in MR and Fourier imaging in multi-dimensions. Introduction of conventional, fast, and chemical-shift imaging techniques. Spin echo, gradient echo, and variable flip-angle methods. Projection reconstruction and sampling theorems. Bloch equations, T1 and T2 relaxation times, rf penetration, diffusion and perfusion. Flow imaging, MR angiography, and functional brain imaging. Sequence and coil design. Prerequisite may be waived with consent of instructor. Recommended preparation: PHYS 122 or PHYS 124 or EBME 410. Offered as EBME 431 and PHYS 431.

EBME 432. Quantitative Analysis of Physiological Systems. 3 Units.

EBME 433. Advanced Topics for Physiological Systems Analysis. 4 Units.

EBME 440. Translational Research for Biomedical Engineers. 3 Units.
Translational Research (TR) in the Biomedical Engineering context means translating laboratory discoveries or developments into improved health care. Topics and activities include: Interdisciplinary teamwork and communication; Research ethics and human subjects protection; Regulation and oversight of human subjects and animal research; Clinical validation study design and biostatistics; Intellectual property, technology transfer and commercialization; Physician shadowing; Attending Grand Rounds and Morbidity-Mortality conferences; Preparing IRB and IACUC protocols; Final integrative project. Prereq: Graduate standing or Undergraduate with Junior or Senior standing and a cumulative GPA of 3.2 or above.

EBME 450. Biomedical Engineering Entrepreneurship. 3 Units.
Biomedical engineering entrepreneurship is a unique in its interdisciplinary and multidisciplinary scope. In this course we examine medical technology innovations in the context of (A) identifying unmet clinical needs, (B) the process of conducting an opportunity analysis for an investable concept, and (C) subsequent translation of these advances into the market This course will emphasize and explore a variety of issues related to innovation and entrepreneurship, demonstrating that there are not many “absolute truths,” but there are numerous best practices and processes that create value. Successful students will conclude this course with new knowledge and insight on biomedical technology and innovation, as well as having demonstrated measurable improvement in their critical thinking skills. Prereq: Graduate student standing.

EBME 451. Molecular and Cellular Physiology. 3 Units.
This course covers cellular and molecular basics for graduate students with little or no prior biology background. The emphasis of EBME 451 is on the molecular and cellular mechanisms underlying physiological processes. Structure-function relationship will be addressed throughout the course. The primary goal of the course is to develop understanding of the principles of the physiological processes at molecular and cellular level and to promote independent thinking and ability to solve unfamiliar problems. This course is no longer a core course of the Biomedical Engineering graduate curriculum but serves as a fundamentals course to prepare students for the graduate cellular and molecular physiology core. Prereq: Graduate standing.

EBME 454. Introduction to Grant and Fellowship Writing. 1 Unit.
This course is intended for first and possibly second year graduate students to learn how to write proposals, such as NSF Graduate Fellowship proposals. Students will be instructed on how to plan their proposal, will go through a mentored proposal writing exercise, and will participate in peer review of their proposals. The course will take place only in the first half of the semester, at twice the normal frequency, since proposals are due in mid-semester (e.g. October). Prereq: Graduate standing.
EBME 460. Advanced Topics in NMR Imaging. 3 Units.
Frontier issues in understanding the practical aspects of NMR imaging. Theoretical descriptions are accompanied by specific examples of pulse sequences, and basic engineering considerations in MRI system design. Emphasis is placed on implications and trade-offs in MRI pulse sequence design from real-world versus theoretical perspectives. Recommended preparation: EBME 431 or PHYS 431. Offered as EBME 460 and PHYS 460. Prereq: Graduate standing or Undergraduate with Junior or Senior standing and a cumulative GPA of 3.2 or above.

EBME 461. Biomedical Image Processing and Analysis. 3 Units.
Principles of image processing and analysis with applications to clinical and biomedical research. Topics include image filtering, registration, morphological processing, segmentation, classification, and 3D image visualization. There will be interesting, realistic computer projects in Matlab. Offered as EBME 361 and EBME 461. Prereq: EBME 401.

EBME 465. Biomedical Optical Imaging. 3 Units.
Fundamentals of biomedical optics (biophotonics) with a focus on concepts and instrumentation behind light-based imaging of biological tissues. Topics include: essentials of optics and photonics, light-tissue interactions, optical imaging, conventional and advanced microscopies, optical coherence tomography. Course will include hands-on labs and demonstrations. Prereq: EBME 308 and (Graduate standing or Undergraduate with Junior or Senior standing and a cumulative GPA of 3.2 or above) or Requisites Not Met permission.

EBME 467. Commercialization and Intellectual Property Management. 3 Units.
This interdisciplinary course covers a variety of topics, including principles of intellectual property and intellectual property management, business strategies and modeling relevant to the creation of start-up companies and exploitation of IP rights as they relate to biomedical-related inventions. The goal of this course is to address issues relating to the commercialization of biomedical-related inventions by exposing law students, MBA students, and Ph.D. candidates (in genetics and proteomics) to the challenges and opportunities encountered when attempting to develop biomedical intellectual property from the point of early discovery to the clinic and market. Specifically, this course seeks to provide students with the ability to value a given technological advance or invention holistically, focusing on issues that extend beyond scientific efficacy and include patient and practitioner value propositions, legal and intellectual property protection, business modeling, potential market impacts, market competition, and ethical, social, and healthcare practitioner acceptance. During this course, law students, MBA students, and Ph.D. candidates in genomics and proteomics will work in teams of five (two law students, two MBA students and one Ph.D. candidate), focusing on issues of commercialization and IP management of biomedical-related inventions. The instructors will be drawn from the law school, business school, and technology-transfer office. Please visit the following website for more information: fusioninnovate.com. Offered as LAWS 5341, MGMT 467, GENE 367, GENE 467, EBME 467 and ECSE 467.

EBME 471. Principles of Medical Device Design and Innovation. 3 Units.
Translational research leading to medical device innovation is highly interdisciplinary, requiring a systematic, structured approach to bringing new medical technologies to market. This course provides the fundamental principles of the Bodesign innovation process, providing the student the essential tools to (A) identify unmet clinical needs, (B) create innovative medical device concepts that respond to a primary unmet need, and (C) understand the process for translating these concepts into the market. In short, the student learns the fundamental principles for the process of identify, invent, implement in the field of Bodesign. Students taking EBME 471 (distance learning) cannot register for EBME 472 BioDesign (on-site) as the core content is substantially similar.

EBME 472. BioDesign. 3 Units.
Medical device innovations that would have been considered science fiction a decade ago are already producing new standards of patient care. Innovation leading to lower cost of care, minimally invasive procedures and shorter recovery times is equally important to healthcare business leaders, educators, clinicians, and policy-makers. Innovation is a driver of regional economic development and wealth creation in organizational units ranging in size from the start-up to the Fortune 500 companies. In a broader context, the pace of translational research leading to product and service innovation is highly interdisciplinary, thus, new products and services result from team efforts, marked by a systematic, structured approach to bringing new medical technologies to market and impacting patient care. In this course we examine medical technology innovations in the context of (A) addressing unmet clinical needs, (B) the process of inventing new medical devices and instruments, and (C) subsequent implementation of these advances in patient care. In short, the student learns the process of "identify, invent, implement" in the field of BioDesign. Offered as EBME 472, IIME 472 and SYBB 472.

EBME 473. Fundamentals of Clinical Information Systems. 3 Units.
Technology has played a significant role in the evolution of medical science and treatment. While we often think about progress in terms of the practical application of, say, imaging to the diagnosis and monitoring of disease, technology is increasingly expected to improve the organization and delivery of healthcare services, too. Information technology plays a key role in the transformation of administrative support systems (finance and administration), clinical information systems (information to support patient care), and decision support systems (managerial decision-making). This introductory graduate course provides the student with the opportunity to gain insight and situational experience with clinical information systems (CIS). Often considered synonymous with electronic medical records, the "art" of CIS more fundamentally examines the effective use of data and information technology to assist in the migration away from paper-based systems and improve organizational performance. In this course we examine clinical information systems in the context of (A) operational and strategic information needs, (B) information technology and analytic tools for workflow design, and (C) subsequent implementation of clinical information systems in patient care. Legal and ethical issues are explored. The student learns the process of "plan, design, implement" through hands-on applications to select CIS problems, while at the same time gaining insights and understanding of the impacts placed on patients and health care providers. Offered as EBME 473, IIME 473 and SYBB 421.
EBME 474. Biotransport Processes. 3 Units.
Biomedical mass transport and chemical reaction processes. Basic mechanisms and mathematical models based on thermodynamics, mass and momentum conservation. Analytical and numerical methods to simulate in vivo processes as well as to develop diagnostic and therapeutic methods. Applications include transport across membranes, transport in blood, tumor processes, bioreactors, cell differentiation, chemotaxis, drug delivery systems, tissue engineering processes. Recommended preparation: EBME 350 or equivalent. Offered as EBME 474 and ECHE 474.

EBME 478. Computational Neuroscience. 3 Units.
Computer simulations and mathematical analysis of neurons and neural circuits, and the computational properties of nervous systems. Students are taught a range of models for neurons and neural circuits, and are asked to implement and explore the computational and dynamic properties of these models. The course introduces students to dynamical systems theory for the analysis of neurons and neural learning, models of brain systems, and their relationship to artificial and neural networks. Term project required. Students enrolled in MATH 478 will make arrangements with the instructor to attend additional lectures and complete additional assignments addressing mathematical topics related to the course. Recommended preparation: MATH 223 and MATH 224 or BIOL 300 and BIOL 306. Offered as BIOL 378, COGS 378, MATH 378, BIOL 478, CSIDS 478, EBME 478, ECSE 478, MATH 478 and NEUR 478.

EBME 480A. Introduction to Wireless Health. 3 Units.
Study of convergence of wireless communications, microsystems, information technology, persuasive psychology, and health care. Discussion of health care delivery system, medical decision-making, persuasive psychology, and wireless health value chain and business models. Understanding of health information technology, processing of monitoring data, wireless communication, biomedical sensing techniques, and health monitoring technical approaches and solutions. Offered as ECSE 480A and EBME 480A.

EBME 480B. The Human Body. 3 Units.
Study of structural organization of the body. Introduction to anatomy, physiology, and pathology, covering the various systems of the body. Comparison of elegant and efficient operation of the body and the related consequences of when things go wrong, presented in the context of each system of the body. Introduction to medical diagnosis and terminology in the course of covering the foregoing. Offered as ECSE 480B and EBME 480B.

EBME 480C. Biomedical Sensing Instrumentation. 3 Units.
Study of principles, applications, and design of biomedical instruments with special emphasis on transducers. Understanding of basic sensors, amplifiers, and signal processing. Discussion of the origin of biopotential, and biopotential electrodes and amplifiers (including biotelemetry). Understanding of chemical sensors and clinical laboratory instrumentation, including microfluidics. Offered as ECSE 480C and EBME 480C. Prereq: EECS/EBME 480A, EECS/EBME 480B

EBME 480D. The Health Care Delivery Ecosystem. 3 Units.
Health care delivery across the continuum of care in the United States, including health policy and reform, financing of care, comparative health systems, population health, public health, access to care, care models, cost and value, comparative effectiveness, governance, management, accountability, workforce, and the future. Discussions of opportunities and challenges for wireless health, integrated into the foregoing topics. Perspective on health care delivery in other countries. Offered as ECSE 480D and EBME 480D.

EBME 480E. Wireless Communications and Networking. 3 Units.
Essentials of wireless communications and networking, including teletraffic engineering, radio propagation, digital and cellular communications, wireless wide-area network architecture, speech and channel coding, modulation schemes, antennas, security, networking and transport layers, and 4G systems. Hands-on learning of the anatomy of a cell phone, and a paired wireless health device and its gateway. Offered as ECSE 480E and EBME 480E.

EBME 480F. Physicians, Hospitals and Clinics. 3 Units.
Rotation through one or more health care provider facilities for a first-hand understanding of care delivery practice, coordination, and management issues. First-hand exposure to clinical personnel, patients, medical devices and instruments, and organizational workflow. Familiarity with provider protocols, physician referral practices, electronic records, clinical decision support systems, acute and chronic care, and inpatient and ambulatory care. Offered as ECSE 480F and EBME 480F.

EBME 480Q. Regulatory Policy and Regulations. 3 Units.
Introduction of wireless health technologies: spectrum, licensed versus unlicensed; personal area networks; body area networks; ultra-wideband low energy level short-range radios; wireless local area networks; wide area networks. The Federal system: separation of powers; the executive branch and its departments; the House of Representatives and its committees; the Senate and its committees; the FCC; policy versus regulatory versus legislative. What is a medical device: FDA; classification system; radiation-emitting products; software; RF in medical devices; converged medical devices; international aspects. Regulation of health information technology and wireless health: American Recovery and Reinvestment Act; Patient Protection and Affordable Care Act; FCC/ FDA MoU; CMS and Reimbursement; privacy and security. Offered as ECSE 480Q and EBME 480Q.

EBME 480R. User Experience Engineering. 3 Units.
Social, cognitive, behavioral, and contextual elements in the design of healthcare technology and systems. User-centered design paradigm from a broad perspective, exploring dimensions of product user experience and learning to assess and modify the design of healthcare technology. Practical utilization of user centered design method and assessment techniques for approaching a design problem. Offered as ECSE 480R and EBME 480R.

EBME 480S. Wireless Health Product Development. 3 Units.
Integrating application requirements, market data, concept formulation, design innovation, and manufacturing resources for creating differentiated wireless health products that delight the user. Learning user-centric product development best practices, safety, security and privacy considerations, and risk management planning. Understanding the regulatory process. Identifying and managing product development tradeoffs. Offered as ECSE 480S and EBME 480S. Prereq: EBME 480R.
EBME 491. Introduction to Translational Health Technology. 2 Units.
Introduction to Translational Health Technology serves to orient students to the field of translational health and highlight specific product development philosophy, projects, and careers in the field. This course of study is particularly helpful for those students enrolled in lock-step translational health specialty degree programs, so they are adequately coached and prepared for the “road ahead” in the translation of leading-edge research into patient care. In addition to providing specific instructional elements, this course also helps students frame the type of capstone project they may wish to pursue as part of their degree program. The course of study includes invited presentations by the existing graduate students to enable: (A) graduate students a chance to reflect on their research and project work and, (B) for new students to develop first-hand experience with the process of inquiry and debate relating to the field of translational health technology.

EBME 500T. Graduate Teaching II. 0 Unit.
This course will provide the Ph.D. candidate with experience in teaching undergraduate or graduate students. The experience is expected to consist of direct student contact, but will be based upon the specific departmental needs and teaching obligations. This teaching experience will be conducted under the supervision of the faculty member who is responsible for the course, but the academic advisor will advise students to ensure that it provides an educational opportunity for the students. Recommended preparation: EBME 400T, BME Ph.D. student.

EBME 515. Grant Writing II. 2 Units.
This course introduces students to writing research proposals. Students will be asked to write a short, concise proposal written according to the funding mechanism is thus appropriate for a student in the formative stages of his or her research project to acquire the skills for conceiving and writing a research proposal. The research proposal can be hypothesis-driven or design-driven. It should include specific aims, Background and Significance (Narrative and Innovation), Approach (Research Strategy and Preliminary Results) and References. The intent for the written proposal is to prepare students for the department’s requirement of a written and associated oral presentation and defense to evaluate the ability of the student to formulate a research problem, to state hypotheses or outline design objectives, to propose a research plan using feasible design, experiment and analysis techniques to either test those hypotheses or achieve the design objectives, and to interpret data. While this proposal will often represent the research ultimately pursued by the student, it is recognized that the details of the proposal and even its goals may evolve significantly over time. Students who have or are writing fellowship proposals are encouraged to use the same concepts in this research proposal, but they should convert the material into the NIH R21 format and should include all of the required components. Prereq: EBME 454 and EBME 570.

EBME 570. Graduate Professional Development for Biomedical Engineers. 1 Unit.
Students will be trained in topics including public speaking, grant writing, notebook management, professionalism, etc. Prereq: Graduate standing.

EBME 600T. Graduate Teaching III. 0 Unit.
This course will provide the Ph.D. candidate with experience in teaching undergraduate or graduate students. The experience is expected to consist of direct student contact, but will be based upon the specific departmental needs and teaching obligations. This teaching experience will be conducted under the supervision of the faculty member who is responsible for the course, but the academic advisor will advise students to ensure that it provides an educational opportunity for the students. Recommended preparation: EBME 500T, BME Ph.D. student.

EBME 601. Pre-candidacy Ph.D. Research. 1 - 18 Units.
Credit as arranged.

EBME 602. Special Topics. 1 - 18 Units.
Credit as arranged.

EBME 611. BME Departmental Seminar I. .5 Unit.
Lectures by invited speakers on subjects of current interest in biomedical engineering. Students will be evaluated on reading and preparation of questions for select speakers, as well as weekly participation. Between this course and EBME 612 students must earn a minimum of 1 credit (two semesters) and can take up to 4 credits over eight different semesters.

EBME 612. BME Departmental Seminar II. .5 Unit.
Lectures by invited speakers on subjects of current interest in biomedical engineering. Students will be evaluated on reading and preparation of questions for select speakers, as well as weekly participation. Between this course and EBME 611 students must earn a minimum of 1 credit (two semesters) and can take up to 4 credits over eight different semesters.

EBME 613. Topic Seminars for NeuroEngineering Students. .5 Unit.
Lectures by students in the seminar series on subjects of current interest to biomedical engineering students in NeuroEngineering. Students will be evaluated on presentation preparation and performance, as well as weekly participation. Between this course and EBME 614 students must earn a minimum of 1 credit (two semesters) and can take up to 4 credits over eight different semesters. Prereq: Graduate standing.

EBME 614. Topic Seminars for NeuroEngineering Students. .5 Unit.
Lectures by students in the seminar series on subjects of current interest to biomedical engineering students in NeuroEngineering. Students will be evaluated on presentation preparation and performance, as well as weekly participation. Between this course and EBME 613 students must earn a minimum of 1 credit (two semesters) and can take up to 4 credits over eight different semesters. Prereq: Graduate standing.

EBME 615. Topic Seminars for Imaging Students. .5 Unit.
Lectures by students in the seminar series on subjects of current interest to biomedical engineering students in Imaging. Students will be evaluated on presentation preparation and performance, as well as weekly participation. Between this course and EBME 616 students must earn a minimum of 1 credit (two semesters) and can take up to 4 credits over eight different semesters. Prereq: Graduate standing.

EBME 616. Topic Seminars for Imaging Students. .5 Unit.
Lectures by students in the seminar series on subjects of current interest to biomedical engineering students in Imaging. Students will be evaluated on presentation preparation and performance, as well as weekly participation. Between this course and EBME 615 students must earn a minimum of 1 credit (two semesters) and can take up to 4 credits over eight different semesters. Prereq: Graduate standing.

EBME 617. Topic Seminars for Biomaterials Students. .5 Unit.
Lectures by students in the seminar series on subjects of current interest to biomedical engineering students in Biomaterials. Students will be evaluated on presentation preparation and performance, as well as weekly participation. Between this course and EBME 618 students must earn a minimum of 1 credit (two semesters) and can take up to 4 credits over eight different semesters. Prereq: Graduate standing.
Mission

The Department of Chemical and Biomolecular Engineering inspires learning and the pursuit of scholarly activities in chemical and biological engineering and related science and engineering disciplines. The Department offers educational programs and a research environment that enable our graduates to succeed in an evolving workplace, provides opportunities for students and faculty to advance knowledge at the highest levels of the profession, and addresses technological and personnel needs of industry, governments, and society.

Background

The profession of chemical engineering involves the analysis, design, operation, and control of processes that convert matter and energy to more useful forms, encompassing processes at all scales from the molecular to the megascale. Traditionally, chemical engineers are responsible for the production of basic chemicals, plastics, and fibers. However, today’s chemical engineers are also involved in food and fertilizer production, synthesis of electronic materials, waste recycling, and power generation. Chemical engineers also develop new materials (ceramic composites and electronic chips, for example) as well as biochemicals and pharmaceuticals. The breadth of training in engineering and the sciences gives chemical engineers a particularly wide spectrum of career opportunities. Chemical engineers work in the chemical and materials-related industries, in government, and are accepted by graduate schools in engineering, chemistry, medicine, and law.

Research

Research in the department is sponsored by a variety of state and federal agencies, by private industry, and by foundations. Current active research topics include:

Energy
- Novel energy storage systems for transportation, grid storage applications, and portable devices
- Energy efficient extraction and processing of materials
- Fuel cells and batteries
- Novel catalysts, electrocatalysts, and plasmas for conversion of gases to fuels
- Simulation, modeling, and fundamental characterization of transport and interfacial processes in electrochemical energy storage and conversion systems

Materials
- Advanced materials for electronic and electrochemical device applications
- Simulation and theory of materials properties
- Surface properties and interfacial phenomena
- Materials processing and engineering at molecular through macro scales
- Advanced separation processes for the nuclear fuel cycle
- Synthesis of novel membranes for gas separations, wastewater treatment and radioanalytical chemistry
- Imaging and prediction of complex fluid dynamics

Biomolecular Engineering
- Biosensors
- Cell and tissue engineering

Department of Chemical and Biomolecular Engineering

116 A.W. Smith Building (7217)
http://engineering.case.edu/eche/
Phone: 216.368.4182
Harihara Baskaran, Professor and Chair
harihara.baskaran@case.edu

The Department of Chemical and Biomolecular Engineering offers Bachelor of Science in Engineering, Master of Science, and Doctor of Philosophy degree programs. The department has twelve full-time faculty members, all of whom lead active research programs in advanced and emerging areas of chemical and biomolecular engineering.
• Transport and metabolism in biological systems
• Biocatalysis and protein engineering

Chair
Hariri Baskaran, PhD
(The Pennsylvania State University)
Professor and Chair
Transport phenomena in biology and medicine, tissue/cell metabolism, cell transport, microvascular tissue engineering, cartilage tissue engineering

Faculty
Rohan N. Akolkar, PhD
(Case Western Reserve University)
F. Alex Nason Professor
Electrochemical phenomena in next-generation batteries, photovoltaics and semiconductor devices

Hariri Baskaran, PhD
(The Pennsylvania State University)
Professor
Transport phenomena in biology and medicine, tissue/cell metabolism, cell transport, microvascular tissue engineering, cartilage tissue engineering

Christine Duval, PhD
(Clemson University)
Assistant Professor
Membranes, radiochemical separations

Donald L. Feke, PhD
(Princeton University)
Distinguished University Professor and Vice Provost for Undergraduate Education
Colloidal and transport phenomena, dispersive mixing, particle science and processing

Burcu Gurkan, PhD
(University of Notre Dame)
Associate Professor
Energy storage, nonflammable electrolytes, electrode fabrication, electrochemical separation processes

Eric Kaler, PhD
(University of Minnesota)
Professor and University President

Daniel Lacks, PhD
(Harvard University)
C. Benson Branch Professor of Chemical Engineering, Department Chair
Molecular simulation, statistical mechanics, triboelectric charging

Uziel Landau, PhD
(University of California, Berkeley)
Professor
Electrochemical engineering, modeling of electrochemical systems, electrodeposition, batteries, fuel cells, electrolyzers, corrosion

Chung-Chiun Liu, PhD
(Case Institute of Technology)
Distinguished University Professor and Wallace R. Persons Professor of Sensor Technology and Control
Electrochemical sensors, electrochemical synthesis, electrochemistry related to electronic materials

Heidi B. Martin, PhD
(Case Western Reserve University)
Associate Professor
Conductive diamond films; electrochemical sensors; chemical modification of surfaces for electrochemical and biomedical applications; biomaterials; microfabrication of sensors and devices

Julie Renner, PhD
(Purdue University)
Assistant Professor
Electrochemical engineering, protein engineering, biomimetic materials, regenerative medicine

Robert F. Savinell, PhD
(University of Pittsburgh)
Distinguished University Professor and George S. Dively Professor
Electrochemical engineering, electrochemical reactor design and simulation, electrode processes, batteries and fuel cells

Jesse S. Wainright, PhD
(Case Western Reserve University)
Research Professor
Electrochemical power sources: fuel cells, batteries, supercapacitors; biomedical applications

Christopher Wirth, PhD
(Carnegie Mellon)
Assistant Professor
Colloids, multiphase materials

Secondary Faculty
Frank Ernst, Dr. ret. nat. habil
(University of Gottingen)
Leonard Case Jr. Professor of Engineering

Ica Manas-Zloczower, DSc
(Isreal Institute of Technology)
Professor

James A. Van Orman, PhD
(Massachusetts Institute of Technology)
Professor

Huiuchun (Judy) Zhang, PhD
(Georgia Institute of Technology)
Associate Professor

Emeritus Faculty
John C. Angus, PhD
(University of Michigan)
Emeritus Professor
Coleman Brosilow, PhD  
(Polytechnic Institute New York)  
Emeritus Professor

Nelson Gardner, PhD  
Emeritus Associate Professor

J. Adin Mann Jr., PhD  
(Iowa State University)  
Emeritus Professor

Syed Qutubuddin, PhD  
(Carnegie Mellon University)  
Emeritus Professor

Undergraduate Programs
The Bachelor of Science in Engineering degree program with a major in Chemical Engineering is accredited by the Engineering Accreditation Commission of ABET, http://www.abet.org.

Program Educational Objectives
The undergraduate program in chemical engineering seeks to produce graduates who will:
1. be able to excel in professional careers across a broad range of industries
2. apply the knowledge, skills and ethical practice acquired through the chemical engineering curriculum to positively contribute to their profession and society
3. assume positions of responsibility and/or leadership in academia, industry, government, and business
4. succeed in post-graduate and professional degree programs

Student Outcomes
In preparation for achieving the above educational objectives, the Bachelor of Science in Engineering degree program with a major in Chemical Engineering is designed so that students attain:

- an ability to identify, formulate, and solve complex engineering problems by applying principles of engineering, science, and mathematics
- an ability to apply engineering design to produce solutions that meet specified needs with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors
- an ability to communicate effectively with a range of audiences
- an ability to recognize ethical and professional responsibilities in engineering situations and make informed judgments, which must consider the impact of engineering solutions in global, economic, environmental, and societal contexts
- an ability to function effectively on a team whose members together provide leadership, create a collaborative and inclusive environment, establish goals, plan tasks, and meet objectives
- an ability to develop and conduct appropriate experimentation, analyze and interpret data, and use engineering judgment to draw conclusions
- an ability to acquire and apply new knowledge as needed, using appropriate learning strategies.

Bachelor of Science in Engineering
Required Courses: Major in Chemical Engineering
These requirements are for students who matriculated in Fall 2020 and later. Students who matriculated in Fall 2019 may choose to opt into these requirements. Students who matriculated prior to Fall 2019 can find their requirements in the General Bulletin for the year they matriculated. Note that ECHE 361, ECHE 364 and ECHE 398 are 3-credit courses before 2022, and become 4-credit courses in 2022 and thereafter.

In addition to engineering general education requirements (p. 1292) and university general education requirements (p. 1212), the major requires the following courses:

<table>

or any 3- or 4-credit lecture- or laboratory-based course (research and independent study courses are excluded) that is 300-level or higher, in an engineering or designated science department. Designated science departments are Chemistry; Physics; Biology; Biochemistry.

Engineering Elective: Any 3- or 4-credit lecture- or laboratory-based course (research and independent study courses are excluded) that is 200-level or higher, offered by the engineering school exclusive of the Department of Computer and Data Science.

Total Units 53

Technical Breadth Elective Sequences

A distinctive feature of the chemical engineering program is the three-course breadth elective sequence that enables a student to specialize in a technical or professional area that complements the chemical engineering core. Breadth elective sequences that have standing departmental approval are described below. Alternatively, students may design their own breadth elective sequence, which must be approved by the department.

BS/MS Advanced Study Sequence (Advisor: Dr. Martin)
Three 400-level 3-credit ECHE courses  9

Total Units  9

Custom-Designed Sequence (Advisor: Dr. Baskaran)
Students can design a custom breadth elective sequence, consisting of three courses (9 credits) that fit in one coherent technical or professional theme. The courses must be technical or professional courses (see footnote a) that are 200-level or higher, with at least one of the courses being 300-level or higher. These courses cannot be research or independent study courses. Students interested in this option should submit a petition to their advisor naming and explaining the coherent theme, why this theme complements the chemical engineering core for him/her, and how the three courses fit into this theme. The petition must be approved by the Undergraduate Studies Committee of the Department of Chemical and Biomolecular Engineering.

For the purpose of the sequences, “technical and professional courses” are defined as courses that would not satisfy the humanities and social sciences requirement of the Case School of Engineering; also excluded are courses in American Studies (AMST), Asian Studies (ASIA), Childhood studies (CHST), ethics (ETHS), Judaic studies (JDST), music (MUAP), education (EDUC), women’s and gender studies (WGST), Washington study program (WASH), and other courses deemed by the department to be of this genre.

Pre-Medical Option
By using the flexibility provided by science and technical electives in the curriculum, students are able to pursue courses that provide the background needed for medical school. Students choose the following electives to meet the course requirements of most medical schools.

Science/Engineering elective: CHEM 224 or CHEM 324  3
Chemistry labs: CHEM 113 and CHEM 233 and CHEM 234 instead of CHEM 290  6

Breadth Elective Sequence: Pre-Medical sequence (described above)  10
One extra course: BIOC 307  4

Bachelor of Science in Engineering
Suggested Program of Study: Major in Chemical Engineering
This program of study considers requirements for students who matriculated in Fall 2020. Students who matriculated in Fall 2019 may choose to opt into these requirements and follow this program of study. Students who matriculated prior to Fall 2019 can find their requirements and suggested program of study in the General Bulletin for the year they matriculated. Note that ECHE 361, ECHE 364 and ECHE 398 are 3-credit courses before 2022, and become 4-credit courses in 2022 and thereafter.

The following is a suggested program of study. Current students should always consult their advisers and their individual graduation requirement plans as tracked in SIS (http://sis.case.edu/).

Total Units in Sequence: 128

Hours required for graduation: 128

* University general education requirement
** Engineering general education requirement
** Higher number (advanced or honors) courses are available to students by invitation only.
** A three-course (9 credit hours minimum) breadth sequence, as described above.
** Engineering Elective: Any 3- or 4-credit lecture- or laboratory-based course (research and independent study courses are excluded) that is 200-level or higher, offered by the engineering school exclusive of the Department of Computer and Data Science.
Note: The course cannot double count towards any other requirement of the major.

9 Science/Engineering elective. One course chosen from:
• PHYS 221 Introduction to Modern Physics
• CHEM 224 Introductory Organic Chemistry II
• EMAC 270 Introduction to Polymer Science and Engineering
• EMAC 276 Polymer Properties and Design
• EMSE 276 Materials Properties and Design
Or any 3- or 4-credit lecture- or laboratory-based course (research and independent study courses are excluded) that is 300-level or higher, in an engineering or designated science department. Designated science departments are Chemistry; Physics; Biology; Biochemistry.

Note: The course cannot double count towards any other requirement of the major.

Co-op and Internship Programs
Opportunities are available for students to alternate studies with work in industry or government as a co-op student, which involves paid full-time employment over seven months (one semester and one summer). Students may work in one or two co-ops, beginning in the third year of study. Co-ops provide students the opportunity to gain valuable hands-on experience in their field by completing a significant engineering project while receiving professional mentoring. During a co-op placement, students do not pay tuition but maintain their full-time student status while earning a salary. Learn more at http://engineering.case.edu/coop/.
Alternatively or additionally, students may obtain employment as summer interns.

Five-Year Combined BS/MS Program
Outstanding undergraduate students have the opportunity to obtain an MS degree in one additional year of study beyond the BS degree. (Normally, it takes two years beyond the BS to earn an MS degree.) In this program, an undergraduate student can take up to nine hours of graduate credit through the Advanced Study technical breadth elective sequence that simultaneously satisfies undergraduate degree requirements. In addition, a student choosing the MS degree program with the thesis option typically start their research in the fall semester of the senior year. The BS degree is awarded at the completion of the senior year. In the fifth year, students take an additional 21 hours of graduate credit. Application for admission to the five-year BS/MS program is made after completion of five semesters of coursework. Minimum requirements are a 3.2 grade point average and the recommendation of the department. Review the Office of Undergraduate Studies BS/MS program requirements (p. 1298).

Six-Year Cooperative BS/MS Program
The cooperative bachelor’s/master’s program enables outstanding students who are enrolled in the cooperative education program to earn an MS in one year beyond the BS degree. Students complete six credits of a graduate project during the second co-op period and follow an Advanced Study technical breadth elective sequence. Up to nine credits of graduate coursework can be used to satisfy both graduate and undergraduate requirements. At the end of the fifth year, the student receives the BS degree. Upon completion of an additional 15 credits of graduate work the following year, the student receives the MS degree (non-thesis). Application for admission to the six-year co-op BS/MS program is made during the second semester of the junior year (this semester is taken in the fall of the fourth year). Minimum requirements are a 3.2 grade point average, satisfactory performance in the previous co-op assignment, and the recommendation of the department.
Minor in Electrochemical Engineering
Electrochemical engineering focuses on fundamental studies and engineering design of widely used and critically important processes and equipment associated with reactions involving charge transfer. Students will gain expertise in the design of indispensable devices such as batteries and fuel-cells, and technologically important processes such as metal production and purification, semiconductor metallization, corrosion, electrodeposition, and biological separations. Students take five courses to complete the minor. The required courses are:

ECHE 381 Electrochemical Engineering 3
ECHE 384 Corrosion Fundamentals 3
Plus three courses selected from the following: 9-10
ECHE 372 Electrochemical Energy Storage
ECHE 382 Electrochemical Processes and Devices
ECHE 383 Chemical Engineering Applied to Microfabrication and Devices
EMSE 343 Processing of Electronic Materials
ECSE 309 Electromagnetic Fields I
ECSE 321 Semiconductor Electronic Devices

Minor in Biomolecular Engineering
Biomolecular engineering focuses on the molecular length scale and seeks to convert molecular-level knowledge of biological phenomena into useful biochemical and chemical products and processes that are derived from living cells or their components. Areas of application include: drug research and development, biosensors, and regenerative medicine applications. Students take five courses to complete the minor:

ECHE 340 Biochemical Engineering 3
ECHE 355 Quantitative Molecular, Cellular and Tissue Bioengineering 3
ECHE 386 Protein Engineering 3
Plus two courses selected from the following: 6-8
BIOL 214 Genes, Evolution and Ecology
BIOL 343 Microbiology
BIOC 307 Introduction to Biochemistry: From Molecules To Medical Science
ECHE 260 Introduction to Chemical Systems
ECHE 363 Thermodynamics of Chemical Systems

Total Units 15-17

* ECHE majors may not count this course toward the minor

Minor in Chemical Engineering
The minor in chemical engineering is for students majoring in other disciplines. A minimum of 17 hours in chemical engineering courses is required for the minor. The required courses are:

ENGR 225 Thermodynamics, Fluid Dynamics, Heat and Mass Transfer 4
ECHE 260 Introduction to Chemical Systems 3
ECHE 360 Transport Phenomena for Chemical Systems 4
Plus two courses selected from the following: 6-8

Graduate Programs
Master of Science Program
Each MS candidate must complete a minimum of 30 hours of graduate-level credits. These credits can be distributed in one of three ways: Thesis-Focused, Project-Focused, or Course-Focused.

Thesis-Focused
ECHE 401 Chemical Engineering Communications 1
ECHE 402 Chemical Engineering Communications II 2
Six graduate-level courses a 18
MS thesis research 9
Total Units 30

Project-Focused
ECHE 401 Chemical Engineering Communications 1
ECHE 402 Chemical Engineering Communications II 2
Eight graduate-level courses a 24
Project and/or Special Problems b 3
Total Units 30

Course-Focused
The Course-Focused M.S. degree program requirements consist of the completion of 30 hours of approved coursework at the 400 level or higher, satisfactory completion of the culminating course-focused experience, i.e. passing the course ENGR 600 with requirements defined by the student's curricular program, and additional requirements as specified by the program. Students should consult with their academic advisor and/or department to determine the detailed requirements within this framework.

Full-time MS students are expected to serve as a teaching assistant as part of their education. Also, at various points during their thesis research, students will be required to present seminars and reports on their progress.
Doctor of Philosophy Program

The degree of Doctor of Philosophy is awarded in recognition of deep and detailed knowledge of chemical engineering and a comprehensive understanding of related subjects together with a demonstration of the ability to perform independent research, to suggest new areas for research, and to communicate results in an acceptable manner. For students entering the PhD program with a BS degree, a total of 12 courses (36 credit hours) is required. Course requirements for students entering with MS degrees are adjusted to account for work done at other universities, but a minimum of 6 courses (18 credit hours) must be taken at CWRU. The course requirements for students entering with a BS degree are as follows:

<table>

<tr>
<td><strong>Total Units</strong></td>
<td><strong>54</strong></td>
</tr>
</tbody>
</table>

a Some of the graduate-level courses should be taken from a list of recommended courses that satisfy the Chemical Engineering core ‘units’ requirement. This list will be provided to the students upon admission to the program. For the PhD program, students should demonstrate that they have acquired a minimum of three core ‘units’ in each of the categories of Chemical Engineering Transport, Thermodynamics, Reactions and Applied Mathematics.

b Professional development is an integral part of the PhD program of study. The 6 professional development credits are acquired through courses in Chemical Engineering Communications (3 total credits), and by attending the Chemical Engineering Colloquium (3 total credits). All PhD students are required to assist in three teaching experiences as part of their degree requirements.

c Students in the PhD program are required to complete 18 credits of thesis research. Also, students who enter the PhD program must pass a First Proposition Oral Examination (with an accompanying written report) that tests a student’s ability to think creatively, grasp new research concepts, and discuss such concepts critically and comprehensively. The First Proposition Exam, typically taken in the Fall semester of the second year, serves as the qualifying examination for the PhD degree. A Second Proposition Exam focusing on the student’s own research topic is required by the end of the second year in the PhD program. All PhD students must satisfy the residency requirements of the university and the Case School of Engineering. In addition, at various points in the course of the dissertation research, students will be required to prepare reports and seminars on their work, and defend their dissertation. The Chemical and Biomolecular Engineering Graduate Student Handbook contains a more detailed description of the department’s PhD requirements and a time schedule for their completion.

The department anticipates that from time to time, special cases will arise which are exceptions to the above guidelines, e.g., a student may have taken a graduate-level course at another school. In these cases, the student must submit a statement with the Academic Program justifying the departure from the guidelines and have it approved by the department.

Facilities

The department is housed in the Albert W. Smith Building and portions of the Bingham Building on the Case Quadrangle. Professor Smith was chair of industrial chemistry at Case from 1911 to 1927. Under his leadership, a separate course of study in chemical engineering was introduced at Case in 1913. Professor Smith was also a close associate of Herbert Dow, the Case alumnus who founded Dow Chemical in 1890 with the help and support of Professor Smith. The Albert W. Smith Chemical Engineering Building contains one technology-enhanced classroom; the undergraduate Unit Operations Laboratory; an undergraduate reading room, named after Prof. Robert V. Edwards; and the normal complement of offices and research laboratories. The lobby of the A.W. Smith Building, renovated by contributions from the James family, often serves as a formal and informal gathering place for students and faculty. The department has exceptionally strong facilities for electrochemical and energy research, microfabrication, and for chemical vapor deposition and thin film synthesis. In addition, a full range of biochemical, analytical and materials characterization instrumentation is available in the Case School of Engineering. Analytical instrumentation is available within the Department of Chemical and Biomolecular Engineering, the Department of Chemistry, and the Materials Research Laboratory.

Courses

ECHE 151. Introduction to Chemical Engineering at Case. 1 Unit.
An introduction to the profession of chemical engineering, its practice in industry, and review of the challenges and opportunities for the profession. The academic programs and curricular enhancements available to students majoring in chemical engineering at CWRU, including breadth sequence sequences and concentrations, undergraduate research, international study opportunities, cooperative education and internships, are presented. In addition to introducing the chemical engineering faculty and their research, a number of guest speakers representing the broad professional opportunities discuss career options with the students. Through lectures and discussions, students are also introduced to topics such as professionalism and ethics. Upperclassmen students conduct their co-op debriefing in the class, sharing experiences and initiating networking. In the lab/recitation section, students in smaller groups conduct experiments on chemical processes, spanning different aspects of the profession, and run computer-based simulations of those experiments. Analysis and discussion of the results will follow. Chemical engineering upperclassmen serve as teaching assistants.

ECHE 250. Honors Research I. 1 - 3 Units.
A special program which affords a limited number of students the opportunity to conduct research under the guidance of one of the faculty. At the end of the first semester of the sophomore year, students who have a strong interest in research are encouraged to discuss research possibilities with the faculty. Assignments are made based on mutual interest. Subject to the availability of funds, the faculty employs students through the summers of their sophomore and junior years, as members of their research teams.

ECHE 251. Honors Research II. 1 - 3 Units.
(See ECHE 250.) Recommended preparation: ECHE 250.

ECHE 250. Introduction to Chemical Systems. 3 Units.
Material and energy balances. Conservation principles and the elementary laws of physical chemistry applied to chemical processes. Developing skills in quantitative formulation and solution of word problems. Prereq: Sophomore Standing and (CHEM 111 OR CHEM 106). Prereq or Coreq: MATH 122 or MATH 124.
ECHE 305. Topics in Chemical Engineering. 1 - 3 Units.
Topics in chemical engineering will be covered in an independent study mode. Readings and homework assignments will be assigned. Students are graded on the basis of homework assignments and a final exam.

ECHE 313. Statistical Analysis of Chemical Processes. 3 Units.
This course covers the role of statistics in chemical processes. Topics include probability/probability plots, descriptive tests, statistical decision rules, strategies for experimentation with multiple factors, design of experiments, basic factorial experiments, regression analysis, screening designs, and optimization experiments. Basic statistical software will be used throughout the class. Prereq: MATH 126 or MATH 223.

ECHE 340. Biochemical Engineering. 3 Units.
Chemical engineering principles applied to biological and biochemical systems and related processes. Microbiology and biochemistry linked with transport phenomena, kinetics, reactor design and analysis, and separations. Specific examples of microbial and enzyme processes of industrial significance. Recommended preparation: BIOC 307, BIOL 343 and ECHE 364, or permission of instructor.

ECHE 350. Undergraduate Research Project I. 3 Units.
This course affords a student the opportunity to conduct research under the guidance of one of the faculty, as part of the Chemical Engineering Research breadth elective sequence. Students who have a strong interest in research are encouraged to discuss research possibilities with the faculty. Assignments are made based on mutual interest.

ECHE 351. Undergraduate Research Project II. 3 Units.
This course affords a student the opportunity to conduct research under the guidance of one of the faculty, as part of the Chemical Engineering Research breadth elective sequence. Students who have a strong interest in research are encouraged to discuss research possibilities with the faculty. Assignments are made based on mutual interest. Prereq: ECHE 350.

ECHE 355. Quantitative Molecular, Cellular and Tissue Bioengineering. 3 Units.
Physical and chemical principles associated with kinetics and mass transport. Molecular-cellular components incorporated in quantitative analysis of cellular, tissue, and organ systems. Mathematical and computational modeling developed for diagnostic and therapeutic applications. Offered as EBME 350 and ECHE 355.

ECHE 360. Transport Phenomena for Chemical Systems. 4 Units.
Fundamentals of fluid flow, heat and mass transport from the microscopic and macroscopic perspectives. Applications to chemical systems, including steady and transient operations, convective and molecular (conduction and diffusion) effects, and interfacial transport. Design of unit operations (e.g., heat exchangers). Heat and mass transfer analogies. Vector/tensor analysis and dimensional analysis used throughout. Prereq: Junior Standing and (ENGR 225 or (Prereq or coreq: EMAC 352)) and (MATH 223 or MATH 227).

ECHE 361. Separation Processes. 4 Units.
Analysis and design of separation processes involving distillation, extraction, absorption, adsorption, and membrane processes. Design problems and the physical and chemical processes involved in separation. Equilibrium stage, degrees of freedom in design, graphical and analytical design techniques, efficiency and capacity of separation processes. Prereq: ECHE 260. Prereq or Coreq: ECHE 363.

ECHE 362. Chemical Engineering Laboratory. 4 Units.
Experiments in the operation of separation and reaction equipment, including design of experiments, technical analysis, and economic analysis. Experiments cover distillation, liquid-liquid extraction, heat transfer, fluidized beds, control, membrane separations, and chemical and electrochemical reactors. Prereq: ECHE 260, ECHE 360, ECHE 361, ECHE 363 and ECHE 364.

ECHE 362D. Chemical Engineering Laboratory in Denmark. 4 Units.
Chemical Engineering Laboratory in Denmark. A version of ECHE 362 taught during the summer at DTU in Lyngby. Prereq: ECHE 260 and ECHE 360 and ECHE 361 and ECHE 363 and ECHE 364.

ECHE 363. Thermodynamics of Chemical Systems. 4 Units.
First law, second law, phase equilibria, phase rule, chemical reaction equilibria, and applications to engineering problems. Thermodynamic properties of real substances, with emphasis on solutions. Thermodynamic analysis of processes including chemical reactions. Recommended preparation: ECHE 260. Prereq or Coreq: ENGR 225.

ECHE 364. Chemical Reaction Processes. 4 Units.

ECHE 365. Measurements Laboratory. 3 Units.
Laboratory introduction to the measurement process in engineering. Matching measurements to approximate and exact physical models is stressed. Extraction of physical parameters and estimation of the errors in the parameter estimates is an important part of the course. Example projects cover steady and unsteady state heat transfer, momentum transfer, and the first law of thermodynamics. Recommended preparation: ECHE 360. Prereq: ECHE 260 and ENGR 225. Prereq or Coreq: ECHE 363.

ECHE 367. Process Control. 4 Units.
Theoretical and practical aspects of feedback control of chemical processes. The course involves extensive use of computer software with some exams taken using the computer. Short laboratories and Labview training are integrated into the course. Topics include: analysis of linear dynamical systems using Laplace transforms, derivation of unsteady state mathematical models of simple chemical processes, dynamic simulation of linear and nonlinear models, design of PID controllers by model inverse methods, tuning of controller to accommodate process model uncertainty, two degrees of freedom controllers, feed-forward and cascade control. The Labview training covers programming basics, interfacing to a data acquisition system, and incorporating control algorithms. Prereq or Coreq: (MATH 224 OR MATH 228) AND ECHE 260.

ECHE 372. Electrochemical Energy Storage. 3 Units.
Batteries and supercapacitors as part of renewable energy systems are introduced. Related fundamental electrochemistry concepts, materials and techniques are described. Challenges, current literature and future opportunities in energy storage will be discussed. Offered as ECHE 372 and ECHE 472. Prereq: Junior or Senior standing or Requisites Not Met permission.
ECHE 377. Data Acquisition and LabVIEW Bootcamp. 1 Unit.
This course will introduce and implement basic data acquisition concepts and LabVIEW virtual instrumentation programming, providing hands-on experience with hardware and software. It is intended to help those with little or no data acquisition experience to get started on setting up data acquisition for their application. No prior experience with LabVIEW is required. Consult with the instructor for additional details. Offered as ECHE 377 and ECHE 477.

ECHE 381. Electrochemical Engineering. 3 Units.
Engineering aspects of electrochemical processes including current and potential distribution, mass transport and fluid mechanical effects. Examples from industrial processes including electroplating, industrial electrolysis, corrosion, and batteries. Recommended preparation: ECHE 260 or permission of instructor. Offered as ECHE 381 and ECHE 480.

ECHE 382. Electrochemical Processes and Devices. 3 Units.
The course addresses major industrial applications of electrochemical technology focusing on batteries and fuel-cells, corrosion and its abatement, electroplating, metal electrowinning (including aluminum, magnesium, titanium and lithium) and refining (copper), industrial electrolytic processes (chlorine), electrochemical separation processes (electrophoresis, osmosis, and dialysis), and electrochemical sensors. The processes and devices are surveyed, focusing on the underlying thermodynamic and transport principles. Approaches to overcome barriers are discussed and future prospects and barriers are critically analyzed.

ECHE 383. Chemical Engineering Applied to Microfabrication and Devices. 3 Units.
Silicon based microfabrication and micromachining require many chemical engineering technologies. Microfabricated devices such as sensors are also directly related to chemical engineering. The applications of chemical engineering principles to microfabrication and micromachining are introduced. Oxidation processing, chemical vapor deposition, etching and patterning techniques, electroplating and other technologies are discussed. Graduate students will submit an additional final project on some technical aspect of microfabrication technology or devices. Recommended preparation: ECHE 363. Offered as ECHE 383 and ECHE 483.

ECHE 384. Corrosion Fundamentals. 3 Units.
This course will cover fundamentals of corrosion, including thermodynamic and kinetic aspects of the electrochemical reactions leading to corrosion. Salient features of the various types of corrosion will be reviewed, with an emphasis on fundamental mechanisms. Electrochemical testing, corrosion monitoring and techniques to stifle corrosion will be discussed. After completion of this course, students will be able to classify corrosion systems, understand the mechanisms underlying corrosion, and outline strategies to design corrosion-resistant systems. Offered as ECHE 384 and ECHE 481.

ECHE 386. Protein Engineering. 3 Units.
This course will provide an in-depth examination of protein engineering topics and their applications. In particular, this class will cover the design and expression of recombinant proteins, purification strategies, and the incorporation of non-natural amino acids using a bacterial system. Specifically, amino acid sequences that dictate well-defined secondary structures such as beta-sheets, alpha-helices, and leucine zippers will be studied. Tissue engineering examples from the literature such as incorporation of bioactive sequences to promote specific cell response (e.g., cell adhesion sites and protease degradation sequences). In addition, this course will explore the application of protein engineering in drug delivery, electrochemical technology, sensors, and nanoparticle assembly. Current computational techniques for protein design and directed evolution methods will also be explored. Offered as ECHE 386 and ECHE 486.

ECHE 389. Chemical Engineering Design Project. 3 Units.
Students work in small groups on projects in conjunction with external companies. The projects are defined by the company, and involve real issues current at the company. All projects will involve design (i.e., open ended problems with no one solution or route), an economic analysis, and will account for possible safety and environmental issues. The nature of the projects varies, depending on the needs of each company. There are no lectures for this course, and students are expected to work on their project for an amount appropriate for a 3-credit course (10 hrs/week). Recommended preparation: ECHE 362, ECHE 365, and ECHE 398. Counts as SAGES Senior Capstone. Prereq: ECHE 360, ECHE 361 and ECHE 363 and ECHE 364. Prereq or Coreq: ECHE 360.

ECHE 400T. Graduate Teaching I. 0 Unit.
All Ph.D. students are required to take this course. The experience includes elements from the following tasks: development of teaching or lecture materials, teaching recitation groups, providing laboratory assistance, tutoring, exam/quiz/homework preparation and grading, mentoring students. Recommended preparation: Entering Ph.D. student in Chemical Engineering.

ECHE 401. Chemical Engineering Communications. 1 Unit.
Introductory course in communication for Chemical Engineering graduate students: preparation of first proposal for thesis, preparation of technical reports and scientific papers, literature sources, reviewing proposals, and manuscripts for professional journals, and making effective technical presentations.

ECHE 402. Chemical Engineering Communications II. 2 Units.
This course is a continuation of ECHE 401 and is designed to develop skills in writing proposals for funding research projects. The federal requirements are reviewed for submitting proposals to the major granting agents including NSF, NIH and DoD. We will study strategies for developing fundable projects. Each student will submit a research proposal for a thesis project and do an oral presentation of the project.
ECHE 431. Design of Chemical Engineering Systems: Material Analysis. 3 Units.
Applying fundamental mass-balance related analysis to industrial separations processes (distillation, absorption, membranes; both plate and packed columns), reactors (CSTR, PFR), and process control (PID feedback controllers). Utilizing relevant thermodynamics theory including liquid-vapor and solid-liquid phase diagrams and azeotropes as needed for separations. Fundamental theory will be integrated in comprehensive design applications including economic analysis (equipment costing, net-present value and return on investment). Process simulation software will be used to introduce students to advanced design tools. Outcome goal will be to have the students learn to integrate fundamental knowledge from different chemical engineering topics to the comprehensive design of processes of industrial relevance. Prereq: Graduate student standing.

ECHE 432. Design of Chemical Engineering Systems: Energy Analysis. 3 Units.
Applying energy balance analysis to the design of comprehensive engineering processes. Fluid-flow fundamentals including mechanical energy balance and Bernoulli’s equation, viscous flow in conduits and around submerged objects, Newton’s law of viscosity and Navier-Stokes equation, among others, will be applied to the analysis and design of systems of industrial significance. Scaling analysis will elucidate critical process parameters. Thermodynamics first and second laws will be applied together with heat transfer models based on differential and integral analysis to the design of heat transfer systems including heat exchangers. Fluid-flow and heat transport analysis will be combined with economic considerations to analyze comprehensive problems and optimize designs. Emphasis will be placed on green and sustainable energy processes. An outcome goal of the course is to have the students develop skills of integrating fundamental knowledge from the fields of fluid flow, heat transfer, and engineering economics to the analysis and design of comprehensive systems of practical interest. Prereq: Graduate student standing.

ECHE 460. Thermodynamics of Chemical Systems. 3 Units.
Phase equilibria, phase rule, chemical reaction equilibria in homogeneous and heterogeneous systems, ideal and non-ideal behavior of fluids and solutions, thermodynamic analysis of closed and open chemical systems with applications. Recommended preparation: ECHE 363.

ECHE 461. Transport Phenomena. 3 Units.

ECHE 462. Chemical Reaction Engineering. 3 Units.

ECHE 464. Surfaces and Adsorption. 3 Units.
Thermodynamics of interfaces, nature of interactions across phase boundaries, capillary wetting properties of adsorbed films, friction and lubrication, flotation, detergency, the surface of solids, relation of bulk to surface properties of materials, non-catalytic surface reactions. Recommended preparation: CHEM 335 or equivalent.

ECHE 466. Colloid Science. 3 Units.

ECHE 469. Chemical Engineering Seminar. 0 Unit.
Distinguished outside speakers present current research in various topics of chemical engineering science. Graduate students also present technical papers based on thesis research.

ECHE 470. Graduate Research Colloquium. .5 Unit.
Outside speakers present lectures on their current research. Various topics in the areas of chemical engineering science, basic and applied chemistry, bioengineering, material science, and applied mathematics are covered in the lectures. Graduate students also present technical papers based on their own research. Students are graded on the submission of one-page summary reports on any two lectures.

ECHE 472. Electrochemical Energy Storage. 3 Units.
Batteries and supercapacitors as part of renewable energy systems are introduced. Related fundamental electrochemistry concepts, materials and techniques are described. Challenges, current literature and future opportunities in energy storage will be discussed. Offered as ECHE 372 and ECHE 472. Prereq: Graduate standing or Requisites Not Met permission.

ECHE 474. Biotransport Processes. 3 Units.
Biomedical mass transport and chemical reaction processes. Basic mechanisms and mathematical models based on thermodynamics, mass and momentum conservation. Analytical and numerical methods to simulate in vivo processes as well as to develop diagnostic and therapeutic methods. Applications include transport across membranes, transport in blood, tumor processes, bioreactors, cell differentiation, chemotaxis, drug delivery systems, tissue engineering processes. Recommended preparation: EBME 350 or equivalent. Offered as EBME 474 and ECHE 474.

ECHE 475. Chemical Engineering Analysis. 3 Units.

ECHE 477. Data Acquisition and LabVIEW Bootcamp. 1 Unit.
This course will introduce and implement basic data acquisition concepts and LabVIEW virtual instrumentation programming, providing hands-on experience with hardware and software. It is intended to help those with little or no data acquisition experience to get started on setting up data acquisition for their application. No prior experience with LabVIEW is required. Consult with the instructor for additional details. Offered as ECHE 377 and ECHE 477.
ECHE 478. Membrane Separations. 3 Units.
Membrane-based separations provide a low-energy technique for performing chemical engineering separations and have applications in water treatment, energy, and human health. This course will provide an introduction to membrane transport mechanisms including solution diffusion, pore-flow and active transport. The course will also cover membrane fabrication methods, analytical techniques for membrane characterization and performance metrics. Fundamental concepts will be discussed in the context of particle filtration, nanofiltration, reverse osmosis, gas separations processes and emerging applications like membrane chromatography. Prereq: Graduate Standing or Requisites Not Met permission.

ECHE 479. Radiochemistry. 3 Units.
This course is intended to provide students with a basic understanding of fundamental chemical and physical properties of radioactive elements. The course will begin with a review of radioactive decay modes and nuclear chemistry. The majority of the course will focus on the solution chemistry, bonding, kinetics and thermodynamics of actinides in the context of analytical purification processes such as liquid-liquid extraction and resin-based chromatography. Common radioanalytical techniques such as gamma spectroscopy, alpha spectroscopy and liquid scintillation counting will also be discussed. Prereq: Graduate student standing.

ECHE 480. Electrochemical Engineering. 3 Units.
Engineering aspects of electrochemical processes including current and potential distribution, mass transport and fluid mechanical effects. Examples from industrial processes including electroplating, industrial electrolysis, corrosion, and batteries. Recommended preparation: ECHE 260 or permission of instructor. Offered as ECHE 381 and ECHE 480.

ECHE 481. Corrosion Fundamentals. 3 Units.
This course will cover fundamentals of corrosion, including thermodynamic and kinetic aspects of the electrochemical reactions leading to corrosion. Salient features of the various types of corrosion will be reviewed, with an emphasis on fundamental mechanisms. Electrochemical testing, corrosion monitoring and techniques to stifle corrosion will be discussed. After completion of this course, students will be able to classify corrosion systems, understand the mechanisms underlying corrosion, and outline strategies to design corrosion-resistant systems. Offered as ECHE 384 and ECHE 481.

ECHE 483. Chemical Engineering Applied to Microfabrication and Devices. 3 Units.
Silicon based microfabrication and micromachining require many chemical engineering technologies. Microfabricated devices such as sensors are also directly related to chemical engineering. The applications of chemical engineering principles to microfabrication and micromachining are introduced. Oxidation processing, chemical vapor deposition, etching and patterning techniques, electroplating and other technologies are discussed. Graduate students will submit an additional final project on some technical aspect of microfabrication technology or devices. Recommended preparation: ECHE 363. Offered as ECHE 383 and ECHE 483.

ECHE 486. Protein Engineering. 3 Units.
This course will provide an in-depth examination of protein engineering topics and their applications. In particular, this class will cover the design and expression of recombinant proteins, purification strategies, and the incorporation of non-natural amino acids using a bacterial system. Specifically, amino acid sequences that dictate well-defined secondary structures such as beta-sheets, alpha-helices, and leucine zippers will be studied. Tissue engineering examples from the literature such as incorporation of bioactive sequences to promote specific cell response (e.g., cell adhesion sites and protease degradation sequences). In addition, this course will explore the application of protein engineering in drug delivery, electrochemical technology, sensors, and nanoparticle assembly. Current computational techniques for protein design and directed evolution methods will also be explored. Offered as ECHE 386 and ECHE 486. Prereq: Graduate standing or requisites not met permission.

ECHE 500T. Graduate Teaching II. 0 Unit.
All Ph.D. students are required to take this course. The experience will include elements from the following tasks: development of teaching or lecture materials, teaching recitation groups, providing laboratory assistance, tutoring, exam/quiz/homework preparation and grading, mentoring students. Recommended preparation: Ph.D. student in Chemical Engineering.

ECHE 508. Seminar on Review of Literature on Research Topic. 3 Units.
Impactful research requires a deep and comprehensive understanding of the current state of research on the topic. A critical review of relevant background literature will help determine what is already known on the topic, how extensively the topic has already been studied, who are the experts active in the field, and the relevant key questions that deserve further exploration. A review of the literature that describes methodologies (both experimental and theoretical) used in prior studies or new approaches that could be adapted from other research areas can also lead to the effective pursuit of the research topic. Through this course, students will learn how to develop a plan for a literature review, conduct the literature review and monitor continuing developments in the field, and create an annotated bibliography appropriate to the research project.

ECHE 509. Seminar on Preparation of Articles for Publication in Journals. 3 Units.
This course is intended for advanced graduate students who have generated results at the stage of being ready to be written up for a journal article. The course will cover: understanding what findings warrant publication, factors affecting journal selection, formatting requirements of journals, publication-quality figures, appropriate material for each of the sections of the paper. During the course students will be putting together a manuscript based on their research that would eventually be submitted to a journal.

ECHE 580. Special Topics. 3 Units.
Special topics in chemical engineering. Prereq: Consent of instructor.

ECHE 600T. Graduate Teaching III. 0 Unit.
All Ph.D. students are required to take this course. The experience will include elements from the following tasks: development of teaching or lecture materials, teaching recitation groups, providing laboratory assistance, tutoring, exam/quiz/homework preparation and grading, mentoring students. Recommended preparation: Ph.D. student in Chemical Engineering.

ECHE 601. Independent Study. 1 - 18 Units.

ECHE 651. Thesis M.S.. 1 - 18 Units.
(Credit as arranged.)
ECHE 660. Special Problems. 1 - 18 Units. Research course taken by Plan B M.S. students.

ECHE 701. Dissertation Ph.D.. 1 - 9 Units. (Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

Department of Civil and Environmental Engineering

Bingham Building (7201)
engineering.case.edu/eciv (http://engineering.case.edu/eciv/)
Phone: 216.368.2950; Fax: 216.368.5229
Xiong (Bill) Yu (Chair)
ecivchair@case.edu

The Department of Civil and Environmental Engineering offers programs of study in environmental, geotechnical, and structural engineering, construction engineering and management, engineering mechanics, and pre-architecture.

Civil engineers plan, design, and construct facilities for meeting the needs of modern society. Civil engineers also help reduce the environmental impact of these designs to help make modern society more sustainable. Examples of such facilities are transportation systems, schools and office buildings, bridges, dams, land reclamation projects, water treatment and distribution systems, commercial buildings, and industrial plants. Civil engineers can choose from a broad spectrum of opportunities in industry and consulting practice; as well as in research and development in firms in which civil engineers are often owners or partners. Employment can be found among a wide variety of industrial, governmental, construction, and private consulting organizations. There is a large demand for civil engineers nationally. The program at Case Western Reserve University is built around small classes, good faculty-student relationships and advising, and a program flexible enough to meet students' personal career goals.

The Department of Civil and Environmental Engineering of the Case School of Engineering offers a Bachelor of Science in Engineering degree program with a major in Civil Engineering with courses in almost all the traditional Civil Engineering subjects. The graduate program offers the Master of Science and Doctor of Philosophy degrees in areas of structural, geotechnical, environmental engineering, and engineering mechanics. A cooperative education program involving participating engineering firms is also available for both undergraduate and graduate students.

The Department’s active research programs provide opportunities for students to participate in projects related to design, analysis, and testing. Projects are in areas such as computational mechanics, probabilistic design, climatic adaptation, risk assessment, bridges, dynamics and wind engineering, response of concrete and steel structures, fracture mechanics, blast engineering, structural health monitoring, foundation engineering, static and dynamic behavior of soils, earthquake engineering, pavement engineering, water and wastewater treatment, water reuse, subsurface and ex-situ remediation, urban hydraulics, contaminated sediments, infrastructure materials, and infrastructure systems optimization.

Mission

The Department of Civil and Environmental Engineering has developed its own mission statement and educational objectives that are consistent with those of the Case School of Engineering. This process involved the entire department faculty along with the department’s Advisory Committee and alumni. Assessing the Department’s mission and educational objectives is an ongoing process.

Our mission is to prepare students for leadership roles in Civil and Environmental Engineering. The Department provides facilities and
research expertise to advance the state of the Civil and Environmental Engineering profession within the mission of the Case School of Engineering. Students address problems, building on solid technical foundations while taking advantage of advanced technologies. Our graduates adhere to high technical and ethical standards, in service to the public. Graduates are prepared for the pursuit of advanced learning in civil and environmental engineering and related fields, as well as for the practice of Civil and Environmental Engineering at the highest professional levels.

Research

Research underway in Civil and Environmental Engineering includes work in analytical, design and experimental areas and is sponsored by industry, state, and federal government sources. Major areas of research interest are:

- **Structural Engineering**
  - Behavior of reinforced and prestressed concrete
  - Behavior and design of steel structures
  - Fiber-reinforced concrete
  - Fiber-reinforced composites
  - Wind engineering
  - Earthquake analysis and design of structures
  - Passive vibration control of structures
  - Finite element methods
  - Nondestructive Testing of Structures
  - Structural health monitoring
  - Blast loading of structures
  - Multiscale simulation of nonlinear dynamic structural behavior
  - Modeling of structural materials and structural systems
  - Extreme dynamic load resistant design
  - Multi-hazard and structural risk assessment
  - High and low-cycle fatigue
  - Fracture mechanics and size effect

- **Geotechnical and Infrastructure**
  - Geotechnical/Pavement Materials
  - Non-destructive testing evaluation of soils and pavement materials
  - Static behavior of anisotropic clays and sands
  - Soil liquefaction
  - Centrifuge modeling of static and dynamic soil behavior
  - Dynamic soil-structure interaction
  - Measurement of dynamic soil properties
  - Design of Structures for High-Speed Vehicles
  - Stability of tailings dams
  - Environmentally conscious manufacturing
  - Geoenviromental engineering
  - Infrastructure engineering
  - Sensor technology
  - Smart materials
  - Intelligent infrastructure and transportation system
  - Transportation safety
  - Driver safety
  - Energy structures and geotechnology

- **Environmental Engineering**
  - Environmental chemistry
  - Water and wastewater treatment
  - Environmental data science
  - Environmental remediation
  - Fate and transport of environmental contaminants
  - Environmental modeling and software development
  - Sediment remediation
  - Bioremediation
  - Biofuel development
  - Urban hydraulics
  - Soil contamination standards
  - Brownfields/structural remediation
  - Environmental materials
  - Environmental hazard and risk engineering

Faculty

Christian Carloni, PhD  
(University of Bologna)  
Associate Professor  
Composite materials for strengthening of reinforced concrete and masonry structures; fracture mechanics, damage mechanics, and fatigue of quasibrittle materials; small and large scale experimental testing of concrete, masonry, geopolymers and other quasibrittle materials and structural systems; mechanics of materials.

YeongAe Heo, PhD  
(University of California, Davis)  
Assistant Professor  
Multi-scale numerical modeling and simulation for nonlinear dynamic behavior of structural materials and systems; Multi-hazard and risk engineering; risk-based extreme dynamic load resistant design for onshore and offshore structures and infrastructures; big data analysis application to structural engineering

Yue Li, PhD  
(Georgia Institute of Technology)  
Professor  
Probabilistic analysis, structural and systems reliability, multi-hazard assessment and mitigation, risk-informed decision making, resilient and sustainability civil infrastructure systems, earthquake engineering, wind engineering, impact of climate change and adaptation strategies.

Michael Pollino, PhD, SE, PE  
(University at Buffalo)  
Associate Professor  
Structural engineering; seismic analysis and design, rehabilitation of structures and civil infrastructure, large scale experimental testing of structural systems and sub-assemblages, structural dynamics, steel structures

Kurt. R. Rhoads, PhD, PE  
(Stanford University)  
Associate Professor  
Environmental Engineering; Fate of organic pollutants, bio-remediation, algal biofuel development
Adel S. Saada, PhD, PE  
(Princeton University)  
Professor  
Mechanics of materials; static and dynamic mechanical behavior of soils; foundation engineering  

Katie P. Wheaton, MS, PE, SE  
(Lehigh University)  
Senior Instructor  
Structural engineering; steel, concrete, and wood structures; geomatics; CAD modeling.  

Xiong (Bill) Yu, PhD, PE  
(Purdue University)  
Professor  
Geotechnical engineering; infrastructure; construction material testing; information technology; intelligent infrastructure; energy geotechnology; sustainable design; sensors: structural health monitoring  

Huichun (Judy) Zhang, PhD  
(Georgia Institute of Technology)  
Professor  
Environmental engineering, environmental chemistry, fate and transformation of emerging contaminants, redox transformation at mineral-water interface, absorption, advanced inorganic and polymer materials for contaminant removal, water and wastewater treatment, and groundwater and soil remediation  

Adjunct Faculty  

Vincent Beach, PE  
Adjunct Lecturer  
Construction Management and Estimation  

Gina Beim, PE  
Adjunct Lecturer  
Civil Engineering Infrastructure  

Carmen Franks, Ph.D., PE  
Adjunct Lecturer  
Environmental Engineering  

Ruth Klee, PE  
Adjunct Lecturer  
Civil Engineering Senior Project  

Mark Loria, PhD  
Adjunct Lecturer  
Environmental Engineering, Hydraulics and Hydrology  

Phil Nagle  
Adjunct Lecturer  
Building Information Modeling  

Martin Schmidt, PhD  
Adjunct Lecturer  
Solid and Hazardous Waste Management  

Dan Ghiocel, Ph.D.  
Adjunct Professor  
Structural Engineering  

Erwin Zaretsky, Ph.D.  
Adjunct Professor  
Structural Engineering  

Xiangwu (David) Zeng, Ph.D.  
Adjunct Professor  
Geotechnical Engineering  

Emeritus Faculty  

J. Ludwig Figueroa, PhD  
(University of Illinois)  
Professor Emeritus  

Dario A. Gasparini, PhD  
(Massachusetts Institute of Technology)  
Professor Emeritus  

Arthur A. Huckelbridge, DEng, PE  
(University of California Berkeley)  
Professor Emeritus  

Aaron Jennings, PhD, PE  
(University of Massachusetts Amherst)  
Professor Emeritus  

Secondary Appointment  

Chris Yinchun Yuan, Ph.D.  
Professor, Mechanical and Aerospace Engineering  
Sustainable Manufacturing  

Undergraduate Programs  

The faculty of the Civil and Environmental Engineering Department believes very strongly that undergraduate education should prepare students to be productive professional engineers. For this reason, particular emphasis in undergraduate teaching is placed on the application of engineering principles to the solution of problems. After completing a set of core courses in general engineering and civil engineering, undergraduate students choose a sequence in one of the areas of civil engineering of particular interest: Structural (S), Geotechnical (G), or Environmental (E) engineering; Construction Engineering and Management (C), or Pre-architecture (P).  

In order to provide undergraduates with experience in the practice of civil engineering, the department attempts to arrange summer employment for students during the three summers between their semesters at Case Western Reserve University. By working for organizations in areas of design and construction, students gain invaluable knowledge about how the profession functions. This experience helps students gain more from their education and helps them be more competitive when seeking future employment.  

A cooperative education program is also available. This allows the student to spend time an extended period of time working full-time in an engineering capacity with a contractor, consulting engineer, architect, or materials supplier during the course of his or her education. This learning experience is designed to integrate classroom theory with practical experience and professional development.  

The civil engineering curriculum has been designed so that students take a set of core civil engineering courses, a set of required courses in their
chosen sequence, and a minimum of six (6) approved elective courses. The sequence gives students the opportunity to pursue a particular area of practice in more depth. In addition, all civil engineering students participate in a team senior capstone design course which provides them experience with solving multidisciplinary problems.

Students enrolled in other majors may pursue a minor in civil engineering. A minimum of 15 credit hours of courses with minor advisor approval is required.

Most classes in the Civil and Environmental Engineering Department have an enrollment of fewer than 25 students to encourage the development of close professional relationships with the faculty. Students also have opportunities to gain practical experience as well as earn a supplemental income by assisting faculty members in consulting work or a funded research project.

Computer use is an integral part of the curriculum. From required courses in computer programming and numerical analysis to the application of civil and environmental engineering programs as a planning, analysis, design, and managerial tool.

All sequences are constructed to provide a balance of marketable skills and theoretical bases for further growth. With departmental approval, other sequences can be developed to meet students’ needs.

The Bachelor of Science in Engineering degree program with a major in Civil Engineering is accredited by the Engineering Accreditation Commission of ABET, http://www.abet.org/.

Program Educational Objectives
1. Graduates of the program will enter the profession of Civil Engineering and advance to positions of greater responsibility and leadership, in line with ASCE Professional Grade Descriptions.
2. Graduates of the program will enter and successfully progress in, or complete, advanced degree programs within their fields of choice.
3. Graduates of the program will progress toward or complete professional registration and licensure.

Student Outcomes
As preparation for achieving the above educational objectives, the Bachelor of Science in Engineering degree program with a major in Civil Engineering is designed so that students attain:

1. an ability to identify, formulate, and solve complex engineering problems by applying principles of engineering, science, and mathematics
2. an ability to apply engineering design to produce solutions that meet specified needs with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors
3. an ability to communicate effectively with a range of audiences
4. an ability to recognize ethical and professional responsibilities in engineering situations and make informed judgments, which must consider the impact of engineering solutions in global, economic, environmental, and societal contexts
5. an ability to function effectively on a team whose members together provide leadership, create a collaborative and inclusive environment, establish goals, plan tasks, and meet objectives
6. an ability to develop and conduct appropriate experimentation, analyze and interpret data, and use engineering judgment to draw conclusions
7. an ability to acquire and apply new knowledge as needed, using appropriate learning strategies.

Bachelor of Science in Engineering
Required Courses: Major in Civil Engineering
In addition to engineering general education requirements (p. 1292) and university general education requirements (p. 1212), the major requires the following courses:

Required Courses (all sequences) 22

<table>

Technical Electives 18
A minimum of six (6) courses and eighteen (18) total cr. hrs. from one of the following technical elective sequences (or alternatives approved by the student's academic advisor), three courses must be from Civil and Environmental Engineering Dept. and two courses must be designated as design courses (indicated with an *)

Structural (S) Technical Electives 18
ECIV 300  Undergraduate Research
ECIV 321  Matrix Analysis of Structures
ECIV 342  BIM and Computer Graphics
ECIV 343  BIM Data Management & Remote Sensing
ECIV 351  Engineering Hydraulics and Hydrology (*)
ECIV 370  Structural Design I (*, both courses)
ECIV 371  Structural Design II
ECIV 368  Environmental Engineering (*)
ECIV 372  Timber and Masonry Design (*)
ECIV 411  Elasticity, Theory and Applications (*)
ECIV 415  Fracture Mechanics and Size Effect
ECIV 420  Finite Element Analysis
ECIV 421  Advanced Topics in Reinforced Concrete Structures (*)
ECIV 422  Advanced Structural Steel Design (*)
ECIV 424  Structural Dynamics
ECIV 425  Structural Design for Dynamic Loads (*)
ECIV 426  Probabilistic Analysis

or ECIV 430  Foundation Engineering (*, both courses)

or ECIV 437  Pavement Analysis and Design

ECIV 456  Intelligent Infrastructure Systems
EMAE 250  Computers in Mechanical Engineering
EMAE 401  Mechanics of Continuous Media
EMSE 276  Materials Properties and Design
EMSE 372  Structural Materials by Design
ECSE 342  Introduction to Global Issues
ECSE 350  Operations and Systems Design
ECSE 352  Engineering Economics and Decision Analysis
ARTS 302  Architecture and City Design I
ENGR 225  Thermodynamics, Fluid Dynamics, Heat and Mass Transfer

Geotechnical (G) Technical Electives 18
ECIV 300  Undergraduate Research
ECIV 321  Matrix Analysis of Structures
ECIV 342  BIM and Computer Graphics
ECIV 343  BIM Data Management & Remote Sensing
ECIV 351  Engineering Hydraulics and Hydrology (*)
ECIV 368  Environmental Engineering (*)
ECIV 370  Structural Design I (*, both courses)
ECIV 371  Structural Design II
ECIV 372  Timber and Masonry Design (*)
ECIV 411  Elasticity, Theory and Applications (*)
ECIV 415  Fracture Mechanics and Size Effect
ECIV 420  Finite Element Analysis
ECIV 430  Foundation Engineering (*, both courses)
ECIV 437  Pavement Analysis and Design
ECIV 432  Mechanical Behavior of Soils
ECIV 433  Soil Dynamics
ECIV 434  Field Instrumentation and Insitu Testing
ECIV 456  Intelligent Infrastructure Systems
ENGR 225  Thermodynamics, Fluid Dynamics, Heat and Mass Transfer
EMAE 250  Computers in Mechanical Engineering
EEPS 110  Physical Geology
EEPS 119  Geology Laboratory
EEPS 220  Environmental Geology
EEPS 305  Geomorphology and Remote Sensing
EEPS 315  Structural Geology and Geodynamics
EEPS 321  Hydrogeology
EEPS 336  Aquatic Chemistry
### Environmental (E) Technical Electives

| Total Units in Sequence: | 129 |

* University general education requirement  
** Engineering general education requirement  
S,G,E,C,P  
ECIV Sequences:  S = Structural, G = Geotechnical, E = Environmental, C = Construction Management, P = Pre-architecture  
1 ENGR 398 and ENGL 398 must be taken concurrently.  
2 Must be an approved course in a basic science other than chemistry or physics such as biology, astronomy, or geology  
3 See list of pre-approved Basic Science/Math Electives for Environmental (E) sequence  
4 ECIV 371, a Fall course, may be taken in lieu of ECIV 370  
5 See list of pre-approved Technical Electives for each sequence. Two of these courses must be a designated “design” course (indicated in list of pre-approved Technical Electives with an asterisk*). Three of these courses must be from ECIV department. Other courses may be approved by the student’s academic advisor.  
6 ECIV 437 may be taken in lieu of ECIV 430  
7 ECIV 398 may be taken in Fall or Spring  

**Co-op and Internship Programs**

Opportunities are available for students to alternate studies with work in industry or government as a co-op student, which involves paid full-time employment over seven months (one semester and one summer). Civil Engineering students typically go on a Co-op following the 3rd academic year at CWRU but should discuss their plans for Co-op with their academic advisor as soon as possible. Co-ops provide students the opportunity to gain valuable hands-on experience in their field by completing a significant engineering project while receiving professional mentoring. During a co-op placement, students do not pay tuition but maintain their full-time student status while earning a salary. Learn
more at http://engineering.case.edu/coop/. Alternatively or additionally, students may obtain employment as summer interns.

BS/MS Program

The Department also encourages CWRU undergraduate students to make use of the university’s BS/MS program to pursue advanced studies in Civil Engineering. Undergraduates should apply for the BS/MS program in their junior year so they are able to select senior electives that will also satisfy MS degree requirements. Up to 9 hours of senior electives may be counted in both the BS and MS programs thus allowing the student to complete the MS degree in the fifth year of study. Fifth-year tuition scholarships may also be available. For more information students should discuss the BS/MS program with their Academic Advisor and/or the department BS/MS program coordinator. Review the Office of Undergraduate Studies BS/MS program requirements here (p. 1298).

Minor in Civil Engineering

Students enrolled in other majors may elect to pursue a minor in Civil Engineering requiring 15 credit hours. Course selections require the approval of a minor advisor. Recommended courses from the Department’s technical sequences are as follows:

<table>
<thead>
<tr>

Minor in Environmental Engineering

Students enrolled in all majors, except for Civil Engineering with an Environmental Engineering sequence, may elect to pursue a minor in Environmental Engineering requiring 15 credit hours and a minimum of five (5) courses. Three (3) of the courses must be from the list below. The additional two (2) courses can be chosen from the list of courses below or courses in the areas of Environmental Science, Environmental Health, and Environmental Law and approved by the minor advisor.

Graduate Programs

The Department of Civil and Environmental Engineering offers the following degree programs: Civil Engineering MS and Civil Engineering PhD. These degree programs offer coursework in structural engineering, geotechnical engineering, engineering mechanics, and environmental engineering to prepare students for careers in industry, professional practice, research, and teaching. Experience has shown that job opportunities are excellent for students who receive advanced degrees in Civil Engineering from Case Western Reserve University. Recent advanced degree recipients have found positions in universities, consulting firms, state and federal agencies, aerospace firms, and the energy industry.

Each student’s program of course work and research is tailored to their interests in close consultation with a faculty advisor. For students working toward the Civil Engineering MS degree, study plans may include a thesis-focused, project-focused, or course-focused approach followed by a culminating experience. For students working toward the Doctor of Philosophy degree, a research dissertation is required.

All students pursuing graduate studies in the Department of Civil and Environmental Engineering must abide by the academic regulations of the School of Graduate Studies (p. 1333) and the Case School of Engineering (https://bulletin.case.edu/schoolofengineering/#degreeprogramstext) contained in the most recent issue of the Bulletin of Case Western Reserve University and approved by the student’s faculty advisor in the Department of Civil and Environmental Engineering.
Civil Engineering MS
Graduate students shall be admitted to one of three MS degree tracks (thesis-focused, project-focused, course-focused) upon recommendation of the faculty of the Department.

Thesis-Focused Track
See academic requirements of the School of Graduate Studies (p. 1333) and Case School of Engineering (https://bulletin.case.edu/schoolofengineering/#degreeprogramstext).

Project-Focused Track
See academic requirements of the School of Graduate Studies (p. 1333) and Case School of Engineering (https://bulletin.case.edu/schoolofengineering/#degreeprogramstext).

Course-Focused Track
See academic requirements of the School of Graduate Studies (p. 1333) and Case School of Engineering (https://bulletin.case.edu/schoolofengineering/#degreeprogramstext).

Civil Engineering PhD
See academic requirements of the School of Graduate Studies (p. 1333) and Case School of Engineering (https://bulletin.case.edu/schoolofengineering/#degreeprogramstext).

Facilities
Vanderhoof-Schuette Structural Laboratory
The Vanderhoof-Schuette Structural Laboratory and Educational facility feature a 2400 ft² cellular strong floor and a 28 ft. high, L-shaped cellular strong wall. The strong wall includes a vertical cell for testing tall specimens with loads up to 1000kips. A 15-ton crane, a scissors lift, and a forklift truck are available for positioning specimens. A 95 gpm hydraulic pump powers servo-hydraulic actuators for applying static or dynamic forces. The laboratory has a variety of instrumentation and data acquisition equipment. Four 6 ft x 6 ft uni-axial shaking tables are available for seismic testing of small physical models.

Bingham Concrete Laboratory
A well-equipped concrete testing laboratory supports the educational and research mission of the department. The laboratory includes 1) a room for concrete batching; 2) a humidity- and temperature-controlled room to support small-scale specimen preparation and storage of advanced cementitious materials and composites, and perform various characterization tests on fresh and hardened concrete and mortars, and 3) a curing room with humidity and temperature control. The laboratory space also houses machining and fabrication equipment that includes welding machines, drill presses, grinders, and saws.

The laboratory includes a 55-kip MTS servo-hydraulic universal testing machine with pressure-controlled hydraulic grips, a 220-kip MTS servo-hydraulic universal testing machine, and a 1,000-kip frame compression machine (ControlsGroup USA).

Environmental Engineering Laboratory
This laboratory is one in a suite of laboratories that support Environmental Engineering teaching and research. The facilities include a teaching laboratory, an advanced instrumentation laboratory, a remediation research laboratory and an electronic classroom/software laboratory. The Environmental Engineering Laboratory is equipped for conventional Standard Methods analysis of water, wastewater, soil, solid waste, and air samples (pH meters, furnaces, glove box, ovens, incubators, hoods, etc.), advanced analytical instruments including high performance liquid chromatography (HPLC), Ion chromatography (IC), UV-visible spectrometer, and ATR-FITR spectroscopy, and for aerobic and anaerobic microbiology work. The lab also offers generous bench top space for student teams to explore laboratory procedures and provides direct access to research, instrumentation, and computational facilities.

Environmental Biotechnology Laboratory
This laboratory is equipped for culturing, processing, and analyzing microorganisms for remediation and biofuel research. Algae are cultivated in a Conviron A1000 growth chamber with programmable temperature and light controls. A Labcomp laminar-flow biocabinet and a Uamato autoclave are used for microbial culturing. Two refrigerated centrifuges, including a microcentrifuge, are available for culture separation. The laboratory is also equipped for molecular analyses with a thermal cycler and regulated temperature baths, with a New Brunswick incubated orbital shaker, a New Brunswick ultra-low temperature freezer and a Panasonic microwave oven.

Geotechnical Engineering Laboratories
The new state-of-the-art Geotechnical Engineering Laboratories and Educational Facilities offer an ideal environment for teaching and research:

The Frank Gerace Undergraduate Laboratory has a complete array of modern units for characterizing and testing soils. Such units lend themselves to automated data acquisition and processing.

The Richard A. Saada Intelligent Geosystems Laboratory houses innovative interdisciplinary research including sensor and non-destructive technologies such as Time Domain Reflectometry (TDR), ultrasonics, fiber optic sensors, smart and functional materials, multiphysics processes in porous materials, etc.

The Saada Family Geotechnical Laboratory has a full array of strength and deformation testing units; notable are automated triaxial units for generalized extension and compression tests, units permitting simultaneous application of hydrostatic, axial and torsional static and dynamic loads, units by means of which one dimensional consolidation in the triaxial cell can be achieved, and various pore pressure, force and deformation measuring devices. Also available is a longitudinal and torsional resonant column device and a large size oedometer equipped with bender elements.

A 20g-tons fully automated centrifuge with a servo-hydraulic earthquake shaker is in operation.

The Warren C. Gibson library has a large array of reference materials, conference proceedings and internet connection to the University library and other sources of technical information.

Haptic Research Laboratory
The haptic interface laboratory hosts two state-of-the-art driving simulators. It provides holistic driving simulations for advanced research, education and training in the area of transportation safety, human perception and human-machine interface.

Concepts in Surveying Laboratory
The Concepts in Surveying Laboratory was established to put surveying equipment into the hands of students. Civil Engineering infrastructure work begins with high-quality accurate survey data. The experience of surveying in the field using advanced equipment, such as levels and total...
stations, supports a student’s use of teamwork and creative problem-solving. From outdoor data collection to computer modeling, students then post-process data using CAD software. The dynamic and exciting science of Geomatics and modern map-making is then studied with software-based lab work that explores LiDAR, Photogrammetry, and Geographic Information Systems (GIS).

**Neff Civil Engineering Undergraduate Computer Laboratory**

This laboratory provides Civil Engineering students with access to all the computer resources needed for both course work and research. The laboratory is supplemented by other facilities provided by the university. All of the computers in the Neff lab can act as independent workstations or provide access via a fiber optic link to other campus computers.

**Civil Engineering Study Lounge**

This study area is designed to supplement the computer laboratories with a quiet workplace for individual or group study.

**ASCE Lounge**

Provides a student controlled venue for hosting American Society of Civil Engineers (ASCE) student chapter activities.

**Miller Library**

The Miller Library named in honor of Craig J. Miller, a former Civil Engineering faculty member, acts as both a library and as the Department’s premier meeting space.

**Vose Room**

The department also shares use of the Vose Room equipment for meetings and video conferencing.

**Courses**

**ECIV 160. Surveying and Computer Graphics. 3 Units.**

Principles and practice of surveying; error analysis, topographic mapping, introduction to photogrammetry and GIS; principles of graphics; computer-aided-drafting. Laboratory.

**ECIV 300. Undergraduate Research. 3 Units.**

Research conducted under the supervision of a sponsoring Civil Engineering faculty member. Research can be done on an independent topic or as part of an established on-going research activity. The student will prepare a written report on the results of the research. Course may fulfill one technical elective requirement.

**ECIV 310. Strength of Materials. 3 Units.**

**ECIV 311. Civil Engineering Materials. 3 Units.**

**ECIV 320. Structural Analysis I. 3 Units.**

**ECIV 321. Matrix Analysis of Structures. 3 Units.**

Matrix formulation and computer analysis (MATLAB recommended) for statically indeterminate linear structural systems; Stiffness method (direct/displacement method); Potential Energy Method; Development of element equations for 1D axial and flexural members and 2D triangle element; Transformation between local to global coordinates; Development of displacement fields (linear function for axial members and cubic function for flexural members); Shape function concept in approximation; Introduction to elasticity, finite element analysis and nonlinear structural analysis. Additional term project on programming for six degrees of freedom beam structure analysis will be assigned to students enrolled in ECIV428. Recommended for all students: Linear Algebra, Structural Analysis, and MATLAB Programming. Offered as ECIV 321 and ECIV 428. Prereq: ECIV 320 and EMAE 250.

**ECIV 330. Soil Mechanics. 4 Units.**

The physical, chemical, and mechanical properties of soils. Soil classification, capillarity, permeability, and flow nets. One dimensional consolidation, stress and settlement analysis. Shear strength, stability of cuts, and design of embankments, retaining walls and footings. Standard laboratory tests performed for the determination of the physical and mechanical properties of soils. Laboratory. Recommended preparation: ECIV 310.

**ECIV 340. Construction Management. 3 Units.**

Selected topics in construction management including specifications writing, contract documents, estimating, materials and labor, bidding procedures and scheduling techniques. The course is augmented by guest lecturers from local industries.

**ECIV 341. Construction Scheduling and Estimating. 3 Units.**

The focus is on scheduling, and estimating and bidding for public and private projects. This includes highways as well as industrial and building construction. The use of computers with the latest software in estimating materials, labor, equipment, overhead and profit is emphasized. Recommended preparation: ECIV 340 and consent of instructor.

**ECIV 342. BIM and Computer Graphics. 3 Units.**

This course is intended to apply Building Information Modeling tools in a meaningful manner within the AEC field. The course will progress through the core concepts of widely used VDC tools: AutoCAD, Sketchup, Revit, Navisworks. The key areas of focus will be conceptualizing projects, quantity takeoff, scheduling, and constructability review. Class time will involve hands-on training and exercises that will simulate real-world situations and deadlines. Complexity levels in the models will be minimized to ensure focus on concepts. Students will have multiple opportunities to hone their presentation skills with their projects through the course progression. Prereq: ECIV 160 and ECIV 340.
ECIV 343. BIM Data Management & Remote Sensing. 3 Units.
The course is intended to create awareness and advocacy for advanced
design and planning technologies in the AEC industry, and integration
into standard BIM platforms. The course will enhance competency in
utilization of core BIM platforms for students with basic experience
in Sketchup, Revit and Navisworks. Class time will involve hands-on
exercises to simulate professional applications of technologies that
improve accuracy and communication on projects. Technical equipment
processes will be demonstrated in person, and situational challenges
will be presented and assigned for course projects. Technology focus
will include drones, LIDAR, and virtual reality simulations. Recommended

ECIV 351. Engineering Hydraulics and Hydrology. 3 Units.
Application of fluid statics and dynamics to Civil Engineering Design.
Hydraulic machinery, pipe network analysis, thrust, hammer, open channel
flow, sewer system design, culverts, flow gauging, retention/detention
basin design. Applied hydrology, hydrograph analysis and hydraulic
routing will also be introduced. Recommended preparation: Concurrent
enrollment in ENGR 225.

ECIV 360. Civil Engineering Systems. 3 Units.
Introduction to probability and statistics. Discrete and continuous
random variables, probability distributions, bivariate data, probabilistic
analysis of systems, and reliability analysis. Introduction to engineering
economics. Interest rates and equivalence, present worth, rate of return
analysis, depreciation, and inflation.

ECIV 361. Water Resources Engineering. 3 Units.
Water doctrine, probabilistic analysis of hydrologic data, common and
rare event analysis, flood forecasting and control, reservoir design,
hydrologic routing, synthetic streamflow generation, hydroelectric
power, water resource quality, water resources planning. Recommended
preparation: ECIV 351.

ECIV 362. Solid and Hazardous Waste Management. 3 Units.
Origin and characterization of solid and hazardous waste. Solid and
hazardous waste regulations. Methods of solid and hazardous waste
disposal. Waste management planning. Landfill siting and design
considerations. Site Conceptual Models for remediation of contaminated
sites. Technologies used for soil and groundwater remediation at solid
and hazardous waste sites. Offered as ECIV 362 and ECIV 462.

ECIV 368. Environmental Engineering. 3 Units.
Principle and practice of environmental engineering. Water and waste
water engineering unit operations and processes including related topics
from industrial waste disposal, air pollution and environmental health.

ECIV 370. Structural Design I. 3 Units.
Professional role of a structural engineer. Professional and legal
responsibilities. Design of structures, beams, columns, beam-
columns, and connections. Structures of steel and reinforced concrete.

ECIV 371. Structural Design II. 3 Units.
Continuation of ECIV 370. Torsion design of concrete members, design
of continuous beams and slabs, reinforcement development, concrete
serviceability deflection criteria, design of two-way slabs, stability design
of steel members, lateral-torsional buckling and local buckling of steel
members, steel connection design, software aided design of a steel
building structure. Recommended preparation: ECIV 310 and ECIV 315.
Offered as ECIV 371 and ECIV 471. Prereq: ECIV 370.

ECIV 372. Timber and Masonry Design. 3 Units.
Introduction to wood material. Design for timber beams and columns to
resist vertical and lateral loads. Design of nailed and bolted connections.
Introduction to masonry materials and design of wall. Offered as
ECIV 372 and ECIV 472. Prereq: ECIV 322.

ECIV 396. Civil Engineering Special Topics I. 1 - 3 Units.
Special topics in civil engineering in which a regular course is not
available. Conferences and report.

ECIV 397. Civil Engineering Topics II. 3 Units.
Special topics in civil engineering in which a regular course is not
available. Conferences and report.

ECIV 398. Civil Engineering Senior Project. 3 Units.
Capstone course for civil engineering students. Material from previous
and concurrent courses used to complete a multidisciplinary engineering
design project. Professional engineering topics such as project
management, engineering design, communications, and professional
ethics. Requirements include periodic reporting of progress, plus a final
oral presentation and written report. Counts as SAGES Senior Capstone.
Counts as SAGES Senior Capstone.

ECIV 400T. Graduate Teaching I. 0 Unit.
This series of three courses will provide Ph.D. students with practical
experience in teaching at the University level and will expose them to
effective teaching methods. Each course assignment will be organized in
coordination with the student’s dissertation advisor and the department
chairperson. Assignments will successively require more contact with
students, with duties approaching the teaching requirements of a faculty
member in the Ph.D. student’s area of study. Prereq: Ph.D. students in
Civil Engineering.

ECIV 411. Elasticity, Theory and Applications. 3 Units.
General analysis of deformation, strain, and stress. Elastic stress-
strain relations and formulation of elasticity problems. Solution of
Thick cylinders, disks, and spheres. Energy principle and introduction
to variational methods. Elastic stability. Matrix and tensor notations
gradually introduced, then used throughout the course. Recommended
preparation: ECIV 310 or equivalent.

ECIV 415. Fracture Mechanics and Size Effect. 3 Units.
Linear Elastic Fracture Mechanics: crack tip fields, stress intensity
factors, energy release rate, J-integral, fracture criteria. Nonlinear
Theories: R-curve, plastic fracture mechanics. Quasibrittle Materials:
cohesive crack models, fracture process zone. Fatigue cracks. Size
Effect: linear elastic fracture mechanics prediction, size effect in
quasibrittle materials. Experimental determination of fracture properties.

ECIV 420. Finite Element Analysis. 3 Units.
Theory and application of the finite element method. Approximation
theory as the basis for finite element methods. The formulations for a
variety of finite elements in one, two, and three dimensions. The modeling
and analysis of structural components and systems using planar, solid,
and plate elements. Implementations of element formulations using
Matlab. An advanced finite element analysis program will be used for
analysis of structural problems. Recommended preparation: ECIV 321
is a prerequisite for structural engineering students. Background in
advanced mechanics and numerical analysis of structures is required for
this course. If you have not completed these courses, please discuss with
the instructor. Prereq: Graduate Standing or ECIV 321.
ECIV 421. Advanced Topics in Reinforced Concrete Structures. 3 Units.
Group project-based course to evaluate nonlinear dynamic behavior of
multistory reinforced concrete structures designed to the US building
design codes (ACI318, ASCE7, ASCE41); Main Topics including Review
of RC Design Principles, Procedure Requirements and Assumptions;
Inelastic Behavior of Plain Concrete, Reinforced Concrete, and
Reinforcing Steel; Code-Based Design vs. Performance-Based Design;
Strength vs. Displacement Demand Parameters at the Member, Story,
and Structure Levels; Pushover Analysis Using an Open Source Code
(OpenSees). Prereq: Graduate Standing or ECIV 321, ECIV 322 and ECIV
323.

ECIV 422. Advanced Structural Steel Design. 3 Units.
Advanced topics for the design of steel structures including member and
frame stability, design of members for torsion, plate girders, base plate
and anchorage connections, and basics of composite systems. Plastic
analysis and design concepts for structural engineering limit state load
applications. Seismic design of steel lateral force resisting systems.
Recommended preparation: ECIV 321. Prereq: ECIV 323 or instructor
consent.

ECIV 424. Structural Dynamics. 3 Units.
Modeling of structures as single and multidegree of freedom dynamic
systems. The eigenvalue problem, damping, and the behavior of dynamic
systems. Deterministic models of dynamic loads such as wind and
earthquakes. Analytical methods, including modal, response spectrum,
time history, and frequency domain analyses. Recommended preparation:
ECIV 321 and consent of instructor.

ECIV 425. Structural Design for Dynamic Loads. 3 Units.
Structural design problems in which dynamic excitations are of
importance. Earthquake, wind, blast, traffic, and machinery excitations.
Human sensitivity to vibration, mechanical behavior of structural
elements under dynamic excitation, earthquake response and
earthquake-resistant design, wind loading, damping in structures,
hysteretic energy dissipation, and ductility requirements. Recommended
preparation: ECIV 424.

ECIV 426. Probabilistic Analysis. 3 Units.
Introduction to probability and statistics. Uncertainty and decision
analysis. Probability models for structural loads and strength.
Probabilistic analysis of engineering systems. Estimation of the reliability
of structures and infrastructure systems. Monte Carlo simulation.
Recommended preparation: ECIV 360, introduction of probability and
statistics, or equivalent.

ECIV 427. Environmental Organic Chemistry. 3 Units.
This is an advanced course focusing on examination of processes that
effect the behavior and fate of anthropogenic organic contaminants
in aquatic environments. The lectures will focus on intermolecular
interactions and thermodynamic principles governing the kinetics of
some of the important chemical and physicochemical transformation
reactions of organic contaminants. Recommended Preparation: One
semester of Organic chemistry or prior approval of the instructor.

ECIV 428. Matrix Analysis of Structures. 3 Units.
Matrix formulation and computer analysis (MATLAB recommended)
for statically indeterminate linear structural systems; Stiffness method
(direct/displacement method); Potential Energy Method; Development
of element equations for 1D axial and flexural members and 2D
triangle element; Transformation between local to global coordinates;
Development of displacement fields (linear function for axial members
and cubic function for flexural members); Shape function concept in
approximation; Introduction to elasticity, finite element analysis and
nonlinear structural analysis. Additional term project on programming
for six degrees of freedom beam structure analysis will be assigned to
students enrolled in ECIV428. Recommended for all students: Linear
Algebra, Structural Analysis, and MATLAB Programming. Offered as
ECIV 321 and ECIV 428. Prereq: Graduate Student standing.

ECIV 430. Foundation Engineering. 3 Units.
Subsoil exploration. Various types of foundations for structures, their
design and settlement performance, including spread and combined
footings, mats, piers, and piles. Design of sand-drain installations and
earth-retaining structures including retaining walls, sheet piles, and

ECIV 432. Mechanical Behavior of Soils. 3 Units.
Soil statics and stresses in a half space-tridimensional consolidation
and sand drain theory; stress-strain relations and representations
with rheological models. Critical state and various failure theories and
their experimental justification for cohesive and noncohesive soils.
Laboratory measurement of rheological properties, pore water pressures,
and strength under combined stresses. Laboratory. Recommended
preparation: ECIV 330.

ECIV 433. Soil Dynamics. 3 Units.
I-DOF and M-DOF dynamics; wave propagation theory; dynamic soil
properties. Foundation vibrations, design of machine foundations.
Seismology, elastic and elastoplastic response spectra, philosophy of
earthquake-resistant design. One and two-dimensional soil amplification,
liquefaction, dynamic settlement. Soil-structure interaction during
earthquakes. Recommended preparation: ECIV 330 and consent of
instructor.

ECIV 434. Field Instrumentation and Insitu Testing. 3 Units.
In situ test methods. Standard Penetration Test (SPT), Cone Penetration
Test (CPT), pressuremeter, vane shear test, dilatometer, seismic methods,
electromagnetic methods, and electrical methods. Geotechnical field
instrumentation. Measurement of load, stress, pore pressure, and
deforotation in the field. Stress wave theory, pile driving analysis,

ECIV 437. Pavement Analysis and Design. 3 Units.
Analysis and design of rigid and flexible airfield and highway pavements.
Pavement evaluation and rehabilitations, overlay design. Recommended
preparation: ECIV 330.
ECIV 450. Environmental Engineering Chemistry. 3 Units.
Fundamentals of inorganic, organic, and physical chemistry with emphasis on the types of problems encountered in the environmental engineering field. Equilibria among liquid, gaseous, and solid phases; kinetics to the extent that time permits. A strong mathematical approach is taken in solving the equilibrium and kinetic problems presented. Equilibrium speciation software for solution of more complex problems. Topics that will be covered in the course include chemical equilibrium, acid/base reactions, mathematical problem solving approach, graphical approaches, titration curves, solubility of gases and solids, buffering systems, numerical solution of equilibrium problems, thermodynamics, oxidation-reduction reactions, principles of quantitative chemistry and analytical techniques, introduction to the use of analytical instrumentation, and chemical kinetics. Prereq: ECIV 368 or requisites not met permission.

ECIV 456. Intelligent Infrastructure Systems. 3 Units.
Topics on smart infrastructure systems; smart materials fabrication, embedded sensing technology for infrastructure condition monitoring, the system models for infrastructural condition diagnosing and adaptive controlling, and spatial-temporal integrated infrastructure management system.

ECIV 461. Environmental Engineering Biotechnology. 3 Units.
Process design fundamentals for biological reactors applied to environmental engineering processes, including wastewater treatment, bioremediation, and bioenergy production. Topics include mass balances, methane fermentation, fixed-growth reactors, molecular biology tools, and reactor models. Recommended preparation: ECIV 368 Environmental Engineering.

ECIV 462. Solid and Hazardous Waste Management. 3 Units.

ECIV 471. Structural Design II. 3 Units.
Continuation of ECIV 370. Torsion design of concrete members, design of continuous beams and slabs, reinforcement development, concrete serviceability deflection criteria, design of two-way slabs, stability design of steel members, lateral-torsional buckling and local buckling of steel members, steel connection design, software aided design of a steel building structure. Recommended preparation: ECIV 310 and ECIV 315. Offered as ECIV 371 and ECIV 471.

ECIV 472. Timber and Masonry Design. 3 Units.
Introduction to wood material. Design for timber beams and columns to resist vertical and lateral loads. Design of nailed and bolted connections. Introduction to masonry materials and design of wall. Offered as ECIV 372 and ECIV 472.

ECIV 500T. Graduate Teaching II. 0 Unit.
This series of three courses will provide Ph.D. students with practical experience in teaching at the University level and will expose them to effective teaching methods. Each course assignment will be organized in coordination with the student's dissertation advisor and the department chairperson. Assignments will successively require more contact with students, with duties approaching the teaching requirements of a faculty member in the Ph.D. student's area of study. Prereq: Ph.D. student in Civil Engineering.

ECIV 600T. Graduate Teaching III. 0 Unit.
This series of three courses will provide Ph.D. students with practical experience in teaching at the University level and will expose them to effective teaching methods. Each course assignment will be organized in coordination with student's dissertation advisor and the department chairperson. Assignments will successively require more contact with students, with duties approaching the teaching requirements of a faculty member in the Ph.D. student's area of study. Prereq: Ph.D. students in Civil Engineering.

ECIV 601. Independent Study. 1 - 18 Units.
Plan B.

ECIV 651. Thesis M.S.. 1 - 18 Units.
Plan A.

ECIV 660. Special Topics. 1 - 18 Units.
Topics of special interest to students and faculty. Topics can be those covered in a regular course when the student cannot wait for the course to be offered.

ECIV 695. Project M.S.. 1 - 9 Units.
Research course taken by Plan B M.S. students. Prereq: Enrolled in the ECIV Plan B MS Program.

ECIV 701. Dissertation Ph.D.. 1 - 9 Units.
(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

Department of Computer and Data Sciences
Glennan Building (7071)
http://engineering.case.edu/cds/
Phone: 216.368.2800; Fax: 216.368.6888

Vipin Chaudhary (vipin@case.edu), Kevin J. Kranzusch Professor and Chair

While the BS degree in Computer Science at Case Western Reserve University was approved in 1987, the Department of Computer and Data Sciences (CDS) was recently established in 2019. Computer Science is the study of the theory, practice, and application of computer systems. Data Science is an interdisciplinary field that utilizes computer systems, computational algorithms, and statistical methods to manage, analyze, and visualize data from different domains in order to extract information and knowledge from data. Computer Science and Data Science are at the heart of modern technology with applications in many disciplines. They both have a profound impact on our society and drive job creation. Starting salaries in our fields are consistently ranked at the top of all college majors. Our graduates work in cutting-edge companies—from giants to start-ups, in a variety of technology sectors, including computer and internet, business and finance, healthcare and medical devices, energy, and consulting.

CDS offers a BS degree in Computer Science, a Computer Science major toward the BA degree, a BS degree in Data Science & Analytics, a combined BS/MS program in Computer Science, and MS and PhD degrees in Computer Science. CDS also offers minors in Computer Science, Computer Gaming, and Artificial Intelligence. The minor in Applied Data Science is administered by the Department of Materials Science and Engineering https://engineering.case.edu/materials-science-and-engineering/academics/.
Educational Philosophy

The CDS department is dedicated to developing high-quality graduates who will take positions of leadership as their careers advance. We recognize that the increasing role of technology in virtually every facet of our society, life, and culture makes it vital that our students have access to progressive and cutting-edge higher education programs. The program values for all of the degree programs in the department are:

• mastery of fundamentals
• creativity
• social awareness
• leadership skills
• professionalism

Stressing excellence in these core values helps to ensure that our graduates are valued and contributing members of our global society and that they will carry on the tradition of industrial and academic leadership established by our alumni.

Our goal is to graduate students who have fundamental technical knowledge of their profession and the requisite technical breadth and communications skills to become leaders in creating the new techniques and technologies which will advance their fields. To achieve this goal, the department offers a wide range of technical specialties consistent with the breadth of computer science and data science, including recent developments in the fields. Because of the rapid pace of advancement in these fields, our degree programs emphasize a broad and foundational science and technology background that equips students for future developments. Our programs include a wide range of electives and our students can also develop individualized programs that can combine computer and data sciences with other disciplines.

Research

At Case Western, we thrive to provide outstanding educational experiences for both our undergraduate and graduate students, while performing cutting edge research in:

1. Algorithms, Theory, and Quantum Computing
2. Artificial Intelligence and Machine Learning
3. Bioinformatics and Systems Biology
4. Data Science and Analytics
5. Databases & Data Mining
7. Security and Privacy
8. Software Engineering

Primary Faculty Appointments

Erman Ayday, PhD
(Georgia Institute of Technology)
Assistant Professor
Cryptography, network security, trust and reputation management, big data analytics

Vipin Chaudhary, PhD
(The University of Texas at Austin)
Kevin J. Kranzusch Professor and Chair
High performance computing, machine learning, computational and data science, computer aided diagnosis and interventions, and quantum computing

Harold S. Connamacher, PhD
(University of Toronto)
Robert J. Herbold Associate Professor in Transformative Teaching
Constraint satisfaction problems, graph theory, random structures, and algorithms

Mehmet Koyuturk, PhD
(Purdue University)
Professor
Bioinformatics and computational biology, computational modeling and algorithm development for systems biology, integration, mining and analysis of biological data, algorithms for distributed systems

Michael Lewicki, PhD
(California Institute of Technology)
Professor
Computational perception and scene analysis, visual representation and processing, auditory representation and analysis

Jing Li, PhD
(University of California, Riverside)
Leonard Case Jr. Professor
Computational biology and bioinformatics, data mining and machine learning, data science and analytics, algorithms

Vincenzo Liberatore, PhD
(Rutgers University)
Associate Professor
Distributed systems, Internet computing, randomized algorithms

Orhan Ozguner, PhD
(Case Western Reserve University)
Assistant Professor
Algorithms, data science, data structure, programming

H. Andy Podgurski, PhD
(University of Massachusetts, Amherst)
Professor
Software engineering methodology and tools, especially use of data mining, machine learning, and program analysis techniques in software testing, fault detection and localization, reliable engineering and software security, electronic medical records, privacy

Michael Rabinovich, PhD
(University of Washington)
Professor
Computer networks, distributed systems, Internet security and performance

Soumya Ray, PhD
(University of Wisconsin, Madison)
Associate Professor
Artificial intelligence, machine learning, reinforcement learning, automated planning, applications to interdisciplinary problems including medicine and bioinformatics

An Wang, PhD
(George Mason University)
Assistant Professor
Systems and network security
Yinghui Wu, PhD
(University of Edinburgh (UK))
Assistant Professor
Data science

Xusheng Xiao, PhD
(North Carolina State University)
Assistant Professor
Software engineering, computer security

Shuai Xu, PhD
(Florida International University)
Assistant Professor
Algorithms and theory

Yanfang (Fanny) Ye, PhD
(Xiamen University)
Theodore L. and Dana J. Schroeder Associate Professor
Cybersecurity, data mining, machine learning, health intelligence

**Adjunct Faculty Appointments**

Mark A. Allman, MSEE
Adjunct Instructor

Nicholas Barendt, MSEE, BSEE
Adjunct Sr. Instructor

Michael Branicky, PhD
Adjunct Professor

Mahdi Cheraghchi Bashi Astaneh, PhD
Adjunct Assistant Professor

Sanjay Gajurel, PhD
Adjunct Assistant Professor

Roberto Galan, PhD
Adjunct Assistant Professor

Eamon Johnson, PhD
Adjunct Instructor

Ronald Loui, PhD
Adjunct Professor

Stanley Omeike
Adjunct Instructor

Gideon Samid, PhD
Adjunct Assistant Professor

Matthew Sargent, PhD
Adjunct Assistant Professor

Sadida Siddiqui
Adjunct Instructor

Miguel Zubizarreta-Ada, PhD
Adjunct Professor

---

**Secondary Faculty Appointments**

Gurkan Bebek, PhD
Assistant Professor
SOM-Center for Proteomics

Marc Buchner, PhD
Associate Professor
CSE-ECSE

M. Cenk Cavusoglu, PhD
(University of California, Berkeley)
Nord Professor of Engineering

Vira Chankong, PhD
Associate Professor
CSE-ECSE

Roger French, PhD
Professor
CSE-EMSE

Michael Fu, PhD
Timothy E. and Allison L. Schroeder Assistant Professor
CSE-ECSE

Mark Griswold, PhD
Professor
SOM-Radiology

Evren Gurkan-Cavusoglu, PhD
Associate Professor
CSE-ECSE

Fulai Jin, PhD
Assistant Professor
SOM-Genetics & Genome Sciences

Thomas LaFramboise, PhD
Associate Professor, Genetics
SOM-Genetics

Xiao Li, PhD
Assistant Professor
SOM-RNA Center

Anant Madabhushi, PhD
Professor
CSE-EBME

Aziz Nazha, PhD
Assistant Professor
SOM, CCF-Ctr of Clinical Artificial Intelligence

Christos Papachristou, PhD
Professor
CSE-ECSE

Satya Sahoo, PhD
Associate Professor
SOM-Dept. of Population & Quantitative Health Sciences

Peter Thomas, PhD
Associate Professor
CAS-MATH
Emeritus Faculty
Gultekin Ozsoyoglu, PhD
(University of Alberta, Canada)
Emeritus Professor
Graph databases and data mining problems in metabolic networks, metabolomics, and systems biology, bioinformatics, web data mining

Z. Meral Ozsoyoglu, PhD
(University of Alberta, Canada)
Emeritus Professor
Database systems, database query languages and optimization, data models, index structures, bioinformatics, medical informatics

Undergraduate Programs
The Computer and Data Science (CDS) department offers programs leading to degrees in:

1. Data Science and Analytics, Bachelor of Science
2. Computer Science, Bachelor of Science
3. Computer Science, Bachelor of Arts

These programs provide students with a strong background in the fundamentals of mathematics and science. Students can use their technical and open electives to pursue concentrations in software engineering, algorithms, artificial intelligence, databases, data mining, bioinformatics, security, computer systems, and computer networks. In addition to an excellent technical education, all students in the department are exposed to societal issues, ethics, professionalism, and have the opportunity to develop leadership and creativity skills.

Data Science and Analytics BS
The Data Science and Analytics BS program provides our students with a broad foundation in the fields of database systems, database query languages and optimization, data models, index structures, bioinformatics, medical informatics, and computational techniques. This major is one of the first undergraduate programs nationwide with a curriculum that includes mathematical modeling, computation, data analytics, visual analytics and project-based applications – all elements of the future emerging field of data science.

Program Educational Objectives
Graduates from the Data Science and Analytics Bachelor of Science program will be prepared to:

1. Analyze real-world problems and create data-driven solutions based on the fundamentals of data science and computing.
2. Work effectively, professionally, and ethically.
3. Assume positions of leadership in industry, academia, public service, and entrepreneurship.
4. Successfully progress in advanced degree programs in data science, computing, and related fields.

Student Outcomes
As preparation for achieving the above educational objectives, the Bachelor of Science degree program in Data Science and Analytics is designed so that students attain the ability to:

1. Analyze a complex computing problem and to apply principles of computing and other relevant disciplines to identify solutions.
2. Design, implement, and evaluate a computing-based solution to meet a given set of computing requirements in the context of the program’s discipline.
3. Communicate effectively in a variety of professional contexts.
4. Recognize professional responsibilities and make informed judgments in computing practice based on legal and ethical principles.
5. Function effectively as a member or leader of a team engaged in activities appropriate to the program’s discipline.
6. Apply theory, techniques, and tools throughout the data analysis lifecycle and employ the resulting knowledge to satisfy stakeholders’ needs.

Major Requirements
The major requires completion The major requires completion of the university general education requirements (http://bulletin.case.edu/undergraduatestudies/degreeprograms/) and the engineering general education requirements (http://bulletin.case.edu/undergraduatestudies/csedegree/#bachelorofscienceindatascienceandtext) as modified for the Bachelor of Science in Data Science and Analytics degree, and the following courses:

<table>

Two of STAT 243, STAT 244, STAT 312, and STAT 325 3 units each. Core courses provide our students with a strong background in foundations and analytics.

Foundations
Each student must supplement their competence in foundational technical areas by taking at least three additional courses, totaling at least nine credit hours from the following list. Other courses, beyond those that are listed, may be approved by the student's academic advisor. The following list is organized in topical areas for informational purposes only; foundation courses may come from the same or from different areas.

**Technical Electives**

Two more courses from the core, foundations, and applications lists for at least six credit hours. The combination of core, foundations, and application courses with technical and open electives makes it possible to achieve a minor in fields as different as Economics and Biology. Interested students should contact their advisors.

**Suggested Program of Study: Data Science and Analytics BS**

The following is a suggested program of study. Current students should always consult their advisors and their individual graduation requirement plans as tracked in SIS (http://sis.case.edu).

**First Year**

</table>
The Bachelor of Science degree program in computer science is designed so that students attain the ability to:

- Analyze a complex computing problem and to apply principles of computing and other relevant disciplines to identify solutions.
- Communicate effectively in a variety of professional contexts.
- Recognize professional responsibilities and make informed judgments in computing practice based on legal and ethical principles.
- Function effectively as a member or leader of a team engaged in activities appropriate to the program’s discipline.
- Apply computer science theory and software development fundamentals to produce computing-based solutions.

Core and breadth courses provide our students with the flexibility to work across many disciplines and prepare them for a variety of professions. Our curriculum is designed to teach fundamental skills and knowledge needed by all CS graduates while providing the greatest flexibility in selecting topics. Students are also required to develop depth in at least one of the following technical areas: software engineering; algorithms and theory; computer systems, networks, and security; databases and data mining; bioinformatics; or artificial intelligence.

### Computer Science BS

The Bachelor of Science degree program in computer science is designed to give a student a strong background in the fundamentals of mathematics and computer science. The curriculum is designed according to the latest ACM/IEEE computer science curriculum guidelines. A graduate of this program should be able to use these fundamentals to analyze and evaluate software systems and the underlying abstractions upon which they are based. A graduate should also be able to design and implement software systems that are state-of-the-art solutions to a variety of computing problems; this includes problems that are sufficiently complex to require the evaluation of design alternatives and engineering trade-offs. In addition to these program-specific objectives, all students in the Case School of Engineering are exposed to societal issues, professionalism, and are provided opportunities to develop leadership skills.

The Bachelor of Science degree program in computer science is accredited by the Computing Accreditation Commission of ABET, [http://www.abet.org/](http://www.abet.org/).

**Mission**

The mission of the Bachelor of Science degree program in computer science is to graduate students who have fundamental technical knowledge of their profession and the requisite technical breadth and communications skills to become leaders in creating the new techniques and technologies which will advance the field of computer science and its application to other disciplines.

**Program Educational Objectives**

1. To educate and train students in the fundamentals of computer science and mathematics
2. To educate students with an understanding of real-world computing needs
3. To train students to work effectively, professionally and ethically in computing-related professions

**Student Outcomes**

As preparation for achieving the above educational objectives, the Bachelor of Science degree program in computer science is designed so that students attain the ability to:

- Analyze a complex computing problem and to apply principles of computing and other relevant disciplines to identify solutions.
- Communicate effectively in a variety of professional contexts.
- Recognize professional responsibilities and make informed judgments in computing practice based on legal and ethical principles.
- Function effectively as a member or leader of a team engaged in activities appropriate to the program’s discipline.
- Apply computer science theory and software development fundamentals to produce computing-based solutions.

Core and breadth courses provide our students with the flexibility to work across many disciplines and prepare them for a variety of professions. Our curriculum is designed to teach fundamental skills and knowledge needed by all CS graduates while providing the greatest flexibility in selecting topics. Students are also required to develop depth in at least one of the following technical areas: software engineering; algorithms and theory; computer systems, networks, and security; databases and data mining; bioinformatics; or artificial intelligence.

**Major Requirements**

Each student is required to complete a total of 20 computer science and computer science related courses, totaling at least 63 credits.
The 20 courses must include:

1. all 6 core courses;
2. at least 5 computer science breadth courses;
3. at least 4 courses in one of the listed computer science depth areas, including all starred courses in that area;
4. and a course from the secure computing requirement list.

The remaining courses needed to fulfill the 20 course requirement may come from the computer science breadth courses, courses of any computer science depth area, and up to 6 of the 20 courses may come from the list of approved technical electives with at most two group 2 courses.

Other computer science related courses not listed here may be used with prior permission from the student's academic advisor. Some courses appear in more than one list. The same course may be used to satisfy multiple requirements of the core, computer science breadth and depth requirements, but courses may not be double counted for the purpose of achieving 20 separate computer science courses and 63 credits.

In addition to engineering general education requirements and (http://bulletin.case.edu/undergraduatestudies/csedegree/#bachelorofscienceincomputersciencetext) and university general education requirements (http://bulletin.case.edu/undergraduatestudies/degreeprograms/), the major requires the following courses:

### Computer Science Core Requirement
All computer science majors are required to complete the following 6 courses.

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSDS 132</td>
<td>Introduction to Programming in Java</td>
<td>3</td>
</tr>
<tr>
<td>CSDS 233</td>
<td>Introduction to Data Structures</td>
<td>4</td>
</tr>
<tr>
<td>CSDS 281</td>
<td>Logic Design and Computer Organization</td>
<td>4</td>
</tr>
<tr>
<td>CSDS 302</td>
<td>Discrete Mathematics</td>
<td>3</td>
</tr>
<tr>
<td>CSDS 310</td>
<td>Algorithms</td>
<td>3</td>
</tr>
<tr>
<td>CSDS 395</td>
<td>Senior Project in Computer Science</td>
<td>4</td>
</tr>
</tbody>
</table>

### Computer Science Breadth Requirement
BS students are required to complete at least 5 of the 7 following computer science breadth courses.

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSDS 314</td>
<td>Computer Architecture</td>
<td>3</td>
</tr>
<tr>
<td>CSDS 325</td>
<td>Computer Networks I</td>
<td>3</td>
</tr>
<tr>
<td>CSDS 338</td>
<td>Intro to Operating Systems and Concurrent Programming</td>
<td>4</td>
</tr>
<tr>
<td>CSDS 341</td>
<td>Introduction to Database Systems</td>
<td>3</td>
</tr>
<tr>
<td>CSDS 345</td>
<td>Programming Language Concepts</td>
<td>3</td>
</tr>
<tr>
<td>CSDS 391</td>
<td>Introduction to Artificial Intelligence</td>
<td>3</td>
</tr>
<tr>
<td>CSDS 393</td>
<td>Software Engineering</td>
<td>3</td>
</tr>
</tbody>
</table>

### Statistics Requirement
Computer science BS students are required to complete a statistics elective.

One Statistics elective may be chosen from:

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>MATH 380</td>
<td>Introduction to Probability</td>
<td>3</td>
</tr>
<tr>
<td>STAT 312</td>
<td>Basic Statistics for Engineering and Science</td>
<td>3</td>
</tr>
<tr>
<td>STAT 313</td>
<td>Statistics for Experimenters</td>
<td>3</td>
</tr>
<tr>
<td>STAT 332</td>
<td>Statistics for Signal Processing</td>
<td>3</td>
</tr>
<tr>
<td>STAT 333</td>
<td>Uncertainty in Engineering and Science</td>
<td>3</td>
</tr>
</tbody>
</table>

### Computer Science Secure Computing Requirement
Students pursuing the BS degree must demonstrate competence in the principles and practices of secure computing by completing one of the following courses as part of their 20 computer science or computer science related courses.

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSDS 344</td>
<td>Computer Security</td>
<td>3</td>
</tr>
<tr>
<td>CSDS 356</td>
<td>Data Privacy</td>
<td>3</td>
</tr>
<tr>
<td>CSDS 427</td>
<td>Internet Security and Privacy</td>
<td>3</td>
</tr>
<tr>
<td>CSDS 444</td>
<td>Computer Security</td>
<td>3</td>
</tr>
<tr>
<td>CSDS 448</td>
<td>Smartphone Security</td>
<td>3</td>
</tr>
<tr>
<td>MATH 408</td>
<td>Introduction to Cryptology</td>
<td>3</td>
</tr>
</tbody>
</table>

This course may be double counted as a computer science depth course, as appropriate. There is no secure computing requirement for students pursuing the BA degree.

### Computer Science Depth Requirement
Students pursuing the BS degree must demonstrate a depth of competence in one of the technical areas listed below. To complete the depth requirement, students must complete at least four courses in one of the depth areas, including all starred courses. Recommended general background courses are listed following each area where applicable.

#### Area 1: Software Engineering

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSDS 293</td>
<td>Software Craftsmanship</td>
<td>4</td>
</tr>
<tr>
<td>CSDS 337</td>
<td>Compiler Design</td>
<td>4</td>
</tr>
<tr>
<td>CSDS 344</td>
<td>Computer Security</td>
<td>3</td>
</tr>
<tr>
<td>CSDS 345</td>
<td>Programming Language Concepts</td>
<td>3</td>
</tr>
<tr>
<td>CSDS 392</td>
<td>App Development for iOS</td>
<td>3</td>
</tr>
<tr>
<td>CSDS 393</td>
<td>Software Engineering</td>
<td>3</td>
</tr>
<tr>
<td>CSDS 427</td>
<td>Internet Security and Privacy</td>
<td>3</td>
</tr>
<tr>
<td>CSDS 438</td>
<td>High Performance Computing</td>
<td>3</td>
</tr>
<tr>
<td>CSDS 448</td>
<td>Smartphone Security</td>
<td>3</td>
</tr>
</tbody>
</table>

#### Area 2: Algorithms and Theory

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>

Recommended breadth and preparation: MATH 380 Introduction to Probability, and either ECSE 416 Convex Optimization for Engineering or CSDS 477 Advanced Algorithms.

List of Approved Technical Electives
This list of approved technical electives is divided into groups according to how closely a course is related to the core knowledge areas as defined in the ACM/IEEE computer science curriculum guidelines. For Computer Science BS students, up to 6 of the 20 computer science and computer science related courses may come from this list with up to two courses from group 2. Computer science related courses not listed below may be used as a technical elective but require prior permission from the student's academic advisor.

Group 1
Any CSDS course.

<table>
<thead>
<tr>
<th>Course Code</th>

**Total Units in Sequence:** 126

**Hours Required for Graduation:** 126

* University general education requirement

** Engineering general education requirement

(https://bulletin.case.edu/undergraduatestudies/csedegree/#bachelorofscienceincomputersciencetext)

a  Chosen from: MATH 380 Introduction to Probability, STAT 312 Basic Statistics for Engineering and Science, STAT 313 Statistics for Experimenters, STAT 332 Statistics for Signal Processing, STAT 333 Uncertainty in Engineering and Science

c. Each student must complete 4 courses in one of the computer science depth areas listed above, including all starred courses.

d. Chosen from additional computer science breadth courses, depth courses, or the list of approved technical electives. Any other course used as a technical elective must be approved by the student’s advisor.

**Computer Science BA**

The Bachelor of Arts degree program in computer science is a combination of a liberal arts program and a computing major. It is a professional program in the sense that graduates can be employed as computer professionals, but it is less technical than the Bachelor of Science degree program in computer science. This degree is particularly suitable for students with a wide range of interests. For example, students can major in another discipline in addition to computer science and routinely complete all of the requirements for the double major in a 4 year period. This is possible because over a third of the courses in the program are open electives. Furthermore, if a student is majoring in computer science and a second technical field such as mathematics or physics many of the technical electives will be accepted for both majors. Another example of the utility of this program is that it routinely allows students to major in computer science and take all of the pre-med courses in a four-year period.

**Mission**

The mission of the Bachelor of Arts degree program in computer science is to graduate students who have fundamental technical knowledge of their profession and the requisite technical breadth and communications skills to become leaders in creating the new techniques and technologies which will advance the field of computer science and its application to other disciplines.

**Program Educational Objectives**

1. To educate and train students in the fundamentals of computer science and mathematics
2. To educate students with an understanding of real-world computing needs
3. To train students to work effectively, professionally and ethically in computing-related professions

**Student Outcomes**

As preparation for achieving the above educational objectives, the Bachelor of Arts degree program in computer science is designed so that students attain the ability to:

- Analyze a complex computing problem and to apply principles of computing and other relevant disciplines to identify solutions.
- Design, implement, and evaluate a computing-based solution to meet a given set of computing requirements in the context of the program’s discipline.
- Communicate effectively in a variety of professional contexts.
- Recognize professional responsibilities and make informed judgments in computing practice based on legal and ethical principles.
- Function effectively as a member or leader of a team engaged in activities appropriate to the program’s discipline.
- Apply computer science theory and software development fundamentals to produce computing-based solutions.

Core and breadth courses provide our students with the flexibility to work across many disciplines and prepare them for a variety of professions. Our curriculum is designed to teach fundamental skills and knowledge needed by all CS graduates while providing the greatest flexibility in selecting topics.

**Major Requirements**

Students are required to complete a total of 13 computer science and computer science related courses, totaling at least 42 credits. The 13 courses for a total of 42 credits must include all 6 core courses and at least 3 computer science breadth courses. The remaining 4 courses may be any CS Course, defined below, plus at most 3 courses from either the group 1 or the group 3 list of approved technical electives. There is no depth requirement for the Computer Science BA degree.

In addition to arts & sciences general education requirements (http://bulletin.case.edu/undergraduatestudies/casdegree/) and university general education requirements (http://bulletin.case.edu/undergraduatestudies/degreeprograms/), the major requires the following courses:

**Computer Science BA Mathematics Requirement**

BA students must complete two calculus courses.

<table>
<thead>
<tr>
<th>Course</th>
<th>Description</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>MATH 121</td>

</tr>
<tr>
<td>or MATH 126</td>
<td>Math and Calculus Applications for Life, Managerial, and Social Sci II</td>
<td></td>
</tr>
</tbody>
</table>

**Computer Science Core Requirement**

All computer science majors are required to complete the following 6 courses.

<table>
<thead>
<tr>
<th>Course</th>
<th>Description</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSDS 132</td>
<td>Introduction to Programming in Java</td>
<td>3</td>
</tr>
<tr>

<td>Introduction to Data Structures</td>
<td>4</td>
</tr>
<tr>
<td>CSDS 281</td>
<td>Logic Design and Computer Organization</td>
<td>4</td>
</tr>
<tr>
<td>CSDS 302</td>
<td>Discrete Mathematics</td>
<td>3</td>
</tr>
</tbody>
</table>
Computer Science Breadth Requirement

Computer science BA students are required to complete at least 3 of the 7 following computer science breadth courses.

CSDS 314  Computer Architecture  3
CSDS 325  Computer Networks I  3
CSDS 338  Intro to Operating Systems and Concurrent Programming  4
CSDS 341  Introduction to Database Systems  3
CSDS 345  Programming Language Concepts  3
CSDS 391  Introduction to Artificial Intelligence  3
CSDS 393  Software Engineering  3

CS Courses

In addition to the required core and breadth courses, computer science BA students must complete an additional CS Course so that the total number of CS Courses completed is at least 10. The remaining 3 courses to complete the major may come from this list of CS Courses or from the list of approved technical electives below.

The CS Courses are:

Any computer science core course.

Any computer science breadth course.

CS 234  Structured and Unstructured Data  3
CS 293  Software Craftsmanship  4
CS 312  Introduction to Data Science Systems  3
CS 313  Introduction to Data Analysis  3
CS 337  Compiler Design  4
CS 339  Web Data Mining  3
CS 343  Theoretical Computer Science  3
CS 344  Computer Security  3
CS 356  Data Privacy  3
CS 392  App Development for iOS  3
CS 394  Introduction to Information Theory  3
CS 405  Data Structures and File Management  3
CS 427  Internet Security and Privacy  3
CS 428  Computer Communications Networks II  3
CS 433  Database Systems  3
CS 435  Data Mining  3
CS 438  High Performance Computing  3
CS 440  Machine Learning  3
CS 442  Causal Learning from Data  3
CS 448  Smartphone Security  3
CS 455  Applied Graph Theory  3
CS 458  Introduction to Bioinformatics  3
CS 459  Bioinformatics for Systems Biology  3
CS 465  Computer Vision  3
CS 477  Advanced Algorithms  3

CSDS 411  Artificial Intelligence: Probabilistic Graphical Models  3
CSDS 496  Artificial Intelligence: Sequential Decision Making  3
CSDS 497  Artificial Intelligence: Statistical Natural Language Processing  3
CSDS 499  Algorithmic Robotics  3
ECSE 484  Computational Intelligence I: Basic Principles  3
MATH 382  High Dimensional Probability  3
MATH 406  Mathematical Logic and Model Theory  3
MATH 408  Introduction to Cryptology  3
MATH 444  Mathematics of Data Mining and Pattern Recognition  3
PHIL 306  Mathematical Logic and Model Theory  3

List of Approved Technical Electives

For Computer Science BA students, up to 3 of the 13 computer science and computer science related courses may come from the group 1 and group 3 lists. Computer science related courses not listed below may be used as a technical elective but require prior permission from the student's academic advisor.

Group 1
Any CSDS course.

ECSE 301  Digital Logic Laboratory  2
ECSE 303  Embedded Systems Design and Laboratory  3
ECSE 317  Computer Design - FPGAs  3
ECSE 318  VLSI/CAD  4
ECSE 419  Computer System Architecture  3
ECSE 485  VLSI Systems  3
ECSE 488  Embedded Systems Design  3
MATH 330  Introduction to Scientific Computing  3
MATH 431  Introduction to Numerical Analysis I  3

Group 3
MATH 201  Introduction to Linear Algebra for Applications  3
or MATH 307  Linear Algebra  3
MATH 380  Introduction to Probability  3

Suggested Program of Study: Computer Science BA

The following is a suggested program of study. Current students should always consult their advisors and their individual graduation requirement plans as tracked in SIS (http://sis.case.edu/).

</table>

**Total Units in Sequence:** 120

**Hours Required for Graduation:** 120

* University general education requirement

** Arts and Sciences general education requirement (http://bulletin.case.edu/undergraduatestudies/casdegree/)

^b Chosen from the list of CS Courses or the list of approved technical electives. Any other course used as a technical elective must be approved by the student’s advisor.

Cooperative Education Program in Computer Science

Opportunities are available for students to alternate studies with work in industry or government as a co-op student, which involves paid full-time employment over seven months (one semester and one summer). Students may work in one or two co-ops, beginning in the third year of study. Co-ops provide students the opportunity to gain valuable hands-on experience in their field by completing a significant engineering project while receiving professional mentoring. During a co-op placement, students do not pay tuition but maintain their full-time student status while earning a salary. Learn more at http://engineering.case.edu/coop/.

Alternatively or additionally, students may obtain employment as summer interns.

BS/MS Program in Computer Science

Students with a grade point average of 3.2 or higher are encouraged to apply to the BS/MS Program which will allow them to get both degrees in five years. The BS can be in Computer Science or a related discipline, such as mathematics or electrical engineering. Integrating graduate study in computer science with the undergraduate program allows a student to satisfy all requirements for both degrees in five years. Review the Office of Undergraduate Studies BS/MS program requirements here (p. 1298).

Minor in Computer Science (BS or BSE)

For students pursuing a BS or BSE degree, the following four courses are required for a minor in computer science:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSDS 132</td>
<td>Introduction to Programming in Java</td>
<td>3</td>
</tr>
<tr>
<td>CSDS 233</td>
<td>Introduction to Data Structures</td>
<td>4</td>
</tr>
</tbody>
</table>
Cognitive Science Track (requires 3 of the following courses):

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSDS 302</td>
<td>Discrete Mathematics</td>
<td>3</td>
</tr>
<tr>
<td>CSDS 310</td>
<td>Algorithms</td>
<td>3</td>
</tr>
</tbody>
</table>

A student must take an additional 3 credit hours of CS Courses (see BA Major Requirements).

**Minor in Computer Science (BA)**

For students pursuing BA degrees, the following courses are required for a minor in computer science:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSDS 132</td>
<td>Introduction to Programming in Java</td>
<td>3</td>
</tr>
<tr>
<td>CSDS 233</td>
<td>Introduction to Data Structures</td>
<td>4</td>
</tr>
<tr>
<td>MATH 125</td>
<td>Math and Calculus Applications for Life, Managerial, and Social Sci I</td>
<td>4</td>
</tr>
</tbody>
</table>

Two additional CS Courses (see BA Major Requirements) are required for this minor.

**Minor in Artificial Intelligence**

The minor consists of five courses. Every student who takes the minor in artificial intelligence must take the two courses, ENGR 131 Elementary Computer Programming and CSDS 391 Introduction to Artificial Intelligence. Students who take the Artificial Intelligence minor must also take an additional three courses from one of two minor tracks.

**Technology Track (requires 3 of the following courses):**

<table>
<thead>

**Minor in Computer Gaming (CGM)**

The Department of Electrical, Computer, and Systems Engineering offers a minor in Computer Gaming (CGM). For more information on the requirements for the minor, visit the Electrical, Computer, and Systems Engineering General Bulletin page (p. 116).

**MS Degree Program (Computer Science)**

The Master of Science in Computer Science has replaced the Master of Science in Computing and Information Science.

MS in CS has three tracks: a Course-Focused track, a Project-Focused track, and a Thesis-Focused track. Although all of the three options require 30 semester hours of credit, they are structured differently to achieve different objectives. The Course-Focused track prepares students for advanced industry employment and should be treated as a terminal MS degree in CS. The Project-Focused track if for students who seek opportunities for completing an applied project, for example within the context of an established collaboration with industry. The Thesis-Focused track is mainly for students who have interests in research. Therefore, the three tracks have different requirements in admission, advising, and course work.

**Admission**

Graduate students shall be admitted to the MS degree program upon recommendation of the faculty of the CS program. Requirements for admission include a strong record of scholarship in a completed bachelor’s degree program in computer science and related areas, and fluency in written and spoken English. The University requires all foreign applicants to show English proficiency by achieving a TOEFL score of at least 90 on the internet-based exam for the thesis-focused or the project-focused track. For the course-focused track, a minimum TOEFL score of 80 is required. For students who are expected to have any professional student to student interaction, e.g., as a teaching assistant, a lab instructor, or a tutor, a minimum TOEFL score of 90 is required. It is required that all students submit original copies of GRE scores, with the exception of CWRU students applying to the BS/MS program.

The MS program requires students to have substantial knowledge of undergraduate computer science material. Applications from students with a bachelor’s degree in fields other than computer science may be granted admission on a provisional basis. Students should have knowledge equivalent to that in the courses:

- CSDS 233 Introduction to Data Structures
- CSDS 310 Algorithms
- Any one course listed as an undergraduate Computer Science Breadth Requirement

Students deficient in one or more of these areas (admission with provision) may be required to satisfy this requirement by taking the corresponding courses listed above. These courses cannot be counted towards their MS requirement. However, a student taking and passing a course that subsumes one of the requirements automatically demonstrates knowledge of the material in the required course; e.g., taking CSDS 410 Analysis of Algorithms demonstrates knowledge of the
material in CSDS 310 Algorithms. Such graduate level courses will be used to satisfy their MS requirement.

Applicants lacking the required background are encouraged to explore the Computer Science pathway options. Additional information on the Computer Science pathway can be obtained by contacting the department.

**Registration**

Course registration can be performed through the SIS system. Each semester before registration, students should update any personal information that may have changed by logging onto the SIS and editing the appropriate information. All registration holds must be lifted in order to successfully complete the registration process.

**Advising**

Each MS student will be assigned an academic advisor, who will assist the student in formulating an academic program. A student in the thesis-focused or project-focused track is expected to pick a research advisor in the program by the end of their first semester. The research advisor will supervise the student's thesis or project and also serves as the academic advisor. A student whose research advisor is a faculty member not in the CDS department must maintain an academic advisor in the CS program. Each student, in consultation with their advisor(s), must submit a Planned Program of Study preferably before completing 9 credit hours of coursework. This should specify all courses and thesis/project work that will be counted toward the 30 credit hour requirement.

**Requirements of different tracks**

The Course-Focused MS degree program requirements consist of the completion of 30 hours of approved coursework, satisfactory completion of a comprehensive exam, i.e., passing the course ENGR 600 with a grade of "P". ENGR 600 consists of Comprehensive Exam questions that are administered in CSDS 410 Analysis of Algorithms, CSDS 425 Computer Networks I, CSDS 440 Machine Learning, CSDS 444 Computer Security, and CSDS 493 Software Engineering. Students must take and pass questions in at least two of these classes. Students who fail one exam in a course may retake that exam one more time but are not required to retake the associated course.

The Project-Focused track requires 24 semester hours of coursework credit and 6 semester hours of project (CSDS 695 Project M.S.).

The Thesis-Focused track requires 18 semester hours of coursework credit and 12 hours of thesis (CSDS 651 Thesis M.S.). A BS/MS student is required to choose the thesis-focused track initially.

Both the Thesis-Focused and the Project-Focused track require a formal written report, as well as a final oral examination by a committee of at least three faculty members, two of whom must be primarily affiliated with the CS program. The academic advisor is normally one of the committee members. For Project-Focused track students, the oral examination fulfills the Comprehensive Examination requirement of the School of Graduate Studies.

If a student wishes to switch from one track to another, the following requirements apply:

- Deadline. In each semester, students must request to switch track one week before the date at which Drop/Add ends, as stated in the academic calendar.
- Course-only or Project to Thesis. A course-only student may request to switch to the thesis track only if she (1) has already taken at least 9 credit hours of letter graded CSDS courses and (2) has a GPA of 3.5 or higher and (3) has a TOEFL score of 90 or higher and (4) has the recommendation of a CDS advisor or (co)advisor.
- Course-only to Project. A course-only student may request to switch to the thesis track only if she (1) has a TOEFL score of 90 or higher and (2) has the recommendation of a CDS advisor or (co)advisor.
- Thesis to Project, or Thesis to Course-only. Such a transfer needs approval from the student's advisor and the department chair.
- Petition. If a student fails to satisfy the transfer requirements, a petition may be submitted by a CDS advisor or (co)advisor to the department chair. In no case, petitions may be submitted by non-CDS faculty members or by students.

Students should consult with their academic advisor and/or department to determine the detailed requirements within this framework.

**Course Requirements**

For all three tracks, at least 18 hours of coursework must be at the 400 level or above. All students are required to have specialized knowledge in at least one of the following depth areas, by taking at least three graduate-level classes from that area. The list of acceptable classes is shown below. For research or project-focused tracks, the chosen area should correspond to the student’s thesis research area or project in general. CSDS 600 Special Topics classes will also qualify in this category with approval from the student’s advisor. The remaining classes can be (i) any other class from the classes listed below, or (ii) any letter graded CDS class (see note below), or (iii) at most two graduate-level classes other than those in category (i) and (ii) (such as non-letter-graded graduate CDS classes or graduate classes in other departments).

(Note: The Graduate School and the School of Engineering limit the number of undergraduate courses that can be taken for credit by Master students.)

Students should discuss their courses with their advisor every semester prior to registration. Students must achieve a grade point average of 3.0 or higher; it is computed for all of the letter-graded courses on the student's academic program.

**List of depth areas and corresponding courses**

1. **Algorithms & Theory**:
   a. CSDS 410 Analysis of Algorithms
   b. CSDS 440 Machine Learning
   c. CSDS 455 Applied Graph Theory
   d. CSDS 456 Data Privacy
   e. CSDS 477 Advanced Algorithms
   f. MATH 408 Introduction to Cryptology

2. **Artificial Intelligence**:
   a. CSDS 440 Machine Learning
   b. CSDS 442 Causal Learning from Data
   c. CSDS 455 Applied Graph Theory
   d. ECSE 484 Computational Intelligence I: Basic Principles
   e. CSDS 491 Artificial Intelligence: Probabilistic Graphical Models
   f. CSDS 496 Artificial Intelligence: Sequential Decision Making
   g. CSDS 497 Artificial Intelligence: Statistical Natural Language Processing
   h. CSDS 499 Algorithmic Robotics
   i. CSDS 465 Computer Vision

3. **Bioinformatics**:
a. CSDS 410 Analysis of Algorithms
b. CSDS 435 Data Mining
c. CSDS 440 Machine Learning
d. CSDS 456 Data Privacy
e. EECS 458 Introduction to Bioinformatics
f. EECS 459 Bioinformatics for Systems Biology
g. SYBB 412 Survey of Bioinformatics: Programming for Bioinformatics

4. Computer Networks and Systems:
   a. CSDS 427 Internet Security and Privacy
   b. ECSE 414 Wireless Communications
   c. CSDS 425 Computer Networks I
   d. CSDS 428 Computer Communications Networks II
   e. CSDS 438 High Performance Computing
   f. CSDS 444 Computer Security
   g. STAT 425 Network Security

5. Databases and Data Mining:
   a. CSDS 405 Data Structures and File Management
   b. CSDS 433 Database Systems
   c. CSDS 435 Data Mining
d. CSDS 439 Web Data Mining
e. CSDS 440 Machine Learning
f. STAT 426 Multivariate Analysis and Data Mining
g. PQHS 471 Machine Learning & Data Mining

6. Security and Privacy:
   a. CSDS 427 Internet Security and Privacy
   b. CSDS 444 Computer Security
c. CSDS 448 Smartphone Security
d. CSDS 456 Data Privacy
e. CSDS 493 Software Engineering
f. MATH 408 Introduction to Cryptology

7. Software Engineering:
   a. CSDS 425 Computer Networks I
   b. CSDS 433 Database Systems
c. CSDS 438 High Performance Computing
d. CSDS 442 Causal Learning from Data
e. CSDS 444 Computer Security
f. CSDS 448 Smartphone Security
g. CSDS 493 Software Engineering

PhD Degree Program (Computer Science)

The Doctor of Philosophy in Computer Science has replaced the Doctor of Philosophy in Computing and Information Science.

Admission

Requirements for admission include a strong record of scholarship in a completed bachelor’s degree program in computer science and related areas, and fluency in written and spoken English. The University requires all foreign applicants to show English proficiency by achieving a TOEFL score of at least 577 on the paper-based exam or 90 on the internet-based exam. It is required that all students submit original copies of GRE scores. When applying to this program, please select the Computer Science option in your application.

Registration

Course registration (including submission of the Academic Program) can be performed through SIS. Each semester before registration, students should update any personal information that may have changed by logging onto the SIS and editing the appropriate information. All registration holds must be lifted in order to successfully complete the registration process.

PhD Requirements

Each student must satisfy requirements in the following categories:

- Course Work
- Mathematics and Science Requirement
- Research Proposal
- Qualifying Examination
- Dissertation

All programs of study must contain at least 36 hours of courses past the undergraduate degree. All courses must be at the 400-level or higher. Six hours must be in a basic science or mathematics. A minimum of 12 hours must be in courses outside the student's thesis area. A student must have attained a minimum 3.25 grade point average (GPA) at the time of graduation. The minimum GPA is calculated based on all courses in the student's Program of Study that carry quality points.

These regulations are in addition to the Academics Regulations of the School of Graduate Studies and the Specific Requirements for the PhD Degree of the Graduate Program in the Case School of Engineering as found in the General Bulletin of Case Western Reserve University.

Academic Advisor and Research Advisor

Upon arrival, each graduate student is assigned an academic advisor from the Computer Science (CS) program faculty, typically the CS graduate representative. By the end of the second semester of study, a PhD student should transfer to a research advisor who may or may not be the same as the academic advisor. Once a research advisor is selected, the research advisor will also serve as the academic advisor, with whom a student consults to ensure that the balance of the PhD course work constitutes a coherent program of study.

If the research advisor is not from the Computer Science program, the student must have an academic advisor from the CS program. The academic advisor may serve as a research co-advisor if so desired by the student and the research advisor.

Academic Program

Each PhD student must submit an Academic Program detailing his or her course work, Qualifying Examination and dissertation schedules. The Academic Program lists all courses taken beyond the undergraduate degree and shows how these courses satisfy the following course requirements for the PhD:

1. The minimum course requirement beyond the BS level is 36 credit hours of courses taken for credit, at least 18 hours of which must be taken at CWRU. The following courses taken for credit will be acceptable:
   - All 400, 500, 600 level courses.
   - Graduate level courses taken at other institutions approved by the student's advisor.

The above courses must include the following:

- 1.1 - A minimum of 12 credit hours in the student's dissertation research area.
1.2 - A minimum of 6 credit hours in mathematics or basic science.
1.3 - A minimum of 12 credit hours of breadth courses that are not in the student's dissertation research area.
   • Note: The courses for items 1.1, 1.2, and 1.3 must be disjoint.
1.4 - A minimum of 18 credit hours of courses approved by the Computer Science program which can be courses used in item 1.1 and item 1.3. These approved Computer Science courses are listed below.

2. A minimum of 18 credit hours of CSDS 701 Dissertation Ph.D..

3. The cumulative grade-point average of all CWRU courses on the program of study must be at least 3.25.

4. All PhD students are required to register for and pass CSDS 400T Graduate Teaching I, CSDS 500T Graduate Teaching II and CSDS 600T Graduate Teaching III which are 0 credit hour courses that provide students with teaching experience.

5. All PhD students are required to register for and pass three semesters of "CSDS 500 CSDS Colloquium" (a 0 credit hour course) before advancement to candidacy and complete a public presentation of their work.

The Academic Program must be approved by the student's academic advisor and the chair of the CDS Department, and it must be approved before the student advances to candidacy.

**Qualifying Examination**
The Computer Science PhD qualifying examination is in the form of an oral exam and a written report, assessing the student's ability to survey a specific research topic, discuss the state-of-the-art in depth, provide a critical description of the literature, and propose creative ideas on improving the state-of-the-art. The written and oral parts of the exam are administered by a committee consisting of three faculty members. The exam is supplemented by the evaluation of the student's course performance and the final decision is made in a meeting of faculty affiliated with the CS program.

Students who hold a MS degree are required to take the qualifying exam at the start of their 3rd semester, and pass the qualifying exam before the start of their 4th semester in the PhD program. Students who do not hold a MS degree are required to take the qualifying exam at the start of their 5th semester, and pass the qualifying exam before the start of their 6th semester in the PhD program.

**Committee:** The exam will be administered by a committee composed of 3 faculty members, at least 2 of them being faculty members whose primary affiliation is Computer Science. The student will provide 0 to 3 names as suggested committee members and the CS Graduate Committee will appoint the committee, taking into account the student's suggestion and maintenance of the load balance of the faculty. If the student has research advisors at the time of the exam, then one advisor must be a member of the committee. Multiple advisors cannot serve on the committee, and no advisors can serve as the chair of the committee. The CS Graduate Committee will make every effort to include a faculty member outside the research area in the committee. The committee must be appointed at least 2 months prior to the exam.

**Format:** The student will select a research area from the following list:

1. Algorithms and Theory
2. Artificial Intelligence
3. Bioinformatics
4. Computer Networks and Systems
5. Databases and Data Mining
6. Security and Privacy
7. Software Engineering

The exam committee will ask the student to write a report that adequately demonstrates the student's ability to perform research in their chosen area of research. Specific examples of this might be a survey of a broad area and/or approaches to a specific problem in the area. This will be followed by an oral examination.

**Written Report:** The student will submit a written report on the specific research problem. The report has to adequately describe the problem and justify its relevance, identify the challenges associated with the problem, provide a broad classification of existing approaches, point out their key differences and trade-offs, identify limitations, and propose solutions for these limitations. The report must be at most 10 pages in length (11 pt font, single-spaced, single column, 1" margins) and use illustrative figures, tables, and other visual material to communicate key ideas. In addition, the report must include a comprehensive list of references. The written report must be submitted to the exam committee three weeks before the date of the oral exam.

**Oral Exam:** In the oral exam, the student will answer questions by the committee members on a specific research problem chosen by the committee in the selected research area, assessing the knowledge, technical depth, and broader vision of the student on the problem. The committee may also ask questions on the fundamentals of computer science as they relate to the specific research problem. The student may prepare slides in advance that will help answer questions or use the chalk board (or both), but the exam will not be in the format of a presentation. The exam will be one hour in duration. All students who are taking the exam for the first time have to take their oral exam in the week prior to the beginning or in the first two weeks of the Fall semester.

**Scoring:** Each of the three committee members will prepare a report rating the student's exam performance according to the following criteria:

- **Fundamentals:** Does the student have broad knowledge of fundamental concepts in computer science that will enable the student to understand and tackle the challenges in the specific research area?
- **Knowledge of Chosen Area:** Does the student have sufficient technical depth and command of the key challenges and the state-of-the-art in the chosen area of research?
- **Vision:** Does the student demonstrate a solid understanding of the relevance of the problem in the context of scientific progress and societal needs? Does the student show creativity in innovating their chosen area of research?
- **Communication:** Can the student explain the concepts in an accessible and comprehensible manner and handle questions effectively?

Possible ratings are 2 (Pass), 1 (Retake), or 0 (Fail).

**Course Work:** The student’s performance in all courses taken before the exam will also be considered by the CS program faculty in making a decision. At the time of the exam, the student must have completed
at least two 400-level Computer Science courses with a "B" or above. One of these courses must be CSDS 410 Analysis of Algorithms or CSDS 477 Advanced Algorithms. The second course must be relevant to their chosen area of research. The relevance of the additional course to the research area is subject to approval by the CS Graduate Studies Committee. The following courses are pre-approved for each area:

1. Algorithms and Theory:
   a. CSDS 410 Analysis of Algorithms
   b. CSDS 477 Advanced Algorithms
2. Artificial Intelligence:
   a. CSDS 440 Machine Learning
   b. CSDS 491 Artificial Intelligence: Probabilistic Graphical Models
3. Bioinformatics:
   a. CSDS 458 Introduction to Bioinformatics
   b. CSDS 459 Bioinformatics for Systems Biology
4. Computer Networks and Systems:
   a. CSDS 425 Computer Networks I
   b. CSDS 428 Computer Communications Networks II
   c. CSDS 427 Internet Security and Privacy
5. Databases and Data Mining:
   a. CSDS 433 Database Systems
   b. CSDS 435 Data Mining
6. Security and Privacy:
   a. CSDS 427 Internet Security and Privacy
   b. CSDS 444 Computer Security
   c. CSDS 448 Smartphone Security
   d. CSDS 456 Data Privacy
7. Software Engineering:
   a. CSDS 493 Software Engineering

Outcome: The final decision will be made by the CS program faculty based on the committee’s reports and the student’s coursework. The outcome of the exam will be one of Pass (the student advances to candidacy), Retake (the student has to retake the exam once more before the end of the following semester. The Retake decision can be partial, i.e. the student may be asked to retake the oral exam only, rewrite the report only, or take/retake a course), Fail (the student will be separated from the PhD program). The decision will be documented by the CS graduate chair and the student will be sent a notification letter.

Advancement to Candidacy
A student formally advances to candidacy after passing the Qualifying Examination and finding a faculty member who agrees to be the student’s research advisor. The student should advance to candidacy within one semester of passing the Qualifying Examination.

Students should submit documentation, approved by the academic and research advisor(s), to the Chairman of the Graduate Studies Committee of Computer Science to be admitted to candidacy.

Students who have failed to complete the conditions above within the time limit will be separated from the PhD program. Separation may also occur in the event of failure of the student to maintain a satisfactory GPA. A student who has been separated may not undertake further study for credit toward the PhD degree. With the approval of the Department and the Dean of Graduate Studies, such a student may complete a master’s degree, may register as a non-degree student or seek admission to the graduate program of another department.

Dissertation Advisory Committee
Each PhD student must form a Dissertation Advisory Committee which consists of at least 4 members of University faculty. The student’s academic advisor serves as the chair of this committee. Both the chair of the committee and at least one other member must be a regular faculty member whose primary affiliation is with the Computer Science program. The committee must also include one member whose primary appointment is not in the Computer Science program.

Dissertation Proposal
The PhD student must write a formal thesis proposal and defend it in an oral presentation to his or her Dissertation Advisory Committee. Normally this is done within a year of advancing to candidacy. A student who fails to defend his or her thesis proposal can attempt to defend it a second time after modifying the thesis proposal, but a second failure will cause the student to be separated from the program.

Dissertation
The student’s dissertation must be original research in CS which represents a significant contribution to existing knowledge in the student’s research area, a portion of which must be suitable for publication in reputable research journals or selective peer-reviewed conferences. In addition to the written dissertation, the doctoral candidate must pass an oral examination in defense of the dissertation. The Dissertation Advisory Committee is responsible for certifying that the quality and suitability of the material presented in the dissertation meet acceptable scholarly standards. If the student has not publicly presented their work at a conference or similar external venue, they must also present the dissertation research in a departmental seminar.

Course List for Program of Study Requirement
CSDS 405 Data Structures and File Management
CSDS 410 Analysis of Algorithms
CSDS 425 Computer Networks I
CSDS 427 Internet Security and Privacy
CSDS 428 Computer Communications Networks II
CSDS 433 Database Systems
CSDS 435 Data Mining
CSDS 438 High Performance Computing
CSDS 439 Web Data Mining
CSDS 440 Machine Learning
CSDS 442 Causal Learning from Data
CSDS 444 Computer Security
CSDS 448 Smartphone Security
CSDS 455 Applied Graph Theory
CSDS 456 Data Privacy
CSDS 458 Introduction to Bioinformatics
CSDS 459 Bioinformatics for Systems Biology
CSDS 466 Computer Graphics
CSDS 477 Advanced Algorithms
ECSE 484 Computational Intelligence I: Basic Principles
CSDS 491 Artificial Intelligence: Probabilistic Graphical Models
CSDS 493 Software Engineering
CSDS 496 Artificial Intelligence: Sequential Decision Making
CSDS 497 Artificial Intelligence: Statistical Natural Language Processing
ECSE 499 Algorithmic Robotics

**Colloquium and Presentation Requirement**

**PhD Students**

The requirement has two parts: (1) passing 3 semesters of CSDS 500 CSDS Colloquium, and (2) a public presentation.

(1) **All PhD students are required to register for and pass CSDS 500 CSDS Colloquium for a total of three semesters of the PhD Program, and this is expected before Advancement to Candidacy. (This is a 0 credit hour required course.) Students (such as students working in industry) may propose an alternative arrangement for fulfilling this requirement, by submitting a written petition to the Graduate Studies Committee.**

(2) **All PhD students must give a public presentation of their research, in addition to their PhD dissertation defense. This presentation must be given either at a research conference or in the CDS seminar series.**

**Facilities**

**Computer Facilities**

The department computer facilities incorporate both Unix/Linux and Microsoft Windows-based operating systems on high-end computing workstations for education and research. A number of file, printing, database, and authentication servers support these workstations, as well as the administrative functions of the department. Labs are primarily located in the Olin and Glennan buildings, but include Nord Hall, and are networked via the Case network.

The Case network is a state-of-the-art, high-speed fiber optic campus-wide computer network that interconnects laboratories, faculty and student offices, classrooms, and student residence halls. It is one of the largest fiber-to-desktop networks anywhere in the world. Every desktop has a 1 Gbps (gigabit per second) connection to a fault-tolerant 10 Gbps backbone. To complement the wired network, over 1,200 wireless access points (WAPs) are also deployed allowing anyone with a laptop or wireless enabled PDA to access resources from practically anywhere on campus.

Off-campus users, through the use of virtual private network (VPN) servers, can use their broadband connections to access many on-campus resources, as well as software, as if they were physically connected to the Case network. The department and the university participate in the Internet2 and National Lambda Rail projects, which provides high-speed, inter-university network infrastructure allowing for enhanced collaboration between institutions. The Internet2 infrastructure allows students, faculty and staff alike the ability to enjoy extremely high-performance connections to other Internet2 member institutions.

Aside from services provided through a commodity Internet connection, Case network users can take advantage of numerous online databases such as EUCLIDplus, the University Libraries’ circulation and public access catalog, as well as Lexus-Nexus™ and various CD-ROM based dictionaries, thesauri, encyclopedias, and research databases. Many regional and national institutional library catalogs are accessible over the network, as well.

**Additional Department Facilities**

**Jennings Computer Center and Undergraduate Computer Lab**

Supported by an endowment from the Jennings Foundation, this lab provides our students with the educational resources necessary for their classwork and exploration of the art of computing. This lab has both PCs and Linux/Unix workstations and includes two high-speed laser printers. This laboratory on the 8th floor of the Olin building supports the freshman computing classes: ENGR 131 Elementary Computer Programming and CSDS 132 Introduction to Programming in Java, as well as other classes that have a lab component.

**Nord Computer Laboratory**

This is a general-purpose computer facility that is open 24 hours a day, to all students. The lab contains 50 PCs running Windows and four Apple Macintosh computers. Facilities for color printing, faxing, copying and scanning are provided. Special software includes PRO/Engineer, ChemCAD and Visual Studio. Visit the website (https://engineering.case.edu/it/nord-computer-lab/) for more information.

**Virtual Worlds (Gaming and Simulation) Laboratory**

The Virtual Worlds Gaming and Simulation Laboratory provides software and hardware to support education and research in computer gaming and simulation activities within the Computer and Data Sciences Department and the University at large. The lab has been leveraged to provide students with extensive gameplay opportunities and excellent, strongly experiential simulation and game development educational opportunities – primarily targeted to the CDS undergraduate population.

The lab also stimulates large amounts of cross-disciplinary collaboration in both education and research. Simulation and visualization techniques are of great value in all science and engineering fields, and the lab is capable of supporting advanced applications of these techniques in real-time applications. In addition, interactive technologies and video games require substantial artistic resources, which has resulted in excellent opportunities for educational and research collaboration with the Cleveland Institute of Art (CIA), the School of Nursing, the Medical School, and the Psychology Department. Of particular note has been the Advanced Game Project course (CSDS 390 Advanced Game Development Project) taught jointly by CWRU and CIA for juniors and seniors. This course has been very popular and has provided truly excellent student game design and production experiences while receiving industrial and popular recognition and acclaim. In addition, an entry-level computer game programming course (CSDS 290 Introduction to Computer Game Design and Implementation) is available for students who have taken both a Java-based programming course and a data structures course to provide an introduction to many of the technical aspects of computer game development. Many other courses in the department also use the lab as an important part of their curriculum including courses on computer graphics, artificial intelligence, simulation, digital signal processing, and control systems. The lab also supports research in the department requiring significant computational resources, e.g. GPU acceleration, VLSI simulation, etc.

A recent large donation for the lab has allowed for the update and renovation of the entire lab including the physical infrastructure (carpeting, furniture, etc.), the gaming PCs, and the gaming consoles. In
addition, a new VR and AR room has been added to represent this new area connected strongly to computer gaming. The lab is now structured into a PC gaming area and an adjacent gaming console area, a VR/AR room, a portable gaming development room, and a team collaboration room.

The renovated lab includes the following primary equipment:

- 24 New Alienware PCs with Dell 27” 4K monitors
- 4 Sony Bravia Television monitors 75” 3DTV
- 2 Microsoft HoloLens AR Units
- 4 Oculus Rift VR units with Haptic Touch Input devices
- A 3D projector (and large wall screen) with 3D capability for common presentations
- 4 Xbox One Units with Xbox One controllers
- 4 PS4 Sony PlayStation units with controllers

Sally & Larry Sears Undergraduate Design Laboratory

This laboratory supports CDS/ECSE courses in circuits and includes a state-of-the-art lecture hall, a modernistic glass-walled lab, an electronics “store”, and a student lounge and meeting area. Specialized lab space is available for senior projects and sponsored undergraduate programs. The lab is open to all undergraduates, and components are provided free of charge, so students can “play and tinker” with electronics and foster innovation and creativity. The laboratory provides access to PCs, oscilloscopes, signal generators, logic analyzers, and specialized equipment such as RF analyzers and generators. In addition, the lab includes full-time staff dedicated to the education, guidance and mentoring of undergraduates in the “art and practice” of hands-on engineering.

This is the central educational resource for students taking analog, digital, and mixed-signal courses in electronics, and has been supported by various corporations in addition to alumnus Larry Sears, a successful engineer and entrepreneur. Basic workstations consist of Windows-based computers equipped with LabView software, as well as Agilent 546xx oscilloscopes, 33120A Waveform Generators, 34401A Digital Multimeters, and E3631A power supplies. Advanced workstations are similarly configured, but with a wider variety of high-performance test equipment.

Courses

CSDS 132. Introduction to Programming in Java. 3 Units.

An introduction to modern programming language features, computer programming and algorithmic problem solving with an emphasis on the Java language. Computers and code compilation; conditional statements, subprograms, loops, methods; object-oriented design, inheritance and polymorphism, abstract classes and interfaces; types, type systems, generic types, abstract data types, strings, arrays, linked lists; software development, modular code design, unit testing; strings, text and file I/O; GUI components, GUI event handling; threads; comparison of Java to C, C++, and C#. Offered as CSDS 132 and ECSE 132. Counts for CAS Quantitative Reasoning Requirement.

CSDS 133. Introduction to Data Science and Engineering for Majors. 3 Units.

This course is an introduction to data science and analytics. In the first half of the course, students will develop a basic understanding of how to manipulate, analyze and visualize large data in a distributed computing environment, with an appreciation of open source development, security and privacy issues. Case studies and team project assignments in the second half of the course will be used to implement the ideas. Topics covered will include: Overview of large scale parallel and distributed (cloud) computing; file systems and file I/O; open source coding and distributed versioning, data query and retrieval; basic data analysis; visualization; data security, privacy and provenance. Prereq: ENGR 131 or EECS 132.

CSDS 233. Introduction to Data Structures. 4 Units.

This course provides an introduction to data structures. Different representations of data: lists, stacks and queues, trees, graphs, and files. Manipulation of data: searching and sorting, hashing, recursion and higher order functions. Abstract data types, templating, and the separation of interface and implementation. Introduction to asymptotic analysis. The Java language is used to illustrate the concepts and as an implementation vehicle throughout the course. Offered as CSDS 233 and ECSE 233. Prereq: CSDS 132 or ECSE 132.

CSDS 234. Structured and Unstructured Data. 3 Units.

This course is an introduction to types of data and their representation, storage, processing and analysis. The course has three parts. In the first part of the course, students will develop a basic understanding and the ability to represent, store, process and analyze structured data. Structured data include catalogs, records, tables, logs, etc., with a fixed dimension and well-defined meaning for each data point. Suitable representation and storage mechanisms include lists and arrays. Relevant techniques include keys, hashes, stacks, queues and trees. In the second part of the course, students will develop a basic understanding and the ability to represent, store, process and analyze semi-structured data. Semi-structured data include texts, web pages and networks, without a dimension and structure, but with well-defined meaning for each data point. Suitable representation and storage mechanisms include trees, graphs and RDF triples. Relevant techniques include XML, YAML, JSON, parsing, annotation, language processing. In the third part of the course, students will develop a basic understanding and the ability to represent, store, process and analyze unstructured data. Unstructured data include images, video, and time series data, without either a fixed dimension and structure, nor well-defined meaning for individual data points. Suitable representation and storage mechanisms include large matrices, EDF, DICOM. Relevant techniques include feature extraction, segmentation, clustering, rendering, indexing, and visualization. Prereq: CSDS 133.

CSDS 236. Introduction to C/C++ Programming. 1 Unit.

This course provides an introduction to C and C++ programming languages. Prior knowledge of these languages is not expected. However, students are expected to know at least one programming language prior to the class. The lectures will cover low-level programming techniques and object-oriented class design. Students will learn specific topics in C/C++ including required background knowledge, pointers & references, memory management, inheritance, polymorphism, templates, exceptions, use of debugging and compiler tools, and others as time permits. Prereq: CSDS 132.
CSDS 275. Fundamentals of Robotics. 4 Units.
The Fundamentals of Robotics course will expose students to fundamental principles of robotics. Students will explore high level conceptual foundations of robotics beginning with Bratneberg vehicles and apply this knowledge to simulated and physical robot hardware in laboratory experiences and in a final project. Laboratory experiences will guide students through applying theory to practice increasingly complex tasks in a project oriented, group work environment. The course culminates in a robotics challenge project at the end of the semester. Topics covered are: sensors, actuators, kinematics, control, planning and programming. Programming languages and concepts (e.g., C++, object oriented programming) used in robotics will be introduced and used with modern robotics programming toolboxes and frameworks. Prior experience with these languages will not be necessary. Previous experience with robotics is not required for this course. Offered as CSDS 275 and ECSE 275. Prereq: (ENGR 131 or EECS 132) and PHYS 121 and MATH 121.

CSDS 281. Logic Design and Computer Organization. 4 Units.
Fundamentals of digital systems in terms of both computer organization and logic level design. Organization of digital computers; information representation; boolean algebra; analysis and synthesis of combinational and sequential circuits; datapaths and register transfers; instruction sets and assembly language; input/output and communication; memory. Offered as CSDS 281 and ECSE 281. Prereq: ENGR 131 or CSDS 132.

CSDS 285. Linux Tools and Scripting. 3 Units.
A fast paced introduction to linux that brings the project-oriented student from little or no linux experience to be fully capable of using scripting languages as tools in a linux command-line environment. This includes systems administration and agile web services with server-side scripting and server-side management. This also involves data cleaning, scraping, wrangling, and processing user data with regular expressions. Current main languages include php, bash, awk, with some client-side javascript, and very brief looks at tcl/lua, powershell, and python. Tools include vim, make, grep/sed, and curl/wget. Recommended preparation: one year of computer programming and familiarity with raw HTML/CSS. Prereq: CSDS 132.

CSDS 290. Introduction to Computer Game Design and Implementation. 3 Units.
This class begins with an examination of the history of video games and of game design. Games will be examined in a systems context to understand gaming and game design fundamentals. Various topics relating directly to the implementation of computer games will be introduced including graphics, animation, artificial intelligence, user interfaces, the simulation of motion, sound generation, and networking. Extensive study of past and current computer games will be used to illustrate course concepts. Individual and group projects will be used throughout the semester to motivate, illustrate and demonstrate the course concepts and ideas. Group game development and implementation projects will culminate in classroom presentation and evaluation. Offered as CSDS 290 and ECSE 290. Prereq: EECS 132 or CSDS 132.

CSDS 293. Software Craftsmanship. 4 Units.
A course to improve programming skills, software quality, and the software development process. Software design; Version control; Control issues and routines; Pseudo-code programming process and developer testing; Defensive programming; Classes; Debugging; Self-documenting code; Refactoring. Offered as CSDS 293 and CSDS 293N. Prereq: Computer Science Major and (CSDS 233 or ECSE 233 or EECS 233) with a C or higher.

CSDS 293N. Software Craftsmanship. 4 Units.
A course to improve programming skills, software quality, and the software development process. Software design; Version control; Control issues and routines; Pseudo-code programming process and developer testing; Defensive programming; Classes; Debugging; Self-documenting code; Refactoring. Offered as CSDS 293 and CSDS 293N. Prereq: (CSDS 233 or ECSE 233 or EECS 233) with a C or higher.

CSDS 296. Independent Projects. 1 - 3 Units.
Independent projects in Computer and Data Science. Recommended preparation: ENGR 131 or EECS/CSDS/ECSE 132. Prereq: Limited to freshmen and sophomore students.

CSDS 297. Special Topics. 1 - 3 Units.
Special topics in Computer and Data Science. Prereq: Limited to freshmen and sophomores.

CSDS 302. Discrete Mathematics. 3 Units.
A general introduction to basic mathematical terminology and the techniques of abstract mathematics in the context of discrete mathematics. Topics introduced are mathematical reasoning, Boolean connectives, deduction, mathematical induction, sets, functions and relations, algorithms, graphs, combinatorial reasoning. Offered as CSDS 302, ECSE 302 and MATH 304. Prereq: MATH 122 or MATH 124 or MATH 126.

CSDS 305. Files, Indexes and Access Structures for Big Data. 3 Units.
Database management become a central component of a modern computing environment, and, as a result, knowledge about database systems has become an essential part of education in computer science and data science. This course is an introduction to the nature and purpose of database systems, fundamental concepts for designing, implementing and querying a database and database architectures. Objectives: - An expert knowledge of basic data structures, basic searching, sorting, methods, algorithm techniques, (such as greedy and divide and conquer) - In-depth knowledge on Search and Index Structures for large, heterogeneous data including multidimensional data, high dimensional data and data in metric spaces (e.g., sequences, images), on different search methods (e.g. similarity searching, partial match, exact match), and on dimensionality reduction techniques. Prereq: CSDS 234 or ECSE 233.

CSDS 310. Algorithms. 3 Units.
Fundamentals in algorithm design and analysis. Loop invariants, asymptotic notation, recurrence relations, sorting algorithms, divide-and-conquer, dynamic programming, greedy algorithms, basic graph algorithms. Offered as CSDS 310 and CSDS 310N. Prereq: (Computer Science Major/Minor or Data Science Major or Biomedical Engineering Major on the Computing and Analysis Track) and (CSDS 302 or ECSE 302 or MATH 304 with a C or higher) and (CSDS 233 or ECSE 233 with a C or higher).

CSDS 310N. Algorithms. 3 Units.
Fundamentals in algorithm design and analysis. Loop invariants, asymptotic notation, recurrence relations, sorting algorithms, divide-and-conquer, dynamic programming, greedy algorithms, basic graph algorithms. Offered as CSDS 310 and CSDS 310N. Prereq: (CSDS 302 or ECSE 302 or MATH 304) with a C or higher and (CSDS 233 or ECSE 233) with a C or higher.
CSDS 312. Introduction to Data Science Systems. 3 Units.
An introduction to the software and hardware architecture of data science systems, with an emphasis on Operating Systems and Computer Architecture that are relevant to Data Sciences systems. At the end of the course, the student should understand the principles and architecture of storage systems, file systems (especially, HDFS), memory hierarchy, and GPU. The student should have carried out projects in these areas, and should be able to critically compare various design decisions in terms of capability and performance. Prereq: CSDS 132.

CSDS 313. Introduction to Data Analysis. 3 Units.
In this class we will give a broad overview of data analysis techniques, covering techniques from data mining, machine learning and signal processing. Students will also learn about probabilistic representations, how to conduct an empirical study and support empirical hypotheses through statistical tests, and visualize the results. Course objectives: -Expose students to different analysis approaches. -Understand probabilistic representations and inference mechanisms. -Understand how to create empirical hypotheses and how to test them. Prereq: EECS 340 and DSCI 234.

CSDS 314. Computer Architecture. 3 Units.
This course provides students the opportunity to study and evaluate a modern computer architecture design. The course covers topics in fundamentals of computer design, performance, cost, instruction set design, processor implementation, control unit, pipelining, communication and network, memory hierarchy, computer arithmetic, input-output, and an introduction to RISC and super-scalar processors. Offered as CSDS 314 and ECSE 314. Prereq: EECS 281.

CSDS 315. Scalable Parallel Data Analysis. 3 Units.
This course provides an introduction to scalable and parallel data analysis using the most common frameworks and programming tools in the age of big data. Covered topics include parallel programming models, parallel hardware architectures, multi-threaded, multi-core programming, cluster computing and GPU programming. The course is designed to provide a heavily hands-on experience with several programming assignments. Prereq: CSDS 312.

CSDS 325. Computer Networks I. 3 Units.
An introduction to computer networks and the Internet. Applications: http, ftp, e-mail, DNS, socket programming. Transport: UDP, TCP reliable data transfer, and congestion control. Network layer: IP routing, and NAT. Link layer: taxonomy, Ethernet, 802.11. Offered as CSDS 325 and CSDS 325N. Prereq: Computer Science Major with minimum Junior Standing and (CSDS 233 or ECSE 233 or EECS 233) with a C or higher.

CSDS 325N. Computer Networks I. 3 Units.
An introduction to computer networks and the Internet. Applications: http, ftp, e-mail, DNS, socket programming. Transport: UDP, TCP reliable data transfer, and congestion control. Network layer: IP routing, and NAT. Link layer: taxonomy, Ethernet, 802.11. Offered as CSDS 325 and CSDS 325N. Prereq: Minimum Junior Standing and (CSDS 233 or ECSE 233 or EECS 233) with a C or higher.

CSDS 335D. Data Mining for Big Data. 3 Units.
With the unprecedented rate at which data is being collected today in almost all fields of human endeavor, there is an emerging economic and scientific need to extract useful information from it. Data mining is the process of automatic discovery of patterns, changes, associations and anomalies in massive databases, and is a highly interdisciplinary field representing the confluence of several disciplines, including database systems, data warehousing, machine learning, statistics, algorithms, data visualization, and high-performance computing. This course is an introduction to the commonly used data mining techniques. In the first part of the course, students will develop a basic understanding of the basic concepts in data mining such as frequent pattern mining, association rule mining, basic techniques for data preprocessing such as normalization, regression, and classic matrix decomposition methods such as SVD, LU, and QR decompositions. In the second part of the course, students will develop a basic understanding of classification and clustering and be able to apply classic methods such as k-means, hierarchical clustering methods, nearest neighbor methods, association based classifiers. In the third part of the course, students will have a chance to study more advanced data mining applications such as feature selection in high-dimensional data, dimension reduction, and mining biological datasets. Prereq: CSDS 234 and CSDS 313.

CSDS 337. Compiler Design. 4 Units.
Design and implementation of compilers and other language processors. Scanners and lexical analysis; regular expressions and finite automata; scanner generators; parsers and syntax analysis; context free grammars; parser generators; semantic analysis; intermediate code generation; runtime environments; code generation; machine independent optimizations; data flow and dependence analysis. There will be a significant programming project involving the use of compiler tools and software development tools and techniques. Offered as CSDS 337 and ECSE 337. Prereq: (CSDS 233 or ECSE 233 or EECS 233) and (CSDS 281 or ECSE 281 or EECS 281).

CSDS 338. Intro to Operating Systems and Concurrent Programming. 4 Units.
Intro to OS: OS Structures, processes, threads, CPU scheduling, deadlocks, memory management, file system implementations, virtual machines, cloud computing. Concurrent programming: fork, join, concurrent statement, critical section problem, safety and liveness properties of concurrent programs, process synchronization algorithms, semaphores, monitors. UNIX systems programming: system calls, UNIX System V IPCs, threads, RPCs, shell programming. Offered as CSDS 338, ECSE, 338, CSDS 338N and ECSE 338N. Prereq: Computer Science Major or Minor and (CSDS 233 or ECSE 233 or EECS 233) with a C or higher.

CSDS 338N. Intro to Operating Systems and Concurrent Programming. 4 Units.
Intro to OS: OS Structures, processes, threads, CPU scheduling, deadlocks, memory management, file system implementations, virtual machines, cloud computing. Concurrent programming: fork, join, concurrent statement, critical section problem, safety and liveness properties of concurrent programs, process synchronization algorithms, semaphores, monitors. UNIX systems programming: system calls, UNIX System V IPCs, threads, RPCs, shell programming. Offered as CSDS 338, ECSE, 338, CSDS 338N and ECSE 338N. Prereq: (CSDS 233 or ECSE 233 or EECS 233) with a C or higher.
CSDS 339. Web Data Mining. 3 Units.
Web crawling technology, web search and information extraction, unsupervised and semi-supervised learning techniques and their application to web data extraction, social network analysis, various pagerank algorithms, link analysis, web resource discovery, web, resource description framework (RDF), XML, Web Ontology Language (OWL). Prereq: (CSDS 338 or ECSE 338) and CSDS 341 and (CSDS 302 or ECSE 302 or MATH 304).

CSDS 340D. Machine Learning for Big Data. 3 Units.
Machine learning is a sub-field of Artificial Intelligence that is concerned with the design and analysis of algorithms that "learn" and improve with experience. While the broad aim behind research in this area is to build systems that can simulate or even improve on certain aspects of human intelligence, algorithms developed in this area have become very useful in analyzing and predicting the behavior of complex systems. Machine learning algorithms have been used to guide diagnostic systems in medicine, recommend interesting products to customers in e-commerce, play games at human championship levels, and solve many other very complex problems. This course is an introduction to algorithms for machine learning and their implementation in the context of big data. We will study different learning settings, the different algorithms that have been developed for these settings, and learn about how to implement these algorithms and evaluate their behavior in practice. We will also discuss dealing with noise, missing values, scalability properties and talk about tools and libraries available for these methods. At the end of the course, you should be able to: --Understand when to use machine learning algorithms; --Understand, represent and formulate the learning problem; --Apply the appropriate algorithm(s) or tools, with an understanding of the tradeoffs involved including scalability and robustness; --Correctly evaluate the behavior of the algorithm when solving the problem. Prereq: CSDS 234 and CSDS 313.

CSDS 341. Introduction to Database Systems. 3 Units.
Relational model, ER model, relational algebra and calculus, SQL, OBE, security, views, files and physical database structures, query processing and query optimization, normalization theory, concurrency control, object relational systems, multimedia databases, Oracle SQL server, Microsoft SQL server. Offered as CSDS 341 and CSDS 341N. Prereq: Computer Science Major or Data Science and Analytics Major and (CSDS 302 or ECSE 302 or MATH 304) and (CSDS233 or ECSE 233) with a C or higher.

CSDS 341D. Introduction to Databases: DS Major. 3 Units.
Database management become a central component of a modern computing environment, and, as a result, knowledge about database systems has become an essential part of education in computer science and data science. This course is an introduction to the nature and purpose of database systems, fundamental concepts for designing, implementing and querying a database and database architectures. Weeks 1-6 provide an overview of basic database systems concepts including database design, database systems architecture, and database querying, using relational model and SQL as query language. Weeks 7-10 Objects, Semi structured data, XML and RDF basics. Weeks 11-14 provide an overview of more advanced topics including Database System Architectures (Parallel Databases and Distributed Databases), and Data Warehousing and Information Retrieval. Students cannot receive credit for both CSDS341 and CSDS341D. Prereq: CSDS 233 or ECSE 233 or CSDS 234.

CSDS 341N. Introduction to Database Systems. 3 Units.
Relational model, ER model, relational algebra and calculus, SQL, OBE, security, views, files and physical database structures, query processing and query optimization, normalization theory, concurrency control, object relational systems, multimedia databases, Oracle SQL server, Microsoft SQL server. Offered as CSDS 341 and CSDS 341N. Prereq: (CSDS 302 or ECSE 302 or MATH 304) with a grade of C or higher and (CSDS 233 or ECSE 233) with a C or higher.

CSDS 343. Theoretical Computer Science. 3 Units.
Introduction to different classes of automata and their correspondence to different classes of formal languages and grammars, computability, complexity and various proof techniques. Offered as CSDS 343 and MATH 343. Prereq: EECS 302 or MATH 304.

CSDS 344. Computer Security. 3 Units.
General types of security attacks; approaches to prevention; secret key and public key cryptography; message authentication and hash functions; digital signatures and authentication protocols; information gathering; password cracking; spoofing; session hijacking; denial of service attacks; buffer overruns; viruses, worms, etc., principles of secure software design, threat modeling; access control; least privilege; storing secrets; socket security; firewalls; intrusions; auditing; mobile security. Recommended preparation: EECS/CSDS/ECSE 132, EECS/CSDS 293, EECS/CSDS 325 and EECS/CSDS 338. Offered as CSDS 344 and CSDS 444.

CSDS 345. Programming Language Concepts. 3 Units.
This course examines the four main programming paradigms: imperative, object-oriented, functional, and logical. It is assumed that students will come to the course with significant exposure to object-oriented programming and some exposure to imperative programming. The course will teach the functional paradigm in depth, enhance the students' knowledge of the object-oriented and imperative paradigms, and introduce the logical paradigm. The course will explore language syntax, semantics, names/scopes, types, expressions, assignment, subprograms, abstraction and inheritance. This exploration will have several forms. Students will study the programming language concepts at a theoretical level, use the concepts in functional language programming, and implement the concepts by designing language interpreters. Offered as CSDS 345 and CSDS 345N. Prereq: Computer Science Major and (CSDS 302 or ECSE 302 or MATH 304) with a C or higher and (CSDS 233 or ECSE 233) with a C or higher.

CSDS 345N. Programming Language Concepts. 3 Units.
This course examines the four main programming paradigms: imperative, object-oriented, functional, and logical. It is assumed that students will come to the course with significant exposure to object-oriented programming and some exposure to imperative programming. The course will teach the functional paradigm in depth, enhance the students' knowledge of the object-oriented and imperative paradigms, and introduce the logical paradigm. The course will explore language syntax, semantics, names/scopes, types, expressions, assignment, subprograms, abstraction and inheritance. This exploration will have several forms. Students will study the programming language concepts at a theoretical level, use the concepts in functional language programming, and implement the concepts by designing language interpreters. Offered as CSDS 345 and CSDS 345N. Prereq: (CSDS 302 or ECSE 302 or MATH 304) with a C or higher and (CSDS 233 or ECSE 233) with a C or higher.
CSDS 356. Data Privacy. 3 Units.
Introduction to privacy, economics and incentives, crypto-based solution for privacy, hiding data from the database user, hiding access patterns from the database owner, anonymous routing and TOR, privacy in online social networks, privacy in cellular and Wi-Fi networks, location privacy, privacy in e-cash systems, privacy in e-voting, genomic privacy. Offered as CSDS 356 and CSDS 456. Prereq: (EECS 132 and EECS 233 and any STAT course) or (Graduate student in Computing & Info Science or Computer Engineering).

CSDS 364. Computational Perception. 3 Units.
An introduction to the information processing and computational algorithms that underlie perception. The course focuses on vision and audition but also covers other senses and various types of perceptual processing in biological systems. The motivating question is: What are the fundamental computational problems faced by perceptual systems in complex environments? The course draws from fields in engineering and the study of biological perception. Specific topics include signal detection and processing; sound localization; motion perception and estimation; sensory coding; perception of structure; active perception; perceptual invariance; attention; object, sound and speech recognition; visual and auditory scene analysis. Offered as CSDS 364 and CSDS 464. Prereq: CSDS 132 or ENGR 131.

CSDS 366. Computer Graphics. 3 Units.
Theory and practice of computer graphics: object and environment representation including coordinate transformations image extraction including perspective, hidden surface, and shading algorithms; and interaction. Covers a wide range of graphic display devices and systems with emphasis in interactive shaded graphics. Offered as CSDS 366, ECSE 366, CSDS 466 and ECSE 466. Prereq: EECS 233.

CSDS 373. Modern Robot Programming. 3 Units.
The goal of this course is to learn modern methods for building up robot capabilities using the Robot Operating System (ROS). Through a sequence of assignments, students learn how to write software to control both simulated and physical robots. Material includes: interfacing software to robot I/O; path and trajectory planning for robot arms; object identification and localization from 3-D sensing; manipulation planning; and development of graphical interfaces for supervisory robot control. Laboratory assignments are scheduled in small groups to explore implementations on specific robots. Graduate students will also perform an independent project. Offered as CSDS 373, ECSE 373, CSDS 473 and ECSE 473.

CSDS 376. Mobile Robotics. 4 Units.
Design of software systems for mobile robot control, including: motion control; sensory processing; localization and mapping; mobile-robot planning and navigation; and implementation of goal-directed behaviors. The course has a heavy lab component involving a sequence of design challenges and competitions performed in teams. Offered as CSDS 376 and ECSE 376. Prereq: CSDS 373 or CSDS 473.

CSDS 377. Introduction to Connected Devices. 3 Units.
Introduction to Connected Devices (e.g., Internet of Things). Undergraduates work in pairs to build a complete connected-device system, an embedded device with wireless networking, cloud and web, and mobile, and then develop hands-on experience with systems-level aspects of the connected-device system, including analytics, remote firmware update, load testing, and essential security. Students learn about current architectures, languages, and technologies, such as Pub/Sub (MQTT), Python, Objective-C, Python Django, JavaScript, HTML/CSS, and Bluetooth Low Energy. Offered as CSDS 377 and ECSE 377.

CSDS 386. Quantum Computing, Information, and Devices. 3 Units.
An introduction to the math, physics, engineering, and computer science underlying the rapidly emerging fields of quantum computing, quantum information, and quantum devices. The course is taught by a group of faculty from physics, engineering, computer science, and math, and is geared towards students with diverse backgrounds and interests in these fields. Students will select a concentration in one of these four areas, and the coursework, while still covering all topics, will be adjusted to focus on the selected area in the most detail. Note that the listed prerequisites depend on choice of concentration. Topics will include: 1. (Mathematics) Introduction to linear algebra, convex geometry, fundamental theory of quantum information. 2. (Physics) Introduction to the quantum mechanics of two-level systems (qubits). Survey of physics and materials for qubit technologies. 3. (Computer Science) Basic quantum gates and circuits, introduction to the theory of algorithms, survey of quantum algorithms. 4. (Engineering) Quantum architectures, mapping algorithms onto circuits. The course consists of lectures, homework, and group projects. Group projects will aim to synthesize the diverse backgrounds of the students and instructors to capture the interdisciplinary nature of the field. Students taking the course for graduate credit will complete an additional literature research project and presentation, in addition to enhanced problem sets. Offered as CSDS 386, CSDS 486, ECSE 386, ECSE 486, MATH 386, MATH 486, PHYS 386, and PHYS 486. Prereq: (CSDS 233 or ECSE 233) and (CSDS 281 or ECSE 281) and (MATH 201 or MATH 307) and (MATH 223 or MATH 227) and (PHYS 122 or PHYS 124).

CSDS 390. Advanced Game Development Project. 3 Units.
This game development project course will bring together an interprofessional group of students in the fields of engineering, computer science, and art to focus on the design and development of a complete, fully functioning computer game as an interdisciplinary team. The student teams are given complete liberty to design their own fully functional games from their original concept to a playable game published in an online marketplace. Student teams will experience the entire game development cycle as they execute their projects. Responsibilities include creating a game idea, writing a story, developing the artwork, designing characters, implementing music and sound effects, programming and testing the game, and publishing the final project. Students enrolled in 487 will develop a healthcare or education virtual environment or video game in collaboration with a mentor who has expertise in the chosen area. Offered as CSDS 390, ECSE 390, CSDS 487, and ECSE 487. Prereq: EECS 233 and EECS 290.

CSDS 391. Introduction to Artificial Intelligence. 3 Units.
This course is an introduction to artificial intelligence. We will study the concepts that underlie intelligent systems. Topics covered include problem solving with search, constraint satisfaction, adversarial games, knowledge representation and reasoning using propositional and first order logic, reasoning under uncertainty, introduction to machine learning, automated planning, reinforcement learning and natural language processing. Recommended: basic knowledge of probability and statistics. Prereq: ENGR 131 or CSDS 132 or ECSE 132.

CSDS 392. App Development for iOS. 3 Units.
This course is an introduction to app development for iPhone and iPad using Cocoa Touch Framework and Xcode development environment. Topics include Swift programming language and iOS SDK/foundations, object-oriented design and model-view-controller framework, user interface design using Xcode. Additional topics may include data management, map applications, animations and some recent developments in iOS. Recommended preparation: experiences in object-oriented programming and Mac OS; knowledge in software engineering and databases. Prereq: ECES 293 and Junior or Senior standing.
CSDS 393. Software Engineering. 3 Units.
Topics: Introduction to software engineering; software lifecycle models; development team organization and project management; requirements analysis and specification techniques; software design techniques; programming practices; software validation techniques; software maintenance practices; software engineering ethics. Undergraduates work in teams to complete a significant software development project. Graduate students are required to complete a research project. Offered as CSDS 393, CSDS 393N, and CSDS 493. Prereq: (Computer Science Major/Minor or Data Science Major) and (CSDS 233 or ECSE 233) with a C or higher.

CSDS 393N. Software Engineering. 3 Units.
Topics: Introduction to software engineering; software lifecycle models; development team organization and project management; requirements analysis and specification techniques; software design techniques; programming practices; software validation techniques; software maintenance practices; software engineering ethics. Undergraduates work in teams to complete a significant software development project. Graduate students are required to complete a research project. Offered as CSDS 393, CSDS 393N, and CSDS 493. Prereq: CSDS 233 or ECSE 233 with a C or higher.

CSDS 394. Introduction to Information Theory. 3 Units.
This course is intended as an introduction to information and coding theory with emphasis on the mathematical aspects. It is suitable for advanced undergraduate and graduate students in mathematics, applied mathematics, statistics, physics, computer science and electrical engineering. Course content: Information measures-entropy, relative entropy, mutual information, and their properties. Typical sets and sequences, asymptotic equipartition property, data compression. Channel coding and capacity; channel coding theorem. Differential entropy, Gaussian channel, Shannon-Nyquist theorem. Information theory inequalities (400 level). Additional topics, which may include compressed sensing and elements of quantum information theory. Recommended preparation: MATH 201 or MATH 307. Offered as CSDS 394, CSDS 394, ECSE 394, MATH 494, CSDS 494 and ECSE 494. Prereq: MATH 223 and MATH 380 or requisites not met permission.

CSDS 395. Senior Project in Computer Science. 4 Units.
Capstone course for computer science seniors. Material from previous and concurrent courses used to solve computer programming problems and to develop software systems. Professional engineering topics such as project management, engineering design, communications, and professional ethics. Requirements include periodic reporting of progress, plus a final oral presentation and written report. Scheduled formal project presentations during last week of classes. Counts as SAGES Senior Capstone. Prereq: Senior standing.

CSDS 396. Independent Projects. 1 - 6 Units.
Independent projects in Computer and Data Science. Prereq: Limited to juniors and seniors.

CSDS 397. Special Topics. 1 - 6 Units.
Special topics in Computer and Data Science. Prereq: Limited to juniors and seniors.

CSDS 400T. Graduate Teaching I. 0 Unit.
This course will provide the Ph.D. candidate with experience in teaching undergraduate or graduate students. The experience is expected to involve direct student contact but will be based upon the specific departmental needs and teaching obligations. This teaching experience will be conducted under the supervision of the faculty member who is responsible for the course, but the academic advisor will assess the educational plan to ensure that it provides an educational experience for the student. Students in this course may be expected to perform one or more of the following teaching related activities: grading homeworks, quizzes, and exams, having office hours for students, tutoring students. Recommended preparation: Ph.D. student in CSDS department.

CSDS 405. Data Structures and File Management. 3 Units.
Fundamental concepts: sequential allocation, linked allocation, lists, trees, graphs, internal sorting, external sorting, sequential, binary, interpolation search, hashing file, indexed files, multiple level index structures, btrees, hashed files. Multiple attribute retrieval; inverted files, multi lists, multiple-key hashing, hd trees. Introduction to data bases. Data models. Recommended preparation: EECS/CSDS/ECSE 233 and MATH 304. Prereq: EECS 341 or Graduate standing.

CSDS 410. Analysis of Algorithms. 3 Units.
This course covers fundamental topics in algorithm design and analysis in depth. Amortized analysis, NP-completeness and reductions, dynamic programming, advanced graph algorithms, string algorithms, geometric algorithms, local search heuristics. Offered as CSDS 410 and OPRE 454. Prereq: EECS 340.

CSDS 425. Computer Networks I. 3 Units.

CSDS 427. Internet Security and Privacy. 3 Units.
This course introduces students to research on Internet security and privacy. Covered topics include denial of service attacks, attacks enabled by man-in-the-middle surveillance, communication hijacking, botnet and fast-flux networks, email and Web spam, threats to privacy on the Internet, and Internet censorship. The course will be based on a collection of research papers. Students will be required to attend lectures, read the materials, prepare written summaries of discussed papers, present a paper in class, complete a course project and take the final exam (in the form of the course project presentation). Prereq: EECS 325 or EECS 425 or graduate standing in Computer Science or Computer Engineering.

CSDS 428. Computer Communications Networks II. 3 Units.
Introduction to topics and methodology in computer networks and middleware research. Traffic characterization, stochastic models, and self-similarity. Congestion control (Tahoe, Reno, Sack). Active Queue Management (RED, FQ) and explicit QoS. The Web: overview and components, HTTP, its interaction with TCP, caching. Overlay networks and CDN. Expected work includes a course-long project on network simulation, a final project, a paper presentation, midterm, and final test. Recommended preparation: EECS/CSDS 425.

CSDS 433. Database Systems. 3 Units.
CSDS 435. Data Mining. 3 Units.
Data Mining is the process of discovering interesting knowledge from large amounts of data stored either in databases, data warehouses, or other information repositories. Topics to be covered includes: Data Warehouse and OLAP technology for data mining, Data Preprocessing, Data Mining Primitives, Languages, and System Architectures, Mining Association Rules from Large Databases, Classification and Prediction, Cluster Analysis, Mining Complex Types of Data, and Applications and Trends in Data Mining. Prereq: EECs 341 or Graduate standing.

CSDS 438. High Performance Computing. 3 Units.
High performance computing (HPC) leverages parallel processing in order to maximize speed and throughput. This hands-on course will cover theoretical and practical aspects of HPC. Theoretical concepts covered include computer architecture, parallel programming, and performance optimization. Practical applications will be discussed from various information and scientific fields. Practical considerations will include HPC job management and Unix scripting. Weekly assessments and a course project will be required. Offered as CSDS 438 and ECSE 438. Prereq: EECs 233 or graduate standing.

CSDS 439. Web Data Mining. 3 Units.
Web crawling technology, web search and information extraction, unsupervised and semi-supervised learning techniques and their application to web data extraction, social network analysis, various pagerank algorithms, link analysis, web resource discovery, web, resource description framework (RDF), XML, Web Ontology Language (OWL). Recommended preparation: EECs/CSDS/ECSE 338, EECs/CSDS 341.

CSDS 440. Machine Learning. 3 Units.
Machine learning is a subfield of Artificial Intelligence that is concerned with the design and analysis of algorithms that "learn" and improve with experience. While the broad aim behind research in this area is to build systems that can simulate or even improve on certain aspects of human intelligence, algorithms developed in this area have become very useful in analyzing and predicting the behavior of complex systems. Machine learning algorithms have been used to guide diagnostic systems in medicine, recommend interesting products to customers in e-commerce, play games at human championship levels, and solve many other very complex problems. This course is focused on algorithms for machine learning; their design, analysis and implementation. We will study different learning settings, including supervised, semi-supervised and unsupervised learning. We will study different ways of representing the learning problem, using propositional, multiple-instance and relational representations. We will study the different algorithms that have been developed for these settings, such as decision trees, neural networks, support vector machines, k-means, harmonic functions and Bayesian methods. We will learn about the theoretical tradeoffs in the design of these algorithms, and how to evaluate their behavior in practice. At the end of the course, you should be able to: --Recognize situations where machine learning algorithms are applicable; --Understand, represent and formulate the learning problem; --Apply the appropriate algorithm(s), or if necessary, design your own, with an understanding of the tradeoffs involved; --Correctly evaluate the behavior of the algorithm when solving the problem. Prereq: CSDS 391 or CSDS 491.

CSDS 442. Causal Learning from Data. 3 Units.
This course introduces key concepts and techniques for characterizing, from observational or experimental study data and from background information, the causal effect of a specific treatment, exposure, or intervention (e.g., a medical treatment) upon an outcome of interest (e.g., disease status). The fundamental problem of causal inference is the impossibility of observing the effects of different and incompatible treatments on the same individual or unit. This problem is overcome by estimating an average causal effect over a study population. Making valid causal inferences with observational data is especially challenging, because of the greater potential for biases (confounding bias, selection bias, and measurement bias) that can badly distort causal effect estimates. Consequently, this topic has been the focus of intense cross-disciplinary research in recent years. Causal inference techniques will be illustrated by applications in several fields such as computer science, engineering, medicine, public health, biology, genomics, neuroscience, economics, and social science. Course grading will be based on quizzes, homeworks, a class presentation, and a causal data analysis project. Specific topics: treatments, exposures, and interventions; causal effects and causal effect measures; confounding bias; potential outcomes and counterfactuals; randomized experiments; observational studies; causal directed acyclic graphs (DAGs); exchangeability and conditional exchangeability; effect modification; causal interactions; nonparametric structural equations; Pearl's Back-Door Criterion, Front-Door Criterion, and related results; covariate adjustment; matching on covariates; selection bias; measurement bias; instrumental variables; causal modeling; inverse probability weighting; marginal structural models; standardization; structural nested models; outcome regression; propensity scores; sensitivity analysis. Prereq: EECs 440 or MATH 380 or STAT 312 or STAT 313 or STAT 332 or STAT 333 or Requisites Not Met permission.

CSDS 444. Computer Security. 3 Units.
General types of security attacks; approaches to prevention; secret key and public key cryptography; message authentication and hash functions; digital signatures and authentication protocols; information gathering; password cracking; spoofing; session hijacking; denial of service attacks; buffer overruns; viruses, worms, etc.; principles of secure software design, threat modeling; access control; least privilege; storing secrets; socket security; firewalls; intrusions; auditing; mobile security. Recommended preparation: EECs/CSDS/ECSE 132, EECs/ CSDS 293, EECs/CSDS 325 and EECs/CSDS 338. Offered as CSDS 344 and CSDS 444.

CSDS 448. Smartphone Security. 3 Units.
This course is designed to better prepare undergraduate and graduate students for researching and developing in the neighborhood of mobile and software security. Lectures, paper readings and presentations, in-class discussions, and projects are the main components. The course covers the basics of Android programming and a wide range of security issues and solutions concerning mobile platforms, including permission analysis, textual artifacts analysis, malware analysis, program analysis, and UI analysis. Students should expect one literature survey paper and one system-building or empirical study project on one selected security solution in mobile app security. Prereq: EECs 132 and a Graduate or Undergraduate Computer Science major.
CSDS 455. Applied Graph Theory. 3 Units.
This course serves as an introduction to many of the important aspects of graph theory. Topics include connectivity, flows, matchings, planar graphs, and graph coloring with additional topics selected from extremal graphs, random graphs, bounded treewidth graphs, social networks and small world graphs. The class will explore the underlying mathematical theory with a specific focus on the development and analysis of graph algorithms. Prereq: Graduate Student or (EECS 302 or MATH 304 or
MATH 305 or MATH 307).

CSDS 456. Data Privacy. 3 Units.
Introduction to privacy, economics and incentives, crypto-based solution for privacy, hiding data from the database user; hiding access patterns from the database owner; anonymous routing and TOR, privacy in online social networks, privacy in cellular and Wi-Fi networks, location privacy, privacy in e-cash systems, privacy in e-voting, genomic privacy. Offered as CSDS 356 and CSDS 456. Prereq: (EECS 132 and ECSE 233 and any STAT course) or (Graduate student in Computing & Info Science or Computer Engineering).

CSDS 458. Introduction to Bioinformatics. 3 Units.
Fundamental algorithmic and statistical methods in computational molecular biology and bioinformatics will be discussed. Topics include introduction to molecular biology and genetics, DNA sequence analysis, polymorphisms and personal genomics, structural variation analysis, gene mapping and haplotypeing algorithms, phylogenetic analysis, biological network analysis, and computational drug discovery. Much of the course will focus on the algorithmic techniques, including but not limited to, dynamic programming, hidden Markov models, string algorithms, graph theories and algorithms, and some representative data mining algorithms. Paper presentations and course projects are also required. Prereq: EECS 340 or Graduate standing.

CSDS 459. Bioinformatics for Systems Biology. 3 Units.

CSDS 464. Computational Perception. 3 Units.
An introduction to the information processing and computational algorithms that underlie perception. The course focuses on vision and audition but also covers other senses and various types of perceptual processing in biological systems. The motivating question is: What are the fundamental computational problems faced by perceptual systems in complex environments? The course draws from fields in engineering and the study of biological perception. Specific topics include signal detection and processing; sound localization; motion perception and estimation; sensory coding; perception of structure; active perception; perceptual invariance; attention; object, sound and speech recognition; visual and auditory scene analysis. Offered as CSDS 364 and CSDS 464. Prereq:
CSDS 132 or ENGR 131.

CSDS 465. Computer Vision. 3 Units.
The goal of computer vision is to create visual systems that recognize objects and recover structures in complex 3D scenes. This course emphasizes both the science behind our understanding of the fundamental problems in vision and the engineering that develops mathematical models and inference algorithms to solve these problems. Specific topics include feature detection, matching, and classification; visual representations and dimensionality reduction; motion detection and optical flow; image segmentation; depth perception, multi-view geometry, and 3D reconstruction; shape and surface perception; visual scene analysis and object recognition. Offered as CSDS 465 and ECSE 465.

CSDS 466. Computer Graphics. 3 Units.
Theory and practice of computer graphics: object and environment representation including coordinate transformations image extraction including perspective, hidden surface, and shading algorithms; and interaction. Covers a wide range of graphic display devices and systems with emphasis in interactive shaded graphics. Offered as CSDS 366, ECSE 366, CSDS 466 and ECSE 466. Prereq: Graduate standing or Requisites Not Met permission.

CSDS 473. Modern Robot Programming. 3 Units.
The goal of this course is to learn modern methods for building up robot capabilities using the Robot Operating System (ROS). Through a sequence of assignments, students learn how to write software to control both simulated and physical robots. Material includes: interfacing software to robot I/O; path and trajectory planning for robot arms; object identification and localization from 3-D sensing; manipulation planning; and development of graphical interfaces for supervisory robot control. Laboratory assignments are scheduled in small groups to explore implementations on specific robots. Graduate students will also perform an independent project. Offered as CSDS 373, ECSE 373, CSDS 473 and ECSE 473.

CSDS 476. Mobile Robotics. 3 Units.
Design of software systems for mobile robot control, including: motion control; sensory processing; localization and mapping; mobile-robot planning and navigation; and implementation of goal-directed behaviors. The course has a heavy lab component involving a sequence of design challenges and competitions performed in teams. Offered as CSDS 476 and ECSE 476. Prereq: EECS 373 or ECSE 473.

CSDS 477. Advanced Algorithms. 3 Units.
CSDS 478. Computational Neuroscience. 3 Units.
Computer simulations and mathematical analysis of neurons and neural circuits, and the computational properties of nervous systems. Students are taught a range of models for neurons and neural circuits, and are asked to implement and explore the computational and dynamic properties of these models. The course introduces students to dynamical systems theory for the analysis of neurons and neural learning, models of brain systems, and their relationship to artificial and neural networks. Term project required. Students enrolled in MATH 478 will make arrangements with the instructor to attend additional lectures and complete additional assignments addressing mathematical topics related to the course. Recommended preparation: MATH 223 and MATH 224 or BIOL 300 and BIOL 306. Offered as BIOL 378, COGS 378, MATH 378, BIOL 478, CSDS 478, EBM 478, ECSE 478, MATH 478 and NEUR 478.

CSDS 486. Quantum Computing, Information, and Devices. 3 Units.
An introduction to the math, physics, engineering, and computer science underlying the rapidly emerging fields of quantum computing, quantum information, and quantum devices. The course is taught by a group of faculty from physics, engineering, computer science, and math, and is geared towards students with diverse backgrounds and interests in these fields. Students will select a concentration in one of these four areas, and the coursework, while still covering all topics, will be adjusted to focus on the selected area in the most detail. Note that the listed prerequisites depend on choice of concentration. Topics will include: 1. (Mathematics) Introduction to linear algebra, convex geometry, fundamental theory of quantum information. 2. (Physics) Introduction to the quantum mechanics of two-level systems (qubits). Survey of physics and materials for qubit technologies. 3. (Computer Science) Basic quantum gates and circuits, introduction to the theory of algorithms, survey of quantum algorithms. 4. (Engineering) Quantum architectures, mapping algorithms onto circuits. The course consists of lectures, homework, and group projects. Group projects will aim to synthesize the diverse backgrounds of the students and instructors to capture the interdisciplinary nature of the field. Students taking the course for graduate credit will complete an additional literature research project and presentation, in addition to enhanced problem sets. Offered as CSDS 386, CSDS 486, ECSE 386, ECSE 486, MATH 386, MATH 486, PHYS 386, and PHYS 486. Prereq: (CSDS 233 or ECSE 233) and (CSDS 281 or ECSE 281) and (MATH 201 or MATH 307) and (MATH 223 or MATH 227) and (PHYS 122 or PHYS 124).

CSDS 487. Advanced Game Development Project. 3 Units.
This game development project course will bring together an interprofessional group of students in the fields of engineering, computer science, and art to focus on the design and development of a complete, fully functioning computer game as an interdisciplinary team. The student teams are given complete liberty to design their own fully functional games from their original concept to a playable game published in an online marketplace. Student teams will experience the entire game development cycle as they execute their projects. Responsibilities include creating a game idea, writing a story, developing the artwork, designing characters, implementing music and sound effects, programming and testing the game, and publishing the final project. Students enrolled in 487 will develop a healthcare or education virtual environment or video game in collaboration with a mentor who has expertise in the chosen area. Offered as CSDS 390, ECSE 390, CSDS 487, and ECSE 487. Prereq: Graduate student standing.

CSDS 489. Robotics I. 3 Units.

CSDS 490. Digital Image Processing. 3 Units.
Digital images are introduced as two-dimensional sampled arrays of data. The course begins with one-to-one operations such as image addition and subtraction and image descriptors such as the histogram. Basic filters such as the gradient and Laplacian in the spatial domain are used to enhance images. The 2-D Fourier transform is introduced and frequency domain operations such as high and low-pass filtering are developed. It is shown how filtering techniques can be used to remove noise and other image degradation. The different methods of representing color images are described and fundamental concepts of color image transformations and color image processing are developed. One or more advanced topics such as wavelets, image compression, and pattern recognition will be covered as time permits. Programming assignments using software such as MATLAB will illustrate the application and implementation of digital image processing. Offered as CSDS 490 and ECSE 490.

CSDS 491. Artificial Intelligence: Probabilistic Graphical Models. 3 Units.
This course is a graduate-level introduction to Artificial Intelligence (AI), the discipline of designing intelligent systems, and focuses on probabilistic graphical models. These models can be applied to a wide variety of settings from data analysis to machine learning to robotics. The models allow intelligent systems to represent uncertainties in an environment or problem space in a compact way and reason intelligently in a way that makes optimal use of available information and time. The course covers directed and undirected probabilistic graphical models, latent variable models, associated exact and approximate inference algorithms, and learning in both discrete and continuous problem spaces. Practical applications are covered throughout the course. Prereq: CSDS 391 or Requisites Not Met permission.

CSDS 493. Software Engineering. 3 Units.
Topics: Introduction to software engineering; software lifecycle models; development team organization and project management; requirements analysis and specification techniques; software design techniques; programming practices; software validation techniques; software maintenance practices; software engineering ethics. Undergraduates work in teams to complete a significant software development project. Graduate students are required to complete a research project. Offered as CSDS 393, CSDS 393N, and CSDS 493. Prereq: (Computer Science Major/ Minor or Data Science Major) and (CSDS 233 or ECSE 233) with a C or higher.
CSDS 494. Introduction to Information Theory. 3 Units.
This course is intended as an introduction to information and coding theory with emphasis on the mathematical aspects. It is suitable for advanced undergraduate and graduate students in mathematics, applied mathematics, statistics, physics, computer science and electrical engineering. Course content: Information measures-entropy, relative entropy, mutual information, and their properties. Typical sets and sequences, asymptotic equipartition property, data compression. Channel coding and capacity: channel coding theorem. Differential entropy, Gaussian channel, Shannon-Nyquist theorem. Information theory inequalities (400 level). Additional topics, which may include compressed sensing and elements of quantum information theory. Recommended preparation: MATH 201 or MATH 307. Offered as MATH 394, CSDS 394, ECSE 394, MATH 494, CSDS 494 and ECSE 494.

CSDS 496. Artificial Intelligence: Sequential Decision Making. 3 Units.
This course will study the formulation and solution of decision making problems by automated agents. Topics covered include one-shot decision making (decision trees and influence diagrams), Markov decision processes (MDPs), automated classical and probabilistic planning, reinforcement learning (RL), hierarchical planning and RL, partially observable MDPs, Bayesian RL, collaborative multi-agent systems. Recommended preparation: EECS/CSDS/ECSE 491 (Probabilistic Graphical Models). Prereq: EECS 391.

CSDS 497. Artificial Intelligence: Statistical Natural Language Processing. 3 Units.
This course gives students an overview of the state of the art in natural language processing. We will discuss computational aspects of language modeling through probabilistic models, computational approaches to syntax (parsing) and semantic representations, discourse and dialog. We will study the applications of these techniques to a variety of problems including information extraction, translation and summarization. At the end of the course a student should be able to (i) understand the various statistical models and algorithms for NLP (ii) modify them as needed or design novel approaches for specific NLP tasks and (iii) understand how to evaluate the performance of these models and compare them to alternatives. Prereq: EECS 440.

CSDS 499. Algorithmic Robotics. 3 Units.
This course introduces basic algorithmic techniques in robotic perception and planning. Course is divided into two parts. The first part introduces probabilistic modeling of robotic motion and sensing, Gaussian and nonparametric filters, and algorithms for mobile robot localization. The second part introduces fundamental deterministic and randomized algorithms for motion planning. Offered as CSDS 499 and ECSE 499. Prereq: Graduate Standing or Requisites Not Met permission.

CSDS 500. CSDS Colloquium. 0 Unit.
Seminars on current topics in Computer and Data Science.

CSDS 500T. Graduate Teaching II. 0 Unit.
This course will provide the Ph.D. candidate with experience in teaching undergraduate or graduate students. The experience is expected to involve direct student contact but will be based upon the specific departmental needs and teaching obligations. This teaching experience will be conducted under the supervision of the faculty member who is responsible for the course, but the academic advisor will assess the educational plan to ensure that it provides an educational experience for the student. Students in this course may be expected to perform one or more of the following teaching related activities: grading homeworks, quizzes, and exams, having office hours for students, running recitation sessions, providing laboratory assistance. Recommended preparation: Ph.D. student in CSDS department.

CSDS 589. Robotics II. 3 Units.
Survey of research issues in robotics. Force control, visual servoing, robot autonomy, on-line planning, high-speed control, man/machine interfaces, robot learning, sensory processing for real-time control. Primarily a project-based lab course in which students design real-time software executing on multi-processors to control an industrial robot. Recommended preparation: EECS/CSDS/ECSE 489. Offered as CSDS 589 and ECSE 589.

CSDS 600. Special Topics. 1 - 18 Units.

CSDS 600T. Graduate Teaching III. 0 Unit.
This course will provide Ph.D. candidate with experience in teaching undergraduate or graduate students. The experience is expected to involve direct student contact but will be based upon the specific departmental needs and teaching obligations. This teaching experience will be conducted under the supervision of the faculty member who is responsible for the course, but the academic advisor will assess the educational plan to ensure that it provides an educational experience for the student. Students in this course may be expected to perform one or more of the following teaching related activities running recitation sessions, providing laboratory assistance, developing teaching or lecture materials presenting lectures. Recommended preparation: Ph.D. student in CSES department.

CSDS 601. Independent Study. 1 - 18 Units.

CSDS 620. Special Topics. 1 - 18 Units.

CSDS 621. Special Projects. 1 - 18 Units.

CSDS 651. Thesis M.S.. 1 - 18 Units.
Credit as arranged.

CSDS 656. Project M.S.. 1 - 9 Units.
Research course taken by Plan B M.S. students. Prereq: Enrolled in the EECS Plan B MS Program.

CSDS 701. Dissertation Ph.D.. 1 - 9 Units.
Credit as arranged.

Department of Electrical, Computer, and Systems Engineering

Glennan Building (7071)

Phone: 216.368.2800; Fax: 216.368.6888
Pedram Mohseni, Professor and Chair of Electrical, Computer, and Systems Engineering (ECSE)
pedram.mohseni@case.edu

Effective as of June 1, 2019, the Electrical Engineering and Computer Science Department in the Case School of Engineering has been renamed to be the Department of Electrical, Computer, and Systems Engineering (ECSE).

The ECSE Department spans a spectrum of topics from (i) materials, devices, circuits, and processors through (ii) control, signal processing, and systems analysis to (iii) human-machine interfaces, computation, computer systems, embedded systems and networking. The ECSE Department at Case Western Reserve supports three synergistic degree programs: Electrical Engineering, Computer Engineering, and Systems & Control Engineering. Each degree program leads to the Bachelor of Science degree at the undergraduate level. At the graduate level, the department offers the Master of Science and Doctor of Philosophy
degrees in Electrical Engineering, Computer Engineering, and Systems & Control Engineering. We offer minors in Electrical Engineering, Computer Engineering, Systems & Control Engineering, and also in Computer Gaming, and Electronics. For supplemental information to this bulletin as well as the latest updates, please visit the ECSE Department website at https://engineering.case.edu/electrical-computer-and-systems-engineering/.

ECSE is at the heart of modern technology. ECSE disciplines are responsible for the devices and microprocessors powering our computers and embedded into everyday devices, from cell phones and tablets to automobiles and airplanes. Healthcare is increasing in demand for ECSE technologies: micro/nano-systems, electronics/instrumentation, implantable systems, embedded microprocessors, wireless medical devices, surgical robots, imaging, system biology, and visualization. The future of energy will be profoundly impacted by ECSE technologies, from smart appliances connected to the Internet, smart buildings that incorporate distributed sensing and control, to the envisioned smart grid that must be controlled, stabilized, and kept secure over an immense network. ECSE drives job creation and starting salaries in our fields are consistently ranked at the top of all college majors. Our graduates work in cutting-edge companies—from giants to start-ups, in a variety of technology sectors, including computer and internet, healthcare and medical devices, manufacturing and automation, automotive and aerospace, defense, finance, energy, and consulting.

Educational Philosophy

The ECSE department is dedicated to developing high-quality graduates who will take positions of leadership as their careers advance. We recognize that the increasing role of technology in virtually every facet of our society, life, and culture makes it vital that our students have access to progressive and cutting-edge higher education programs. The core values for all of the degree programs in the department are:

- mastery of fundamentals
- creativity
- social awareness
- leadership skills
- professionalism

Stressing excellence in these core values helps to ensure that our graduates are valued and contributing members of our global society and that they will carry on the tradition of engineering leadership established by our alumni.

Our goal is to graduate students who have fundamental technical knowledge of their profession and the requisite technical breadth and communications skills to become leaders in creating the new techniques and technologies which will advance their fields. To achieve this goal, the department offers a wide range of technical specialties consistent with the breadth of electrical engineering, computer engineering, and systems & control engineering, including recent developments in the fields. Because of the rapid pace of advancement in these fields, our degree programs emphasize a broad and foundational science and technology background that equips students for future developments. Our programs include a wide range of electives and our students are encouraged to develop individualized programs which can combine many aspects of electrical engineering, computer engineering, and systems & control engineering.

Research

The research thrusts of the Electrical, Computer, and Systems Engineering department include:

1. Micro/Nano Systems
2. Electronics and Instrumentation
3. Robotics and Human-Machine Interfaces
4. Embedded Systems, including VLSI and FPGA design
6. Systems Biology
7. Machine Learning and Data Mining
8. Computer Networks and Distributed Systems
9. Energy Systems, including Wind and Power Grid Management/Control
10. Gaming, Simulation, Optimization
11. Medical Informatics and Wireless Health

ECSE participates in a number of groundbreaking collaborative research and educational programs, including the Microelectromechanical Systems Research Program, the Center for Computational Genomics, graduate program in Systems Biology and Bioinformatics, the Clinical & Translational Science Collaborative, the Great Lakes Energy Institute, and the VA Center for Advanced Platform Technology.

Faculty

Marc Buchner, PhD
(Michigan State University)
Associate Professor
Computer gaming and simulation, virtual reality, software-defined radio, wavelets, joint time-frequency analysis

M. Cenk Cavusoglu, PhD
(University of California, Berkeley)
Nord Professor of Engineering
Robotics, systems and control theory, and human-machine interfaces; with emphasis on medical robotics, haptics, virtual environments, surgical simulation, and bio-system modeling and simulation

Vira Chankong, PhD
(Case Western Reserve University)
Associate Professor
Large-scale optimization; logic-based optimization; multi-objective optimization; optimization applications in radiation therapy treatment planning, medical imaging, manufacturing and production systems, and engineering design problems

Michael Fu, PhD
(Case Western Reserve University)
Timothy E. and Allison L. Schroeder Assistant Professor
Neuro-rehabilitation and motor-relearning, with emphasis on virtual environments, neuromuscular electrical stimulation, and haptic interfaces

Mario Garcia-Sanz, DrEng
(University of Navarra, Spain)
Professor
Robust and nonlinear control, quantitative feedback theory, multivariable control, dynamic systems, systems modeling and identification; energy innovation, wind energy, spacecraft, electrical, mechanical, environmental and industrial applications
Evren Gurkan-Cavusoglu, PhD
(Middle East Technical University)
Associate Professor
Systems and control theory, systems biology, computational biology, biological system modeling, signal processing applied to biological systems, signal processing

Hossein Miri Lavasani, PhD
(The Georgia Institute of Technology)
Assistant Professor
High performance integrated circuits and systems, Low power interface circuits for MEMS and sensors

Gregory S. Lee, PhD
(University of Washington)
Assistant Professor
Haptic devices, including low-power design and effects on perception; applications to robotic surgery and telesurgery; secure teleoperation

Pan Li, PhD
(University of Florida)
Associate Professor
Networks, Cybersecurity, Big data, Cyber-physical systems, Bioinformatics

Wei Lin, PhD
(Washington University in St. Louis)
Professor
Nonlinear control, dynamic systems and homogeneous systems theory, H-infinity and robust control, adaptive control, system parameter estimation and fault detection, nonlinear control applications to under-actuated mechanical systems, biologically-inspired systems and systems biology

Kenneth A. Loparo, PhD
(Case Western Reserve University)
Arthur L. Parker Professor
Stability and control of nonlinear and stochastic systems; fault detection, diagnosis, and prognosis; recent applications work in advanced control and failure detection of rotating machines, signal processing for the monitoring and diagnostics of physiological systems, and modeling, analysis, and control of power and energy systems

Behnam Malakooti, PhD, PE
(Purdue University)
Professor
Risk analysis and prediction, design and multiple-objective optimization of manufacturing/production/operations systems, NASA intelligent internet protocol systems and networks, feed-forward artificial neural networks, intelligent decision making

Mehran Mehregany, PhD
(Massachusetts Institute of Technology)
Professor
Research and development at the intersections of micro/nano-electromechanical systems, semiconductor silicon carbide and integrated circuits

Pedram Mohseni, PhD
(University of Michigan)
Goodrich Professor of Engineering Innovation and Chair
Biomedical microsystems, bioelectronics, wireless neural interfaces, CMOS interface circuits for MEMS, low-power wireless sensing/actuating microsystems

Wyatt S. Newman, PhD, PE
(Massachusetts Institute of Technology)
Professor
Mechatronics, high-speed robot design, force- and vision-based machine control, artificial reflexes for autonomous machines, rapid prototyping, agile manufacturing, mobile robotic platforms

Christos Papachristou, PhD
(Johns Hopkins University)
Professor
VLSI design and CAD, computer architecture and parallel processing, design automation, embedded system design

Daniel Saab, PhD
(University of Illinois at Urbana-Champaign)
Associate Professor
Computer architecture, VLSI system design and test, CAD design automation

Sree N. Sreenath, PhD
(University of Maryland)
Professor
Systems biology complexity research (modeling, structural issues, and simulation); cell signaling, population behavior, and large-scale behavior; global issues and sustainable development

Christian A. Zorman, PhD
(Case Western Reserve University)
F. Alex Nason Professor
Materials and processing techniques for MEMS and NEMS, wide bandgap semiconductors, development of materials and fabrication techniques for polymer-based MEMS and bioMEMS

Secondary Faculty Appointments

Vipin Chaudhary, PhD
(University of Texas at Austin)
Professor, Computer and Data Sciences

Kathryn Daltorio, PhD
(Case Western Reserve University)
Assistant Professor, Mechanical & Aerospace Engineering

Dominique Durand, Ph.D.
(University of Toronto)
Professor, Biomedical Engineering

Mark Griswold, PhD
(University of Würzburg, Germany)
Professor, Radiology

Anant Madabhushi, Ph.D.
(University of Pennsylvania)
Professor, Biomedical Engineering
Roger D. Quinn, PhD  
(Virginia Polytechnic Institute and State University)  
Professor, Mechanical and Aerospace Engineering

Satya S. Sahoo, PhD  
(Wright State University)  
Associate Professor, Dept of Population & Quantitative Health Sciences

Peter Thomas, PhD  
(University of Chicago)  
Associate Professor, Mathematics, Applied Mathematics, and Statistics

Dustin Tyler, PhD  
(Case Western Reserve University)  
Professor, Biomedical Engineering

Satish Viswanath, PhD  
(Rutgers University)  
Assistant Professor, Biomedical Engineering

Xiong (Bill) Yu, PhD, PE  
(Purdue University)  
Professor, Civil and Environmental Engineering

Research Faculty

Mahdi Bayat, PhD  
(University of Minnesota)  
Research Assistant Professor  
Signal processing, biomedical imaging, machine learning

Farhad Kaffashi, PhD  
(Case Western Reserve University)  
Research Assistant Professor  
Signal processing of physiological time series data, systems and control

Michael A. Suster, Ph.D.  
(Case Western Reserve University)  
Research Assistant Professor  
Point-of-care diagnostic platforms, sensors, circuits, and microsystems

Adjunct Faculty Appointments

Hanieh Agharazi, PhD  
(Case Western Reserve University)  
Adjunct Assistant Professor

Nicholas Barendt, MSEE  
(Case Western Reserve University)  
Adjunct Sr. Instructor

Michael S. Branicky, ScD, PE  
(Massachusetts Institute of Technology)  
Adjunct Professor

Philip Feng, Ph.D.  
(California Institute of Technology)  
Adjunct Professor

Roberto Galan, PhD  
(Humboldt Universität zu Berlin, Germany)  
Adjunct Associate Professor

Suparek Janjarasjitt, PhD  
(Case Western Reserve University)  
Adjunct Assistant Professor

David Kazdan, Ph.D.  
(Case Western Reserve University)  
Adjunct Assistant Professor

Soumyajit Mandal, Ph.D.  
(Massachusetts Institute of Technology)  
Adjunct Associate Professor

Amit Sinha, PhD  
(Case Western Reserve University)  
Adjunct Assistant Professor

Benjamin Vandendriessche, PhD  
(Ghent University)  
Adjunct Professor

Francis G. Wolff, Ph.D.  
(Case Western Reserve University)  
Adjunct Associate Professor

Olaf Wolkenhauer, PhD  
(UMIST, Manchester)  
Adjunct Professor

Lawrence Sears  
(Case Western Reserve University)  
Adjunct Instructor

Nicole Seiberlich, PhD  
(Universitaet Wuerzburg, Wuerzburg)  
Adjunct Associate Professor

Emeritus Faculty

Sheldon Gruber, PhD  
Emeritus Professor  
Electrical Engineering and Applied Physics

Francis "Frank" L. Merat, PhD, PE  
(Case Western Reserve University)  
Emeritus Professor  
Computer and robot vision, digital image processing, sensors, titanium capacitors and power electronics; RF and wireless systems; optical sensors; engineering education
Undergraduate Programs
The ECSE department offers programs leading to degrees in:

1. Electrical Engineering (Bachelor of Science in Engineering)
2. Computer Engineering (Bachelor of Science in Engineering)
3. Systems and Control Engineering (Bachelor of Science in Engineering)

These programs provide students with a strong background in the fundamentals of mathematics, science, and engineering. Students can use their technical and open electives to pursue concentrations in bioelectrical engineering, complex systems, automation and control, digital systems design, embedded systems, micro/nano systems, robotics and intelligent systems, signal processing and communications. In addition to an excellent technical education, all students in the department are exposed to societal issues, ethics, professionalism, and have the opportunity to develop leadership and creativity skills.

Bachelor of Science in Electrical Engineering
The Bachelor of Science in Engineering degree program with a major in Electrical Engineering provides our students with a broad foundation in electrical engineering through combined classroom and laboratory work which prepares our students for entering the profession of electrical engineering, as well as for further study at the graduate level.

The Bachelor of Science in Engineering degree program with a major in Electrical Engineering is accredited by the Engineering Accreditation Commission of ABET, http://www.abet.org/.

Mission
The educational mission of the electrical engineering program is to graduate students who have fundamental technical knowledge of their profession and the requisite technical breadth and communications skills to become leaders in creating the new techniques and technologies that will advance the general field of electrical engineering.

Program Educational Objectives
1. Graduates will be successful professionals obtaining positions appropriate to their background, interests, and education.
2. Graduates will use continuous learning opportunities to improve and enhance their professional skills.
3. Graduates will demonstrate leadership in their profession.

Student Outcomes
As preparation for achieving the above educational objectives, the Bachelor of Science in Engineering degree program with a major in Electrical Engineering is designed so that students attain:

• an ability to apply knowledge of mathematics, science, and engineering
• an ability to design and conduct experiments, as well as to analyze and interpret data
• an ability to design a system, component, or process to meet desired needs
• an ability to function in multi-disciplinary teams
• an ability to identify, formulate, and solve engineering problems
• an understanding of professional and ethical responsibility
• an ability to communicate effectively

Core courses provide our students with a strong background in signals and systems, computers, electronics (both analog and digital), and semiconductor devices. Students are required to develop depth in at least one of the following technical areas: signals and systems, solid state, computer hardware, computer software, control, circuits, robotics, and biomedical applications. Each electrical engineering student must complete the following requirements:

Major in Electrical Engineering
In addition to engineering general education requirements (p. 1292) and university general education requirements (p. 1212), the major requires the following courses:

<table>
<thead>
<tr>
<th>Major Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>ECSE 245</td>
</tr>
<tr>
<td>ECSE 246</td>
</tr>
<tr>
<td>ECSE 281</td>
</tr>
<tr>
<td>ECSE 309</td>
</tr>
<tr>
<td>ECSE 313</td>
</tr>
<tr>
<td>ECSE 321</td>
</tr>
</tbody>
</table>

Core courses provide our students with a strong background in signals and systems, computers, electronics (both analog and digital), and semiconductor devices. Students are required to develop depth in at least one of the following technical areas: signals and systems, solid state, computer hardware, computer software, control, circuits, robotics, and biomedical applications. Each electrical engineering student must complete the following requirements:

Technical Elective Requirement
Each student must complete eighteen (18) credit hours of approved technical electives. Technical electives shall be chosen to fulfill the depth requirement (see next) and otherwise increase the student’s understanding of electrical engineering. Technical electives not used to satisfy the depth requirement are more generally defined as any course related to the principles and practice of electrical engineering. This includes all ECSE courses at the 200 level and above and can include courses from other programs. All non-ECSE technical electives must be approved by the student’s academic advisor.

Statistics Requirement

<table>
<thead>
<tr>
<th>Statistics Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>STAT 332</td>
</tr>
</tbody>
</table>

*STAT 333 Uncertainty in Engineering and Science may be substituted with approval of advisor

Design Requirement

<table>
<thead>
<tr>
<th>Design Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>ECSE 398</td>
</tr>
<tr>
<td>ECSE 399</td>
</tr>
</tbody>
</table>

In consultation with a faculty advisor, a student completes the program by selecting technical and open elective courses that provide in-depth training in one or more of a spectrum of specialties, such as, control, signal processing, electronics, integrated circuit design and fabrication, and robotics. With the approval of the advisor, a student may emphasize other specialties by selecting elective courses from other programs or departments.

Additionally, math and statistics classes are highly recommended as an integral part of the student’s technical electives to prepare for work in industry and government and for graduate school. The following math/
statistics classes are recommended and would be accepted as approved technical electives:

- MATH 201 Introduction to Linear Algebra for Applications
- MATH 307 Linear Algebra
- MATH 330 Introduction to Scientific Computing
- MATH 380 Introduction to Probability

Other Math/Statistics may be used as technical electives with the approval of the student’s academic advisor.

Many courses have integral or associated laboratories in which students gain “hands-on” experience with electrical engineering principles and instrumentation. Students have ready access to the teaching laboratory facilities and are encouraged to use them during non-scheduled hours in addition to the regularly scheduled laboratory sessions. Opportunities also exist for undergraduate student participation in the wide spectrum of research projects being conducted in the department.

Depth Requirement
Each student must show a depth of competence in one technical area by taking at least three courses from one of the following areas. This depth requirement may be met using a combination of the above core courses and a selection of open and technical electives. Alternative depth areas may be considered by petition to the program faculty.

Area I: Signals & Control
ECSE 304  Control Engineering I with Laboratory 3
ECSE 313  Signal Processing 3
ECSE 351  Communications and Signal Analysis 3
ECSE 354  Digital Communications 3
ECSE 374  Advanced Control and Energy Systems 3
ECSE 375  Applied Control 3
ECSE 490  Digital Image Processing 3
MATH 307  Linear Algebra 3

Area II: Computer Software
CSDS 293  Software Craftsmanship 4
CSDS 302  Discrete Mathematics 3
CSDS 310  Algorithms 3
CSDS 391  Introduction to Artificial Intelligence 3
CSDS 393  Software Engineering 3
ECSE 233  Introduction to Data Structures 4
ECSE 338  Intro to Operating Systems and Concurrent Programming 4
ECSE 373  Modern Robot Programming 3
ECSE 473  Modern Robot Programming 3

Area III: Solid State
ECSE 321  Semiconductor Electronic Devices 4
ECSE 322/415  Integrated Circuits and Electronic Devices 3
ECSE 422  Solid State Electronics II 3
PHYS 221  Introduction to Modern Physics 3

Area IV: Circuits
EBME 310  Principles of Biomedical Instrumentation 3
ECSE 245  Electronic Circuits 4
ECSE 326  Instrumentation Electronics 3
ECSE 344  Electronic Analysis and Design 3
ECSE 371  Applied Circuit Design 4
ECSE 426  MOS Integrated Circuit Design 3

Area V: Computer Hardware
ECSE 281  Logic Design and Computer Organization 4
ECSE 301  Digital Logic Laboratory 2
ECSE 314  Computer Architecture 3
ECSE 315  Digital Systems Design 4
ECSE 317  Computer Design - FPGAs 3
ECSE 318  VLSI/CAD 4

Area VI: Biomedical Applications
EBME 201  Physiology-Biophysics I (and 2 of the following 4 courses) 3
EBME 310  Principles of Biomedical Instrumentation 3
EBME 320  Biomedical Imaging 3
EBME 327  Bioelectric Engineering 3
EBME 401D  Biomedical Instrumentation and Signal Processing 3

Area VII: Robotics
ECSE 246  Signals and Systems 4
ECSE 275  Fundamentals of Robotics 4
ECSE 304  Control Engineering I with Laboratory 3
ECSE 373  Modern Robot Programming 3
or ECSE 473  Modern Robot Programming 3
ECSE 376  Mobile Robotics 4
or ECSE 476  Mobile Robotics 4
ECSE 484  Computational Intelligence I: Basic Principles 3
ECSE 489  Robotics I 3

Suggested Program of Study: Major in Electrical Engineering

**Total Units in Sequence: 128**

* University general education requirement

** Engineering general education requirement

b Selected students may be invited to take PHYS 123 Physics and Frontiers I - Mechanics and PHYS 124 Physics and Frontiers II - Electricity and Magnetism in place of PHYS 121 General Physics I - Mechanics and PHYS 122 General Physics II - Electricity and Magnetism.

c Students may replace STAT 332 Statistics for Signal Processing with STAT 333 Uncertainty in Engineering and Science if approved by their advisor.

d Technical electives will be chosen to fulfill the depth requirement and otherwise increase the student's understanding of electrical engineering. Courses used to satisfy the depth requirement must come from the department's list of depth areas and related courses. Technical electives not used to satisfy the depth requirement are more generally defined as any course related to the principles and practice of electrical engineering. This includes all ECSE courses at the 200 level and above, and can include courses from other programs. All non-ECSE technical electives must be approved by the student's advisor.

e BS/MS students may double count ECSE 651 Thesis M.S. to fulfill the ECSE 399 Engineering Projects II requirement.

f CO-OP students may obtain design credit for ECSE 399 Engineering Projects II if their co-op assignment included significant design responsibility; however, the student is still responsible for such course obligations as reports, presentations, and ethics assignments. Design credit and fulfillment of remaining course responsibilities are arranged through the course instructor.

g At least 10 of the 14 required Electrical Engineering courses (ECSE 281 Logic Design and Computer Organization, ECSE 245 Electronic Circuits, ECSE 246 Signals and Systems, ECSE 309 Electromagnetic Fields I, ECSE 313 Signal Processing, ECSE 321 Semiconductor Electronic Devices, ECSE 398 Engineering Projects I, ECSE 399 Engineering Projects II and the six technical electives) in the Electrical Engineering BS program must be satisfied by courses in the ECSE department.

Double Major: Systems and Control Engineering & Electrical Engineering

The department also offers a double major in Systems and Control Engineering and Electrical Engineering. Students pursuing the Bachelor of Science in Engineering degree program with a major in Electrical Engineering can take the following courses as technical and open electives to earn a second major in Systems and Control Engineering:

<table>
<thead>
<tr>
<th>Units</th>
<th>Fall</th>
<th>Spring</th>
</tr>
</thead>
<tbody>
<tr>
<td>ECSE 216 Fundamental System Concepts</td>
<td>3</td>
<td></td>
</tr>
<tr>
<td>ECSE 304 Control Engineering I with Laboratory</td>
<td>3</td>
<td></td>
</tr>
<tr>
<td>ECSE 305 Control Engineering I Laboratory</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>ECSE 324 Modeling and Simulation of Continuous Dynamical Systems</td>
<td>3</td>
<td></td>
</tr>
<tr>
<td>ECSE 342 Introduction to Global Issues</td>
<td>3</td>
<td></td>
</tr>
<tr>
<td>ECSE 352 Engineering Economics and Decision Analysis</td>
<td>3</td>
<td></td>
</tr>
</tbody>
</table>
are required for the electronics minor:

The students' skills and distribution requirements. The following courses credit hours, of which 10 credit hours may be used to satisfy portions of College of Arts and Sciences. This program requires the completion of 31

The department also offers a minor in electronics for students in the

Minor in Electronics

Students enrolled in degree programs other than Electrical Engineering can have a minor specialization by completing the following courses:

Approved technical elective

ECSE 245 Electronic Circuits 4
ECSE 246 Signals and Systems 4
ECSE 281 Logic Design and Computer Organization 4
ECSE 309 Electromagnetic Fields I 3

Total Units 18

Bachelor of Science in Systems and Control Engineering

The Bachelor of Science in Engineering degree program with a major in Systems and Control Engineering provides our students with the basic

Program Educational Objectives

1. Graduates apply systems methodology to multi-disciplinary projects that include technical, social, environmental, and/or economic factors.
2. Graduates use systems understanding, thinking and problem-solving skills to analyze and design systems or processes that respond to technical and societal needs.
3. Graduates use teamwork, leadership, communication, and management skills to facilitate multidisciplinary projects that bring together practitioners of various engineering fields in an effective, professional, and ethical manner.

Student Outcomes

• an ability to apply knowledge of mathematics, science, and engineering
• an ability to design and conduct experiments, as well as to analyze and interpret data
• an ability to design a system, component, or process to meet desired needs
• an ability to function in multi-disciplinary teams
• an ability to identify, formulate, and solve engineering problems
• an understanding of professional and ethical responsibility
• an ability to communicate effectively
Major in Systems and Control Engineering

In addition to engineering general education requirements (p. 1292) and university general education requirements (p. 1212), the major requires the following courses:

**Major Requirements**

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>

</table>

**Double Major: Systems and Control Engineering & Electrical Engineering**

From Systems and Control Engineering (S&CE) to Electrical Engineering (EE): S&CE students can earn a double major with EE by taking the following four courses as Technical Electives in the S&CE program:

<table>
<thead>
<tr>
<th>Course</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>ECSE 245 Electronic Circuits</td>
<td>4</td>
</tr>
<tr>
<td>ECSE 281 Logic Design and Computer Organization</td>
<td>4</td>
</tr>
<tr>
<td>ECSE 309 Electromagnetic Fields I</td>
<td>3</td>
</tr>
<tr>
<td>ECSE 321 Semiconductor Electronic Devices</td>
<td>4</td>
</tr>
</tbody>
</table>

And one of the following two courses:

As the three courses ECSE 281, ECSE 245, and ECSE 321 are 4 credit-hours instead of 3, the three credit-hour “Open Elective” course in the original S&CE program is not needed.

<table>
<thead>
<tr>
<th>Course</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>ECSE 374 Advanced Control and Energy Systems</td>
<td>3</td>
</tr>
<tr>
<td>ECSE 375 Applied Control</td>
<td>3</td>
</tr>
</tbody>
</table>

**Cooperative Education Program in Systems and Control Engineering**

Opportunities are available for students to alternate studies with work in industry or government as a co-op student, which involves paid full-
time employment over seven months (one semester and one summer). Students may work in one or two co-ops, beginning in the third year of study. Co-ops provide students the opportunity to gain valuable hands-on experience in their field by completing a significant engineering project while receiving professional mentoring. During a co-op placement, students do not pay tuition but maintain their full-time student status while earning a salary. Learn more at http://engineering.case.edu/coop/. Alternatively or additionally, students may obtain employment as summer interns.

BS/MS Program in Systems and Control Engineering
The department encourages highly motivated and qualified students to apply for admission to the BS/MS Program in the junior year. This integrated program, which permits up to 9 credit hours of graduate level coursework to be counted towards both BS and MS degree requirements (including an option to substitute MS thesis work for ECSE 399 Engineering Projects II, the second senior project). It also offers the opportunity to complete both the Bachelor of Science in Engineering and Master of Science degrees within five years. Review the Office of Undergraduate Studies BS/MS program requirements (p. 1298).

Minor in Systems and Control Engineering
A total of five courses (15 credit hours) are required to obtain a minor in systems and control engineering. This includes

- ECSE 246 Signals and Systems
- Three of the following four courses selected in consultation with the program minor advisor: ECSE 304 Control Engineering I with Laboratory/ECSE 305 Control Engineering I Laboratory; ECSE 324 Modeling and Simulation of Continuous Dynamical Systems; ECSE 346 Engineering Optimization; ECSE 352 Engineering Economics and Decision Analysis;
- One of ECSE 313 Signal Processing, ECSE 351 Communications and Signal Analysis, or ECSE 354 Digital Communications.

Bachelor of Science in Computer Engineering
The Bachelor of Science in Engineering degree program with a major in Computer Engineering is designed to give a student a strong background in the fundamentals of computer engineering through combined classroom and laboratory work. A graduate of this program will be able to use these fundamentals to analyze and evaluate computer systems, both hardware and software. A computer engineering graduate would also be able to design and implement a computer system for general purpose or embedded computing incorporating state-of-the-art solutions to a variety of computing problems. This includes systems which have both hardware and software components, whose design requires a well-defined interface between the two and the evaluation of the associated trade-offs.

The Bachelor of Science in Engineering degree program with a major in Computer Engineering is accredited by the Engineering Accreditation Commission of ABET, http://www.abet.org/.

Mission
The educational mission of the computer engineering program is to train students who have fundamental technical knowledge of their profession along with requisite technical breadth and communications skills to become leaders in creating the new techniques and technologies which will advance the general field of computer engineering. Core courses provide our students with a strong background in digital systems design, computer organization, hardware architecture, and digital electronics.

Program Educational Objectives
1. Graduates will be successful professionals obtaining positions appropriate to their background, interests, and education.
2. Graduates will engage in life-long learning to improve and enhance their professional skills.
3. Graduates will demonstrate leadership in their profession by using their knowledge, communication skills, and engineering ability.

Student Outcomes
As preparation for achieving the above educational objectives, the Bachelor of Science in Engineering degree program with a major in Computer Engineering is designed so that students attain:

- an ability to apply knowledge of mathematics, science, and engineering
- an ability to design and conduct experiments, as well as to analyze and interpret data
- an ability to design a system, component, or process to meet desired needs
- an ability to function in multi-disciplinary teams
- an ability to identify, formulate, and solve engineering problems
- an understanding of professional and ethical responsibility
- an ability to communicate effectively

Major in Computer Engineering
In addition to engineering general education requirements (p. 1292) and university general education requirements (p. 1212), the major requires the following courses:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Credit Hours</th>
</tr>
</thead>
<tbody>
<tr>
<td>ECSE 132</td>
<td>Introduction to Programming in Java</td>
<td>3</td>
</tr>
<tr>
<td>ECSE 233</td>
<td>Introduction to Data Structures</td>
<td>4</td>
</tr>
<tr>
<td>ECSE 281</td>
<td>Logic Design and Computer Organization</td>
<td>4</td>
</tr>
<tr>
<td>ECSE 301</td>
<td>Digital Logic Laboratory</td>
<td>2</td>
</tr>
<tr>
<td>ECSE 314</td>
<td>Computer Architecture</td>
<td>3</td>
</tr>
<tr>
<td>ECSE 315</td>
<td>Digital Systems Design</td>
<td>4</td>
</tr>
<tr>
<td>ENGR 210</td>
<td>Introduction to Circuits and Instrumentation</td>
<td>4</td>
</tr>
</tbody>
</table>

Statistics Requirement
One Statistics elective may be chosen from:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Credit Hours</th>
</tr>
</thead>
<tbody>
<tr>
<td>STAT 312</td>
<td>Basic Statistics for Engineering and Science</td>
<td>3</td>
</tr>
<tr>
<td>STAT 313</td>
<td>Statistics for Experimenters</td>
<td>3</td>
</tr>
<tr>
<td>STAT 332</td>
<td>Statistics for Signal Processing</td>
<td>3</td>
</tr>
<tr>
<td>STAT 333</td>
<td>Uncertainty in Engineering and Science</td>
<td>3</td>
</tr>
</tbody>
</table>

Design Requirement
ECSE 398 Engineering Projects I 4

In consultation with a faculty advisor, a student completes the program by selecting technical and open elective courses that provide in-depth training in the principles and practice of computer engineering. Students must take 5-6 courses, that add up to 18 credit hours of technical electives, to fulfill this requirement. With the approval of the advisor, a
student may emphasize a specialty of his/her choice by selecting elective courses from other programs or departments.

Many courses have integral or associated laboratories in which students gain “hands-on” experience with computer engineering principles and instrumentation. Students have ready access to the teaching laboratory facilities and are encouraged to use them during non-scheduled hours in addition to the regularly scheduled laboratory sessions. Opportunities also exist for undergraduate student participation in the wide spectrum of research projects being conducted in the department.

Suggested Program of Study: Major in Computer Engineering
The following is a suggested program of study. Current students should always consult their advisors and their individual graduation requirement plans as tracked in SIS (http://sis.case.edu/).

</tbody>
</table>

Total Units in Sequence: 128

Hours Required for Graduation: 129

* University general education requirement
** Engineering general education requirement
| a | Technical electives are more generally defined as any course related to the principles and practice of computer engineering. This includes all ECSE courses at the 200 level and above, and can include courses from other programs. All non-ECSE technical electives must be approved by the student’s advisor.
| b | The student must take ECSE 303 Embedded Systems Design and Laboratory, ECSE 318 VLSI/CAD, or another three credit hour technical elective.
| c | Chosen from: STAT 312 Basic Statistics for Engineering and Science, STAT 313 Statistics for Experimenters, STAT 332 Statistics for Signal Processing, STAT 333 Uncertainty in Engineering and Science
| d | May be taken in the Fall semester if the student would like to take ECSE 399 Engineering Projects II.

Cooperative Education Program in Computer Engineering
Opportunities are available for students to alternate studies with work in industry or government as a co-op student, which involves paid full-time employment over seven months (one semester and one summer). Students may work in one or two co-ops, beginning in the third year of study. Co-ops provide students the opportunity to gain valuable hands-on experience in their field by completing a significant engineering project while receiving professional mentoring. During a co-op placement, students do not pay tuition but maintain their full-time student status while earning a salary. Learn more at http://engineering.case.edu/coop/.
Alternatively or additionally, students may obtain employment as summer interns.
BS/MS Program in Computer Engineering
Highly motivated and qualified students are encouraged to apply to the BS/MS Program which will allow them to get both degrees in five years. The BS can be in Computer Engineering or a related discipline, such as mathematics or electrical engineering. Integrating graduate study in computer engineering with the undergraduate program allows a student to satisfy all requirements for both degrees in five years. Review the Office of Undergraduate Studies BS/MS program requirements (p. 1298).

Minor in Computer Engineering
The department also offers a minor in computer engineering. The minor has a required two-course sequence followed by a two-course sequence in either hardware or software aspects of computer engineering. The following two courses are required for any minor in computer engineering:

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>ECSE 281</td>
<td>Logic Design and Computer Organization</td>
<td>4</td>
</tr>
<tr>
<td>ECSE 233</td>
<td>Introduction to Data Structures</td>
<td>4</td>
</tr>
</tbody>
</table>

Students should note that ECSE 132 Introduction to Programming in Java is a prerequisite for ECSE 233 Introduction to Data Structures.

The two-course hardware sequence is:

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>ECSE 314</td>
<td>Computer Architecture</td>
<td>3</td>
</tr>
<tr>
<td>ECSE 315</td>
<td>Digital Systems Design</td>
<td>4</td>
</tr>
</tbody>
</table>

The corresponding two-course software sequence is:

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>ECSE 303</td>
<td>Embedded Systems Design and Laboratory</td>
<td>3</td>
</tr>
<tr>
<td>ECSE 3XX</td>
<td>Approved by advisor</td>
<td>4</td>
</tr>
</tbody>
</table>

Minor in Artificial Intelligence (AI)
The Computer and Data Sciences Department offers a minor in Artificial Intelligence (AI). For more information on the requirements for the minor, visit the Computer and Data Sciences General Bulletin page (p. 88).

Minor in Computer Gaming (CGM)
The minor is 16 hours as follows:

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSDS 391</td>
<td>Introduction to Artificial Intelligence</td>
<td>3</td>
</tr>
<tr>
<td>ECSE 233</td>
<td>Introduction to Data Structures</td>
<td>4</td>
</tr>
<tr>
<td>or CSDS 233</td>
<td>Introduction to Data Structures</td>
<td></td>
</tr>
<tr>
<td>ECSE 290</td>
<td>Introduction to Computer Game Design and Implementation</td>
<td>3</td>
</tr>
<tr>
<td>or CSDS 290</td>
<td>Introduction to Computer Game Design and Implementation</td>
<td></td>
</tr>
<tr>

</table>

It is recommended that one additional open elective be a “content creation” course taken from the following areas: Art, English, or Music.

Students should note that ECSE 132 Introduction to Programming in Java is a prerequisite for ECSE 233 Introduction to Data Structures.

Graduate Programs
MS Degree Programs
The Department of Electrical, Computer, and Systems Engineering offers the following Master of Science degrees:

• Electrical Engineering MS
• Computer Engineering MS
• Systems and Control Engineering MS

Admission
Graduate students shall be admitted to one of three MS degree tracks (thesis-focused, project-focused, course-focused) upon recommendation of the faculty of the Department. Requirements for admission include a strong record of scholarship in a completed bachelor’s degree program in a field of engineering, mathematical or physical sciences, and fluency in written and spoken English.

For a thesis-focused or project-focused track, the University requires all foreign applicants to show English proficiency by achieving a TOEFL score of at least 90 on the internet-based exam. For a course-focused track, a minimum TOEFL score of 80 is required. If there is any professional student-to-student interaction, e.g. as a teaching assistant, a lab instructor, or a tutor, then a minimum TOEFL score of 90 is required.

It is required that all students submit original copies of GRE scores, with the exception of CWRU students applying to the BS/MS program. Applications from students with a bachelor's degree in fields other than those listed above may be granted admission on a provisional basis. Such provisional students may be advanced to full standing upon completion of prerequisite conditions stipulated in the letter of admission.

Registration
Course registration is performed through the Student Information System (SIS). Each semester before registration, students should update any personal information that may have changed by logging into SIS and editing the appropriate information. All registration holds must be lifted in order to successfully complete the registration process.

Advising
Upon admission to the graduate program, each graduate student is assigned an academic advisor to assist in registration as well as planning a program of study (Academic Program). This is a temporary assignment made by the Department Chairperson based on the student's academic and research interests as identified at the time of application.

During the first semester in the program, it is strongly suggested that each student meet with various members of faculty to discuss academic objectives/goals and research opportunities. In order to complete the research component of their respective degree program, each student must identify a faculty member who is willing to serve as the student's research advisor. Students are expected to pick a research advisor by the end of their first semester in the program who will supervise their thesis or project. Each student, in consultation with their advisor, must submit an Academic Program preferably before completing 9 credit hours of coursework. This should specify all courses and thesis work that will be counted toward the 30 credit hour requirement.

The research advisor will also serve as the student’s permanent academic advisor if they are a member of the department faculty. If, however, the
research advisor is not a member of the department faculty, the student is required to find a permanent academic advisor from the department faculty. For students enrolled in an MS Thesis-Focused degree program, the research advisor is commonly known as the “thesis advisor.”

Students may change advisors for a variety of reasons of which one of the most common is a change of the student’s field of interest. It should be noted that a change in research advisor may require that the student start a new research project, which could result in delaying graduation. It is the responsibility of the student to inform the ECSE Office of Student Affairs in the event of a change in advisor. In addition, the student must file all appropriate forms with Graduate Studies.

Appeals
Any decision by an academic advisor, thesis guidance committee or department associate chairperson may be appealed, in writing, to the department associate chairperson who shall present the appeal, with their recommendations, to the faculty at its next regular faculty meeting. The faculty’s decision shall be final.

Other Regulations
All students pursuing graduate studies in the Department of Electrical, Computer, and Systems Engineering must abide by the academic regulations of the School of Graduate Studies (p. 1333) and the Case School of Engineering contained in the most recent issue of the Bulletin of Case Western Reserve University, and supplemented by the Department of Electrical, Computer, and Systems Engineering regulations.

Electrical Engineering MS
Thesis-Focused Track
The MS Thesis-Focused track is composed of two components:

1. graduate-level coursework and
2. a research-oriented thesis

Progression through the program is monitored by an Academic Program that is required to be filed through SIS. This contains a comprehensive list of all courses to be applied to the degree (including transfer courses) and must be approved by the student’s academic advisor, Department Chairperson, and Dean of Graduate Studies.

At least 30 semester credit hours of coursework at the 400 level or above, of which a minimum of 18 credits must be from non-thesis related courses is required. Each Electrical Engineering MS Thesis-Focused student must complete at least 9 credit hours of ECSE 651 Thesis M.S., which is the course associated with MS thesis research. Each student must complete their approved Academic Program coursework with a cumulative grade point average of 3.0 or greater.

Completion of the MS Thesis-Focused track requires that the student submit a written thesis and make an oral presentation of the findings (hereafter known as the defense) to a thesis guidance committee. The thesis guidance committee shall consist of the student’s research advisor and at least two additional faculty members recommended by the advisor. At least two members of the committee must be faculty members in the ECSE department. The chairperson of the guidance committee is normally the candidate’s research advisor. The student is responsible for forming the thesis guidance committee. The student will work closely with their advisor to determine when the thesis is ready for review by the guidance committee. The student shall provide an announcement containing a title, abstract, date, time and location of the defense to the ECSE Office of Student Affairs for general distribution at least 10 days in advance of the thesis defense.

Project-Focused Track
The MS Project-Focused track is composed of two components:

1. graduate-level coursework and
2. a research-oriented project

Progression through the program is monitored by an Academic Program that is required to be filed through SIS. The Academic Program contains a comprehensive list of all courses to be applied to the degree (including transfer courses) and must be approved by the student’s academic advisor, Department Chairperson, and Dean of Graduate Studies.

The Academic Program must contain at least 30 semester credit hours of coursework at the 400 level or above, of which a minimum of 21 credits must be from courses other than ECSE 695 Project M.S. (which is the course associated with the MS research project) is required. Each Electrical Engineering MS Project-Focused student must complete at least 3 credit hours of ECSE 695 Project M.S. Each student must complete their approved Academic Program coursework with a cumulative grade point average of 3.0 or greater.

Each candidate for the Electrical Engineering master’s degree under a Project-Focused track must pass a comprehensive examination to be administered by a committee of department faculty. The examination committee should be composed of the student’s academic advisor and at least two additional members of the department faculty. In such cases, the chairperson of the committee is normally the candidate’s academic advisor. The examination may be written, oral, or a combination as determined by the committee. A student must be registered during the semester in which any part of the comprehensive examination is taken. If not registered for other courses, the student will be required to register for one semester hour of EXAM 600 Master’s Comprehensive Exam.

Course-Focused Track
The Course-Focused MS track requirements consist of:

1. the completion of 30 hours of approved coursework at the 400 level or higher,
2. satisfactory completion of the culminating course-focused experience, i.e. passing the course ENGR 600 with requirements defined by the student’s curricular program, and
3. additional requirements as specified by the program.

Students should consult with their academic advisor and/or department to determine the detailed requirements within this framework.

Computer Engineering MS
Thesis-Focused Track
The MS Thesis-Focused track is composed of two components:

1. graduate-level coursework and
2. a research-oriented thesis

Progression through the program is monitored by an Academic Program that is required to be filed through SIS. This contains a comprehensive list of all courses to be applied to the degree (including transfer courses) and must be approved by the student’s academic advisor, Department Chairperson, and Dean of Graduate Studies.

At least 30 semester credit hours of coursework at the 400 level or above, of which a minimum of 18 credits must be from non-thesis related
courses is required. Each Computer Engineering MS Thesis-Focused student must complete at least 9 credit hours of ECSE 651 Thesis M.S., which is the course associated with MS thesis research. Each student must complete their approved Academic Program coursework with a cumulative grade point average of 3.0 or greater.

Completion of the MS Thesis-Focused track requires that the student submit a written thesis and make an oral presentation of the findings (hereafter known as the defense) to a thesis guidance committee. The thesis guidance committee shall consist of the student’s research advisor and at least two additional faculty members recommended by the advisor. At least two members of the committee must be faculty members in the ECSE department. The chairperson of the guidance committee is normally the candidate’s research advisor. The student is responsible for forming the thesis guidance committee. The student will work closely with their advisor to determine when the thesis is ready for review by the guidance committee. The student shall provide an announcement containing a title, abstract, date, time and location of the defense to the ECSE Office of Student Affairs for general distribution at least 10 days in advance of the thesis defense.

Project-Focused Track
The MS Project-Focused track is composed of two components:

1. graduate-level coursework and
2. a research-oriented project

Progression through the program is monitored by an Academic Program that is required to be filed through SIS. The Academic Program contains a comprehensive list of all courses to be applied to the degree (including transfer courses) and must be approved by the student’s academic advisor, Department Chairperson, and Dean of Graduate Studies.

The Academic Program must contain at least 30 semester credit hours of coursework at the 400 level or above, of which a minimum of 21 credits from courses other than ECSE 695 Project M.S. (which is the course associated with the MS research project) is required. Each Computer Engineering MS Project-Focused student must complete at least 3 credit hours of ECSE 695 Project M.S.. Each student must complete their approved Academic Program coursework with a cumulative grade point average of 3.0 or greater.

Each candidate for the Computer Engineering master’s degree under a Project-Focused track must pass a comprehensive examination to be administered by a committee of department faculty. The examination committee should be composed of the student’s academic advisor and at least two additional members of the department faculty. In such cases, the chairperson of the committee is normally the candidate’s academic advisor. The examination may be written, oral or a combination as determined by the committee. A student must be registered during the semester in which any part of the comprehensive examination is taken. If not registered for other courses, the student will be required to register for one semester hour of EXAM 600 Master’s Comprehensive Exam.

Course-Focused Track
The Course-Focused MS track requirements consist of:

1. the completion of 30 hours of approved coursework at the 400 level or higher,
2. satisfactory completion of the culminating course-focused experience, i.e. passing the course ENGR 690 with requirements defined by the student's curricular program, and
3. additional requirements as specified by the program.

Students should consult with their academic advisor and/or department to determine the detailed requirements within this framework.

Systems and Control Engineering MS
Thesis-Focused Track
The MS Thesis-Focused track is composed of two components:

1. graduate-level coursework and
2. a research-oriented thesis

Progression through the program is monitored by an Academic Program that is required to be filed through SIS. This contains a comprehensive list of all courses to be applied to the degree (including transfer courses) and must be approved by the student’s academic advisor, Department Chairperson, and Dean of Graduate Studies.

At least 30 semester credit hours of coursework at the 400 level or above, of which a minimum of 18 credits must be from non-thesis related courses is required. Each Systems and Control Engineering MS Thesis-Focused student must complete at least 9 credit hours of ECSE 651 Thesis M.S., which is the course associated with MS thesis research. Each student must complete their approved Academic Program coursework with a cumulative grade point average of 3.0 or greater.

Completion of the MS Thesis-Focused track requires that the student submit a written thesis and make an oral presentation of the findings (hereafter known as the defense) to a thesis guidance committee. The thesis guidance committee shall consist of the student’s research advisor and at least two additional faculty members recommended by the advisor. At least two members of the committee must be faculty members in the ECSE department. The chairperson of the guidance committee is normally the candidate’s research advisor. The student is responsible for forming the thesis guidance committee. The student will work closely with their advisor to determine when the thesis is ready for review by the guidance committee. The student shall provide an announcement containing a title, abstract, date, time and location of the defense to the ECSE Office of Student Affairs for general distribution at least 10 days in advance of the thesis defense.

Project-Focused Track
The MS Project-Focused track is composed of two components:

1. graduate-level coursework and
2. a research-oriented project

Progression through the program is monitored by an Academic Program that is required to be filed through SIS. The Academic Program contains a comprehensive list of all courses to be applied to the degree (including transfer courses) and must be approved by the student’s academic advisor, Department Chairperson, and Dean of Graduate Studies.

The Academic Program must contain at least 30 semester credit hours of coursework at the 400 level or above, of which a minimum of 21 credits from courses other than ECSE 695 Project M.S. (which is the course associated with the MS research project) is required. Each Systems and Control Engineering MS Project-Focused student must complete at least 3 credit hours of ECSE 695 Project M.S.. Each student must complete their approved Academic Program coursework with a cumulative grade point average of 3.0 or greater.

Each candidate for the Systems and Control Engineering master’s degree under a Project-Focused track must pass a comprehensive examination to be administered by a committee of department faculty. The examination committee should be composed of the student’s
academic advisor and at least two additional members of the department faculty. In such cases, the chairperson of the committee is normally the candidate’s academic advisor. The examination may be written, oral or a combination as determined by the committee. A student must be registered during the semester in which any part of the comprehensive examination is taken. If not registered for other courses, the student will be required to register for one semester hour of EXAM 600 Master’s Comprehensive Exam.

Course-Focused Track
The Course-Focused MS track requirements consist of:

1. the completion of 30 hours of approved coursework at the 400 level or higher;
2. satisfactory completion of the culminating course-focused experience, i.e. passing the course ENGR 600 with requirements defined by the student’s curricular program, and
3. additional requirements as specified by the program.

Students should consult with their academic advisor and/or department to determine the detailed requirements within this framework.

PhD Degree Programs
The Department of Electrical, Computer, and Systems Engineering offers the following Doctor of Philosophy degrees:

- Electrical Engineering PhD
- Computer Engineering PhD
- Systems and Control Engineering PhD

Admission
Requirements for admission include a strong record of scholarship in a completed bachelor’s degree program in a field of engineering, mathematical or physical sciences, and fluency in written and spoken English. The University requires all foreign applicants to show English proficiency by achieving a TOEFL score of at least 577 on the paper-based exam or 90 on the internet-based exam. It is required that all students submit original copies of GRE scores. Applications from students with a bachelor’s degree in fields other than those listed above may be granted admission on a provisional basis. Such provisional students may be advanced to full standing upon completion of prerequisite conditions stipulated in the letter of admission.

Registration
Course registration is performed through the Student Information System (SIS). Each semester before registration, students should update any personal information that may have changed by logging into SIS and editing the appropriate information. All registration holds must be lifted in order to successfully complete the registration process.

Advising
Upon admission to the graduate program, each graduate student is assigned an academic advisor to assist in registration as well as planning a program of study (Academic Program). This is a temporary assignment made by the Department Chairperson based on the student’s academic and research interests as identified at the time of application.

During the first two semesters in the program, it is strongly suggested that each student meet with various members of faculty to discuss academic objectives/goals and research opportunities. In order to complete the research component of their respective degree program, each student must identify a faculty member who is willing to serve as the student’s research advisor. The research advisor will also serve as the student’s permanent academic advisor if they are members of the department faculty. If, however, the research advisor is not a member of the department faculty, the student is required to find a permanent academic advisor from the department faculty. For students enrolled in the PhD program, the research advisor is commonly known as the “dissertation” advisor.

Each student is required to file an Academic Program, which must be approved by the student’s advisor and the Department Chairperson, and submitted to the Dean of Graduate Studies. Full-time PhD students should choose a research advisor and file an Academic Program before taking the qualifier but no later than the beginning of the third semester. Upon passing the qualifier, full-time PhD students will be required to assemble the dissertation guidance committee, prepare a dissertation proposal, and present this proposal to the committee for their approval. This process should be completed within one semester of passing the PhD qualifier.

The student shall be responsible for forming a dissertation guidance committee which shall consist of the student’s academic advisor and additional faculty members recommended by the advisor. For the PhD program, the minimum number of additional faculty members on the dissertation guidance committee is three, and at least two of the committee must be within the ECSE program areas (Computer Engineering, Electrical Engineering, and Systems and Control Engineering). The chairperson of the dissertation guidance committee is normally the candidate’s research advisor.

Students may change advisors for a variety of reasons of which one of the most common is a change of the student’s field of interest. It should be noted that a change in research advisor may require that the student start a new research project, which could result in delaying graduation. It is the responsibility of the student to inform the ECSE Office of Student Affairs in the event of a change in advisor.

Appeals
Any decision by an academic advisor, dissertation guidance committee or Department Associate Chairperson may be appealed, in writing, to the Department Associate Chairperson who shall present the appeal, with their recommendations, to the faculty at its next regular faculty meeting. The faculty’s decision shall be final.

Other Regulations
All students pursuing graduate studies in the Electrical, Computer, and Systems Engineering department must abide by the academic regulations of the School of Graduate Studies (p. 1333) and the Case School of Engineering contained in the most recent issue of the Bulletin of Case Western Reserve University, and supplemented by the Department of Electrical, Computer, and Systems Engineering regulations.

PhD Degree Program Requirements
In order to successfully complete the PhD Degree Program, a student must satisfy the following requirements:

- Select a major dissertation subject area in Electrical Engineering, Computer Engineering, or Systems and Control Engineering
- Fulfill all PhD course requirements in the chosen major area (see individual degree requirements below)
• Have an approved Program of Study and complete the CWRU courses in the approved Program of Study with a cumulative grade point average of 3.25 or greater
• Successfully complete the PhD Qualifying Examination
• Successfully complete the PhD Proposal Defense
• Successfully complete and defend the PhD Dissertation
• Fulfill the PhD residency requirement

PhD Candidacy
The final consideration of whether to admit the student to PhD candidacy will be taken by the PhD Qualifying Committee (for Electrical Engineering and Computer Engineering students) or the student’s dissertation guidance committee (for Systems and Control Engineering students) after the student has passed the PhD Qualifier. A written report on the results of the qualifier and PhD candidacy will be prepared by the committee and submitted to the Department Chairperson, who, in turn, will notify the School of Graduate Studies of the results.

PhD Proposal
After passing the Qualifier and being admitted to PhD candidacy, the PhD candidate is required to pass a Dissertation Proposal Exam on a timely basis, generally within one semester after being admitted to candidacy. This exam shall be administered by the student’s dissertation guidance committee and consists of a written dissertation proposal and an oral presentation of the proposed dissertation research. As part of the oral presentation, the student will be expected to answer questions covering the proposed research as well as questions on related topics as deemed appropriate by the student’s dissertation guidance committee. The written dissertation proposal must be received by the committee members at least ten days before the date scheduled for the oral exam and presentation. The Dissertation Proposal Exam, the PhD research, the final oral dissertation defense, and all other requirements in the student’s PhD program of study must be completed within five years after the student is admitted to PhD candidacy.

The PhD Oral Defense
The student shall provide an announcement containing a title, abstract, date, time and location of the defense to the ECSE Office of Student Affairs for general distribution at least 10 days in advance of the thesis defense.

The PhD Residency Requirements
All PhD students shall fulfill the PhD residency requirements set forth by the Case School of Engineering and the School of Graduate Studies (p. 1327). Specifically, the PhD student is required either to register for at least 9 credit hours during each of two consecutive semesters or to engage in academic work (taking courses, assisting in course development and/or teaching, fully engaging in research, or some other scholarly activities) in at least six consecutive terms (fall, spring, or summer) between matriculation and a period not exceeding 5 years after the first credited hour of ECSE 701 Dissertation Ph.D.. The period during a leave of absence cannot be counted to fulfill the residency requirement.

Electrical Engineering PhD
Course Requirements and Academic Program
Each Electrical Engineering PhD student is required to have an Academic Program, approved by the academic advisor, Department Chairperson, and Dean of Graduate Studies, that includes a minimum of 36 credit hours of coursework beyond the BS degree. At least 18 credit hours of coursework must be taken at CWRU. In addition, the student is also required to complete a minimum of 18 credit hours of ECSE 701 Dissertation Ph.D. to fulfill the requirement for PhD-level research. Acceptable courses include suitable CWRU courses at the 400 level or higher and approved graduate-level courses taken at other institutions. Students holding an MS degree in an appropriate field of study from CWRU or another degree-granting institution may apply up to 18 credit hours of coursework completed for their MS degree towards the aforementioned 36 credit hour requirement.

Each PhD student is required to have a fully-approved Academic Program before taking the PhD Qualifying examination and before registering for the final 18 credit hours of the program. The Academic Program shall be prepared by the student and approved by the research advisor or the permanent academic advisor in the case where the research advisor is not in the Department.

An Academic Program must meet the following requirements:

• A minimum of two courses in mathematics, statistics, or basic science.
• At least six approved courses from the student’s major area of study. At least 4 of these courses must be from within the ECSE department.
• Four additional courses that are not listed under the student’s major program area. These courses should satisfy the requirement for breadth in the student’s program of study.
• A minimum of 18 hours of PhD Dissertation research as noted by enrollment in and successful completion of ECSE 701 Dissertation Ph.D.
• Successful completion of ECSE 400T Graduate Teaching I, ECSE 500T Graduate Teaching II and ECSE 600T Graduate Teaching III.
• Successful completion of the ECSE 500 ECSE Colloquium requirement (see below)

The above represents the minimum course requirements beyond the BS degree. The total number of 3 credit hour courses in the Academic Program is at least twelve (12) beyond the BS level. The selection of these courses should be done with guidance from the student’s permanent academic advisor. Any additional courses may be in any one of the above categories as approved by the student’s advisor.

ECSE Colloquium and Presentation Requirement
The PhD program includes a colloquium and public presentation requirement.

For those who matriculated during or after Fall 2012, the requirement has two parts:
1. All PhD students are required to register for and pass ECSE 500 ECSE Colloquium for a total of three semesters of the PhD Program, and this is expected before Advancement to Candidacy. This is a 0 credit hour required course. Students, such as part-time students working in industry, may propose an alternative arrangement for fulfilling this requirement, by submitting a written petition to the Graduate Studies Committee.
2. All PhD students must give a public presentation of their research, in addition to their PhD dissertation defense. This presentation must be given either at a research conference, in the ECSE seminar series, workshop presentations or similar presentations in a public venue. MS thesis and PhD dissertation defenses cannot be used to fulfill the public presentation requirement.

Additional details and the associated forms can be acquired from the ECSE Office of Student Affairs.
For students who matriculated before Fall 2012, the requirement can be met in one of two ways:

1. Completing the requirements detailed above, or
2. Passing 5 semesters of ECSE 500 ECSE Colloquium. Students, such as part-time students working in industry, may propose an alternative arrangement for fulfilling this requirement by submitting a written petition to the ECSE Graduate Studies Committee.

**PhD Qualifying Examination**

A student shall be admitted to PhD candidacy only after they have passed the PhD Qualifying Examination. The Qualifying Exam is intended to test the students’ knowledge in the student’s chosen major program area of Electrical Engineering. The objectives of the exam are:

1. To assess the PhD student’s understanding of the fundamental concepts in Electrical Engineering as embodied in the respective graduate curriculum.
2. To ensure that the student have the ability to pursue PhD level research, and have mastered the graduate level coursework necessary to succeed as researchers.

Full-time PhD students are recommended to take the PhD qualifier before the beginning of their third semester of full-time (or equivalent) enrollment, and must pass the exam within two years of being admitted to the program. For part-time students, the Qualifying Exam must be passed before more than 27 credit hours of coursework have been completed. For students who must take remedial courses to make up for shortcomings in their engineering and mathematics knowledge base, the deadline can be extended to the fifth semester of full-time (or equivalent) enrollment, but this requires a petition to the ECSE Graduate Committee. Students have two opportunities to pass the PhD Qualifier. A student who fails to pass the Qualifier after two attempts will not be allowed to continue in the PhD program in the Department of Electrical, Computer, and Systems Engineering.

To pass the PhD Qualifier, the student must demonstrate proficiency in two parts:

**Part 1: Electrical Engineering**

The first part of the PhD Qualifier assesses the student’s fundamental knowledge and proficiency in Electrical Engineering.

**For students matriculating after 8/1/2014:**

Students must demonstrate competency in one of the following areas within electrical engineering in which the electrical engineering faculty have established research thrust areas:

1. Circuits and Instrumentation
2. Robotics
3. Micro- and Nano-systems

To demonstrate competency in one of these areas, the student must do one of the following:

1. take the course for that area and pass that course with a grade of A, or
2. pass a written exam for that specific area.

The designated courses for each of the areas are:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>ECSE 246</td>
<td>Robotics I</td>
<td>3</td>
</tr>
<tr>
<td>ECSE 422</td>
<td>Solid State Electronics II</td>
<td>3</td>
</tr>
<tr>
<td>ECSE 426</td>
<td>MOS Integrated Circuit Design</td>
<td>3</td>
</tr>
<tr>
<td>ECSE 489</td>
<td>Robotics I</td>
<td>3</td>
</tr>
</tbody>
</table>

In the event that a designated course is not offered within a reasonable period of time, the student may petition the faculty in electrical engineering to designate a suitable substitute.

A student failing to meet the requirements prescribed above may, with the support of their dissertation research advisor, petition the faculty for an oral exam. The oral exam will consist of a 30-minute presentation by the student to a 3-member examination committee made up of electrical engineering faculty. The topic will be drawn from the student’s area of interest as selected by their advisor and approved by the committee. The topic may not come directly from the student’s MS thesis conducted at CWRU or elsewhere.

A student has completed the PhD Qualifier in electrical engineering when:

1. they have successfully completed the aforementioned competency requirement,
2. a group of faculty within their selected research area has conducted a review of the student’s academic record and determined that adequate progress has been made, and
3. the student has formally identified a dissertation advisor.

**For students matriculating prior to 8/1/2014:**

The written portion of the PhD Qualifier in Electrical Engineering is designed to assess a student’s knowledge and understanding of topics fundamental to all electrical engineering students pursuing a doctorate in the field. The written exam will consist of questions at the advanced undergraduate level covering material from the three topic areas listed below. Courses currently in the Electrical Engineering undergraduate curriculum corresponding to a particular topic area are listed below:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>ECSE 309</td>
<td>Electromagnetic Fields I</td>
<td>3</td>
</tr>
<tr>
<td>ECSE 245</td>
<td>Electronic Circuits</td>
<td>4</td>
</tr>
<tr>
<td>or ECSE 281</td>
<td>Logic Design and Computer Organization</td>
<td>4</td>
</tr>
<tr>
<td>ECSE 246</td>
<td>Signals and Systems</td>
<td>4</td>
</tr>
</tbody>
</table>

Exam problems will be limited to materials contained in the selected references as well as the aforementioned courses. Sample problems from previous exams as well as a list of relevant references are available upon request.

Students must show competency in all three tested areas. Upon recommendation of the faculty, a student showing marginal proficiency in one area may be required to correct this deficiency, for example, by taking an appropriate course (as determined by the faculty) and pass this course with at least a B grade or by serving as a teaching assistant of an appropriate course.

The written part of the Qualifying Exam for Electrical Engineering will be offered at least once a year during the month of January, prior to the beginning of the spring semester.

**Part 2: Electrical Engineering**

The second part of the PhD Qualifier shall be prepared and administered by the designated PhD Qualifying committee for students in the Electrical Engineering program. This exam will test the student on advanced topics...
in the student’s major area of study as well as specialized topics relevant to the student’s research area.

**For students matriculating after 8/1/2014:**

Does not apply

**For students matriculating prior to 8/1/2014:**

Only those students performing adequately on the written exam will advance to the oral portion of the qualifier. The exam will be administered by a three-member examination committee assembled from the ECSE faculty. The oral portion of the PhD Qualifier will consist of a two-part examination. The first part of the oral exam will consist of a 20-minute presentation by the student on a topic selected by the examination committee. The topic will be one that is well documented in the scientific/engineering literature. In selecting the topic, the examination committee will take into account the student’s research interests, academic background, and experience in the field. The student will be given the topic 15 working days prior to the examination. The topic will be presented to the student in the form of a published paper or collection of papers.

The student will be required to demonstrate competency in the following areas:

1. the material directly covered by the paper(s),
2. the material covered in the important references in the paper(s), and
3. any relevant background material that is necessary for the fundamental understanding of the paper.

The second part of the oral exam will consist of a series of questions drawn from the topic areas covered by the written exam. As with the written exam, a student showing marginal proficiency during the oral exam may be asked to perform some sort of remediation at the discretion of the oral examination committee.

**Computer Engineering PhD**

**Course Requirements and Academic Program**

Each Computer Engineering PhD student is required to have an Academic Program, approved by the academic advisor, Department Chairperson, and Dean of Graduate Studies, that includes a minimum of 36 credit hours of coursework beyond the BS degree. At least 18 credit hours of coursework must be taken at CWRU. In addition, the student is also required to complete a minimum of 18 credit hours of ECSE 701 Dissertation Ph.D. to fulfill the requirement for PhD-level research. Acceptable courses include suitable CWRU courses at the 400 level or higher and approved graduate-level courses taken at other institutions. Students holding an MS degree in an appropriate field of study from CWRU or another degree-granting institution may apply up to 18 credit hours of coursework completed for their MS degree towards the aforementioned 36 credit hour requirement.

Each PhD student is required to have a fully-approved Academic Program before taking the PhD Qualifying examination and before registering for the final 18 credit hours of the program. The Academic Program shall be prepared by the student and approved by the research advisor or the permanent academic advisor in the case where the research advisor is not in the Department.

An Academic Program must meet the following requirements:

- At least six approved courses from the student’s major area of study. At least 4 of these courses must be from within the ECSE department.
- Four additional courses that are not listed under the student’s major program area. These courses should satisfy the requirement for breadth in the student’s program of study.
- A minimum of 18 hours of PhD Dissertation research as noted by enrollment in and successful completion of ECSE 701 Dissertation Ph.D.
- Successful completion of ECSE 400T Graduate Teaching I, ECSE 500T Graduate Teaching II and ECSE 600T Graduate Teaching III.
- Successful completion of the ECSE 500 ECSE Colloquium requirement (see below)

The above represents the minimum course requirements beyond the BS degree. The total number of 3 credit hour courses in the Academic Program is at least twelve (12) beyond the BS level. The selection of these courses should be done with guidance from the student’s permanent academic advisor. Any additional courses may be in any one of the above categories as approved by the student’s advisor.

**ECSE Colloquium and Presentation Requirement**

The PhD program includes a colloquium and public presentation requirement.

**For those who matriculated during or after Fall 2012, the requirement has two parts:**

1. All PhD students are required to register for and pass ECSE 500 ECSE Colloquium for a total of three semesters of the PhD Program, and this is expected before Advancement to Candidacy. This is a 0 credit hour required course. Students, such as part-time students working in industry, may propose an alternative arrangement for fulfilling this requirement, by submitting a written petition to the Graduate Studies Committee.

2. All PhD students must give a public presentation of their research, in addition to their PhD dissertation defense. This presentation must be given either at a research conference, in the ECSE seminar series, workshop presentations or similar presentations in a public venue. MS thesis and PhD dissertation defenses cannot be used to fulfill the public presentation requirement.

Additional details and the associated forms can be acquired from the ECSE Office of Student Affairs.

**For students who matriculated before Fall 2012, the requirement can be met in one of two ways:**

1. Completing the requirements detailed above, or
2. Passing 5 semesters of ECSE 500 ECSE Colloquium. Students, such as part-time students working in industry, may propose an alternative arrangement for fulfilling this requirement by submitting a written petition to the ECSE Graduate Studies Committee.

**PhD Qualifying Examination**

A student shall be admitted to PhD candidacy only after they have passed the PhD Qualifying Examination. The Qualifying Exam is intended to test the students’ knowledge in the student’s chosen major program area of Computer Engineering. The objectives of the exam are:

1. To assess the PhD student’s understanding of the fundamental concepts in Computer Engineering as embodied in the respective graduate curriculum.
2. To ensure that the student have the ability to pursue PhD level research, and have mastered the graduate level coursework necessary to succeed as researchers

Full-time PhD students are recommended to take the PhD qualifier before the beginning of their third semester of full-time (or equivalent) enrollment, and must pass the exam within two years of being admitted to the program. For part-time students, the Qualifying Exam must be passed before more than 27 credit hours of coursework have been completed. For students who must take remedial courses to make up for shortcomings in their engineering and mathematics knowledge base, the deadline can be extended to the fifth semester of full-time (or equivalent) enrollment, but this requires a petition to the ECSE Graduate Committee. Students have two opportunities to pass the PhD Qualifier. A student who fails to pass the Qualifier after two attempts will not be allowed to continue in the PhD program in the Department of Electrical, Computer, and Systems Engineering.

To pass the PhD Qualifier, the student must demonstrate proficiency in two parts:

**Part 1: Computer Engineering**

Part 1 of the PhD Qualifier will consist of a written examination with questions drawn from several course areas listed below. At least three (3) topic areas must be pursued by the student for a complete qualifier. The exam style is a mini-project oriented, take home test that must be completed within a one week period.

<table>

</tbody>
</table>

Additional topic areas may be assigned depending on the student's interests and recommendations from their advisors.

If a student fails all three areas of the written examination, the entire exam must be taken again. If a student fails some areas, the faculty may elect to give another exam to the student in just the areas failed.

The written part of the Qualifying Exam for Computer Engineering will be offered at least once a year at the end of the spring semester.

**Part 2: Computer Engineering**

Part 2 will consist of an oral exam based on the areas of the written examination. However, the oral exam may be waived if the student has performed well in all three topic areas of the written exam.

2. Define and analyze the requirements for the upcoming academic year.

An Academic Program must meet the following requirements:

- A minimum of two courses in mathematics, statistics, or basic science.
- At least six approved courses from the student's major area of study. At least 4 of these courses must be from within the ECSE department.
- Four additional courses that are not listed under the student's major program area. These courses should satisfy the requirement for breadth in the student's program of study.
- A minimum of 18 hours of PhD Dissertation research as noted by enrollment in and successful completion of ECSE 701 Dissertation Ph.D.
- Successful completion of ECSE 400T Graduate Teaching I, ECSE 500T Graduate Teaching II and ECSE 600T Graduate Teaching III.
- Successful completion of the ECSE 500 ECSE Colloquium requirement (see below)

The above represents the minimum course requirements beyond the BS degree. The total number of 3 credit hour courses in the Academic Program is at least twelve (12) beyond the BS level. The selection of these courses should be done with guidance from the student's permanent academic advisor. Any additional courses may be in any one of the above categories as approved by the student's advisor.

**ECSE Colloquium and Presentation Requirement**

The PhD program includes a colloquium and public presentation requirement.

**For those who matriculated during or after Fall 2012, the requirement has two parts:**

1. All PhD students are required to register for and pass ECSE 500 ECSE Colloquium for a total of three semesters of the PhD Program, and this is expected before Advancement to Candidacy. This is a 0 credit hour required course. Students, such as part-time students working in industry, may propose an alternative arrangement for fulfilling this requirement, by submitting a written petition to the Graduate Studies Committee.

2. All PhD students must give a public presentation of their research, in addition to their PhD dissertation defense. This presentation must be given either at a research conference, in the ECSE seminar series, workshop presentations or similar presentations in a public venue. MS thesis and PhD dissertation defenses cannot be used to fulfill the public presentation requirement.

Additional details and the associated forms can be acquired from the ECSE Office of Student Affairs.

**For students who matriculated before Fall 2012, the requirement can be met in one of two ways:**
1. Completing the requirements detailed above, or
2. Passing 5 semesters of ECSE 500 ECSE Colloquium. Students, such as part-time students working in industry, may propose an alternative arrangement for fulfilling this requirement by submitting a written petition to the ECSE Graduate Studies Committee.

**PhD Qualifying Examination**

A student shall be admitted to PhD candidacy only after they have passed the PhD Qualifying Examination. The Qualifying Exam is intended to test the students’ knowledge in the student’s chosen major program area of Systems and Control Engineering. The objectives of the exam are:

1. To assess the PhD student’s understanding of the fundamental concepts in Systems and Control Engineering as embodied in the respective graduate curriculum.
2. To ensure that the student have the ability to pursue PhD level research, and have mastered the graduate level coursework necessary to succeed as researchers

Full-time PhD students are recommended to take the PhD qualifier before the beginning of their third semester of full-time (or equivalent) enrollment, and must pass the exam within two years of being admitted to the program. For part-time students, the Qualifying Exam must be passed before more than 27 credit hours of coursework have been completed. For students who must take remedial courses to make up for shortcomings in their engineering and mathematics knowledge base, the deadline can be extended to the fifth semester of full-time (or equivalent) enrollment, but this requires a petition to the ECSE Graduate Committee. Students have two opportunities to pass the PhD Qualifier. A student who fails to pass the Qualifier after two attempts will not be allowed to continue in the PhD program in the Department of Electrical, Computer, and Systems Engineering.

To pass the PhD Qualifier, the student must demonstrate proficiency in two parts:

**Part 1: Systems and Control Engineering**

Students must show competency in control systems engineering, signals and systems, and systems analysis (optimization, simulation, stochastic modeling, and decision and economic analysis). Students must demonstrate proficiency in at least three of the following areas:

**Control Systems**

- ECSE 304 Control Engineering I with Laboratory
- ECSE 408 Introduction to Linear Systems

**Optimization**

- ECSE 346 Engineering Optimization
- ECSE 416 Convex Optimization for Engineering

**Signal Processing**

- ECSE 313 Signal Processing
- ECSE 401 Digital Signal Processing

**Simulation and Discrete Event Systems**

- ECSE 324 Modeling and Simulation of Continuous Dynamical Systems

**Stochastic Models and Decisions**

- ECSE 352 Engineering Economics and Decision Analysis
- ECSE 452 Random Signals

To demonstrate proficiency in an area, the student can either take one of the courses listed for that area and obtain a course grade of A or take and pass an exam for that specific area. Upon recommendation by the faculty, the student showing marginal proficiency in any area may be required to improve proficiency by serving as a teaching assistant of an appropriate course.

**Part 2: Systems and Control Engineering**

A typical exam begins with a selection by the student's dissertation guidance committee of 5-6 research articles relevant to the student's research area. The students will be given 4 weeks to write a report answering questions formulated from those papers by the dissertation guidance committee. This will be followed within one week by an oral exam during which the student will give an oral presentation based on the report and answer questions from the dissertation guidance committee and other attending ECSE faculty. Questions will be based on the report as well as miscellaneous questions on advanced topics in Systems and Control Engineering as deemed appropriate by committee members and/or other attending faculty.

**Facilities**

**Computer Facilities**

The department computer facilities incorporate both UNIX (primarily Linux) and Microsoft Windows-based operating systems on high-end computing workstations for education and research. A number of file, printing, database and authentication servers support these workstations, as well as the administrative functions of the department. Labs are primarily located in the Olin and Glennan buildings, but include Nord Hall, and are networked via the Case network.

The Case network is a state-of-the-art, high-speed fiber optic campus-wide computer network that interconnects laboratories, faculty and student offices, classrooms, and student residence halls. It is one of the largest fiber-to-desktop networks anywhere in the world. Every desktop has a 1 Gbps (gigabit per second) connection to a fault-tolerant 10 Gbps backbone. To complement the wired network, over 1,200 wireless access points (WAPs) are also deployed allowing anyone with a laptop or wireless enabled PDA to access resources from practically anywhere on campus.

Off-campus users, through the use of virtual private network (VPN) servers, can use their broadband connections to access many on-campus resources, as well as software, as if they were physically connected to the Case network. The department and the university participate in the Internet2 and National Lambda Rail projects, which provide high-speed, inter-university network infrastructure allowing for enhanced collaboration between institutions. The Internet2 infrastructure allows students, faculty and staff alike the ability to enjoy extremely high-performance connections to other Internet2 member institutions.

Aside from services provided through a commodity Internet connection, Case network users can take advantage of numerous online databases such as EUCLIDplus, the University Libraries' circulation and public access catalog, as well as Lexus-Nexis™ and various CD-ROM based dictionaries, thesauri, encyclopedias, and research databases. Many
The ECSE undergraduate population.

ECSE faculty are active users of the Microfabrication Laboratory and participants in the Advanced Platform Technology Center described under Interdisciplinary Research Centers.

**Additional Department Facilities**

**Sally & Larry Sears Undergraduate Design Laboratory**

This laboratory supports all departmental courses in circuits and includes a state-of-the-art lecture hall, a modernistic glass-walled lab, an electronics "store", and a student lounge and meeting area. Specialized lab space is available for senior projects and sponsored undergraduate programs. The lab is open to all undergraduates, and components are provided free of charge, so students can "play and tinker" with electronics and foster innovation and creativity. The laboratory provides access to PCs, oscilloscopes, signal generators, logic analyzers, and specialized equipment such as RF analyzers and generators. In addition, the lab includes full-time staff dedicated to the education, guidance and mentoring of undergraduates in the "art and practice" of hands-on engineering.

This is the central educational resource for students taking analog, digital, and mixed-signal courses in electronics, and has been supported by various corporations in addition to alumnus Larry Sears, a successful engineer and entrepreneur. Basic workstations consist of Windows-based computers equipped with LabView software, as well as Agilent 546xx oscilloscopes, 33120A Waveform Generators, 34401A Digital Multimeters, and E3631A power supplies. Advanced workstations are similarly configured, but with a wider variety of high-performance test equipment.

**ECSE Undergraduate Computer Lab**

This laboratory (recently renovated with major funding provided by Rockwell Automation) on the 8th floor of the Olin building is accompanied by a suite of instructor/TA offices and supports the freshman computing classes: ENGR 131 Elementary Computer Programming and ECSE 132 Introduction to Programming in Java.

Thirty student Macintosh workstations with underlying UNIX operating systems are available for hands-on instruction and support the study of introductory programming at the university.

**Nord Computer Laboratory**

This is a general-purpose computer facility that is open 24 hours a day, to all students. The lab contains 50 PCs running Windows and four Apple Macintosh computers. Facilities for color printing, faxing, copying and scanning are provided. Special software includes PRO/Engineer, ChemCAD and Visual Studio. Blank CDs, floppy disks, transparencies and other supplies are available for purchase. Visit the website (https://engineering.case.edu/it/nord-computer-lab/) for more information.

**Kevin Kranzusch Virtual Worlds (Gaming and Simulation) Laboratory**

The Kevin Kranzusch Virtual Worlds Gaming and Simulation Laboratory provides software and hardware to support education and research in computer gaming and simulation activities within the Electrical, Computer, and Systems Engineering Department and the University at large. The lab has been leveraged to provide students with extensive game play opportunities and excellent, strongly experiential simulation and game development educational opportunities – primarily targeted to the ECSE undergraduate population.

The lab also stimulates large amounts of cross-disciplinary collaboration in both education and research. Simulation and visualization techniques are of great value in all science and engineering fields, and the lab is capable of supporting advanced applications of these techniques in real-time applications. In addition, interactive technologies and video games require substantial artistic resources, which has resulted in excellent opportunities for educational and research collaboration with the Cleveland Institute of Art (CIA), the School of Nursing, the Medical School, and the Psychology Department. Of particular note has been the Advanced Game Project course (ECSE 390 Advanced Game Development Project) taught jointly by CWRU and CIA for juniors and seniors. This course has been very popular and has provided truly excellent student game design and production experiences while receiving industrial and popular recognition and acclaim. In addition, an entry-level computer game programming course (ECSE 290 Introduction to Computer Game Design and Implementation) is available for students who have taken both a Java-based programming course and a data structures course to provide an introduction to many of the technical aspects of computer game development. Many other courses in the department also use the lab as an important part of their curriculum including courses on computer graphics, artificial intelligence, simulation, digital signal processing, and control systems. The lab also supports research in the department requiring significant computational resources, e.g. GPU acceleration, VLSI simulation, etc.

A recent large donation for the lab has allowed for the update and renovation of the entire lab including the physical infrastructure (carpeting, furniture, etc.), the gaming PCs, and the gaming consoles. In addition, a new VR and AR room has been added to represent this new area connected strongly to computer gaming. The lab is now structured into a PC gaming area and an adjacent gaming console area, a VR/AR room, a portable gaming development room, and a team collaboration room.

The renovated lab includes the following primary equipment:

- 24 New Alienware PCs with Dell 27” 4K monitors
- 4 Sony Bravia Television monitors 75” 3DTV
- 2 Microsoft HoloLens AR Units
- 4 Oculus Rift VR units with Haptic Touch Input devices
- A 3D projector (and large wall screen) with 3D capability for common presentations
- 4 Xbox One Units with Xbox One controllers
- 4 PS4 Sony PlayStation units with controllers

**Intelligent Networks & Systems Architecting (INSA) Research Laboratory**

The Intelligent Networks & Systems Architecting (INSA) Research Laboratory is a state-of-the-art research facility dedicated to intelligent computer networks, systems engineering, design, and architecture. It includes optimization, simulation, artificial intelligence, visualization, and emulation. This lab has been partially supported by NASA's Space Exploration programs for Human and Robotic Technology (H&RT). The INSA Lab is equipped with 10 high-performance workstations and 2 servers in a mixed Windows and Linux environment, with over 40 installed network interface cards providing connectivity to its wired and wireless research networks. It includes software packages such as GINO and LINDO, Arena simulation, ns2 and OPNET, as well as the STK satellite toolkit, artificial neural network, systems architecting and modeling, and statistical analysis and data management packages such as SPSS. The
INSA Lab is also used for research in heterogeneous, sensor web, and mobile ad-hoc networks with space and battlefield applications.

**VLSI/CAD Design Laboratory**

This lab has been supported by the Semiconductor Research Corporation, NSF, AFRL, NASA, Synopsys, Mentor, and Sun Microsystems. This laboratory has a number of advanced UNIX/Linux workstations that run commercial CAD software tools for VLSI ASIC and microchip design, simulation and testing. The lab is currently being used to develop design and testing techniques for embedded system-on-chip (SoC).

**Embedded Systems Laboratory**

The Embedded Systems Laboratory is equipped with several Sun Blade Workstations running Solaris and Intel PCs running Linux. This lab has been recently equipped with advanced FPGA Virtex II prototype boards from Xilinx, including many Xilinx Virtex II FPGAs and Xilinx CAD tools for development work. A grant-in-aid from Synopsys has provided the Synopsys commercial CAD tools for software development and simulation. More recently, the lab has been equipped with many modern embedded platforms based on Raspberry Pi 3 and 4 models with numerous sensor devices. The lab has also been equipped with advanced embedded FPGA/ARM boards based on the Xilinx Zynq platform. This lab is also equipped with NIOS FPGA boards from Altera, including software tools. Together with software CAD EDK tools, these modern equipment and tools will be of great help to students’ education and research work.

**Mixed-Signal Integrated Circuit Laboratory**

This research laboratory includes a cluster of Windows workstations and a UNIX server with integrated circuit design software (Cadence Custom IC Bundle), as well as a variety of equipment used in the characterization of mixed-signal (analog and digital) integrated circuits, which are typically fabricated using the MOSIS foundry service. Test equipment includes an IC probe station, surface-mount soldering equipment, logic and network/spectrum analyzers, an assortment of digital oscilloscopes with sample rates up to 1 GHz, and a variety of function generators, multi-meters, and power supplies.

**Microelectromechanical Systems (MEMS) Research Laboratory**

The MEMS Research Laboratory is equipped for microfabrication processes that do not require a clean room environment. These include chemical-mechanical polishing (two systems), bulk silicon etching, aqueous chemical release of free-standing micromechanical components, and supercritical point drying. In addition to the fabrication capabilities, the lab is also well equipped for testing and evaluation of MEMS components as it houses wafer-scale probe stations, a vacuum probe station, a multipurpose vacuum chamber, and an interferometric load-deflection station. Two large (8 x 2 ft) vibration isolated air tables are available for custom testing setups. The laboratory has a wide variety of electronic testing instruments, including a complete IV-CV testing setup.

**BioMicroSystems Laboratory**

This research laboratory focuses on developing wireless integrated circuits and microsystems for a variety of applications in biomedical and neural engineering. The laboratory contains several PC computers, software packages for design, simulation, and layout of high-performance, low-noise, analog/mixed-signal/RF circuits and systems, and testing/measurement equipment such as dc power supply, arbitrary function generator, multichannel mixed-signal oscilloscope, data acquisition hardware, spectrum analyzer, potentiostat, and current source meter. Visit the website (http://www.mohsenilab-cwru.org/) for more information.

**Emerging Materials Development and Evaluation Laboratory**

The EMDE Laboratory is equipped with tooling useful in characterizing materials for MEMS applications. The laboratory contains a PC-based apparatus for load-deflection and burst testing of micromachined membranes, a custom-built test chamber for evaluation and reliability testing of MEMS-based pressure transducers and other membrane-based devices, a probe station for electrical characterization of micro-devices, a fume hood configured for wet chemical etching of Si, polymers, and a wide variety of metals, tooling for electroplating, an optical reflectometer, and a supercritical-point dryer for release of surface micromachined devices. The lab also has a PC with layout and finite element modeling software for device design, fabrication process design, and analysis of testing data.

**Control and Energy Systems Center (CESC)**

The Control and Energy Systems Center (CESC) looks for new transformational research and engineering breakthroughs to build a better world, improving our industry, economy, energy, environment, water resources and society, all with sustainability and within an international collaboration framework. With an interdisciplinary and concurrent engineering approach, the CESC focuses on bridging the gap between fundamental and applied research in advanced control and systems engineering, with special emphasis on energy innovation, wind energy, power systems, water treatment plants, sustainability, spacecraft, environmental and industrial applications. Fundamental research foci are to gain knowledge and understanding on multi-input-multi-output physical worlds, nonlinear plants, distributed parameter systems, plants with non-minimum phase, time delay and/or uncertainty, etc., and to develop new methodologies to design quantitative robust controllers to improve the efficiency and reliability of such systems. Applied research aims to develop advanced solutions with industrial partners, for practical control engineering problems in energy systems, multi-megawatt wind turbines, renewable energy plants, power system dynamics and control, grid integration, energy storage, power electronics, wastewater treatment plants, desalination systems, formation flying spacecraft, satellites with flexible appendages, heating systems, robotics, parallel kinematics, telescope control, etc. The Center was established in 2009 with the support of the Milton and Tamar Maltz Family Foundation and the Cleveland Foundation.

**Process Control Laboratory**

This laboratory contains process control pilot plants and computerized hardware for data acquisition and process control that is used for demonstrations, teaching, and research. This laboratory also has access to steam and compressed air for use in the pilot processes that include systems for flow and temperature control, level and temperature control, pH control, and pressure control plants.

**Dynamics and Control Laboratory**

This laboratory contains data acquisition and control devices, PLCs, electromechanical systems, and mechanical, pneumatic, and electrical laboratory experiments for demonstrations, teaching, and research. Particular systems include: AC/DC servo systems, multi-degree-of-freedom robotic systems, rectilinear and torsional multi-degree-of-freedom vibration systems, inverted pendulum, magnetic levitation system, and a PLC-controlled low-voltage AC smart grid demonstration system that includes conventional and renewable (wind and solar)
Medical Robotics and Computer Integrated Surgery (MeRCIS) Laboratory

The Medical Robotics and Computer Integrated Surgical Systems Laboratory (MeRCIS) is equipped for research on medical robotics, advanced control systems, haptics, and human-machine interfaces. Specifically, the MeRCIS laboratory houses major equipment, computational resources, and software infrastructure to support: i) design, modeling, and simulation of robotic systems, specifically milli- and micro-robotic tools for medical applications, ii) design, modeling and simulation of high performance control systems, iii) design and analysis of haptic systems, iv) development of virtual environment-based medical training simulators, and v) modeling and simulation of complex biological systems.

The laboratory is equipped with state-of-the-art sensing, electronic measurement, and data acquisition equipment, as well as, some rare and unique resources available to support research on robotics and intelligent systems, with specific emphasis on medical robotics. The laboratory has an Intuitive Surgical daVinci™ IS1200 robotic surgical system. The system has been upgraded with an open interface electronics kit that converted the system into a ROS compatible open research platform (dVRK).

Courses

ECSE 132. Introduction to Programming in Java. 3 Units.
An introduction to modern programming language features, computer programming and algorithmic problem solving with an emphasis on the Java language. Computers and code compilation; conditional statements, subprograms, loops, methods; object-oriented design, inheritance and polymorphism, abstract classes and interfaces; types, type systems, generic types, abstract data types, strings, arrays, linked lists; software development, modular code design, unit testing; strings, text and file I/O; GUI components, GUI event handling; threads; comparison of Java to C, C++, and C#. Offered as CSDS 132 and ECSE 132. Counts for CAS Quantitative Reasoning Requirement.

ECSE 216. Fundamental System Concepts. 3 Units.
Develops framework for addressing problems in science and engineering that require an integrated, interdisciplinary approach, including the effective management of complexity and uncertainty. Introduces fundamental system concepts in an integrated framework. Properties and behavior of phenomena regardless of the physical implementation through a focus on the structure and logic of information flow. Systematic problem solving methodology using systems concepts. Recommended preparation: MATH 224.

ECSE 233. Introduction to Data Structures. 4 Units.
Different representations of data: lists, stacks and queues, trees, graphs, and files. Manipulation of data: searching and sorting, hashing, recursion and higher order functions. Abstract data types, templating, and the separation of interface and implementation. Introduction to asymptotic analysis. The Java language is used to illustrate the concepts and as an implementation vehicle throughout the course. Offered as CSDS 233 and ECSE 233. Prereq: CSDS 132 or ECSE 132 or EECS 132.

ECSE 245. Electronic Circuits. 4 Units.

ECSE 246. Signals and Systems. 4 Units.

ECSE 275. Fundamentals of Robotics. 4 Units.
The Fundamentals of Robotics course will expose students to fundamental principles of robotics. Students will explore high level conceptual foundations of robotics beginning with Braitenberg vehicles and apply this knowledge to simulated and physical robot hardware in laboratory experiences and in a final project. Laboratory experiences will guide students through applying theory to practice increasingly complex tasks in a project oriented, group work environment. The course culminates in a robotics challenge project at the end of the semester. Topics covered are: sensors, actuators, kinematics, control, planning and programming. Programming languages and concepts (e.g., C++, object oriented programming) used in robotics will be introduced and used with modern robotics programming toolboxes and frameworks. Prior experience with these languages will not be necessary. Previous experience with robotics is not required for this course. Offered as CSDS 275 and ECSE 275. Prereq: (ENGR 131 or EECS 132) and PHYS 121 and MATH 121.

ECSE 281. Logic Design and Computer Organization. 4 Units.
Fundamentals of digital systems in terms of both computer organization and logic level design. Organization of digital computers; information representation; boolean algebra; analysis and synthesis of combinational and sequential circuits; datapaths and register transfers; instruction sets and assembly language; input/output and communication; memory. Offered as CSDS 281 and ECSE 281. Prereq: ENGR 131 or ECSE 132.

ECSE 290. Introduction to Computer Game Design and Implementation. 3 Units.
This class begins with an examination of the history of video games and of game design. Games will be examined in a systems context to understand gaming and game design fundamentals. Various topics relating directly to the implementation of computer games will be introduced including graphics, animation, artificial intelligence, user interfaces, the simulation of motion, sound generation, and networking. Extensive study of past and current computer games will be used to illustrate course concepts. Individual and group projects will be used throughout the semester to motivate, illustrate and demonstrate the course concepts and ideas. Group game development and implementation projects will culminate in classroom presentation and evaluation. Offered as CSDS 290 and ECSE 290. Prereq: EECS 132 or CSDS 132.
ECSE 296. Independent Projects. 1 - 3 Units.
Independent projects in Electrical Engineering, Computer Engineering and Systems Engineering. Recommended preparation: ENGR 131 or EECS/ CSDS/ECSE 132. Prereq: Limited to freshmen and sophomore students.

ECSE 297. Special Topics. 1 - 3 Units.
Special topics in Electrical Engineering, Computer Engineering and Systems and Control Engineering. Prereq: Limited to freshmen and sophomores.

ECSE 301. Digital Logic Laboratory. 2 Units.
This course is an introductory experimental laboratory for digital networks. The course introduces students to the process of design, analysis, synthesis and implementation of digital networks. The course covers the design of combinational circuits, sequential networks, registers, counters, synchronous/asynchronous Finite State Machines, register based design, and arithmetic computational blocks. Prereq: EECS 281.

ECSE 302. Discrete Mathematics. 3 Units.
A general introduction to basic mathematical terminology and the techniques of abstract mathematics in the context of discrete mathematics. Topics introduced are mathematical reasoning, Boolean connectives, deduction, mathematical induction, sets, functions and relations, algorithms, graphs, combinatorial reasoning. Offered as CSDS 302, ECSE 302 and MATH 304. Prereq: MATH 122 or MATH 124 or MATH 126.

ECSE 303. Embedded Systems Design and Laboratory. 3 Units.
The purpose of this Course and Laboratory is to expose and train the students in modern embedded systems software and hardware design techniques and practices including networking and mobile connectivity. The rationale for the Course and Lab is based on the explosive growth of embedded systems in the industry, specifically industrial automation, aviation, surveillance, medical devices, but also common consumer products. The course topics cover a wide range of material as follows. Microcontroller systems based on the ARM processor. Essential components, memories, busses interfaces. Devices, peripherals, GPIOs, device drivers. Sensors and Actuators, A/D, D/A, DSP. Embedded Linux, kernels, kernel modules, compilers and assemblers. Libraries, and debugging facilities. The Lab will be based on common platforms such as Raspberry pi, Arduino, ARM embed, supported by a network of Linux workstations.

ECSE 304. Control Engineering I with Laboratory. 3 Units.
Analysis and design techniques for control applications. Linearization of nonlinear systems. Design specifications. Classical design methods: root locus, bode, nyquist. PID, lead, lag, lead-lag controller design. State space modeling, solution, controllability, observability and stability. Modeling and control demonstrations and experiments single-input/ single-output and multivariable systems. Control system analysis/ design/implementation software. The course will incorporate the use of Grand Challenges in the areas of Energy Systems, Control Systems, and Data Analytics in order to provide a framework for problems to study in the development and application of the concepts and tools studied in the course. Various aspects of important engineering skills relating to leadership, teaming, emotional intelligence, and effective communication are integrated into the course. Prereq: EECS 246 or EMAE 350.

ECSE 305. Control Engineering I Laboratory. 1 Unit.
A laboratory course based on the material in ECSE 304. Modeling, simulation, and analysis using MATLAB. Physical experiments involving control of mechanical systems, process control systems, and design of PID controllers. Coreq: EECS 304.

ECSE 309. Electromagnetic Fields I. 3 Units.
Maxwell's integral and differential equations, boundary conditions, constitutive relations, energy conservation and Pointing vector, wave equation, plane waves, propagating waves and transmission lines, characteristic impedance, reflection coefficient and standing wave ratio, in-depth analysis of coaxial and strip lines, electro- and magneto-quasistatics, simple boundary value problems, correspondence between fields and circuit concepts, energy and forces. Prereq: PHYS 122 or PHYS 124. Prereq or Coreq: MATH 224.

ECSE 310. Communication Laboratory. 3 Units.
Fourier series and transforms. Analog and digital filters. Fast-Fourier transforms, sampling, and modulation for discrete time signals and systems. Consideration of stochastic signals and linear processing of stochastic signals using correlation functions and spectral analysis. The course will incorporate the use of Grand Challenges in the areas of Energy Systems, Control Systems, and Data Analytics in order to provide a framework for problems to study in the development and application of the concepts and tools studied in the course. Various aspects of important engineering skills relating to leadership, teaming, emotional intelligence, and effective communication are integrated into the course. Prereq: EECS 246.

ECSE 311. Computer Architecture. 3 Units.
This course provides students the opportunity to study and evaluate a modern computer architecture design. The course covers topics in fundamentals of computer design, performance, cost, instruction set design, processor implementation, control unit, pipelining, communication and network, memory hierarchy, computer arithmetic, input-output, and an introduction to RISC and super-scalar processors. Offered as CSDS 314 and ECSE 314. Prereq: EECS 281.

ECSE 312. Digital Systems Design. 4 Units.
This course gives students the ability to design modern digital circuits. The course covers topics in logic level analysis and synthesis, digital electronics: transistors, CMOS logic gates, CMOS lay-out, design metrics space, power, delay. Programmable logic (partitioning, routing), state machine analysis and synthesis, register transfer level block design, datapath, controllers, ASM charts, microsequencers, emulation and rapid prototyping, and switch/logic-level simulation. Prereq: EECS 281.

ECSE 316. Wireless Communications. 3 Units.
This course introduces the fundamentals of wireless communications including backgrounds, important concepts, and cutting-edge technologies. In particular, the course focuses on interesting and important topics in wireless communications, such as (but not limited to): Overview of wireless communication networks and protocols, the cellular concept, system design fundamentals, brief introduction to wireless physical layer fundamentals, multiple access control protocols for wireless systems, wireless networking (routing rerouting, wireless TCP/IP), mobility management, call admission control and resource allocation, revolution/evolution towards future generation wireless networks, overview of wireless mesh networks, mobile ad hoc networks and wireless sensor networks, and wireless security (optional). Offered as ECSE 316 and ECSE 414. Prereq: (EECS 351 or ECSE 351) with a C or better, or a Graduate student.
ECSE 317. Computer Design - FPGAs. 3 Units.
The aim is to expose the student to methodologies for systematic design of digital systems with emphasis on programmable logic implementations and prototyping. The course requires a number of hands-on experiments and an overall lab project. The lab involves a number of class lectures to familiarize the students with the modern design techniques based on VHDL/Verilog Hardware Design Languages, CAD tools, and FPGAs. Offered as ECSE 317 and ECSE 417. Prereq: EECS 281.

ECSE 318. VLSI/CAD. 4 Units.
With Very Large Scale Integration (VLSI) technology there is an increased need for Computer-Aided Design (CAD) techniques and tools to help in the design of large digital systems that deliver both performance and functionality. Such high performance tools are of great importance in the VLSI design process, both to perform functional, logical, and behavioral modeling and verification to aid the testing process. This course discusses the fundamentals in behavioral languages, both VHDL and Verilog, with hands-on experience. Prereq: ECSE 281 and ECSE 315.

ECSE 319. Applied Probability and Stochastic Processes for Biology. 3 Units.
Applications of probability and stochastic processes to biological systems. Mathematical topics will include: introduction to discrete and continuous probability spaces (including numerical generation of pseudo random samples from specified probability distributions), Markov processes in discrete and continuous time with discrete and continuous sample spaces, point processes including homogeneous and inhomogeneous Poisson processes and Markov chains on graphs, and diffusion processes including Brownian motion and the Ornstein-Uhlenbeck process. Biological topics will be determined by the interests of the students and the instructor. Likely topics include: stochastic ion channels, molecular motors and stochastic ratchets, actin and tubulin polymerization, random walk models for neural spike trains, bacterial chemotaxis, signaling and genetic regulatory networks, and stochastic predator-prey dynamics. The emphasis will be on practical simulation and analysis of stochastic phenomena in biological systems. Numerical methods will be developed using a combination of MATLAB, the R statistical package, MCell, and/or URDME, at the discretion of the instructor. Student projects will comprise a major part of the course. Offered as BIOL 319, ECSE 319, SYBB 319, BIOL 419, EBME 419, MATH 419, PHOL 419, and SYBB 419. Prereq: (MATH 224 or MATH 223) and (BIOL 300 or BIOL 306) and (MATH 201 or MATH 307).

ECSE 321. Semiconductor Electronic Devices. 4 Units.
Energy bands and charge carriers in semiconductors and their experimental verifications. Excess carriers in semiconductors. Principles of operation of semiconductor devices that rely on the electrical properties of semiconductor surfaces and junctions. Development of equivalent circuit models and performance limitations of these devices. Devices covered include: junctions, bipolar transistors, Schottky junctions, MOS capacitors, junction gate and MOS field effect transistors, optical devices such as photodetectors, light-emitting diodes, solar cells, and lasers. Prereq: PHYS 122. Prereq or Coreq: MATH 224.

ECSE 322. Integrated Circuits and Electronic Devices. 3 Units.
Technology of monolithic integrated circuits and devices, including crystal growth and doping, photolithography, vacuum technology, metalization, wet etching, thin film basics, oxidation, diffusion, ion implantation, epitaxy, chemical vapor deposition, plasma processing, and micromachining. Basics of semiconductor devices including junction diodes, bipolar junction transistors, and field effect transistors. Prereq: PHYS 122. Prereq or Coreq: MATH 224.

ECSE 324. Modeling and Simulation of Continuous Dynamical Systems. 3 Units.
This course examines the computer-based modeling and simulation of continuous dynamical system behavior in a variety of systems including electric power systems, industrial control systems, and signal processing that are represented by a set of differential equations need to be solved numerically in order to compute and represent their behavior for study. In addition to these applications, there are many other important applications of these tools in computer games, virtual worlds, weather forecasting, and population models, to name a few examples. Numerical integration techniques are developed to perform these computations. Multiple computational engines such as Matlab, Simulink, Unity, and physics engines etc. are also examined as examples of commonly used software to solve for and visualize continuous-time system behavior. The course will incorporate the use of Grand Challenges in the areas of Energy Systems, Control Systems, and Data Analytics in order to provide motivation and a framework for problems to study in the development and application of the concepts and tools studied in the course. Various aspects of important engineering skills relating to leadership, teaming, emotional intelligence, and effective communication are integrated into the course. Prereq: MATH 224.

ECSE 326. Instrumentation Electronics. 3 Units.
A second course in instrumentation with emphasis on sensor interface electronics. General concepts in measurement systems, including accuracy, precision, sensitivity, linearity, and resolution. The physics and modeling of resistive, reactive, self-generating, and direct-digital sensors. Signal conditioning for same, including bridge circuits, coherent detectors, and a variety of amplifier topologies: differential, instrumentation, charge, and transimpedance. Noise and drift in amplifiers and resistors. Practical issues of interference, including grounding, shielding, supply/return, and isolation amplifiers. Prereq: ENGR 210 and (EECS 246, EBME 308 or EMAE 350).

ECSE 329. Introduction to Nanomaterials: Material Synthesis, Properties and Device Applications. 3 Units.
The behavior of nanoscale materials is close, to atomic behavior rather than that of bulk materials. The growth of nanomaterials, such as quantum dots, has the tendency to be viewed as an art rather than science. These nanostructures have changed our view of Nature. This course is designed to provide an introduction to nanomaterials and devices to both senior undergraduate and graduate students in engineering. Topics covered include an introduction to growth issues, quantum mechanics, quantization of electronic energy levels in periodic potentials, tunneling, distribution functions and density of states, optical and electronic properties, and devices. Offered as ECSE 329 and ECSE 429. Coreq: ECSE 309.

ECSE 337. Compiler Design. 4 Units.
Design and implementation of compilers and other language processors. Scanners and lexical analysis; regular expressions and finite automata; scanner generators; parsers and syntax analysis; context free grammars; parser generators; semantic analysis; intermediate code generation; runtime environments; code generation; machine independent optimizations; data flow and dependence analysis. There will be a significant programming project involving the use of compiler tools and software development tools and techniques. Offered as CSCE 337 and ECSE 337. Prereq: (CSDS 233 or ECSE 233 or EECS 233) and (CSDS 281 or ECSE 281 or EECS 281).
ECSE 338. Intro to Operating Systems and Concurrent Programming. 4 Units.
Intro to OS: OS Structures, processes, threads, CPU scheduling, deadlocks, memory management, file system implementations, virtual machines, cloud computing. Concurrent programming: fork, join, concurrent statement, critical section problem, safety and liveness properties of concurrent programs, process synchronization algorithms, semaphores, monitors. UNIX systems programming: system calls, UNIX System V IPCs, threads, RPCs, shell programming. Offered as CSDS 338, ECSE, 338, CSDS 338N and ECSE 338N. Prereq: Computer Science Major or Minor and (CSDS 233 or ECSE 233 or EECS 233) with a C or higher.

ECSE 338N. Intro to Operating Systems and Concurrent Programming. 4 Units.
Intro to OS: OS Structures, processes, threads, CPU scheduling, deadlocks, memory management, file system implementations, virtual machines, cloud computing. Concurrent programming: fork, join, concurrent statement, critical section problem, safety and liveness properties of concurrent programs, process synchronization algorithms, semaphores, monitors. UNIX systems programming: system calls, UNIX System V IPCs, threads, RPCs, shell programming. Offered as CSDS 338, ECSE, 338, CSDS 338N and ECSE 338N. Prereq: (CSDS 233 or ECSE 233 or EECS 233) with a C or higher.

ECSE 342. Introduction to Global Issues. 3 Units.
This systems course is based on the paradigm of the world as a complex system. Global issues such as population, world trade and financial markets, resources (energy, water, land), global climate change, and others are considered with particular emphasis put on their mutual interdependence. A reasoning support computer system which contains extensive data and a family of models is used for future assessment. Students are engaged in individual, custom-tailored, projects of creating conditions for a desirable or sustainable future based on data and scientific knowledge available. Students at CWRU will interact with students from fifteen universities that have been strategically selected in order to give global coverage to UNESCO’S Global-problematique Education Network Initiative (GENIe) in joint, participatory scenario analysis via the internet.

ECSE 342I. Global Issues, Health, & Sustainability in India. 3 Units.
Global Issues, Health, & Sustainability in India is an interdisciplinary social work and engineering collaboration that includes a short-term cross-cultural immersion. This course brings together social work (knowledge, values, and skills) and health care (promotion, education, and community) perspectives to the understanding of technical project assessment, selection, planning and implementation in India. The course is also designed to help students understand culturally relevant community engagement strategies to ensure project acceptance in underserved and developing communities. Many field sites will be visited in order to observe first-hand the community assessment and development of projects that engineers implement. An example of these projects could include infrastructure to support green energy and water (resource planning, development, conservation, and sanitation). This study abroad course will acquaint students with history and culture of India, its social, political and economic development and the impact it has on health and the delivery of social services. Participants will learn about factors affecting the abilities to reach, treat, educate, and equip communities to improve health outcomes. Engineering students will learn the quantitative aspects using a paradigm of hierarchical systems, mathematical modeling, and scenario analysis using a 'reasoning support' system. Together the engineering, social work, and health sciences students in disciplinary-balanced teams will jointly work on real and meaningful projects marrying the descriptive scenarios (that is the 'subjective' aspect) with the numerical scenario analysis based on mathematical modeling (or 'objective' aspect) to form a coherent view of the future. The course will be taught using both lecture and experiential modalities. Engineering students will conduct computer modeling work. Along with visiting a variety of governmental and non-governmental institutions, organizations and projects, students will visit historical sites and attend cultural events. Offered as ECSE 342I and SASS 375I. Counts for CAS Global & Cultural Diversity Requirement.

ECSE 344. Electronic Analysis and Design. 3 Units.
The design and analysis of real-world circuits. Topics include: junction diodes, non-ideal op-amp models, characteristics and models for large and small signal operation of bipolar junction transistors (BJTs) and field effect transistors (FETs), selection of operating point and biasing for BJT and FET amplifiers. Hybrid-pi model and other advanced circuit models, cascaded amplifiers, negative feedback, differential amplifiers, oscillators, tuned circuits, and phase-locked loops. Computers will be extensively used to model circuits. Selected experiments and/or laboratory projects. Prereq: EECS 245.

ECSE 346. Engineering Optimization. 3 Units.
Optimization techniques including linear programming and extensions; transportation and assignment problems; network flow optimization; quadratic, integer, and separable programming; geometric programming; and dynamic programming. Nonlinear optimization topics: optimality criteria, gradient and other practical unconstrained and constrained methods. Computer applications using engineering and business case studies. The course will incorporate the use of Grand Challenges in the areas of Energy Systems, Control Systems, and Data Analytics in order to provide a framework for problems to study in the development and application of the concepts and tools studied in the course. Various aspects of important engineering skills relating to leadership, teaming, emotional intelligence, and effective communication are integrated into the course. Recommended preparation: MATH 201.
ECSE 350. Operations and Systems Design. 3 Units.
Introduction to design, modeling, and optimization of operations and scheduling systems with applications to computer science and engineering problems. Topics include, forecasting and time series, strategic, tactical, and operational planning, life cycle analysis, learning curves, resources allocation, materials requirement and capacity planning, sequencing, scheduling, inventory control, project management and planning. Tools for analysis include: multi-objective optimization, queuing models, simulation, and artificial intelligence.

ECSE 351. Communications and Signal Analysis. 3 Units.
Fourier transform analysis and sampling of signals. AM, FM and SSB modulation and other modulation methods such as pulse code, delta, pulse position, PSK and FSK. Detection, multiplexing, performance evaluation in terms of signal-to-noise ratio and bandwidth requirements. Prereq: EECS 246 or requisites not met permission.

ECSE 352. Engineering Economics and Decision Analysis. 3 Units.
Economic analysis of engineering projects, focusing on financial decisions concerning capital investments. Present worth, annual worth, internal rate of return, benefit/cost ratio. Replacement and abandonment policies, effects of taxes, and inflation. Decision making under risk and uncertainty. Decision trees. Value of information. The course will incorporate the use of Grand Challenges in the areas of Energy Systems, Control Systems, and Data Analytics in order to provide a framework for problems to study in the development and application of the concepts and tools studied in the course. Various aspects of important engineering skills relating to leadership, teaming, emotional intelligence, and effective communication are integrated into the course.

ECSE 354. Digital Communications. 3 Units.

ECSE 360. Manufacturing and Automated Systems. 3 Units.
Formulation, modeling, planning, and control of manufacturing and automated systems with applications to computer science and engineering problems. Topics include, design of products and processes, location/spatial problems, transportation and assignment, product and process layout, group technology and clustering, cellular and network flow layouts, computer control systems, reliability and maintenance, and statistical quality control. Tools and analysis include: multi-objective optimization, artificial intelligence, and heuristics for combinatorial problems. Offered as ECSE 360 and ECSE 460.

ECSE 366. Computer Graphics. 3 Units.
Theory and practice of computer graphics: object and environment representation including coordinate transformations image extraction including perspective, hidden surface, and shading algorithms; and interaction. Covers a wide range of graphic display devices and systems with emphasis in interactive shaded graphics. Offered as CSDS 366, ECSE 366, CSDS 466 and ECSE 466. Prereq: EECS 233.

ECSE 368. Power System Analysis I. 3 Units.
This course introduces the steady-state modeling and analysis of electric power systems. The course discusses the modeling of essential power system network components such as transformers and transmission lines. The course also discusses important steady-state analysis of three-phase power system network, such as the power flow and economic operation studies. Through the use of PowerWorld Simulator education software, further understanding and knowledge can be gained on the operational characteristics of AC power systems. Special topics concerning new grid technologies will be discussed towards the semester end. The prerequisite requirements of the course include the concepts and computational techniques of Alternative Current (AC) circuit and electromagnetic field. Offered as ECSE 368 and ECSE 468. Prereq: EECS 245.

ECSE 369. Power System Analysis II. 3 Units.
This course extends upon the steady state analysis of power systems to cover study topics that are essential for power system planning and operation. Special system operating conditions are considered, such as unbalanced network operation and component faults. Among the most important analytical methods developed, are symmetrical components and sequence networks. Other study topics discussed include the electric machine modeling and power system transient stability. The latter half of the course presents computational methods and control algorithms that are essential for power system operation, such as generation control and state estimation. Offered as ECSE 369 and ECSE 469. Prereq: ECSE 368.

ECSE 370. Smart Grid. 3 Units.
This course starts with an introduction to the US electric power system infrastructure and national electricity policy. Then power system operations and reliability practices are described. In the context of currently existing infrastructure and operation strategies, the course discusses the new Smart Grid technologies such as renewable resources, distributed generation, demand response, energy storage and electric vehicles. Additional important topics of discussion include Advanced Meter Infrastructure, microgrids, the IEEE 1547 Interconnection Standard, and other interoperability standards. The course captures the evolving progress made in Smart Grid technologies and the impacts on power system economics and reliability. Offered as ECSE 370 and ECSE 470. Prereq: ECSE 368.

ECSE 371. Applied Circuit Design. 4 Units.
This course will consist of lectures and lab projects designed to provide students with an opportunity to consolidate their theoretical knowledge of electronics and to acquaint them with the art and practice of circuit and product design. The lectures will cover electrical and electronic circuits and many electronic and electrical devices and applications. Examples include mixed-signal circuits, power electronics, magnetic and piezo components, gas discharge devices, sensors, motors and generators, and power systems. In addition, there will be discussion of professional topics such as regulatory agencies, manufacturing, testing, reliability, and product cost. weekly labs will be true design opportunities representing real-world applications. A specification or functional description will be provided, and the students will design the circuit, select all components, construct a breadboard, and test. The objective will be functional, pragmatic, cost-effective designs. Prereq: ECSE 245.
ECSE 372. Introduction to Distribution Systems. 3 Units.
Introduction to Distribution Systems provides students with a fundamental understanding of distribution power system configurations, equipment and loads. It also provides a detailed review of distributed energy resources and their impacts on utility distribution systems. Since today's distribution utilities are facing the challenge of managing a distribution network made up of assets from proven and mature technologies while integrating new technologies this course will also discuss a concept of smart grid and its application to distribution systems. The first part of the course reviews the fundamental methods used in the steady state analysis of AC circuits as applied to power distribution systems following by the steady-state modeling of electric power distribution systems. The second part of the course introduces fundamental analysis of electric power distribution systems such as power flow, state estimation, and fault calculation and discusses concerns such as reliability, power quality and voltage regulation. Offered as EECS 372 and ECSE 472. Prereq: PHYS 122 and MATH 224.

ECSE 373. Modern Robot Programming. 3 Units.
The goal of this course is to learn modern methods for building up robot capabilities using the Robot Operating System (ROS). Through a sequence of assignments, students learn how to write software to control both simulated and physical robots. Material includes: interfacing software to robot I/O; path and trajectory planning for robot arms; object identification and localization from 3-D sensing; manipulation planning; and development of graphical interfaces for supervisory robot control. Laboratory assignments are scheduled in small groups to explore implementations on specific robots. Graduate students will also perform an independent project. Offered as CSDS 373, ECSE 373, CSDS 473 and ECSE 473. Prereq: ENGR 131 or EECS 132. Coreq: EECS 373L.

ECSE 374. Advanced Control and Energy Systems. 3 Units.
This course introduces applied quantitative robust and nonlinear control engineering techniques to regulate automatically renewable energy systems in general and wind turbines in particular. The course also studies the fundamentals for dynamic multidisciplinary modeling and analysis of large multi-megawatt wind turbines (mechanics, aerodynamics, electrical systems, control concepts, etc.). The course combines lecture sessions and lab hours. The 400-level includes an experimental lab competition, where the object is to design, implement, and experimentally validate a control strategy to regulate a real system in the laboratory (helicopter control competition or similar); it will also include additional project design reports. Offered as ECSE 374 and ECSE 474. Prereq: EECS 304.

ECSE 375. Applied Control. 3 Units.
This course provides a practical treatment of the study of control engineering systems. It emphasizes best practices in industry so that students learn what aspects of plant and control system design are critical. The course develops theory and practice for digital computer control systems; PID controller design (modes, forms and tuning methods); Control structure design (feed-forward, cascade control, predictive control, disturbance observers, multi-loop configurations, multivariable control); Actuators, sensors and common loops; Dynamic performance evaluation; and some advanced control techniques (quantitative robust control, gain-scheduling and adaptive control) to achieve a good performance over a range of operating conditions. Recommended preparation: EECS/ECSE 374 or ECES/ECSE 474. Offered as ECSE 375 and ECSE 475. Prereq: EECS 304 or Requisites Not Met permission.

ECSE 376. Mobile Robotics. 4 Units.
Design of software systems for mobile robot control, including: motion control; sensory processing; localization and mapping; mobile-robot planning and navigation; and implementation of goal-directed behaviors. The course has a heavy lab component involving a sequence of design challenges and competitions performed in teams. Offered as CSDS 376 and ECSE 376. Prereq: ECSE 373 or ECSE 473.

ECSE 377. Introduction to Connected Devices. 3 Units.
Introduction to Connected Devices (e.g., Internet of Things). Undergraduates work in pairs to build a complete connected-device system, an embedded device with wireless networking, cloud and web, and mobile, and then develop hands-on experience with systems-level aspects of the connected-device system, including analytics, remote firmware update, load testing, and essential security. Students learn about current architectures, languages, and technologies, such as Pub/Sub (MQTT), Python, Objective-C, Python Django, JavaScript, HTML/CSS, and Bluetooth Low Energy. Offered as CSDS 377 and ECSE 377.

ECSE 379. Introduction to Relay Protection. 3 Units.
Protection does not mean prevention, but rather, minimizing the duration of the trouble and limiting the damage, outage time, and related problems that may result otherwise. Introduction to Relay Protection introduces the power system protection, including basic fundamental understanding of relaying, common protection methods and relay applications. The first part of the course reviews the technical tools of the relay engineering (phasors, polarity and symmetrical components), fault analyzes, protection fundamentals and basic design principles. The second part of the course focuses on the line, transformer, bus, generation and motor protection. The course will be accompanied by relay protection laboratory where students will have hands on experience with main types of protective relays. Offered as ECSE 379 and ECS3 479. Prereq: MATH 224 and PHYS 122.

ECSE 386. Quantum Computing, Information, and Devices. 3 Units.
An introduction to the math, physics, engineering, and computer science underlying the rapidly emerging fields of quantum computing, quantum information, and quantum devices. The course is taught by a group of faculty from physics, engineering, computer science, and math, and is geared towards students with diverse backgrounds and interests in these fields. Students will select a concentration in one of these four areas, and the coursework, while still covering all topics, will be adjusted to focus on the selected area in the most detail. Note that the listed prerequisites depend on choice of concentration. Topics will include: 1. (Mathematics) Introduction to linear algebra, convex geometry, fundamental theory of quantum information. 2. (Physics) Introduction to the quantum mechanics of two-level systems (qubits). Survey of physics and materials for qubit technologies. 3. (Computer Science) Basic quantum gates and circuits, introduction to the theory of algorithms, survey of quantum algorithms. 4. (Engineering) Quantum architectures, mapping algorithms onto circuits. The course consists of lectures, homework, and group projects. Group projects will aim to synthesize the diverse backgrounds of the students and instructors to capture the interdisciplinary nature of the field. Students taking the course for graduate credit will complete an additional literature research project and presentation, in addition to enhanced problem sets. Offered as CSDS 386, CSDS 486, ECSE 386, ECSE 486, MATH 386, MATH 486, PHYS 386, and PHYS 486. Prereq: (CSDS 281 or ECSE 281) and (ENGR 131 or CSDS 132 or ECSE 132) and (MATH 223 or MATH 227) and (MATH 224 or MATH 228) and (PHYS 122 or PHYS 124).
**ECSE 390. Advanced Game Development Project. 3 Units.**
This game development project course will bring together an interdisciplinary team of students in the fields of engineering, computer science, and art to focus on the design and development of a complete, fully functioning computer game as an interdisciplinary team. The student teams are given complete liberty to design their own fully functional games from their original concept to a playable game published in an online marketplace. Student teams will experience the entire game development cycle as they execute their projects. Responsibilities include creating a game idea, writing a story, developing the artwork, designing characters, implementing music and sound effects, programming and testing the game, and publishing the final project. Students enrolled in 487 will develop a healthcare or education virtual environment or video game in collaboration with a mentor who has expertise in the chosen area. Offered as CSDS 390, ECSE 390, CSDS 487, and ECSE 487. Prereq: EECS 233 and EECS 290.

**ECSE 394. Introduction to Information Theory. 3 Units.**
This course is intended as an introduction to information and coding theory with emphasis on the mathematical aspects. It is suitable for advanced undergraduate and graduate students in mathematics, applied mathematics, statistics, physics, computer science and electrical engineering. Course content: Information measures-entropy, relative entropy, mutual information, and their properties. Typical sets and sequences, asymptotic equipartition property, data compression. Channel coding and capacity: channel coding theorem. Differential entropy, Gaussian channel, Shannon-Nyquist theorem. Information theory inequalities (400 level). Additional topics, which may include compressed sensing and elements of quantum information theory. Recommended preparation: MATH 201 or MATH 307. Offered as MATH 394, CSDS 394, ECSE 394, MATH 494, CSDS 494 and ECSE 494. Prereq: MATH 223 and MATH 380 or requisites not met permission.

**ECSE 396. Independent Projects. 1 - 6 Units.**

**ECSE 397. Special Topics. 1 - 6 Units.**
Special topics in Computer Engineering, Electrical Engineering, and Systems and Control Engineering. Prereq: Limited to juniors and seniors.

**ECSE 398. Engineering Projects I. 4 Units.**
Capstone course for electrical, computer, and systems and control engineering seniors. Material from previous and concurrent courses used to solve engineering design problems. Professional engineering topics such as project management, engineering design, communications, multidisciplinary teaming, and professional ethics. Requirements include periodic reporting of progress, plus a final oral presentation and written report. Scheduled formal project presentations during last week of classes. Counts as SAGES Senior Capstone. Prereq: Senior Standing. Prereq or Coreq: ENGR 398 and ENGL 398.

**ECSE 399. Engineering Projects II. 3 Units.**
Continuation of ECSE 398. Material from previous and concurrent courses applied to engineering design and research. Requirements include periodic reporting of progress, plus a final oral presentation and written report. Prereq: Senior Standing.

**ECSE 400T. Graduate Teaching I. 0 Unit.**
This course will provide the Ph.D. candidate with experience in teaching undergraduate or graduate students. The experience is expected to involve direct student contact but will be based upon the specific departmental needs and teaching obligations. This teaching experience will be conducted under the supervision of the faculty member who is responsible for the course, but the academic advisor will assess the educational plan to ensure that it provides an educational experience for the student. Students in this course may be expected to perform one or more of the following teaching related activities: grading homeworks, quizzes, and exams, having office hours for students, tutoring students. Recommended preparation: Ph.D. student in ECSE department.

**ECSE 401. Digital Signal Processing. 3 Units.**

**ECSE 404. Digital Control Systems. 3 Units.**
Analysis and design techniques for computer based control systems. Sampling, hybrid continuous-time/discrete-time system modeling; sampled data and state space representations, controllability, observability and stability, transformation of analog controllers, design of deadbeat and state feedback controllers; pole placement controllers based on input/output models, introduction to model identification, optimal control and adaptive control. Recommended preparation: EECS/ECSE 304 or equivalent.

**ECSE 407. Engineering Economics and Financial Analysis. 3 Units.**
In this course, money and profit as measures of "goodness" in engineering design are studied. Methods for economic analysis of capital investments are developed and the financial evaluation of machinery, manufacturing processes, buildings, R&D personnel development, and other long-lived investments is emphasized. Optimization methods and decision analysis techniques are examined to identify economically attractive alternatives. Basic concepts of cost accounting are also covered. Topics include: economics criteria for comparing projects: present worth, annual worth analysis; depreciation and taxation; retirement and replacement; effect of inflation and escalation on economic evaluations; case studies; use of optimization methods to evaluate many alternatives; decision analysis; accounting fundamentals: income and balance sheets; cost accounting. Offered as ECSE 407 and EPOM 407.

**ECSE 408. Introduction to Linear Systems. 3 Units.**
ECSE 410. Mobile Health (mHealth) Technology. 3 Units.
Advances in communications, computer, and medical technology have facilitated the practice of personalized health, which utilizes sensory computational communication systems to support improved and more personalized healthcare and healthy lifestyle choices. The current proliferation of broadband wireless services, along with more powerful and convenient handheld devices, is helping to introduce real-time monitoring and guidance for a wide array of patients. Indeed, a large research community and a nascent industry is beginning to connect medical care with technology developers, vendors of wireless and sensing hardware systems, network service providers, and enterprise data management communities. Students in the course and labs will explore cutting-edge technologies in 1) information technologies and 2) healthcare/medical applications, through lectures, lab assignments, exams, presentations, and final projects. The overall course objectives are to introduce electrical engineering, computer engineering, and computer science students the fundamentals of wearable sensors, mobile health informatics, big data analysis, telehealthcare security & privacy, and human computer interaction considerations. Prereq: MS and PhD student only.

ECSE 411. Applied Engineering Statistics. 3 Units.
In this course a combination of lectures, demonstrations, case studies, and individual and group computer problems provides an intensive introduction to fundamental concepts, applications and the practice of contemporary engineering statistics. Each topic is introduced through realistic sample problems to be solved first by using standard spreadsheet programs and then using more sophisticated software packages. Primary attention is given to teaching the fundamental concepts underlying standard analysis methods. Offered as EPOM 405 and ECSE 411.

ECSE 413. Nonlinear Systems I. 3 Units.
This course will provide an introduction to techniques used for the analysis of nonlinear dynamic systems. Topics will include existence and uniqueness of solutions, phase plane analysis of two dimensional systems including Poincare-Bendixon, describing functions for single-input single-output systems, averaging methods, bifurcation theory, stability, and an introduction to the study of complicated dynamics and chaos. Recommended preparation: Concurrent enrollment in ECSE 408.

ECSE 414. Wireless Communications. 3 Units.
This course introduces the fundamentals of wireless communications including backgrounds, important concepts, and cutting-edge technologies. In particular, the course focuses on interesting and important topics in wireless communications, such as (but not limited to): Overview of wireless communication networks and protocols, the cellular concept, system design fundamentals, brief introduction to wireless physical layer fundamentals, multiple access control protocols for wireless systems, wireless networking (routing/rerouting, wireless TCP/IP), mobility management, call admission control and resource allocation, revolution/evolution towards future generation wireless networks, overview of wireless mesh networks, mobile ad hoc networks and wireless sensor networks, and wireless security (optional). Offered as ECSE 316 and ECSE 414. Prereq: Graduate student or (EECS 351 or ECSE 351) with a C or better.

ECSE 415. Integrated Circuit Technology I. 3 Units.
ECSE 429. Introduction to Nanomaterials: Material Synthesis, Properties and Device Applications. 3 Units.
The behavior of nanoscale materials is close, to atomic behavior rather than that of bulk materials. The growth of nanomaterials, such as quantum dots, has the tendency to be viewed as an art rather than science. These nanostructures have changed our view of Nature. This course is designed to provide an introduction to nanomaterials and devices to both senior undergraduate and graduate students in engineering. Topics covered include an introduction to growth issues, quantum mechanics, quantization of electronic energy levels in periodic potentials, tunneling, distribution functions and density of states, optical and electronic properties, and devices. Offered as ECSE 329 and ECSE 429.

ECSE 434. Microsystems Technology. 3 Units.
This course provides an overarching coverage of microsystems technology, which is rooted in micro-electromechanical systems (MEMS). It covers the convergence of sensors and actuators, with wireless communications, computing, and (social) networks. Microsystems incorporate sensors and actuators to interface computing with its physical environment-enabling perception and control. Microsystems are key enablers of smartphones, wearables, drones, robots, cars, aircrafts, weapons, etc. Recommended preparation: EECS/ECSE 322.

ECSE 438. High Performance Computing. 3 Units.
High performance computing (HPC) leverages parallel processing in order to maximize speed and throughput. This hands-on course will cover theoretical and practical aspects of HPC. Theoretical concepts covered include computer architecture, parallel programming, and performance optimization. Practical applications will be discussed from various information and scientific fields. Practical considerations will include HPC job management and Unix scripting. Weekly assessments and a course project will be required. Offered as CSDS 438 and ECSE 438. Prereq: EECS 233 or graduate standing.

ECSE 443. Flexible Electronics. 3 Units.
Learning about flexible and stretchable electronics from materials to applications. Covering organic and inorganic semiconductors, vacuum and solution-based metal-oxide semiconductors, nanomembranes and nanocrystals, conductors and insulators, flexible and ultra-high-resolution displays, lightemitting transistors, organic and inorganic photovoltaics, large-area imagers and sensors, non-volatile memories and radio-frequency identification tags. Discussing applications of flexible, stretchable and large-area electronics as part of the foregoing topics. Recommended preparation: EECS/ECSE 322.

ECSE 450. Operations and Systems Design. 3 Units.
Introduction to design, modeling, and optimization of operations and scheduling systems with applications to computer science and engineering problems. Topics include, forecasting and times series, strategic, tactical, and operational planning, life cycle analysis, learning curves, resources allocation, materials requirement and capacity planning, sequencing, scheduling, inventory control, project management and planning. Tools for analysis include: multi-objective optimization, queuing models, simulation, and artificial intelligence.

ECSE 452. Random Signals. 3 Units.

ECSE 460. Manufacturing and Automated Systems. 3 Units.
Formulation, modeling, planning, and control of manufacturing and automated systems with applications to computer science and engineering problems. Topics include, design of products and processes, location/spatial problems, transportation and assignment, product and process layout, group technology and clustering, cellular and network flow layouts, computer control systems, reliability and maintenance, and statistical quality control. Tools and analysis include: multi-objective optimization, artificial intelligence, and heuristics for combinatorial problems. Offered as ECSE 360 and ECSE 460.

ECSE 465. Computer Vision. 3 Units.
The goal of computer vision is to create visual systems that recognize objects and recover structures in complex 3D scenes. This course emphasizes both the science behind our understanding of the fundamental problems in vision and the engineering that develops mathematical models and inference algorithms to solve these problems. Specific topics include feature detection, matching, and classification; visual representations and dimensionality reduction; motion detection and optical flow; image segmentation; depth perception, multi-view geometry, and 3D reconstruction; shape and surface perception; visual scene analysis and object recognition. Offered as CSDS 465 and ECSE 465.

ECSE 466. Computer Graphics. 3 Units.
Theory and practice of computer graphics: object and environment representation including coordinate transformations image extraction including perspective, hidden surface, and shading algorithms; and interaction. Covers a wide range of graphic display devices and systems with emphasis in interactive shaded graphics. Offered as CSDS 366, ECSE 366, CSDS 466 and ECSE 466. Prereq: Graduate standing or Requisites Not Met permission.
ECSE 467. Commercialization and Intellectual Property Management. 3 Units.
This interdisciplinary course covers a variety of topics, including principles of intellectual property and intellectual property management, business strategies and modeling relevant to the creation of start-up companies and exploitation of IP rights as they relate to biomedical-related inventions. The goal of this course is to address issues relating to the commercialization of biomedical-related inventions by exposing law students, MBA students, and Ph.D. candidates (in genetics and proteomics) to the challenges and opportunities encountered when attempting to develop biomedical intellectual property from the point of early discovery to the clinic and market. Specifically, this course seeks to provide students with the ability to value a given technological advance or invention holistically, focusing on issues that extend beyond scientific efficacy and include patient and practitioner value propositions, legal and intellectual property protection, business modeling, potential market impacts, market competition, and ethical, social, and healthcare practitioner acceptance. During this course, law students, MBA students, and Ph.D. candidates in genomics and proteomics will work in teams of five (two laws students, two MBA students and one Ph.D. candidate), focusing on issues of commercialization and IP management of biomedical-related inventions. The instructors will be drawn from the law school, business school, and technology-transfer office. Please visit the following website for more information: fusioninnovate.com. Offered as LAWS 5341, MGMT 467, GENE 367, GENE 467, EBME 467 and ECSE 467.

ECSE 468. Power System Analysis I. 3 Units.
This course introduces the steady-state modeling and analysis of electric power systems. The course discusses the modeling of essential power system network components such as transformers and transmission lines. The course also discusses important steady-state analysis of three-phase power system network, such as the power flow and economic operation studies. Through the use of PowerWorld Simulator education software, further understanding and knowledge can be gained on the operational characteristics of AC power systems. Special topics concerning new grid technologies will be discussed throughout the semester end. The prerequisite requirements of the course include the concepts and computational techniques of Alternative Current (AC) circuit and electromagnetic field. Offered as ECSE 368 and ECSE 468. Prereq: EECS 245.

ECSE 469. Power System Analysis II. 3 Units.
This course extends upon the steady state analysis of power systems to cover study topics that are essential for power system planning and operation. Special system operating conditions are considered, such as unbalanced network operation and component faults. Among the most important analytical methods developed, are symmetrical components and sequence networks. Other study topics discussed include the electric machine modeling and power system transient stability. The latter half of the course presents computational methods and control algorithms that are essential for power system operation, such as generation control and state estimation. Offered as ECSE 369 and ECSE 469. Prereq: EECS 368.

ECSE 470. Smart Grid. 3 Units.
This course starts with an introduction to the US electric power system infrastructure and national electricity policy. Then power system operations and reliability practices are described. In the context of currently existing infrastructure and operation strategies, the course discusses the new Smart Grid technologies such as renewable resources, distributed generation, demand response, energy storage and electric vehicles. Additional important topics of discussion include Advanced Meter Infrastructure, microgrids, the IEEE 1547 Interconnection Standard, and other interoperability standards. The course captures the evolving progress made in Smart Grid technologies and the impacts on power system economics and reliability. Offered as ECSE 370 and ECSE 470. Prereq: EECS 368.

ECSE 472. Introduction to Distribution Systems. 3 Units.
Introduction to Distribution Systems provides students with a fundamental understanding of distribution power system configurations, equipment and loads. It also provides a detailed review of distributed energy resources and their impacts on utility distribution systems. Since today’s distribution utilities are facing the challenge of managing a distribution network made up of assets from proven and mature technologies while integrating new technologies this course will also discuss a concept of smart grid and its application to distribution systems. The first part of the course reviews the fundamental methods used in the steady state analysis of AC circuits as applied to power distribution systems following by the steady-state modeling of electric power distribution systems. The second part of the course introduces fundamental analysis of electric power distribution systems such as power flow, state estimation, and fault calculation and discusses concerns such as reliability, power quality and voltage regulation. Offered as EECS 372 and EECS 472. Prereq: Graduate student standing.

ECSE 473. Modern Robot Programming. 3 Units.
The goal of this course is to learn modern methods for building up robot capabilities using the Robot Operating System (ROS). Through a sequence of assignments, students learn how to write software to control both simulated and physical robots. Material includes: interfacing software to robot I/O; path and trajectory planning for robot arms; object identification and localization from 3-D sensing; manipulation planning; and development of graphical interfaces for supervisory robot control. Laboratory assignments are scheduled in small groups to explore implementations on specific robots. Graduate students will also perform an independent project. Offered as CSDS 373, ECSE 373, CSDS 473 and ECSE 473. Prereq: ENGR 131 or EECS 132.

ECSE 474. Advanced Control and Energy Systems. 3 Units.
This course introduces applied quantitative robust and nonlinear control engineering techniques to regulate automatically renewable energy systems in general and wind turbines in particular. The course also studies the fundamentals for dynamic interdisciplinary modeling and analysis of large multi-megawatt wind turbines (mechanics, aerodynamics, electrical systems, control concepts, etc.). The course combines lecture sessions and lab hours. The 400-level includes an experimental lab competition, where the object is to design, implement, and experimentally validate a control strategy to regulate a real system in the laboratory (helicopter control competition or similar); it will also include additional project design reports. Offered as ECSE 374 and ECSE 474. Prereq: EECS 304.
ECSE 475. Applied Control. 3 Units.
This course provides a practical treatment of the study of control engineering systems. It emphasizes best practices in industry so that students learn what aspects of plant and control system design are critical. The course develops theory and practice for digital computer control systems; PID controller design (modes, forms and tuning methods); Control structure design (feed-forward, cascade control, predictive control, disturbance observers, multi-loop configurations, multivariable control); Actuators, sensors and common loops; Dynamic performance evaluation; and some advanced control techniques (quantitative robust control, gain-scheduling and adaptive control) to achieve a good performance over a range of operating conditions. Recommended preparation: EECS/ECSE 374 or EECS/ECSE 474. Offered as ECSE 375 and ECSE 475. Prereq: EECS 304 or Requisites Not Met permission.

ECSE 476. Mobile Robotics. 3 Units.
Design of software systems for mobile robot control, including: motion control; sensory processing; localization and mapping; mobile-robot planning and navigation; and implementation of goal-directed behaviors. The course has a heavy lab component involving a sequence of design challenges and competitions performed in teams. Offered as CSDS 476 and ECSE 476. Prereq: EECS 373 or EECS 473.

ECSE 478. Computational Neuroscience. 3 Units.
Computer simulations and mathematical analysis of neurons and neural circuits, and the computational properties of nervous systems. Students are taught a range of models for neurons and neural circuits, and are asked to implement and explore the computational and dynamic properties of these models. The course introduces students to dynamical systems theory for the analysis of neurons and neural learning, models of brain systems, and their relationship to artificial and neural networks. Term project required. Students enrolled in MATH 478 will make arrangements with the instructor to attend additional lectures and complete additional assignments addressing mathematical topics related to the course. Recommended preparation: MATH 223 and MATH 224 or BIOL 300 and BIOL 306. Offered as BIOL 378, COGS 378, MATH 378, BIOL 478, CSDS 478, EBME 478, ECSE 478, MATH 478 and NEUR 478.

ECSE 479. Introduction to Relay Protection. 3 Units.
Protection does not mean prevention, but rather, minimizing the duration of the trouble and limiting the damage, outage time, and related problems that may result otherwise. Introduction to Relay Protection introduces the power system protection, including basic fundamental understanding of relaying, common protection methods and relay applications. The first part of the course reviews the technical tools of the relay engineering (phasors, polarity and symmetrical components), fault analyzes, protection fundamentals and basic design principles. The second part of the course focuses on the line, transformer, bus, generation and motor protection. The course will be accompanied by relay protection laboratory where students will have hands on experience with main types of protective relays. Offered as ECSE 379 and ECE 479. Prereq: Graduate student standing.

ECSE 480A. Introduction to Wireless Health. 3 Units.
Study of convergence of wireless communications, microsystems, information technology, persuasive psychology, and health care. Discussion of health care delivery system, medical decision-making, persuasive psychology, and wireless health value chain and business models. Understanding of health information technology, processing of monitoring data, wireless communication, biomedical sensing techniques, and health monitoring technical approaches and solutions. Offered as ECSE 480A and EBME 480A.

ECSE 480B. The Human Body. 3 Units.
Study of structural organization of the body. Introduction to anatomy, physiology, and pathology, covering the various systems of the body. Comparison of elegant and efficient operation of the body and the related consequences of when things go wrong, presented in the context of each system of the body. Introduction to medical diagnosis and terminology in the course of covering the foregoing. Offered as ECSE 480B and EBME 480B.

ECSE 480C. Biomedical Sensing Instrumentation. 3 Units.
Study of principles, applications, and design of biomedical instruments with special emphasis on transducers. Understanding of basic sensors, amplifiers, and signal processing. Discussion of the origin of biopotential, and biopotential electrodes and amplifiers (including biotelemetry). Understanding of chemical sensors and clinical laboratory instrumentation, including microfluidics. Offered as ECSE 480C and EBME 480C. Prereq: EECS/EBME 480A, EECS/EBME 480B

ECSE 480D. The Health Care Delivery Ecosystem. 3 Units.
Health care delivery across the continuum of care in the United States, including health policy and reform, financing of care, comparative health systems, population health, public health, access to care, care models, cost and value, comparative effectiveness, governance, management, accountability, workforce, and the future. Discussions of opportunities and challenges for wireless health, integrated into the foregoing topics. Perspective on health care delivery in other countries. Offered as ECSE 480D and EBME 480D.

ECSE 480E. Wireless Communications and Networking. 3 Units.
Essentials of wireless communications and networking, including teletraffic engineering, radio propagation, digital and cellular communications, wireless wide-area network architecture, speech and channel coding, modulation schemes, antennas, security, networking and transport layers, and 4G systems. Hands-on learning of the anatomy of a cell phone, and a paired wireless health device and its gateway. Offered as ECSE 480E and EBME 480E.

ECSE 480F. Physicians, Hospitals and Clinics. 3 Units.
Rotation through one or more health care provider facilities for a first-hand understanding of care delivery practice, coordination, and management issues. First-hand exposure to clinical personnel, patients, medical devices and instruments, and organizational workflow. Familiarity with provider protocols, physician referral practices, electronic records, clinical decision support systems, acute and chronic care, and inpatient and ambulatory care. Offered as ECSE 480F and EBME 480F.

ECSE 480G. Applied Cryptography. 3 Units.
This course begins with a discussion of how mobility-driven computing and communication systems use cryptography to protect data and protocols. The foundation for critical cryptographic concepts, techniques, and algorithms are covered. The fundamental cryptographic concepts are studied, including: symmetric encryption, public key encryption, digital signatures, cryptographic hash function, and message authentication codes; cryptographic protocols, such as key exchange, remote user authentication, and interactive proofs; cryptanalysis of cryptographic primitives and protocols, such as by side-channel attacks, differential cryptanalysis, or replay attacks; and cryptanalytic techniques on deployed systems, such as memory remanence, timing attacks, fault attacks, and differential power analysis. Techniques used for code making (cryptographic) and break codes (cryptanalytic) are covered, as well as how these techniques are used within larger security systems.
ECSE 480H. Software Security. 3 Units.
This course begins with discussions of good software engineering practices to ensure security in modern software systems and additional challenges to security due to code mobility in software for mobility-driven computing. The basics of software security and threat models, methods to protect software (operating systems, databases, distributed software) - including risk analysis, authentication and authorization, access control, and software architecture for security - are studied. Principles of secure coding, validation and verification of secure software, software and data watermarking, code obfuscation, tamper resistant software are studied, as well as the benefits of open source and closed source software. Use of software as an attack mechanism and emerging attack models (including joint hardware-software attacks) are studied.

ECSE 480K. Hardware Security. 3 Units.
This course begins with the keys to enabling secure, trustworthy operation of computer hardware - understanding security issues and how appropriate security measures are included during design, verification, test, and deployment. Increasingly the security primitives such as the Trusted Computing Module are being introduced at the hardware level to prevent the compromise of security in systems being deployed today. A comprehensive coverage of security issues in computer hardware is provided. Topics of embedded systems security, hardware Trojans, security in implantable medical devices, security in RFID/NFC, protection from side channel attacks, tamper resistance and crypto processor design, trusted FPGA design/JTAG, hardware-based cryptanalysis, and hardware IP protection against piracy and reverse-engineering are covered. A course project (Can you Hack It?) that challenges students to hack a hardware is included.

ECSE 480Q. Regulatory Policy and Regulations. 3 Units.
Introduction of wireless health technologies: spectrum, licensed versus unlicensed; personal area networks; body area networks; ultra-wideband low energy level short-range radios; wireless local area networks; wide area networks. The Federal system: separation of powers; the executive branch and its departments; the House of Representatives and its committees; the Senate and its committees; the FCC; policy versus regulatory versus legislative. What is a medical device: FDA; classification system; radiation-emitting products; software; RF in medical devices; converged medical devices; international aspects. Regulation of health information technology and wireless health: American Recovery and Reinvestment Act; Patient Protection and Affordable Care Act; FCC/ FDA MoU, CMS and Reimbursement; privacy and security. Offered as ECSE 480Q and EBME 480Q.

ECSE 480R. User Experience Engineering. 3 Units.
Social, cognitive, behavioral, and contextual elements in the design of healthcare technology and systems. User-centered design paradigm from a broad perspective, exploring dimensions of product user experience and learning to assess and modify the design of healthcare technology. Practical utilization of user centered design method and assessment techniques for approaching a design problem. Offered as ECSE 480R and EBME 480R.

ECSE 480S. Wireless Health Product Development. 3 Units.
Integrating application requirements, market data, concept formulation, design innovation, and manufacturing resources for creating differentiated wireless health products that delight the user. Learning user-centric product development best practices, safety, security and privacy considerations, and risk management planning. Understanding the regulatory process. Identifying and managing product development tradeoffs. Offered as ECSE 480S and EBME 480S. Prereq: EECS 480R.

ECSE 480T. Wearable Computing Design. 3 Units.
Learning about wearable devices using flexible/conformal electronics designed for convenience and uninterrupted wear-ability. Examining related design challenges from the technology, human and business points of view. Understanding wearable product design for general and special-purpose tasks in information processing, media operations, and information extraction from sensed data. Learning about the technological challenges for design, including miniaturization, power delivery and management, data storage, and wireless networking. Learning about hardware choices (processor, field programmable gate array or custom ASIC based design) for wearable computers and software architectures for smart data processing. Learning about wearable designs centered on the human experience, including sensing and interfacing with the human body, as well as user interaction, convenience, and support for non-intrusive social appearance. Case studies tying the business requirements with the technology and design issues.

ECSE 480U. Wearable Computing Technology. 3 Units.
Learning about a broad range of cutting-edge technologies suitable for wearable computing. Understanding printed and flexible electronics technologies required for creating wearable computing, in particular organics for active components due to their flexibility or conformity. Examine the tradeoffs between flexible/conformal versus rigid electronics in the context of wearable computing. Reviewing the history of printed electronics used as conductors for membrane keypads, car windshield heaters and RFID tag antennas to name a few application examples. Reviewing the latest technology advances in functional components such as displays, lighting, transistors (p-type & n-type), memory, batteries, photovoltaics (PV), sensors, and conductors as well as integration/packaging steps. Understanding the market potential of these technologies by reviewing emerging products.

ECSE 480W. Wearable Computing Manufacturing. 3 Units.
Learning about the supply chain and manufacturing processes for flexible electronics, sensors, and other technologies contributing to the development of wearable products. Understanding supply chain issues in low mobility materials, multilevel substrates, nanocomposites, materials for low power sensors, and inks suitable for direct printing. Identifying the tradeoffs involved in various manufacturing methods such as roll-to-roll manufacturing a mature coating technology yet to be proven for full device integration. Studying other manufacturing techniques such as plate-to-plate, direct printing, 3D printing, and screening techniques for their applicability to the manufacturing and integration of flexible electronics. Understanding the use of lithography and vapor deposition techniques in the context of flexible electronics. Examining the issues of systems integration and packaging of the manufactured products.

ECSE 480X. Mobility-Driven Computing. 3 Units.
Fundamental concepts in computing and architecture for mobile devices, mobile operating systems, mobility and mobile data management. Application of technologies for location awareness, context awareness, integrated sensors, mobile Internet, displays, pattern recognition and natural language processing, and touch/gesture based user interaction. Understanding of the tradeoffs in design (smartphones, tablets) due to resource constraints such as wireless connectivity, application processing, power management, and graphics. Integration of near- and wide-area wireless communication technologies (Bluetooth, Wireless WAN). Exploration of emerging technologies and services for the mobile platform. Integration of the foregoing concepts in a specific mobile context application (home/office, pedestrian, vehicular).
ECSE 480Y. Mobility-Driven Embedded Systems. 3 Units.
Foundations of reliable, energy-efficient and secure design of embedded systems. Fundamentals of mobility in embedded systems including wireless technology, location awareness, sensors, and actuators. Design consideration for processors, DSP, memory, and interfaces under mobility constraints (connectivity, power, and data management). Systems software for embedded computing, device management, and real-time I/O. Software design under constraints of size, performance, availability, and reliability. Software development techniques and practices (compilers, OS, and runtime systems). Case studies of mobility driven real-time embedded systems and software. Applications of mobility driven embedded systems, for example in in biomedical implant systems.

ECSE 480Z. Mobile Applications Development. 3 Units.
Understanding of the mobile application architecture, operating systems, and platforms. Challenges and opportunities in mobile application development. Evaluation of the leading mobile platform frameworks with respect to their features, functions, libraries, support, and ease of development. Software design for mobile applications in gaming, multimedia, entertainment, and enterprise applications. Development of enhanced user experience in a multi-touch, multi-sensor (accelerometer, gyroscopes, camera, geo-location) environment. Understanding of software development environments and testing tools, and use of wireless connectivity and data in mobile applications. Development of or extension of a modest application based on a major mobile platforms (iOS, Windows Phone 7, or Android).

ECSE 484. Computational Intelligence I: Basic Principles. 3 Units.
This course is concerned with learning the fundamentals of a number of computational methodologies which are used in adaptive parallel distributed information processing. Such methodologies include neural net computing, evolutionary programming, genetic algorithms, fuzzy set theory, and "artificial life." These computational paradigms complement and supplement the traditional practices of pattern recognition and artificial intelligence. Functionalities covered include self-organization, learning a model or supervised learning, optimization, and memorization.

ECSE 485. VLSI Systems. 3 Units.
Basic MOSFET models, inverters, steering logic, the silicon gate, nMOS process, design rules, basic structure designs (e.g., NAND and NOR gates, PLA, ROM, RAM), design methodology and tools (spice, N.mpc, Caesar, mkpla), VLSI technology and system architecture. Requires project and student presentation, laboratory.

ECSE 486. Quantum Computing, Information, and Devices. 3 Units.
An introduction to the math, physics, engineering, and computer science underlying the rapidly emerging fields of quantum computing, quantum information, and quantum devices. The course is taught by a group of faculty from physics, engineering, computer science, and math, and is geared towards students with diverse backgrounds and interests in these fields. Students will select a concentration in one of these four areas, and the coursework, while still covering all topics, will be adjusted to focus on the selected area in the most detail. Note that the listed prerequisites depend on choice of concentration. Topics will include: 1. (Mathematics) Introduction to linear algebra, convex geometry, fundamental theory of quantum information. 2. (Physics) Introduction to the quantum mechanics of two-level systems (qubits). Survey of physics and materials for qubit technologies. 3. (Computer Science) Basic quantum gates and circuits, introduction to the theory of algorithms, survey of quantum algorithms. 4. (Engineering) Quantum architectures, mapping algorithms onto circuits. The course consists of lectures, homework, and group projects. Group projects will aim to synthesize the diverse backgrounds of the students and instructors to capture the interdisciplinary nature of the field. Students taking the course for graduate credit will complete an additional literature research project and presentation, in addition to enhanced problem sets. Offered as CSDS 386, CSDS 486, ECSE 386, ECSE 486, MATH 386, MATH 486, PHYS 386, and PHYS 486. Prereq: (CSDS 281 or ECSE 281) and (ENGR 131 or CDS 132 or ECSE 132) and (MATH 223 or MATH 227) and (MATH 224 or MATH 228) and (PHYS 122 or PHYS 124).

ECSE 487. Advanced Game Development Project. 3 Units.
This game development project course will bring together an interdisciplinary group of students in the fields of engineering, computer science, and art to focus on the design and development of a complete, fully functioning computer game as an interdisciplinary team. The student teams are given complete liberty to design their own fully functional games from their original concept to a playable game published in an online marketplace. Student teams will experience the entire game development cycle as they execute their projects. Responsibilities include creating a game idea, writing a story, developing the artwork, designing characters, implementing music and sound effects, programming and testing the game, and publishing the final project. Students enrolled in 487 will develop a healthcare or education virtual environment or video game in collaboration with a mentor who has expertise in the chosen area. Offered as CSDS 390, ECSE 390, CSDS 487, and ECSE 487. Prereq: Graduate student standing.

ECSE 488. Embedded Systems Design. 3 Units.
Objective: to introduce and expose the student to methodologies for systematic design of embedded system. The topics include, but are not limited to, system specification, architecture modeling, component partitioning, estimation metrics, hardware software codesign, diagnostics.

ECSE 489. Robotics I. 3 Units.
ECSE 490. Digital Image Processing. 3 Units.
Digital images are introduced as two-dimensional sampled arrays of data. The course begins with one-to-one operations such as image addition and subtraction and image descriptors such as the histogram. Basic filters such as the gradient and Laplacian in the spatial domain are used to enhance images. The 2-D Fourier transform is introduced and frequency domain operations such as high and low-pass filtering are developed. It is shown how filtering techniques can be used to remove noise and other image degradation. The different methods of representing color images are described and fundamental concepts of color image transformations and color image processing are developed. One or more advanced topics such as wavelets, image compression, and pattern recognition will be covered as time permits. Programming assignments using software such as MATLAB will illustrate the application and implementation of digital image processing. Offered as CS 490 and ECSE 490.

ECSE 494. Introduction to Information Theory. 3 Units.
This course is intended as an introduction to information and coding theory with emphasis on the mathematical aspects. It is suitable for advanced undergraduate and graduate students in mathematics, applied mathematics, statistics, physics, computer science and electrical engineering. Course content: Information measures-entropy, relative entropy, mutual information, and their properties. Typical sets and sequences, asymptotic equipartition property, data compression. Channel coding and capacity: channel coding theorem. Differential entropy, Gaussian channel, Shannon-Nyquist theorem. Information theory inequalities (400 level). Additional topics, which may include compressed sensing and elements of quantum information theory. Recommended preparation: MATH 201 or MATH 307. Offered as MATH 394, CS 394, ECSE 394, MATH 494, CSDS 494 and ECSE 494.

ECSE 499. Algorithmic Robotics. 3 Units.
This course introduces basic algorithmic techniques in robotic perception and planning. Course is divided into two parts. The first part introduces probabilistic modeling of robotic motion and sensing, Gaussian and nonparametric filters, and algorithms for mobile robot localization. The second part introduces fundamental deterministic and randomized algorithms for motion planning. Offered as CS 499 and ECSE 499. Prerequisites: Graduate Standing or Requisites Not Met permission.

ECSE 500. ECSE Colloquium. 0 Unit.
Seminars on current topics in Electrical, Computer and Systems Engineering.

ECSE 500T. Graduate Teaching II. 0 Unit.
This course will provide Ph.D. candidate with experience in teaching undergraduate or graduate students. The experience is expected to involve direct student contact but will be based upon the specific departmental needs and teaching obligations. This teaching experience will be conducted under the supervision of the faculty member who is responsible for the course, but the academic advisor will assess the educational plan to ensure that it provides an educational experience for the student. Students in this course may be expected to perform one or more of the following teaching related activities: grading homeworks, quizzes, and exams, having office hours for students, running recitation sessions, providing laboratory assistance. Recommended preparation: Ph.D. student in ECSE department.

ECSE 526. Integrated Mixed-Signal Systems. 3 Units.
Mixed-signal (analog/digital) integrated circuit design. D-to-A and A-to-D conversion, applications in mixed-signal VLSI, low-noise and low-power techniques, and communication sub-circuits. System simulation at the transistor and behavioral levels using SPICE. Class will design a mixed-signal CMOS IC for fabrication by MOSIS. Recommended preparation: EECS/ECSE 426.

ECSE 527. Advanced Sensors: Theory and Techniques. 3 Units.
Sensor technology with a primary focus on semiconductor-based devices. Physical principles of energy conversion devices (sensors) with a review of relevant fundamentals: elasticity theory, fluid mechanics, silicon fabrication and micromachining technology, semiconductor device physics. Classification and terminology of sensors, defining and measuring sensor characteristics and performance, effect of the environment on sensors, predicting and controlling sensor error. Mechanical, acoustic, magnetic, thermal, radiation, chemical and biological sensors will be examined. Sensor packaging and sensor interface circuitry.

ECSE 589. Robotics II. 3 Units.
Survey of research issues in robotics. Force control, visual servoing, robot autonomy, on-line planning, high-speed control, man/machine interfaces, robot learning, sensory processing for real-time control. Primarily a project-based lab course in which students design real-time software executing on multi-processors to control an industrial robot. Recommended preparation: EECS/CSDS/ECSE 489. Offered as CSDS 589 and ECSE 589.

ECSE 600. Special Topics. 1 - 18 Units.

ECSE 600T. Graduate Teaching III. 0 Unit.
This course will provide Ph.D. candidate with experience in teaching undergraduate or graduate students. The experience is expected to involve direct student contact but will be based upon the specific departmental needs and teaching obligations. This teaching experience will be conducted under the supervision of the faculty member who is responsible for the course, but the academic advisor will assess the educational plan to ensure that it provides an educational experience for the student. Students in this course may be expected to perform one or more of the following teaching related activities running recitation sessions, providing laboratory assistance, developing teaching or lecture materials presenting lectures. Recommended preparation: Ph.D. student in ECSE department.

ECSE 601. Independent Study. 1 - 18 Units.

ECSE 620. Special Topics. 1 - 18 Units.

ECSE 621. Special Projects. 1 - 18 Units.

ECSE 651. Thesis M.S.. 1 - 18 Units.
Credit as arranged.

ECSE 695. Project M.S.. 1 - 9 Units.
Research course taken by Plan B M.S. students. Prerequisite: Enrolled in the EECS Plan B MS Program.

ECSE 701. Dissertation Ph.D.. 1 - 9 Units.
Credit as arranged.

Engineering Physics

Xuan Gao, Professor of Physics and Program Director
The Engineering Physics major allows students with strong interests in both physics and engineering to concentrate their studies in the common areas of these disciplines. The Engineering Physics major prepares students to pursue careers in industry, either directly after undergraduate studies, or following graduate study in engineering or physics. Many employers value the unique problem-solving approach of physics, especially in industrial research and development. Its engineering science and design components prepare students to work as professional engineers.

Students majoring in engineering physics complete the Engineering Core as well as a rigorous course of study in physics. Students select a concentration area from an engineering discipline and must complete a sequence of at least four courses in this discipline. In addition, a senior research project under the guidance of a faculty member is required. The project includes a written report and participation in the senior seminar and symposium.

The Bachelor of Science in Engineering degree program with a major in Engineering Physics is accredited by the Engineering Accreditation Commission of ABET, http://www.abet.org.

**Mission**

The mission of the Engineering Physics program is to prepare students for careers in engineering where physics principles can be applied to the advancement of technology. This education at the intersection of engineering and physics will enable students to seek employment in engineering upon graduation while providing a firm foundation for the pursuit of graduate studies in either engineering or physics. The Engineering Physics program will develop sufficient depth in both engineering and physics skills to produce engineers who can relate fundamental physics to practical engineering problems and will possess the versatility to address new problems in our rapidly changing technological base. The program will provide a curriculum and environment to develop interdisciplinary collaboration, ethical and professional outlooks, communication skills, and the tools and desire for life-long learning.

**Program Educational Objectives**

1. Graduates of the Engineering Physics program will apply their strong problem-solving skills as physicists along with an understanding of the approach, methods, and requirements of engineering and engineering design for a successful career in advancing technology.
2. Graduates of the Engineering Physics program will use their strong skills in problem-solving, research experience and knowledge in physics and engineering as successful graduate students and researchers in highly ranked graduate programs.

**Student Outcomes**

As preparation for achieving the above program educational objectives, the Bachelor of Science in Engineering degree program with a major in Engineering Physics is designed so that students attain:

- an ability to identify, formulate, and solve engineering problems
- an understanding of professional and ethical responsibility
- an ability to communicate effectively

**Bachelor of Science in Engineering Required Courses: Major in Engineering Physics**

In addition to engineering general education requirements (p. 1292) and university general education requirements (p. 1212), the major requires the following courses:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Name</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>PHYS 208</td>
<td>Instrumentation and Signal Analysis Laboratory</td>
<td>4</td>
</tr>
<tr>
<td>PHYS 221</td>
<td>Introduction to Modern Physics</td>
<td>3</td>
</tr>
<tr>
<td>PHYS 250</td>

**Breadth Elective Sequence** 38-39

- **Two semester course.** Students may elect to satisfy the SAGES capstone requirement by completing one of the SAGES capstone courses in another department in the Case School of Engineering in place of PHYS 352 and PHYS 353. Students selecting this option must also complete a 3-credit hour technical elective satisfied by any 200 level or above course in the Case School of Engineering.

**Engineering Physics Concentration**

Engineering Physics majors must complete a sequence of at least four upper-level courses in an engineering concentration. Students should seek advice from those engineering representatives listed below to select the courses consistent with scheduling, student preparation, and student interest. Both the program representative and the student’s adviser must approve the sequence. Following approval, students must submit the paperwork to undergraduate studies to ensure credit for the sequence toward graduation.
Bachelor of Science in Engineering

Suggested Program of Study: Major in Engineering Physics

The following is a suggested program of study. Current students should always consult their advisers and their individual graduation requirement plans as tracked in SIS (http://case.edu/sis/).

Total Units in Sequence: 129

Hours required for graduation: 129

* University general education requirement
** Engineering general education requirement
a Selected students may be invited to take MATH 124 Calculus II, MATH 227 Calculus III or MATH 228 Differential Equations in place of MATH 121 Calculus for Science and Engineering I, MATH 122 Calculus for Science and Engineering II, MATH 223 Calculus for Science and Engineering III or MATH 224 Elementary Differential Equations.
b Selected students may be invited to take PHYS 123 Physics and Frontiers I - Mechanics or PHYS 124 Physics and Frontiers II - Electricity and Magnetism in place of PHYS 121 General Physics I - Mechanics or PHYS 122 General Physics II - Electricity and Magnetism.
c Students may also choose to fulfill this requirement with CSDS 132 Introduction to Programming in Java.
Engineering Physics Concentration courses are flexible, but must be in a specific engineering discipline or study area and be approved by an advisor. Possible concentration areas include: Biomedical Engineering (Biomedical Systems and Analysis, Devices and Instrumentation, Biomaterials); Chemical and Biomolecular Engineering; Civil and Environmental Engineering (Solid Mechanics, Structural Engineering, Geotechnical Engineering, Environmental Engineering); Electrical, Computer, and Systems Engineering (Solid State, Computer Science, Computer Engineering-Software, Computer Engineering-Hardware, Systems and Control); Macromolecular Science and Engineering; Materials Science and Engineering; Mechanical and Aerospace Engineering (Aerospace, Mechanics). One of the Engineering Physics concentration courses must provide an engineering design experience which can be satisfied by completing one of the following courses - EBM 380, ECHE 399, ECIV 398, EECS 398, EMAC 378, EMAE 360, EMAE 398 or EMSE 379.

Students may choose to fulfill this requirement in their third year:
- PHYS 315 Introduction to Solid State Physics
- PHYS 332 Introduction to Quantum Mechanics II
- PHYS 327 Laser Physics/PHYS 427 Laser Physics
- ECSE 321 Semiconductor Electronic Devices

Students may elect to satisfy the SAGES capstone requirement by completing one of the SAGES capstone courses in the Case School of Engineering in place of PHYS 352 and PHYS 353. Students selecting this option must also complete a 3-credit hour technical elective satisfied by any 200 level or above course in the Case School of Engineering.

Department of Macromolecular Science and Engineering
314 Kent Hale Smith Building (7202)
http://polymers.case.edu
Phone: 216.368.4172; Fax: 216.368.4202
Gary Wnek, Professor and Chair
gary.wnek@case.edu

Macromolecular science and engineering is the study of the synthesis, structure, processing, and properties of polymers. These giant molecules are the basis of synthetic materials including plastics, fibers, rubber, films, paints, membranes, and adhesives. Research is constantly expanding these applications through the development of new high performance polymers, e.g. for engineering composites, electronic, optical, and biomedical uses. In addition, most biological systems are composed of macromolecules—proteins (e.g. silk, wool, tendon), carbohydrates (e.g. cellulose) and nucleic acids (RNA and DNA) are polymers and are studied by the same methods that are applied to synthetic polymers.

Production of polymers and their components is central to the chemical industry, and statistics show that over 75 percent of all chemists and chemical engineers in industry are involved with some aspect of polymers. Despite this, formal education in this area is offered by only a few universities in this country, resulting in a continued strong demand for our graduates upon completion of their BS, MS, or PhD degrees.

Mission
To educate students who will excel and lead in the development of polymeric materials and the application of structure-property relationships. The department seeks to prepare students for either professional employment or advanced education, primarily in this or related science or engineering disciplines, but also in professional schools of business, law or medicine. Undergraduate students are offered opportunities for significant research experience, capitalizing on the strength of our graduate program.

Research

The research activities of the department span the entire scope of macromolecular science and polymer technology.

Synthesis

New types of macromolecules are being made in the department's synthesis laboratories. The emphasis is on creating polymers with novel functional properties such as photoconductivity, selective permeation, and biocompatibility, and in producing new materials which behave like classical polymers without being linked together by covalent bonds.

Physical Characterization

This is the broad area of polymer analysis, which seeks to relate the structure of the polymer at the molecular level to the bulk properties that determine its actual or potential applications. This includes characterization of polymers by infrared, Raman, and NMR and mass spectroscopy, thermal and rheological analysis, determination of structure and morphology by x-ray diffraction, electron microscopy, and atomic force microscopy, permeability and free volume, and investigation of molecular weights and conformation by light scattering.

Mechanical Behavior and Analysis

Polymeric materials are known for their unusual mechanical capabilities, usually exploited as components of structural systems. Analysis includes the study of viscoelastic behavior, yielding and fracture phenomena and a variety of novel irreversible deformation processes.

Processing

A major concern of industry is the efficient and large scale production of polymer materials for commercial applications. Research in this area is focusing on reactive processing, multi-layer processing and polymer mixing, i.e., compounding and blends. The integration of sensors and processing equipment, and methods for examining changes in structure and composition during processing steps are growing areas of inquiry. Both laboratory and simulation research are brought to bear on these critical issues.

Materials Development and Design

Often, newly conceived products require the development of polymeric materials with certain specific properties or design characteristics. Materials can be tailor-made by designing synthesis and processing conditions to yield the best performance under specified conditions. Examples might be the design of photoluminescent and semi-conducting polymers for use in optoelectronic devices, polymers that are stable at high temperatures for fire-retardant construction materials, high temperature polymer electrolytes for use in advanced fuel cells, low density thermal insulating polymer composite materials, advanced polymeric optical devices, and biocompatible polymers for use in prosthetic implants, reconstructive medicine and drug-delivery vehicles.

Biopolymers

Living systems are composed primarily of macromolecules, and research is in progress on several projects of medical relevance. The department has a long-standing interest in the hierarchical structure and properties
of the components of connective tissues (e.g., skin, cartilage, and bone). The department is also engaged in the development of new biocompatible polymers for applications in human health.

**Faculty**

Gary Wnek, PhD  
*University of Massachusetts, Amherst*  
*The Joseph F. Toot, Jr. Professor and Chair*

Polymeric biomaterials for drug delivery and regenerative medicine; nano- and micro-fiber fabrication; bio-mimicking approaches for polymer flammability mitigation; polymer packaging systems design; polyelectrolyte gels and elastomers; physiologically-mimicking macromolecular constructs with attention to primitive motile and irritable systems

Eric Baer, DEng  
*Johns Hopkins University*  
*Director, Centered for Layered Polymeric Systems (CLiPS) and Herbert Henry Dow Professor of Science and Engineering*

Multilayered and ultrathin polymer films and devices. Irreversible microdeformation mechanisms; pressure effects on morphology and mechanical properties; relationships between hierarchical structure and mechanical function; mechanical properties of soft connective tissue; polymer composites and blends; polymerization and crystallization on crystalline surfaces; viscoelastic properties of polymer melts; damage and fracture analysis of polymers and their composites. Structure-property relationships in biological systems

Michael Hore, PhD  
*University of Pennsylvania*  
*Associate Professor*

Polymer physics; neutron scattering; polymer nanocomposites; grafted polymers and brushes; theory and modeling; self-consistent field theory; structure-property relationships; reconfigurable materials.

Hatsuo Ishida, PhD  
*Case Western Reserve University*  
*Professor*

Processing of polymers and composite materials; structural analysis of surfaces and interfaces; molecular spectroscopy of synthetic polymers

João Maia, PhD  
*University of Wales Aberystwyth, U.K.*  
*Associate Professor*

Polymer rheology: extensional rheology and rheometry; micro- and nano-rheology; bio-rheology: food rheology and processing; rheology for macromolecular technology; development and optimization of polymer blends and composites; viscoelasticity of micro- and nano-layered polymer films; on- and in-line monitoring of extrusion-based processes; micro-processing; environmental rheology and processing

Ica Manas-Zloczower, DSc  
*Israel Institute of Technology*  
*Professor*

Structure and micromechanics of fine particle clusters; interfacial engineering strategies for advanced materials processing; dispersive mixing mechanisms and modeling; design and mixing optimization studies for polymer processing equipment through flow simulations

Svetlana Morozova  
*University of Massachusetts, Amherst*  
*Assistant Professor*

Polymer dynamics

Valentin Rodionov, PhD  
*Scripps Res. Institute*  
*Assistant Professor*

Organic polymer chemistry; synthesis of novel macromolecular structures and architectures; catalysis

Lei Zhu, PhD  
*University of Akron*  
*Professor*

Nanoscale structure and morphology of crystalline/liquid crystalline polymers and block copolymers; ferroelectric and dielectric polymers for electric energy storage; polymer/inorganic hybrid nanocomposites; biodegradable polymers for diagnostic and drug delivery

**Secondary Faculty**

James M. Anderson, PhD  
*Oregon State University, M.D.*  
*Professor of Macromolecular Science, Pathology, and Biomedical Engineering*

Biocompatibility, inflammation, foreign body reaction to medical devices, prostheses, and biomaterials

Donald Feke, PhD  
*Princeton University*  
*Professor of Chemical Engineering and Macromolecular Science*

Fine-particle processing, colloidal phenomena, dispersive mixing, and acoustic separation methods

Roger French, PhD  
*Massachusetts Institute of Technology*  
*F. Alex Nason Professor of Materials Science*

Optical materials and elements, optical properties and electronic structure of materials, and electrodynamic van der Waals-London dispersion interactions

John Protasiewicz, PhD  
*Cornell University*  
*Professor of Chemistry*

Inorganic, organic, main group, materials, polymer, catalysis, organometallic chemistry, and X-ray crystallography

Charles Rosenblatt, PhD  
*Harvard University*  
*Professor of Physics*

Experimental condensed matter physics and liquid crystal physics

Kenneth Singer, PhD  
*University of Pennsylvania*  
*Professor of Physics*

Modern optics and condensed matter experiment and nonlinear optics

Philip Taylor, PhD  
*Cambridge University, England*  
*Perkins Professor of Physics*

Phase transitions and equations of state for crystalline polymers; piezoelectricity and pyroelectricity
Novel platforms for the delivery of molecules and cells and the use of novel stimuli-responsive polymers for use in gene and drug delivery

**Adjunct Faculty**

Thomas Chapin, PhD  
(University of Connecticut)  
*Vice President, UL Laboratories*  
*Polymer Flammability*

Lashanda Korley, PhD  
(Massachusetts Institute of Technology)  
*Associate Professor, Chemical Engineering and Materials Science and Engineering University of Delaware*  
*Hierarchical peptide polymer hybrids; new fiber manufacturing strategies for functional material development; responsive composites; interplay of covalent and non-covalent interactions*

Jon Pokorski, PhD  
(Northwestern University)  
*Associate Professor*  
*Biomaterials for delivery of therapeutic proteins; protein-polymer conjugates; drug-delivery; biopolymer catalysts; self-assembling peptides; affinity-based delivery of therapeutics; layered polymeric delivery systems*

Stuart Rowan, PhD  
(University of Glasgow)  
*Professor, The Institute for Molecular Engineering, University of Chicago*  
*Supramolecular chemistry; synthesis of metallosupramolecular and stimuli-responsive polymers; isolation and utilization of cellulose nanocrystals in biomimetic and porous systems; reversible covalent chemistry*

Christoph Weder, DrScNat  
(ETH Zurich Switzerland)  
*Professor of Polymer Chemistry and Materials and Director, Adolphe Merkle Institute of the University of Fribourg, Switzerland*  
*Design, synthesis and investigation of structure-property relationships of novel functional polymers: polymers with unusual optic and/or electronic properties; (semi)conducting conjugated polymers; stimuli-responsive polymers; biomimetic materials, polymer nanocomposites, supramolecular chemistry*

**CWRU/Brazil Dual PhD Degree Adjunct Professors**

Rosario Elida Suman Bretas, PhD  
(Federal University of Sao Carlos)  
*Professor*  
*Department of Materials Engineering*

Veronica Maria de Araujo Calado, PhD  
(Federal University of Rio de Janeiro)  
*Professor*  
*Department of Mechanical Engineering*  
*Sidnei Paciornik, PhD*  
*Pontifical Catholic University of Rio de Janeiro*  
*Professor*  
*Department of Materials Engineering*  
*Luiz Antonio Pessan, PhD*  
*Federal University of Sao Carlos*  
*Professor*  
*Department of Materials Engineering*
Cesar Liberato Petzhold, PhD
(Federal University of Rio Grande do Sul)
Professor
Institute of Chemistry

Joao Henrique Zinnoc Dos Santos, PhD
(Federal University of Rio Grande do Sul)
Professor
Institute of Chemistry

Paulo Henrique Schneider, PhD
(Federal University of Rio Grande do Sul)
Professor
Institute of Chemistry

Henri Stephan Schrekker, PhD
(Federal University of Rio Grande do Sul)
Professor
Institute of Chemistry

Argimiro Resende Secchi, PhD
(Federal University of Rio de Janeiro)
Professor
COPPE-Chemical Engineering Program

Bluma Guenther Soares, PhD
(Federal University of Rio Grande do Sul)
Professor
Institute of Chemistry

Marcio Nele De Souza, PhD
(Federal University of Rio de Janeiro)
Professor
Department of Chemical Engineering

Frederico Wanderley Tavares, PhD
(Federal University of Rio de Janeiro)
Professor
School of Chemistry and Program of Chemical Engineering of COPPE

Roney Leon Thompson, PhD
(Federal University of Rio de Janeiro)
Professor
Department of Mechanical Engineering

David A. Schiraldi, Ph.D.
(University of Oregon)
Peter A. Asseff, Professor of Organic Chemistry Emeritus
Composites, including Aerogel composites, structure-property relationships, transport phenomena and packaging materials, condensation polymers, bio-based polymer synthesis, polymer flammability and sustainable FR agents, polymer blends and complex polymer systems.

Undergraduate Programs

In 1970, the department introduced a program leading to the Bachelor of Science in Engineering degree with a major in Polymer Science and Engineering, which is designed to prepare the student both for employment in polymer-based industry and for graduate education in polymer science.

The Case School of Engineering is proud that the polymer science and engineering program was the first such undergraduate program in the country to receive accreditation from the Engineering Council for Professional Development. The curriculum combines courses dealing with all aspects of polymer science and engineering with basic courses in chemistry, physics, mathematics, and biology, depending on the needs and interests of the student. The student chooses a sequence of technical electives, in consultation with a faculty advisor, allowing a degree of specialization in one particular area of interest, e.g., biomaterials, chemical engineering, biochemistry, or physics. In addition to required formal laboratory courses, students are encouraged to participate in the research activities of the department, both through part-time employment as student laboratory technicians and through the senior project requirement: a one or two semester project that involves the planning and performance of a research project.

Polymer science undergraduates are also strongly encouraged to seek summer employment in industrial laboratories during at least one of their three years with the department. In addition to the general undergraduate curriculum in Polymer Science and Engineering, the department offers two specialized programs which lead to the Bachelor of Science in Engineering with a major in Polymer Science and Engineering. The cooperative program contains all the course work required for full-time resident students plus one or two six-month cooperative sessions in polymer-based industry. The company is selected by the student in consultation with his or her advisor, depending on the available opportunities. The dual-degree program allows students to work simultaneously on two baccalaureate level degrees within the university. It generally takes five years to complete the course requirements for each department for the degree. The BS/MS program leads to the simultaneous completion of requirements for both the master’s and bachelor’s degrees. Students with a minimum GPA of 3.0 may apply for admission to this program in their junior year.

The Bachelor of Science in Engineering degree program with a major in Polymer Science and Engineering is accredited by the Engineering Accreditation Commission of ABET, http://www.abet.org.

Program Educational Objectives

This program will produce graduates who:

1. Are competent, creative, and highly valued professionals in industry, academia, or government.
2. Are flexible and adaptable in the workplace, possess the capacity to embrace new opportunities of emerging technologies, and embrace...
leadership and teamwork opportunities, all affording sustainable engineering careers.

3. Continue their professional development by obtaining advanced degrees in Polymer Science and Engineering or other professional fields, as well as medicine, law, management, finance or public policy.

4. Act with global, ethical, societal, ecological, and commercial awareness expected of practicing engineering professionals.

**Student Outcomes**

As preparation for achieving the above educational objectives, the Bachelor of Science in Engineering degree program with a major in Polymer Science and Engineering is designed so that students attain:

- an ability to apply knowledge of mathematics, science, and engineering
- an ability to design and conduct experiments, as well as to analyze and interpret data
- an ability to design a system, component, or process to meet desired needs
- an ability to function in multi-disciplinary teams
- an ability to identify, formulate, and solve engineering problems
- an understanding of professional and ethical responsibility
- an ability to communicate effectively

**Bachelor of Science in Engineering**

**Required Courses: Major in Polymer Science and Engineering**

In addition to engineering general education requirements (p. 1292) and university general education requirements (p. 1212), the major requires the following courses:

Total Units in Sequence: 128  
Hours required for graduation: 128

* University general education requirement  
** Engineering general education requirement  
** Approved Natural Science electives:  
  - PHYS 221 Introduction to Modern Physics  
  - STAT 312 Basic Statistics for Engineering and Science  
  - PHYS 349 Methods of Mathematical Physics I  
  - BIOC 307 Introduction to Biochemistry: From Molecules To Medical Science  
  - EMAC 325 may be taken as a technical elective. Students choosing the polymer major in the freshman year are encouraged to register for EMAC 125 (https://sis.case.edu/psp/P90SCWR/?cmd=login&languageCd=ENG) (1 credit), which may be used as a technical elective provided the student also completes EMAC 325 (https://sis.case.edu/psp/P90SCWR/?cmd=login&languageCd=ENG) for at least 2 credits.  
  - Technical sequence must be approved by department advisor.  
  - Preparation for the polymer science project should commence in the previous semester.

Professional Communication for Engineers (ENGL 398) & Professional Communication for Engineers (ENGR 398)**  
Polymer Physics and Engineering (EMAC 352)

Total Units in Sequence: 131

Hours required for graduation: 128

- University general education requirement
- Engineering general education requirement
- Approved Natural Science electives:
  - BIOL 214 Genes, Evolution and Ecology (d);
  - BIOL 215 Cells and Proteins (d);
  - BIOC 307 Introduction to Biochemistry: From Molecules To Medical Science (d);
  - BIOL 362 Principles of Developmental Biology
- Suggested for pre-med students
- EMAC 355 Polymer Analysis Laboratory is strongly recommended.

At least 3 of the 4 Technical Electives have to be taken from:
- EBME 316 Biomaterials for Drug Delivery;
- EBME 325 Introduction to Tissue Engineering;
- EBME 350 Quantitative Molecular, Cellular and Tissue Bioengineering;
- EBME 426 Nanomedicine;
- EMAC 471 Polymers in Medicine / EBME 406 Polymers in Medicine;
- a three-credit research sequence of EMAC 125 Freshman Research on Polymers and EMAC 325 Undergraduate Research in Polymer Science
- EMAC 372 Polymer Processing and Testing Laboratory (offered in the spring semester of the fourth year)
- Other technical electives, as approved by the student’s academic advisor

Preparation for the polymer science project should commence in the previous semester.
Co-op and Internship Programs

Opportunities are available for students to alternate studies with work in industry or government as a co-op student, which involves paid full-time employment over seven months (one semester and one summer). Students may work in one or two co-ops, beginning in the third year of study. Co-ops provide students the opportunity to gain valuable hands-on experience in their field by completing a significant engineering project while receiving professional mentoring. During a co-op placement, students do not pay tuition but maintain their full-time student status while earning a salary. Learn more at http://engineering.case.edu/coop/. Alternatively or additionally, students may obtain employment as summer interns.

Five-Year Combined BS/MS Program

This program offers outstanding undergraduate students the opportunity to obtain an MS degree, with a thesis, in one additional year of study beyond the BS degree (normally, it takes 2 years beyond the BS to earn an MS degree). In this program, an undergraduate student can take up to 9 credit hours that simultaneously satisfy undergraduate and graduate requirements. If the BS part of the BS/MS is in Polymer Science & Engineering, then participating students generally will not take the standard EMAC 401-405 sequence; the additional course work will be taken as electives in this case. Students in this program typically produce a senior thesis during the fall of their fourth year. They then start their research leading to the MS thesis in the spring semester of that year, culminating in a thesis defense spring semester of year five.

Application for admission to the five year BS/MS program is made after completion of five semesters of course work. Minimum requirements are a 3.2 grade point average and the recommendation of a faculty member. Review the Office of Undergraduate Studies BS/MS program requirements here (p. 1298).

</table>

Total Units in Sequence: 18

Note: A number of 2 credit hour electives are offered each year by the Macro Department, so students may elect to take a sequence of four electives, totaling at least 9 credit hours, in addition to the required 9 hours of EMAC 651 Thesis M.S.

Graduate Programs

Courses leading to the Master of Science (MS) and Doctor of Philosophy (PhD) degrees in macromolecular science are offered within the Case School of Engineering. They are designed to increase the student’s knowledge of macromolecular science and of his/her own basic area of scientific interest, with application to specific polymer research problems. Research programs derive particular benefit from close cooperation with graduate programs in chemistry, physics, materials science, chemical engineering, biological sciences, and other engineering areas. The interdisciplinary academic structure allows the faculty to fit the individual program to the student's background and career plans. Basic and advanced courses are offered in polymer synthesis, physical chemistry, physics, biopolymers, and applied polymer science and engineering. A laboratory course in polymer characterization instructs students in the use of modern experimental techniques and equipment. Graduate students are also encouraged to take advanced course work in polymer solid state physics, physical chemistry, synthesis, rheology, and polymer processing.

Master of Science

Master’s Thesis-Focused Track

The minimum requirement to complete a master’s degree under the Thesis-Focused Track is 30 hours. Of the 30 hours, at least 18 hours must be coursework, and 9 hours must be EMAC 651 Thesis M.S. At least 18 semester hours of coursework, including thesis, must be at the 400 level or higher.

All Thesis-Focused MS students must take 6 credits of departmental fundamentals courses including the lab component. Please note: Once a student begins registration of EMAC 651 Thesis M.S., the student must register for at least one credit hour of this course every semester until graduation. The normal residency period for an MS degree is 2 years.

Elective and core courses can be taken via Distance Learning or by transfer (transfers need to be approved by the chair of the department and dean of graduate studies; core courses also need instructors’ approval).

Minor in Polymer Science and Engineering

The minor in Polymer Science and Engineering consists of five courses from the list below (special arrangements can be made to include appropriate EMAC graduate courses as well).

<table>
<thead>
<tr>
<th>Required Courses</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>EMAC 270</td>
<td>6</td>
</tr>
<tr>
<td>EMAC 276</td>

<td></td>
</tr>
<tr>
<td>EMAC 377</td>
<td>3</td>
</tr>
<tr>
<td>EMAC 378</td>
<td></td>
</tr>
<tr>
<td>Total Units</td>
<td>15</td>
</tr>
</tbody>
</table>
EMAC 401 Polymer Foundation Course I: Organic Chemistry
EMAC 402 Polymer Foundation Course II: Physical Chemistry
EMAC 403 Polymer Foundation Course III: Physics
EMAC 404 Polymer Foundation Course IV: Engineering

Plus an additional 6 credit hours of coursework for Thesis-Focused courses to be approved by their advisor.

For completion of a master's degree in the Thesis-Focused Track, an oral examination (defense) of the master's thesis is required. The examination is conducted by a committee of three university faculty members. The candidate's thesis advisor usually serves as the chair of the examining committee. The chair of the department or the curricular program faculty appoints members of the committee. The examining committee must agree unanimously that the candidate has passed the thesis examination.

Master's Project-Focused Track
The master's Project-Focused Track is available for individuals who live out of state or are working full-time. A research report and oral examination are required before graduation. This option requires 30 total credit hours; categorized by the following:

1. 3-6 cr. hrs. need to be project credit (independent study) which needs to be approved by advisor
2. 21-24 course credits (of which 9 must be based in Macromolecular Science); and
3. 6 core course credits

Each candidate for the master's degree under Project-Focused Track must satisfactorily pass a comprehensive examination, which is administered by the department or curricular program committee. The examination may be written or oral or both. A student must be registered during the semester in which any part of the comprehensive examination is taken. If not registered for other courses, the student will be required to register for one semester hour of EXAM 600 Master's Comprehensive Exam, before taking the examination.

Elective and core courses can be taken via Distance Learning or by transfer (transfers need to be approved by the chair of the department and dean of graduate studies; core courses also need instructors' approval).

MS students will generally be required to take the core courses:

EMAC 401 Polymer Foundation Course I: Organic Chemistry
EMAC 402 Polymer Foundation Course II: Physical Chemistry
EMAC 403 Polymer Foundation Course III: Physics
EMAC 404 Polymer Foundation Course IV: Engineering

Plus an additional 15 credit hours of coursework for Project-Focused courses to be approved by their advisor.

Master's Course-Focused Track
The Course-Focused MS degree program requirements consist of the completion of 30 hours of approved coursework at the 400 level or higher, satisfactory completion of the culminating course-focused experience, i.e. passing the course ENGR 600 with requirements defined by the student's curricular program, and additional requirements as specified by the program. Students should consult with their academic advisor and/or department to determine the detailed requirements within this framework.

Master of Science in Engineering with Specialization Advanced Films and Packaging Systems
The Department of Macromolecular Science and Engineering at Case Western Reserve University offers a Master's Degree track in Advanced Films and Packaging Systems. This program is designed to be completed over 12 months but can be spread out over multiple years. Options for either a thesis-based or a course-based Master's are available.

Through a 30 credit hour curriculum, students explore and learn how to apply the fundamental principles of macromolecular science and engineering toward emerging challenges and opportunities in the utilization of plastics in films and packaging. The department offers a unique intersection of deep expertise polymer synthesis, structure-property-relationships, and processing which can be applied to benefit an industry with a global economic impact of at least $1 trillion annually.

Fire Science and Engineering
The Case School of Engineering at Case Western Reserve University offers an MS graduate program in Fire Science and Engineering. Students will choose either a Master of Science in Macromolecular Science and Engineering or a Master of Science in Mechanical Engineering, both with a concentration in fire science. Case Western Reserve offers a unique intersection of expertise in macromolecular and combustion science and mechanical and chemical engineering, making us singularly suited to cover all aspects of fire protection, safety, and flammability.

Through a 30 credit hour curriculum, students explore and learn how to apply the fundamental principles of fire behavior and dynamics, protection and suppression systems, polymeric materials structure, properties and selection and more. The program is designed to be completed in one year but can be spread out over multiple years.

The Fire Science and Engineering program at Case Western Reserve covers all aspects of combustion and fire suppression. After graduating from this degree program, students will be ready to apply their thorough understanding of:

- The chemistry of fire and materials
- Flammability logistics
- Fire dynamics and fire behavior
- Fire risk assessment
- Fire protection engineering
- Combustion
- Fire and safety-related codes
- Human behavior and life safety analysis
- Structural fire protection
- Passive fire protection systems
- Polymer engineering
This fire protection engineering degree is offered over three semesters: 12 credits in the fall semester; 12 credits in the spring semester; and 6 credits in the summer. See the university's academic calendar (http://www.case.edu/registrar/calendar.html).

### How to Apply

Application to the Fire Science and Engineering program is handled through the university's School of Graduate Studies. Students will need to know whether they wish to apply for the MS in Macromolecular Science and Engineering or the MS in Mechanical Engineering.

Students interested in applying to the Fire Science and Engineering program should already have a bachelor's degree in Chemistry, Chemical Engineering, Mechanical Engineering or Materials Science & Engineering and have taken the GRE. Additional application requirements include a statement of objectives, academic transcripts, and three letters of recommendation. International students will also need to take the Test of English as a Foreign Language (TOEFL). Read more about the university's full application procedure requirements here (http://gradstudies.case.edu/prospect/admissions/apply.html).

When you are ready to apply, electronic applications can be submitted here (https://app.applyyourself.com/AYApplicantLogin/ApplicantConnectLogin.asp?id=casegrad).

### PhD Programs

The PhD program consists of 36 hours of coursework, including the departmental core courses and 18 credit hours of PhD thesis (EMAC 701 Dissertation Ph.D.) are required for the PhD degree, in addition to passing the research qualifying exam (oral proposal) and the written qualifying exam.

Of the coursework credit requirements, the core courses are designated as "depth" courses (12 credits). In addition, all students will take a minimum of two breadth courses in basic science and/or other departments in the School of Engineering (for a total of six credits). The remaining breadth requirements (up to 18 credits) are satisfied by course modules taken in Macromolecular Science and Engineering.

Each doctoral student is responsible for becoming sufficiently familiar with the research interests of the department or program faculty to choose in a timely manner a faculty member who will serve as the student's research advisor. The research advisor is expected to provide mentorship in research conception, methods, performance, and ethics, as well as focus on development of the student's professional communication skills, building professional contacts in the field, and fostering the professional behavior standard of the field and research in general.

The research advisor also assists with the selection of three other faculty to serve as the required additional members of the dissertation advisory committee. This committee must be formed within the second semester following admission. Throughout the development and completion of the dissertation, these members are expected to provide constructive criticism and helpful ideas generated by the research problem from the viewpoint of their particular expertise. Each member will make an assessment of the originality of the dissertation, its value, the contribution it makes and the clarity with which concepts are communicated, especially to a person outside the field.

The doctoral student is expected to arrange meetings and maintain periodic contact with each committee member. A meeting of the full committee for the purpose of assessing the student's progress should occur at least once a year until the completion of the dissertation.

**Degree Options**

The Fire Science and Engineering master's degree track comprises 30 credit hours, which may be all coursework or include an MS thesis (9 credit hours) or a project (3 to 6 credit hours). Students can choose to receive a Master of Science in Macromolecular Science and Engineering with a specialization in Fire Science and Engineering, or a Master of Science in Mechanical Engineering with a specialization in Fire Science and Engineering.

All students will take six core fire protection engineering courses. Other courses can be chosen from the elective track for macromolecular science and engineering or mechanical engineering. The materials track focuses on polymer chemistry and materials, and the chemistry of flammability and fire suppression. The mechanical track follows a traditional mechanical engineering/combustion approach to fire protection and suppression, but with specialization classes in polymers.

The track can be finished in one year or in multiple years. Students have the option of completing a thesis or research project at their employers' laboratories with Case Western Reserve faculty members as co-advisors.

For additional information, please contact:

Gary Wnek, Chair of the Department of Macromolecular Science and Engineering

Ya-Ting Liao, Assistant Professor in the Department of Mechanical and Aerospace Engineering

**Academic Calendar**

This fire protection engineering degree is offered over three semesters: 12 credits in the fall semester; 12 credits in the spring semester; and 6 credits in the summer. See the university's academic calendar (http://www.case.edu/registrar/calendar.html).
For students entering the PhD program with an MS degree, 18, instead of 36 credit hours, of coursework is required. Other requirements for a PhD remain the same as described above. Normally students should orient their training around their main area of interest/expertise and in relation to their research program. For those enrolled in the MD/PhD degree program, all 18 course credits for breadth and depth courses must be taken within the Medical School Program.

The core courses designated as depth courses are:

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>EMAC 401</td>
<td>Polymer Foundation Course I: Organic Chemistry</td>
<td>3</td>
</tr>
<tr>
<td>EMAC 402</td>
<td>Polymer Foundation Course II: Physical Chemistry</td>
<td>3</td>
</tr>
<tr>
<td>EMAC 403</td>
<td>Polymer Foundation Course III: Physics</td>
<td>3</td>
</tr>
<tr>
<td>EMAC 404</td>
<td>Polymer Foundation Course IV: Engineering</td>
<td>3</td>
</tr>
</tbody>
</table>

Students are required to take all four depth courses (12 credits), but on the approval of the instructor, can be excused from one or more of the courses if the relevant course content is not satisfied by a course taken in prior undergraduate or graduate degrees. However, the excused credits must be fulfilled by taking additional breadth courses. NOTE: While EMAC 401 Polymer Foundation Course I: Organic Chemistry and EMAC 402 Polymer Foundation Course II: Physical Chemistry, and EMAC 404 Polymer Foundation Course IV: Engineering are offered at the same time in the Fall and Spring semesters, respectively, students can still sign up for both courses, since one is offered in the first half and the other in the second half of the semester.

Two courses in basic science and/or engineering are required. These courses can be taken in other departments of the School of Engineering, or the departments of Mathematics, Biology, Biochemistry, Chemistry, or Physics as approved by the advisor.

As part of the course requirements, all students are required to register for EMAC 677 Colloquium in Macromolecular Science and Engineering (the Friday departmental seminars) which will be graded with either “Pass” or “No Pass.”

Students who have taken EMAC 370 Polymer Chemistry and EMAC 376 Polymer Engineering as undergraduates can use these courses to fulfill one or more of the depth requirements in the Department of Macromolecular Science and Engineering for the MS and PhD degree. However, the credits for this course cannot be applied towards the course credit requirements for the graduate degree. Exceptions are possible for the combined BS/MS program.

**Graduate Program Rules**

Graduates entering the Department of Macromolecular Science and Engineering are subject to the academic rules of the University, of the School of Engineering, and of the Department. Consult the Graduate Student Handbook (http://gradstudies.case.edu/).

A short abstract of important points include:

1. GPA requirements are described below in the Departmental Rules.
2. A student receiving a "U" in a course is automatically placed on probation and must remove him/herself from probation within one year (usually by repeating the course). If a course is repeated, both original and revised grades will count in the grade point average.
3. Some students are admitted on a probationary basis and must achieve a 3.0 GPA after two semesters to remain in good standing (this is a rule of the Engineering School).
4. Students entering the graduate program for a PhD will need to fill out the Academic Program by the end of their second semester.
5. All students are required to serve as teaching assistants. Responsibilities as a TA include serving as an instructor, lab assistant, recitation leader, grader, or tutor in an undergraduate course. After fulfilling the required teaching assistant program, UNIV 400, students will make sure that three teaching courses (400T, 500T, and 600T) are listed on their Academic Program. Completion of this teaching requirement will be monitored by Graduate Studies and is required in order to graduate.

**Engineering School Rules**

Most of these rules are incorporated in the number and type of courses required by the Department. However, Case School of Engineering PhD students are required to 1) maintain full-time status as a PhD bound student; 2) maintain a grade point average of 3.2 or above; and 3) continue making satisfactory academic progress as certified by their advisor.

**Departmental Rules**

1. Students in the PhD program receiving a GPA below 2.50 in any two consecutive semesters will be asked to terminate their graduate study program.
2. The GPA requirement established by the university at various stages of the graduate program shall exclude MS or PhD thesis credits which will be graded “S” or “U” until a final grade is given at the end of the program. Hence a student must maintain a minimum GPA of 3.0 (for an MS) OR a 3.0 (for a PhD) in coursework. (As mentioned above, Case School of Engineering PhD students must maintain a GPA of 3.2 or above.)
3. Thesis-Focused Track MS students must give a departmental seminar (as part of the student lecture series).
4. Project-Focused Track MS degrees are limited to non-fellowship students.
5. Coursework may be transferred from another university, subject to Graduate Committee approval if:
   - the courses duplicate requirements of the department;
   - the courses were in excess of the undergraduate degree requirements; or
   - the courses were taken in a graduate program elsewhere;
   - a grade of B or better was achieved in those courses;
   - a petition is made to and approved by the Graduate Committee of the Department.
   - the transferred grades will not count in the GPA at CWRU.
6. The Department reserves the right to withhold financial support to a student if that student takes an undue amount of time in completing his/her MS or PhD requirements (normally no longer than 3 years for MS and 5 years after initial registration of EMAC 701 Dissertation Ph.D.).
7. A PhD student must pass the written Qualifying Exam within 18 months after enrollment with an MS degree into the PhD program. A PhD student must pass the written Qualifying Exam within 24 months after enrollment with a BS degree into the PhD program. A student only has two chances to pass the Qualifying Exam. Students will be asked to answer 4 mandatory questions – one from each of the following five areas:

• Polymer Synthesis
• Polymer Physical Chemistry
• Polymer Physics
• Applied Polymer Science
• Seminars (from the previous year)

Two elective questions will be chosen from a number of questions from all elective courses offered in the Department. NOTE: The Qualifying Exam is given twice per year respectively on the first Friday at the beginning and the first Friday after the end of the Spring semester. For PhD students enrolled in a Spring semester, those with MS must pass the Qualifying Exam at the end of his/her second Spring semester, and those with BS must pass it at the beginning of his/her third Spring semester.

8. The Research Qualifying Exam (RQE) is designed to test the student’s knowledge of the chosen field as well as his/her originality and ability to perform high quality, independent research. It consists of a written research proposal and an oral defense. All PhD students who hold an MS degree must pass the RQE within 2 years of enrolling in the PhD program, while students with a BS degree must do so within 2.5 years. Successful passing of the Written Qualifying Exam (not to be confused with the written portion of this RQE) is a prerequisite to taking the RQE. Students have two chances to pass the RQE and no student will be allowed to continue on to a PhD degree if he/she has not successfully taken it. A conditional pass with major revision (see below) requires modification to the written or oral portion, at the examination committee’s discretion, within ten business days and following guidelines by the examination committee. A second exam, if required due to failure of the first exam, must be taken within six months of the first exam with at least one examination committee member remaining the same. Passing the exam constitutes advancement to candidacy and is required for enrolling in EMAC 701 Dissertation Ph.D.

9. At least three (3) weeks prior to the RQE oral defense, the student will submit to the graduate chairperson a research proposal title with a one-paragraph synopsis of the research problem and approach, along with suggestions for two members ((i) and (ii), below) of the three member examining committee. The examining committee will consist of three faculty members: (i) a member (or intended member) of the student’s Thesis Advisory Committee, (ii) an expert in the research proposal area and (iii) a faculty member selected systematically and in a neutral manner by the Graduate Committee. The student’s primary thesis advisor or co-advisors is/are excluded from the examining committee. Upon establishing the examining committee, the student will arrange with the committee for the date, time, and location of the RQE. The student will then distribute the written research proposal to the examining committee five full business days before the defense. It should be no less than 15 and no more than 20 pages of double-spaced text with 1” margins on all sides. No more than 5 pages can be devoted to the proposal introduction or background. Figures, tables, and schemes should not exceed five pages in total. Literature citations are in addition to this page count. The oral presentation will be chaired by a designated chairperson from the examining committee. It should contain only limited background material, focusing primarily on execution of the proposed research. The oral presentation should last 20-30 minutes, with questions from faculty being for clarification only. Following the presentation, the examining committee will ask questions for the student to answer concerning the proposal. On the basis of the written proposal and oral defense (presentation and question responses), the faculty will then confer and tender a decision of pass, conditional pass with major revision, or fail, immediately. The decision will be communicated to the student and graduate chairperson in writing within one business day.

10. All PhD students are required to fulfill their teaching requirement by registering for the three teaching courses, 400T, 500T, and 600T that will be posted to the departmental roster each semester. Completion of the teaching requirement will be monitored by Graduate Studies, and these three teaching courses must appear both on the Program of Study form and the student’s transcript.

11. It is expected that all students will present the results of their research in a Departmental Seminar. This is mandatory for students enrolled in the PhD program. Attendance and registration for these seminars EMAC 677 Colloquium in Macromolecular Science and Engineering. Colloquia Seminars are also mandatory.

12. The department requires the equivalent of six credit hours of departmental assistance. This requirement takes the form of grading, laboratory assistance and/or general departmental duties and is designed to utilize no more than three hours/week of a student’s time. The departmental service requirement must be completed within the first two semesters of study. However, the departmental service requirement form must be turned in at the end of each semester until the obligation is met.

13. Vacation Policy. Graduate students in the department who receive fellowship support for 12 months are normally entitled to two weeks vacation plus national holidays. Alternative arrangements may be made with the student’s advisor, giving ample advance notice. In certain situations, it is possible to take a leave of absence without financial support.

14. Prior to graduation, a student is required to clean out his/her laboratory space including removal of waste solvents and hazardous material.

15. Failure to comply with all of the above course requirements may result in termination or delay in graduation.

Facilities
The Kent Hale Smith Science and Engineering Building houses the Department of Macromolecular Science. The building was built in 1993, and specifically designed to meet the specific needs of polymer research. The facility consists of five floors, plus a basement. The laboratories for chemical synthesis are located principally on the top floor, the molecular and materials characterization laboratories on the middle floors, and the major engineering equipment on the ground floor, while the NMR, MALDI-TOF, and TA-instruments. Thermal Characterization instrumentation are located in the basement. Modern, computer-interfaced classrooms are installed on the ground floor. Additional instrumentation available includes Small and Wide-Angle X-ray diffractometers; scanning electron microscopy, a complete range of molecular spectroscopic equipment including FTIR, laser Raman, and high resolution solution and solid-
state NMR (including imaging), as well as Raman and FTIR microscopes; and dynamic light scattering spectroscopy. There are also facilities for polymer characterization (molecular weight distribution), optical microscopy, solution and bulk rheology, scanning calorimetry, and for testing and evaluating the mechanical properties of materials. A newly built-out processing lab provides the complete suite of Thermo-Fisher batch, single- and twin-screw mixing and extrusion equipment, as well as that manufacturer’s state of the art rheometers. The C. Richard Newpher polymer processing laboratory includes a high temperature Rheometrics RMS-800 dynamic mechanical spectrometer, a Bomem DA-3 FTIR with FT-Raman capabilities, a compression molding machine, a Brabender plastocorder, a high speed Instron testing machine, and a vibrating sample magnetometer. The Charles E. Reed ’34 Laboratory is concerned with the mechanical analysis of polymeric materials. The major testing is done by Instron Universal testing instruments including an Instron model 1123 with numerous accessories such as an environmental chamber for high or low temperature experiments. Additional mechanical testing of fibers, films and injection-molded (Boy model 22-S) are provided by MTS universal testers which are used for both research and undergraduate teaching laboratory classes. The NSF Center for Layered Polymeric Systems (CLiPS) has its central facility within the department, with three cutting-edge multilayer extrusion systems as its centerpiece. CLiPS also operates a Bruckner KARO IV biaxial stretching unit, which allows controlled biaxial stretching of polymer films, and an Atomic Force Microscope which probes the morphological and mechanical properties of materials at the nanoscale. The Molecular Modeling Center provides access to various software packages for the rheological and molecular modeling of polymers.

Courses

EMAC 125. Freshman Research on Polymers. 1 Unit.
Freshman research in polymer chemistry, engineering, and physics. Students will be placed in active research groups and will participate in real research projects under the supervision of graduate students and faculty mentors.

EMAC 270. Introduction to Polymer Science and Engineering. 3 Units.

EMAC 276. Polymer Properties and Design. 3 Units.
The course reviews chemical and physical structures of a wide range of applications for synthetic and natural polymers, and addresses “Which polymer do we choose for a specific application and why?” We examine the polymer properties, the way that these depend on the chemical and physical structures, and reviews how they are processed. We aim to understand the advantages and disadvantages of the different chemical options and why the actual polymers that are used commercially are the best available in terms of properties, processibility and cost. The requirements include two written assignments and one oral presentation. Prereq: ENGR 145 and EMAC 270.

EMAC 303. Structure of Biological Materials. 3 Units.
Structure of proteins, nucleic acids, connective tissue and bone, from molecular to microscopic levels. An introduction to bioengineering biological materials and biomimetic materials, and an understanding of how different instruments may be used for imaging, identification and characterization of biological materials. Recommended preparation: EMAC 270. Offered as: EBME 303 and EMAC 303. Prereq: EBME 201, EBME 202, and EBME 306.

EMAC 325. Undergraduate Research in Polymer Science. 1 - 3 Units.
Undergraduate laboratory research in polymer chemistry/physics/engineering. Students will undertake an independent research project, working under the mentoring of both a graduate student and a faculty member. A mid-term written progress report is required. A written report and oral presentation will be made at the end of the semester. Can be taken for 1-3 credits per semester, up to a total of 6 credit hours. Students are expected to spend approximately 5 hours/week in the laboratory per credit registered each semester. Recommended preparation: Sophomore/Junior standing and consent of instructor.

EMAC 351. Physical Chemistry for Engineering. 3 Units.
Principles of physical chemistry and their application to systems involving physical and chemical transformations. The nature of physical chemistry, properties of gases, overview of the laws of thermodynamics, thermochemistry, solutions, phases and chemical equilibrium, kinetics of chemical reaction, solutions of electrolytes and introduction to quantum mechanics, atomic structure and molecular statistics. Prereq: ENGR 145.

EMAC 352. Polymer Physics and Engineering. 3 Units.
Single chain statistics and thermodynamics of dilute polymer solutions (single chain statistics, Flory-Kringbaum theory, vapor pressure and osmotic pressure, light, small angle X-Ray, and small-angle neutron scattering), solid state properties of polymers (polymer viscoelasticity (time-temperature superposition; rubber thermodynamics and statistics), glasses and related mechanical properties (fracture mechanism), crystals and liquid crystals; structure property relationship, polymer blends, block copolymers and composites, transport phenomena (conversation of mass, momentum and energy, differential forms, integral forms, momentum transport, laminar and turbulent flow, Navier-Stokes equation, mass transport, diffusion, Fick’s law) and transport phenomena of polymer solutions (intrinsic viscosity, sedimentation and diffusion, dynamic light scattering, polyelectrolytes and block copolymers in solution, size exclusion chromatography). Prereq: EMAC 351

EMAC 353. Foundations of Scattering. 3 Units.
Introduction to the fundamentals of using scattering techniques to characterize the structure and dynamics of soft matter and its interfaces, with an emphasis on X-ray and neutron techniques. Topics covered include a mechanistic description of scattering processes, diffraction, small-angle scattering, reflectometry, and quasi-elastic scattering applied to polymers, proteins, gels/networks, nanoparticles, and other soft materials. Offered as EMAC 353 and EMAC 453. Prereq: EMAC 351 and EMAC 352.

EMAC 355. Polymer Analysis Laboratory. 3 Units.
Experimental techniques in polymer synthesis and characterization. Synthesis by a variety of polymerization mechanisms. Quantitative investigation of polymer structure by spectroscopy, diffraction and microscopy. Molecular weight determination. Physical properties. Prereq: EMAC 276 and (CHEM 290 or CHEM 322).

EMAC 370. Polymer Chemistry. 3 Units.
The fundamentals of organic chemistry of polymer synthesis, suitable for laboratory and industrial polymer production. Prereq: EMAC 270 and (CHEM 224 or CHEM 324).

EMAC 372. Polymer Processing and Testing Laboratory. 3 Units.
Basic techniques for the rheological characterization of thermoplastic and thermostrok resins; "hands-on" experience with the equipment used in polymer processing methods such as extrusion, injection molding, compression molding; techniques for mechanical characterization and basic principles of statistical quality control. Prereq: EMAC 377.
EMAC 375. Fundamentals of Non-Newtonian Fluid Mechanics and Polymer Rheology. 3 Units.
This course will involve the study of Rheology from the perspectives of rheological property measurement, phenomenological and molecular models, and applicability to polymer processing. In particular, students will be introduced to: 1) General concepts of Rheology and Newtonian Fluid Mechanics, 2) Standard flows and material functions; 3) The role of Rheology as a structural characterization tool, with an emphasis on polymeric systems; 4) Experimental methods in Rheology with quantitative descriptions of associated flows and data analyses; 5) Viscoelasticity and Non-Newtonian Fluid Mechanics, including the application of models, both phenomenological and molecular, to the prediction of rheological behavior and extraction of model parameters from real data sets; and 6) The relevance of rheological behavior of different systems to practical processing schemes, particularly with respect to plastics manufacturing. Offered as EMAC 375 and EMAC 475. Prereq: ENGR 225 or EMAC 404.

EMAC 376. Polymer Engineering. 3 Units.
Mechanical properties of polymer materials as related to polymer structure and composition. Viscoelastic behavior, yielding and fracture behavior including irreversible deformation processes. Recommended preparation: ENGR 200. Offered as EMAC 376 and EMAC 476. Prereq: EMAC 276.

EMAC 377. Polymer Processing. 3 Units.
Application of the principles of fluid mechanics, heat transfer and mass transfer to problems in polymer processing; elementary steps in polymer processing (handling of particulate solids, melting, pressurization and pumping, mixing); principles and procedures for extrusion, injection molding, reaction injection molding, secondary shaping. Prereq: EMAC 352 or ENGR 225.

EMAC 378. Polymer Engineer Design Product. 3 Units.
Uses material taught in previous and concurrent courses in an integrated fashion to solve polymer product design problems. Practicality, external requirements, economics, thermal/mechanical properties, processing and fabrication issues, decision making with uncertainty, and proposal and report preparation are all stressed. Several small exercises and one comprehensive process design project will be carried out by class members. Offered as EMAC 378 and EMAC 478. Counts as SAGES Senior Capstone.

EMAC 379. Advanced Polymer Engineering. 2 Units.
This Advanced Polymer Engineering course will focus on the ultimate engineering properties for polymers, including fracture mechanics, electrical, and optical properties of polymers. For polymer fracture mechanics, deformation and fracture behavior of polymers will be introduced. The electrical properties include both insulation and conduction/semiconduction properties for polymers. In the optical property section, we will introduce polymer photonics and polymers in liquid crystal displays. The goal of the course is to help students achieve fundamental understanding of advanced polymer properties. EMAC 479 students will do an additional project design. Offered as EMAC 379 and EMAC 479. Prereq: EMAC 376.

EMAC 396. Special Topics. 1 - 18 Units.
(Credit as arranged.)
EMAC 398. Polymer Science and Engineering Project I. 1 - 3 Units.
(Senior project). Research under the guidance of faculty. Requirements include periodic reporting of progress, plus a final oral presentation and written report. Repeatable up to 3 credit hours. When taken for 3 credits it may be spread over two successive semesters. Counts as SAGES Senior Capstone. Prereq: Senior Standing.

EMAC 399. Polymer Science and Engineering Project II. 1 - 9 Units.
(Senior project.) Research under the guidance of staff, culminating in thesis. Recommended preparation: Majors only and senior standing.

EMAC 400T. Graduate Teaching I. 0 Unit.
This course will engage the Ph.D. students in teaching experiences that will include non-contact (such as preparation and grading of homeworks and tests) and direct contact (leading recitations and monitoring laboratory works, lectures and office hours) activities. The teaching experience will be conducted under the supervision of the faculty. All Ph.D. students will be expected to perform direct contact teaching during the course sequence. The proposed teaching experiences for EMAC Ph.D. students are outlined below in association with undergraduate classes. The individual assignments will depend on the specialization of the students. The activities include grading, recitation, lab supervision and guest lecturing. Recommended preparation: Ph.D. student in Macromolecular Science.

EMAC 401. Polymer Foundation Course I: Organic Chemistry. 3 Units.
The class is an introduction to the synthesis and organic chemistry of macromolecules. The course introduces the most important polymerization reactions, focusing on their reaction mechanisms and kinetic aspects. Topics include free radical and ionic chain polymerization, condensation (step-growth) polymerization, ring-opening, insertion and controlled addition polymerization. There is no limit on the number of students for the class as a whole.

EMAC 402. Polymer Foundation Course II: Physical Chemistry. 3 Units.
This class is an introduction to the physical chemistry of polymers in solution. Topics include: polymer statistics: (microstructure, chain configuration, and chain dimensions), thermodynamics and transport properties of polymers in solution, methods for molecular weight determination, physical chemistry of water-soluble polymers, and characterization of polymer microstructure (IR and NMR). There is no limit on the number of students for the class as a whole.

EMAC 403. Polymer Foundation Course III: Physics. 3 Units.
This class is an introduction to the physics of polymers in the bulk amorphous and crystalline states. Topics include: structural and morphological analysis using X-ray diffraction, electron microscopy and atomic force microscopy, characterization of thermal transitions, viscoelastic behavior and rubber elasticity, and dynamic mechanical analysis. There is no limit on the number of students for the class as a whole.

EMAC 404. Polymer Foundation Course IV: Engineering. 3 Units.
This class is an introduction to the engineering and technology of polymeric materials. Topics include: additives, blends and composites, natural polymers and fibers, thermoplastics, elastomers, and thermosets, polymer degradation and stability, polymers in the environment, polymer rheology and polymer processing, and polymers for advanced technologies (membrane science, biomedical engineering, applications in electronics, photonic polymers). There is no limit on the number of students for the class as a whole.

EMAC 405. Polymer Characterization Laboratory. 3 Units.
Laboratory experience through synthesis and characterization of polymers. Synthesis via addition and condensation polymerization. Characterization methods include size exclusion chromatography, infrared and NMR spectroscopy. Solid samples are characterized by x-ray diffraction, electron microscopy, thermal analysis, and physical properties. Fluid samples are characterized by melt rheology. Prereq: EMAC 401, EMAC 402, EMAC 403 and EMAC 404.
EMAC 410. Polymers Plus Self - Assembly and Nanomaterials. 2 Units.
The course focuses on the concepts of supramolecular chemistry and self-assembly specifically as it applies to nano-polymeric systems. After dealing with many of the fundamental aspects of supramolecular chemistry the focus of the class deals with how to access/utilize nano-scale features using such processes, namely the 'bottom-up' approach to nanomaterials/systems. Areas which will be addressed include block copolymers, DNA assemblies, nanotubes and dendrimers. Prereq: EMAC 401 or EMAC 370.

EMAC 413. Polymers Plus Green Chemistry and Engineering. 2 Units.
This course focuses on green chemistry and engineering, particularly as it relates to polymers. Specific topics to be covered in this course will include green chemistry, catalysis, alternative solvents, green processing, renewable materials, and life cycle analysis. Case studies will be utilized to connect lecture topics to real-world examples. Prereq: EMAC 401 and EMAC 404.

EMAC 415. Polymers Plus Structure and Morphology. 2 Units.
This special topic focuses on polymer structure and morphology and their applications. Topics include solid-state physics of various polymeric materials, ranging from crystalline polymers to liquid crystalline polymers, and block copolymers. First, symmetry operation, space groups, reciprocal spaces are introduced. Examples of the crystalline structures of industrially important polymers and typical polymer crystalline morphology such as lamellar and spherulitic crystals are discussed. Defects in crystalline polymer is also an important issue that determines their physical properties. Second, typical phase structure and transitions of liquid crystals and liquid crystalline polymers are introduced, including both thermotropic and lyotropic liquid crystals. Finally, nanostructure and morphology of block copolymers are discussed. Prereq: EMAC 402 and EMAC 403.

EMAC 422. Polymers Plus Microscopy. 2 Units.
This course focuses on application of microscopy techniques to the analysis of the microstructure of polymeric materials. Specifically, atomic force microscopy, transmission and scanning electron microscopy, and optical microscopy will be discussed. Practical aspects of these techniques will be applied to a variety of systems, including block copolymers, nanocomposites, LC polymers, and multi-layered films. Prereq: EMAC 403.

EMAC 426. Biopolymers: Structure, Synthesis, and Application in Medicine. 2 Units.
An introduction to biomacromolecules including DNA, RNA, and proteins. The course will deal with the synthesis and manipulation of biological and synthetic macromolecules as it applies to topics in modern medicine. Topics covered will include nanoparticle gene and drug delivery systems, polymer hydrogels, polymer imaging agents, and protein-polymer conjugates. The purpose of this course is to provide a survey of important areas in medicine where a polymer chemist/engineer can intervene to make a meaningful contribution. Prereq: CHEM 323 and CHEM 324.

EMAC 436. Polymers in Advanced Packaging Systems. 2 Units.
This course serves as a graduate-level introduction to structure-property relationships for many important polymeric materials. Roughly one specific class of polymer will be studied in detail per week, with analysis and discussion that includes discovery history, physical structure (e.g., morphology) and processing, and how these relate to mechanical, thermal, optical, transport and other properties important in packaging. Examples of selected polymers include polyolefins, vinyl polymers, polyesters, ionomers, and bio-based plastics. A growing awareness of sustainability considerations for packaging will be addressed in the course. Prereq: EMAC 270 and EMAC 276 or Requisites Not Met permission.

EMAC 437. Advanced Polymeric Films. 2 Units.
This course is focused on processing structure and property relationships with particular emphasis on a variety of layered film systems. Two classes will be offered per week, emphasizing a large variety of layered film systems for advanced applications. These film systems exhibit unique properties that allow applications in 1) selective barrier films for food and packaging and flexible photovoltaic protection; 2) optical and photonic characteristics for security-enhanced devices and systems; 3) transport phenomena and separation processes for battery separators and particle separation; and, 4) multilayer films for enhancement of mechanical and adhesive properties. Prereq: EMAC 270 and EMAC 276 or Requisites Not Met permission.

EMAC 438. Packaging Design and Innovation. 3 Units.
The course aims to introduce an enterprise-wide understanding of challenges and opportunities for innovation in packaging design. Students will be introduced to the discipline of product design in the area of advanced packaging systems with an emphasis on needs-based innovation, sustainability, and value creation that leverages technical considerations from a deep understanding of polymer science and engineering. This will be accomplished through an intensive team-based design project selected from a list of topics proposed by industry with fast-feedback via value creation forums and culminating with a functional prototype. An industry representative will co-mentor each team. In addition to a weekly drive toward design and execution of a compelling design project, one class each week will emphasize an important theme that connects to the overall design philosophy. Topics include human factors, sustainability, and marketing among others. Prereq: EMAC 436.

EMAC 450. The Business of Polymers. 2 Units.
This course will link polymer technology to business and management issues that need to be considered for successful technology commercialization. Topics include project management, finance, opportunity assessment, the voice of the customer, and protection of intellectual property. Case studies from both large and small companies will be used to illustrate key concepts. Recommended preparation: EMAC 270, EMAC 276.

EMAC 453. Foundations of Scattering. 3 Units.
Introduction to the fundamentals of using scattering techniques to characterize the structure and dynamics of soft matter and its interfaces, with an emphasis on X-ray and neutron techniques. Topics covered include a mechanistic description of scattering processes, diffraction, small-angle scattering, reflectometry, and quasi-elastic scattering applied to polymers, proteins, gels/networks, nanoparticles, and other soft materials. Offered as EMAC 353 and EMAC 453. Prereq: EMAC 402 and EMAC 403.
EMAC 461. Chemistry of Fire Safe Polymers and Composites. 3 Units.
Chemistry of Fire Safe Polymers and Composites starts with the introduction of characterization techniques used for fire safe materials and combustion phenomena research. General discussion on how reduced flammability of polymers and composites are obtained, for example by additives and preparing intrinsically thermally stable chemical structure and some examples of smart approaches, will be discussed. It also discusses the synthetic methods of preparing high temperature stable polymers in addition to the raw materials used to prepare those materials. Special emphasis will be placed on the thermal stability data obtained by thermogravimetric analysis (TGA) and combustion calorimetry for those fire safe materials. Mechanistic aspects of the flammability of polymers will be explained with special emphasis on the molar contribution of chemical functionality to the heat release capacity. Theoretical derivation of thermokinetic parameters will be explained. In addition, a common sense build-up will be attempted by providing actual numbers associated with those thermokinetic parameters. Upon completion of background formation, a more advanced materials, composites and nanocomposites, will be discussed using the results recently reported. Preliminary attempts to explain flame retardation by nanocomposite structures will also be discussed. Offered as EMAC 461 and EMAE 461.

EMAC 463. Fire Dynamics. 3 Units.
This course introduces compartment fires and burning behavior of materials. Topics include: buoyant driven flow, fire plume, ceiling jet, vent flow, flashover and smoke movement as well as steady burning of liquids and solids; ignition, extinction and flame spread over solids. Recommended Preparation: Elementary knowledge in thermo-fluids is required. Offered as EMAE 463 and EMAC 463.

EMAC 464. Fire Protection Engineering. 3 Units.
This course introduces essentials of fire protection in industry and houses. Topics include: hazard identification (release of flammable gases and their dispersion), fire and explosion hazards, prevention and risk mitigation, fire detection systems, mechanisms of fire extinguishment, evaluation of fire extinguishing agents and systems. Offered as EMAC 464 and EMAE 464.

EMAC 471. Polymers in Medicine. 3 Units.
This course covers the important fundamentals and applications of polymers in medicine, and consists of three major components: (i) the blood and soft-tissue reactions to polymer implants; (ii) the structure, characterization and modification of biomedical polymers; and (iii) the application of polymers in a broad range of cardiovascular and extravascular devices. The chemical and physical characteristics of biomedical polymers and the properties required to meet the needs of the intended biological function will be presented. Clinical evaluation, including recent advances and current problems associated with different polymer implants. Recommended preparation: EBME 306 or equivalent. Offered as EBME 406 and EMAC 471.

EMAC 475. Fundamentals of Non-Newtonian Fluid Mechanics and Polymer Rheology. 3 Units.
This course will involve the study of Rheology from the perspectives of rheological property measurement, phenomenological and molecular models, and applicability to polymer processing. In particular, students will be introduced to: 1) General concepts of Rheology and Newtonian Fluid Mechanics, 2) Standard flows and material functions; 3) The role of Rheology as a structural characterization tool, with an emphasis on polymeric systems; 4) Experimental methods in Rheology with quantitative descriptions of associated flows and data analyses; 5) Viscoelasticity and Non-Newtonian Fluid Mechanics, including the application of models, both phenomenological and molecular, to the prediction of rheological behavior and extraction of model parameters from real data sets; and 6) The relevance of rheological behavior of different systems to practical processing schemes, particularly with respect to plastics manufacturing. Offered as EMAC 375 and EMAC 475. Prereq: ENGR 225 or EMAC 404.

EMAC 476. Polymer Engineering. 3 Units.
Mechanical properties of polymer materials as related to polymer structure and composition. Visco-elastic behavior, yielding and fracture behavior including irreversible deformation processes. Recommended preparation: ENGR 200. Offered as EMAC 376 and EMAC 476.

EMAC 477. Elementary Steps in Polymer Processing. 3 Units.
This course is an application of principles of fluid mechanics and heat transfer to problems in polymer processing. In the first part of the course, basic principles of transport phenomena will be reviewed. In the second part, the elementary steps in polymer processing will be described and analyzed with application to a single screw extruder.

EMAC 478. Polymer Engineer Design Product. 3 Units.
Uses material taught in previous and concurrent courses in an integrated fashion to solve polymer product design problems. Practicality, external requirements, economics, thermal/mechanical properties, processing and fabrication issues, decision making with uncertainty, and proposal and report preparation are all stressed. Several small exercises and one comprehensive process design project will be carried out by class members. Offered as EMAC 378 and EMAC 478. Counts as SAGES Senior Capstone.

EMAC 479. Advanced Polymer Engineering. 2 Units.
This Advanced Polymer Engineering course will focus on the ultimate engineering properties for polymers, including fracture mechanics, electrical, and optical properties of polymers. For polymer fracture mechanics, deformation and fracture behavior of polymers will be introduced. The electrical properties include both insulation and conduction/semiconduction properties for polymers. In the optical property section, we will introduce polymer photonics and polymers in liquid crystal displays. The goal of the course is to help students achieve fundamental understanding of advanced polymer properties. EMAC 479 students will do an additional project design. Offered as EMAC 379 and EMAC 479. Prereq: EMAC 404.

EMAC 491. Polymers Plus Literature Review. 1 Unit.
This course involves weekly presentations of the current polymer literature. It involves at least one presentation by the enrolled student and participation in all literature reviews (at least 10/semester). The course will focus on presentation skills (both oral and written), scientific interpretation, and development of peer-review skills. This course can be taken for a total of 3 credits over three different semesters.
EMAC 500T. Graduate Teaching II. 0 Unit.
This course will engage the Ph.D. students in teaching experiences that will include non-contact (such as preparation and grading of homework and tests) and direct contact (leading recitations and monitoring laboratory works, lectures and office hours) activities. The teaching experience will be conducted under the supervision of the faculty. All Ph.D. students will be expected to perform direct contact teaching during the course sequence. The proposed teaching experiences for EMAC Ph.D. students are outlined below in association with graduate classes. The individual assignments will depend on the specialization of the students. The activities include grading, recitation, lab supervision and guest lecturing. Recommended preparation: Ph.D. student in Macromolecular Science.

This course aims to provide a broad overview of the structure and function of cellular macromolecules, with the major focus being an exploration biological cells as soft materials. Special emphasis is given to connections between cell material properties and macromolecular assemblies (e.g., viscoelasticity and cytoskeletal networks) and roles in determining mechanical, physical, electrical and transport properties. Material properties of collections of cells, namely selected tissues and organs, will be also discussed with special attention to irritability and motion and the design of smart materials and artificial cells using fundamental concepts from macromolecular science and engineering.

EMAC 600T. Graduate Teaching III. 0 Unit.
This course will engage the Ph.D. students in teaching experiences that will include non-contact and direct contact activities. The teaching experience will be conducted under the supervision of the faculty. The proposed teaching experiences for EMAC Ph.D. student in this course involve instruction in the operation of major instrumentation and equipment used in the daily research activities. The individual assignments will depend on the specialization of the students. Recommended preparation: Ph.D. student in Macromolecular Science.

EMAC 601. Independent Study. 1 - 18 Units.
(Credit as arranged.)

EMAC 651. Thesis M.S.. 1 - 18 Units.
(Credit as arranged.)

EMAC 673. Selected Topics in Polymer Engineering. 2 - 3 Units.
Timely issues in polymer engineering are presented at the advanced graduate level. Content varies, but may include: mechanisms of irreversible deformation: failure, fatigue and fracture of polymers and their composites; processing structure-property relationships; and hierarchical design of polymeric systems. Recommended preparation: EMAC 376 or EMAC 476.

EMAC 677. Colloquium in Macromolecular Science and Engineering. 0 - 1 Units.
Lectures by invited speakers on subjects of current interest in polymer science and engineering. This course can be taken for 3 credits over three different semesters.

EMAC 690. Special Topics in Macromolecular Science. 1 - 18 Units.

EMAC 695. Project M.S.. 1 - 9 Units.
Research course taken by Plan B M.S. students. Prereq: Enrolled in the EMAC Plan B Program.

EMAC 701. Dissertation Ph.D.. 1 - 9 Units.
(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

Department of Materials Science and Engineering

White Building (7204)
http://engineering.case.edu/emse/
Phone: 216.368.4230
Department Chair: Frank Ernst
Frank.Ernst@case.edu

Materials science and engineering is a discipline that extends from understanding the microscopic structure and properties of materials to designing materials in engineering systems and evaluating their performance. Achievements in materials engineering underpin the revolutionary advances in technology that define the modern standard of living. Materials scientists and engineers understand how the properties of materials relate to their microscopic structure and composition and engineer the synthesis and microstructure of materials to advance their performance in conventional and innovative technical applications.

The Department of Materials Science and Engineering of the Case School of Engineering offers programs leading to the degrees of Bachelor of Science in Engineering, Master of Science, and Doctor of Philosophy. The technological challenges that materials engineers face demand knowledge across a broad spectrum of materials. The Department conducts academic and research activities with metals, ceramics, semiconductors, polymers, and composites. Timely research and education respond to the demands for new materials and improved materials performance in existing applications, often transcending the traditional materials categories.

While a discipline of engineering, the field brings basic science to bear on the technological challenges related to the performance of industrial products and their manufacture. Materials science draws on chemistry in its concern for bonding, synthesis, and composition of engineering materials and their chemical interactions with the environment. Physics provides a basis for understanding the atomistic and electronic structure of materials and how they determine mechanical, thermal, optical, magnetic, and electrical properties. Mathematics, computation, and data science provide quantitative physical theories and modeling of the atomistic and electronic structure and provide advances in methods for microstructural analysis, materials design, and manufacturing processes.

Mission
The Department of Materials Science and Engineering engages faculty, students, postdoctoral researchers, engineers, and staff in developing and understanding relationships between processing, structure, properties, and the performance of materials in engineering applications. The Department provides a research-intensive environment that encourages collaboration and underpins modern education of undergraduate and graduate students as well as professionals in the field. This environment provides a strong foundation for advancing the frontiers of materials research, developing important technical innovations, and preparing engineers and scientists for challenging leadership careers.

Research Areas
Deformation and Fracture
Stress–strain relations during elastic and anelastic deformation. Plastic deformation mechanisms controlled by dislocation activity, twinning, or transformation-induced shear mechanisms, as well as
Materials Processing
Phase-change processing and processing of alloys, including solution-, precipitation-, and stress-relief treatments, also for intentional generation of residual-stresses. Deformation processing of materials. Surface engineering, crystal growth, sputtering, vapor- and laser-ablation synthesis of films. Melting and casting of metal alloys into sand/ceramic molds, injection into metallic molds, and by rapid solidification to form crystalline or (metallic-) glass ribbons. Ceramic- and metal powder synthesis. Consolidation processing by cold-pressing and sintering, electric-field-assisted compaction, or hot-pressing. Composite Materials by forming of layered materials, electroplated metals, diffusion-bonding, brazing, and welding. Electrochemical- and thermo-chemical conversion processing, e.g. oxide-film growth by anodizing or thermochemical conversion. Synthesis of micro-to-nano-porous metal/oxide structures, e.g. for battery and capacitor electrodes or for catalyst support.

Environmental Effects

Surfaces and Interfaces
Material surfaces in vacuum, ambient-, and chemical environments, grain- and phase boundaries, hetero-interfaces (interfaces between different metals, ceramics, carbon/graphite, polymers, and combinations thereof).

Electronic, Magnetic, and Optical Materials
Materials for energy conversion technologies, such as photovoltaics, organic and inorganic light-emitting diodes and displays, fuel cells, electrolytic capacitors, solid-state Li-ion batteries, and building-envelope materials. Processing, properties, and characterization of magnetic, ferroelectric, and piezoelectric materials.

Microcharacterization of Materials
Facilities for high-resolution imaging, spatially resolved chemical analysis and spectrometry, and diffractometry. Conventional, analytical, and high-resolution transmission electron microscopy, scanning electron microscopy, focused ion beam techniques, scanning probe microscopy, light-optical microscopy, optical and electron spectroscopies, surface analysis, and X-ray diffractometry.

Materials Data Science
Rapid qualification of alloys, data science applications in polymers and coatings. Distributed computing, informatics, statistical analytics, exploratory data analysis, statistical modeling, and prediction. Hadoop, cloud computing, and computationally intensive research are supported through the operation of a scalable high-performance computing (HPC) system.

Faculty
Frank Ernst, Dr. rer. nat. habil.  
(University of Göttingen)

Leonard Case Jr. Professor of Engineering
Microstructure and microcharacterization, alloy surface engineering, defects in crystalline materials, interface- and stress-related phenomena.

William A. “Bud” Baeslack III, PhD  
(Rensselaer Polytechnic Institute)
Professor
Welding, joining of materials, and titanium and aluminum metallurgy.

Jennifer W. Carter, PhD  
(The Ohio State University)
Associate Professor
Processing–structure–property relationships of crystalline and amorphous materials. Multi-scale material characterization methods for correlating local microstructural features with mechanical and environmental responses.

Mark R. DeGuire, PhD  
(Massachusetts Institute of Technology)
Associate Professor

Roger H. French, PhD  
(Massachusetts Institute of Technology)
Kyocera Professor
Optical properties and electronic structure of polymers, ceramics, optical and biomolecular materials. These determine the vDW interactions which drive wetting of interfaces and mesoscale assembly biomolecular and inorganic systems including CNTs, proteins and DNA. Energy research focused on lifetime and degradation science. Including developing CRADLE, a Hadoop/Hbase/Spark-based distributed computing environment, for data science and analytics of complex systems such as photovoltaics and outdoor exposed materials. This allows multi-factor real-world performance to be integrated with lab-based datasets to identify mechanisms and pathways activated over lifetime using statistical and machine learning.

Peter Lagerlof, PhD  
(Case Western Reserve University)
Associate Professor
Mechanical properties of ceramics and metals. Low-temperature deformation twinning. Light-induced plasticity of semiconductors. Methodology of transmission electron microscopy and diffractometry.

John J. Lewandowski, PhD  
(Carnegie Mellon University)
Arthur P Armington Professor of Engineering
David H. Matthiesen, PhD  
(Massachusetts Institute of Technology)  
Associate Professor; Director, Wind Energy Research and Commercialization (WERC) Center  

James D. McGuffin-Cawley, PhD  
(Case Western Reserve University)  
Arthur S. Holden Professor of Engineering  

Alp Sehirlioglu, PhD  
(University of Illinois at Urbana Champaign)  
Assistant Professor  

Gerhard E. Welsch, PhD  
(Case Western Reserve University)  
Professor  

Matthew A. Willard, PhD  
(Carnegie Mellon University)  
Associate Professor  

Jennifer Braid, PhD  
(Colorado School of Mines)  
Research Assistant Professor  
Developing data science and computer vision techniques for PV module and system research.

Laura S. Bruckman, PhD  
(University of South Carolina)  
Research Associate Professor  
Electronic materials, lifetime and degradation science, data science.

Jeffrey Yarus, PhD  
(University of South Carolina)  
Research Professor  
Applications of data science and statistics in materials science, materials engineering, and geology.

Secondary Faculty

Clemens Burda, PhD  
Professor  
Chemistry

Sunniva Collins, PhD  
Associate Professor  
Mechanical Engineering

Liming Dai, PhD  
Kent Hale Smith Professor  
Macromolecular Science and Engineering

Walter Lambrecht, PhD  
Professor  
Physics

Clare Rimnac, PhD  
Professor  
Mechanical Engineering

Mohan Sankaran, PhD  
Goodrich Professor of Engineering Innovation  
Chemical Engineering

Russell Wang, DDS  
Associate Professor  
Dentistry

Xiong (Bill) Yu, PhD, PE  
Professor  
Civil Engineering

Adjunct Faculty

Amon Chait, PhD  
(The Ohio State University)  
Adjunct Professor  
NASA Lewis Research Center

George Fisher, PhD  
Adjunct Professor  
Ion Vacuum Technologies Corporation

Hoda Amani Hamedani, PhD  
(Georgia Institute of Technology)  
Adjunct Professor  
Case Western Reserve University

N.J. Henry Holroyd, PhD  
(Newcastle University)  
Adjunct Professor  
Luxfer Gas Cylinders

Jeffrey J. Hoyt, PhD  
(University of California, Berkeley)  
Adjunct Professor  
McMaster University

Jennie S. Hwang, PhD  
(Case Western Reserve University)  
Adjunct Professor  
H-Technologies Group
Undergraduate Programs

The curriculum leading to the Bachelor of Science in Engineering degree with a major in Materials Science and Engineering includes the “Engineering Core” – basic courses in mathematics, physics, chemistry, and engineering along with breadth electives – and the CWRU General Education requirements. To these are added courses in engineering materials, which also allow students to choose one of several areas of concentration within the major. A total of 129 credit hours (units) is required.

Throughout the undergraduate curriculum in Materials Science and Engineering, scientific fundamentals are integrated with coverage of current manufacturing, design, and applications of engineering materials.

The goal of the Department of Materials Science and Engineering is to prepare students for rewarding careers that provide creative, effective solutions to societal needs, through coursework and associated activities that emphasize:

- The interrelationships among the processing, structure, properties, and performance of engineering materials
- The mutual reinforcement of education and professional development throughout one’s career

The undergraduate experience in Materials Science and Engineering at Case Western Reserve is marked by a high degree of hands-on experience and many opportunities for professional development before graduation. Lab courses, senior projects, and plant tours ensure that every student sees the field first-hand in current research and industrial settings.

The Bachelor of Science in Engineering degree program with a major in Materials Science and Engineering is accredited by the Engineering Accreditation Commission of ABET, http://www.abet.org/.

Program Educational Objectives

1. Graduates will take an active part in professional organizations.
2. Graduates will assume leadership positions in materials science related industries.
3. Graduates will be effectively involved in solving technical problems.
4. Graduates may successfully enter and complete graduate and professional degree programs.

Student Outcomes

As preparation for achieving the above educational objectives, the Bachelor of Science in Engineering degree program with a major in Materials Science and Engineering is designed so that students attain:

- an ability to apply knowledge of mathematics, science, and engineering
- an ability to design and conduct experiments, as well as to analyze and interpret data
- an ability to design a system, component, or process to meet desired needs
- an ability to function in multi-disciplinary teams
- an ability to identify, formulate, and solve engineering problems
- an understanding of professional and ethical responsibility
- an ability to communicate effectively

Bachelor of Science in Engineering

Required Courses for Major in Materials Science and Engineering

Course numbers beginning on 1, 2, and 3 indicate undergraduate-level courses. Course numbers beginning on 4 indicate masters-level courses. In addition to Engineering Core (p. 1292) and CWRU General Education (p. 1212) requirements, the major requires the following courses.
### Concentrations

The undergraduate program includes courses that expose students to greater depth in areas related to materials science and engineering. These concentration sequences are of two types:

- Students may select an area of concentration that is based on an application or subfield of engineering materials. Each concentration will be a coherent set of courses that, in conjunction with one or more of the courses already required for all EMSE majors plus a specified mathematics/natural science/statistics course, will provide significant depth in an area of materials specialization.

- Students also have the option of designing a concentration — Advanced Materials Science and Engineering — in consultation with their advisors and subject to approval by the department’s Undergraduate Studies Committee.

The concentrations are below. All concentrations equal 12 units (four courses).

**Year Total:** 15 18
application for admission to the five year BS/MS program is made after completion of five semesters of course work. Minimum requirements are a 3.2 grade point average and the recommendation of a faculty member of the department. Interested students should contact Professor Peter Lagerlöf. Review the Office of Undergraduate Studies BS/MS program requirements here (p. 1298).

**Bachelor of Science in Data Science and Analytics**

A Bachelor of Science in Data Science and Analytics (p. 116) is administered in the Computer and Data Sciences Department.

**Minor in Applied Data Science**

In addition to the Bachelor of Science in Engineering degree program with a major in Materials Science and Engineering, the department also offers a minor in Materials Science and Engineering. This sequence is intended primarily for a student majoring in science or engineering, but it is open to any student with a sound background in introductory calculus, chemistry, and physics. This program requires the completion of EMSE 276 Materials Properties and Design and a minimum of 12 additional credit hours (units) of EMSE courses, including no more than 3 credit hours (units) of EMSE 125 Freshman Research in Materials Science and Engineering and EMSE 325 Undergraduate Research in Materials Science and Engineering, and no more than 6 credit hours (units) of one- or two-unit courses. Interested students please contact Prof Mark De Guire (mark.deguire@case.edu) (510 White, 216.368.4221).

**Minor in Materials Science and Engineering**

In addition to the Bachelor of Science in Engineering degree program with a major in Materials Science and Engineering, the department also offers a minor in Materials Science and Engineering. This sequence is intended primarily for a student majoring in science or engineering, but it is open to any student with a sound background in introductory calculus, chemistry, and physics. This program requires the completion of EMSE 276 Materials Properties and Design and a minimum of 12 additional credit hours (units) of EMSE courses, including no more than 3 credit hours (units) of EMSE 125 Freshman Research in Materials Science and Engineering and EMSE 325 Undergraduate Research in Materials Science and Engineering, and no more than 6 credit hours (units) of one- or two-unit courses. Interested students please contact Prof Mark De Guire (mark.deguire@case.edu) (510 White, 216.368.4221).

**Five-Year Combined BS/MS Program**

This program offers outstanding undergraduate students the opportunity to obtain an MS degree, with a thesis, in one additional year of study beyond the BS degree. (Normally, it takes two years beyond the BS to earn an MS degree.) In this program, an undergraduate student can take up to 9 credit hours (units) that simultaneously satisfy undergraduate and graduate requirements. Students considering the combined BS/MS Program should use the Advanced Materials Science and Engineering concentration, and should select their concentration in consultation with their departmental academic advisor. Typically, students in this program start their research leading to the MS thesis in the fall semester of the senior year. The BS degree is awarded at the completion of the senior year.

Application for admission to the five year BS/MS program is made after completion of five semesters of course work. Minimum requirements are a 3.2 grade point average and the recommendation of a faculty member of the department. Interested students should contact Professor Peter Lagerlöf. Review the Office of Undergraduate Studies BS/MS program requirements here (p. 1298).

**Bachelor of Science in Data Science and Analytics**

A Bachelor of Science in Data Science and Analytics (p. 116) is administered in the Computer and Data Sciences Department.

This program offers outstanding undergraduate students the opportunity to obtain an MS degree, with a thesis, in one additional year of study beyond the BS degree. (Normally, it takes two years beyond the BS to earn an MS degree.) In this program, an undergraduate student can take up to 9 credit hours (units) that simultaneously satisfy undergraduate and graduate requirements. Students considering the combined BS/MS Program should use the Advanced Materials Science and Engineering concentration, and should select their concentration in consultation with their departmental academic advisor. Typically, students in this program start their research leading to the MS thesis in the fall semester of the senior year. The BS degree is awarded at the completion of the senior year.

Application for admission to the five year BS/MS program is made after completion of five semesters of course work. Minimum requirements are a 3.2 grade point average and the recommendation of a faculty member of the department. Interested students should contact Professor Peter Lagerlöf. Review the Office of Undergraduate Studies BS/MS program requirements here (p. 1298).

**Bachelor of Science in Data Science and Analytics**

A Bachelor of Science in Data Science and Analytics (p. 116) is administered in the Computer and Data Sciences Department.

**Minor in Applied Data Science**

In addition to the Bachelor of Science in Engineering degree program with a major in Materials Science and Engineering, the department also offers a minor in Materials Science and Engineering. This sequence is intended primarily for a student majoring in science or engineering, but it is open to any student with a sound background in introductory calculus, chemistry, and physics. This program requires the completion of EMSE 276 Materials Properties and Design and a minimum of 12 additional credit hours (units) of EMSE courses, including no more than 3 credit hours (units) of EMSE 125 Freshman Research in Materials Science and Engineering and EMSE 325 Undergraduate Research in Materials Science and Engineering, and no more than 6 credit hours (units) of one- or two-unit courses. Interested students please contact Prof Mark De Guire (mark.deguire@case.edu) (510 White, 216.368.4221).

**Minor in Materials Science and Engineering**

In addition to the Bachelor of Science in Engineering degree program with a major in Materials Science and Engineering, the department also offers a minor in Materials Science and Engineering. This sequence is intended primarily for a student majoring in science or engineering, but it is open to any student with a sound background in introductory calculus, chemistry, and physics. This program requires the completion of EMSE 276 Materials Properties and Design and a minimum of 12 additional credit hours (units) of EMSE courses, including no more than 3 credit hours (units) of EMSE 125 Freshman Research in Materials Science and Engineering and EMSE 325 Undergraduate Research in Materials Science and Engineering, and no more than 6 credit hours (units) of one- or two-unit courses. Interested students please contact Prof Mark De Guire (mark.deguire@case.edu) (510 White, 216.368.4221).

**Five-Year Combined BS/MS Program**

This program offers outstanding undergraduate students the opportunity to obtain an MS degree, with a thesis, in one additional year of study beyond the BS degree. (Normally, it takes two years beyond the BS to earn an MS degree.) In this program, an undergraduate student can take up to 9 credit hours (units) that simultaneously satisfy undergraduate and graduate requirements. Students considering the combined BS/MS Program should use the Advanced Materials Science and Engineering concentration, and should select their concentration in consultation with their departmental academic advisor. Typically, students in this program start their research leading to the MS thesis in the fall semester of the senior year. The BS degree is awarded at the completion of the senior year.

**Minor in Materials Science and Engineering**

In addition to the Bachelor of Science in Engineering degree program with a major in Materials Science and Engineering, the department also offers a minor in Materials Science and Engineering. This sequence is intended primarily for a student majoring in science or engineering, but it is open to any student with a sound background in introductory calculus, chemistry, and physics. This program requires the completion of EMSE 276 Materials Properties and Design and a minimum of 12 additional credit hours (units) of EMSE courses, including no more than 3 credit hours (units) of EMSE 125 Freshman Research in Materials Science and Engineering and EMSE 325 Undergraduate Research in Materials Science and Engineering, and no more than 6 credit hours (units) of one- or two-unit courses. Interested students please contact Prof Mark De Guire (mark.deguire@case.edu) (510 White, 216.368.4221).
Elements of the Minor:

The undergraduate minor is structured so that the students who qualify for the minor have a working understanding of the basic ADS tools and their application in their domain area. This includes:

- Formulate Data Science analyses of real-world datasets, to answer critical questions in various domain and application areas;
- Data Management: datastores, sources, streams;
- High Performance and Distributed Computing: local computer, high performance computing clusters, distributed computing (such as Hadoop), or other cloud computing environments;
- Informatics, Ontology, Query: including search, data assembly, annotation;
- Statistical Analytics: tools such as R statistics and high-level scripting languages (such as Python3); and
- Machine Learning and Deep Learning: Machine learning approaches such as support vector machines, or neural networks, and deep learning frameworks such as Keras and TensorFlow2.

The data types found in these domains are diverse. They include time series and spectral data for Energy, Physics, Chemistry and Astronomy, and sensor and production data and image and volumetric data for Manufacturing. In Health, Translational ADS includes Genomic, Proteomic, and other Omics data, while Clinical ADS includes patient data, medical data, physiological time series, and mobile data. And in Social Sciences natural language datasets, both written and oral. Business data types include stock and other financial market data for Finance, time series and cross-section data for Economics, and operations and consumer behavior data for Marketing.

Students will develop comprehensive experience in the steps of data analysis.

- Define the Applied Data Science questions.
- Identify, locate, and/or generate the necessary data, including defining the ideal data set and variables of interest, determining and obtaining accessible data and cleaning the data in preparation for analysis.
- Exploratory data analysis to start identifying the significant characteristics of the data and information it contains.
- Statistical modeling, inference and prediction, including interpretation of results, challenging results, and developing insights and actions.
- Machine learning, deep learning and approaches to data visualization, images, natural language and artificial intelligence implementations.
- Synthesizing the results in the context of the domain and the initial questions, and writing this up.
- The creation of reproducible research, including code, datasets, documentation, and reports, which are easily transferable and verifiable.
- Communicating data science results in context, with consideration of privacy, openness, security, ethics, and value considerations.

The ADS minor curriculum

The undergraduate minor curriculum is based on five 3-credit courses, with one class chosen from each of Levels 1 through Level 5, which cover the spectrum of learning needed to achieve domain area expertise in data science and analytics. The courses are chosen to be both cross-cutting, i.e., intermixing students from across the university in the fundamental concepts such as scripting and statistics (Levels 1, 2, and 4), and domain-focused (Levels 3 and 5). For the Level 5 advanced topics course, the research topic will be either a semester research project approved by the minor advisor, and will also be a 3-credit project, or an advanced data science topic class. This will provide minor students both the domain focused learning they need, and a broadening perspective on applications, methods, and uses of ADS in other domains.

Courses Counted Toward Minor Requirements

Established courses included in the Minor are found in Case School of Engineering (Materials Science, Electrical Engineering and Computer Science, Manufacturing), College of Art & Science (Mathematics, Astronomy, Philosophy, Cognitive Science); School of Medicine, School of Nursing, and Weatherhead School of Management (Marketing, Finance, Operations, and Economics) and Mandel School for Social Sciences.

The courses that meet the requirements for the Minor can also be taken by students to meet requirements in Major programs, and therefore serve a dual purpose in our academic offerings. However, each program, department, and school may have its own criteria on whether a given course could be "double counted" towards major and minor requirements.

Level 5:
- DSCI 352/352M/452 Applied Data Science Research 3
- DSCI 354/354M/454 Data Visualization and Analytics 3
- DSCI 330 Cognition and Computation 3
- DSCI 332/432 Spatial Statistics for Near Surface, Surface, and Subsurface Modeling 3
- SYBB 387 Undergraduate Research in Systems Biology 1 - 3

Level 4:
- DSCI 353/353M/453 Data Science: Statistical Learning, Modeling and Prediction 3
- ASTR 306 Astronomical Techniques 3
- BAFI 361 Empirical Analysis in Finance 3
- MKMR 308 Measuring Marketing Performance 3
- MKMR 310 Marketing Analytics 3
- ECON 327 Advanced Econometrics 3
- SYBB 459 Bioinformatics for Systems Biology 3
- SYBB 421 Fundamentals of Clinical Information Systems 3
- SYBB 311A/311B/311C Survey of Bioinformatics: Technologies in Bioinformatics 1

Level 3:
- DSCI 351/351M/451 Exploratory Data Science 3
- SYBB 412 Survey of Bioinformatics: Programming for Bioinformatics 3

Level 2:
- STAT 312R Basic Statistics for Engineering and Science Using R Programming 3
The Applied Data Science Minor is based in the Case School of Engineering, and includes coursework from schools across the university.

**Graduate Programs**

The Department of Materials Science and Engineering offers programs leading to the degrees of MS (Master of Science) and PhD (Doctor of Philosophy). The (same) MS degree can be obtained by three different master’s programs, addressing specific needs of different groups of graduate students. Each master’s program prepares students for an advanced professional career by profoundly deepening their understanding and knowledge of materials science and engineering beyond the basics. The Doctor of Philosophy is one of the highest academic degrees conferred by Case Western Reserve University.

The underlying PhD program combines acquiring a great breadth of knowledge and understanding with building in-depth knowledge and skills in a chosen cutting-edge field of active materials research. Doctoral students develop skills to realize their own, original, curiosity-driven scientific research. As they research a specific topic in depth, doctoral students experience an intellectual transformation that enables them to succeed universally in challenging professional tasks, positioning them for the most ambitious leadership careers in academia, national laboratories, industrial research, etc.

**MS Degree Requirements**

The (same) degree of MS (Master of Science) in Materials Science and Engineering is awarded through one of the following three programs.

"**Research**" (Thesis-Focused) Master’s Track

This plan is appropriate for full-time graduate students. It requires a total of 30 credit hours (units). The coursework component comprises successful completion of 7 courses (21 credit hours/units). 1 course can be 300-level, all others must be 400- or higher level. Up to 2 courses can be from an engineering or science curriculum outside the department. The minimum cumulative GPA is 3.0. Students with lower standing will be placed on academic probation. Up to 6 hours of course credit can be transferred from graduate level courses (grade B or better) taken at another university in excess of their BS degree requirements. The thesis component consists of individual research (EMSE 651 Thesis M.S.), totaling no fewer than 9 credit hours (units), and a final oral defense. The examining committee includes 3 faculty members of the department. Additional committee members may be added at the discretion of the student in consultation with their advisor. A PPOS (planned program of study) must be submitted by the end of the second semester, prepared by the student the advisor and submitted online to the School of Graduate Studies.

"**Professional**" (Project-Focused) Master’s Track

This program suits part-time graduate students, e.g. while employed elsewhere as materials engineers. The coursework component comprises successful completion of 9 courses (27 credit hours/units). 1 course can be 300-level, all others must be 400- or higher level. Up to 2 courses can be from an engineering or science curriculum outside the department. The minimum cumulative GPA is 3.0. Students with lower standing will be placed on academic probation. Up to 6 hours of course credit can be transferred from graduate level courses (grade B or better) taken at another university in excess of their BS degree requirements. The program involves a project, typically 3 credit hours/units (EMSE 649 Special Projects) and completed in a single semester, and a final comprehensive oral exam. The examining committee consists of three faculty members of the department. Additional committee members may be added at the discretion of the student in consultation with their advisor. An Academic Program must be submitted by the end of the second semester, prepared by the student the advisor and submitted online to the School of Graduate Studies.

"**Accelerated**" (Course-Focused) Master’s Track

Materials science and engineering is a discipline that extends from the basic science of materials micro-structure and properties to the design and evaluation of materials in engineering systems. Data science and analytics seeks to identify statistically significant relationships, model development, and predictive behavior of large data sets generated by e.g. manufacturing technologies. The Accelerated Master’s Track is a course-work-only program that extends classical education in materials science and engineering with data science and analytics. It can be completed in just one calendar year!

The suggested program of study includes 10 courses, taken over the fall-, spring-, and summer semester of one academic year.

- Fall Semester: DSCI 451 Exploratory Data Science, EMSE 504 Thermodynamics of Solids, EMSE 503 Structure of Materials, EMSE 413 Fundamentals of Materials Engineering and Science, and EMSE 599 Critical Review of Materials Science and Engineering Colloquium for either 1 or 2 credit hours.
- Fall Semester: EMSE 505 Phase Transformations, Kinetics, and Microstructure, EMSE 414 Electrical, Magnetic, Optical, and Thermal Properties of Materials, one EMSE-400-level elective course, DSCI 453 Data Science: Statistical Learning, Modeling and Prediction, and EMSE 599 Critical Review of Materials Science and Engineering Colloquium for either 1 or 2 credit hours (units), adding up to a total of 3 credit hours (units) of EMSE 599 Critical Review of Materials Science and Engineering Colloquium.
- Summer Semester: DSCI 452 Applied Data Science Research, EMSE 515 Analytical Methods in Materials Science and the following optional courses of DSCI 432 Spatial Statistics for Near Surface, Surface, and Subsurface Modeling, DSCI 452 Applied Data Science Research, DSCI 454 Data Visualization and Analytics.

The 3 credit hours (units) of EMSE-599 can be replaced by an additional course of 3 credit hours (units), e.g. EMSE 468 Scientific Writing in Materials Science and Engineering.

**PhD Degree Requirements**

**Overview**

Candidates for a PhD degree in Materials Science and Engineering perform coursework and research that leads to a dissertation. The coursework must include the Materials Science and Engineering Core and fulfill a Breadth Requirement and a Basic Science Requirement. In

**Entering the Program**

Immediately upon entering the department, the PhD candidate normally will:

- Fill out and submit the first part of the Academic Program and the Supplementary Form.
- Register for 2 courses during the first semester and EMSE-499, "Materials Engineering Colloquium;"
- Register for EMSE-701 Dissertation PhD (usually 3 credit hours/units) during the first semester. Note that registration for EMSE-701 is not permitted before the Academic Program form is turned in.

As specified in the University General Bulletin section of the School of Graduate Studies (http://bulletin.case.edu/schools/graduateschools/academicrequirements/): "In order to meet the requirements for the doctorate, a student must pass satisfactorily a general examination (or a series of examinations covering different fields) specified and administered by the student's department or supervising committee."

**PhD Program of Study – Course and GPA Requirements**

The student's Academic Program is a list of the courses the student will take to fulfill the PhD requirements, will be discussed and updated as needed at the time of the Thesis Proposal Evaluation.

A PhD student must take a minimum of 18 credit hours (units) of EMSE 701 Dissertation Ph.D. and must continue registration each subsequent regular semester (Fall and Spring) until the dissertation is complete, unless granted a leave of absence.

The time limit for the PhD program is 5 years for full-time students, starting with the first semester of EMSE 701 Dissertation Ph.D. registration.

The minimum course requirement is 12 courses (36 credit hours/units) beyond the BS level, of which at least 6 courses (18 credit hours/units) must be taken at Case Western Reserve University. Of these 12 courses, 4 courses must satisfy the Breadth Requirement and 2 courses must satisfy the Basic Science Requirement for the department as outlined below.

In the case of a student entering with an MS degree from another discipline, additional courses may be required at the discretion of the student's academic advisor.

Graduation requires a GPA of at least 3.0. Students with a cumulative GPA below 3.0 will be placed on academic probation.

A required part of the PPOS for all PhD students in the Materials Science and Engineering Core. It consists of the following sequence of courses:

- EMSE 503 Structure of Materials
- EMSE 504 Thermodynamics of Solids
- EMSE 505 Phase Transformations, Kinetics, and Microstructure

Transfer credit for comparable graduate courses taken at another institution will be allowed on a case-by-case basis. Students may find it helpful to complete the Materials Science and Engineering Core sequence prior to taking the PhD comprehensive exam.

**Breadth Requirement**

The Breadth Requirement can be fulfilled by taking a total of 4 courses (12 credit hours/units) within the Case School of Engineering (including Materials Science and Engineering), selected in consultation with the student's advisor.

**Basic-Science Requirement**

The Basic-Science Requirement consists of taking 2 corresponding courses (6 credit hours/units). These can be courses at the 400 or 500 level with course designation PHYS, CHEM, BIOL, MATH, STAT, or DSCI and/or certain engineering curricula approved by the Graduate Studies Committee of the Department of Materials Science and Engineering. Engineering courses used to meet this requirement must be approved prior to enrolling in the course. The deadline is the conclusion of add/drop in any given semester. Students making such a request are required to submit a petition to the Graduate Studies Committee that justifies the role of the stipulated course as basic (rather than applied) science. Such petitions are expected to be brief. Courses that are not approved as meeting the Basic-Science Requirement may still be applicable to the Breadth Requirement.

**Advanced Standing**

Students entering the PhD program with an MS degree in a materials-related field are considered to be in advanced standing. For these students, the minimum course requirement is 6 courses (18 credit hours/units). The Breadth Requirement and the Basic-Science Requirement may require taking further courses.

**Exams**

**Comprehensive Exam**

The Comprehensive Exam of the PhD program consists of two parts:

1. The "General Exam," also known as "PhD-Qualifying Exam," a written general exam.
2. The "PhD Proposal Evaluation" includes a written thesis proposal, an oral presentation, and an examination by the thesis committee that may address the thesis proposal, the presentation, and general knowledge.

The General Exam (PhD-Qualifying Exam) has multi-part questions that cover the following four areas:

- EMSE 503 Structure of Materials.
- EMSE 504 Thermodynamics of Solids
- EMSE 505 Phase Transformations, Kinetics, and Microstructure
- A Synthesis Area, which combines concepts from the first three areas as they apply to performance of materials.

Students who achieve a score of 70% or above on three of the completed questions and an overall average of 75% or above will pass outright. Students who do not achieve this on their first attempt of the written exam will have one more opportunity to take the General Exam the next time the department offers it.

To register for taking the General Exam, students need a cumulative GPA of 3.0 or higher for courses taken at Case Western Reserve University is required. The exam will be offered once per year, typically in June. The time limits within which students must take the General Exam are as follows:

- Full-time students entering with an MS degree: within one year.
- Full-time students entering with a BS degree: within two years of entering the PhD program.
Dissertation Advisory Committee
After passing the General Exam and before the Thesis Proposal Evaluation, the student needs to establish a Dissertation Advisory Committee. It must consist of at least three faculty members from the department and one non-departmental member. The committee members should be chosen in consultation with the advisor.

Thesis Proposal Evaluation
The Thesis Proposal Evaluation must occur in the semester immediately following the successful completion of the General Exam (unless a petition, supported by the research advisor, is approved by the Graduate Studies Committee of the Department of Materials Science and Engineering). The Thesis Proposal Evaluation tests the more specific knowledge of the PhD candidate concerning the science underlying the proposed research and the candidate's intellectual maturity. It includes a written document in which the candidate proposes a doctoral research project, an oral presentation on this project, and an examination by the thesis committee addressing the written document, the presentation, general knowledge of materials science and engineering, and special knowledge the candidate acquired e.g. in advanced courses taken in support of their research program. The written document and the oral presentation should include an analysis of a research problem, the results of a corresponding literature search, suggested research procedures, and major results and scientific advances to be expected. The written document must be submitted to the student’s Dissertation Advisory Committee for examination at least one week prior to the oral evaluation. The written document as well as the presentation and committee examination of the Thesis Proposal Evaluation will be graded P/N (pass/no pass).

PhD Candidacy
Upon passing both the Comprehensive Exam and the Thesis Proposal Evaluation, a student will advance to PhD Candidacy.

Dissertation and Defense
Upon successful completion of all requirements, a PhD candidate must submit a written dissertation as evidence for their ability to conduct original scientific research. No later than 10 days before the defense, the candidate must provide a copy of the completed dissertation to each member of the Dissertation Advisory Committee. The defense consists of a (public) presentation and a (non-public) oral exam by the members of the student’s Dissertation Advisory Committee.

Facilities
Advanced Manufacturing and Mechanical Reliability Center (AMMRC)

Contact: John Lewandowski
216-368-4234
john.lewandowski@case.edu

The AMMRC (Advanced Manufacturing and Mechanical Reliability Center) permits the determination of mechanical behavior of materials over loading rates ranging from static to impact, with the capability of testing under a variety of stress states under either monotonic or cyclic conditions. A variety of furnaces and environmental chambers are available to enable testing at temperatures ranging from -196 °C to 1800 °C. The facility is operated under the direction of a faculty member and under the guidance of a full-time engineer. The facility contains one of the few laboratories in the world for high-pressure deformation and processing, enabling experimentation under a variety of stress states and temperatures. This state-of-the-art facility includes the following equipment:

- **High-Pressure Deformation Apparatus** These units enable tension or compression testing to be conducted under conditions of high hydrostatic pressure. Each apparatus consists of a pressure vessel and diagnostics for measurement of load and strain on deforming specimens, as well as instantaneous pressure in the vessel. Pressures up to 1.0 GPa loads up to 10 kN, and displacements of up to 25 mm are possible. The oil based apparatus is operated at temperatures up to 300 °C room temperature while a gas (i.e. Ar) based apparatus is used at room temperature.
- **Hydrostatic-Extrusion Apparatus** Hydrostatic extrusion (e.g. pressure-to-air, pressure-to-pressure) can be conducted at temperatures up to 300 °C on manually operated equipment interfaced with a computer data acquisition package. Pressures up to 2.0 GPa are possible, with reduction ratios up to 6 to 1, while various diagnostics provide real time monitoring of extrusion pressure and ram displacement.
- **Advanced Forging-Simulation Rig** A multi-actuator MTS machine based on 1.5 MN, four post frame, enables sub-scale forging simulations over industrially relevant strain rates. A 490 kN forging actuator is powered by five nitrogen accumulators enabling loading rates up to 3.0 m/s on large specimens. A 980 kN indexing actuator provides precise deformation sequences for either single, or multiple, deformation sequences. Date acquisition at rates sufficient for analysis is available. Testing with heated dies is possible.
- **Advanced Metal-Forming Rig** A four-post frame with separate control of punch actuator speed and blank hold down pressure enables determination of forming limit diagrams. Dynamic control of blank hold down pressure is possible, with maximum punch actuator speeds of 30.0 cm/s. A variety of die sets are available.
- **Servo-hydraulic Machines** Four MTS Model 810 computer-controlled machines with load capacities of 13 kN, 90 kN, 220 kN, and 220 kN, permit tension, compression, and fatigue studies to be conducted under load-, strain-, or stroke control. Fatigue crack growth may be monitored via a DC potential drop technique as well as via KRAK gages applied to the specimen surfaces. Fatigue studies may be conducted at frequencies up to 30 Hz. In addition, an Instron Model 1331 90 kN Servo-hydraulic machine are available for both quasi-state and cyclic testing.

- **Universal Testing Machines** Three INSTRON screw-driven machines, including two INSTRON Model 1125 units permit tension, compression, and torsion testing.
- **Electromechanical Testing Machine** A computer-controlled INSTRON Model 1361 can be operated under load-, strain-, or stroke control. Stroke rates as slow as 0.3 nm/s are possible.
- **Fatigue Testing Machines** Three Sonntag fatigue machines and two R. R. Moore rotating-bending fatigue machines are available for producing fatigue-life (S–N) data. The Sonntag machines may be operated at frequencies up to 60 Hz.
• Creep Testing Machines Three constant load frames with temperature capabilities up to 800 °C permit creep testing, while recently modified creep frames permit thermal cycling experiments as well as slow cyclic creep experiments.

• Impact Testing Machines Two Charpy impact machines with capacities ranging from 20 ft-lbs to 240 ft-lbs are available. Accessories include a Dynatup instrumentation package interfaced with an IBM PC, which enables recording of load vs. time traces on bend specimens as well as on tension specimens tested under impact conditions.

• Instrumented Microhardness Tester A Nikon Model QM High-Temperature Microhardness Tester permits indentation studies on specimens tested at temperatures ranging from -196 °C to 1600 °C under vacuum and inert gas atmospheres. This unit is complemented by a Zwick Model 3212 Microhardness Tester as well as a variety of Rockwell Hardness and Brinell Hardness Testing Machines.

Swagelok Center for Surface Analysis of Materials
Glennan Building 101

Contact: Jennifer Carter, 216-368-4214, jwc137@case.edu
Jeffrey Pigott, 216-368-6012, jxp652@case.edu

Website: https://engineering.case.edu/centers/scsam/

SCSAM, the Swagelok Center for Surface Analysis of Materials, is a multi-user facility providing cutting-edge major instrumentation for microcharacterization of materials. SCSAM is administered by the CSE (Case School of Engineering) and is central to much of the research carried out by CSE’s seven departments. The facility is also extensively used by the CAS (College of Arts and Sciences) Departments of Physics, Chemistry, Biology, and Earth, Environmental, and Planetary Sciences, as well as many departments within the School of Medicine and the School of Dental Medicine. Typically, more than 200 users, mostly academic, utilize the facility per year.

SCSAM’s instruments encompass a wide and complementary range of characterization techniques, which provide a comprehensive resource for high-resolution imaging, diffractometry, and spatially-resolved compositional analysis.

Current capabilities for high-resolution imaging include: an AFM (atomic force microscope) which can optionally be operated with an imaging nanoindenter scan head or a stand-alone automated nanoindenter; a Keyence optical microscope providing the next-generation of optical microscopy with a large depth-of-field and advanced measurement capabilities for inspection and failure analysis.; two scanning electron microscopes, one equipped for FIB (focused ion beam) micromachining, and both equipped with XEDS (X-ray energy-dispersive spectrometry), TSEM (transmission scanning electron microscopy), and EBSD (electron backscatter diffraction) detectors.

For XRD (X-ray diffractometry), SCSAM provides two diffractometers with 1D and 2D detectors to allow for phase identification, phase fraction determination, crystal structure refinements, as well as stress and strain measurements of crystalline solids.

SCSAM’s surface analysis suite of instruments includes an instrument for ToF-SIMS (time-of-flight secondary-ion mass spectrometry), a SAM (scanning Auger microscope) for spatially resolved AES (Auger electron spectroscopy), and an instrument for XPS (X-ray photoelectron spectroscopy, also known as ESCA, electron spectrometry for chemical analysis), that accomplishes high spatial resolution by operating with a focused X-ray beam.

SCSAM’s instruments are housed in a centralized area allowing users convenient access to state-of-the-art tools for their research. For more information, please visit the center’s website (https://engineering.case.edu/centers/scsam/).

Electronic Properties Laboratories

Magnetometry Laboratory
Contact: Matthew Willard
216-368-5070
mark.deguire@case.edu

The Magnetometry Laboratory has facilities used to investigate the magnetic properties of materials. This laboratory has the following instruments:

• Lake Shore Cryotronics Model 7410 Vibrating Sample Magnetometer This instrument serves for measurement of hysteresis loops (at constant temperature) and thermomagnetic measurements (at constant magnetic field). The maximum applied field at room temperature (without furnace in place) is 3.1 T. For high temperature measurements, the maximum applied field is 2.5 T over the temperature range from room temperature to 1000 °C.

• Home-Built Magnetostriction Measurement System This system has been designed and built to measure the shape change of magnetic materials under applied magnetic fields. Better than 1 ppm sensitivity is possible by this strain gauge technique. An applied field of ≈0.2 T is used to saturate samples.

Fuel Cell Testing Laboratory
AW Smith Building 27

Contact: Mark De Guire
216-368-4221
mark.deguire@case.edu

Facilities (located in the AW Smith Building) for testing of solid-oxide fuel cells include:

• Furnaces Dedicated furnaces and ovens for preparing cells for testing.

• Test Stands for 4” Cells 2 test stands for 4” cells and small stacks (Fuel Cell Technologies). Test temperatures to 1000°C. Professional turnkey LabView interface for system control and data acquisition.

• Test Stands for 1” Cells 2 test stands for 1” cells. Test temperatures to 1000°C. LabView interface for complete system control and data acquisition. Omega mass-flow controllers. Keithley and Amrel electronics. AutoLab Electrochemical Analyzer for I–V, galvanostatic, or amperometric testing and AC impedance spectroscopy.

All test stands are contained in dedicated enclosures rated for use with hydrogen, hydrogen sulfide, and carbon monoxide with ventilation system, leak detection, tank pressure monitors, alarm system.

SDLE Research Center
White Building 538
A data science approach is needed to handle large-scale data on materials, components, systems, modules, commercial power plants, and the grid. These approaches involve data ingestion into nonrelational data warehouses and data-driven modeling with a foundation in the underlying physics and chemistry of degradation and lifetime performance. Assembling FAIR (Findable, Accessible, Interoperable, Reusable) data and other data, developing and sharing codes and tools, and reporting research results along a materials value chain is a key component of the Center. The SDLE Research Center facilitates complex data-driven modeling, including geostatistical, geospatiotemporal modeling, graph network modeling, and degradation network models. The data analytics platform (CRADLE), an integrated distributed and high performance computing cluster, was developed in the center to facilitate large data storage and analysis with ease of access to team members enabling fleets of high performance computing jobs for improved data analytics.

The SDLE Center has developed a method to enable large-scale distributed analysis of commercial fleet scale photovoltaic (PV) power plants for both performance loss rate (PLR) determination and power forecasting. This study includes a set of 4,000 PV plant inverters and determines the data quality of these plants in relation to prediction of PLR. Additionally, a multi-year benchmarking and review of the impact of data quality and filtering, power prediction algorithms, and PLR determination methods has define the challenges in PLR determination. The data quality, data gaps, and filtering of timeseries data of commercial fleets of PV plants restrict which algorithms analyses can use and can bias results and reduces their accuracy. Data quality and data gaps can be improved with spatio-temporal graph neural network (st-GNN) models of PV power plant data including satellite weather data and autoencoders for data imputation of missing data. FAIR data principles are used to make FAIR data and models in order to improve transferability of data and models.

The SDLE Center has a focus on materials data science in relation to long-lived materials. This work determines the degradation mechanisms in material systems, which can be mitigated to optimize lifetime performance of materials, components, and devices. Understanding these key degradation mechanisms in relation to the stress and stress level is fundamental to lifetime and degradation science (L&DS). By encompassing the knowledge from the experimental insights of the degradation of materials, the lifetime of materials can be predicted under multiple different stress conditions. Thus far traditional materials reliability has been flawed with costly failures in applications such as polyamide backsheet failure in photovoltaic (PV) modules. The Center has developed an epidemiological approach to understanding materials degradation which provides more scientific value by giving information on the standard deviation within a population. Additionally, by combining standard and modified accelerated exposures with real-world exposures, degradation can be more accurately predicted on a variety of different grades of materials or component structure. Then data-driven or network modeling provides insights into the impact of stress conditions on degradation and performance. Real-world degradation gives the information on the complex and synergistic nature of materials degradation compared to single or even combinational accelerated stressors. The unique environment that a material exists in the real world or in-use conditions is varied due to specific microstressors as well as the impact of climate change on climate zones.

Geostatistical geospatiotemporal modeling is an active area of research within SDLE which is a quantitative method for mapping phenomena that are inherently tied to geographic and/or temporal space. The method provides for estimating at unsampled locations and for simulating multiple equally probable realizations to assess the space of uncertainty in the subsurface, surface, or near surface environment. Applications include environmental, mineral resources, geothermal, hydrology, agriculture, climate, forestry, soil, air, and more.

The SDLE Research Center's Core Facility has capabilities and equipment including:

- Outdoor solar exposures: SunFarm with 14 dual-axis solar trackers with multi-sun concentrators, and power degradation monitoring
- Solar simulators for 1-1000X solar exposures
- Multi-factor environmental test chambers with temperature, humidity, freeze/thaw, and cycling
- A full suite of optical, interfacial, thermo-mechanical, and electrical evaluation tools for materials, components, and systems
- CRADLE: two nonrelational data warehouses based on Cloudera's distribution of Apache's Hadoop, Hbase, and Spark
- High Performance Compute Cluster for data analytics

Courses

EMSE Courses

EMSE 102. Materials for Current and Future Technologies. 1 Unit.
Open to all students discussing the importance of materials on current and future technologies. The course will be a series of seminars by the faculty at the Department of Materials Science and Engineering covering important topics such as materials processing, use of materials in a variety of technologically important areas; e.g., construction, energy related technologies, biomedical applications and space applications.

EMSE 110. Transitioning Ideas to Reality I - Materials in Service of Industry and Society. 1 Unit.
In order for ideas to impact the lives of individuals and society they must be moved from "blue sky" to that which is manufacturable. Therein lies true creativity - design under constraint. Greater Cleveland is fortunate to have a diverse set of industries that serve medical, aerospace, electric, and advanced-materials technologies. This course involves trips to an array of work sites of leading companies to witness first-hand the processes and products, and to interact directly with practitioners. Occasional in-class speakers with demonstrations will be used when it is not logistically reasonable to visit off-site.
EMSE 120. Transitioning Ideas to Reality II - Manufacturing Laboratory. 2 Units.
This course complements EMSE 110. In that class students witness a diverse array of processing on-site in industry. In this class students work in teams and as individuals within processing laboratories working with an array of "real materials" to explore the potential of casting, machining, and deformation processes to produce real parts and/or components. An introduction to CAD as a means of communication is provided. The bulk of the term is spent in labs doing hands-on work. Planned work is carried out to demonstrate techniques and potential. Students have the opportunity to work independently or in teams to produce articles as varied as jewelry, electronics, transportation vehicles, or novel components or devices of the students' choosing.

EMSE 125. Freshman Research in Materials Science and Engineering. 1 Unit.
Freshman students conduct independent research in the area of material science and engineering, working closely with graduate student(s) and/or postdoctoral fellow(s), and supervised by an EMSE faculty member. An average of 5-6 hr/wk in the laboratory, periodic updates, and an end of semester report is required. Prereq: Limited to freshman, with permission of instructor.

EMSE 220. Materials Laboratory I. 2 Units.

EMSE 228. Mathematical and Computational Methods for Materials Science and Engineering. 3 Units.
The course combines fundamental topics of material science and engineering with underlying mathematical methods and coding for computation. Focusing on the mathematics of vectors and using Mathematica as computational framework, the course teaches how to solve problems drawn from crystallography, diffraction, imaging of materials, and image processing. Students will develop a fundamental understanding of the basis for solving these problems including understanding the constituent equations, solution methods, and analysis and presentation of results. Prereq: (ENGR 131 or EECS 132) and ENGR 145

EMSE 276. Materials Properties and Design. 3 Units.
Relation of crystal structure, microstructure, and chemical composition to the properties of materials. The role materials processing has in controlling structure so as to obtain desired properties, using examples from metals, semiconductors, ceramics, and composites. Design content includes exercises in materials selection, and in design of materials to meet specified performance requirements. Prereq: MATH 121 and ENGR 145. Prereq or Coreq: PHYS 122 or PHYS 124.

EMSE 308. Welding Metallurgy. 3 Units.
Introduction to arc welding and metallurgy of welding. The course provides a broad overview of different industrial applications requiring welding, the variables controlling critical property requirements of the weld and a survey of the different types of arc welding processes. The course details the fundamental concepts that govern the different aspects of arc welding including the welding arc, weld pool solidification, precipitate formation and solid state phase transformations. Offered as EMSE 308 and EMSE 408. Coreq: EMSE 327.

EMSE 319. Processing and Manufacturing of Materials. 3 Units.
Introduction to processing technologies by which materials are manufactured into engineering components. Discussion of how processing methods are dependent on desired composition, structure, microstructure, and defects, and how processing affects material performance. Emphasis will be placed on processes and treatments to achieve or improve chemical, mechanical, physical performance and/or aesthetics, including: casting, welding, forging, cold-forming, powder processing of metals and ceramics, and polymer and composite processing. Coverage of statistics and computational tools relevant to materials manufacturing. Prereq: EMSE 276.

EMSE 320. Materials Laboratory II. 1 Unit.
Measurement of thermophysical properties of materials emphasizing thermal and electrical properties of materials. Laboratory teams are selected for all experiments. Statistical analysis of experimental results also emphasized. Recommended preparation or corequisite: EMSE 276.

EMSE 325. Undergraduate Research in Materials Science and Engineering. 1 - 3 Units.
Undergraduate laboratory research in materials science and engineering. Students will undertake an independent research project alongside graduate student(s) and/or postdoctoral fellow(s), and will be supervised by an EMSE faculty member. Written and oral reports will be given on a regular basis, and an end of semester report is required. The course can be repeated up to four (4) times for a total of six (6) credit hours. Prereq: Sophomore or Junior standing and consent of instructor.

EMSE 327. Thermodynamic Stability and Rate Processes. 3 Units.
An introduction to thermodynamics of materials as applied to metals, ceramics, polymers and optical/radiant heat transfer for photovoltaics. The laws of thermodynamics are introduced and the general approaches used in the thermodynamic method are presented. Systems studied span phase stability and oxidation in metals and oxides; nitride ceramics and semiconductors; polymerization, crystallization and block copolymer domain formation; and the thermodynamics of systems such as for solar power collection and conversion. Recommended preparation: EMSE 228 and ENGR 225 or equivalent. Prereq: EMSE 276 or EMSE 201.

EMSE 328. Mesoscale Structural Control of Functional Materials. 3 Units.
The course focuses on mesoscale structure of materials and their interrelated effects on properties, mostly in electrical in nature. The mesoscale science covers the structures varying from electronic- to micro-structure. In each scale, fundamental science will be complimented by examples of applications and how the structure is exploited both to modify and enable function. The student will develop an understanding of how the structure across multiple scales are interrelated and how to tailor them for desired outcomes. Offered as: EMSE 328 and EMSE 428. Prereq: (MATH 223 or MATH 227) and (EMSE 276 or EMSE 201).

EMSE 330. Materials Laboratory III. 2 Units.
EMSE 335. Strategic Metals and Materials for the 21st Century. 3 Units.
This course seeks to create an understanding of the role of mineral-based materials in the modern economy focusing on how such knowledge can and should be used in making strategic choices in an engineering context. The history of the role of materials in emerging technologies from a historical perspective will be briefly explored. The current literature will be used to demonstrate the connectedness of materials availability and the development and sustainability of engineering advances with examples of applications exploiting structural, electronic, optical, magnetic, and energy conversion properties. Processing will be comprehensively reviewed from source through refinement through processing including property development through application of an illustrative set of engineering materials representing commodities, less common metals, and minor metals. The concept of strategic recycling, including design for recycling and waste stream management will be considered. Offered as EMSE 335 and EMSE 435. Prereq: Senior standing or graduate student.

EMSE 343. Processing of Electronic Materials. 3 Units.
The class will focus on the processing of materials for electronic applications. Necessary background into the fundamentals and applications will be given at the beginning to provide the basis for choices made during processing. MOSFET will be used as the target application. However, the processing steps covered are related to many other semiconductor based applications. The class will include both planar and bulk processing. Offered as: EMSE 343 and EMSE 443. Prereq: (PHYS 122 or PHYS 124) and EMSE 276.

EMSE 345. Engineered Materials for Biomedical Applications. 3 Units.
A survey of synthetic biomedical materials from the perspective of materials science and engineering, focusing on how processing/synthesis, structure, and properties determine materials performance under the engineering demands imposed by physiological environments. Comparisons and contrasts between engineered metals, ceramics, and polymers, versus the biological materials they are called on to replace; consequences for materials and device design. Biomedical materials in applications such as orthopedic implants, dental restorations, wound healing, ophthalmic materials, and biomedical microelectromechanical systems (bioMEMS). Additive manufacturing of biomedical materials. Prereq: ENGR 200 and ENGR 145.

EMSE 349. Role of Materials in Energy and Sustainability. 3 Units.
This course has two parts: engineered materials as consumers of resources (raw materials, energy); and as key contributors to energy efficiency and sustainable energy technologies. Topics covered include: Energy usage in the U.S. and the world. Availability of raw materials, including strategic materials; factors affecting global reserves and annual world production. Resource demand of materials production, fabrication, and recycling. Design strategies, and how the inclusion of environmental impacts in design criteria can affect design outcomes and material selection. Roles of engineered materials in energy technologies: photovoltaics, solar thermal, fuel cells, wind, batteries, capacitors. Materials in energy-efficient lighting. Energy return on energy invested. Semester projects will allow students to explore related topics (e.g. geothermal, biomass; energy-efficient manufacturing and transportation). Offered as EMSE 349 and EMSE 449. Prereq: (ENGR 225 or EMAE 251 or EMAC 351) and ENGR 145 and (PHYS 122 or PHYS 124) or Requisites Not Met permission.

EMSE 365. Surface Engineering of Materials. 3 Units.
Introduction to surface engineering of materials, understood as a treatment that allows the surface to perform functions different from those performed by the bulk. This may include engineering the mechanical, chemical, electrical, magnetic, or optical properties of the surface and near-surface regions for specific applications. For a variety of technologically important classes of materials, the course reviews general concepts of surface engineering, the underlying physical and materials science principles, technical implementations, and typical applications. Recommended for graduate students and advanced undergraduate students. Offered as EMSE 365 and EMSE 465. Prereq: (EMSE 276 and ENGR 225) or Requisites Not Met permission.

EMSE 366. Scientific Writing in Materials Science and Engineering. 3 Units.
For writing a thesis (or a publication) in the field of materials science and engineering, students need a diverse set of skills in addition to mastering the scientific content. Generally, scientific writing requires proficiency in document organization, professional presentation of numerical and graphical data, literature retrieval and management, text processing, version control, graphical illustration, mathematical typesetting, the English language, elements of style, etc. Scientific writing in materials science and engineering, specifically, requires additional knowledge about e.g. conventions of numerical precision, error limits, mathematical typesetting, proper use of units, proper digital processing of micrographs, etc. Having to acquire these essential skills at the beginning of thesis (or publication) writing may compromise the outcome by distracting from the most important task of composing the best possible scientific content. This course properly prepares students for scientific writing with a comprehensive spectrum of knowledge, skills, and tools enabling them to fully focus on the scientific content of their thesis or publication when the time has come to start writing. Similar to artistic drawing, where the ability to "see" is as (or more) important as skills of the hand, the ability of proper scientific writing is intimately linked to the ability of critically reviewing scientific texts. Therefore, students will practice both authoring and critical reviewing of material science texts. To sharpen students' skills of reviewing, examples of good and less good scientific writing will be taken from published literature of materials science and engineering and analyzed in the context of knowledge acquired in the course. At the end of the course, students will have set up skills and a highly functional work environment to start writing their role thesis or article with full focus on the scientific content. While the course mainly targets students of materials science and engineering, students of other disciplines of science and engineering may also benefit from the course material. Offered as EMSE 368 and EMSE 468.

EMSE 372. Structural Materials by Design. 4 Units.
EMSE 379. Design for Lifetime Performance. 3 Units.

EMSE 396. Special Project or Thesis. 1 - 18 Units.
Special research projects or undergraduate thesis in selected material areas.

EMSE 398. Senior Project in Materials I. 1 Unit.
Independent Research project. Projects selected from those suggested by faculty; usually entail original research. The EMSE 398 and 399 sequence form an approved SAGES capstone. Counts as SAGES Senior Capstone.

EMSE 399. Senior Project in Materials II. 2 Units.
Independent Research project. Projects selected from those suggested by faculty; usually entail original research. Requirements include periodic reporting of progress, plus a final oral presentation and written report. Counts as SAGES Senior Capstone.

EMSE 400T. Graduate Teaching I. 0 Unit.
To provide teaching experience for all Ph.D.-bound graduate students. This will include preparing exams/quizzes, homework, leading recitation sessions, tutoring, providing laboratory assistance, and developing teaching aids that include both web-based and classroom materials. Graduate students will meet with supervising faculty member throughout the semester. Grading is pass/fail. Students must receive three passing grades and up to two assignments may be taken concurrently. Recommended preparation: Ph.D. student in Materials Science and Engineering.

EMSE 408. Welding Metallurgy. 3 Units.
Introduction to arc welding and metallurgy of welding. The course provides a broad overview of different industrial applications requiring welding, the variables controlling critical property requirements of the weld and a survey of the different types of arc welding processes. The course details the fundamental concepts that govern the different aspects of arc welding including the welding arc, weld pool solidification, precipitate formation and solid state phase transformations. Offered as EMSE 308 and EMSE 408.

EMSE 409. Deformation Processing. 3 Units.
Flow stress as a function of material and processing parameters; yielding criteria; stress states in elastic-plastic deformation; forming methods: forging, rolling, extrusion, drawing, stretch forming, composite forming.

EMSE 413. Fundamentals of Materials Engineering and Science. 3 Units.
Provides a background in materials for graduate students with undergraduate majors in other branches of engineering and science: reviews basic bonding relations, structure, and defects in crystals. Lattice dynamics; thermodynamic relations in multi-component systems; microstructural control in metals and ceramics; mechanical and chemical properties of materials as affected by structure; control of properties by techniques involving structure property relations; basic electrical, magnetic and optical properties.

EMSE 414. Electrical, Magnetic, Optical, and Thermal Properties of Materials. 3 Units.
Reviews quantum mechanics as applied to materials, energy bands, and density of states; Electrical properties of metals, semiconductors, insulators, and superconductors; Optical properties of materials, including: metallic luster, color, and optoelectronics; Magnetic properties of materials, including: Types of magnetic behavior, theory, and applications; Thermal properties of materials, including: heat capacity, thermal expansion, and thermal conductivity. Prereq: Graduate Standing in Materials Science and Engineering or Requisites Not Met permission.

EMSE 417. Properties of Materials in Extreme Environments. 3 Units.
Fundamentals of degradation pathways of materials under extreme conditions; thermodynamic stability of microstructures, deformation mechanisms, and failure mechanisms. Extreme conditions that will typically be addressed include: elevated temperatures, high-strain rates (ballistic), environmental effects, nuclear radiation, and small scales. Examples will be drawn from recent events as appropriate.

EMSE 421. Fracture of Materials. 3 Units.

EMSE 422. Failure Analysis. 3 Units.
Methods and procedures for determining the basic causes of failures in structures and components. Recognition of fractures and excessive deformations in terms of their nature and origin. Development and full characterization of fractures. Review of essential mechanical behavior concepts and fracture mechanics concepts applied to failure analyses in inorganic, organic, and composite systems. Legal, ethical, and professional aspects of failures from service. Prereq: EMSE 372 or EMAE 372 or Requisites Not Met permission.

EMSE 427. Defects in Solids. 3 Units.
Defects in solids control many properties of interest to the materials scientist or engineer. This course focuses on point, line, and interfacial defects in crystals and their interactions, including calculations of defect energies and interaction forces. Crystallographic defects presented include point defects (e.g., vacancies, interstitials, substitutional and interstitial impurities), line defects (e.g., dislocations), and planar defects (e.g., grain boundaries). The consequence of point defects on diffusion as well as on optical and electronic properties is discussed. Dislocation motion and dislocation dissociation are treated, and the influence of dislocation dynamics on yield phenomena, work hardening, and other mechanical properties are discussed. The role of grain boundaries and inter-phase boundaries in determining the physical properties of the material are presented. Experimental techniques for characterizing defects are integrated throughout the course. Recommended preparation: MATH 223 (or equivalent) and EMSE 276 (or equivalent).

EMSE 428. Mesoscale Structural Control of Functional Materials. 3 Units.
The course focuses on mesoscale structure of materials and their interrelated effects on properties, mostly in electrical in nature. The mesoscale science covers the structures varying from electronic-to-microstructure. In each scale, fundamental science will be complimented by examples of applications and how the structure is exploited both to modify and enable function. The student will develop an understanding of how the structure across multiple scales are interrelated and how to tailor them for desired outcomes. Offered as: EMSE 328 and EMSE 428.
EMSE 430. Additive Manufacturing of Metals, Polymers, and Ceramics. 3 Units.
Additive manufacturing, though rooted in well-established unit operations, has emerged as a distinctive approach to the production of components and assemblies. This course will cover the conceptual approach, its history, the current state of the art, and analysis of projections of its future role. The respective advances in digital description of parts and digital control of processes will be described as machine design and construction. The emphasis, however, will be on the processing-structure-property relationships. Polymers, metals, and ceramics will be treated separately and contrasted. The course will make extensive use of current literature. Prereq: EMSE 276 or Requisites Not Met permission.

EMSE 435. Strategic Metals and Materials for the 21st Century. 3 Units.
This course seeks to create an understanding of the role of mineral-based materials in the modern economy focusing on how such knowledge can and should be used in making strategic choices in an engineering context. The history of the role of materials in emerging technologies from a historical perspective will be briefly explored. The current literature will be used to demonstrate the connectedness of materials availability and the development and sustainability of engineering advances with examples of applications exploiting structural, electronic, optical, magnetic, and energy conversion properties. Processing will be comprehensively reviewed from source through refinement through processing including property development through application of an illustrative set of engineering materials representing commodities, less common metals, and minor metals. The concept of strategic recycling, including design for recycling and waste stream management will be considered. Offered as EMSE 335 and EMSE 435. Prereq: Senior standing or graduate student.

EMSE 443. Processing of Electronic Materials. 3 Units.
The class will focus on the processing of materials for electronic applications. Necessary background into the fundamentals and applications will be given at the beginning to provide the basis for choices made during processing. MOSFET will be used as the target application. However, the processing steps covered are related to many other semiconductor based applications. The class will include both planar and bulk processing. Offered as: EMSE 343 and EMSE 443. Prereq: (PHYS 122 or PHYS 124) and EMSE 276.

EMSE 449. Role of Materials in Energy and Sustainability. 3 Units.
This course has two parts: engineered materials as consumers of resources (raw materials, energy); and as key contributors to energy efficiency and sustainable energy technologies. Topics covered include: Energy usage in the U.S. and the world. Availability of raw materials, including strategic materials; factors affecting global reserves and annual world production. Resource demand of materials production, fabrication, and recycling. Design strategies, and how the inclusion of environmental impacts in design criteria can affect design outcomes and material selection. Roles of engineered materials in energy technologies: photovoltaics, solar thermal, fuel cells, wind, batteries, capacitors. Materials in energy-efficient lighting. Energy return on energy invested. Semester projects will allow students to explore related topics (e.g. geothermal; biomass; energy-efficient manufacturing and transportation). Offered as EMSE 349 and EMSE 449. Prereq: ENGR 225 and (ENGR 145 or EMSE 146) and (PHYS 122 or PHYS 124) or requisites not met permission.

EMSE 463. Magnetism and Magnetic Materials. 3 Units.
This course covers the fundamentals of magnetism and application of modern magnetic materials especially for energy and data storage technologies. The course will focus on intrinsic and extrinsic magnetic properties, processing of magnetic materials to achieve important magnetic performance metrics, and the state-of-the-art magnetic materials used today. The topics related to intrinsic properties, include: magnetic dipole moments, magnetization, exchange coupling, magnetic anisotropy and magnetostriction. Topics related to extrinsic properties, include: magnetic hysteresis, frequency dependent magnetic response and magnetic losses. Technologically important permanent magnets (including rare earth containing alloys and magnetic oxides), soft magnets (including electrical steels, amorphous, ferrites, and nanocrystalline alloys), and thin film materials (including iron platinum) will be discussed in the context of their technological interest. Throughout the course, experimental techniques and data analysis will be discussed. The course is suitable for most graduate students and advanced undergraduates in engineering and science.

EMSE 465. Surface Engineering of Materials. 3 Units.
Introduction to surface engineering of materials, understood as a treatment that allows the surface to perform functions different from those performed by the bulk. This may include engineering the mechanical, chemical, electrical, magnetic, or optical properties of the surface and near-surface regions for specific applications. For a variety of technologically important classes of materials, the course reviews general concepts of surface engineering, the underlying physical and materials science principles, technical implementations, and typical applications. Recommended for graduate students and advanced undergraduate students. Offered as EMSE 365 and EMSE 465.

EMSE 468. Scientific Writing in Materials Science and Engineering. 3 Units.
For writing a thesis (or a publication) in the field of materials science and engineering, students need a diverse set of skills in addition to mastering the scientific content. Generally, scientific writing requires proficiency in document organization, professional presentation of numerical and graphical data, literature retrieval and management, text processing, version control, graphical illustration, mathematical typesetting, the English language, elements of style, etc. Scientific writing in materials science and engineering, specifically, requires additional knowledge about e.g. conventions of numerical precision, error limits, mathematical typesetting, proper use of units, proper digital processing of micrographs, etc. Having to acquire these essential skills at the beginning of thesis (or publication) writing may compromise the outcome by distracting from the most important task of composing the best possible scientific content. This course properly prepares students for scientific writing with a comprehensive spectrum of knowledge, skills, and tools enabling them to fully focus on the scientific content of their thesis or publication when the time has come to start writing. Similar to artistic drawing, where the ability to “see” is as (or more) important as skills of the hand, the ability of proper scientific writing is intimately linked to the ability of critically reviewing scientific texts. Therefore, students will practice both authoring and critical reviewing of material science texts. To sharpen students’ skills of reviewing, examples of good and less good scientific writing will be taken from published literature of materials science and engineering and analyzed in the context of knowledge acquired in the course. At the end of the course, students will have set up skills and a highly functional work environment to start writing their role thesis or article with full focus on the scientific content. While the course mainly targets students of materials science and engineering, students of other disciplines of science and engineering may also benefit from the course material. Offered as EMSE 368 and EMSE 468.
EMSE 499. Materials Science and Engineering Colloquium. 0 Unit.
Invited speakers deliver lectures on topics of active research in materials science. Speakers include researchers at universities, government laboratories, and industry. Course is offered only for 0 credits. Attendance is required.

EMSE 500T. Graduate Teaching II. 0 Unit.
To provide teaching experience for all Ph.D.-bound graduate students. This will include preparing exams/quizzes/homework, leading recitation sessions, tutoring, providing laboratory assistance, and developing teaching aids that include both web-based and classroom materials. Graduate students will meet with supervising faculty member throughout the semester. Grading is pass/fail. Students must receive three passing grades and up to two assignments may be taken concurrently. Recommended preparation: Ph.D. student in Materials Science and Engineering.

EMSE 503. Structure of Materials. 3 Units.
The structure of materials and physical properties are explored in terms of atomic bonding and the resulting crystallography. The course will cover basic crystal chemistry, basic crystallography (crystal symmetries, point groups, translation symmetries, space lattices, and crystal classes), basic characterization techniques and basic physical properties related to a materials structure.

EMSE 504. Thermodynamics of Solids. 3 Units.

EMSE 505. Phase Transformations, Kinetics, and Microstructure. 3 Units.
Phase diagrams are used in materials science and engineering to understand the interrelationships of composition, microstructure, and processing conditions. The microstructure and phases constitution of metallic and nonmetallic systems alike are determined by the thermodynamic driving forces and reaction pathways. In this course, solution thermodynamics, the energetics of surfaces and interfaces, and both diffusional and diffusionless phase transformations are reviewed. The development of the laws of diffusion and its application for both melts and solids are covered. Phase equilibria and microstructure in multicomponent systems will also be discussed.

EMSE 509. Conventional Transmission Electron Microscopy. 3 Units.
Introduction to transmission electron microscopy-theoretical background and practical work. Lectures and laboratory experiments cover the technical construction and operation of transmission electron microscopes, specimen preparation, electron diffraction by crystals, electron diffraction techniques of TEM, conventional TEM imaging, and scanning TEM. Examples from various fields of materials research illustrate the application and significance of these techniques. Recommended preparation: Consent of instructor.

EMSE 515. Analytical Methods in Materials Science. 3 Units.
Microcharacterization techniques of materials science and engineering: SPM (scanning probe microscopy), SEM (scanning electron microscopy), FIB (focused ion beam) techniques, SIMS (secondary ion mass spectrometry), EPMA (electron probe microanalysis), XPS (X-ray photoelectron spectrometry), and AES (Auger electron spectrometry), ESCA (electron spectrometry for chemical analysis). The course includes theory, application examples, and laboratory demonstrations.

EMSE 599. Critical Review of Materials Science and Engineering Colloquium. 1 - 2 Units.
Invited speakers deliver lectures on topics of active research in materials science. Speakers include researchers at universities, government laboratories, and industry. Each course offering is for 1 or 2 credits but the course can be taken multiple times totaling up to a maximum of six credits. Attendance is required. Graded coursework is in the form of a term paper per credit. The topic for the term paper(s) should be chosen from seminar topics. The term paper will be graded by the advisor of the graduate student.

EMSE 600T. Graduate Teaching III. 0 Unit.
To provide teaching experience for all Ph.D.-bound graduate students. This will include preparing exams/quizzes/homework, leading recitation sessions, tutoring, providing laboratory assistance, and developing teaching aids that include both web-based and classroom materials. Graduate students will meet with supervising faculty member throughout the semester. Grading is pass/fail. Students must receive three passing grades and up to two assignments may be taken concurrently. Recommended preparation: Ph.D. student in Materials Science and Engineering.

EMSE 601. Independent Study. 1 - 18 Units.

EMSE 634. Special Topics of Materials Science. 1 - 3 Units.
This course introduces graduate students to specific topics of material science, tailored to individual interests of the students. For example, students with interest in specific techniques for microcharacterization of materials may be educated in the physical background of these techniques by studying literature under the guidance of the instructor, presenting and discussing the learned material with the instructor and other students, and being trained in practical experimentation in laboratory sessions demonstrating these techniques on instruments of SCSAM, the Swagelok Center for Surface Analysis of Materials.

EMSE 649. Special Projects. 1 - 18 Units.

EMSE 651. Thesis M.S.. 1 - 18 Units.
Required for Master's degree. A research problem in metallurgy, ceramics, electronic materials, biomaterials or archeological and art historical materials, culminating in the writing of a thesis.

EMSE 653. Project M.S.. 1 - 9 Units.
Research course taken by Plan B M.S. students. Prereq: Enrolled in the EMSE Plan B MS Program.

EMSE 701. Dissertation Ph.D.. 1 - 9 Units.
Required for Ph.D. degree. A research problem in metallurgy, ceramics, electronic materials, biomaterials or archeological and art historical materials, culminating in the writing of a thesis. Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

**Applied Data Science Courses**

DSCI 134. Introduction to Applied Data Science. 3 Units.
This course is an introduction to data science and analytics. In the first half of the course, students will develop a basic understanding of how to manipulate, analyze and visualize large data in a distributed computing environment, with an appreciation of open source development, security and privacy issues. In the second half of the course, students will gain experience in data manipulation and analysis using scripted programming languages such as Python.
DSCI 330. Cognition and Computation. 3 Units.
An introduction to (1) theories of the relationship between cognition and computation; (2) computational models of human cognition (e.g. models of decision-making or concept creation); and (3) computational tools for the study of human cognition. All three dimensions involve data science: theories are tested against archives of brain imaging data; models are derived from and tested against datasets of e.g., financial decisions (markets), legal rulings and findings (juries, judges, courts), legislative actions, and healthcare decisions; computational tools aggregate data and operate upon it analytically, for search, recognition, tagging, machine learning, statistical description, and hypothesis testing. Offered as COGS 330, COGS 430, DSCI 330 and DSCI 430.

DSCI 332. Spatial Statistics for Near Surface, Surface, and Subsurface Modeling. 3 Units.
This course is on spatial modeling of near surface, surface, and subsurface data, also known as geostatistical modeling. Spatial modeling has its origins in predictive modeling of minerals in subsurface formations, from which many examples are used in this class. Students will learn the basics of spatial models in order to understand how they are built from various data types and how their uncertainties are assessed and risk reduced. Students will be expected to learn the rudimentary navigation of R Studio, execute pre-written publically available R code (provided), and make simple modifications. Graduate students will be expected to learn the above and develop a 10 week modeling project focused on the use of spatial modeling methods with R using data relevant to their specific discipline or interest. These projects will include preparing datasets to be executed in R code scripts. Resulting scripts will be placed in a git repository for use by other students as open source code. Along with documentation demonstrating the reproducible spatial modeling science and analyses for these problems. Geostatistical (spatial) mapping is applicable across many disciplines. Examples of graduate projects from previous classes include subsurface modeling (geology), earthquake mapping (geophysics/civil engineering), soil stability modeling (civil engineering), aquifer characterization (hydrology), and pollution/contaminant mapping (environmental studies/medicine). Offered as DSCI 332 and DSCI 432.

DSCI 351. Exploratory Data Science. 3 Units.
In this course, we will learn data science and analysis approaches to identify statistically significant relationships and better model and predict the behavior of these systems. We will assemble and explore real-world datasets, perform clustering and pair plot analyses to investigate correlations, and logistic regression will be employed to develop associated predictive models. Results will be interpreted, visualized and discussed. We will introduce basic elements of statistical analysis using R Project open source software for exploratory data analysis and model development. R is an open-source software project with broad abilities to access machine-readable open-data resources, data cleaning and munging functions, and a rich selection of statistical packages, used for data analytics, model development and prediction. This will include an introduction to R data types, reading and writing data, looping, plotting and regular expressions, so that one can start performing variable transformations for linear fitting and developing structural equation models, while exploring for statistically significant relationships. The M section of DSCI 351 is for students focusing on Materials Data Science. Offered as DSCI 351, DSCI 351M and DSCI 451. Prereq: (ENGR 131 or EECS 132 or DSCI 134) and (STAT 312R or STAT 201R or SYBB 310 or PQHS/EPBI 431).

DSCI 352. Applied Data Science Research. 3 Units.
This is a project based data science research class, in which project teams identify a research project under the guidance of a domain expert professor. The research is structured as a data analysis project including the 6 steps of developing a reproducible data science project, including 1: Define the ADS question, 2: Identify, locate, and/or generate the data 3: Exploratory data analysis 4: Statistical modeling and prediction 5: Synthesizing the results in the domain context 6: Creation of reproducible research, including code, datasets, documentation and reports. During the course special topic lectures will include Ethics, Privacy, Openness, Security, Ethics. Value. The M section of DSCI 352 is for students focusing on Materials Data Science. Offered as DSCI 352, DSCI 352M and DSCI 452. Prereq: (DSCI 133 or DSCI 134 or ENGR 131 or EECS 132) and (STAT 312R or STAT 201R or SYBB 310 or PQHS/EPBI 431 or OPRE 207) and (DSCI 351 or (SYBB 311A and SYBB 311B and SYBB 311C and SYBB 311D) or SYBB 321 or MKMR 201).

DSCI 352M. Applied Data Science Research. 3 Units.
This is a project based data science research class, in which project teams identify a research project under the guidance of a domain expert professor. The research is structured as a data analysis project including the 6 steps of developing a reproducible data science project, including 1: Define the ADS question, 2: Identify, locate, and/or generate the data 3: Exploratory data analysis 4: Statistical modeling and prediction 5: Synthesizing the results in the domain context 6: Creation of reproducible research, including code, datasets, documentation and reports. During the course special topic lectures will include Ethics, Privacy, Openness, Security, Ethics. Value. The M section of DSCI 352 is for students focusing on Materials Data Science. Offered as DSCI 352, DSCI 352M and DSCI 452. Prereq: (DSCI 133 or DSCI 134 or ENGR 131 or EECS 132) and (STAT 312R or STAT 201R or SYBB 310 or PQHS/EPBI 431 or OPRE 207) and (DSCI 351 or (SYBB 311A and SYBB 311B and SYBB 311C and SYBB 311D) or SYBB 321 or MKMR 201).
DSCI 353. Data Science: Statistical Learning, Modeling and Prediction. 3 Units.
In this course, we will use an open data science tool chain to develop reproducible data analyses useful for inference, modeling and prediction of the behavior of complex systems. In addition to the standard data cleaning, assembly and exploratory data analysis steps essential to all data analyses, we will identify statistically significant relationships from datasets derived from population samples, and infer the reliability of these findings. We will use regression methods to model a number of both real-world and lab-based systems producing predictive models applicable in comparable populations. We will assemble and explore real-world datasets, use pair-wise plots to explore correlations, perform clustering, self-similarity, and logistic regression develop both fixed-effect and mixed-effect predictive models. We will introduce machine-learning approaches for classification and tree-based methods. Results will be interpreted, visualized and discussed. We will introduce the basic elements of data science and analytics using R Project open source software. R is an open-source software project with broad abilities to access machine-readable open-data resources, data cleaning and assembly functions, and a rich selection of statistical packages, used for data analytics, model development, prediction, inference and clustering. With this background, it becomes possible to start performing variable transformations for linear regression fitting and developing structural equation models, fixed-effects and mixed-effects models along with other statistical learning techniques, while exploring for statistically significant relationships. The class will be structured to have a balance of theory and practice. We'll split class into Foundation and Practicum a) Foundation: lectures, presentations, discussion b) Practicum: coding, demonstrations and hands-on data science work. The M section of DSCI 353 is for students focusing on Materials Data Science. Offered as DSCI 353, DSCI 353M and DSCI 453.

DSCI 353M. Data Science: Statistical Learning, Modeling and Prediction. 3 Units.
In this course, we will use an open data science tool chain to develop reproducible data analyses useful for inference, modeling and prediction of the behavior of complex systems. In addition to the standard data cleaning, assembly and exploratory data analysis steps essential to all data analyses, we will identify statistically significant relationships from datasets derived from population samples, and infer the reliability of these findings. We will use regression methods to model a number of both real-world and lab-based systems producing predictive models applicable in comparable populations. We will assemble and explore real-world datasets, use pair-wise plots to explore correlations, perform clustering, self-similarity, and logistic regression develop both fixed-effect and mixed-effect predictive models. We will introduce machine-learning approaches for classification and tree-based methods. Results will be interpreted, visualized and discussed. We will introduce the basic elements of data science and analytics using R Project open source software. R is an open-source software project with broad abilities to access machine-readable open-data resources, data cleaning and assembly functions, and a rich selection of statistical packages, used for data analytics, model development, prediction, inference and clustering. With this background, it becomes possible to start performing variable transformations for linear regression fitting and developing structural equation models, fixed-effects and mixed-effects models along with other statistical learning techniques, while exploring for statistically significant relationships. The class will be structured to have a balance of theory and practice. We'll split class into Foundation and Practicum a) Foundation: lectures, presentations, discussion b) Practicum: coding, demonstrations and hands-on data science work. The M section of DSCI 353 is for students focusing on Materials Data Science. Offered as DSCI 353, DSCI 353M and DSCI 453.

DSCI 354. Data Visualization and Analytics. 3 Units.
Data Visualization and Analytics students will learn data visualization and analytics techniques focused on different types of data such as time-series, spectral, or image data science problems. This class will focus on increasing analysis of complex data sets through visualization by enhancing exploratory data analysis and data cleaning. This class will focus on creating effective data visualizations to communicate data analytics results to different audiences. Different datasets will be provided to develop different types of visualizations and analytics. Types of data visualizations include in interactive plots (e.g., bar graphs change over time), applications that allow users to adjust the visualizations based on their decisions (e.g., shiny applications), interactive maps, 3-D plots of data, etc. Discussing how an audience understands information and brings in data as well as the ethics of making data visualizations will be discussed. The class will also include ways to increase modeling and analysis with effective visualizations for credible, data-driven decision making. This will include a git repository for other students to use these codes as open source resources and the preparation of reproducible data science analyses for different types of problems. Offered as DSCI 354, DSCI 354M, and DSCI 454. Prereq: (DSCI 351 or DSCI 351M) and (DSCI 353 or DSCI 353M).
DSCI 354M. Data Visualization and Analytics. 3 Units.
Data Visualization and Analytics students will learn data visualization and analytics techniques focused on different types of data such as time-series, spectral, or image data science problems. This class will focus on increasing analysis of complex data sets through visualization by enhancing exploratory data analysis and data cleaning. This class will focus on creating effective data visualizations to communicate data analytics results to different audiences. Different datasets will be provided to develop different types of visualizations and analytics. Types of data visualizations include in interactive plots (e.g., bar graphs change over time), applications that allow users to adjust the visualizations based on their decisions (e.g., shiny applications), interactive maps, 3-D plots of data, etc. Discussing how an audience understands information and brings in data as well as the ethics of making data visualizations will be discussed. The class will also include ways to increase modeling and analysis with effective visualizations for credible, data-driven decision making. This will include a git repository for other students to use these codes as open source resources and the preparation of reproducible data science analyses for different types of problems. Offered as DSCI 354, DSCI 354M, and DSCI 454. Prereq: (DSCI 351 or DSCI 351M) and (DSCI 353 or DSCI 353M).

DSCI 430. Cognition and Computation. 3 Units.
An introduction to (1) theories of the relationship between cognition and computation; (2) computational models of human cognition (e.g. models of decision-making or concept creation); and (3) computational tools for the study of human cognition. All three dimensions involve data science: theories are tested against archives of brain imaging data; models are derived from and tested against datasets of e.g., financial decisions (markets), legal rulings and findings (juries, judges, courts), legislative actions, and healthcare decisions; computational tools aggregate data and operate upon it analytically, for search, recognition, tagging, machine learning, statistical description, and hypothesis testing. Offered as COGS 330, COGS 430, DSCI 330 and DSCI 430.

DSCI 432. Spatial Statistics for Near Surface, Surface, and Subsurface Modeling. 3 Units.
This course is on spatial modeling of near surface, surface, and subsurface data, also known as geostatistical modeling. Spatial modeling has its origins in predictive modeling of minerals in subsurface formations, from which many examples are used in this class. Students will learn the basics of spatial models in order to understand how they are built from various data types and how their uncertainties are assessed and risk reduced. Students will be expected to learn the rudimentary navigation of R Studio, execute pre-written publically available R code (provided), and make simple modifications. Graduate students will be expected to learn the above and develop a 10 week modeling project focused on the use of spatial modeling methods with R using data relevant to their specific discipline or interest. These projects will include preparing datasets to be executed in R code scripts. Resulting scripts will be placed in a git repository for use by other students as open source resources along with documentation demonstrating the reproducible spatial modeling science and analyses for these problems. Geostatistical (spatial) mapping is applicable across many disciplines. Examples of graduate projects from previous classes include subsurface modeling (geology), earthquake mapping (geophysics/civil engineering), soil stability modeling (civil engineering), aquifer characterization (hydrology), and pollution/contaminant mapping (environmental studies/medicine). Offered as DSCI 332 and DSCI 432.

DSCI 452. Applied Data Science Research. 3 Units.
This is a project based data science research class, in which project teams identify a research project under the guidance of a domain expert professor. The research is structured as a data analysis project including the 6 steps of developing a reproducible data science project, including: 1: Define the ADS question, 2: Identify, locate, and/or generate the data, 3: Exploratory data analysis 4: Statistical modeling and prediction 5: Synthesizing the results in the domain context 6: Creation of reproducible research, including code, datasets, documentation and reports. During the course special topic lectures will include Ethics, Privacy, Openness, Security, Ethics. Value. The M section of DSCI 352 is for students focusing on Materials Data Science. Offered as DSCI 351, DSCI 351M and DSCI 451.
DSCI 453. Data Science: Statistical Learning, Modeling and Prediction. 3 Units.
In this course, we will use an open data science tool chain to develop reproducible data analyses useful for inference, modeling and prediction of the behavior of complex systems. In addition to the standard data cleaning, assembly and exploratory data analysis steps essential to all data analyses, we will identify statistically significant relationships from datasets derived from population samples, and infer the reliability of these findings. We will use regression methods to model a number of both real-world and lab-based systems producing predictive models applicable in comparable populations. We will assemble and explore real-world datasets, use pair-wise plots to explore correlations, perform clustering, self-similarity, and logistic regression develop both fixed-effect and mixed-effect predictive models. We will introduce machine-learning approaches for classification and tree-based methods. Results will be interpreted, visualized and discussed. We will introduce the basic elements of data science and analytics using R Project open source software. R is an open-source software project with broad abilities to access machine-readable open-data resources, data cleaning and assembly functions, and a rich selection of statistical packages, used for data analytics, model development, prediction, inference and clustering. With this background, it becomes possible to start performing variable transformations for linear regression fitting and developing structural equation models, fixed-effects and mixed-effects models along with other statistical learning techniques, while exploring for statistically significant relationships. The class will be structured to have a balance of theory and practice. We’ll split class into Foundation and Practicum.
- Foundation: lectures, presentations, discussion
- Practicum: coding, demonstrations and hands-on data science work.

DSCI 353 is for students focusing on Materials Data Science. Offered as DSCI 353, DSCI 353M and DSCI 453.

DSCI 454. Data Visualization and Analytics. 3 Units.
Data Visualization and Analytics students will learn data visualization and analytics techniques focused on different types of data such as time-series, spectral, or image data science problems. This class will focus on increasing analysis of complex data sets through visualization by enhancing exploratory data analysis and data cleaning. This class will focus on creating effective data visualizations to communicate data analytics results to different audiences. Different datasets will be provided to develop different types of visualizations and analytics. Types of data visualizations include in interactive plots (e.g., bar graphs change over time), applications that allow users to adjust the visualizations based on their decisions (e.g., shiny applications), interactive maps, 3-D plots of data, etc. Discussing how an audience understands information and brings in data as well as the ethics of making data visualizations will be discussed. The class will also include ways to increase modeling and analysis with effective visualizations for credible, data-driven decision making. This will include a git repository for other students to use these codes as open source resources and the preparation of reproducible data science analyses for different types of problems. Offered as DSCI 354, DSCI 354M, and DSCI 454. Prereq: DSCI 451 and DSCI 453.

robert.gao@case.edu

The Department of Mechanical and Aerospace Engineering of the Case School of Engineering offers programs leading to bachelor’s, master’s, and doctoral degrees. It administers the programs leading to the degrees of Bachelor of Science in Engineering with a major in Aerospace Engineering and Bachelor of Science in Engineering with a major in Mechanical Engineering. Both curricula are based on four-year programs of preparation for productive engineering careers or further academic training.

Mission
The mission of the Mechanical and Aerospace Engineering Department is to educate and prepare students at both the undergraduate and graduate levels for leadership roles in the fields of Mechanical Engineering and Aerospace Engineering and to conduct research for the benefit of society.

The undergraduate program emphasizes fundamental engineering science, analysis and experiments to ensure that graduates will be strong contributors in their work environment, be prepared for advanced study at top graduate schools and be proficient lifelong learners. The graduate programs emphasize advanced methods of analysis, mathematical modeling, computational and experimental techniques applied to a variety of mechanical and aerospace engineering specialties including, applied mechanics, dynamic systems, robotics, biomechanics, fluid mechanics, heat transfer, propulsion and combustion. Leadership skills are developed by infusing the program with current engineering practice, design, and professionalism (including engineering ethics and the role of engineering in society) led by concerned educators and researchers.

The academic and research activities of the department center on the roles of mechanics, thermodynamics, heat and mass transfer, robotics, mechatronics, data analytics, sustainability in manufacturing, and engineering design in a wide variety of applications such as aeronautics, astronautics, biomechanics and orthopedic engineering, biomimetics and biologically-inspired robotics, energy, environment, machinery dynamics, mechanics of advanced materials, nanotechnology and tribology. Many of these activities involve strong collaborations with the Departments of Biology, Electrical Engineering and Computer Science, Materials Science and Engineering, and Orthopaedics of the School of Medicine.

The significant constituencies of the Mechanical and Aerospace Engineering Department are the faculty, the students, the alumni and the external advisory boards. The educational program objectives are established and reviewed continuously, based on the feedback from the various constituencies as well as archival information about the program graduates. The faculty engages in continuing discussions of the academic programs in the regularly scheduled faculty meetings throughout the academic year. Periodic surveys of alumni provide data regarding the preparedness and success of the graduates as well as guidance in program development. Archival data include the placement information for graduating seniors, which provides direct information regarding the success of the graduates in finding employment or being admitted to graduate programs.

Mastery of Fundamentals
- A strong background in the fundamentals of chemistry, physics and mathematics
- Methods of mechanical engineering analysis, both numerical and mathematical, applied to mechanics, dynamic systems and control, thermodynamics, fluid mechanics and heat transfer
The aerospace engineering major has been developed to address the needs of those students seeking career opportunities in the highly specialized and advancing aerospace industries.

**Mechanical Engineering**

Civilization, as we know it today, depends on the intelligent and humane use of our energy resources and machines. The mechanical engineer’s function is to apply science and technology to the design, analysis, development, manufacture, and use of machines that convert and transmit energy, and to apply energy to the completion of useful operations. The top ten choices of the millennium committee of the National Academy of Engineering, asked to select the 20 top engineering accomplishments of the 20th century, was abundant with mechanical engineering accomplishments, electrification (large scale power generation and distribution), automobiles, air travel (development of aircraft and propulsion), mechanized agriculture, and refrigeration and air conditioning.

**Research**

**Aerospace Technology and Space Exploration**

Flow in turbomachinery, molecular dynamics simulation of rarefied gas flow, two phase flow, supersonic combustion and propulsion, thermoacoustic refrigeration, in-situ resource utilization from space. Gravitational effects on transport phenomena, fluids and thermal processes in advance life support systems for long duration space travel, interfacial processes, g-jitter effects on microgravity flows, two phase flow in zero and reduced gravity.

**Combustion and Fire Engineering**

Hydrogen ignition and safety, catalytic combustion, flame spread, fire research and protection, combustion in micro- and partial gravity.

**Data Analytics**

Multi-domain signal decomposition and analysis, wavelet transform and other transformation methods, data fusion, stochastic modeling and statistical methods for defect detection, root cause diagnosis, and remaining service life prognosis, multi-scale analysis.

**Dynamics of Rotating Machinery**

Forced and instability vibration of rotor/bearing/seal systems, nonlinear rotor dynamics, torsional rotor vibration, rotor dynamic characteristics of bearings and seals (computational and experimental approach), control of rotor system dynamics, rub-impact studies on bearings and compressor/turbine blading systems. Advanced rotating machinery monitoring and diagnostics.

**Engineering Design**

Optimization and computer-aided design, feasibility studies of kinematic mechanisms, kinematics of rolling element-bearing geometries, mechanical control systems, experimental stress analysis, failure analysis, development of biologically inspired methodologies.

**Heat Transfer**

Analysis of heat transfer in complex systems such as biological organisms, multi-functional materials and building enclosures.

**Sustainable and Additive Manufacturing**

Modeling, characterization and manufacturing of next-generation lithium ion batteries for electric vehicles and perovskite solar cells for low-cost solar power generation, multiphysics electrochemistry modeling, atomic...
layer deposition, scalable nano-manufacturing, life cycle assessment of lithium ion batteries on environmental sustainability, agile manufacturing work cells based on coordinated, multiple robots, additive manufacturing, in-process sensing and control.

**Materials**
Development of novel experimental techniques to investigate material response at elevated temperatures and high rates of deformation. Constitutive modeling of damage evolution, shear localization and failure of advanced engineering materials. Fabrication of mechanical properties of composite materials; creep, rupture, and fatigue properties of engineering materials at elevated temperatures.

**Multiphase Flow**
Application of non-intrusive laser based diagnostic techniques and ultrasound techniques including pulsed ultrasound Doppler velocimetry to study solid-liquid, solid-gas, liquid-gas and solid-liquid-gas, multiphase flows encountered in slurry transport and bio-fluid mechanics.

**Nanotechnology**
Research related to various nanotechnology applications with particular emphasis on energy conversion, generation and storage in nanostructured materials including the synthesis of polymer-based nanocomposites. Current research projects include investigation of nanocomposites for thermolectric devices, molecular simulation of thermal transport across interfacial regions, and biomimetic research on protein-based shark gel.

**Musculoskeletal Mechanics and Materials**
Design, modeling, and failure analysis of orthopaedic prostheses and material selection; mechanical properties of, and transport processes in, bone and soft tissue; tribology of native and tissue engineered cartilage; nondestructive mechanical evaluation of tissue engineered cartilage.

**Robotics**
Biologically inspired and biologically based design and control of legged robots. Dynamics, control and simulation of animals and robots. Distributed intelligence, swarm robotics, social robots, wearable telesensors, and tangible game interface.

**Sensing and Metrology**
Signal transduction mechanisms, design, modeling, functional characterization, and performance evaluation of mechanical, thermal, optical, and magnetic-field sensors, multi-physics sensing, and precision instrumentation.

**Tribology and Seals**
Time-resolved friction on nano- and microsecond time scale with applications to high speed machining and mechanics of armor penetration. Study of gas lubricated foil bearing systems with application to oil-free turbomachinery. Evaluation of advanced seal concepts and configurations for high temperature applications in gas turbine engines.

**Turbomachinery**
Vibration characteristics of seals and bearings and measurement of chaotic motion. Rub impact studies of blade tip/casing interactions, particle-blade/casing interactions in centrifugal pumps.

**Faculty**
Robert X. Gao, PhD
(technical University of Berlin, Germany)
*Cady Staley Professor of Engineering and Department Chair*
Signal transduction, mechatronic systems, acoustics, wavelet transform, stochastic modeling, sensors and sensor networks

Ozan Akkus, PhD
(Case Western Reserve University)
*Leonard Case Jr. Professor of Engineering*
Nano biomechanics, biomedical devices, biomaterials, fracture mechanics

Richard J. Bachmann, PhD
(Case Western Reserve University)
*Assistant Professor*
Biologically inspired robotics

Paul Barnhart, PhD, PE
(Case Western Reserve University)
*Professor and Director of Undergraduate and Online Programs*
Aerospace engineering, aerospace design

Sunniva Collins, PhD, FASM
(Case Western Reserve University)
*Associate Professor and Associate Dean of Professional Programs*
Design for manufacturing, steel metallurgy, heat treatment, surface engineering, fatigue analysis, fatigue of metals, welding, material analytical methods

Kathryn Daltorio, PhD
(Case Western Reserve University)
*Assistant Professor*
Biologically-inspired robotics, control, learning, kinetics, and kinematics for robots design

Umut A. Gurkan, PhD
(Purdue University)
*Warren E. Rupp Associate Professor*
Micro-and nano-scale technologies, biomimufacturing, cell mechanics, and microfluidics

Steve Hostler, PhD
(California Institute of Technology)
*Assistant Professor*
Granular Materials and Thermal Management

Chirag Kharangate, PhD
(Purdue University)
*Assistant Professor*
Thermal management, two-phase flows, computational fluid dynamics, microgravity

Bo Li, PhD
(California Institute of Technology)
*Associate Professor*
Solid and computational mechanics, meshfree methods, failure processes in solids, biomechanics, thermal-fluid structure interaction and high performance computing
Ya-Ting T. Liao, PhD
(Case Western Reserve University)
Assistant Professor
Fire dynamics, computational fluid dynamics, thermal fluids

Brian Maxwell, PhD
(University of Ottawa, Canada)
Assistant Professor
Detonations, Turbulent combustion, Compressible and reactive flows

Roger D. Quinn, PhD
(Virginia Polytechnic Institute & State University)
Arthur P. Armington Professor of Engineering
Biologically inspired robotics, agile manufacturing systems, structural dynamics, vibration and control

Clare M. Rimnac, PhD
(Lehigh University)
Wilbert J. Austin Professor of Engineering
Biomechanics; fatigue and fracture mechanics

Bryan E. Schmidt, PhD
(California Institute of Technology)
Assistant Professor
Turbulence, Hypersonics, Image Processing

Fumiaki Takahashi, PhD
(Keio University)
Professor
Combustion, fire science and engineering

Vedha Nayagam, PhD
(University of Kentucky)
Research Associate Professor, National Center for Space Exploration Research
Low gravity combustion and fluid physics

Associated Faculty
Kenneth Loparo, PhD
(Case Western Reserve University)
Professor of Electrical Engineering and Computer Science
Control; robotics; stability of dynamical systems; vibrations

David Matthiesen, PhD
(Massachusetts Institute of Technology)
Associate Professor of Materials Science Engineering
Microgravity crystal growth

Wyatt S. Newman, PhD
(Massachusetts Institute of Technology)
Professor of Electrical Engineering and Computer Science
Mechatronics; high-speed robot design; force and vision-bases machine control; artificial reflexes for autonomous machines; rapid prototyping; agile manufacturing

Mario Garcia Sanz, PhD
(University of Navarra)
Professor of Electrical Engineering and Computer Science
Systems and control, spacecraft controls, automated manufacturing

Ravi Vaidyanathan, PhD
(Case Western Reserve University)
Adjunct Assistant Professor; Imperial College
Robotics and control

Xiong Yu, PhD, PE
(Purdue University)
Associate Professor
Geotechnical engineering, non-destructive testing, intelligent infrastructures

Emeritus Faculty
Dwight T. Davy, PhD, PE
(University of Iowa)
Professor Emeritus
Musculo-skeletal biomechanics; applied mechanics

Isaac Greber, PhD
(Massachusetts Institute of Technology)
Professor Emeritus
Fluid dynamics; molecular dynamics and kinetic theory; biological fluid mechanics; acoustics

Jaikrishnan R. Kadambi, PhD
(University of Pittsburgh)
Professor Emeritus
Experimental fluid mechanics, laser diagnostics, bio-fluid mechanics, turbomachinery
Yasuhiro Kamotani, PhD  
(Case Western Reserve University)  
Professor  
Experimental fluid dynamics, heat transfer, microgravity fluid mechanics

Thomas P. Kicher, PhD  
(Case Institute of Technology)  
Arthur P. Armington Professor Emeritus of Engineering  
Elastic stability; plates and shells; composite materials; dynamics; design; failure analysis

Joseph M. Mansour, PhD  
(Rensselaer Polytechnic Institute)  
Professor Emeritus  
Biomechanics and applied mechanics

Eli Reshotko, PhD  
(California Institute of Technology)  
Kent H. Smith Emeritus Professor of Engineering  
Fluid Dynamics; heat transfer, propulsion; power generation

James S. Tien, PhD  
(Princeton University)  
Professor Emeritus  
Combustion, propulsion, and fire research

Undergraduate Programs

Bachelor of Science in Engineering

Program Educational Objectives: Aerospace Engineering

- Graduates will enter and successfully engage in careers in Aerospace Engineering and other professions appropriate to their background, interests, and skills.
- Graduates will engage in continued learning through post-baccalaureate education and/or professional development in engineering or other professional fields.
- Graduates will develop as leaders in their chosen professions.

Program Educational Objectives: Mechanical Engineering

- Graduates will enter and successfully engage in careers in Mechanical Engineering and other professions appropriate to their background, interests, and skills.
- Graduates will engage in continued learning through post-baccalaureate education and/or professional development in engineering or other professional fields.
- Graduates will develop as leaders in their chosen professions.

Student Outcomes

- An ability to identify, formulate, and solve complex engineering problems by applying principles of engineering science and mathematics
- An ability to apply engineering design to produce solutions that meet specified needs with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors
- An ability to communicate effectively with a range of audiences
- An ability to recognize ethical and professional responsibilities in engineering situations and make informed judgments, which must consider the impact of engineering solutions in global, economic, environmental and societal contexts
- An ability to function effectively on a team whose members together provide leadership, create a collaborative and inclusive environment, establish goals, plan tasks, and meet objectives
- An ability to develop and conduct appropriate experimentation, analyze and interpret data, and use engineering judgment to draw conclusions
- An ability to acquire and apply new knowledge as needed, using appropriate learning strategies

The Bachelor of Science in Engineering degree program with a major in Aerospace Engineering is accredited by the Engineering Accreditation Commission of ABET, http://www.abet.org.

The Bachelor of Science in Engineering degree program with a major in Mechanical Engineering is accredited by the Engineering Accreditation Commission of ABET, http://www.abet.org.

Bachelor of Science in Engineering

Major in Aerospace Engineering

In addition to engineering general education requirements (p. 1292) and university general education requirements (p. 1212), the major requires the following courses:

<table>
<thead>

Technical Electives by Program
- All 200-, 300-, and 400-level courses from the following areas: EMAE all, EMAE cross-listed, EBME all, EBME cross-listed, ECIV all, ESCE all, ESCE cross-listed, EMAC all, EMSE all, EMSE cross-listed
- All 300- and 400-level courses in ECHE
- All 300-level MATH and STAT courses with the concurrence of the advisor

Bachelor of Science in Engineering
Suggested Program of Study: Major in Aerospace Engineering

The following is a suggested program of study. Current students should always consult their advisers and their individual graduation requirement plans as tracked in SIS (http://sis.case.edu/).

Total Units in Sequence: 129

Bachelor of Science in Engineering
Major in Mechanical Engineering

In addition to engineering general education requirements (p. 1292) and university general education requirements (p. 1212), the major requires the following courses:

Major Courses
- EMAE 160 Mechanical Manufacturing 3
- EMAE 181 Dynamics 3
- EMAE 250 Computers in Mechanical Engineering 3
- EMAE 251 Thermodynamics 3
- EMAE 252 Fluid Mechanics 3
- EMAE 260 Design and Manufacturing I 3
- EMAE 285 Mechanical Engineering Measurements Laboratory 4
- ECSE 304 Control Engineering I with Laboratory 3
- ECIV 310 Strength of Materials 3
- EMAE 350 Mechanical Engineering Analysis 3
Department of Mechanical and Aerospace Engineering

EMAE 353 Heat Transfer 3
EMAE 355 Design of Fluid and Thermal Elements 3
EMAE 360 Design and Manufacturing II 3
EMAE 370 Design of Mechanical Elements 3
EMAE 398 Senior Project 3
Four Technical Electives 12
Total Units 58

Technical Electives by Program
• All 200-, 300-, and 400-level courses from the following areas: EMAE all, EMAE cross-listed, EBME all, EBME cross-listed, ECIV all, ECSE all, ECSE cross-listed, EMAC all, EMSE all, EMSE cross-listed
• All 300- and 400-level courses in ECHE
• All 300-level MATH and STAT courses with the concurrence of the advisor

Science Electives for Mechanical Engineering Majors
The Student Information System is currently set up to accept PHYS 221 Introduction to Modern Physics or STAT 312 Basic Statistics for Engineering and Science as a science elective. Other courses for individual students can be selected with the approval of the student’s advisor and the chair using an Academic Advisement Requirement Form (https://case.edu/ugstudies/media/caseedu/undergraduate-studies/forms--applications/advisement-report-correction.pdf).

d May be taken fall or spring semester.
Double Major Mechanical and Aerospace Engineering

The department also offers a double major in Mechanical and Aerospace Engineering. Students completing this plan of study meet the requirements for both the Aerospace Engineering program and the Mechanical Engineering program. The course selection details are provided in the course listing section.

**Total Units in Sequence:** 132

Hours required for graduation: 132

* University general education requirement
** Engineering general education requirement
d May be taken fall or spring semester.

### Cooperative Education

Opportunities are available for students to alternate studies with work in industry or government as a co-op student, which involves paid full-time employment over seven months (one semester and one summer). Students may work in one or two co-ops, beginning in the third year of study. Co-ops provide students the opportunity to gain valuable hands-on experience in their field by completing a significant engineering project while receiving professional mentoring. During a co-op placement, students do not pay tuition but maintain their full-time student status while earning a salary. Learn more at http://engineering.case.edu/coop/. Alternatively or additionally, students may obtain employment as summer interns.

### BS/MS Program

The combined bachelors/masters program allows a student to double count 9 credit hours of graduate course work towards the Bachelor of Science in Engineering degree in any one of the department’s two degree programs. By completing the remaining graduate credit hours and a thesis, a student may earn a Master of Science degree in mechanical or aerospace engineering. This typically takes 5 years or slightly longer. Application to this program is initiated in the spring of the junior year with the department’s graduate student programs office. A minimum grade point of 3.2 is required for consideration for this accelerated program. Review the Office of Undergraduate Studies BS/MS program requirements here (p. 1298).
BS/MS Academic Program Details

The current regulations for the MS degree by the School of Graduate Studies (http://www.case.edu/provost/gradstudies/) require a minimum of 18 credit hours of coursework at the 400-level (or higher). Please note that any 400-level course taken prior to admission to the BS/MS Program cannot typically be counted as part of the MS degree. However, EMAE 398 Senior Project may be included in the double counted credit hours toward the MS Thesis, if appropriate.

Follow the links below to learn more about the components of the BS/MS Program.

- BS/MS Application Process (https://engineering.case.edu/emae/bs-ms/application-process/)
- BS/MS Thesis Project (https://engineering.case.edu/emae/bs-ms/thesis/)
- BS/MS Financial Aid (https://engineering.case.edu/emae/bs-ms/financial-aid/)
- BS/MS Graduation (https://engineering.case.edu/emae/bs-ms/graduation/)

If you have additional questions, please contact either:

- Professor Chirag Kharangate crk91@case.edu (kiju.lee@case.edu)
- Student Affairs Coordinator Carla Wilson cxw75@case.edu

Master of Engineering and Management Program

Another option is the 5 year TiME Program taught in conjunction with the Weatherhead School of Management in which a student completes a BS in Aerospace or Mechanical Engineering and earns a Master of Engineering and Management.

Minor in Mechanical Design and Manufacturing

A minor in Mechanical Design and Manufacturing is offered to students in other departments with an interest in design and manufacturing. The minor consists of an approved set of five EMAE courses.

Required Courses:

<table>

1). Student writes a one-page proposal clearly explaining how the project involves mechanical design and/or manufacturing at an advanced undergraduate level.

2). The proposal is approved by both the student’s major advisor, and the EMAE advisor for the mechanical design and manufacturing minor.

Total Units 15

Graduate Programs

MS Degree Programs

The Department of Mechanical and Aerospace Engineering offers the following Master of Science degrees:

- Mechanical Engineering MS
- Aerospace Engineering MS

Mechanical Engineering BS/MS and Aerospace Engineering BS/MS programs are also offered for our undergraduate students. For more information, click here (p. 192).

The Department of Mechanical and Aerospace Engineering participates in the practice-oriented Master of Engineering Program offered by the Case School of Engineering. The Master of Engineering degree is also available exclusively online. Visit http://online-engineering.case.edu/masters (http://online-engineering.case.edu/masters/) for more details.

Mechanical Engineering MS

A Mechanical Engineering MS is also available exclusively online. Visit http://online-engineering.case.edu/mechanical/ for more details.

Thesis-Focused Track

For a thesis-focused Mechanical Engineering MS, each candidate must complete a minimum of 30 hours of graduate-level credits, including:

1. a minimum of 21 hours of graduate-level courses and
2. 9 credit hours of MS thesis research.

Project-Focused Track

For a project-focused Mechanical Engineering MS, students must complete 30 credit hours distributed in either of three ways:

1. 24 credit hours (8 courses) of approved graduate coursework and 6 credit hours of project replacing the MS thesis,
2. 27 credit hours (9 courses) of approved graduate coursework and 3 credit hours of project replacing the MS thesis, or
3. 30 credit hours (10 courses) of approved graduate course work.

Course-Focused Track

For a course-focused Mechanical Engineering MS option, requirements consist of:

1. completion of 30 hours of approved coursework at the 400 level or higher,
2. satisfactory completion of the culminating course-focused experience, i.e. passing the course ENGR 600 with requirements defined by the student’s curricular program, and
3. additional requirements as specified by the program.

Students should consult with their academic advisor and/or department to determine the detailed requirements within this framework.
List of Required Graduate Courses
Depending on the area of interest, students should select courses from the list below with the approval of their advisor. Courses with double asterisks are required for the specific area of focus.

**Biomechanics**
- EMAE 414 Nanobiomechanics in Biology 3
- EMAE 415 Introduction to Musculo-skeletal Biomechanics 3
- EMAE 456 Micro-Electro-Mechanical Systems in Biology and Medicine (BioMEMS) ** 3
- EMAE 466 Mechanics of Biological Fluids 3
- EMAE 480 Fatigue of Materials 3

**Dynamics, Control and Manufacturing**
- ECSE 475 Applied Control 3
- EMAE 481 Advanced Dynamics I ** 3
- EMAE 487 Vibration Problems in Engineering ** 3
- EMAE 488 Advanced Robotics 3
- EMAE 540 Advanced Dynamics II 3
- EMAE 560 Sustainable Manufacturing ** 3

**Fluids and Thermal Sciences**
- EMAE 453 Advanced Fluid Dynamics I ** 3
- EMAE 454 Advanced Fluid Dynamics II 3
- EMAE 455 Advanced Thermodynamics ** 3
- EMAE 457 Combustion 3
- EMAE 459 Advanced Heat Transfer ** 3
- EMAE 471 Computational Fluid Dynamics 3

**Solid Mechanics**
- ECIV 411 Elasticity, Theory and Applications ** 3
- ECIV 420 Finite Element Analysis ** 3
- EMAE 401 Mechanics of Continuous Media ** 3
- EMAE 689 Special Topics 1 - 18

**Online and other Courses**
- EMAE 450 Advanced Mechanical Engineering Analysis 3
- EMAE 460 Theory and Design of Fluid Power Machinery 3
- EMAE 461 Chemistry of Fire Safe Polymers and Composites 3
- EMAE 494 Energy Systems 3

**Required courses for the given areas of focus**

**Mechanical Engineering MS with Specialization**

**Fire Science and Engineering**
The Case School of Engineering at Case Western Reserve University offers a Mechanical Engineering MS graduate program with a specialization in Fire Science and Engineering. Students can choose either a Mechanical Engineering MS or Macromolecular Science and Engineering MS (p. 158), both with a concentration in fire science. Case Western Reserve offers a unique intersection of expertise in macromolecular and combustion science and mechanical and chemical engineering, making us singularly suited to cover all aspects of fire protection, safety, and flammability.

Through a 30-credit-hour curriculum, students explore and learn how to apply the fundamental principles of fire behavior and dynamics, protection and suppression systems, polymeric materials structure, properties and selection and more. The program is designed to be completed in 12 months, but can be spread out over multiple years. Students have the option of completing a thesis or research project at their employers’ laboratories with Case Western Reserve faculty members as co-advisors. This fire protection engineering degree is offered over three semesters: 12 credits in the fall semester; 12 credits in the spring semester; and 6 credits in the summer. See the university’s academic calendar (https://case.edu/registrar/dates-deadlines/academic-calendar/).

The Fire Science and Engineering program at Case Western Reserve covers all aspects of combustion and fire suppression. After graduating from this degree program, students will be ready to apply their thorough understanding of:

- The chemistry of fire and materials
- Flammability logistics
- Fire dynamics and fire behavior
- Fire risk assessment
- Fire protection engineering
- Combustion
- Fire and safety-related codes
- Human behavior and life safety analysis
- Structural fire protection
- Passive fire protection systems
- Polymer engineering

**Fire Science and Engineering Specialization Minimum Requirements**

**Thesis-Focused Track**
1. Completion of at least 18 hours of graduate coursework at or above the 400 level. The coursework should consist of the following:
   a. 6 credit hours (two of the three core courses) from the Fluids and Thermal Sciences area in Mechanical and Aerospace Engineering.
   b. 12 credit hours (four of the six core courses) from the Fire Science and Engineering concentration.
2. Completion of 9 hours of thesis work culminating in a thesis examination given by at least three professors, plus approval by the chair of the department offering the degree.
3. Completion of another 3 credit hours by completing one of the following:
   a. 3 credit hours of MS thesis, or
   b. a 3 credit hour graduate class, or
   c. taking the 1 credit hour seminar course for 3 semesters.

**Project-Focused Track**
Completion of at least 30 hours of graduate coursework at or above the 400 level. The coursework should consist of the following:

1. 6 credit hours (two of the three core courses) from the Fluids and Thermal Sciences area in Mechanical and Aerospace Engineering.
2. 18 credit hours (all six of the core courses) from the Fire Science and Engineering concentration.
   a. Among these courses, up to two can be replaced by Special Problem coursework (i.e. project).
b. The Special Problem topic needs to be in Fire Science and Engineering field and be approved by the chair of the department offering the degree. The Special Problem course may be carried out at the student’s place of employment with nominal supervision by a faculty advisor or in the school’s laboratories under direct supervision.

3. 3 credit hours (one additional course) at or above the 400 level. Students should consult their advisor regarding selection of this course.

4. Completion of another 3 credit hours by completing one of the following:
   a. 3 credit hours of MS thesis, or
   b. a 3 credit hour graduate class, or
   c. taking the 1 credit hour seminar course for 3 semesters.

Six core fire protection engineering courses are required. Other courses can be chosen from the elective course list for mechanical engineering. The Mechanical Engineering MS with specialization follows a traditional mechanical engineering/combustion approach to fire protection and suppression, but with specialization classes in polymers.

How to Apply

Application to the Fire Science and Engineering program is handled through the university’s School of Graduate Studies. Students will need to know whether they wish to apply for the Mechanical Engineering MS or the Macromolecular Science and Engineering MS.

Students interested in applying to the Fire Science and Engineering program should already have a bachelor’s degree in Chemistry, Chemical Engineering, Mechanical Engineering or Materials Science & Engineering and have taken the GRE. Additional application requirements include a statement of objectives, academic transcripts, and three letters of recommendation. International students will also need to take the Test of English as a Foreign Language (TOEFL). Read more about the university’s full application procedure requirements here (http://www.case.edu/gradstudies/prospective-students/admissions-information/).

When you are ready to apply, electronic applications can be submitted here (https://app.applyyourself.com/AYApplicantLogin/fl_ApplicantConnectLogin.asp?id=case-gr).

For additional information, please contact: Ya-Ting Liao, Assistant Professor in the Department of Mechanical and Aerospace Engineering

Aerospace Engineering MS

Thesis-Focused Track
For a thesis-focused Aerospace Engineering MS, each candidate must complete a minimum of 30 hours of graduate-level credits, including:

1. a minimum of 21 hours of graduate-level courses and
2. 9 credit hours of MS thesis research.

Project-Focused Track
For a project-focused Aerospace Engineering MS, students must complete 30 credit hours distributed in either of three ways:

1. 24 credit hours (8 courses) of approved graduate coursework and 6 credit hours of project replacing the MS thesis,
2. 27 credit hours (9 courses) of approved graduate coursework and 3 credit hours of project replacing the MS thesis, or
3. 30 credit hours (10 courses) of approved graduate course work.

Course-Focused Track
For a course-focused Aerospace Engineering MS option, requirements consist of:

1. completion of 30 hours of approved coursework at the 400 level or higher,
2. satisfactory completion of the culminating course-focused experience, i.e. passing the course ENGR 600 with requirements defined by the student’s curricular program, and
3. additional requirements as specified by the program.

Students should consult with their academic advisor and/or department to determine the detailed requirements within this framework.

List of Required Graduate Courses

**Required courses for the given areas of focus**

**PhD Degree Programs**

Students wishing to pursue a Mechanical Engineering PhD or an Aerospace Engineering PhD must successfully pass the doctoral qualifying examination consisting of both written and oral components. Qualifying exams are offered on applied mechanics, dynamics and design or fluid and thermal engineering sciences. Students can choose to take it in the fall or spring semesters.

**Mechanical Engineering PhD**

The Mechanical Engineering PhD minimum course requirements are as follows:

**Depth Courses**
All programs of study must include 18 credit hours (six graduate-level mechanical courses) in mechanical engineering. Usually, these courses follow a logical development of a branch of mechanics, dynamics, and design or fluid and thermal engineering science determined in conjunction with the student’s dissertation advisor to meet the objectives of the dissertation research topic.

**Breadth and Basic Science Courses**
A minimum of 18 credit hours (six graduate courses) are required to fulfill the breadth and basic science courses. The basic science requirement is satisfied by taking two courses in the area of science and mathematics. Four additional courses are needed to provide the breadth outside the student’s area of research.

**Dissertation Research**
All doctoral programs must include a minimum of 18 credit hours of thesis research, EMAE 701 Dissertation Ph.D.

**Residence and Teaching Requirements**
All doctoral programs must meet the residency requirements of the School of Graduate Studies (p. 1327) and the teaching requirements of the Case School of Engineering.

**Aerospace Engineering PhD**

The Aerospace Engineering PhD minimum course requirements are as follows:

**Depth Courses**
All programs of study must include 18 credit hours (six graduate-level mechanical courses) in aerospace engineering. Usually, these courses follow a logical development of a branch of mechanics, dynamics, and design or fluid and thermal engineering science determined in conjunction with the student’s dissertation advisor to meet the objectives of the dissertation research topic.

**Breadth and Basic Science Courses**
A minimum of 18 credit hours (six graduate courses) are required to fulfill the breadth and basic science courses. The basic science requirement is satisfied by taking two courses in the area of science and mathematics.
Four additional courses are needed to provide the breadth outside the student's area of research.

**Dissertation Research**
All doctoral programs must include a minimum of 18 credit hours of thesis research, EMAE 701 Dissertation Ph.D.

**Residence and Teaching Requirements**
All doctoral programs must meet the residency requirements of the School of Graduate Studies (p. 1327) and the teaching requirements of the Case School of Engineering.

**List of Required PhD Courses**
Courses in bold are required for the specific area of focus.

**Biomechanics**
- EMAE 414 Nanobiomechanics in Biology 3
- EMAE 415 Introduction to Musculo-skeletal Biomechanics 3
- EMAE 456 Micro-Electro-Mechanical Systems in Biology and Medicine (BioMEMS) 3
- EMAE 466 Mechanics of Biological Fluids 3
- EMAE 480 Fatigue of Materials 3

**Dynamics, Control and Manufacturing**
- ECSE 475 Applied Control 3
- EMAE 481 Advanced Dynamics I 3
- EMAE 487 Vibration Problems in Engineering 3
- EMAE 488 Advanced Robotics 3
- EMAE 540 Advanced Dynamics II 3
- EMAE 560 Sustainable Manufacturing 3

**Fluids and Thermal Sciences**
- EMAE 453 Advanced Fluid Dynamics I 3
- EMAE 454 Advanced Fluid Dynamics II 3
- EMAE 455 Advanced Thermodynamics 3
- EMAE 457 Combustion 3
- EMAE 459 Advanced Heat Transfer 3
- EMAE 471 Computational Fluid Dynamics 3

**Solid Mechanics**
- ECIV 411 Elasticity, Theory and Applications 3
- ECIV 420 Finite Element Analysis 3
- EMAE 401 Mechanics of Continuous Media 3
- EMAE 689 Special Topics 1-18

**Online and other Courses**
- EMAE 450 Advanced Mechanical Engineering Analysis 3
- EMAE 460 Theory and Design of Fluid Power Machinery 3
- EMAE 461 Chemistry of Fire Safe Polymers and Composites 3
- EMAE 494 Energy Systems 3

**Facilities**
The education and research philosophy of the Department of Mechanical and Aerospace Engineering for both the undergraduate and graduate programs is based on a balanced operation of analytical, experimental, and computational activities. All three of these tools are used in a fundamental approach to the professional activities of research, development, and design. Among the major assets of the department are the experimental facilities maintained and available for the faculty, students, and staff.

The introductory undergraduate courses are taught through the Robert M. Ward '41 Laboratory, the Bingham Student Workshop, the Reinberger Product and Process Development Laboratory, and the Reinberger Design Studio. The Ward Laboratory is modular in concept and available to the student at regularly scheduled class periods to conduct a variety of prepared experimental assignments. The lab is equipped with a variety of instruments ranging from classic analog devices to modern digital computer devices for the collection of data and the control of processes. Advanced facilities are available for more specialized experimental tasks in the various laboratories dedicated to each specific discipline. Most of these laboratories also house the research activities of the department, so students are exposed to the latest technology in their prospective professional practice. Finally, every undergraduate and graduate degree program involves a requirement, i.e., Project, Thesis or Dissertation, in which the student is exposed to a variety of facilities of the department.

The following is a listing of the major laboratory facilities used for the advanced courses and research of the department.

**Biorobotics Laboratory Facilities**
The Biorobotics Laboratory (http://biorobots.cwru.edu/) consists of approximately 1080 square feet of laboratory and 460 square feet of office space. The lab includes two CNC machines for fabrication of smaller robot components. The lab's relationship with CAISR (Center for Automation and Intelligent Systems Research) provides access to a fully equipped machine shop where larger components are fabricated. The laboratory hardware features several biologically inspired hexapod robots including two cockroach-like robots, Robot III and Robot IV. Both are based on the Blaberus cockroach and have 24 actuated revolute joints. They are 17 times larger than the insect (30 inches long). Robot IV is actuated with pneumatic artificial muscles. A compressed air facility has been installed to operate the robots. In addition, the lab contains structural dynamic testing equipment (sensors, DAQ boards, shakers) and an automated treadmill (5 feet by 6 feet) for developing walking robots. The Biorobotics Laboratory contains 20 PCs and a dedicated LAN connected to the campus. Algor Finite Element Analysis software, Mechanical Desktop, and Pro/Engineer are installed for mechanical design and structural analysis. Also, the lab has developed dynamic simulation software for analyzing walking animals and designing walking robots.

**Distributed Intelligence and Robotics Laboratory**
The Distributed Intelligence and Robotics Laboratory (DIRL) is a new laboratory in the Department of Mechanical and Aerospace Engineering that facilitates research activities on robotics and mechatronics. The primary research focuses on distributed intelligence, multi-agent systems, biologically-inspired robotics and medical applications. The laboratory is currently being constructed to house self-sufficient facilities and equipment for designing, testing, and preliminary manufacturing. The DIRL also conduct theoretical research related to design methodology and control algorithms based on information theory, complexity analysis, and group theory.

**Mechanics of Materials Experimental Facility**
The major instructional, as well as research facility for experimental methods in mechanics of materials, is the Daniel K. Wright Jr.
Laboratory. Presently, the facility houses a single-stage gas-gun along with tension/compression split Hopkinson bar and torsional Kolsky bar apparatus for carrying out fundamental studies in dynamic deformation and failure of advanced material systems. Hewlett Packard and Tektronix high speed, wide bandwidth digitizing oscilloscopes along with strain-gage conditioners and amplifiers are available for data recording and processing. The facility houses state-of-the-art laser interferometry equipment for making spatial and temporal measurements of deformation. High-speed Hg-Cd-Te detector arrays are available for making time-resolved multi-point non-contact temperature measurements.

A Schenck Pegasus digital servo-controlled hydraulic testing system with a 20Kip Universal testing load frame equipped with hydraulic grips and instrumentation is available for quasi-static mechanical testing under load or displacement control. A newly developed moiré microscope is available for studying large-scale inelastic deformation processes on micron size scales. CCD camera along with the appropriate hardware/software for image acquisition, processing and analyzing of full field experimental data from optical interferometers such as moiré microscope, photo-elasticity, and other laser based spatial interferometers are available.

**Multiphase Flow and Laser Diagnostics Laboratory**
A laser diagnostics laboratory is directed toward investigation of complex two-phase flow fields involved in energy-related areas, bio-fluid mechanics of cardiovascular systems, slurry flow in pumps and thermoacoustic power and refrigeration systems. The laboratory is equipped with state-of-the-art Particle Image Velocimetry (PIV) equipment, Pulsed Ultrasound Doppler Velocimeter, Ultrasound concentration measurement instrumentation and modern data acquisition and analysis equipment including PCs. The laboratory houses a clear centrifugal slurry flow pump loop and heart pump loop. Current research projects include investigation of flow through microchip devices, CSF flow in ventricles, investigation of solid-slurry flow in centrifugal pumps using ultrasound technique and PIV, thermo-acoustic refrigeration for space application.

**Rotating Machinery Dynamics and Tribology Laboratory**
This laboratory focuses on rotating machinery monitoring and diagnostic methods relating chaos content of dynamic non-linearity and model-based observers’ statistical measures to wear and impending failure modes. A double-spool-shaft rotor dynamics test rig provides independent control over spin speed and frequency of an adjustable magnitude circular rotor vibration orbit for bearing and seal rotor-dynamic characterizations.

Simultaneous radial and axial time-varying loads on any type of bearing can be applied on a second test rig. Real-time control of rotor-mass unbalance at two locations on the rotor while it is spinning up to 10,000 rpm, simultaneous with rotor rubbing and shaft crack propagation, can be tested on a third rig. Self-excited instability rotor vibrations can be investigated on a fourth test rig.

**Musculoskeletal Mechanics and Materials Laboratories**
These laboratories are a collaborative effort between the Mechanical and Aerospace Engineering Department of the Case School of Engineering and the Department of Orthopaedics of the School of Medicine that has been ongoing for more than 40 years. Research activities have ranged from basic studies of mechanics of skeletal tissues and skeletal structures, experimental investigation of prosthetic joints and implants, measurement of musculoskeletal motion and forces, and theoretical modeling of mechanics of musculoskeletal systems. Many studies are collaborative, combining the forces of engineering, biology, biochemistry, and surgery. The Biomechanics Test labs include Instron mechanical test machines with simultaneous axial and torsional loading capabilities, a non-contacting video extensometer for evaluation of biological materials and engineering polymers used in joint replacements, acoustic emission hardware, and software, and specialized test apparatus for analysis of joint kinematics. The Bio-imaging Laboratory includes microscopes and three-dimensional imaging equipment for evaluating tissue microstructure and workstations for three-dimensional visualization, measurement, and finite element modeling. An Orthopaedic Implant Retrieval Analysis lab has resources for characterization and analysis of hard tissues and engineering polymers, as well as resources to maintain a growing collection of retrieved total hip and total knee replacements that are available for the study of implant design. The Soft Tissue Biomechanics lab includes several standard and special test machines. Instrumentation and histology facilities support the activities within the Musculoskeletal Mechanics and Materials Laboratories

**nanoEngineering Laboratory**
The nanoEngineering Laboratory focuses on research related to various nanotechnology applications with particular emphasis on energy conversion, generation, and storage in nanostructured and bio-inspired materials. Synthesis of polymer-based nanocomposites, nanofluids, and individual nanostructures is accomplished with tools available in the laboratory. Furthermore, the laboratory houses various pieces of equipment for thermal and electrical characterization of these materials. Research projects include investigation of nanocomposites for thermoelectric devices, molecular simulation of thermal transport across interfacial regions, characterization of nanomaterials for thermal management (of electronics and buildings) as well as thermal insulation applications, and biomimetic research on a protein-based shark gel.

**Other Experimental Facilities**
The department facilities also include several specialized laboratories.

**Engineering Services Fabrication Center** offers complete support to assist projects from design inception to completion of fabrication. Knowledgeable staff is available to assist Faculty, Staff, Students, Researchers, and personnel associated with Case Western Reserve University.

**The Bingham Student Workshop** is a 2380 sq. ft. facility complete with machining, welding, metal fabrication, and woodworking equipment. This facility is available for the Case undergrads in Mechanical Engineering. Before gaining access to the shop all ME students are required to take the EMAE 160, Mechanical Manufacturing course. This course gives the student a foundation in basic machining, welding, sheet metal fabrication, and safety. Manual drafting, design, and computer-aided drafting is also included in the course. After completion, the student can use the shop for other Mechanical Engineering courses requiring prototypes. The BSW, is also, used for senior projects and student organizations, such as the SAE Baja and Formula and the Design-Build and Fly.

**The Harry A. Metcalf Laboratory** in Glennan Hall Room 458, which was made possible through the generous gift of Sylvia Lissa to honor her late husband and Mechanical Engineering graduate, Class of 1903, has recently been renovated and updated. The restructuring of the computational lab and adjacent experimental lab takes advantage of the Case School of Engineering’s Virtual Desktop Infrastructure built on Citrix XenDesktop via gigabit networking. This high-speed networking provides access to software packages including SolidWorks, PTC Creo,
MasterCam, Abaqus, MatLab, Microsoft Office, Mathematica, LabView, and many others. The lab is set up to allow the students to use their laptops or ones provided in the lab by the Department for course and project work. As a result of using the Virtual Desktop Infrastructure, engineering students will also be able to access the engineering software listed above from anywhere on any device. Students' home drives are automatically mapped as well when using the virtual applications so that they have access to their files at all times on any device.

The Reinberger Design Studio includes a total of 33 Wyse terminals for Undergraduate Student design use. The Studio is tied directly to the campus network allowing information to be shared with the HAMCL and other network resources. The Studio is used for the instruction of the SolidWorks 2005 CAD software, MasterCam 9.0 CAM software, Solidworks CAD/CAM/FEA software, and Algor 16.1 FEA software. The RDS also offers a 3D Systems SLA 250 and a Dimension machine for generating SLA models from CAD models.

The Reinberger Product and Process Development Laboratory is 1600 square feet of laboratory and office space dedicated to computer-aided engineering activities. The computer numerical control (CNC) laboratory includes both two industrial sized machine tools with additional space for lecture and group project activities. The CNC machine tools located in the laboratory are: a HAAS VF3 4 axis-machining center, a HAAS 2 axis lathe. A Mitutoyo coordinate measuring machine (CMM) located in its own laboratory space completes the facilities. The CMM enables students to inspect their manufactured components to a very degree of precision. The laboratory is used to support both undergraduate and graduate manufacturing courses (EMAE 390, EMAE 490).

High Performance Computing- For high performance computing the department uses the CWRU high performance computing cluster (HPCC). The HPCC consists of 112 compute nodes with Intel Pentium 4 Xeon EM64T processors. All nodes are interconnected with Gigabit Ethernet for MPI message passing and all nodes are interconnected by a separate Ethernet for the purpose of out-of-band cluster management. The MAE Department also has direct access to all the Ohio Supercomputing Center and all NSF supercomputing centers, primarily to the Pittsburgh Supercomputing Center. Computing-intensive research projects can obtain an account on those supercomputers through their advisers. Research projects carried on in cooperation with the NASA Glenn Research Center can have access to NASA computing facilities. Sophisticated, extensive, and updated general and graphics software are available for applications in research and classroom assignments.

Courses

EMAE 160. Mechanical Manufacturing. 3 Units.
The course is taught in two sections-Graphics and Manufacturing. Manufacturing To introduce manufacturing processes and materials and their relationships to mechanical design engineering. Course includes hands-on machining and metal fabrication lab. Also, each lab creates a ‘virtual’ field trip of a manufacturing facility to be shared with the class. Graphics Development of mechanical engineering drawings in orthographic, sectional, and pictorial views using manual drafting and computer-aided drafting (CAD software), dimensioning, tolerancing geometric dimensioning and tolerancing and assembly drawings will also be covered. All students are paired up to give a Manufacturing Design Presentation demonstrating the course material. The course has two (75) minute lectures and one (110) minute Machining Lab per week.

EMAE 181. Dynamics. 3 Units.
Elements of classical dynamics: particle kinematics and dynamics, including concepts of force, mass, acceleration, work, energy, impulse, momentum. Kinetics of systems of particles and of rigid bodies, including concepts of mass center, momentum, mass moment of inertia, dynamic equilibrium. Elementary vibrations. Recommended preparation: MATH 122 and PHYS 121 and ENGR 200.

EMAE 250. Computers in Mechanical Engineering. 3 Units.

EMAE 251. Thermodynamics. 3 Units.
Thermodynamic concepts and definitions, properties of pure substances, work and heat, first and second laws, entropy, power and refrigeration cycles, thermodynamic relations, mixtures and solutions, chemical reactions, phase and chemical equilibrium. Prereq: CHEM 111, PHYS 121 and MATH 122.

EMAE 252. Fluid Mechanics. 3 Units.
Fluid properties, hydrostatics, fluid dynamics and kinematics, control volume analysis, differential analysis, dimensional analysis and similarity, viscous internal flows, external flows and boundary layers, lift and drag. Prereq: EMAE 251 and MATH 223.

EMAE 260. Design and Manufacturing I. 3 Units.
This is the second course of a 4-course sequence focusing on "Engineering Design and Manufacturing." This course develops students' competence and self-confidence as design engineers by exposing the students to design as a creative process and its relationship with modern manufacturing practices. The outcomes of the course focus on the student's ability to apply their knowledge of mathematics, science, and engineering to design a system, component, or process that meets desired needs within realistic, multi-dimensional constraints, such as: economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability. Additionally, students will be given the opportunity to identify, formulate, and solve engineering problems, while applying professional and ethical practices. Professional communication skills are emphasized and expected during all stages of the design process. The course has five main areas of emphasis: design as a creative process, decision-based design methodologies, project management, engineering economics, and design for manufacture (CAD/CAM/CAE) using industrial software tools. The course exposes the student to the integration of engineering design, manufacturing, and management disciplines and includes activities to consider and understand the complex processes associated with controlling and managing product data through all stages of the product life-cycle (PLM). Topics include: engineering ethics, design as a creative process, design methodologies, project management, engineering economics, product life-cycle management (PLM), CAD/CAM/CAE, and the role of digital manufacturing within the design process. Design/Rapid Prototyping Studio activities are an integral part of the course, and enable the students to be part of a design and build team working on various project-based tasks. Prereq: EMAE 160.
EMAE 272. Actuators and Drive Trains. 3 Units.
Graphical, analytical, and computer techniques for analyzing displacements, velocities, and accelerations in mechanisms. Analysis and synthesis of linkages, cams, and gears. Analysis of actuators, including motors, linear actuators, solenoids, hydraulics, pneumatics, and piezoelectrics. Laboratory projects include analysis, design, construction, and evaluation of students’ devices that include both actuators and transmission mechanisms. Prereq: EMAE 181 and EMAE 250.

EMAE 285. Mechanical Engineering Measurements Laboratory. 4 Units.
Techniques and devices used for experimental work in mechanical and aerospace engineering. Lecture topics include elementary statistics, linear regression, propagation of uncertainty, digital data acquisition, characteristics of common measurement systems, background for measurement laboratories, and elements of report writing. Hands-on laboratory experiences may include measurements in solid mechanics, dynamics, and fluid and thermal sciences, which are summarized in group reports. At least one report will focus on design of a measurement. Recommended preparation: ENGR 181, ENGR 225 and ECIV 310.

EMAE 290. Computer-Aided Manufacturing. 3 Units.
An advanced design and manufacturing engineering course covering a wide range of topics associated with the ‘design for manufacturability’ concept. Students will be introduced to a number of advanced solid modeling assignments (CAD), rapid prototyping (RP), and computer-aided manufacturing (CAM). In addition, students will be introduced to computer numerical control (CNC) manual part-programming for CNC milling and turning machine tools. All students will be given a design project requiring all detail and assembly drawings for a fully engineered design. The course has two (50) minute lectures and one (110) minute CAD/CAM Lab per week. Prereq: EMAE 160.

EMAE 307. Fundamentals of Biomechanics. 3 Units.
Fundamentals of biomechanics will teach students how to apply basic principles of mechanics to understand, explain, and model biological processes at the cross of the relevant length-scales (cell-tissue-organ-organism), and over a broad range of physiological systems (respiratory, ocular, circulatory, and musculoskeletal). Physiology of organs and tissues that are involved in biomechanical functions will also be covered. Offered as EMAE 307 and EBME 317. Prereq: ENGR 200.

EMAE 350. Mechanical Engineering Analysis. 3 Units.

EMAE 352. Thermodynamics in Energy Processes. 3 Units.
Thermodynamic properties of liquids, vapors and real gases, thermodynamic relations, non-reactive mixtures, psychometrics, combustion, thermodynamic cycles, compressible flow. Prereq: ENGR 225.

EMAE 353. Heat Transfer. 3 Units.
Steady-state and transient conduction, principles of convection, empirical relations for forced convection, natural convection, boiling and condensation, radiation heat transfer, heat exchangers, mass transfer. Prereq: EMAE 251 and EMAE 252.

EMAE 355. Design of Fluid and Thermal Elements. 3 Units.

EMAE 356. Aerospace Design. 3 Units.
Interactive and interdisciplinary activities in areas of fluid mechanics, heat transfer, solid mechanics, thermodynamics, and systems analysis approach in design of aerospace vehicles. Projects involve developing (or improving) design of aerospace vehicles of current interest (aircraft and spacecraft) starting from mission requirements to researching developments in relevant areas and using them to obtain conceptual design. Prereq: EMAE 160, EMAE 355, EMAE 376, EMAE 383, EMAE 384 and Senior standing. Coreq: EMAE 382.

EMAE 359. Aero/Gas Dynamics. 3 Units.

EMAE 360. Design and Manufacturing II. 3 Units.
This is the third course of a 4-course sequence focusing on "Engineering Design and Manufacturing," and is the senior capstone design course focused on a semester-long design/build/evaluate project. The course draws on a student’s past and present academic and industrial experiences and exposes them to the design and manufacture of a product or device that solves an open-ended "real world" problem with multidimensional constraints. The course is structured and time-tabled within the Case School of Engineering (CSE) to give the EMAE 360 students the opportunity to team with students from other CSE departments (e.g., BME and EECS) to form multidisciplinary design teams to work on the solution to a common problem. The outcomes of the course continue to focus on the student’s ability to function on multidisciplinary teams while applying their knowledge of mathematics, science and engineering to design a system, component, or process that meets desired needs within realistic, multidimensional constraints, such as: economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability. Professional communication skills are emphasized and expected during all stages of the design process and will include formal and informal oral presentations, periodic peer-focused design reviews, and a development through its various evolutionary stages to completion. Counts as SAGES Senior Capstone. Prereq: EMAE 160 and EMAE 260.

EMAE 363. Mechanical Engineering Modern Analysis Methods. 3 Units.
This is a required mechanical engineering course to develop an in-depth fundamental understanding of current analysis software tools, as well as to develop an ability to perform practical analyses using current software tools to analyze assigned industrial case studies for the following topical areas: (1) mechanism synthesis, (2) finite element analyses for stress and deflection, (3) machinery vibration, and (4) computational fluid dynamics. It is comprised of three lectures and one software application laboratory period per week. Prereq: ENGR 225, EMAE 181, EMAE 250, and ECIV 310.

EMAE 370. Design of Mechanical Elements. 3 Units.

EMAE 371. Computational Fluid Dynamics. 3 Units.
EMAE 372. Structural Materials by Design. 4 Units.

EMAE 376. Aerostructures. 3 Units.

EMAE 377. Biorobotics Team Research. 3 Units.
Many exciting research opportunities cross disciplinary lines. To participate in such projects, researchers must operate in multidisciplinary teams. The Biorobotics Team Research course offers a unique capstone opportunity for undergraduate students to utilize skills they developed during their undergraduate experience while acquiring new teaming skills. A group of eight students form a research team under the direction of two faculty leaders. Team members are chosen from appropriate majors through interviews with the faculty. They will research a biological mechanism or principle and develop a robotic device that captures the actions of that mechanism. Although each student will cooperate on the team, they each have a specific role, and must develop a final paper that describes the research generated on their aspect of the project. Students meet for one class period per week and two 2-hour lab periods. Initially students brainstorm ideas and identify the project to be pursued. They then acquire biological data and generate robotic designs. Both are further developed during team meetings and reports. Final oral reports and a demonstration of the robotic device occur in week 15. Offered as BIOL 377, EMAE 377, BIOL 467, and EMAE 477. Counts as SAGES Senior Capstone.

EMAE 379. Mechanics and Control of Compliant Robotics. 3 Units.
Robots are fundamentally mechanical devices designed to function autonomously or semi-autonomously. In autonomous systems including animals and robots, one of the most important mechanical properties is stiffness. Selective compliance allows robots to grasp a wide range of objects and traverse rougher terrain. A new field of Soft Robotics aims to create robots that are robust, cheap, and safe in close proximity to humans. However, as engineers challenge themselves to make increasingly soft robots, new challenges in design and control need to be addressed. This course will provide an introduction to state of the art in robotics as cyber-physical systems from a fundamental mechanics perspective. Topics include: grasping, wearable assistive locomotion, legged locomotion, locomotion in fluids, and locomotion over soft terrain. Offered as EMAE 379 and EMAE 479. Prereq: (ENGR 131 or EECS 132) and EMAE 181 and EECS 304.

EMAE 382. Propulsion. 3 Units.

EMAE 383. Flight Mechanics. 3 Units.
Aircraft performance: take-off and landing, unaccelerated flight, range and endurance, flight trajectories. Aerodynamics and propulsion. Aircraft static stability and control, simple maneuvers. Aircraft flight dynamics and control, flight simulation. Offered as EMAE 383 and EMAE 483. Prereq: EMAE 181 and EMAE 252 and EMAE 359 and (EECS 304 or ECSE 304).

EMAE 384. Orbital Dynamics. 3 Units.
Spacecraft orbital mechanics: the solar system, elements of celestial mechanics, orbit transfer under impulsive thrust, continuous thrust, orbit transfer, decay of orbits due to drag, elements of lift-off and re-entry. Rigid body dynamics, altitude dynamics and control, simulations. Prereq: EMAE 181 and EMAE 252 and EMAE 359 and (EECS 304 or ECSE 304).

EMAE 387. Vibration Problems in Engineering. 4 Units.

EMAE 390. Advanced Manufacturing Technology. 3 Units.
This course will focus on advanced manufacturing technologies and processes, with an emphasis on the fundamental understanding of the material behaviors and process in the manufacturing operations. Topics will include: materials in manufacturing, glass manufacturing, polymer composite manufacturing, metal casting, metal machining, metal forming, grinding, welding, heat treatment, and quality control. The course will be lecture-based, with lab-based class project in the machine shop and think[box] studios. Prereq: EMAE 290.

EMAE 396. Special Topics in Mechanical and Aerospace Engineering. 1 - 18 Units.
(Credit as arranged.)

EMAE 397. Independent Laboratory Research. 1 - 3 Units.
Independent research in a laboratory.

EMAE 398. Senior Project. 3 Units.
Individual or team design or experimental project under faculty supervisor. Requirements include periodic reporting of progress, plus a final oral presentation and written report. Recommended preparation: Senior standing, EMAE 360, and consent of instructor. Counts as SAGES Senior Capstone.

EMAE 399. Advanced Independent Laboratory Research/Design. 1 - 3 Units.
Students perform advanced independent research or an extended design project under the direct mentorship of the instructor. Typically performed as an extension to EMAE 397 or EMAE 398. Prereq: EMAE 397.
EMAE 400T. Graduate Teaching I. 0 Unit.
This course will engage the Ph.D. candidate in a variety of teaching experiences that will include direct contact (for example, teaching recitations and laboratories, guest lectures, office hours) as well non-contact preparation (exams, quizzes, demonstrations) and grading activities. The teaching experiences will be conducted under the supervision of the faculty member(s) responsible for coordinating student teaching activities. All Ph.D. candidates enrolled in this course sequence will be expected to perform direct contact teaching at some point in the sequence. Recommended preparation: Ph.D. student in Mechanical Engineering.

EMAE 401. Mechanics of Continuous Media. 3 Units.
Vector and tensor calculus. Stress and traction, finite strain and deformation tensors. Kinematics of continuous media, general conservation and balance laws. Material symmetry groups and observer transformation. Constitutive relations with applications to solid and fluid mechanics problems.

EMAE 414. Nanobiomechanics in Biology. 3 Units.
This course will elucidate the forces at play at the level of proteins including those associated with mass, stiffness, viscosity, thermal and chemical factors. Basic polymer mechanics within the context of biological molecules will be covered and structures of key proteins associated with mechanical functions, such as actin, myosin and the cell membrane will be explained. Generation of force by polymerization of filamentous proteins as well as motor proteins will be included. Interaction forces between proteins, DNA/RNA mechanics will also be elucidated. Besides lectures, there will be term long project assignments (outreach-based or detailed literature survey on a subject associated with nanomechanics of cells/proteins). Recommended Preparation: Mechanics of Materials, Thermodynamics, Statics, Introductory Level Differential Equations, Introductory Level Fluid Mechanics.

EMAE 415. Introduction to Musculo-skeletal Biomechanics. 3 Units.

EMAE 450. Advanced Mechanical Engineering Analysis. 3 Units.
This course is intended to equip students with tools for solving mathematical problems commonly encountered in mechanical, fluid and thermal systems. Specific goals are to: i) Enable the student to properly categorize the problem in a variety of ways ii) Enable the student to identify appropriate approaches to solving the problem iii) Provide the student experience in applying some common methods for obtaining numerical solutions iii) Provide the student with understanding of trade-offs and expectations for the methods used. The course covers topics related to analytical and computational approaches to problems categorized in a variety of ways including: 1. Linear versus nonlinear problems 2) finite degrees of freedom v. infinite degrees of freedom, 3) equilibrium v. propagation v. eigenvalue problems, 4) direct formulations v. indirect formulations 5) analytical v. numerical solutions. The course will be built around specific examples from solid mechanics, dynamics, vibrations, heat transfer and fluid mechanics. The significance of the various categorizations will be developed as an ongoing part of the approach to solving the problems. Prereq: EMAE 350 or Requisites Not Met permission.

EMAE 453. Advanced Fluid Dynamics I. 3 Units.
Derivation and discussion of the general equations for conservation of mass, momentum, and energy using tensors. Several exact solutions of the incompressible Newtonian viscous equations. Kinematics and dynamics of inviscid, incompressible flow including free streamline theory developed using vector, complex variable, and numerical techniques.

EMAE 454. Advanced Fluid Dynamics II. 3 Units.

EMAE 455. Advanced Thermodynamics. 3 Units.
Basic ideas of thermodynamics and dominant methods of their development: operational, postulational, and statistical. Entropy and information theory. Irreversible thermodynamics. Applications.

Microscale technologies have enabled advanced capabilities for researchers in unexplored territories of cells in biology and medicine. Biological (or Biomedical) Micro-Electro-Mechanical Systems (MEMS) and Biomanufacturing involve the fundamentals of mechanics, electronics and advanced microfabrication technologies with specific emphasis on biological applications. MEMS is an interdisciplinary research area which brings together multiple disciplines including, mechanical engineering, biomedical engineering, chemical engineering, materials science, electrical engineering, clinical sciences, medicine, and biology. MEMS based technologies have found real world applications in tissue engineering, implantable microdevices, proteomics, genomics, molecular biology, and point-of-care platforms. This course aims to: (1) introduce the need for miniaturized systems in biology and medicine and the fundamental design and microfabrication concepts, (2) introduce the basics of microscale manipulation of cells, biological agents, and biomanufacturing, employing the fundamentals of microscale behaviors of fluids and mechanical systems, (3) expose the students to applications of MEMS and on-chip technologies in biology and medicine.

EMAE 457. Combustion. 3 Units.
Chemical kinetics and thermodynamics; governing conservation equations for chemically reacting flows; laminar premixed and diffusion flames; turbulent flames; ignition; extinction and flame stabilization; detonation; liquid droplet and solid particle combustion; flame spread, combustion-generated air pollution; applications of combustion processes to engines, rockets, and fire research.

EMAE 459. Advanced Heat Transfer. 3 Units.
Analysis of engineering heat transfer from first principles including conduction, convection, radiation, and combined heat and mass transfer. Examples of significance and role of analytic solutions, approximate methods (including integral methods) and numerical methods in the solution of heat transfer problems. Recommended preparation: EMAE 453.

EMAE 460. Theory and Design of Fluid Power Machinery. 3 Units.
Fluid mechanic and thermodynamic aspects of the design of fluid power machinery such as axial and radial flow turbomachinery, positive displacement devices and their component characterizations. Recommended preparation: Consent of instructor.
EMAE 461. Chemistry of Fire Safe Polymers and Composites. 3 Units.
Chemistry of Fire Safe Polymers and Composites starts with the introduction of characterization techniques used for fire safe materials and combustion phenomena research. General discussion on how reduced flammability of polymers and composites are obtained, for example by additives and preparing intrinsically thermally stable chemical structure and some examples of smart approaches, will be discussed. It also discusses the synthetic methods of preparing high temperature stable polymers in addition to the raw materials used to prepare those materials. Special emphasis will be placed on the thermal stability data obtained by thermogravimetric analysis (TGA) and combustion calorimetry for those fire safe materials. Mechanistic aspects of the flammability of polymers will be explained with special emphasis on the molar contribution of chemical functionality to the heat release capacity. Theoretical derivation of thermokinetic parameters will be explained. In addition, a common sense build-up will be attempted by providing actual numbers associated with those thermokinetic parameters. Upon completion of background formation, a more advanced materials, composites and nanocomposites, will be discussed using the results recently reported. Preliminary attempts to explain flame retardation by nanocomposite structures will also be discussed. Offered as EMAC 461 and EMAE 461.

EMAE 463. Fire Dynamics. 3 Units.
This course introduces compartment fires and burning behavior of materials. Topics include: buoyant driven flow, fire plume, ceiling jet, vent flow, flashover and smoke movement as well as steady burning of liquids and solids; ignition, extinction and flame spread over solids. Recommended Preparation: Elementary knowledge in thermo-fluids is required. Offered as EMAE 463 and EMAC 463. Prereq: EMAE 325 or Requisites Not Met permission.

EMAE 464. Fire Protection Engineering. 3 Units.
This course introduces essentials of fire protection in industry and houses. Topics include: hazard identification (release of flammable gases and their dispersion), fire and explosion hazards, prevention and risk mitigation, fire detection systems, mechanisms of fire extinguishment, evaluation of fire extinguishing agents and systems. Offered as EMAC 464 and EMAE 464.

EMAE 466. Mechanics of Biological Fluids. 3 Units.
This is a senior/graduate level course which aims to provide a solid grasp of the role of mechanics in biological fluids and in the human circulatory system that will help in the research and design of new medical instruments, equipment, and procedures. The course will cover properties of Newtonian and non-Newtonian fluids, hydrostatic and dynamic forces, principles of continuity, conservation of mass, energy and momentum and their applications in biological fluids, laminar and turbulent flows and boundary layer, introduction to Navier Stokes, dimensional analysis and similarity, blood flow in the cardiovascular system, gas exchange in the pulmonary system, blood flow in microcirculation and vessels. Important concepts will be covered by case studies.

EMAE 471. Computational Fluid Dynamics. 3 Units.

EMAE 477. Biorobotics Team Research. 3 Units.
Many exciting research opportunities cross disciplinary lines. To participate in such projects, researchers must operate in multidisciplinary teams. The Biorobotics Team Research course offers a unique capstone opportunity for undergraduate students to utilize skills they developed during their undergraduate experience while acquiring new teaming skills. A group of eight students form a research team under the direction of two faculty leaders. Team members are chosen from appropriate majors through interviews with the faculty. They will research a biological mechanism or principle and develop a robotic device that captures the actions of that mechanism. Although each student will cooperate on the team, they each have a specific role, and must develop a final paper that describes the research generated on their aspect of the project. Students meet for one class period per week and two 2-hour lab periods. Initially students brainstorm ideas and identify the project to be pursued. They then acquire biological data and generate robotic designs. Both are further developed during team meetings and reports. Final oral reports and a demonstration of the robotic device occur in week 15. Offered as BIOL 377, EMAE 377, BIOL 467, and EMAE 477. Counts as SAGES Senior Capstone.

EMAE 479. Mechanics and Control of Compliant Robotics. 3 Units.
Robots are fundamentally mechanical devices designed to function autonomously or semi-autonomously. In autonomous systems including animals and robots, one of the most important mechanical properties is stiffness. Selective compliance allows robots to grasp a wide range of objects and traverse rougher terrain. A new field of Soft Robotics aims to create robots that are robust, cheap, and safe in close proximity to humans. However, as engineers challenge themselves to make increasingly soft robots, new challenges in design and control need to be addressed. This course will provide an introduction to state of the art in robotics as cyber-physical systems from a fundamental mechanics perspective. Topics include: grasping, wearable assistive locomotion, legged locomotion, locomotion in fluids, and locomotion over soft terrain. Offered as EMAE 379 and EMAE 479.

EMAE 480. Fatigue of Materials. 3 Units.

EMAE 481. Advanced Dynamics I. 3 Units.

EMAE 482. Propulsion. 3 Units.

EMAE 483. Flight Mechanics. 3 Units.
Aircraft performance: take-off and landing, unaccelerated flight, range and endurance, flight trajectories. Aerodynamics and propulsion. Aircraft static stability and control, simple maneuvers. Aircraft flight dynamics and control, flight simulation. Offered as EMAE 383 and EMAE 483.
EMAE 487. Vibration Problems in Engineering. 3 Units.

EMAE 488. Advanced Robotics. 3 Units.
This course will focus on up-to-date knowledge and theories related to robotics and multi-agent systems. Related mathematics and theories including group theory (Lie groups), rigid-body motions (SO(3) and SE(3)), kinematics, dynamics, and control will be studied. In addition, the class will also discuss structural, computational and task complexity in robotic systems based on combinatorial analysis, information theory, and graph theory. Lecture and discussion topics: Kinematics; Introduction to Group Theory and Lie Groups; Rigid-body Motions (SO(3), SE(3)); Multi-body Dynamical Systems: Order-N computational methods; Complexity Analysis for Robotic Systems; Structural complexity, information-theoretic complexity, and task complexity; Special Discussion Topics; Special discussion topics may vary each year. Students enrolled in this class will be required to conduct a final project. Two or three students will work as a team. The topics for student teams may include: computer simulation of multi-body dynamical systems, art robot design, and complexity analysis for coupled complex systems. The detailed information will be provided in the first week of the class. The final presentations and demonstrations will be held during the last week of class and will be open to the public audience. Students are also required to submit a final report following a IEEE conference paper template.

EMAE 489. Robotics I. 3 Units.

EMAE 494. Energy Systems. 3 Units.
The overarching goal of this course is to introduce energy systems to graduate students, allowing the class to explore energy resource options and technologies. We will evaluate (from a scientific, mathematical and societal perspective) the trade-offs and uncertainties of various energy systems and explores a framework for assessing solutions. Topics will include resource estimation, environmental effects and economic evaluations of fossil fuels, nuclear power, hydropower, solar energy and more. Prereq: Junior or Senior Undergraduate Engineering major or Graduate Engineering major.

EMAE 500T. Graduate Teaching II. 0 Unit.
This course will engage the Ph.D. candidate in a variety of teaching experiences that will include direct contact (for example, teaching, recitations and laboratories, guest lectures, office hours) as well non-contact preparation (exams, quizzes, demonstration) and grading activities. The teaching experience will be conducted under the supervision of the faculty member(s) responsible for coordinating student teaching activities. All Ph.D. candidates enrolled in this course sequence will be expected to perform direct contact teaching at some point in the sequence. Recommended preparation: Ph.D. student in Mechanical Engineering.

EMAE 540. Advanced Dynamics II. 3 Units.

EMAE 552. Viscous Flow Theory. 3 Units.
Compressible boundary layer theory. Blowing and suction effects. Three-dimensional flows; unsteady flows. Introduction to real gas effects. Recommended preparation: EMAE 454.

EMAE 554. Turbulent Fluid Motion. 3 Units.

EMAE 557. Convective Two-Phase Flow and Heat Transfer. 3 Units.

EMAE 558. Conduction and Radiation. 3 Units.
Fundamental law, initial and boundary conditions, basic equations for isotropic and anisotropic media, related physical problems, steady and transient temperature distributions in solid structures. Analytical, graphical, numerical, and experimental methods for constant and variable material properties. Recommended preparation: Consent of instructor.

EMAE 560. Sustainable Manufacturing. 3 Units.
This course focuses on sustainable manufacturing principles and analysis methods including material flow analysis, energy flow analysis, life cycle assessment, and Taguchi method, etc., and covers a comprehensive list of manufacturing processes from conventional manufacturing such as metal casting and machining, to emerging manufacturing techniques like additive manufacturing and nano-manufacturing on their sustainable manufacturing operations and practices. Some of the important goals of this course are: a. Students learn to understand the fundamental methods and techniques of sustainable manufacturing. b. Students learn the theory and practices on sustainable manufacturing through sustainability analysis and improvement of industrial manufacturing processes. c. Students learn state-of-the-art knowledge on environmental impact assessment methods. d. Students apply the learned knowledge and skills in class discussions and project implementation. Prereq: Graduate student standing.

EMAE 600T. Graduate Teaching III. 0 Unit.
This course will engage the Ph.D. candidate in a variety of teaching experiences that will include direct (for example, teaching recitations and laboratories, guest lectures, office hours) as well non-contact preparation (exams, quizzes, demonstrations) and grading activities. The teaching experience will be conducted under the supervision of the faculty member(s) responsible for coordinating student teaching activities. All Ph.D. candidates enrolled in this course sequence will be expected to perform direct contact teaching at some point in the sequence. Recommended preparation: Ph.D. student in Mechanical Engineering.
EMAE 601. Independent Study. 1 - 18 Units.
EMAE 649. Project M.S.. 1 - 6 Units.
EMAE 650. Grad Student Seminar. 1 Unit.
This seminar course is to broaden the knowledge and enhance the academic background of the graduate students in Mechanical and Aerospace Engineering through attending seminars on the cutting-edge research topics presented by both internal and externally-invited speakers.

EMAE 651. Thesis M.S.. 1 - 18 Units.
(Credit as arranged.)
EMAE 689. Special Topics. 1 - 18 Units.
EMAE 695. Project M.S.. 1 - 9 Units.
Research course taken by Plan B M.S. students. Prereq: Enrolled in the EMAE Plan B MS Program.
EMAE 701. Dissertation Ph.D.. 1 - 9 Units.
(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

Division of Engineering Leadership and Professional Practice
312 Nord (7240)
http://engineering.case.edu/delpp/
Phone: 216.368.5119

The Division of Engineering Leadership and Professional Practice (http://engineering.case.edu/delpp/) (DELPP) designs, develops and administers programs and opportunities which complement and enhance the curricular offerings in the Case School of Engineering.

The DELPP staff is committed to serving all engineering undergraduate and graduate students. We work closely with students, faculty, staff, and off-campus organizational representatives to deliver experiences designed to promote excellence in engineering education.

Mission
The mission of the Division of Engineering Leadership and Professional Practice is to support, through teaching and educational research, the Case School of Engineering’s educational programs, student programs, and outreach activities at all academic levels: PreK-12, undergraduate, graduate, and continuing education.

The activities supported by DELPP include optional academic programs that enhance the engineering curriculum, such as Cooperative Education and the Dual Degree undergraduate programs, as well as global programs, leadership exposure and opportunities, and professional practice.

Cooperative Education for Undergraduate and Graduate Engineering Students
Undergraduate Cooperative Education (https://engineering.case.edu/coop/) is an academic program that enables students to alternate classroom studies with career-based experiences in industry. It is a learning experience designed to integrate classroom theory with practical experience and professional development. Co-op is a paid full-time work experience designed to maximize the student’s education. Co-op assignments are typically for a seven-month period consisting of a summer and a contiguous spring or fall semester. Co-op is available to students who have completed 4-5 semesters of coursework, are in good academic standing, registered as a full-time student, and pursuing a degree in engineering, engineering physics, or computer science. Registration in this course will serve to maintain full-time student status for the period of time that the student is on a co-op assignment.

Graduate Cooperative Education (https://engineering.case.edu/coop/) is an academic program designed for graduate students to enhance their classroom, laboratory, and research learning through participation and experience in various organizational/industrial environments where theory is applied to practice. Co-op is a paid full-time work experience for one seven-month period. Students must obtain approval from their academic advisor prior to accepting a co-op position. Graduate cooperative education experiences may be integrated with the student’s thesis or research project areas, or be solely for the purpose of gaining professional experience related to the student’s major field of study. Registration in this course will serve to maintain full-time student status for the period of time the student is on a co-op assignment. A large variety of companies hire and train the co-op students providing quality and challenging experiences.

For additional information, please contact Genine Apidone (genine/apidone@case.edu) 216.368.5024.

Dual Degree (3+2) Engineering Program
The Dual Degree (3+2) Engineering Program (https://engineering.case.edu/academics/dual-degree-program/) enables superior undergraduate students, enrolled at approximately forty participating liberal arts colleges in the continental United States and Puerto Rico, to combine a strong liberal arts foundation with the study of engineering. While enrolled at a cooperating liberal arts college, students complete courses in mathematics, chemistry, physics, and computer science in addition to studies in the humanities and social sciences. Students complete these courses during their first three years and must obtain the approval of the designated faculty liaison at the liberal arts college prior to admission to the Case School of Engineering.

Qualified candidates continue at the Case School of Engineering for an additional two years of concentrated coursework in an engineering field. At the conclusion of five years, two baccalaureate degrees are awarded: one from the liberal arts college and the other in the Bachelor of Science in Engineering degree program from Case Western Reserve University.

For additional information, please contact Deborah Fatica (deborah.fatica@case.edu) or 216.368.4449.

Engineering Academic Community Engagement
The DELPP develops strategic and intentional programming designed to engage students and promote a strong and supportive campus community.

Joint activities with faculty, alumni, staff and corporate sponsors include, but are not limited to: leadership opportunities in Engineering student organizations including National Engineers Week and the Dean’s Student Advisory Committee, hands-on industry-sponsored design competitions, and networking and mentoring with alumni and faculty.

Center for Engineering Action
The mission of the Center For Engineering Action is to provide students with opportunities to participate in multi-disciplinary team-based design
projects, research and coursework which focuses on advancing the public good through partnerships between local, regional, and global communities and Case Western Reserve University. We do this through:

- Supporting student organizations that focus on working with the vulnerable and underserved.
- Integrating service- and humanitarian-oriented experiential learning into the Case Western Reserve engineering curriculum.
- Cultivating and maintaining relationships with partner communities, organizations, and academic institutions.
- Communicating to the Case Western Reserve University community, and the public in general, the value and purpose of the Center’s work.
- Promoting available service opportunities so all interested students can take advantage of them.
- Advancing the scholarship of service-learning from both technical and pedagogical points of view.
- Building capacity in partner communities and institutions by collaboration and training.

For additional information, please contact Lynn Rollins (Lynn.Rollins@case.edu).

**Global Programs**

Global Programs ([http://engineering.case.edu/outside-classroom/global-opportunities/](http://engineering.case.edu/outside-classroom/global-opportunities/)) offer international opportunities for engineering students ranging from study abroad to short-term programs, internships and cooperative education experiences, and research opportunities. Participation in global activities optimizes the student’s educational experience as well as contributes to their societal awareness. Exposure to global activities is a valuable asset for leadership positions within multinational corporations.

The Division of Engineering Leadership and Professional Practice designs and implements programs tailored to students’ interests. Currently, short-term cultural and language immersion programs are offered in the summer at various international universities, with more being established. Additional Engineering core courses are being taught abroad during the summer.

The Case School of Engineering hosts many students from various countries which enables students to learn about and interact with various cultures. New programs and opportunities continue to develop for students.

On the graduate level, the Case School of Engineering is establishing partnerships with top-ranked international universities to host 3+1+1 students. This program enables students to receive a bachelor’s degree from their home university along with receiving a master’s degree from the Case School of Engineering.

Approximately 80% of the Case School of Engineering faculty collaborate with over one hundred universities and organizations in over thirty countries spanning six continents.

For additional information, please contact Deborah Fatica (debora.fatica@case.edu) or 216.368.4449.

**Engineering Peer Advising Program**

A staff of upper-class Engineering students, representing all Engineering majors, are available to advise undergraduate students on a drop-in basis in the Peer Advising Program ([https://engineering.case.edu/content/peer-advising-program/](https://engineering.case.edu/content/peer-advising-program/)).

Peer Advisors assist their fellow students at all stages in their college careers-helping them review major and minor selections, declare majors, review academic requirements, navigate dropping and adding courses, as well as offering recommendations and identification of other campus resources.

The Peer Advisors are selectively chosen to represent the various Engineering majors. They work in partnership with the Engineering Departmental Chairs and faculty. The Peer Advisors are extensively trained and are well prepared to answer questions and provide sound advice to their fellow students in terms of both general engineering and program-specific concerns.

All students are encouraged to stop by the Peer Advising Office in Nord, Room 316.

**Envoys High School Program**

The purpose of the Envoys Program is to increase access and persistence in STEM at CWRU for underrepresented minority students from the Cleveland and East Cleveland public schools.

Envoys is an immersive high school STEM education, training and college preparatory program. It includes:

- Three years and three summers of progressive and intensive research, mentorship and STEM coursework offered free of charge to students starting in grade 10 through grade 12.
- Coursework in chemistry, physics, math, engineering design and polymer science.
- Real-world laboratory research under the guidance of a graduate student mentor.
- Wrap-around supports, including industry mentors, leadership classes, tutoring and college-ready workshops.
- An annual stipend to help prevent Envoys students from having to work part-time.
- 1,400+ hours of individualized instruction above the normal high school curriculum.

Envoys, an innovative program for high school students, was developed at Case Western Reserve University as a vehicle for broadening participation in STEM fields through the NSF Science and Technology Center (STC) in Layered Polymeric Systems (CLiPS). The program continues in operation at CWRU with support from the university and investment from individual benefactors and philanthropic foundations. Special thanks to Mark Gelfand and the Gelfand Foundation for their support.

To learn more about the Envoys program, contact Tryreno Sowell (tns21@case.edu), Director for Education and Diversity.
COLLEGE OF ARTS AND SCIENCES

Case Western Reserve University's College of Arts and Sciences (http://artsci.case.edu/) combines a history of educational excellence with a commitment to innovation and discovery. Building on a 195-year-old tradition, the college traces its origins to several predecessor institutions, including Adelbert College, Flora Stone Mather College, Cleveland College, Western Reserve College, and Case Institute of Technology.

Today, the college offers educational and research programs in the arts and humanities, mathematics and natural sciences, and social sciences. It comprises 21 academic departments and 35 interdisciplinary programs and centers.

Brief History

Western Reserve College, the earliest of our predecessor institutions, was founded in 1826 in Hudson, Ohio, about 26 miles southwest of Cleveland. In 1882 the college moved to Cleveland, where it formed the basis for Western Reserve University. The institution expanded to include several professional and graduate schools in addition to its liberal arts programs. It also served as a magnet for other artistic, cultural, educational, medical, and scientific organizations, now its neighbors in the extraordinary setting known as University Circle.

Central to the heritage of the college are the traditions of the programs that preceded it: Adelbert College, as the men's undergraduate unit of Western Reserve University was known after the move to Cleveland; Flora Stone Mather College, initially founded in 1888 as the Cleveland College for Women; and Cleveland College, founded in 1925 in downtown Cleveland to serve part-time and adult students. These three units, each with a distinguished history of scholarship and achievement, were brought together in 1972 under the revived name of Western Reserve College. The college took its present form in 1992 when undergraduate and graduate programs and research in the arts, humanities, and social sciences were united with those in the physical sciences to form the College of Arts and Sciences.

Since the early 19th century, the college and its predecessors have participated in important developments in higher education. Examples include:

Engagement in issues of social justice. Western Reserve College's early years in Hudson saw debates between two groups, each opposing slavery. Colonizationists believed that liberated slaves should be resettled in Africa; abolitionists did not favor such a policy. After long and bitter conflict, supporters of the abolitionist movement carried the day.

Emergence of science. The college in Hudson was home to early and distinguished programs in astronomy and mathematics. Later, in 1887, Professor Edward Morley collaborated with Professor Albert Michelson of the Case School of Applied Science in a series of experiments that remain among the most significant in the history of physics.

Education of women. In the 1850s, the college's Cleveland-based Department of Medicine awarded six of the first seven medical degrees granted to women in this country. The founding of the College for Women in 1888 was only the second instance of a separate “coordinate” college for women at a major university.

Demographic and technological change. Following World War II, enrollment in Cleveland College swelled with returning veterans. During this period, the introduction of new technologies and fields of study drove increasing demand for advanced education and research in a wide range of disciplines.

Undergraduate Programs

Undergraduates in the college can choose a major or minor from almost 60 programs, design their own courses of study, or enroll in integrated bachelor’s/master’s degree programs. The university offers great flexibility to students wishing to pursue double majors in disparate fields, such as physics and studio art. In addition, students from all fields are eligible to participate in the college’s vibrant performing arts programs, including music and dance ensembles.

Beyond their course work, students are encouraged to conduct independent research within the college, in other units of the university, or in the scientific and cultural institutions of University Circle. They also have opportunities to engage in service learning projects and internships in research institutions, businesses, cultural institutions, and governmental agencies. With funding from the college's Experiential Learning Fellowship programs, undergraduates may design and carry out ambitious research projects in Cleveland or across the globe.

Graduate Programs

The college's graduate offerings include doctoral programs in 19 fields and several distinctive master’s programs. Through a partnership with Cleveland Play House, the Department of Theater has created one of the world's preeminent Master of Fine Arts programs in acting (http://theater.case.edu/graduate/master-of-fine-arts-in-acting/). The Science and Technology Entrepreneurship Program (STEP) (http://step.case.edu/) offers a three- or four-semester sequence of courses leading to a Master of Science degree in biotechnology, chemistry, or physics.

Administration

Joy K. Ward, PhD
(Duke University)
Dean; Professor, Department of Biology

Lee Thompson, PhD
(University of Colorado, Boulder)
Senior Associate Dean for Faculty Affairs; Professor, Department of Psychological Sciences

Joy Bostic, PhD
(Union Theological Seminary)
Associate Dean for Diversity, Equity, and Inclusion; Associate Professor, Department of Religious Studies

Lauren Calandrucio, PhD
(Syracuse University)
Associate Dean for Academic Affairs; Louis D. Beaumont University Professor II, Department of Psychological Sciences

Daniel Goldmark, PhD
(University of California, Los Angeles)
Associate Dean for Interdisciplinary Initiatives and International Affairs; Director, Baker Nord Center; Professor, Department of Music
analysts and their guests; 3) to contribute to the wider community by
publicize and increase the reach of the work of CWRU's policy
profile of the university by sponsoring programs and other activities
about and engage in the creation of public policy; 2) to raise the public
and rewarding institution for students and faculty who wish to learn
objectives: 1) to make Case Western Reserve University a more attractive
The Center for Policy Studies
(University of California, Berkeley)
Associate Dean and Director for SAGES; Professor, Department of Earth,
Environmental, and Planetary Sciences
Paul Wolansky, M.A.
(Bowling Green State University)
Associate Dean for Development and External Relations
Baker-Nord Center for the Humanities
Established in 1996 with a generous endowment gift from Eric and Jane
Nord, the Baker-Nord Center (http://bakernd.case.edu/) is dedicated to: 1) highlighting and celebrating the arts and humanities at Case
Western Reserve University (art history and art, classics, English, history,
modern languages and literatures, music, philosophy, religious studies,
theater, and dance) through public lectures, panels, performances,
and special programs; 2) supporting research and creative work in
the humanities and arts through fellowships, grants, and symposia,
as well as encouraging new and innovative directions in research
and creativity, including the digital humanities, through public forums
and open discussion; and 3) facilitating cross-disciplinary and inter-
disciplinary collaborations among Case Western Reserve University
faculty and members of other University Circle institutions that address
questions and problems of broad human interest, within and outside of
the academy.
Center for Education and Research in Cosmology and Astrophysics
The Center for Education and Research in Cosmology and Astrophysics
(http://www.case.edu/origins/sciences/cosmology.html) (CERCA)
is a center for the advancement and promotion of the scientific
understanding of the origin and evolution of the universe and its
contents, and their connection to fundamental physics. CERCA connects
scientists and educators in the Departments of Physics and Astronomy
and at the Shafrazi Planetarium of the Cleveland Museum of Natural
History (CMNH). It draws together theoretical and experimental
physicists and astrophysicists with observational astronomers to explore
the cosmos and, together with partner educators, to communicate
their excitement and knowledge to students and to the world at large.
CERCA is also a partner in the Institute for the Science of Origins, a
partnership of Case Western Reserve, CMNH, and ideastream to advance
their excitement and knowledge to students and to the world at large.
Center for Policy Studies
The Center for Policy Studies (http://policy.case.edu/) has four
objectives: 1) to make Case Western Reserve University a more attractive
and rewarding institution for students and faculty who wish to learn
about and engage in the creation of public policy; 2) to raise the public
profile of the university by sponsoring programs and other activities
that publicize and increase the reach of the work of CWRU’s policy
analysts and their guests; 3) to contribute to the wider community by
disseminating information and analysis of policy issues as generated
both by faculty and by guests we bring to campus; and 4) to encourage
creation of a community of policy studies on campus that may serve
in the future as the basis for further development of policy-oriented
curriculum at both the undergraduate and graduate levels.
Center for Research on Tibet
The Center for Research on Tibet (http://www.case.edu/affil/tibet/) at
Case Western Reserve University was founded in 1987 and is
administered within the Department of Anthropology. The center’s goal
is to conceptualize and conduct research on Tibetan history, society,
language, ecology/physiology, and culture so as to understand traditional
Tibet and the manner in which it has changed.
Leonard Gelfand STEM Center
The Leonard Gelfand STEM Center (http://www.case.edu/arts/csm/)
links the resources of the College of Arts and Sciences - including
faculty, staff, and students - with needs in the K12 STEM community.
Its collaborations with external partners, including schools and public
libraries, park systems, and science museums, enhance instruction and
generate student interest in the STEM fields of science, technology,
engineering, and mathematics. The center hosts the annual Northeast
Ohio Regional Science Olympiad, conducts a summer Shipwreck Camp
that includes lessons in meteorology and marine geology, and engages
middle school students in biological fieldwork in its Environmental
Heroes Program. Through the Gelfand Science and Engineering Fair
Program, it provides support for science fairs in Northeast Ohio schools,
and it recruits and trains undergraduates to assist younger students
with their science fair projects. In addition, the center participates in
the university’s Robert Noyce Teacher Scholarship Program, which provides
mentoring and other support for future math and science teachers.
Center for the Study of Writing
The Center for the Study of Writing (CSW) is a flexible, cross-disciplinary
center that fosters connections between innovative writing research and
sound pedagogical practices, and between specialized faculty expertise
and the needs and interests of aspiring undergraduate and graduate
students.
Dittrick Medical History Center
The Dittrick Medical History Center is comprised of the Dittrick museum,
archives, and collections of rare books, artifacts, and images. The center
originated as part of the Cleveland Medical Library Association (est.
1894) and today functions as an interdisciplinary study center within the
College of Arts and Sciences.
Ernest B. Yeager Center for Electrochemical Sciences
The mission of the Ernest B. Yeager Center for Electrochemical Sciences
(http://www.case.edu/arts/chem/yces/) (YCES) is: 1) to enhance the
education and training of students in fundamental and applied aspects
of electrochemistry; 2) to provide a national and international resource
for the dissemination of electrochemical knowledge within industrial,
laboratory, and academic communities and to the general public and
to support the continuing education of professional electrochemists;
(3) to promote interactions between electrochemists and their research
colleagues through seminars and symposia; and 4) to foster the
improvement of the environment and human welfare through research in
the design of materials and the development of processes and devices
that will positively influence fields from medicine and microelectronics
to energy conversion and energy storage.
Schubert Center for Child Studies
The Schubert Center for Child Studies (http://schubertcenter.case.edu/)
aims to strengthen links between child-related academic
study, public policy formation, and professional practice. The Schubert
Center convenes experts from across campus and throughout the
Cleveland community to provide an innovative forum for multidisciplinary
education, research, and communications focused on child policy.

Skeletal Research Center
The mission of the Skeletal Research Center (http://www.case.edu/
artscl/biol/skeletal/) (SRC) is to facilitate the advancement of basic
research and to accelerate the translation of this new information into
innovative clinical strategies for the regeneration and maintenance of
skeletal tissues. Based in the Department of Biology, the center provides
an organizational umbrella for the creative and innovative interactions
of faculty. Although members of our faculty have long been recognized
as leaders in skeletal research, the center was established in 1986 to
draw these individuals together into a multidisciplinary group that could
jointly approach current basic research and clinical problems. SRC is an
administrative entity under the dean of the College of Arts and Sciences
and the dean of the School of Medicine.

HUMN (HUMN)
Courses
HUMN 101. Colloquium in the Humanities. 1 Unit.
A multi-disciplinary and interdisciplinary introduction to the humanities,
which explores the multiple possibilities for working across disciplinary
boundaries. The course will include meetings with faculty from across
the humanities at the university. Colloquium meetings will consist of
discussion of prepared readings; an introduction to Baker-Nord Center
programs, including Humanities@Work; an introduction to the cultural
institutions of University Circle and Cleveland; and meetings with visiting
speakers. Course open only to Baker-Nord Scholars in the Humanities.

HUMN 201. The Public Humanities. 3 Units.
Public scholarship is a vital component of CWRU’s mission to improve
and enrich society through research that capitalizes on the power of
collaboration. This course is designed to harness that power by bringing
together students from across different humanities departments and by
facilitating deep engagement through experiential learning. Throughout
the semester, students will work individually and collaboratively towards
projects that enhance the public humanities in greater Cleveland. In
this collaborative classroom environment, students will combine their
disciplinary expertise and personal interests with our course readings and
seminar discussions. The first half of the semester focuses on theories
and methods for cultivating the public humanities. The second half of the
semester allows students to test and apply their knowledge by imagining
how they would curate future programming in the public humanities.

HUMN 224. Cleveland, Humanities, Collaboration: Research
Communities. 1 Unit.
What is collaborative inquiry in the humanities? This seminar explores
collaborative and cross-disciplinary methodologies in the humanities,
paying special attention to critical research resources and practices that
support community-based, public humanities projects and programming.
This seminar will provide a space to expand upon a research project
from prior or current coursework while experimenting with collaborative
modes of research, writing, feedback, and presentation. In the process,
students will also develop relevant skills that serve to secure meaningful
internships and other summer research opportunities or employment
in humanities-related fields. Prereq or Coreq: SAGES First Seminar or
FSTS 100.

HUMN 225. Cleveland, Humanities, Collaboration: Leadership Values and
Skills. 1 Unit.
How do the humanities shape leadership values? How can the next
generation of humanities leaders make the values of diversity and
sustainability more central to their organizations? In this one-credit
experiential engagement course, students reflect on these questions
through a combination of seminar readings and direct conversations
with former humanities students who are now in leadership positions
at museums, corporations, nonprofits, and community organizations.
Over the course of the semester, the students also work collaboratively
to broaden their own leadership skills, including through networking,
informational interviews, public speaking, career benchmarks, and short
writing assignments. Over the course of the semester, students will:
- Critically examine the role of the humanities in shaping leadership values
- Present their expertise confidently through both live and pre-recorded
formats - Explain their social and intellectual values in succinct and
engaging ways - Work as teams to network in support of their individual
postgraduate goals Prereq: Successful completion of FSTS 100 or SAGES
First Seminar.

HUMN 226. Cleveland, Humanities, Collaboration: Sharing Discoveries. 1
Unit.
How do you effectively communicate your humanities research and
education to multiple publics? In this seminar, we will explore the practice
of translation, paying particular attention to the various modes of writing
and communication that enable humanities scholars to communicate
both the value and significance of their humanities research and
education. This seminar will provide a space to develop your writing
and scholarly portfolio while also experimenting with different modes
of translation including blog posts, opinion editorials, resumes, grant
writing, and digital portfolios. In the process, the seminar will further
develop relevant skills that serve to secure meaningful internships and
other summer research opportunities or employment in humanities-
related fields. Prereq: Passing letter grade in SAGES First Seminar or
FSTS 100.

HUMN 316. Methods in Public Humanities and Civic Engagement. 3
Units.
Who has access to knowledge and why? How is knowledge produced and
publicized? What and where is the public? Who is included and excluded
in this public? What is the role of art and culture in various publics? This
innovative new course will address these questions as it introduces
students to the theories and methods of the Public Humanities and
Civic Engagement. Broadly defined, Public Humanities works to engage
diverse publics in the subjects of the humanities by making topics like art
history, literary history, film, and theater, accessible and understandable
to a wider civic audience, but it also interrogates the concept of the
expert and seeks to find experts in the field, rather than exclusively
in the academy. Through a combination of reading, discussion, and
virtual (or in person) visits from leaders of Cleveland-area organizations,
administrators, legislators, and public historians, this course will teach
you how to put your degrees to work for the greater good! Although this
course is about Public Humanities & Civic Engagement, it is open to
students in all fields across the university who are interested in ways
to integrate the community in their education and to think creatively
about the types of work their academic training prepares them to do.
Undergraduate and graduate students will benefit from opportunities to
broaden their professional networks and to learn more about the kinds
of skills that are necessary in professions across the disciplines. Offered as
ARTH 316, ARTH 416, HUMN 316, and HUMN 416.
IHSC (IHSC)

IHSC 300. Synthesis of Premedical Concepts. 3 Units.
This course aims to hone skills necessary to synthesize and integrate knowledge across multiple subject areas, and to assist in preparing for health professional school admission, such as the MCAT. The course is team taught to include faculty expertise in biochemistry, biology, chemistry, English, mathematics, physics, psychological sciences and sociology. Critical analysis and reasoning skills will be emphasized. Completion of introductory courses in all subject areas above is strongly recommended before taking this course. MCAT materials from the AAMC (Association of American Medical Colleges) will be used to guide and enhance a student's ability to synthesize across many fields, and increase critical reasoning and analytical competencies.

Academic English Proficiency for International Graduate Students

717 Crawford Hall
www.case.edu/international/international-student-services/academic-english-program (http://www.case.edu/international/international-student-services/academic-english-program/)
Phone: 216.368.6994
Kurt Koenigsberger
kurt.koenigsberger@case.edu

The Academic English Proficiency (AEP) Program for International Graduate Students provides English language development for students who need to raise their scores on the Test of English as a Foreign Language (TOEFL), International English Language Testing System (IELTS), or equivalent evaluation, for acceptance into a CWRU graduate degree program. The successful applicant gains provisional acceptance into a graduate program, with the provision being satisfied by their achievement of the necessary language score.

The program's English language and speech production curriculum comprises two modules, each module lasting one semester and consisting of three three-credit courses. Students enroll in one module (one semester) or two modules (two semesters) depending on their incoming language achievement score. AEP students also enroll each semester in a supplementary, non-credit-bearing workshop designed to assist students in engaging effectively at CWRU.

Please note: the AEP program is not accepting applications at this time.

Department of Anthropology

238 Mather Memorial Building
www.case.edu/artsci/anth (http://www.case.edu/artsci/anth/)
Phone: 216.368.3703; Fax: 216.368.5334
Janet McGrath, Department Chair
janet.mcgrath@case.edu

Anthropology, with its broad comparative approach, is in a strategic position to contribute to the identification and resolution of many of the problems, both local and global, that challenge society today. The Department of Anthropology offers programs leading to both undergraduate (Bachelor of Arts) and graduate (Master of Arts, Doctor of Philosophy) degrees. In addition, the department offers joint graduate degree programs with the Case Western Reserve University School of Medicine (MA or PhD/MPH and MA or PhD/MD). Students graduating with a BA in anthropology (http://www.case.edu/artsci/anth/) normally must continue for the MA or PhD degree if they are interested in working as anthropologists.

Department Faculty

Janet McGrath, PhD
(Northwestern University)
Professor and Chair; Director of Graduate Programs; Associate Professor of International Health, School of Medicine
Biomedical anthropology; anthropology of infectious disease; international and global health; AIDS; urban health; United States, Africa

Katia M. Almeida-Tracy, PhD
(Federal University of Rio Janeiro)
Senior Instructor
Cultural and social anthropology; cultures of Latin America and Brazil; linguistic anthropology; anthropology and higher education; globalization and human development; visual anthropology, art & aesthetics; contemporary youth cultures; Amazonian ethnology

Cynthia Beall, PhD
(Pennsylvania State University)
Distinguished University Professor and Sarah Idell Pyle Professor of Anthropology; Co-Director, Center for Research on Tibet; Member, National Academy of Sciences
Biological anthropology; adaptation to high-altitude hypoxia on the Andean, Tibetan, and East African plateau; genetics of human adaptation, evolutionary human biology, evolutionary medicine
Melvyn C. Goldstein, PhD  
(University of Washington)  
Distinguished University Professor; John Reynolds Harkness Professor; Co-Director, Center for Research on Tibet; Professor of International Health, School of Medicine; Member, National Academy of Sciences  
Sociocultural anthropology; global aging, population studies, pastoralism, modernization and nationalism, anthropology and history, Sino-Tibetan history; Tibet, China, Mongolia, Himalayas

Lawrence P. Greksa, PhD  
(Pennsylvania State University)  
Professor  
Physical anthropology; human biology; growth and development; nutrition; demography; modernization; Polynesia; Andes; Old Order Amish

Lee D. Hoffer, PhD  
(University of Colorado, Denver; Washington University School of Medicine)  
Associate Professor  
Cultural and medical anthropology; drug addiction; psychiatric epidemiology; ethnographic research methods; complex systems; computational modeling; economic anthropology; United States

Jill E. Korbin, PhD  
(University of California, Los Angeles)  
Lucy Adams Leffingwell Professor; Senior Advisor, Schubert Center for Child Studies; Co-Director, Childhood Studies Program  
Cultural, medical, and psychological anthropology; culture and human development; child maltreatment and child well-being; neighborhood and community; Urban U.S.; Old Order Amish

Jim G. Shaffer, PhD  
(University of Wisconsin, Madison)  
Associate Professor  
Archaeology; Middle East, Central Asia, Indus Valley, India

Lihong Shi, PhD  
(Tulane University)  
Associate Professor  
Sociocultural anthropology; reproduction; gender and family relations; grief and healing; population aging and sex-ratio imbalance; China, East Asia

---

Jennifer Furin, MD, PhD  
(Harvard University; University of California)  
Adjunct Assistant Professor; Lecturer, Department of Global Health and Social Medicine, Harvard Medical School  
Medical anthropology; infectious diseases; HIV, TB; community health; health policy and programming; Haiti, Peru, former Soviet Union, Resotho, Rwanda

Bridget M. Haas, PhD  
(University of California, San Diego)  
Adjunct Assistant Professor; NIH T32 Postdoctoral Research Fellow, School of Medicine  
Cultural, medical, and psychological anthropology; refugees and asylum seekers; migration and health; culture and trauma; violence; families and youth; United States

Yohannes Haile-Selassie Ambaye, PhD  
(University of California, Berkeley)  
Adjunct Professor; Curator and Head of Physical Anthropology, Cleveland Museum of Natural History  
Human evolution; Plio-Miocene mammalian evolution; Hominin paleoecology

David Kaawa-Mafagiri, PhD  
(Case Western Reserve University)  
Adjunct Assistant Professor; Associate Director, Center for Social Science Research on AIDS; Senior Lecturer, Department of Social Work and Social Administration, Makerere University (Uganda); Senior Research Fellow, Global Applied Research in Social, Economic, Health and Development (GARSEHD); Research Director, Equal Opportunities for Women and Children in Uganda Limited (EWOC)  
Biomedical anthropology; Anthropology of infectious disease; Global health; social patterning of health; community health interventions; child abuse and neglect; health sciences and social work educational systems; East and Central Africa, Uganda

---

Katharina Rynkiewich, PhD  
(Washington University)  
Postdoctoral Scholar  
Sociocultural and medical anthropology, antibiotic resistance

---

Adjunct Faculty

Nicole M. Burt, PhD  
(University of Alberta, Edmonton)  
Adjunct Assistant Professor; Curator and Head of Human Health and Evolutionary Medicine, Cleveland Museum of Natural History  
Stable isotope biogeochemistry (diet and migration); chronic disease; human growth and development; forensics

---

Secondary Faculty

Patricia A. Marshall, PhD  
(University of Kentucky)  
Professor, Department of Bioethics, School of Medicine  
Empirical bioethics research; informed consent to research; ethics in genetics research; genomic research in Africa; cross-cultural studies
Scott W. Simpson, PhD  
(Kent State University)  
Professor, Department of Anatomy, School of Medicine  
Miocene-Pleistocene hominin evolution; dental anthropology; human anatomy; functional anatomy

James C. Spilsbury, PhD  
(Case Western Reserve University)  
Associate Professor and Director, Academic Development Core, Department of Epidemiology and Biostatistics, Center for Clinical Investigation, CWRU School of Medicine  
Cultural and medical anthropology; sleep, child maltreatment; United States

Visiting Faculty

Alanna Cooper, PhD  
(Boston University)  
Visiting Assistant Professor, Abba Hillel Silver Chair of Jewish Studies, Department of Religious Studies  
Jewish Studies; Central Asia; history and memory; material culture

Emeriti

Charlotte Ikels, PhD  
(University of Hawaii)  
Professor Emerita  
Cross-cultural aging, lifecourse, death and dying; intergenerational relationships; urban life; comparative bioethics; China

Retired

Atwood D. Gaines, PhD (University of California), MPH (Berkeley)  
Professor; Professor of Psychiatry and Professor of Bioethics, CWRU School of Medicine; Professor of Nursing, Frances Payne Bolton School of Nursing  
Millennial medical anthropology; cultural studies of science and medicine; cultural bioethics; religion; aging and dementia; social identity and health; United States; France and the Mediterranean

Undergraduate Programs

Majors

The undergraduate major requires a minimum of 30 semester hours in anthropology. The undergraduate program provides a cross-cultural perspective on human behavior, culture, and biology. Students may choose from four major concentrations.

1. **The General Anthropology Concentration** provides training in three subdisciplines of anthropology. The first, sociocultural anthropology, emphasizes relationships among socioeconomic institutions, cultural ecology, health and medicine, religion and symbolism, individual psychological variables, and language. The second, physical anthropology, emphasizes human ecology and adaptability, human growth and development, nutritional adaptation, epidemiology, and human and nonhuman primate evolution. The third, archaeology, deals with the long sequences of independent sociocultural, technological, and ecological evolution that have taken place under diverse conditions.

2. **The Medical Anthropology Concentration** provides training in the three subdisciplines discussed above, but with a focus on their relationship to physical and mental health, illness, disease, and medicine.

3. **The Physical Anthropology Concentration** deals with the biological nature of humans past and present. Physical anthropologists look beyond purely biological phenomena to understand how biology, behavior, and environment interact. Most course work is in the subdiscipline of human biology, which seeks to understand those interactions by studying physiology, genetics, nutrition, and epidemiology in modern human populations throughout the world. The concentration also provides training in paleoanthropology, which documents the biological history of humans and, in conjunction with archaeology, analyzes those interactions for past humans.

4. **The Archaeology Concentration** focuses on the customs and daily life of people who lived in the past. Anthropologists excavate and analyze the material remains of the sites of human occupation. At the same time, archaeological research seeks to understand the evolution of culture and society by determining how and why changes in human society have occurred.

### Approved anthropology electives 6

### Total Units 30

### Departmental Honors

This program is open to qualified majors in anthropology who have completed 15 hours of anthropology with a 3.25 GPA and who have an overall 3.0 GPA. Students should apply for the program in the fall semester of their junior year and, if approved, register for ANTH 391 Honors Tutorial and ANTH 392 Honors Tutorial in the spring of their junior year and the fall of their senior year.

Honors students are required to undertake a research project under the supervision of one or more faculty members and to present an acceptable research paper in the fall semester of their senior year. Students interested in the program should contact one of the department's undergraduate advisors.
Certificate in Global Health
The Certificate in Global Health (p. 854) is the centerpiece of the Framework for Global Health, a program made up of faculty members from across the Case Western Reserve University campus. Undergraduate and graduate anthropology students in the Certificate Program will be grounded in global health issues by a core course (INTH 301 Fundamentals of Global Health) that introduces them to key concepts and vocabulary and facilitates communication across disciplines.

Requirements for the Certificate in Global Health are as follows:
- INTH 301 Fundamentals of Global Health
- ANTH 359 Introduction to Global Health
- ANTH 215 Health, Culture, and Disease: An Introduction to Medical Anthropology
- One approved elective

Integrated Graduate Studies
The Department of Anthropology participates in the Integrated Graduate Studies Program (p. 1298). Interested students can find the general requirements and the admission procedures for the program in the Undergraduate Studies section of this bulletin and may consult the department for further information.

Minors
The department offers four minor emphases in anthropology: general anthropology, medical anthropology, archaeology, and physical anthropology. All require a minimum of 15 semester hours in anthropology.

General Anthropology Minor
ANTH 102 Being Human: An Introduction to Social and Cultural Anthropology 3
ANTH 103 Introduction to Human Evolution 3
One geographic area course, such as the courses listed here. Other courses must be approved by the Department.
- ANTH 312 Ethnography of Southeast Asia
- ANTH 314 Cultures of the United States
- ANTH 331 The Most Ancient Near East
- ANTH 333 Roots of Ancient India: Archaeology of South Asia
- ANTH 349 Cultures of Latin America
- ANTH 353 Chinese Culture and Society
Approved electives 6
Total Units 15

Medical Anthropology Minor
ANTH 102 Being Human: An Introduction to Social and Cultural Anthropology 3
ANTH 103 Introduction to Human Evolution 3
ANTH 215 Health, Culture, and Disease: An Introduction to Medical Anthropology 3
One geographic area course, such as the courses listed here. Other courses must be approved by the Department.
- ANTH 312 Ethnography of Southeast Asia
- ANTH 314 Cultures of the United States
- ANTH 331 The Most Ancient Near East
- ANTH 333 Roots of Ancient India: Archaeology of South Asia
- ANTH 353 Chinese Culture and Society
Two approved physical anthropology electives, such as: 6
- ANTH 302 Darwinian Medicine
- ANTH 320B Field Methods and Field Work in Paleoanthropology
- ANTH 323 AIDS: Epidemiology, Biology, and Culture

One anthropology course covering health/illness-related topics, such as the courses listed here. Other courses must be approved by the department.
- ANTH 302 Darwinian Medicine
- ANTH 303 Interdisciplinary Solutions to Global Health Issues
- ANTH 306 The Anthropology of Childhood and the Family
- ANTH 316 Current Global Health Events
- ANTH 323 AIDS: Epidemiology, Biology, and Culture
- ANTH 326 Power, Illness, and Inequality: The Political Economy of Health
- ANTH 328 Medical Anthropology and Public Health
- ANTH 335 Illegal Drugs and Society
- ANTH 337 Comparative Medical Systems
- ANTH 338 Maternal Health: Anthropological Perspectives on Reproductive Practices and Health Policy
- ANTH 359 Introduction to Global Health
- ANTH 360 Global Politics of Reproduction
- ANTH 365 Gender and Sex Differences: Cross-cultural Perspective
- ANTH 366 Population Change: Problems and Solutions
- ANTH 371 Culture, Behavior, and Person: Psychological Anthropology
- ANTH 376 Topics in the Anthropology of Health and Medicine
- ANTH 378 Reproductive Health: An Evolutionary Perspective

Total Units 15

Physical Anthropology Minor
ANTH 102 Being Human: An Introduction to Social and Cultural Anthropology 3
ANTH 103 Introduction to Human Evolution 3
One geographic area course, such as the courses listed here. Other courses must be approved by the Department.
- ANTH 312 Ethnography of Southeast Asia
- ANTH 314 Cultures of the United States
- ANTH 331 The Most Ancient Near East
- ANTH 333 Roots of Ancient India: Archaeology of South Asia
- ANTH 353 Chinese Culture and Society
Two approved physical anthropology electives, such as: 6
- ANTH 302 Darwinian Medicine
- ANTH 320B Field Methods and Field Work in Paleoanthropology
- ANTH 323 AIDS: Epidemiology, Biology, and Culture
The Department of Anthropology offers graduate programs leading to the Master of Arts and Doctor of Philosophy degrees in anthropology with specializations in medical anthropology and global health.

The department also offers these combined degrees with the School of Medicine:

- MA or PhD/MPH
- MA or PhD/MD

### Master of Arts

The purpose of the Master of Arts degree program is to prepare students to begin teaching, research, or service careers with a solid background in anthropology. Undergraduate course work in anthropology, while helpful, is not a prerequisite for admission.

The MA program is designed for two groups of students. First, students who wish to obtain a PhD but enter the program with only a BA, must obtain the MA before being admitted to the PhD program. This is accomplished in three semesters. Second, for those students who wish to obtain an MA only, it is possible to meet degree requirements in one year (two semesters). This program is designed for students who plan careers in other fields, including the allied health professions. These students may not enter the PhD program directly, although they may choose to apply.

Requirements for the master's degree include credit hour requirements, core course requirements, and a six-hour comprehensive written Master of Arts examination. A candidate for the master's degree is required to complete 30 hours of class work, including an approved statistics course (3 hours) in which the student has earned a grade of C or better. No more than 6 credit hours of electives may be taken in 300-level courses (advanced undergraduate courses). All master's degree candidates are required to attain a minimum cumulative grade point average of 3.0 in the core courses (described below) in order to qualify for the degree.

All master's degree candidates are required to take the comprehensive written examination before the completion of 30 semester hours of graduate work. Written master's degree examinations can receive one of three grades: High Pass, Pass, or Fail. "High Pass" signifies performance sufficient for both the Master of Arts degree and advancement to the Doctor of Philosophy program, provided other requirements have also been satisfied. "Pass" signifies performance adequate for the master's degree but insufficient to enter the doctoral program. "Fail" means a performance inadequate for the master's degree. In the case of grades of Pass and Fail, the written examination may be retaken once.

### Medical Anthropology and Global Health Program

The objective of the Medical Anthropology and Global Health Program is to train medical anthropologists, physicians, nurses, and other health professionals (1) to recognize and deal with, on both theoretical and practical levels, the complex relations between the biological, social, cultural, psychological, economic, and techno-environmental determinants and concomitants of sickness and health in both local and global settings; and (2) to analyze and evaluate how health services are organized and delivered.

Students are encouraged to obtain a Certificate in Global Health (p. 854) during their studies. The Certificate in Global Health is described below.

### MA Requirements

The curriculum covers the range of medical anthropology interests: ethnomedicine, international and global health, psychiatric anthropology, human adaptation and disease, nutrition, and so on. All Master of Arts degree students in medical anthropology must complete 30 hours:

<table>
<thead>
<tr>

* Anthropology or other department offerings with advisor approval.
**Doctor of Philosophy**

The Doctor of Philosophy degree program includes specializations in medical anthropology and global health. It requires a minimum of 36 credit hours.

PhD students work with their doctoral advisor and faculty committee to determine prior to completing candidacy exams what foreign language, if any, is needed to successfully complete the PhD. If language competency is required, the language requirement can be met by a demonstration of competency either in a relevant written language or in an oral field language. The advisor, in consultation with the committee, will determine the level of competency needed and by what means language proficiency will be certified. Certification of competency must occur prior to the dissertation defense.

**PhD Requirements**

All PhD students in medical anthropology are required to complete the PhD requirements. Students develop a specific plan of study, requiring a minimum of 36 credit hours, in consultation with their advisor.

- Students must take an approved statistics course (3 credits) and earn a grade of C or better if this requirement has not been fulfilled at the MA level.
- Students must take ANTH 504 Anthropological Research Design
- Students must complete two approved seminars (500 level).
  ANTH 504 and ANTH 599 Tutorial: Advanced Studies in Anthropology
do not count towards this requirement.
- Students may not take more than six total credit hours of ANTH 599.
- Students must take 18 credit hours in dissertation (ANTH 701 Dissertation Ph.D.) after completing a candidacy examination.

After completing course requirements, a student must take the written Doctor of Philosophy candidacy examination. This examination consists of two topical exams and a dissertation prospectus. The examination is designed and evaluated by the doctoral committee.

**Certificate in Global Health (p. 854)**

The Certificate in Global Health is the centerpiece of the Framework for Global Health, a program made up of faculty members from across the Case Western Reserve University campus. Anthropology students in the Certificate program will be grounded in global health issues by a core course (INTH 301 Fundamentals of Global Health) that introduces them to key concepts and vocabulary and facilitates communication across disciplines. The Certificate in Global Health is available to anthropology graduate students at both the MA and PhD levels.

Requirements for the Certificate in Global Health are as follows:

- INTH 401 Fundamentals of Global Health
- ANTH 459 Introduction to Global Health
- ANTH 480 Medical Anthropology and Global Health
- ANTH 599 Tutorial: Advanced Studies in Anthropology

**Dual-Degree Programs**

**MA or PhD/MPH Program with the School of Medicine**

The joint MA or PhD/MPH program provides students with the opportunity to receive an anthropology graduate degree and a public health degree simultaneously. A combined public health/anthropology degree is especially valuable to students interested in working in global or international health, or within health policy programs. By allowing for cross-counting of course credits, the dual degree MA/MPH program can be completed by taking 63 credit hours (24 in anthropology and 39 in public health). The dual degree PhD/MPH requires an additional 18 credit hours in anthropology beyond the MA level and 18 hours of ANTH 701 Dissertation Ph.D. All dual-degree students develop a program of study with their advisors in both anthropology and public health.

**MA or PhD/MD Program with the School of Medicine**

The objectives of the dual MA or PhD/MD program are to train unusually qualified and motivated students to conduct research on a broad range of bio-cultural problems, with emphasis on the relationship between medicine, ecology, subsistence variables, population dynamics, and disease epidemiology; and to identify and analyze sociocultural impediments to the successful introduction of effective functioning and evaluation of health care programs in diverse contexts. Applicants should make separate application for admission to the School of Medicine and the Department of Anthropology (through the School of Graduate Studies). Applications to the Department of Anthropology may include MCAT scores rather than GRE scores, in addition to other information indicated on the graduate school forms.

**Courses**

ANTH 101. Exploring Anthropology. 1 Unit.
The broad field of anthropology studies "all things human" in ways that stand apart from sociology, psychology, history, and other areas of the humanities and sciences. This course explores anthropologists, study of archaeology, culture, human biology, language and medicine to understand humans in general and in specific contexts. It dispels common myths and misconceptions (for instance, archaeologists like to excavate graves, humans evolved from monkeys, the field deals with primitive people, it is not scientific). The faculty of the Case Western Reserve University Anthropology Department and affiliated anthropologists talk briefly about their field or subfield, its big questions, and their research.

ANTH 102. Being Human: An Introduction to Social and Cultural Anthropology. 3 Units.
The nature of culture and humans as culture-bearing animals. The range of cultural phenomena including language, social organization, religion, and culture change, and the relevance of anthropology for contemporary social, economic, and ecological problems.

ANTH 103. Introduction to Human Evolution. 3 Units.
Physical, cultural, and technological evolution of humans. The systematic interrelationships between humans, culture, and environment.

ANTH 107. Archaeology: An Introduction. 3 Units.
Basic archaeological concepts are discussed followed by a review of human cultural and biological evolution from the earliest times through development of state organized societies. Geographical scope is worldwide with special attention given to ecological and cultural relationships affecting human societies through time.

ANTH 202. Archaeology of Eastern North America. 3 Units.
This course is an introduction to the archaeology and prehistory of the eastern woodlands of North America. Course material will focus on the archaeological record of native societies living east of the Mississippi River from the first arrivals at the end of the Pleistocene up to the coming of Europeans. Specific topics for discussion include late Pleistocene settlement, hunter-gatherer environmental adaptations, the origin of food production, and the development of ranked societies.
ANTH 215. Health, Culture, and Disease: An Introduction to Medical Anthropology. 3 Units.
This course is an introduction to the field of Medical Anthropology. Medical Anthropology is concerned with the cross-cultural study of culture, health, and illness. During the course of the semester, our survey will include (1) theoretical orientations and key concepts; (2) the cross-cultural diversity of health beliefs and practices (abroad and at home); and (3) contemporary issues and special populations (e.g., AIDS, homelessness, refugees, women’s health, and children at risk).

ANTH 225. Evolution. 3 Units.
Multidisciplinary study of the course and processes of organic evolution provides a broad understanding of the evolution of structural and functional diversity, the relationships among organisms and their environments, and the phylogenetic relationships among major groups of organisms. Topics include the genetic basis of micro- and macro-evolutionary change, the concept of adaptation, natural selection, population dynamics, theories of species formation, principles of phylogenetic inference, biogeography, evolutionary rates, evolutionary convergence, homology, Darwinian medicine, and conceptual and philosophical issues in evolutionary theory. Offered as ANTH 225, BIOL 225, EEPS 225, HSTY 225, and PHIL 225.

ANTH 233. Introduction to Jewish Folklore. 3 Units.
Exploration of a variety of genres, research methods and interpretations of Jewish folklore, from antiquity to the present. Emphasis on how Jewish folk traditions and culture give us access to the spirit and mentality of the many different generations of the Jewish ethnic group, illuminating its past and informing the direction of its future development. Offered as ANTH 233, RLGN 233, and JDST 233. Counts for CAS Global & Cultural Diversity Requirement.

ANTH 255. Global Judaism: Diversity Across the Jewish World. 3 Units.
Scattered across the globe over the course of millennia, Jews’ diverse histories and environments have given rise to a great range of religious, cultural and social forms. Using ethnographies as our primary texts, we will think critically and comparatively about Judaism and Jewishness in the Americas, Europe, Africa, and Asia. Along our journey, we examine how Jews have navigated their experiences as minorities in their many diaspora homelands, and how they have they adapted their cultural and religious practices to the various environments in which they have found themselves. In addition to exploring their Jewishness vis-à-vis others, we also examine questions of exclusion and belonging that Jews have faced as they have encountered each other in recent decades through tourism, mass migration, globalization, and the internet. How do the world’s varied Jewish groups - who are of different skin colors, who speak different languages, and who carry different historical memories - navigate ethnic divides, race relations, and religious diversity? Should we speak of a single Jewish religion and Jewish people at all? Offered as ANTH 255, ETHS 255, JDST 255 and RLGN 255. Counts for CAS Global & Cultural Diversity Requirement.

ANTH 300. Global Health Design in Uganda. 1 - 3 Units.
The CWRU Anthropology-Engineering Collaborative (AEC) offers this unique course applying social science and engineering skills and expertise to address global health issues in Uganda. The AEC is part of a longstanding collaboration between CWRU and Makerere University in Kampala, Uganda. Students collaborate with students at Makerere University in Kampala, Uganda and the CWRU student group, Global Health Design Collaborative (GHDC), to design and implement solutions to specific health issues in Luwero, Uganda. Students meet weekly during the semester to learn about global health technology design and anthropology. Students work with GHDC and program faculty on specific projects; activities may include conducting needs assessment, prototype development, design validation and verification, and preparation of a project report. Current projects focus on designing a pediatric pulse oximeter; identifying means to preserve the cold chain for vaccine outreach and improving medical waste disposal. In Uganda, students and their Makerere University counterparts travel together to Luwero district where they visit health centers to collaborate with local staff to review current design prototypes and issues. Activities include: talking to health center staff at different levels of the health care system, observing a community health outreach, and meeting with diverse stakeholders in Luwero and Kampala. Students gain hands-on experience in engineering design, social science methods, and working in transnational, interdisciplinary teams and contribute directly to ongoing efforts to address global health issues in Uganda. Students are encouraged to contribute to the projects through ongoing work with GHDC. The course may be taken as either ENGR 350U or ANTH 300. The course fee covers travel and on-the-ground expenses. The class is open to all majors but enrollment is by application and instructors’ consent. Students who enroll in 3 credits may count the class for the CSE humanities/social science requirement and/or the CAS Global and Cultural Diversity requirement. Offered as ENGR 350U and ANTH 300.

ANTH 302. Darwinian Medicine. 3 Units.
Darwinian medicine deals with evolutionary aspects of modern human disease. It applies the concepts and methods of evolutionary biology to the question of why we are vulnerable to disease. Darwinian (or evolutionary) medicine proposes several general hypotheses about disease causation including disease as evolutionary legacy and design compromise, the result of a novel environment, a consequence of genetic adaptation, the result of infectious organisms' evolutionary adaptations, and disease symptoms as manifestation of defense mechanisms. It proposes that evolutionary ideas can explain, help to prevent and perhaps help to treat some diseases. This course presents the basic logic of Darwinian medicine and evaluates hypotheses about specific diseases that illustrate each of the hypotheses about disease causation. Recommended preparation: ANTH 103. Offered as ANTH 302 and ANTH 402.
ANTH 303. Interdisciplinary Solutions to Global Health Issues. 3 Units.
This unique course brings together the expertise of engineers and social scientists to address global health issues through a combination of classroom-based learning and experiential learning through team-based design projects and field-based community assessments. Students will experience the process of engineering design by participating in teams organized around solutions to real-world health problems in the developing world. Methods from social sciences will be practiced and brought to bear in the process, including assessment of global health needs, and evaluation of success of interventions. Students will study and discuss current key issues in global health, and ethics surrounding health care, disparity, methods of intervention, and develop skills in how to define and frame problems and communicate effectively across disciplines. The course is organized around ongoing projects that seek to design technical solutions to global health issues, with a focus on Uganda. The teams will also work and learn with students and faculty of Biomedical Engineering and Social Sciences at Makerere University (MUK), Uganda. Examples of interactions with MUK will include discussion of common readings, peer-review, and joint planning, implementation, and review of fieldwork. Students enrolled in ANTH 303/ENGR 397 are eligible to travel to Uganda to participate in project activities over Spring Break. Travelers must be enrolled in ENGR 350U. This course is an approved SAGES Departmental Seminar. A student in the Case School of Engineering may use this course to meet an Engineering Core Breadth requirement, either in place of ENGL 398 and ENGR 398, or as a Social Science course (ANTH 303 cross-list). No student may count the course to satisfy both of these requirements. Offered as ANTH 303 and ENGR 397. Counts as SAGES Departmental Seminar. Counts for CAS Global & Cultural Diversity Requirement.

ANTH 305. Public Policy in Child Development. 3 Units.
This course introduces students to issues in public policy that impact children and families. Local, state, and federal child policy will be considered, and topics will include, for example, policies related to child poverty, education, child welfare, juvenile justice, and children’s physical and mental health. Students will learn how policy is developed, how research informs policy and vice versa, and a framework for analyzing social policy. Recommended preparation: One social sciences course or consent. Offered as ANTH 305, ANTH 405, CHST 301, CHST 401, and POSC 382A.

ANTH 306. The Anthropology of Childhood and the Family. 3 Units.
Child-rearing patterns and the family as an institution, using evidence from Western and non-Western cultures. Human universals and cultural variation, the experience of childhood and recent changes in the American family. Recommended preparation: ANTH 102. Offered as ANTH 306 and ANTH 406.

ANTH 307. Experiential Learning in Child Policy. 3 Units.
Focus on state and federal legislative policy impacting children, youth, and families. Course includes an experiential learning component at the state or federal level and a travel experience to either Columbus, OH or Washington, DC to learn firsthand how policy is formed. Students may take this course twice for credit. Offered as ANTH 307 and CHST 302.

ANTH 308. Child Policy Externship. 3 Units.
Externships offered through CHST 398/ANTH 308 give students an opportunity to work directly with professionals who design and implement policies that impact the lives of children and their families. Agencies involved are active in areas such as public health, including behavioral health, education, juvenile justice, childcare and/or child welfare. Students apply for the externships, and selected students are placed in local public or nonprofit agencies with a policy focus. Each student develops an individualized learning plan in consultation with the Childhood Studies Program faculty and the supervisor in the agency. CHST 398/ANTH 308 is a 3 credit-hour course and may be taken twice for a total of 6 credit hours. Offered as CHST 398 and ANTH 308. Prereq: CHST 301.

ANTH 310. Introduction to Linguistic Anthropology. 3 Units.
This is an introduction to the core concepts, theories and methodologies that form the study of language from an anthropological point of view. The course provides exposure to current issues in linguistic anthropological research and reviews some of the foundational topics of research past, highlighting the contributions of linguistics to anthropology and social science. Topics to be explored include: 1) an overview of the study of language (language structure and patterns, the effects of linguistic categories on thought and behavior, meaning and linguistic relativity, cross-language comparison, and non-verbal communication); 2) doing linguistic anthropology "on the ground" (an intro to the laboratory and field techniques of linguistic anthropology); 3) the study of language as function and social action (language and social structure, speech acts and events, verbal art, language and emotion); and 4) the study of language/discourse and power (language in politics, medicine, and law). Offered as ANTH 310 and ANTH 410.

ANTH 312. Ethnography of Southeast Asia. 3 Units.
This course examines the people and cultures of Southeast Asia from an anthropological perspective. From a starting place of the local people we will explore important aspects of life in this region such as agriculture, religion, health, medicine, nation-building, ethnic identity, art, and technology. Additionally, we will examine and question the ideas, traditions, and scholarly modes of study that brought this geographical area together as a region. Offered as ANTH 312 and ANTH 412. Counts for CAS Global & Cultural Diversity Requirement.

ANTH 314. Cultures of the United States. 3 Units.
This course considers the rich ethnic diversity of the U.S. from the perspective of social/cultural anthropology. Conquest, immigration, problems of conflicts and accommodation, and the character of the diverse regional and ethnic cultures are considered as are forms of racism, discrimination, and their consequences. Groups of interest include various Latina/o and Native peoples, African-American groups, and specific ethnic groups of Pacific, Mediterranean, European, Asian, and Caribbean origin. Offered as ANTH 314, ETHS 314, and ANTH 414.

ANTH 316. Current Global Health Events. 3 Units.
This course will introduce students to an anthropological approach to understanding disease, illness, sickness and suffering in a global health context. The course will expose students to biological, socio-cultural, historical, political-economic, and epidemiological assessments of the disease and illness states. Students will be asked to bring a critical focus to the use of ethnographic, population-based, and clinical approaches to addresses global health problems. Additionally students will learn about the key organizations, institutions, and commercial enterprises that come to play in the assessment, prioritizing, and treatment of these health issues. Counts as SAGES Departmental Seminar. Prereq: ANTH 102 and ANTH 215.
ANTH 319. Introduction to Statistical Analysis in the Social Sciences. 3 Units.
Statistical description (central tendency, variation, correlation, etc.) and statistical evaluation (two sample comparisons, regression, analysis of variance, non-parametric statistics). Developing an understanding of statistical inference, particularly on proper usage of statistical methods. Examples from the social sciences. Cannot be used to meet the A&S Humanities and Social Sciences requirement. Not available for credit to students who have completed STAT 201, STAT 201R, or PSCL 282. Counts for CAS Quantitative Reasoning Requirement. Prereq: Major in Anthropology.

ANTH 320A. Field Methods and Field Work in Archaeology. 3 - 6 Units.
This course is intended to provide a home for archaeology field courses taken at other institutions. It can be used for courses which provide students with a comprehensive introduction to archaeological field work, including classroom and practical training in archaeological methods, laboratory experience in dealing with artifacts, and instruction in the relevant cultural context.

ANTH 320B. Field Methods and Field Work in Paleanthropology. 3 - 6 Units.
This course is intended to provide a home for paleoanthropology field courses taken at other institutions. It can be used for courses which provide students with a comprehensive introduction to paleoanthropological field work, including classroom and practical training in paleoanthropological methods, laboratory experience in dealing with fossils and artifacts, and instruction in the relevant species.

ANTH 323. AIDS: Epidemiology, Biology, and Culture. 3 Units.
This course will examine the biological and cultural impact of AIDS in different societies around the world. Topics include: the origin and evolution of the virus, the evolutionary implications of the epidemic, routes of transmission, a historical comparison of AIDS to other epidemics in human history, current worldwide prevalences of AIDS, and cultural responses to the epidemic. Special emphasis will be placed on the long-term biological and social consequences of the epidemic. Recommended preparation: ANTH 102 or ANTH 103. Offered as ANTH 323 and ANTH 423.

ANTH 325. Economic Anthropology. 3 Units.
Economic anthropology is a sub-field of anthropology that examines how people in modern and non-modern societies produce, distribute, exchange, and consume goods, services, and other valued resources. The sub-field seeks to understand how cultures, including our own, organize and structure these activities through institutions, rituals, and beliefs systems. However, unlike the formal approach of the field of economics, the in-depth methods of economic anthropology concentrate on day-to-day experiences of what the economic means, how this is defined, and what we can learn about human behavior through it. This course will introduce students to economic anthropology and some of the major questions and challenges this field addresses. The history of this sub-field, how it relates to economic sociology, and areas where economic anthropology and traditional economics overlap, will also be explored. This class does not present economic anthropology and modern economics as adversaries, instead how and why they are fundamentally different orientations with often seemingly little in common. On this backdrop, this class will survey a number of different topics, including: health commodification; gift exchange; commodity chains; the history of money and debt; why objects have value; how people make ends meet; rational vs. non-rational decision-making; behavioral economic experiments conducted in other cultures; development economics, and why some objects and services have prices while others do not. Offered as ANTH 325 and ANTH 425.

ANTH 326. Power, Illness, and Inequality: The Political Economy of Health. 3 Units.
This course explores the relationship between social inequality and the distribution of health and illness across class, race, gender, sexual orientation, and national boundaries. Class readings drawn from critical anthropological approaches to the study of health emphasize the fundamental importance of power relations and economic constraints in explaining patterns of disease. The course critically examines the nature of Western biomedicine and inequality in the delivery of health services. Special consideration is given to political economic analysis of health issues in the developing world such as AIDS, hunger, reproductive health, and primary health care provision. Recommended preparation: ANTH 102 or ANTH 215. Offered as ANTH 326 and ANTH 426.

ANTH 328. Medical Anthropology and Public Health. 3 Units.
Anthropology has a longstanding relationship with the field of public health, which dates back to before the flourishing of medical anthropology as a subfield. Direct participation of medical anthropologists in public health research and practice continues to grow. This course explores the intersection of medical anthropology and public health from the perspective of anthropological history, theory, and methods. Course topics include: the history of anthropological work in public health, medical anthropology theory as a guide to anthropological public health research, and anthropological methods and approaches to public health work. Case studies from around the world will be employed throughout the course. Offered as ANTH 328 and ANTH 428.

ANTH 329. Anthropological Perspectives of Migration and Health. 3 Units.
This course provides an overview of anthropological perspectives on transnational migration and health. We will focus particularly on health and health care issues concerning refugees, asylum seekers and undocumented migrants. This course will focus on the following topics: the physical and mental health consequences of forced migration; refugee trauma; the intersection of health care and immigration policies; immigration and health care access and utilization. Readings and coursework will consider the sociocultural, political, and economic factors that contribute to migrant health disparities. We will also address issues of medical pluralism among transnational migrants and critically examine the concept of cultural competence in clinical settings. Class readings will comprise a variety of theoretical and ethnographic literature within anthropology and closely related disciplines, drawing on cases from across the globe and in cross-cultural comparison. The class will use lectures, readings, and class discussions to explore these relevant issues in migration and health, with the opportunity to engage in hands on ethnographic work with refugees locally. Offered as ANTH 329 and ANTH 429.

ANTH 331. The Most Ancient Near East. 3 Units.
The Near East, archaeologically, is the most intensely researched area in the world. The research, spanning 150 years, reveals a continuous archaeological record of this extraordinary period beginning two million years ago until about 4000 BC is reviewed. Emphasis is placed on political economic analysis of health issues in the developing world such as AIDS, hunger, reproductive health, and primary health care provision. Recommended preparation: ANTH 102 or ANTH 215. Offered as ANTH 326 and ANTH 426.

ANTH 328. Medical Anthropology and Public Health. 3 Units.
This course explores the relationship between social inequality and the distribution of health and illness across class, race, gender, sexual orientation, and national boundaries. Class readings drawn from critical anthropological approaches to the study of health emphasize the fundamental importance of power relations and economic constraints in explaining patterns of disease. The course critically examines the nature of Western biomedicine and inequality in the delivery of health services. Special consideration is given to political economic analysis of health issues in the developing world such as AIDS, hunger, reproductive health, and primary health care provision. Recommended preparation: ANTH 102 or ANTH 215. Offered as ANTH 326 and ANTH 426.
ANTH 333. Roots of Ancient India: Archaeology of South Asia. 3 Units.
Archaeological discoveries in South Asia (modern India, Pakistan, Sri Lanka, Bangladesh, and Nepal) reveal a continuous record of human habitation from almost two million years ago until the present. Early human populations in the region encountered dramatically changing ecological conditions resulting in various cultural adaptations over this long period. Beginning with the earliest hunter-gatherer populations, archaeological data reveal a diversity of cultural changes/adaptations in South Asia resulting in the indigenous development of sedentary agricultural societies coexisting with hunters and gatherers, and with pastoral nomadic groups interacting over diverse ecologies. These cultural developments resulted in the formation of the Harappan (Indus Valley) culture - a unique, ancient (2600-1300 BC) Old World civilization. Archaeological data indicate this Harappan culture provided basic fundamental cultural traits that evolved into the culturally Early Historic Indian Tradition. Special attention is given to theoretical controversies surrounding the cultural continuity issue in South Asian culture history and its significance for understanding Old World archaeology. Recommended preparation: ANTH 102 or ANTH 107.

ANTH 335. Illegal Drugs and Society. 3 Units.
This course provides perspectives on illegal drug use informed by the social, political and economic dimensions of the issues. Framed by the history, epidemiology, and medical consequences of drug use, students will confront the complex challenges posed by addiction. Anthropological research conducted in the U.S. and cross-culturally will demonstrate, elaborate and juxtapose various clinical, public health, and law enforcement policies and perspectives. Topics examined will include: why exclusively using a bio-medical model of addiction is inadequate; how effective is the war on drugs; what prevention, intervention and treatment efforts work; and various ideological/moral perspectives on illegal drug use. Offered as ANTH 335 and ANTH 435.

ANTH 337. Comparative Medical Systems. 3 Units.
This course considers the world’s major medical systems. Foci include professional and folk medical systems of Asia and South Asia, North and South America, Europe and the Mediterranean, including the Christian and Islamic medical traditions. Attention is paid to medical origins and the relationship of popular to professional medicines. The examination of each medical tradition includes consideration of its psychological medicine and system of medical ethics. Recommended preparation: ANTH 215. Offered as ANTH 337 and ANTH 437.

ANTH 338. Maternal Health: Anthropological Perspectives on Reproductive Practices and Health Policy. 3 Units.
The reproductive process is shared by humans as biological beings. However, the experience of pregnancy and childbirth is also dependent on the cultural, social, political, historical, and political-economic setting. This course frames issues in reproductive health by looking at the complex issues associated with maternal health and mortality worldwide. After reviewing biomedical perspectives on reproductive processes this course will focus on childbirth and pregnancy as the process and ritual by which societies welcome new members. This course will review ethnomedical concepts; discuss the interaction between local, national, and global agendas shaping reproductive practices; and conclude with anthropological critiques of reproductive health initiatives. Offered as ANTH 338 and ANTH 438.

ANTH 339. Ethnographic and Qualitative Research Methods. 3 Units.
This is a course on applying ethnographic research methods in the social sciences. Ethnographic research seeks to understand and describe the experiences of research participants (i.e. subjects) through becoming involved in their daily lives. Findings from ethnography are generated through systematic observation within the natural context in which behavior occurs (i.e. fieldwork). Unlike methods that emphasize detachment, distance, and objectivity, ethnography involves developing knowledge by becoming an ad hoc member of the group(s) one is studying. The principal techniques of ethnography, "participant-observation" and "In-depth open ended interviewing," require actively engaging the research process. This class will explore ethnographic research techniques, as well as other qualitative research methods. In addition to addressing how such methods make claims about social phenomena, this class will also explore more practical topics such as: developing questions, entering the field, establishing rapport, taking and managing field notes, coding data, and data analysis. Lectures, readings, and class discussion will be complimented by assignments using techniques. Offered as ANTH 339 and ANTH 439. Prereq: ANTH 102.

ANTH 340. Cultures of the World: Study Abroad. 3 Units.
ANTH 340 is a vehicle to allow anthropology courses taken during study abroad that have a primary focus on the culture of a specific society or geographic area to be accepted as equivalent to a CWRU course that meets the CAS Global and Cultural Diversity requirement. In order to be accepted as equivalent to ANTH 340 a course must (a) be taught in a department of anthropology or by an anthropologist in an allied department; and (b) cover the breadth of a culture. Courses focusing on one aspect of a society (economics, political structure, history, etc.) cannot be accepted as equivalent to ANTH 340. In order to verify that a course meets these requirements students must submit a course description and syllabus for the course to the Chair, Department of Anthropology. If a syllabus is not available in advance of the course, approval will be contingent on review of the course syllabus. This course will fulfill the CAS Global and Cultural Diversity requirement, as well as meet the geographic area requirement for Anthropology majors and minors. Counts for CAS Global & Cultural Diversity Requirement.

ANTH 344. Archaeology of the Ancient Mediterranean. 3 Units.
This course examines the ancient Mediterranean through the material cultures of Egypt, Greece and Rome. Each of these great civilizations will be individually explored, but also examined within a broader historical context. Particular focus will be placed on the social, political and economic ideas that were exchanged across the Mediterranean Sea and the influence this interconnectivity had on eastern Mediterranean societies. Offered as ANEE 344, ANEE 444, ANTH 344, ANTH 444, ARTH 344, ARTH 444, CLSC 344 and CLSC 444.
ANTH 349. Cultures of Latin America. 3 Units.
The aim of this course is to consider cultural diversity and social inequality in contemporary Latin America from an anthropological perspective. A variety of aspects related to ethnicity, religion, music, gender, social movements, cuisine, urban spaces, violence, and ecology are considered in addition to current economic and political issues. These topics will be analyzed in relation to Latin America’s complex historical and social formation and its identity representations. The course takes under consideration various case studies in which not just local communities but also perceptions of national institutions and practices will be analyzed from pluralistic approaches (provided by either Latin American and non-Latin American researchers) that combine fieldwork, interviews and life experiences with textual and media sources. Special attention will be paid to contemporary global issues affecting Latin America. Offered as ANTH 349 and ANTH 449. Counts as SAGES Departmental Seminar. Counts for CAS Global & Cultural Diversity Requirement. Prereq: ANTH 102.

ANTH 353. Chinese Culture and Society. 3 Units.
Focuses on Chinese cultural and social institutions during the Miaoist and post-Miaoist eras. Topics include ideology, economics, politics, religion, family life, and popular culture. Recommended preparation: ANTH 102. Offered as ANTH 353 and ANTH 453. Counts for CAS Global & Cultural Diversity Requirement.

ANTH 354. Health and Healing in East Asia. 3 Units.
This course examines the illness experiences and the healing practices in East Asia. After introducing the anthropological approaches to the study of medicine, this course will explore the practices of ethnomedicine and biomedicine, mental health, family planning and reproductive health, the experience of aging and care giving, infectious disease, environmental health, and biotechnology. By delving into the illness experiences and the healing practices in East Asia, the course will discuss issues related to medical pluralism, health inequality, biological citizenship, social stigmatization, and bioethics. Offered as ANTH 354 and ANTH 454. Counts for CAS Global & Cultural Diversity Requirement.

ANTH 355. Paleodiet(s): Understanding Food and Diet Past and Present. 3 Units.
The Paleodiet promotes to the public the notion that humans evolved to eat one single diet; that is far from the truth. In this class, we will learn about the evolution of our diets and nutrition, the diversity of human diets over time and space, the relationship of diet to health, and the methods biological anthropologists use to scientifically study diet. Expect to learn about early human diets right up to modern diets. Additionally, this course will focus on how to read and interpret scientific papers/concepts, as well as how to construct a scientific argument. Students will apply those skills by giving a presentation to classmates following the structure of scientific meetings. Offered as ANTH 355 and ANTH 455. Prereq: ANTH 103.

ANTH 359. Introduction to Global Health. 3 Units.
This course is an introduction to the field of international and global health from the perspective of anthropology. Key health problems in the world are identified and anthropological research on these issues is presented and examined. The course covers current international and global health issues and reviews the history of anthropological engagement in the field. Case studies of current health issues will be discussed. Offered as ANTH 359 and ANTH 459.

ANTH 360. Global Politics of Reproduction. 3 Units.
This course offers an anthropological examination of reproductive politics around the world. It explores historical, cultural, socioeconomic, political, and technological factors contributing to reproductive activities. After introducing the anthropological approaches to the study of reproduction, the course will delve into the ways to regulate reproduction in historical and contemporary times, various factors contributing to fertility change, state intervention in reproduction, and assisted reproductive technologies. Offered as ANTH 360, ANTH 460, and WGST 360.

ANTH 362. Contemporary Theory in Anthropology. 3 Units.
A critical examination of anthropological thought in England, France and the United States during the second half of the twentieth century. Emphasis will be on the way authors formulate questions that motivate anthropological discourse, on the way central concepts are formulated and applied and on the controversies and debates that result. Readings are drawn from influential texts by prominent contemporary anthropologists. Recommended preparation: ANTH 102. Offered as ANTH 362 and ANTH 462.

ANTH 365. Gender and Sex Differences: Cross-cultural Perspective. 3 Units.
Gender roles and sex differences throughout the lifetime cycle considered from a cross-cultural perspective. Major approaches to explaining sex roles discussed in light of information from both Western and non-Western cultures. Offered as ANTH 365, ANTH 465 and WGST 365. Prereq: ANTH 102 or consent of department.

ANTH 366. Population Change: Problems and Solutions. 3 Units.
The course examines population processes and their social consequences from an anthropological perspective. It introduces basic concepts and theories of population studies and demonstrates the ways in which anthropological research contributes to our understanding of population issues. We will explore questions such as: How has world population changed in history? How does a population age or grow younger? What are the factors affecting population health? Why do people migrate? And what are the policy implications of population change? We will examine the sociocultural, economic, political, and ecological factors contributing to population processes, such as factors affecting childbearing decisions, cultural context of sex-selective abortion, various caregiving arrangements for the elderly, and policy responses to population change. We will explore these issues with cases from across the world, with a special focus on China, the world’s most populous country with the most massive family-planning program in modern human history. Offered as ANTH 366 and ANTH 466.

ANTH 367. Topics in Evolutionary Biology. 3 Units.
The focus for this course on a special topic of interest in evolutionary biology will vary from one offering to the next. Examples of possible topics include theories of speciation, the evolution of language, the evolution of sex, evolution and biodiversity, molecular evolution. ANAT/ANTH/EEPS/PHIL/PHOL 467/BIOL 468 will require a longer, more sophisticated term paper, and additional class presentation. Offered as ANTH 367, BIOL 368, EEPS 367, PHIL 367, ANAT 467, ANTH 467, BIOL 468, EEPS 467, PHIL 467 and PHOL 467. Prereq: ANTH 225 or equivalent.
ANTH 369D. The Anthropology of Nutrition. 3 Units.
Human nutrition is examined from an anthropological perspective. We will briefly cover methods for assessing and evaluating dietary intake and dietary patterns. The remainder of the course will focus on various social, ecological, and genetic factors which influence human nutritional patterns and the causes and consequences of protein-energy malnutrition. The course will be taught in a seminar format and is designed to enhance your skills in critically reading the anthropological literature and in improving your written and oral communication skills. A student may not receive credit for both ANTH 369 and ANTH 369D. Recommended preparation: ANTH 102, ANTH 103. Counts as SAGES Departmental Seminar.

ANTH 370. Field Seminar in Paleoanthropology. 12 Units.
Paleoanthropology is the study of human physical and cultural evolution based on fossils and cultural remains from ancient geological times. These fossils and cultural remains are collected by conducting fieldwork in various parts of the world where geological phenomena have exposed fossiliferous sedimentary windows from the deep past. Hence, fieldwork is one of the major backbones of paleoanthropology. This course is designed for advanced undergraduate students who are interested in pursuing higher degrees in paleoanthropology, human paleobiology, evolutionary biology, or other related disciplines. This course introduces students to the principles and methods of paleontological fieldwork in real time. It introduces students to paleoanthropological fieldwork from locating fossiliferous areas based on aerial photo interpretations to survey methodology; from methods of systematic excavation, fossil collection and documentation in the field, to curation and preparation of fossil specimens in laboratories; from conducting scientific analyses in laboratory environments to subsequently publishing the results in peer-reviewed journals. Recommended preparation: ANTH 377. Prereq: ANTH 103 and ANTH 375.

ANTH 371. Culture, Behavior, and Person: Psychological Anthropology. 3 Units.
Cross-cultural perspectives on personality, human development, individual variability, cognition, deviant behavior, and the role of the individual in his/her society. Classic and contemporary anthropological writings on Western and non-Western societies. Recommended preparation: ANTH 102. Offered as ANTH 371 and ANTH 471.

ANTH 372. Anthropological Approaches to Religion. 3 Units.
The development of, and current approaches to, comparative religion from an anthropological perspective. Topics include witchcraft, ritual, myth, healing, religious language and symbolism, religion and gender, religious experience, the nature of the sacred, religion and social change, altered states of consciousness, and evil. Using material from a wide range of world cultures, critical assessment is made of conventional distinctions such as those between rational/irrational, natural/supernatural, magic/religion, and primitive/civilized. Recommended preparation: ANTH 102. Offered as ANTH 372, RLGN 372 and ANTH 472.

ANTH 376. Topics in the Anthropology of Health and Medicine. 3 Units.
Special topics of interest, such as the biology of human adaptability; the ecology of the human life cycle health delivery systems; transcultural psychiatry; nutrition, health, and disease; paleoepidemiology; and population anthropology. Recommended preparation: ANTH 102 or ANTH 103. Offered as ANTH 376 and ANTH 476.

ANTH 378. Reproductive Health: An Evolutionary Perspective. 3 Units.
This course provides students with an evolutionary perspective on the factors influencing human reproductive health, including reproductive biology, ecology, and various aspects of natural human fertility. Our focus will be on variation in human reproduction in mostly non-western populations. Recommended preparation for ANTH 378: ANTH 103. Offered as ANTH 378 and ANTH 478. Counts as SAGES Departmental Seminar.

ANTH 379. Topics in Cultural and Social Anthropology. 3 Units.
Special topics of interest across the range of social and cultural anthropology. Recommended preparation: ANTH 102. Offered as ANTH 379 and ANTH 479.

ANTH 380. Independent Study in Laboratory Archaeology I. 1 - 3 Units.
This course provides an introduction to the basic methods and techniques of artifact curation and laboratory analysis in archaeology. Under the supervision of the instructor, each student will develop and carry out a focused project of material analysis and interpretation using the archaeology collections of the Cleveland Museum of Natural History. Each student is required to spend a minimum of two hours per week in the Archaeology laboratory for each credit hour taken. By the end of the course, the student will prepare a short report describing the results of their particular project. Recommended preparation: ANTH 107 and permission of department, and prior permission of Department of Archaeology at the Cleveland Museum of Natural History.

ANTH 381. Independent Study in Laboratory Archaeology II. 1 - 3 Units.
This course provides an introduction to the basic methods and techniques of artifact curation and laboratory analysis in archaeology. Under the supervision of the instructor, each student will develop and carry out a focused project of material analysis and interpretation using the archaeology collections of the Cleveland Museum of Natural History. Each student is required to spend a minimum of two hours per week in the Archaeology laboratory for each credit hour taken. By the end of the course, the student will prepare a short report describing the results of their particular project. Recommended preparation: ANTH 107 and permission of department, and prior permission of Department of Archaeology at the Cleveland Museum of Natural History.

ANTH 382. Anthropological and Ecological Perspectives on Preserving and Restoring the Natural World. 3 Units.
Now that the environmentally deleterious effects of modern Western culture on the natural world have reached major proportions it has become crucial to explore innovative solutions to this dilemma. In this course novel perspectives derived from the intersection of anthropology and ecology are discussed. The primary perspective focused upon is the understanding that human culture and the natural world in which it is embedded are essentially communicative, or semiotic processes, which thrive upon diverse interaction and feedback. Preserving and restoring the Natural World thus shifts from protecting individual species and particular cultural practices to enhancing the communicative matrix of life and multiple cultural views of the environment. Through this understanding, students will learn to apply a more elegant, effective, and aesthetically pleasing perspective to the challenging environmental issues facing our contemporary world. An in-depth examination of the North American Prairie, along with a comparison of influences on the landscape by indigenous and modern Western Culture will serve as the particular region of focus. Offered as ANTH 382 and ANTH 482. Counts as SAGES Departmental Seminar.
ANTH 385. Applied Anthropology. 3 Units.
This class will provide students with an overview of how anthropologists put theories, methods, and findings to use in addressing social issues and problems. Applied projects presented will span a diverse range of topics and fields, including: healthcare and medicine, nutrition, international development, displacement of populations, education, as well projects from business and industry. Class discussion will address orientations of and advantages in applied approaches, as well the ethical questions such projects often encounter. Offered as ANTH 385 and ANTH 485.

ANTH 391. Honors Tutorial. 3 Units.
Prereq: Acceptance into Honors Program.

ANTH 392. Honors Tutorial. 3 Units.
Prereq: Acceptance into Honors Program.

ANTH 396. Undergraduate Research in Evolutionary Biology. 3 Units.
Students propose and conduct guided research on an aspect of evolutionary biology. The research will be sponsored and supervised by a member of the CASE faculty or other qualified professional. A written report must be submitted to the Evolutionary Biology Steering Committee before credit is granted. Offered as ANTH 396, BIOL 396, EEPS 396, and PHIL 396. Prereq: ANTH 225 or equivalent.

ANTH 398. Anthropology SAGES Capstone. 3 Units.
Supervised original research on a topic in anthropology, culminating in a written report and a public presentation. The research project may be in the form of an independent research project, a literature review, or some other original project with anthropological significance. The project must be approved and supervised by faculty. Group research projects are acceptable, but a plan which clearly identifies the distinct and substantial role of each participant must be approved by the supervising faculty. Counts as SAGES Senior Capstone. Prereq: Major in Anthropology.

ANTH 398C. Child Policy Externship and Capstone. 3 Units.
Externships offered through CHST/ANTH/PSCL 398C give students an opportunity to work directly with professionals who design and implement policies that impact the lives of children and their families. Agencies involved are active in areas such as public health, including behavioral health, education, juvenile justice, childcare and/or child welfare. Students apply for the externships, and selected students are placed in local public or nonprofit agencies with a policy focus. Each student develops an individualized learning plan in consultation with the Childhood Studies Program faculty and the supervisor in the agency. Offered as CHST 398C, ANTH 398C, and PSCL 398C. Counts as SAGES Senior Capstone. Prereq: CHST 301.

ANTH 399. Independent Study. 1 - 6 Units.
Students may propose topics for independent reading and research.

ANTH 402. Darwinian Medicine. 3 Units.
Darwinian medicine deals with evolutionary aspects of modern human disease. It applies the concepts and methods of evolutionary biology to the question of why we are vulnerable to disease. Darwinian (or evolutionary) medicine proposes several general hypotheses about disease causation including disease as evolutionary legacy and design compromise, the result of a novel environment, a consequence of genetic adaptation, the result of infectious organisms’ evolutionary adaptations, and disease symptoms as manifestation of defense mechanisms. It proposes that evolutionary ideas can explain, help to prevent and perhaps help to treat some diseases. This course presents the basic logic of Darwinian medicine and evaluates hypotheses about specific diseases that illustrate each of the hypotheses about disease causation. Recommended preparation: ANTH 103. Offered as ANTH 302 and ANTH 402.

ANTH 405. Public Policy in Child Development. 3 Units.
This course introduces students to issues in public policy that impact children and families. Local, state, and federal child policy will be considered, and topics will include, for example, policies related to child poverty, education, child welfare, juvenile justice, and children’s physical and mental health. Students will learn how policy is developed, how research informs policy and vice versa, and a framework for analyzing social policy. Recommended preparation: One social sciences course or consent. Offered as ANTH 305, ANTH 405, CHST 301, CHST 401, and POSC 382A.

ANTH 406. The Anthropology of Childhood and the Family. 3 Units.
Child-rearing patterns and the family as an institution, using evidence from Western and non-Western cultures. Human universals and cultural variation, the experience of childhood and recent changes in the American family. Recommended preparation: ANTH 102. Offered as ANTH 306 and ANTH 406.

ANTH 410. Introduction to Linguistic Anthropology. 3 Units.
This is an introduction to the core concepts, theories and methodologies that form the study of language from an anthropological point of view. The course provides exposure to current issues in linguistic anthropological research and reviews some of the foundational topics of research past, highlighting the contributions of linguistics to anthropology and social science. Topics to be explored include: 1) an overview of the study of language (language structure and patterns, the effects of linguistic categories on thought and behavior, meaning and linguistic relativity, cross-language comparison, and non-verbal communication); 2) doing linguistic anthropology “on the ground” (an intro to the laboratory and field techniques of linguistic anthropology); 3) the study of language as function and social action (language and social structure speech acts and events, verbal art, language and emotion); and 4) the study of language/discourse and power (language in politics, medicine, and law). Offered as ANTH 310 and ANTH 410.

ANTH 412. Ethnography of Southeast Asia. 3 Units.
This course examines the people and cultures of Southeast Asia from an anthropological perspective. From a starting place of the local people we will explore important aspects of life in this region such as agriculture, religion, health, medicine, nation-building, ethnic identity, art, and technology. Additionally, we will examine and question the ideas, traditions, and scholarly modes of study that brought this geographical area together as a region. Offered as ANTH 312 and ANTH 412. Counts for CAS Global & Cultural Diversity Requirement.

ANTH 414. Cultures of the United States. 3 Units.
This course considers the rich ethnic diversity of the U.S. from the perspective of social/cultural anthropology. Conquest, immigration, problems of conflicts and accommodation, and the character of the diverse regional and ethnic cultures are considered as are forms of racism, discrimination, and their consequences. Groups of interest include various Latina/o and Native peoples, African-American groups, and specific ethnic groups of Pacific, Mediterranean, European, Asian, and Caribbean origin. Offered as ANTH 314, ETHS 314, and ANTH 414.

ANTH 423. AIDS: Epidemiology, Biology, and Culture. 3 Units.
This course will examine the biological and cultural impact of AIDS in different societies around the world. Topics include: the origin and evolution of the virus, the evolutionary implications of the epidemic, routes of transmission, a historical comparison of AIDS to other epidemics in human history, current worldwide prevalence of AIDS, and cultural responses to the epidemic. Special emphasis will be placed on the long-term biological and social consequences of the epidemic. Recommended preparation: ANTH 102 or ANTH 103. Offered as ANTH 323 and ANTH 423.
ANTH 425. Economic Anthropology. 3 Units.

Economic anthropology is a sub-field of anthropology that examines how people in modern and non-modern societies produce, distribute, exchange, and consume goods, services, and other valued resources. The sub-field seeks to understand how cultures, including our own, organize and structure these activities through institutions, rituals, and beliefs systems. However, unlike the formal approach of the field of economics, the in-depth methods of economic anthropology concentrate on day-to-day experiences of what the economic means, how this is defined, and what we can learn about human behavior through it. This course will introduce students to economic anthropology and some of the major questions and challenges this field addresses. The history of this sub-field, how it relates to economic sociology, and areas where economic anthropology and traditional economics overlap, will also be explored. This class does not present economic anthropology and modern economics as adversaries, instead how and why they are fundamentally different orientations with often seemingly little in common. On this backdrop, this class will survey a number of different topics, including: health commodification; gift exchange; commodity chains; the history of money and debt; why objects have value; how people make ends meet; rational vs. non-rational decision-making; behavioral economic experiments conducted in other cultures; development economics, and why some objects and services have prices while others do not. Offered as ANTH 325 and ANTH 425.

ANTH 426. Power, Illness, and Inequality: The Political Economy of Health. 3 Units.

This course explores the relationship between social inequality and the distribution of health and illness across class, race, gender, sexual orientation, and national boundaries. Class readings drawn from critical anthropological approaches to the study of health emphasize the fundamental importance of power relations and economic constraints in explaining patterns of disease. The course critically examines the nature of Western biomedicine and inequality in the delivery of health services. Special consideration is given to political economic analysis of health issues in the developing world such as AIDS, hunger, reproductive health, and primary health care provision. Recommended preparation: ANTH 102 or ANTH 215. Offered as ANTH 326 and ANTH 426.

ANTH 428. Medical Anthropology and Public Health. 3 Units.

Anthropology has a longstanding relationship with the field of public health, which dates back to before the flourishing of medical anthropology as a subfield. Direct participation of medical anthropologists in public health research and practice continues to grow. This course explores the intersection of medical anthropology and public health from the perspective of anthropological history, theory, and methods. Course topics include: the history of anthropological work in public health, medical anthropology theory as a guide to anthropological public health research, and anthropological methods and approaches to public health work. Case studies from around the world will be employed throughout the course. Offered as ANTH 328 and ANTH 428.

ANTH 429. Anthropological Perspectives of Migration and Health. 3 Units.

This course provides an overview of anthropological perspectives on transnational migration and health. We will focus particularly on health and health care issues concerning refugees, asylum seekers and undocumented migrants. This course will focus on the following topics: the physical and mental health consequences of forced migration; refugee trauma; the intersection of health care and immigration policies; immigration and health care access and utilization. Readings and coursework will consider the sociocultural, political, and economic factors that contribute to migrant health disparities. We will also address issues of medical pluralism among transnational migrants and critically examine the concept of cultural competence in clinical settings. Class readings will comprise a variety of theoretical and ethnographic literature within anthropology and closely related disciplines, drawing on cases from across the globe and in cross-cultural comparison. The class will use lectures, readings, and class discussions to explore these relevant issues in migration and health, with the opportunity to engage in hands on ethnographic work with refugees locally. Offered as ANTH 329 and ANTH 429.

ANTH 435. Illegal Drugs and Society. 3 Units.

This course provides perspectives on illegal drug use informed by the social, political and economic dimensions of the issues. Framed by the history, epidemiology, and medical consequences of drug use, students will confront the complex challenges posed by addiction. Anthropological research conducted in the U.S. and cross-culturally will demonstrate, elaborate and juxtapose various clinical, public health, and law enforcement policies and perspectives. Topics examined will include: why exclusively using a bio-medical model of addiction is inadequate; how effective is the war on drugs; what prevention, intervention and treatment efforts work; and various ideological/moral perspectives on illegal drug use. Offered as ANTH 335 and ANTH 435.

ANTH 437. Comparative Medical Systems. 3 Units.

This course considers the world's major medical systems. Foci include professional and folk medical systems of Asia and South Asia, North and South America, Europe and the Mediterranean, including the Christian and Islamic medical traditions. Attention is paid to medical origins and the relationship of popular to professional medicines. The examination of each medical tradition includes consideration of its psychological medicine and system of medical ethics. Recommended preparation: ANTH 215. Offered as ANTH 337 and ANTH 437.

ANTH 438. Maternal Health: Anthropological Perspectives on Reproductive Practices and Health Policy. 3 Units.

The reproductive process is shared by humans as biological beings. However, the experience of pregnancy and childbirth is also dependent on the cultural, social, political, historical, and political-economic setting. This course frames issues in reproductive health by looking at the complex issues associated with maternal health and mortality worldwide. After reviewing biomedical perspectives on reproductive processes this course will focus on childbirth and pregnancy as the process and ritual by which societies welcome new members. This course will review ethnomedical concepts; discuss the interaction between local, national, and global agendas shaping reproductive practices; and conclude with anthropological critiques of reproductive health initiatives. Offered as ANTH 338 and ANTH 438.
ANTH 439. Ethnographic and Qualitative Research Methods. 3 Units.
This is a course on applying ethnographic research methods in the social sciences. Ethnographic research seeks to understand and describe the experiences of research participants (i.e. subjects) through becoming involved in their daily lives. Findings from ethnography are generated through systematic observation within the natural context in which behavior occurs (i.e. fieldwork). Unlike methods that emphasize detachment, distance, and objectivity, ethnography involves developing knowledge by becoming an ad hoc member of the group(s) one is studying. The principal techniques of ethnography, “participant-observation” and “In-depth open ended interviewing,” require actively engaging the research process. This class will explore ethnographic research techniques, as well as other qualitative research methods. In addition to addressing how such methods make claims about social phenomena, this class will also explore more practical topics such as: developing questions, entering the field, establishing rapport, taking and managing field notes, coding data, and data analysis. Lectures, readings, and class discussion will be complemented by assignments using techniques. Offered as ANTH 339 and ANTH 439.

ANTH 439B. Applying Anthropological Research Methods. 1 Unit.
This class will provide students with practical experience utilizing the anthropological research methods taught in ANTH 439, Ethnographic and Qualitative Research Methods. With guidance from the instructor, students will plan and implement a preliminary / pilot research project. Prereq: ANTH 439 and Graduate Standing in Anthropology.

ANTH 444. Archaeology of the Ancient Mediterranean. 3 Units.
This course examines the ancient Mediterranean through the material cultures of Egypt, Greece and Rome. Each of these great civilizations will be individually explored, but also examined within a broader historical context. Particular focus will be placed on the social, political and economic ideas that were exchanged across the Mediterranean Sea and the influence this interconnectivity had on eastern Mediterranean societies. Offered as ANEE 344, ANEE 444, ANTH 344, ANTH 444, ARTH 444, CLSC 344 and CLSC 444.

ANTH 449. Cultures of Latin America. 3 Units.
The aim of this course is to consider cultural diversity and social inequality in contemporary Latin America from an anthropological perspective. A variety of aspects related to ethnicity, religion, music, gender, social movements, cuisine, urban spaces, violence, and ecology are considered in addition to current economic and political issues. These topics will be analyzed in relation to Latin America’s complex historical and social formation and its identity representations. The course takes under consideration various case studies in which not just local communities but also perceptions of national institutions and practices will be analyzed from pluralistic approaches (provided by either Latin American and non-Latin American researchers) that combine fieldwork, interviews and life experiences with textual and media sources. Special attention will be paid to contemporary global issues affecting Latin America. Offered as ANTH 349 and ANTH 449. Counts as SAGES Departmental Seminar. Counts for CAS Global & Cultural Diversity Requirement.

ANTH 453. Chinese Culture and Society. 3 Units.
Focuses on Chinese cultural and social institutions during the Maoist and post-Maoist eras. Topics include ideology, economics, politics, religion, family life, and popular culture. Recommended preparation: ANTH 102. Offered as ANTH 353 and ANTH 453. Counts for CAS Global & Cultural Diversity Requirement.

ANTH 454. Health and Healing in East Asia. 3 Units.
This course examines the illness experiences and the healing practices in East Asia. After introducing the anthropological approaches to the study of medicine, this course will explore the practices of ethnomedicine and biomedicine, mental health, family planning and reproductive health, the experience of aging and care giving, infectious disease, environmental health, and biotechnology. By delving into the illness experiences and the healing practices in East Asia, the course will discuss issues related to medical pluralism, health inequality, biological citizenship, social stigmatization, and bioethics. Offered as ANTH 354 and ANTH 454. Counts for CAS Global & Cultural Diversity Requirement. Prereq: Graduate Standing.

ANTH 455. Paleodiet(s)?: Understanding Food and Diet Past and Present. 3 Units.
The Paleodiet promotes to the public the notion that humans evolved to eat one single diet; that is far from the truth. In this class, we will learn about the evolution of our diets and nutrition, the diversity of human diets over time and space, the relationship of diet to health, and the methods biological anthropologists use to scientifically study diet. Expect to learn about early human diets right up to modern diets. Additionally, this course will focus on how to read and interpret scientific papers/concepts, as well as how to construct a scientific argument. Students will apply those skills by giving a presentation to classmates following the structure of scientific meetings. Offered as ANTH 355 and ANTH 455.

ANTH 459. Introduction to Global Health. 3 Units.
This course is an introduction to the field of international and global health from the perspective of anthropology. Key health problems in the world are identified and anthropological research on these issues is presented and examined. The course covers current international and global health issues and reviews the history of anthropological engagement in the field. Case studies of current health issues will be discussed. Offered as ANTH 359 and ANTH 459.

ANTH 460. Global Politics of Reproduction. 3 Units.
This course offers an anthropological examination of reproductive politics around the world. It explores historical, cultural, socioeconomic, political, and technological factors contributing to reproductive activities. After introducing the anthropological approaches to the study of reproduction, the course will delve into the ways to regulate reproduction in historical and contemporary times, various factors contributing to fertility change, state intervention in reproduction, and assisted reproductive technologies. Offered as ANTH 360, ANTH 460, and WGST 360. Prereq: Graduate Standing.

ANTH 462. Contemporary Theory in Anthropology. 3 Units.
A critical examination of anthropological thought in England, France and the United States during the second half of the twentieth century. Emphasis will be on the way authors formulate questions that motivate anthropological discourse, on the way central concepts are formulated and applied and on the controversies and debates that result. Readings are drawn from influential texts by prominent contemporary anthropologists. Recommended preparation: ANTH 102. Offered as ANTH 362 and ANTH 462.

ANTH 465. Gender and Sex Differences: Cross-cultural Perspective. 3 Units.
Gender roles and sex differences throughout the life cycle considered from a cross-cultural perspective. Major approaches to explaining sex roles discussed in light of information from both Western and non-Western cultures. Offered as ANTH 365, ANTH 465 and WGST 365.
ANTH 466. Population Change: Problems and Solutions. 3 Units.
The course examines population processes and their social consequences from an anthropological perspective. It introduces basic concepts and theories of population studies and demonstrates the ways in which anthropological research contributes to our understanding of population issues. We will explore questions such as: How has world population changed in history? How does a population age or grow younger? What are the factors affecting population health? Why do people migrate? And what are the policy implications of population change? We will examine the sociocultural, economic, political, and ecological factors contributing to population processes, such as factors affecting childbearing decisions, cultural context of sex-selective abortion, various caregiving arrangements for the elderly, and policy responses to population change. We will explore these issues with cases from across the world, with a special focus on China, the world's most populous country with the most massive family-planning program in modern human history. Offered as ANTH 366 and ANTH 466. Prereq: Graduate standing.

ANTH 467. Topics in Evolutionary Biology. 3 Units.
The focus for this course on a special topic of interest in evolutionary biology will vary from one offering to the next. Examples of possible topics include theories of speciation, the evolution of language, the evolution of sex, evolution and biodiversity, molecular evolution. ANAT/ANTH/EEPS/PHIL/PHOL 467/BIOL 468 will require a longer, more sophisticated term paper, and additional class presentation. Offered as ANTH 367, BIOL 368, EEPS 367, PHIL 367, ANAT 467, ANTH 467, BIOL 468, EEPS 467, PHIL 467 and PHOL 467.

ANTH 471. Culture, Behavior, and Person: Psychological Anthropology. 3 Units.
Cross-cultural perspectives on personality, human development, individual variability, cognition, deviant behavior, and the role of the individual in his/her society. Classic and contemporary anthropological writings on Western and non-Western societies. Recommended preparation: ANTH 102. Offered as ANTH 371 and ANTH 471.

ANTH 472. Anthropological Approaches to Religion. 3 Units.
The development of, and current approaches to, comparative religion from an anthropological perspective. Topics include witchcraft, ritual, myth, healing, religious language and symbolism, religion and gender, religious experience, the nature of the sacred, religion and social change, altered states of consciousness, and evil. Using material from a wide range of world cultures, critical assessment is made of conventional distinctions such as those between rational/irrational, natural/supernatural, magic/religion, and primitive/civilized. Recommended preparation: ANTH 102. Offered as ANTH 372, RLGN 372 and ANTH 472.

ANTH 476. Topics in the Anthropology of Health and Medicine. 3 Units.
Special topics of interest, such as the biology of human adaptability; the ecology of the human life cycle health delivery systems; transcultural psychiatry; nutrition, health, and disease; paleoepidemiology; and population anthropology. Recommended preparation: ANTH 102 or ANTH 103. Offered as ANTH 376 and ANTH 476.

ANTH 478. Reproductive Health: An Evolutionary Perspective. 3 Units.
This course provides students with an evolutionary perspective on the factors influencing human reproductive health, including reproductive biology, ecology, and various aspects of natural human fertility. Our focus will be on variation in human reproduction in mostly non-western populations. Recommended preparation for ANTH 378: ANTH 103. Offered as ANTH 378 and ANTH 478. Counts as SAGES Departmental Seminar.

ANTH 479. Topics in Cultural and Social Anthropology. 3 Units.
Special topics of interest across the range of social and cultural anthropology. Recommended preparation: ANTH 102. Offered as ANTH 379 and ANTH 479.

ANTH 480. Medical Anthropology and Global Health I. 3 Units.
The first in a sequence of two graduate core courses in medical anthropology and global health. This course focuses on foundational concepts and theories in medical anthropology, as well as topical areas which have been central to the development of the field. Prereq: Graduate Standing in Anthropology.

ANTH 480B. Medical Anthropology and Global Health I Recitation. 1 Unit.
ANTH 480B serves as a complement to ANTH 480 (Medical Anthropology and Global Health I). There are two primary goals. The first goal is to provide additional time to review, discuss, and integrate through discussion and additional readings topics covered in ANTH 480. This will better prepare students for both course exams and the MA Qualifying Exam, as well as meeting stated student interests in expanded opportunities to engage with graduate student colleagues about contemporary anthropological research. The second goal is to support students in building their professional identity as anthropologists and to enhance professional development through specific skill-building. Coreq: ANTH 480. Prereq: Anthropology Graduate Student.

ANTH 481. Medical Anthropology and Global Health II. 3 Units.
The second in a sequence of two graduate core courses in medical anthropology and global health. This course focuses on the application of medical anthropology theory and methods to the study of global health. Recommended preparation: ANTH 480. Prereq: Graduate Standing in Anthropology.

ANTH 481B. Medical Anthropology and Global Health II Recitation. 1 Unit.
ANTH 481B serves as a complement to ANTH 481 (Medical Anthropology and Global Health II). The goal of the course is to provide additional time to review, discuss, and integrate through discussion and additional readings topics covered in ANTH 481. This will better prepare students for both course exams and the MA Qualifying Exam, as well as meeting stated student interests in expanded opportunities to engage with graduate student colleagues about contemporary anthropological research. Prereq: Graduate Standing in Anthropology.

ANTH 482. Anthropological and Ecological Perspectives on Preserving and Restoring the Natural World. 3 Units.
Now that the environmentally deleterious effects of modern Western culture on the natural world have reached major proportions it has become crucial to explore innovative solutions to this dilemma. In this course novel perspectives derived from the intersection of anthropology and ecology are discussed. The primary perspective focused upon is the understanding that human culture and the natural world in which it is embedded are essentially communicative, or semiotic processes, which thrive upon diverse interaction and feedback. Preserving and restoring the Natural World thus shifts from protecting individual species and particular cultural practices to enhancing the communicative matrix of life and multiple cultural views of the environment. Through this understanding, students will learn to apply a more elegant, effective, and aesthetically pleasing perspective to the challenging environmental issues facing our contemporary world. An in-depth examination of the North American Prairie, along with a comparison of influences on the landscape by indigenous and modern Western Culture will serve as the particular region of focus. Offered as ANTH 382 and ANTH 482. Counts as SAGES Departmental Seminar.
ANTH 485. Applied Anthropology. 3 Units.
This class will provide students with an overview of how anthropologists put theories, methods, and findings to use in addressing social issues and problems. Applied projects presented will span a diverse range of topics and fields, including: healthcare and medicine, nutrition, international development, displacement of populations, education, as well projects from business and industry. Class discussion will address orientations of and advantages in applied approaches, as well the ethical questions such projects often encounter. Offered as ANTH 385 and ANTH 485.

ANTH 503. Seminar in Social Cultural Anthropology. 3 Units.

ANTH 504. Anthropological Research Design. 3 Units.
Practical and theoretical issues in the selection of questions for health and aging research in societal settings. Illustration of frameworks and designs for research. Discussion of the problems of collection, analysis, and interpretation of data along with the nonscientific influences on the research process and the use of results. Prereq: Graduate standing in anthropology.

ANTH 511. Seminar in Anthropology and Global Health: Topics. 3 Units.
This course examines the current issues in global health and the emerging anthropological paradigm directed at global health issues. The objective of the course is to provide graduate students in medical anthropology an in-depth examination of global health from several perspectives. The course will feature perspectives from anthropologists as well as others working in the fields of global health. Prereq: Graduate standing in Anthropology.

ANTH 513. Seminar in Ethnopsychiatry. 3 Units.
Theory and practice of psychotherapeutic forms. Diagnostic and therapeutic forms from Europe, the United States, Japan, India, and other major cultural traditions and those of local areas such as West Africa, Native America, and Latin America. The cultural theories of mental disorders, related conceptions of self and person, and the relationships of local psychological theory to clinical praxis and outcome.

ANTH 519. Seminar in Human Ecology and Adaptability. 3 Units.

ANTH 530. Seminar in Medical Anthropology: Topics. 3 Units.
Various topics will be offered for graduate students in medical anthropology, such as “Anthropological Perspectives on Women’s Health and Reproduction” and “Biocultural Anthropology.” Prereq: ANTH 480.

ANTH 591. Seminar in Physical Anthropology. 3 Units.

ANTH 599. Tutorial: Advanced Studies in Anthropology. 1 - 18 Units.
(Credit as arranged.) Advanced studies in anthropology.

ANTH 601. Independent Research. 1 - 18 Units.
(Credit as arranged.)

ANTH 701. Dissertation Ph.D.. 1 - 9 Units.
(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

Department of Art History and Art

Mather House

Elizabeth Bolman, Department Chair
elizabeth.bolman@case.edu

The Department of Art History and Art (http://www.case.edu/artsci/arth/arth.html) offers opportunities to study art history, to engage in pre-professional museum training, to participate in a broad range of studio offerings, and to pursue state teacher licensure in art education. The Bachelor of Arts degree is granted in art history and in pre-architecture (second major only), and the Bachelor of Science degree in art education. The department offers graduate programs leading to the degrees of Doctor of Philosophy in art history, Master of Arts in art history, Master of Arts in art history and museum studies, and Master of Arts in art education. In conjunction with the School of Law, the department also offers a combined JD/Master of Arts in art history and museum studies. Qualified undergraduates majoring in art history or art education may participate in the Integrated Graduate Studies Program.

All art programs are considerably enhanced by close cooperation with cultural institutions located in University Circle, in particular the Cleveland Museum of Art, the Cleveland Institute of Art, and the Museum of Contemporary Art (MOCA). The planned Nancy and Joseph Keithley Institute for Art History, to be created jointly with the Cleveland Museum of Art, will promote art historical studies through graduate fellowship support, collections-based graduate seminars, travel and research funding, undergraduate internship funding, and joint programming with the Cleveland Museum of Art.

In collaboration with the Department of Physics and other university associates, the department is launching a new series of programs under the umbrella art.lab.cle.

art.lab.cle supports the transformation of the fields of art history and art education. We approach these ambitious objectives from two principal points of view: transdisciplinary collaboration with the sciences and technology, and social justice. At times, these two objectives mesh in a single project. The democratization of art is at the heart of our vision. Please see our website for more information.

Art History Program

The study of art history expands visual literacy, deepens critical reading and writing skills, and increases students’ abilities to think across fields. The discipline is profoundly multidisciplinary, and it enhances awareness of cultural diversity around the globe and throughout time. Students majoring in art history have a wide variety of career opportunities. Graduates with a strong background in art history are employed as college and university professors; as museum professionals (in curatorial, educational, and administrative positions); as art librarians and archivists; as development officers; as journalists; as art gallery or auction house staff members; as art conservators and restorers; as art specialists in the diplomatic service and at all levels of government; and in other careers in industry, film, and television. Some of these specialties require additional study and professional preparation beyond the bachelor’s degree. Other art history majors who have fulfilled the required prerequisites go on to attend law, medical, or business school. Increasingly, familiarity with global visual culture is desirable for those pursuing careers well outside the field (for example, engineering students).

The graduate programs in art history are offered as part of the exceptional joint program in art history of Case Western Reserve University and the Cleveland Museum of Art. Most classes, undergraduate and graduate level, are held in the museum, and some courses are offered or co-taught by museum curators who hold adjunct appointments in the department. Students taking advanced-level courses use the museum’s extensive research library, and all students have an opportunity to study original works of art in the museum’s superb collections and conservation laboratories.
Art Education Programs

There is a temporary pause in admissions to the Art Education Programs. Contact Steven Ciampaglia (src137@case.edu) for more information.

The Art Education Programs' mission is "to prepare proactive, scholar-practitioner art educators who will develop into leaders, teachers, and talented artists in the field of art education."

The undergraduate and graduate degree programs in art education are offered in conjunction with the Cleveland Institute of Art. Art education majors have the advantage of pursuing their academic studies in a university environment and their studio studies at a professional art school that educates artists and designers. Students participate in educational field experiences conducted in many of Greater Cleveland's urban and suburban school systems, museums, and cultural institutions. Graduates of the Art Education Programs have pursued careers as teachers, supervisors, and consultants in public and private schools, colleges, art schools, and museums; as administrators of galleries and art organizations; as designers of educational programs for industry; and as practicing artists. The programs are especially proud of their record in recruiting and graduating students from diverse backgrounds.

Art Studio Program

For students seeking to develop and nurture their artistic and creative talents, the Art Studio Program offers a variety of introductory art courses in a variety of art media. Courses in drawing, painting, design, ceramics, enameling and jewelry, textiles, photography, digital media, and architecture are taught at various skill levels by experienced, professional artists. These courses can be taken as university electives or to fulfill minors in art studio, photography, or architecture. The program offers pre-architecture as a second major and as a minor for students who expect to continue architectural studies at the graduate level or who simply wish to pursue an area of interest to complete a second major in pre-architecture. At the end of each semester, there is a comprehensive public art exhibition of student work in the Art Gallery.

Department Faculty

Elizabeth Bolman, PhD  
(Bryn Mawr College)  
Elsie B. Smith Chair in the Liberal Arts; Professor of Art History; Chair; Department of Art History and Art  
Late Antique and Byzantine visual culture

Henry Adams, PhD  
(Yale University)  
Ruth Coulter Heede Professor in Art History  
American art

Erin Benay, PhD  
(Rutgers University)  
Associate Professor  
Early Modern Southern European art

Elina Gertsman, PhD  
(Boston University)  
Archbishop Paul J. Hallinan Professor in Catholic Studies II; Director of Graduate Studies  
Medieval art

Eunyoung Park, PhD  
(University of Kansas)  
Assistant Professor  
Modern and contemporary art

Maggie L. Popkin, PhD  
(The Institute of Fine Arts, New York University)  
Robson Junior Professor; Associate Professor  
Ancient Roman art and archaeology

Andrea Wolk Rager, PhD  
(Yale University)  
Jesse Hauk Shera Assistant Professor; Director of Undergraduate Studies  
Nineteenth- and twentieth-century British and European art

Catherine B. Scallen, PhD  
(Princeton University)  
Andrew W. Mellon Professor of the Humanities; Associate Professor  
Northern Renaissance and Baroque art and historiography

Adjunct Faculty from the Cleveland Museum of Art

Louis Adrean, MLS  
(Syracuse University)  
Adjunct Instructor; Head, Research and Programs, Ingalls Library and Museum Archives

Susan Bergh, PhD  
(Columbia University)  
Adjunct Associate Professor; Curator, Art of the Ancient Americas

Cory Korkow, PhD  
(University of Virginia)  
Adjunct Associate Professor; Associate Curator, European Art

Heather Lemonedes, PhD  
(The Graduate School and University Center, City University of New York)  
Adjunct Associate Professor; Deputy Director and Chief Curator

Sonya Rhie Mace, PhD  
(Harvard University)  
Adjunct Professor; George P. Bickford Curator of Indian and Southeast Asian Art

Sooa Im McCormick, PhD  
(University of Kansas)  
Adjunct Assistant Professor; Assistant Curator, Korean Art

Emily Peters, PhD  
(University of California, Santa Barbara)  
Adjunct Professor; Curator, Prints and Drawings

William Robinson, PhD  
(Case Western Reserve University)  
Adjunct Professor; Curator, Modern European Art

Barbara Tannenbaum, PhD  
(University of Michigan)  
Adjunct Professor; Curator, Photography
Art Education

Steven Ciampaglia, EdD
(Northern Illinois University)
Champney Family Professor of Art; Associate Professor; Director, Art Education and Art Studio Programs
Social justice and community arts; critical pedagogy; art + tech; media arts education

David King, MFA
(Kent State University)
Lecturer; Supervisor, Art Education Secondary Student Teaching

Adjunct Art History Faculty

Heather Galloway, Certificate in Conservation; MA in Art History
(Conservation Center, Institute of Fine Arts, New York University; Williams College Graduate Program in the History of Art)
Adjunct Assistant Professor
Physical examination of works of art

Gary Sampson, PhD
(University of California, Santa Barbara)
Associate Dean, Graduate Studies, Cleveland Institute of Art
History of photography

Holly Witchey, PhD
(Case Western Reserve University)
Adjunct Professor
Museum studies

Art Studio

Steven Ciampaglia, EdD
(Northern Illinois University)
Champney Family Professor of Art; Associate Professor; Director, Art Education and Art Studio Programs
Social justice and community arts; critical pedagogy; art + tech; media arts education

Jerry Birchfield, MFA
(Cornell University)
Lecturer, Photography Advisor
Photography, creative photography

Margaret Fischer, MA
(Case Western Reserve University)
Lecturer
Enameling and jewelry

Adriel Meyer, MA
(Case Western Reserve University)
Lecturer
Fibers and textiles

Emeriti

Ellen G. Landau
Andrew W. Mellon Professor Emerita of the Humanities

Edward J. Olszewski
Professor Emeritus

Undergraduate Programs

The art history curriculum is designed to give students a broad grounding in a variety of artistic media with a strong emphasis on understanding the cultural context in which they were produced. Students develop technical and critical vocabularies as well as sound writing skills to analyze works of art. Study of and research on works of art in the Cleveland Museum of Art are essential components of the undergraduate curriculum. Internships for credit or with volunteer status are available at the Cleveland Museum of Art, the Museum of Contemporary Art, and other arts institutions in University Circle.

Integrated Graduate Studies Program. Qualified undergraduates majoring in art history or art education may also participate in the Integrated Graduate Studies Program (p. 1298). Interested students should note the general requirements and the admission procedures in this bulletin and may consult the department for further information. The GRE is required for all students applying to the IGS program in art history.

Majors

Bachelor of Arts in Art History
This major requires 36 hours of coursework in art history, including:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARTH 101</td>
<td>Art History I: Pyramids to Pagodas</td>
<td>3</td>
</tr>
<tr>
<td>ARTH 102</td>
<td>Art History II: Michelangelo to Maya Lin</td>
<td>3</td>
</tr>
<tr>
<td>Art History 200-level courses</td>
<td>3-6</td>
<td></td>
</tr>
<tr>
<td>ARTH 396</td>
<td>Majors Seminar</td>
<td>3</td>
</tr>
<tr>
<td>Art History electives at the 300 level</td>
<td>15-18</td>
<td></td>
</tr>
<tr>
<td>Art Studio courses</td>
<td>3-6</td>
<td></td>
</tr>
</tbody>
</table>

Students must take one 200- or 300-level course in four of the following five areas: Ancient Art, Arts of Asia/Africa/the Americas, Medieval Art, Renaissance and Baroque Art, and Modern/American/Contemporary
Art. Foreign language study (French, German, or Italian) is highly recommended.

Departmental Honors. Majors who wish to earn the Bachelor of Arts degree with honors in art history must make written application to the department chair no later than the fall semester of their senior year. Departmental honors are awarded upon fulfillment of the following requirements: a grade point average of at least 3.5 in the major and an A in ARTH 399 Honors Thesis.

Bachelor of Science in Art Education
There is a temporary pause in admissions to the BS in Art Education.

The Bachelor of Science in art education requires a total of 124 credits and is designed to educate professional teachers of art for public and private schools who are also competent, creative artists. The program meets the requirements of the Ohio Board of Education to qualify its university-recommended students for Pre-K-12 Visual Art Specialist Licensure to teach art in the public schools of Ohio and more than 40 reciprocating states.

This program is conducted jointly by Case Western Reserve University and the Cleveland Institute of Art. Admission requires application to Case Western Reserve University and submission of an art portfolio. Academic work is taken at Case Western Reserve, and the majority of art studio courses at the Cleveland Institute of Art, as follows:

Academic Courses at Case Western Reserve University

SAGES (First Seminar) 4
Two of the following: 6
  USNA Thinking About Natural and Technological World (3 cr hrs)
  USSO Thinking about the Social World (3 cr hrs)
  USSY Thinking about the Symbolic World (3 cr hrs)
Natural Sciences 3
Quantitative Reasoning (MATH or STAT) 3
Global & Cultural Diversity 3
ARTH 101 Art History I: Pyramids to Pagodas 3
ARTH 102 Art History II: Michelangelo to Maya Lin 3
ARTH Electives (one must be at 300 level) 6
PHED Physical Education (2 semesters)

Total Units 31

Professional Education/Art Education

ARTS 295 Introduction to Art Education 3
ARTS 300 Art For Different Futures 3
ARTS 385 Clinical/Field Based Experience I 1
ARTS 386 Clinical/Field Based Experience II 1
ARTS 387 Clinical/Field Based Experience III 1
ARTS 393 Art Content, Pedagogy, Methodology, and Assessment 3
ARTS 366A Student Teaching in Art: Pre-K - 6th Grade 4
ARTS 366B Student Teaching in Art: 7th - 12th Grade 4
ARTS 465 Seminar for Art Teachers 4
EDUC 301 Introduction to Education 3

PSCL 101 General Psychology I 3
EDUC 304 Educational Psychology 3
EDUC 255 Literacy Across the Content Areas 3
EDUC 386 Introduction to Instructional Technology 3

Total Units 39

Art Studio Courses at the Cleveland Institute of Art

I. Cleveland Institute of Art Foundations Core

Foundations Core introduces you to the forms, methods, and media concepts crucial to creative development, self-expression, and effective visual communication and production. The program provides a solid, broad-based core of art fundamentals that supports each subsequent year of advanced study throughout the institute’s curriculum. The foundation experience fosters a learning environment that is responsive to the aspirations and needs of the young artist, as well as innovations in the world of art and design, by balancing fundamental approaches with experimentation. The program fosters students’ aesthetic sensibilities and prepares them for the visual language, concepts, discipline, and skills that are necessary for excelling as an artist and art educator.

REQUIRED CLASSES

CIAR 103D Digital Color 1.5
CIAR 103M Material Color 1.5
CIAR 104 Digital Synthesis 3
CIAR 107 2D Design 3
CIAR 108 3D Design 3
CIAR 117 Drawing I 3
CIAR 118 Drawing II 3
CIAR 221 Intro to Painting 3
CIAR 233 Painting After the Photograph 3
CIAR 229A Intro to Sculpture Fabrication 3
Two Foundation Electives (6 cr. hrs) 6

Total Units 33

CLEVELAND INSTITUTE OF ART & ART STUDIO ELECTIVES (7 classes, 21 hours)

Seven different Art Studio 3-credit courses may be selected as electives in the areas of drawing, painting, design, sculpture, printmaking, crafts (ceramics, enameling, glass, fiber and materials studies, jewelry and metals), technology and integrated media, and film and video photographic arts. These courses offer students an opportunity for both breadth and depth based on their artistic aspirations and interests.

Recommended Classes

CIA PRI 200 Printmaking or PRI 232 Artist Book
CIA CDE Creative Process & Materials or CWRU ARTS 214 Ceramics

CWRU ARTS 216 Painting

CIA PHV 295 Photo I or CWRU ARTS 220 Photo I
CIA MET 249 Intro to Jewelry or CWRU ARTS 210 Enameling & Jewelry
CIA PPEL 400 Putting Artists in the Classroom
CIA Advanced Drawing or Painting Course

Total Units
124

Retention and Advanced Standing (Undergraduate Level)

The Bachelor of Science program in art education is designed to educate professional teachers of art. There are four decision points in the program, and for each of these decision points, there are three possible outcomes: unconditional admission; conditional admission with a prescribed remedial plan which when successfully completed will result in unconditional admission; or denial of admission. Denial of admission at any decision point means the student is no longer able to pursue an art education degree at Case Western Reserve.

Decision Point 1: Entry to the Program

Official admission to the Art Education Program generally occurs at the end of the fall semester of the sophomore year after a student completes ARTS 295 Introduction to Art Education. Admission to the program requires:

1. Successful interview and satisfactory score on the Teacher Licensure Admission Assessment
2. Cumulative GPA at CWRU of 2.7 or better (undergraduate)
3. Demonstration of entry-level competency in the discipline through successful presentation of an art portfolio
4. Signed statement of Good Moral Character
5. Being accepted as an art major through a portfolio review before matriculation
6. Successful completion of ARTS 295 Introduction to Art Education, including evaluation of an initial Teaching ePortfolio

Decision Point 2: Admission to Advanced Standing

The Application for Advanced Standing should be submitted by the junior year and the fall semester after Decision Point 1. The application requires:

1. Cumulative GPA of 2.7 or better
2. Discipline GPA of 2.7 or better
3. Education GPA of 3.0 or better
4. Minimum average score of 2.0 on Candidate Disposition Assessment Inventory (DAI)
5. Minimum average score of 2.0 on the ePortfolio

Decision Point 3: Admission to Student Teaching

The Application for Student Teaching should be completed by week 8 of the semester prior to student teaching. The application requires:

1. Cumulative GPA of 2.7 or better
2. Discipline GPA of 2.7 or better
3. Education GPA of 3.0 or better
4. Minimum average score of 2.5 on the ePortfolio that includes documentation of clinical/field experiences
5. Pass TB test; present documentation of hepatitis B vaccinations
6. Pass criminal background checks (BCI & FBI)
7. Minimum average score of 2.5 on DAI
8. Successful completion of the Student Teaching Interview

Decision Point 4: Retention During the Student Teaching Semester

1. Minimum average score of 2.75 on each CWRU Student Teaching Final Assessment by Cooperating Teacher and University Supervisor during the first student teaching placement
2. Minimum average mid-semester score of 2.75 on DAI

Decision Point 5: Recommendation for Initial Licensure

1. Cumulative GPA of 2.7 or better
2. Discipline GPA of 2.7 or better
3. Education GPA of 3.0 or better
4. Completion of degree requirements
5. Minimum average score of 3.0 on the ePortfolio
6. Minimum average score of 3.0 or better on DAI
7. Completion of CWRU Student Teaching Final Assessment by Cooperating Teacher and University Supervisor averaging 3.0 or better on each
8. Achieve passing scores on Ohio licensure exams
9. Completion of the following: Feedback on University Supervisor, Feedback on Cooperating Teacher, CWRU Teacher Licensure Exit Interview and Survey

After successfully completing all requirements at the four decision points, the student is recommended by the university's director of teacher education for the Ohio Visual Art (Pre-K-12) License. Completion of the Bachelor of Science in art education does not ensure that the State of Ohio's Visual Art Teacher License will be awarded.

Teacher licensure is also obtainable through the Art Education Graduate Program of Study. Additional information on this program is available in the office of the director of art education.

Bachelor of Arts in Pre-Architecture

The Pre-Architecture Program introduces the student to the forms, history, and functions of architecture as well as to the studio skills relevant to its practice. The program is designed to provide a background for undergraduate students who plan to continue architectural studies at the graduate level, as well as for those interested in the study of architecture as part of a liberal or technical education.

Pre-architecture may be chosen only as a second major. The double major is required so that the perspectives provided by this interdisciplinary program may be complemented by a concentrated disciplinary experience. For a student who completes a Bachelor of Science degree (BS, BSE, or BSN), pre-architecture may serve as the sole major for a BA degree.

To declare a pre-architecture major, students should have declared a first major and have sophomore or junior standing. Up to 6 credits in general education requirements and elective courses taken by students for their first major may be applied to their pre-architecture major.

The major consists of a minimum of 30 credit hours, 15 of which are in required courses and the remainder of which are approved elective courses. Detailed information about approved electives is available in the departmental office.
The required courses are:

Doctor of Philosophy in Art History

Our highly selective doctoral program in art history, founded in 1967 and offered in collaboration with the Cleveland Museum of Art, provides unique training for museum and academic careers. The object-grounded approach to the study of art history, based on the encyclopedic collections of the CMA and other area institutions, affords an exceptional opportunity to fuse the varied practices of the discipline pursued within the museum and the academy. Through study rooted in careful examination of the specific properties and idiosyncrasies of art objects, students can contribute concretely to a broader cultural and theoretical academic discourse. Graduate students are trained in both traditional and newer, theoretically-based art historical approaches in classes taught by faculty renowned for their expertise in a diversity of fields, all of whom maintain an object-oriented approach to teaching and research. Many CMA curators and museum educators hold adjunct faculty positions and teach courses for the program. Classes are frequently held at the CMA, where students have access to the permanent collections and a rotating schedule of exhibitions as well as to the Ingalls Library, the third largest art research library in the United States.

The innovative CWRU-CMA doctoral program in art history trains flexible and creative professionals who have the tools to achieve excellence in museum and academic careers. The pace of the program is accelerated; full funding for five years of tuition in addition to a $25,000 yearly stipend enables our doctoral students to work full time on their degrees, with the goal of finishing in five to six years. Many aspects of the current curriculum were developed through two generous grants given jointly to CWRU and the CMA in 2013 and 2019 by the Andrew W. Mellon Foundation as part of a program to further collaborations between art history graduate programs and art museums.

An MA in art history and reading knowledge of one approved foreign language (such as French, German, Italian, Japanese, or Chinese) are prerequisites. Very rarely, an exceptionally well-prepared applicant may be
considered for admission with a BA degree only. Admission preference is given to applicants whose scholarly interests coincide with the interests of a department faculty member, those who wish to focus on distinctive holdings in the collection of the Cleveland Museum of Art, and/or those planning to pursue topics in museum or collecting history or the history of the art market. Admission to the program is made on the basis of academic record and scholarly promise, recommendations, experience, and personal interviews. Applicants must also submit GRE scores and two art history research papers. Students whose MA was awarded more than five years prior to application for admission may be required to pass a qualifying examination and/or foreign language examination administered by the department before being admitted to full standing in the PhD program.

Total Units: 60

Doctoral students must demonstrate an ability to read two approved languages other than English useful in art historical research. The general examination cannot be taken until the language requirement is fulfilled either through course work or successfully passing language reading examinations. Doctoral students in Asian art should enter the program with a reading knowledge of at least one Asian language (Chinese, Japanese, or Korean). Prior to taking the comprehensive exam, students must demonstrate reading knowledge of two languages relevant to the student's research interests. The second language is chosen in consultation with a faculty advisor. It may be a modern Asian language, a classical Asian language, or a European language.

Doctoral students are required to pass an oral examination of major and minor fields and a written examination in the form of a research paper of 20-30 pages in length. The topic for the research paper will be set by the examination committee after the oral examination is held, the paper will be due two weeks after the student picks up the assigned topic. A final evaluation will be based on the student's performance in both the written and oral sections of the general examination.

**Master of Arts in Art History**

The MA program in art history is designed to provide the student with a broad knowledge of the major art historical periods, scholarly and bibliographical resources, and the methodologies of art history. It also offers an opportunity to investigate art historical problems in some depth. In addition to the regular graduate school application form, applicants to the graduate program in art history are required to submit GRE scores and two research papers that they consider to represent their best work. Applicants for the MA should have a BA major or minor concentration in art history or a related humanities field and a minimum GPA of 3.5. All applicants whose native language is not English, or who have not received a degree from an English-speaking university, must take the Test of English as a Foreign Language (TOEFL); the required minimum score on the online test is 100.

The master’s degree in art history is conducted exclusively under Plan B as described under the School of Graduate Studies (p. 1333) in this bulletin. All other requirements of the MA program must be fulfilled.

Total Units: 30

**Master of Arts in Art History and Museum Studies**

The MA program in art history and museum studies includes the same broad requirements and objectives as the MA program in art history, along with a year-long museum studies course and two supervised museum internships. In addition to the regular graduate school application form, applicants to the graduate program in art history are required to submit GRE scores and two research papers that they consider to represent their best work. Applicants for the MA should have a BA major or minor concentration in art history or a related humanities field and a minimum GPA of 3.5. All applicants whose native language is not English, or who have not received a degree from an English-speaking university, must take the Test of English as a Foreign Language (TOEFL); the required minimum score on the online test is 100.

The requirements include:

**JD/MA in Art History and Museum Studies**

The School of Law at Case Western Reserve University prepares JD students to practice law in, among other areas, the fields of intellectual property and law and the arts. The MA in Art History and Museum Studies
program, coordinated by the Department of Art History and Art and the Cleveland Museum of Art, is designed to provide students with a broad knowledge of the major art historical periods, of the historiography and critical methodologies of art history, and of museological practice and history, connoisseurship, conservation, and interpretation, through course work and museum internships. The dual degree program prepares students to participate in the fields of intellectual property and law and the visual arts and provides students with an opportunity to develop expertise in areas of substantive interest.

The School of Law requires 88 credit hours of coursework, including 36 hours of required courses and an upper-class writing requirement, for the JD degree. Most of the requirements are completed during the first year of the law program, which includes:

In addition to the 30 credits of first-year courses, JD students must complete LAWS 2001 Professional Responsibility, LAWS 2002 Constitutional Law I, and LAWS 2803 Legal Writing, Leadership, Experiential Learning, Advocacy, and Professionalism 3: Advanced Skills during their second year of study. Students must also fulfill an upper-class writing requirement and complete a capstone project during the final year of study. Students should consult the School of Law curriculum guides for details about degree requirements that are applicable to the JD/MA dual degree program.

Students in the MA program in art history and museum studies must complete 31 hours of graduate credit, nine hours of which must be taken in the Law School, to satisfy the requirements for the dual JD/MA degree. In addition, students in the MA program must demonstrate a reading knowledge of one approved modern language other than English. They must also take the MA comprehensive examination at the conclusion of their art history studies.

The 31 hours of course work must be taken at the 400 level or higher, and be distributed as follows:

One course in each of the three following areas:

- Pre-Modern (pre-1800)
- Modern (post-1800)
- Non-Western

### Relevant Law School courses *

- Three of the courses in these two categories must be seminars.

The dual degree program requires students to complete 98 credit hours. Law students enrolled in the dual degree program will earn up to 12 credit hours toward the JD degree for completion of the graduate-level art history courses. Credit will not be given for work done in such courses before the student completes the first year of law school. Dual degree students are required to complete 22 credit hours toward the MA. Nine hours of law school coursework will count toward the 31 hours required for the MA in Art History and Museum Studies. The Department of Art History and Art liaison must approve the law school courses that will count toward the MA.

Dual degree students generally begin study in the law school and defer enrollment in the MA program until their second year. (There may be exceptions to this general rule. In certain cases, for example, students may be permitted to take one course in the art history department during the second semester of the first year of law school.) Students interested in completing the dual degree should consult both programs early in the process to avoid difficulties. After the first year of law school, students may enroll in law courses or art history courses; the program will not require students to complete a specific “core” in a “dedicated” semester in the Department of Art History and Art. Completion of the dual degree program will take at least seven semesters or three-and-a-half years of coursework.

#### Year 1: First-year law school curriculum. (30 hours)

#### Year 2, 3 & 4: Mixture of courses between the two units, including 22 hours of coursework in the art history program and the MA comprehensive examination.

### Credit Hour Requirements

- Total Hours in the School of Law: 76
- Total Hours in the art history department: 22
- Total Hours in the Dual Degree Program: 98

### Dual Degree Student Advising System

Dual degree students are advised by the Associate Dean for Academic Affairs at the School of Law. In addition, dual degree students are granted priority registration for upperclass courses, ensuring that they will be able to enroll in the classes they need. In the Department of Art History and Art, dual degree students will be advised by the art history department liaison and the director of graduate studies.

### Admissions

Students wishing to enroll in the dual degree program must be separately admitted to each program. The Department of Art History and Art will waive the GRE requirement for admission to the MA program and use the LSAT in the admissions process. Applicants can apply to the dual degree program when they apply to the School of Law or after the first year of enrollment in the School of Law. Once students have been admitted, they will consult with the Associate Dean for Academic Affairs at the School of Law and the Department of Art History and Art liaison to determine their appropriate course of study.
Master of Arts in Art Education

There is a temporary pause in admissions to the MA in Art Education.

The Master of Arts in Art Education is offered in two plans: Plan I for those who already hold teacher licenses and who desire advanced studio- and art-related studies; Plan II for those holding the Bachelor of Fine Arts or equivalent degree who desire multi-age teacher licensure as visual art specialists. Both programs are offered jointly by Case Western Reserve University and the Cleveland Institute of Art, and both require 36 semester hours.

The admission procedure includes an online application, three letters of recommendation, a college transcript, which are to be submitted to the Art Education office, and an interview with the program director in which students show a portfolio of artwork and discuss their program of study. For students pursuing Plan I, the Cleveland Institute of Art admission procedure requires a portfolio. Approval by both the University and the Cleveland Institute of Art is required for admission into Plan I. Information and application forms are available online through the Office of Graduate Admission at Case Western Reserve University.

Plan I
- 18 hours in studio to be taken at the Cleveland Institute of Art or Case Western Reserve University at the 300 level or above; and 18 hours in academic courses to be taken at Case Western Reserve University at the 400 level or above, to be selected in consultation with the director of art education; or
- 30 semester hours of course credit: 18 hours in studio to be taken at the Cleveland Institute of Art at the 300 level or above; and 12 hours in academic courses to be taken at Case Western Reserve University at the 400 level or above, to be selected in consultation with the director of art education; AND a required Thesis Exhibition based on individual research (not less than 6 semester hours of registration).

Plan II

Total Units: 36

The Master's Plan II Program in Art Education is designed to educate professional teachers of art. There are four decision points in the Art Education Program. For each of the decision points, there are three possible outcomes: unconditional admission; conditional admission with a prescribed remedial plan which when successfully completed will result in unconditional admission; or denial of admission. Denial of admission at any decision point means the student is no longer able to pursue an art education degree at Case Western Reserve University.

Decision Point 1: Entry to the Program

Application for admission to the program requires:
1. being accepted to the university
2. being accepted as an art major through an art portfolio review
3. submission of a signed Statement of Assurance of Good Moral Character
4. a satisfactory interview with art education faculty, documented on the Teacher Licensure Admission Assessment Form

Decision Points 2 and 3: Admission to Advanced Standing & Student Teaching

Application for advanced standing and student teaching requires:
1. Cumulative GPA of 2.7 or better
2. Discipline GPA of 2.7 or better
3. Education GPA of 3.0 or better
4. Minimum average score of 2.5 on the ePortfolio
5. Pass TB test; present documentation of hepatitis B vaccinations
6. Pass criminal background checks (BCI & FBI)
7. Minimum average score of 2.5 on DAI
8. Successful completion of the Student Teaching Interview.

Decision Point 4: Retention During the Student Teaching Semester

1. Minimum average score of 2.75 on each CWRU Student Teaching Final Assessment by Cooperating Teacher and University Supervisor during the first student teaching placement
2. Minimum average mid-semester score of 2.75 on DAI

Decision Point 5: Recommendation for Initial Licensure

Application for initial licensure occurs after successful completion of all degree requirements. The application requires:
1. Cumulative GPA of 2.7 or better.
2. Discipline GPA of 2.7 or better.
3. Education GPA of 3.0 or better
4. Completion of degree requirements
5. Minimum average score of 3.0 on the ePortfolio
6. Minimum average score of 3.0 or better on DAI
7. Completion of CWRU Final Student Teaching Assessment by Cooperating Teacher and University Supervisor averaging 3.0 or better on each
8. Achieve passing scores on Ohio Licensure exams
9. Completion of the following: Feedback on University Supervisor, Feedback on Cooperating Teacher, CWRU Teacher Licensure Exit Interview and Survey.
10. submission of a current final transcript documenting the following: a cumulative GPA of 3.0 or better, an art course GPA of 3.0 or better, and an education GPA of 3.0 or better
11. a passing score on DAI, completed by the art education faculty
12. achievement of state-mandated scores on the two Ohio Assessments for Educators exams
13. completion of the CWRU Student Teaching Final Assessment by the cooperating teacher and university supervisor with a grade of B or better

14. completion of the CWRU Teacher Licensure Exit Interview and Survey

After successfully completing all requirements at the four decision points, the student is recommended by the university's director of teacher education for the Ohio Provisional Art (Pre-K-12) License. Completion of the Master's Plan II Program in Art Education degree does not ensure that the State of Ohio's Provisional Visual Art Teacher License will be awarded.

**ARTH Courses**

**ARTH 101. Art History I: Pyramids to Pagodas. 3 Units.**
The first half of a two-semester survey of world art highlighting the major monuments of the ancient Mediterranean, medieval Europe, MesoAmerica, Africa, and Asia. Special emphasis on visual analysis, and socio-cultural contexts, and objects in the Cleveland Museum of Art. Counts for CAS Global & Cultural Diversity Requirement.

**ARTH 102. Art History II: Michelangelo to Maya Lin. 3 Units.**
The second half of a two-semester survey of world art highlighting the major monuments of art made in Africa, the Americas, Asia, and Europe from 1400 to the present. Special emphasis on visual analysis, historical and sociocultural contexts, and objects in the Cleveland Museum of Art. Counts for CAS Global & Cultural Diversity Requirement.

**ARTH 203. The Arts of Asia. 3 Units.**
This course surveys a selection of major developments in the arts of Asia from the bronze age to the present in a wide range of media including: sculpture, painting, ceramics, architecture, bronzes, calligraphy, prints and contemporary installations. We explore factors behind the making of works of art, including social, political, religious and personal meanings, while examining the historical contexts for the arts of India, China, Japan, Korea, Cambodia and Thailand. Attention will be paid to the material and stylistic qualities of art as well as art's relationship to the ideas and practices of Buddhism, Hinduism, and Daoism. Visits to the Asian galleries at the Cleveland Museum of Art form an integral part of the course. Counts for CAS Global & Cultural Diversity Requirement.

**ARTH 208. Arts of Japan. 3 Units.**
This course explores a selection of major developments in Japanese visual and material culture from ancient times to the present day. We consider works in multiple media including paintings, sculpture, calligraphy, ceramics, woodblock prints, architecture, performance art, and installations. We look into the roles of art in society, the relationship of art to political authority, the place of art in religious practice and experience, connections between art and literature, and how art relates to the expression of personal, social, political, and cultural identity. We pay particular attention to tea ceramics, Edo and Meiji period, woodblock prints, Chinese and Euro-American influences on Japanese art, works associated with Buddhist religious practices and ideas such as ink painting, portraiture, and statuary connected with Zen. We also examine the role of museums in selecting, preserving, and presenting Japanese art in the 20th and 21st century. Visits to the Cleveland Museum of Art form an integral part of the course. Counts for CAS Global & Cultural Diversity Requirement.

**ARTH 220. Jewish Traditional Art and Architecture. 3 Units.**
Tradition and transformation in Jewish artistic expression over time and across space. Course will begin with biblical period and continue down to the present day in Israel and America. Examination of how concepts such as "Jewish" and "art" undergo change within the Jewish community over this period. Offered as ARTH 220 and JDST 220. Counts for CAS Global & Cultural Diversity Requirement.

**ARTH 226. Greek and Roman Sculpture. 3 Units.**
This survey course explores the history of sculpture in ancient Greece and Rome, from the Mycenaean period through the reign of Constantine (A.D. 306-337). Students learn how to analyze works of sculpture in terms of form, function, and iconography. Particular emphasis is placed on situating sculptures within the changing historical, cultural, political, and religious contexts of the classical world, including the Greek city-state, the Hellenistic kingdoms that followed Alexander the Great, the Roman Republic, and the Roman Empire. Students will study a variety of sculptures--such as statues, reliefs, and carved gems--from across the Greek and Roman worlds. As we study sculptures from the classical world, we will consider questions of design, patronage, artistic agency, viewer reception, and cultural identity. We will also consider the cultural interaction between ancient Greece and Rome and what impact this had on the production and appearance of sculpture. Offered as ARTH 226 and CLSC 226. Counts for CAS Global & Cultural Diversity Requirement.

**ARTH 241. Medieval Art. 3 Units.**
This course will introduce students to the pivotal works of art created between approximately 250 and 1500. We will discuss painting, sculpture, architecture, manuscript illumination, and graphic arts. Medieval visual and material culture will be considered within the framework of socio-political developments, rapid urban growth, the flowering of monastic culture, the rise of universities, and changes in devotional practices. While the course will primarily focus on western part of the medieval Christendom, we will also discuss Jewish, Byzantine, and Islamic art. Visits to the CMA will form an integral part of the course. Counts for CAS Global & Cultural Diversity Requirement.

**ARTH 250. Art in the Age of Discovery. 3 Units.**
A survey of developments in Renaissance art and architecture in northern Europe and Italy during a new age of science, discovery and exploration, 1400-1600.

**ARTH 260. Art in Early Modern Europe. 3 Units.**
A survey of European art in the seventeenth and eighteenth centuries, an era of rising nationalism, political aggrandizement, religious expansion and extravagant art patronage. The tensions between naturalism and idealization, court and city, public and private, church and secular patronage, grand commissions and an open air market, will provide themes of the course as we explore what characterized the arts of Austria, Belgium, England, France, Germany, Italy, The Netherlands, and Spain. Counts for CAS Global & Cultural Diversity Requirement.

**ARTH 270. American Art and Culture Before 1900. 3 Units.**
Survey of the development of American art from colonial times to the present which explores how art has expressed both American values and American anxieties. Painting is emphasized, but the course also considers architecture, the decorative arts, film, literature, and music. Offered as AMST 270 and ARTH 270.

**ARTH 271. American Art and Culture: The Twentieth Century. 3 Units.**
Survey of the development of American art from 1900 to the present (and the future) which will explore how art has expressed both American values and American anxieties. Painting will be emphasized, but the course will also consider architecture, the decorative arts, film, literature, and music. Offered as AMST 271 and ARTH 271.
**ARTH 274. Nineteenth-Century European Art. 3 Units.**
This course will examine the development of European art across the tumultuous long nineteenth century, from the French Revolution in 1789 to the eve of the First World War in 1914. Adopting a thematic, as well as an international approach, this course will seek to interrogate the canonical understanding of this period of dramatic change across France, Britain, Germany, and Spain. We will explore issues of politics, economics, class, gender, imperialism, nationalism, and industrialization that surround the advent of artistic modernity. The class will also consider a range of artistic media, including painting, sculpture, photography, the decorative arts, and architecture, taking advantage of the rich collections of the Cleveland Museum of Art. Counts for CAS Global & Cultural Diversity Requirement.

**ARTH 280. Modern Art and Modern World. 3 Units.**
This course will explore the development of modern art, primarily the art of Europe and the United States, from the late 18th to the mid-20th century. Tracing key art movements and the careers of significant artists, this course will not only examine innovations in style, materials, technique, subject matter, and theory in modern art history, but will also analyze issues related to the rise of new social classes, industrialization and technological development, as well as changes to the urban environment and the development of popular culture in modern society. Through the examination of artists’ responses to technological, cultural, social, and political changes, this course will explore the emergence and development of “modernity” and “modernism” in Western art. Visits to the Cleveland Museum of Art will form an integral part of the course.

**ARTH 284. History of Photography. 3 Units.**
A survey of the history of photography from its inception in 1839 to the present. Emphasis is on the complex relationship between technological innovations and picture-making; the artistic, documentary, and personal uses of photography; and the relationship of photography to other art forms.

**ARTH 286. Introduction to Contemporary Art. 3 Units.**
This course will explore contemporary art and visual culture since the 1960s with a focus on major artistic movements and artists. The first part of the course will focus on changes in artistic practices in the United States and Europe, through the study of Pop Art, Minimalism, Conceptual Art, Institutional Critique, Performance Art, Feminist Art, and Activist Art. The second part of the course will investigate the global turn in contemporary art from the 1980s onward introducing art from Asia, Africa, and the Middle East. This course will examine a set of issues related to postmodernism, postcolonialism, globalization, and transnationalism and trace cultural, social, and geopolitical shifts in contemporary art. Counts for CAS Global & Cultural Diversity Requirement.

**ARTH 302. Buddhist Art in Asia. 3 Units.**
This course explores the visual and material culture of Buddhism in Asia from its origins in India to its transmission and transformation in China, Korea, Japan, Tibet, Thailand, Cambodia and Indonesia. Our historically and culturally structured examination traces major developments in Buddhist art and their relationships with belief, practice, and ritual. We consider the ways that artistic traditions have adapted and evolved both within individual cultures and cross-culturally. We primarily focus on studying the historical contexts for sculpture, architecture, and painting, but we also consider the movement of Buddhist works from temples to sites of secular display in museums around the world, and the religious, cultural, and ethical issues that arise from these moves. Topics include: representations of the life of the historical Buddha; visual programs of temples; artistic representations of paradises and hells; sacred sites and architecture; imperial patronage of Buddhist art; the role of art in pilgrimage and ritual; and visual imagery associated with Pure Land, Chan, Zen and esoteric traditions. Visits to and engagement with objects in the new Asian galleries at the Cleveland Museum of Art provide a rich environment for our class sessions and student projects. Offered as ARTH 302 and ARTH 402. Counts for CAS Global & Cultural Diversity Requirement.

**ARTH 307. Arts of China. 3 Units.**
This course explores a selection of major developments in Chinese visual and material culture from ancient times to the present day. We consider works in multiple media including bronzes, pottery, sculpture, calligraphy, paintings, ceramics and installations. We look into the roles of art in society, the relationship of art to political authority, the place of art in religious practice and experience, connections between art and literature, and how art relates to the expression of personal, social, political, and cultural identity. We pay particular attention to landscape painting; pictorial and sculptural programs of Buddhist grottoes; art commissioned and collected by the imperial court; objects associated with Daoist, Buddhist, and Confucian religious practices and sacred sites; art produced during periods of non-Chinese rule under the Mongols and Manchus; the affects of foreign styles and ideas on artists; and the role of Chinese artists in the contemporary global art world and market. We also examine the role of museums in selecting, preserving, and presenting Chinese art in the 20th and 21st century. Visits to the Cleveland Museum of Art form an integral part of the course. Offered as ARTH 307 and ARTH 407. Counts for CAS Global & Cultural Diversity Requirement.

**ARTH 308. Daoism: Visual Culture, History and Practice. 3 Units.**
This course explores developments in the visual culture, history and practices of Daoist religious traditions in China from the third to twentieth centuries. Our historically and conceptually structured examination draws upon a balance of visual, textual, and material sources, while considering the various approaches scholars have employed to understand the history and development of Daoist traditions. Topics include: sacred scriptures and liturgies, biographies and visual narratives, iconography and functions of the pantheon of gods and immortals, views of the self and the body, practices of inner alchemy and self-cultivation, thunder deities and exorcism, dietetics and medicine and modes of meditation and ritual. Offered as ARTH 308, ARTH 408, and RLGN 308. Counts for CAS Global & Cultural Diversity Requirement.
ARTH 315. Art and Architecture of Ancient Egypt and Mesopotamia. 3 Units.
The golden mask of Tutankhamun, the imposing Ishtar Gate, delicately
 carved ivories, and expertly chiseled stone sculpture; the art and
 architecture of Ancient Egypt and Mesopotamia are some of the most
captivating examples of visual culture from the ancient world. This
course will emphasize the examination of art and architecture of Egypt
and Mesopotamia in context, focusing on material from prehistory
through the 6th century BC. We will explore the deep connection between
art, religion, and the worldview of Ancient Egypt and Mesopotamia,
in addition to the meaning and audience for art, the principles which
guided art production, trends in media and themes over time, and the
relationship of writing and art. We will also consider the interaction
between Egyptian and Mesopotamian art, museums and the modern
artistic and political landscapes. Offered as ANEE 315, ANEE 415,
ARTH 315 and ARTH 415.

ARTH 316. Methods in Public Humanities and Civic Engagement. 3 Units.
Who has access to knowledge and why? How is knowledge produced and
publicized? What and where is the public? Who is included and excluded
in this public? What is the role of art and culture in various publics? This
innovative new course will address these questions as it introduces
students to the theories and methods of the Public Humanities and
Civic Engagement. Broadly defined, Public Humanities works to engage
diverse publics in the subjects of the humanities by making topics like art
history, literary history, film, and theater, accessible and understandable
to a wider civic audience, but it also interrogates the concept of the
expert and seeks to find experts in the field, rather than exclusively
in the academy. Through a combination of reading, discussion, and
virtual (or in person) visits from leaders of Cleveland-area organizations,
administrators, legislators, and public historians, this course will teach
you how to put your degrees to work for the greater good! Although this
course is about Public Humanities & Civic Engagement, it is open to
students in all fields across the university who are interested in ways
to integrate the community in their education and to think creatively
about the types of work their academic training prepares them to do.
Undergraduate and graduate students will benefit from opportunities to
broaden their professional networks and to learn more about the kinds of
skills that are necessary in professions across the disciplines. Offered as
ARTH 316, ARTH 416, HUMAN 316, and HUMAN 416.

ARTH 325. Art at the Crossroads of Religion: Polytheistic, Christian, and
Islamic Art in Antiquity. 3 Units.
People often single out the reign of Constantine (A.D. 306-337) as the
point in history when Rome transformed from a polytheistic empire to a
Christian empire. This course questions the strict divide between the
categories of "pagan" and "Christian" in Rome in the imperial period and
beyond. Through a close examination of the artistic and architectural
record, students will come to understand that this dichotomy is a modern
invention; for people living in the Roman Empire, religious identities
were extraordinarily fluid. Indeed, traditional polytheistic religion and
Christianity remained closely intertwined for centuries after Constantine
"Christianized" the Empire. Moreover, religious pluralism had been a
fundamental part of Roman culture since the founding of ancient Rome.
We will survey a range of material culture, including public statuary,
sarcophagi, silver hordes, and temples and churches. We will also
examine sites such as the border city of Dura-Europos in Syria to explore
how religious identities in the Roman Empire (including Judaism, early
Christianity, and so-called mystery cults) intertwined even when Rome
was still supposedly a "pagan" Empire. The course pays particular
attention to the art and architecture produced under Constantine, whom
people today often remember as Rome's first Christian emperor but who
represents, in fact, a complex amalgam of polytheistic and monotheistic
practices and identities. We will also explore how Christian art slowly but
ultimately became the predominant visual culture in the Roman Empire.
Finally, we will examine how Early Islamic art and architecture exploited
the Greco-Roman visual tradition to the ends of this new religion. Offered
as ARTH 325, ARTH 425 and CLSC 325. Counts for CAS Global & Cultural
Diversity Requirement.

ARTH 329. Marvels of Rome: Monuments and Their Decoration in the
Roman Empire. 3 Units.
This course examines some of the most famous monuments of the
Roman Empire, including Nero's Golden House, the Colosseum, the
Pantheon, Hadrian's Villa at Tivoli, and the lavish villa of Piazza Armerina
in Sicily. We will study each monument in depth, delving into the
architecture, paintings, sculptures, mosaics, and social functions of each
monument. Students will learn how to analyze artistic and archaeological
evidence, ancient textual evidence (poems, prose, and inscriptions),
and secondary scholarship to reconstruct the visual appearances
and historical and cultural contexts of the monuments in questions.
Throughout the course, students will gain a new appreciation and deeper
understanding of some of the most iconic buildings of the classical
tradition. Offered as ARTH 329, ARTH 429, and CLSC 329. Counts for CAS
Global & Cultural Diversity Requirement.

ARTH 333. Greek and Roman Painting. 3 Units.
Greek vase painting, Etruscan tomb painting and Roman wall painting.
The development of monumental painting in antiquity. Offered as
ARTH 333, CLSC 333, and ARTH 433.

ARTH 335. Issues in Ancient Art. 3 Units.
Various topics in Ancient art. Lectures, discussions and reports. Offered
as ARTH 335 and ARTH 435.
ARTH 336. Representations of War in Ancient Rome. 3 Units.
Few societies in history have been as militaristic as ancient Rome--or as proud of their warrior culture. This course examines the many ways that Romans constructed and contested their conceptions of war from the founding of the Roman Republic in 509 B.C.E. to the reign of Constantine (306-337 C.E.). Why did Romans choose to represent war in certain ways, and how did these artistic representations shape Romans' military values? What can the visual record tell us about how different groups (soldiers, women, slaves) experienced war in the Roman world? We will explore major public monuments in the city of Rome (including triumphal arches and the Colosseum) and private objects (such as silver drinking vessels) to observe how Roman militarism pervaded different walks of life. We will also examine monuments on the edges of Rome's empire, such as the towering trophies in modern France and Romania, to explore how works of art and architecture mediated the relationship between Romans and the peoples they conquered. Students will be encouraged to think about how art and architecture contributed to the construction of militarism as a chief Roman value, but also about how visual representations provided an important means to debate the value of Rome's military efforts, to subvert Rome's rigidly hierarchical social order, and to grapple with what it meant to "be Roman" as wars transformed Rome from a small city in Italy to a massive, pan-Mediterranean empire. After exploring Romans' conceptions of war and victory, students also may ask whether the common comparison between the Roman Empire and modern America is appropriate. Offered as ARTH 336, ARTH 436, CLSC 336 and CLSC 436. Counts for CAS Global & Cultural Diversity Requirement.

ARTH 340. Issues in the Art of China. 3 Units.
This is a topics course. Each offering will focus on a specific topic within the area of Chinese art. Sample topics may include: Women painters in Beijing, Modern Artists in China-1980-Present, Shang Dynasty Tombs, Yuan Dynasty Buddhist Art. Lectures, discussions, and reports. Offered as ARTH 340 and ARTH 440.

ARTH 341. Issues in the Art of Japan. 3 Units.
This is a topics course. Each offering will focus on a specific topic within the area of Japanese art. Sample topics may include: Muromachi Hanging Scrolls, Ryoan-ji Temple Garden Architecture, Rimpa School Panel Screens, Buddhist Painting in the Edo Period. Lectures, discussions, and reports. Offered as ARTH 341 and ARTH 441.

ARTH 344. Archaeology of the Ancient Mediterranean. 3 Units.
This course examines the ancient Mediterranean through the material cultures of Egypt, Greece and Rome. Each of these great civilizations will be individually explored, but also examined within a broader historical context. Particular focus will be placed on the social, political and economic ideas that were exchanged across the Mediterranean Sea and the influence this interconnectivity had on eastern Mediterranean societies. Offered as ANEE 344, ANEE 444, ANTH 344, ANTH 444, ARTH 344, ARTH 444, CLSC 344 and CLSC 444.

ARTH 349. Gothic Art: Vision and Matter. 3 Units.
This course will examine the development and dissemination of Gothic art in Western Europe in the High and Late Middle Ages. We will consider a variety of media, including architecture, metalwork, sculpture, manuscript illumination, panel paintings, fresco cycles, and small devotional objects. As we study medieval art in its socio-historical contexts--private and public, monastic and political, liturgical and lay--we will pay special attention to issues of patronage, relationships between texts and images, the introduction of visionary and mystical devotion, attitudes towards education and authority, differences between male and female piety, modes of medieval viewing, and reception and manipulation of art by medieval audiences. Visits to the CMA will form an integral part of the course. Offered as ARTH 349 and ARTH 449. Counts for CAS Global & Cultural Diversity Requirement.

ARTH 350. Issues in Medieval Art. 3 Units.
Various topics in Medieval Art. Lectures, discussions, and reports. Offered as ARTH 350 and ARTH 450.

ARTH 353. Sixteenth Century Italian Art. 3 Units.
The development of the High Renaissance and Mannerist styles in Italy and late 16th century trends: painting and sculpture. Offered as ARTH 353 and ARTH 453.

ARTH 355. The Book in the Middle Ages: The Christian, Jewish, and Islamic Tradition. 3 Units.
This course will examine later medieval manuscript production, paying particular attention to the issues of patronage, gender, literacy, reception, and cultural biases. We will explore the imagery and texts of monastic and courtly manuscripts, travel books and devotional manuals, all within the framework of the tightly interwoven theological and social discourses of the institutions that commissioned them. As the title of the course indicates, we will study Christian, Jewish, and Islamic books and their interrelations; for example, we will compare Islamic encyclopedias of the natural world, such as Zakariya ibn Muhammad al-Qazwini’s Illustrated Wonders of Creation, with medieval bestiaries, herbals, and encyclopedias such as Hartman Schedel’s Liber Chronicarum and Les Merveilles du Monde. Each religious culture will receive a special close-study spotlight: Jewish Haggadot (books for the Passover Seder), Christian courtly romances, and Islamic manuscripts of the Shahnama epic. Offered as ARTH 355 and ARTH 455. Counts for CAS Global & Cultural Diversity Requirement.

ARTH 356. Medieval Matters: The Monstrous, the Macabre, the Miraculous. 3 Units.
This course will explore three distinct but interrelated topics in medieval visual culture, which haunt the modern world as well. We will first study the concepts of the monsters and the monstrous in medieval Europe, as they were manifested in visual, literary, and cryptozoological production. From monster theory to monster culture, we will look at the anxieties that the monsters--those from the edges, those from within--have written on the body of medieval art. These same anxieties, rooted in the fear of difference, manifest themselves in the macabre art: the art of living death that predicated material universe of the late Middle Ages. We will explore the ghosts and the revenants, the living corpses and the nimble skeletons that populate medieval murals, manuscripts, and sculpture. All this is wrapped into the notion of the miraculous, both wondrous and dangerous at once. Here, the focus will be on female bodies, seen as monstrous, macabre, and miraculous at once. Students should be prepared to discuss these topics both within the context of medieval Europe and within our own historical moment. Offered as ARTH 356 and ARTH 456.
ARTH 357. Medieval Wonders: Monuments from Across the Globe. 3 Units.
This course will introduce art of the medieval world, considered globally, with a special focus on monuments surviving from the seventh to fifteenth centuries. Emphasis will be on sculpture and architecture; other media—manuscript illumination, wall paintings, ceramics, and metalwork—will be discussed in conjunction with the related sites. We will travel, virtually, to Pre-Columbian Yucatan, Judeo-Christian Europe, Islamic Spain and Central Asia, Hindu and Buddhist India, Tibet, and Southeast Asia. Each week one or two monuments will be discussed in depth, and other sites will be introduced to place it into historical and art historical contexts. Among the themes we will explore are the power relationships between sovereignty and religion; visual expressions of politics and propaganda; the ways literature, performance, and devotion informed medieval material culture; the importance of pilgrimage; and influences of international trade. Ethical and nationalist issues surrounding looting and cultural patrimony will also be discussed. Objects from CMA’s permanent collections will form an integral part of the course. Each unit will end with the consideration of collecting practices. Offered as ARTH 357 and ARTH 457.

ARTH 360. Renaissance Art in Northern Europe. 3 Units.
Painting, sculpture, and the graphic arts in Belgium, France, Germany, and The Netherlands, 1400-1580, highlighting the careers and contributions of specific artists such as Jan van Eyck, Albrecht Durer, and Pieter Bruegel. We will also analyze the changing social, cultural, religious, and political circumstances of the art made during this period, which saw the invention of printmaking, the Protestant Revolution, and increased strife between rulers and their subjects. The rise of new subjects such as landscape and scene of everyday life will be explored, and changes in patronage will be discussed, concentrating on the shift from church and noble patronage to increasingly middle-class patronage related to the beginnings of the open art market. Offered as ARTH 360 and ARTH 460. Counts for CAS Global & Cultural Diversity Requirement.

ARTH 361. 17th-Century Art in Belgium and The Netherlands. 3 Units.
The arts of painting, drawing, and printmaking in Belgium and The Netherlands are discussed in relationship to political, social, cultural, and religious contexts. We will explore the careers and production of individual artists such as Rubens, Van Dyck, Hals, Rembrandt, and Vermeer. Developments in new subjects, artistic specialization, and the expansion of the open market are seen as important factors in shaping Belgian and Dutch art. Offered as ARTH 361 and ARTH 461. Counts for CAS Global & Cultural Diversity Requirement.

ARTH 362. Issues in Early Modern Southern European Art. 3 Units.
Various topics in the art of southern Europe, 1400-1800. Lectures, discussions, reports, and gallery visits in the CMA. Offered as ARTH 362 and ARTH 462. Counts for CAS Global & Cultural Diversity Requirement.

ARTH 365. Issues in Early Modern Northern European Art. 3 Units.
Various topics in the art of northern Europe, 1400-1800. Lectures, discussions, reports, and gallery visits in the CMA. Offered as ARTH 365 and ARTH 465. Counts for CAS Global & Cultural Diversity Requirement.

ARTH 367. 17th and 18th Century Art in France. 3 Units.
A Survey of the arts of painting, sculpture and architecture in France from 1600-1780, a period in which France became the leading political and cultural power in Europe. We will focus on the relationship between the arts and changing social, cultural, religious and political circumstances at a time that saw the rise of the absolute state before the French Revolution, the increased use of art for political propaganda, and the burgeoning of a consumer culture in the middle class. Offered as ARTH 367 and ARTH 467. Counts for CAS Global & Cultural Diversity Requirement.

ARTH 368. Doors Wide Shut: The Private Art Collection from Raphael to Rauschenberg. 3 Units.
A child’s room is often stocked with marvels: bird nests, shells, shiny stones, books, and drawings. The great art collections of the Renaissance began in much the same way as these playful assemblages. From cabinets of curiosities containing treasures from foreign lands, to paintings of nude women by Titian and Raphael, these early collections marked the beginning of the modern art museum. What do the hoarding tendencies of the Jesuit Athanasius Kircher (1601-1680), founder of the ‘Kircherianum—a museum filled with taxidermy animals and mechanical inventions—have in common with Ronald Lauder’s recent and widely publicized purchase of a Gustav Klimt painting for $135 million? Famous American art collectors of the 19th & 20th centuries like Henry Clay Frick, Isabella Stewart Gardner, and Peggy Guggenheim opened these formerly private realms of display to the public, revealing the complex motives and politics inherent to the practice of art collection. This course will focus first on the conceptual issues that informed early modern collecting in the western world, and subsequently the way that these ideas and modalities later inflected and shaped the history of modern collecting—particularly in the private sector in Europe and America. Offered as: ARTH 368 and ARTH 468. Counts for CAS Global & Cultural Diversity Requirement.

ARTH 374. Impressionism to Symbolism. 3 Units.
Major developments in European painting and sculpture during the latter half of the nineteenth century. Post-impressionism synthethism, symbolism, and the arts and crafts movement considered in their socio-cultural contexts. Works of Degas, Manet, Monet, Klimt, Becklin, Gauguin, etc. Offered as ARTH 374 and ARTH 474.

ARTH 379. Issues in 19th Century Art. 3 Units.
Various topics in 19th century art, with class lectures, discussions and reports. Consult department for current topic. Offered as ARTH 379 and ARTH 479.

ARTH 382. Art, Eco-criticism, and the Environment. 3 Units.
As issues of sustainability and environmental impact have become increasingly dominant concerns in contemporary society, eco-criticism has emerged as a vital methodological thread across the humanities. Motivated by ethical as well as scholarly concerns, eco-criticism not only enacts a fundamental examination of nature as an ideological construct, but also seeks to investigate the complex interrelationship between humanity and the environment. Concurrently, there has been a marked interest in studying the role of “green issues” in contemporary art, particularly in tracing the development of earth art or eco-art from the early 1970s to the present. The goal of this seminar is to forge a link between these two emergent strands by tracing the complex relationship between art and the environment from the nineteenth-century to the present, seeking to thereby assess the capaciousness of eco-criticism as a methodological approach to art history. Offered as ARTH 382, ARTH 482 and ESTD 382. Counts for CAS Global & Cultural Diversity Requirement.

ARTH 384. American Art and Architecture in the Age of Washington and Jefferson. 3 Units.
In the 18th century, Americans created not only a political revolution but an artistic and creative one as well. In the 17th century, most Americans were subsistence farmers and most of their products, manufactures, and buildings were relatively crude. In the 18th century, Americans not only established a new and lasting form of government, but for the first time produced paintings, buildings, furniture and silver that rivaled the finest productions of Europe. Notably, many of the leaders of the American Revolution, such as Paul Revere, George Washington, and Thomas Jefferson, also made significant contributions to the arts. Offered as ARTH 384 and ARTH 484.
ARTH 386. Issues in American Art. 3 Units.
Various topics in American art. Each offering will focus on a specific topic within American art. Lectures, discussions, and report. The course will entail regular oral classroom reports and short writing assignments as well as a final paper. Producing an intellectually significant final paper is the major goal of the class. Graduate students are expected to produce a final paper of greater length than Undergraduates and that shows evidence of original scholarship. Offered as ARTH 386 and ARTH 486.

ARITH 387. The Tools of the Artist: An Adventure in Hands-On Learning. 3 Units.
This class embraces John Dewey's mantra of "Learning through doing." Students will produce work in different media, and then apply what they have learned to closely analyze a "masterpiece" object in the Cleveland Museum of Art from the standpoint of materials and technique. Media explored will include pottery, blown-glass, papermaking, drawing with a variety of tools, computer games, 3-D computer printing, and painting in watercolor, oil, and Japanese ink. Unlike most art classes, the goal is not necessarily to create an outstanding work of art, but to gain understanding of the challenges of working with different media. While serious effort is expected, grading will take into account the different skill-sets of Art Students and students with an interest in mastering scholarly writing and art history. If you can make a mark on paper you have the artistic skill necessary to take this class. Meetings will draw on Cleveland's rich art-related resources—including not only Thinkbox and the art facilities of Case Western Reserve but the Cleveland Museum of Art, the Cleveland Institute of Art, The Glass Bubble Project, The Morgan Art of Papermaking Conservatory, and the Zygote Press. Students will produce an object or objects in a media that interests them and will share what they learned with their classmates. They will write a few short papers and a final paper on an object in the Cleveland Museum of Art. Offered as ARTH 387 and ARTH 487.

ARITH 392. Issues in 20th/21st Century Art. 3 Units.
Various topics in 20th/21st century art, with class lectures, discussions, and reports. Offered as ARTH 392 and ARTH 492.

ARITH 393. Contemporary Art: Critical Directions. 3 Units.
An examination of the directions taken by avant-garde American art and criticism in the aftermath of Abstract Expressionism. Includes the rise and fall of modernism in the 1960s and '70s, as well as an investigation of Post-modern trends and theories. Offered as ARTH 393 and ARTH 493.

ARITH 394. Departmental Seminar. 3 Units.
The Department of History of Art and Art departmental seminar. A topical course, emphasizing disciplinary writing and modes of investigation and analysis. It is recommended for Art History majors before the majors seminar/capstone course, typically taken in the junior or senior years. The course advances the goals of SAGES within the disciplinary context of art history by focusing on close readings of art history texts (with an emphasis upon methodological approaches), examination of original works of art when possible, analytical writing, and intensive seminar-style discussion. Counts as SAGES Departmental Seminar.

ARITH 395. Internship. 3 Units.
This course is designated for students seeking professional experience in art history. It focuses on the museum experience (registration, exhibition, interpretation, and administration) although students may also elect to conduct internships in museum-related environments such as art conservation. Students are encouraged to have gained significant experience in art history coursework before embarking on an internship. Students must identify an internship and supervisor as well as a campus internship supervisor the semester before enrolling in the internship. Recommended preparation: ARTH 101, ARTH 102, or ARTH 104, and consent.

ARITH 396. Majors Seminar. 3 Units.
Capstone course required of all undergraduate Art History majors, typically taken in senior year. Requires professional-level research with peer and faculty oversight culminating in formal written and oral presentations. Limited to Art History majors. Counts as SAGES Senior Capstone.

ARITH 397. Contemporary Art in East Asia. 3 Units.
This course will explore modern and contemporary art and visual culture in East Asia produced since the mid-twentieth century with a focus on major artistic movements and artists active in China, Japan, and Korea. Encountering complicated geopolitical and socioeconomic conditions in the post-war era, a series of experimental and radical artistic, cultural, and political movements have emerged in East Asia. The course will map the critical topographies of Asian art from 1945 to the 1980s through the exploration of the following: post-war art and experimental art in Japan and Korea, Chinese art during the Cultural Revolution, material culture in Japanese Mono-ha and Korean Dansaekhwa, and art of resistance in China and Korea in the 1980s. The course will also investigate contemporary Asian art and visual culture focusing on its global turn from the late 1980s. Fueled by international geopolitical change, economic boom, and the impact of globalization, art in Asia or by Asian artists has gained a high level of international visibility and taken a central position in contemporary art exhibitions and art criticism. This visual, social, and theoretical development in the recent art in Asia will be examined through key issues and themes: art's revisiting of tradition and history, its exploration of body and identity, the impact of consumerism and popular culture, and its engagement with public space and the urban environment. Offered as ARTH 397 and ARTH 497. Counts for CAS Global & Cultural Diversity Requirement.

ARITH 398. Independent Study in Art History. 1 - 3 Units.
Individual research and reports on special topics.

ARITH 399. Honors Thesis. 3 Units.
Intensive study of a topic or problem leading to the preparation of an honors thesis.

ARITH 402. Buddhist Art in Asia. 3 Units.
This course explores the visual and material culture of Buddhism in Asia from its origins in India to its transmission and transformation in China, Korea, Japan, Tibet, Thailand, Cambodia and Indonesia. Our historically and culturally structured examination traces major developments in Buddhist art and their relationships with belief, practice, and ritual. We consider the ways that artistic traditions have adapted and evolved both within individual cultures and cross-culturally. We primarily focus on studying the historical contexts for sculpture, architecture, and painting, but we also consider the movement of Buddhist works from temples to sites of secular display in museums around the world, and the religious, cultural, and ethical issues that arise from these moves. Topics include: representations of the life of the historical Buddha; visual programs of temples; artistic representations of paradies and hells; sacred sites and architecture; imperial patronage of Buddhist art; the role of art in pilgrimage and ritual; and visual imagery associated with Pure Land, Chan, Zen and esoteric traditions. Visits to and engagement with objects in the new Asian galleries at the Cleveland Museum of Art provide a rich environment for our class sessions and student projects. Offered as ARTH 302 and ARTH 402. Counts for CAS Global & Cultural Diversity Requirement.
ARTH 407. Arts of China. 3 Units.
This course explores a selection of major developments in Chinese visual and material culture from ancient times to the present day. We consider works in multiple media including bronzes, pottery, sculpture, calligraphy, paintings, ceramics and installations. We look into the roles of art in society, the relationship of art to political authority, the place of art in religious practice and experience, connections between art and literature, and how art relates to the expression of personal, social, political, and cultural identity. We pay particular attention to landscape painting; pictorial and sculptural programs of Buddhist grottoes; art commissioned and collected by the imperial court; objects associated with Daoist, Buddhist, and Confucian religious practices and sacred sites; art produced during periods of non-Chinese rule under the Mongols and Manchus; the effects of foreign styles and ideas on artists; and the role of Chinese artists in the contemporary global art world and market. We also examine the role of museums in selecting, preserving, and presenting Chinese art in the 20th and 21st century. Visits to the Cleveland Museum of Art form an integral part of the course. Offered as ARTH 307 and ARTH 407. Counts for CAS Global & Cultural Diversity Requirement.

ARTH 408. Daoism: Visual Culture, History and Practice. 3 Units.
This course explores developments in the visual culture, history and practices of Daoist religious traditions in China from the third to twentieth centuries. Our historically and conceptually structured examination draws upon a balance of visual, textual, and material sources, while considering the various approaches scholars have employed to understand the history and development of Daoist traditions. Topics include: sacred scriptures and liturgies, biographies and visual narratives, iconography and functions of the pantheon of gods and immortals, views of the self and the body, practices of inner alchemy and self-cultivation, thunder deities and exorcism, dietetics and medicine and modes of meditation and ritual. Offered as ARTH 308, ARTH 408, and RLGN 308. Counts for CAS Global & Cultural Diversity Requirement.

ARTH 415. Art and Architecture of Ancient Egypt and Mesopotamia. 3 Units.
The golden mask of Tutankhamun, the imposing Ishtar Gate, delicately carved ivories, and expertly chiseled stone sculpture; the art and architecture of Ancient Egypt and Mesopotamia are some of the most captivating examples of visual culture from the ancient world. This course will emphasize the examination of art and architecture of Egypt and Mesopotamia in context, focusing on material from prehistory through the 6th century BC. We will explore the deep connection between art, religion, and worldview of Ancient Egypt and Mesopotamia, in addition to the meaning and audience for art, the principles which guided art production, trends in media and themes over time, and the relationship of writing and art. We will also consider the interaction between Egyptian and Mesopotamian art, museums and the modern artistic and political landscapes. Offered as ANEE 315, ANEE 415, ARTH 315 and ARTH 415.

ARTH 416. Methods in Public Humanities and Civic Engagement. 3 Units.
Who has access to knowledge and why? How is knowledge produced and publicized? What and where is the public? Who is included and excluded in this public? What is the role of art and culture in various publics? This innovative new course will address these questions as it introduces students to the theories and methods of the Public Humanities and Civic Engagement. Broadly defined, Public Humanities works to engage diverse publics in the subjects of the humanities by making topics like art history, literary history, film, and theater, accessible and understandable to a wider civic audience, but it also interrogates the concept of the expert and seeks to find experts in the field, rather than exclusively in the academy. Through a combination of reading, discussion, and virtual (or in person) visits from leaders of Cleveland-area organizations, administrators, legislators, and public historians, this course will teach you how to put your degrees to work for the greater good! Although this course is about Public Humanities & Civic Engagement, it is open to students in all fields across the university who are interested in ways to integrate the community in their education and to think creatively about the types of work their academic training prepares them to do. Undergraduate and graduate students will benefit from opportunities to broaden their professional networks and to learn more about the kinds of skills that are necessary in professions across the disciplines. Offered as ARTH 316, ARTH 416, HUMN 316, and HUMN 416.

ARTH 425. Art at the Crossroads of Religion: Polytheistic, Christian, and Islamic Art in Antiquity. 3 Units.
People often single out the reign of Constantine (A.D. 306-337) as the point in history when Rome transformed from a polytheistic empire to a Christian empire. This course questions the strict divide between the categories of “pagan” and “Christian” in Rome in the imperial period and beyond. Through a close examination of the artistic and architectural record, students will come to understand that this dichotomy is a modern invention; for people living in the Roman Empire, religious identities were extraordinarily fluid. Indeed, traditional polytheistic religion and Christianity remained closely intertwined for centuries after Constantine “Christianized” the Empire. Moreover, religious pluralism had been a fundamental part of Roman culture since the founding of ancient Rome. We will survey a range of material culture, including public statuary, sarcophagi, silver hordes, and temples and churches. We will also examine sites such as the border city of Dura-Europos in Syria to explore how religious identities in the Roman Empire (including Judaism, early Christianity, and so-called mystery cults) intertwined even when Rome was still supposedly a “pagan” Empire. The course pays particular attention to the art and architecture produced under Constantine, whom people today often remember as Rome’s first Christian emperor but who represents, in fact, a complex amalgam of polytheistic and monotheistic practices and identities. We will also explore how Christian art slowly but ultimately became the predominant visual culture in the Roman Empire. Finally, we will examine how Early Islamic art and architecture exploited the Greco-Roman visual tradition to the ends of this new religion. Offered as ARTH 325, ARTH 425 and CLSC 325. Counts for CAS Global & Cultural Diversity Requirement.
ARTH 429. Marvels of Rome: Monuments and Their Decoration in the Roman Empire. 3 Units.
This course examines some of the most famous monuments of the Roman Empire, including Nero's Golden House, the Colosseum, the Pantheon, Hadrian's Villa at Tivoli, and the lavish villa of Piazza Armerina in Sicily. We will study each monument in depth, delving into the architecture, paintings, sculptures, mosaics, and social functions of each monument. Students will learn how to analyze artistic and archaeological evidence, ancient textual evidence (poems, prose, and inscriptions), and secondary scholarship to reconstruct the visual appearances and historical and cultural contexts of the monuments in questions. Throughout the course, students will gain a new appreciation and deeper understanding of some of the most iconic buildings of the classical tradition. Offered as ARTH 329, ARTH 429, and CLSC 329. Counts for CAS Global & Cultural Diversity Requirement.

ARTH 433. Greek and Roman Painting. 3 Units.
Greek vase painting, Etruscan tomb painting and Roman wall painting. The development of monumental painting in antiquity. Offered as ARTH 333, CLSC 333, and ARTH 433.

ARTH 435. Issues in Ancient Art. 3 Units.
Various topics in Ancient art. Lectures, discussions and reports. Offered as ARTH 335 and ARTH 435.

ARTH 436. Representations of War in Ancient Rome. 3 Units.
Few societies in history have been as militaristic as ancient Rome—or as proud of their warrior culture. This course examines the many ways that Romans constructed and contested their conceptions of war from the founding of the Roman Republic in 509 B.C.E. to the reign of Constantine (306-337 C.E.). Why did Romans choose to represent war in certain ways, and how did these artistic representations shape Romans’ military values? What can the visual record tell us about how different groups (soldiers, women, slaves) experienced war in the Roman world? We will explore major public monuments in the city of Rome (including triumphal arches and the Colosseum) and private objects (such as silver drinking vessels) to observe how Roman militarism pervaded different walks of life. We will also examine monuments on the edges of Rome’s empire, such as the towering trophies in modern France and Romania, to explore how works of art and architecture mediated the relationship between Romans and the peoples they conquered. Students will be encouraged to think about how art and architecture contributed to the construction of militarism as a chief Roman value, but also about how visual representations provided an important means to debate the value of Rome’s military efforts, to subvert Rome’s rigidly hierarchical social order, and to grapple with what it meant to "be Roman" as wars transformed Rome from a small city in Italy to a massive, pan-Mediterranean empire. After exploring Romans’ conceptions of war and victory, students also may ask whether the common comparison between the Roman Empire and modern America is appropriate. Offered as ARTH 336, ARTH 436, CLSC 336 and CLSC 436. Counts for CAS Global & Cultural Diversity Requirement.

ARTH 440. Issues in the Art of China. 3 Units.
This is a topics course. Each offering will focus on a specific topic within the area of Chinese art. Sample topics may include: Women painters in Beijing, Modern Artists in China-1980-Present, Shang Dynasty Tombs, Yuan Dynasty Buddhist Art. Lectures, discussions, and reports. Offered as ARTH 340 and ARTH 440.

ARTH 441. Issues in the Art of Japan. 3 Units.
This is a topics course. Each offering will focus on a specific topic within the area of Japanese art. Sample topics may include: Muromachi Hanging Scrolls, Ryoan-ji Temple Garden Architecture, Rimpa School Panel Screens, Buddhist Panting in the Edo Period. Lectures, discussions, and reports. Offered as ARTH 341 and ARTH 441.

ARTH 444. Archaeology of the Ancient Mediterranean. 3 Units.
This course examines the ancient Mediterranean through the material cultures of Egypt, Greece and Rome. Each of these great civilizations will be individually explored, but also examined within a broader historical context. Particular focus will be placed on the social, political and economic ideas that were exchanged across the Mediterranean Sea and the influence this interconnectivity had on eastern Mediterranean societies. Offered as ANEE 344, ANEE 444, ANTH 344, ANTH 444, ARTH 344, ARTH 444, CLSC 344 and CLSC 444.

ARTH 449. Gothic Art: Vision and Matter. 3 Units.
This course will examine the development and dissemination of Gothic art in Western Europe in the High and Late Middle Ages. We will consider a variety of media, including architecture, metalwork, sculpture, manuscript illumination, panel paintings, fresco cycles, and small devotional objects. As we study medieval art in its socio-historical contexts—private and public, monastic and political, liturgical and lay—we will pay special attention to issues of patronage, relationships between texts and images, the introduction of visionary and mystical devotion, attitudes towards education and authority, differences between male and female piety, modes of medieval viewing, and reception and manipulation of art by medieval audiences. Visits to the CMA will form an integral part of the course. Offered as ARTH 349 and ARTH 449. Counts for CAS Global & Cultural Diversity Requirement.

ARTH 450. Issues in Medieval Art. 3 Units.
Various topics in Medieval Art. Lectures, discussions, and reports. Offered as ARTH 350 and ARTH 450.

ARTH 453. Sixteenth Century Italian Art. 3 Units.
The development of the High Renaissance and Mannerist styles in Italy and late 16th century trends: painting and sculpture. Offered as ARTH 353 and ARTH 453.

ARTH 455. The Book in the Middle Ages: The Christian, Jewish, and Islamic Tradition. 3 Units.
This course will examine later medieval manuscript production, paying particular attention to the issues of patronage, gender, literacy, reception, and cultural biases. We will explore the imagery and texts of monastic and courtly manuscripts, travel books and devotional manuals, all within the framework of the tightly interwoven theological and social discourses of the institutions that commissioned them. As the title of the course indicates, we will study Christian, Jewish, and Islamic books and their interrelations; for example, we will compare Islamic encyclopedias of the natural world, such as Zakariya ibn Muhammad al-Qazwini’s illustrated Wonders of Creation, with medieval bestiaries, herbs, and encyclopedias such as Hartman Schedel’s Liber Chronicarum and Les Merveilles du Monde. Each religious culture will receive a special close-study spotlight: Jewish Haggadot (books for the Passover Seder), Christian courtly romances, and Islamic manuscripts of the Shahnama epic. Offered as ARTH 355 and ARTH 455. Counts for CAS Global & Cultural Diversity Requirement.
ARTH 456. Medieval Matters: The Monstrous, the Macabre, the Miraculous. 3 Units.
This course will explore three distinct but interrelated topics in medieval visual culture, which haunt the modern world as well. We will first study the concepts of the monsters and the monstrous in medieval Europe, as they were manifested in visual, literary, and cryptozoological production. From monster theory to monster culture, we will look at the anxieties that the monsters—those from the edges, those from within—have written on the body of medieval art. These same anxieties, rooted in the fear of difference, manifest themselves in the macabre art: the art of living death that predicated material universe of the late Middle Ages. We will explore the ghosts and the revenants, the living corpses and the nimble skeletons that populate medieval murals, manuscripts, and sculpture. All this is wrapped into the notion of the miraculous, both wondrous and dangerous at once. Here, the focus will be on female bodies, seen as monstrous, macabre, and miraculous at once. Students should be prepared to discuss these topics both within the context of medieval Europe and within our own historical moment. Offered as ARTH 356 and ARTH 456.

ARTH 457. Medieval Wonders: Monuments from Across the Globe. 3 Units.
This course will introduce art of the medieval world, considered globally, with a special focus on monuments surviving from the seventh to fifteenth centuries. Emphasis will be on sculpture and architecture; other media—manuscript illumination, wall paintings, ceramics, and metalwork—will be discussed in conjunction with the related sites. We will travel, virtually, to Pre-Columbian Yucatan, Judeo-Christian Europe, Islamic Spain and Central Asia, Hindu and Buddhist India, Tibet, and Southeast Asia. Each week one or two monuments will be discussed in depth, and other sites will be introduced to place it into historical and art historical contexts. Among the themes we will explore are the power relationships between sovereignty and religion; visual expressions of politics and propaganda; the ways literature, performance, and devotion informed medieval material culture; the importance of pilgrimage; and influences of international trade. Ethical and nationalist issues surrounding looting and cultural patrimony will also be discussed. Objects from CMA's permanent collections will form an integral part of the course. Each unit will end with the consideration of collecting practices. Offered as ARTH 357 and ARTH 457.

ARTH 460. Renaissance Art in Northern Europe. 3 Units.
Painting, sculpture, and the graphic arts in Belgium, France, Germany, and The Netherlands, 1400-1580, highlighting the careers and contributions of specific artists such as Jan van Eyck, Albrecht Durer, and Pieter Bruegel. We will also analyze the changing social, cultural, religious, and political circumstances of the art made during this period, which saw the invention of printmaking, the Protestant Revolution, and increased strife between rulers and their subjects. The rise of new subjects such as landscape and scene of everyday life will be explored, and changes in patronage will be discussed, concentrating on the shift from church and noble patronage to increasingly middle-class patronage related to the beginnings of the open art market. Offered as ARTH 360 and ARTH 460. Counts for CAS Global & Cultural Diversity Requirement.

ARTH 461. 17th-Century Art in Belgium and The Netherlands. 3 Units.
The arts of painting, drawing, and printmaking in Belgium and The Netherlands are discussed in relationship to political, social, cultural, and religious contexts. We will explore the careers and production of individual artists such as Rubens, Van Dyck, Hals, Rembrandt, and Vermeer. Developments in new subjects, artistic specialization, and the expansion of the open market are seen as important factors in shaping Belgian and Dutch art. Offered as ARTH 361 and ARTH 461. Counts for CAS Global & Cultural Diversity Requirement.

ARTH 462. Issues in Early Modern Southern European Art. 3 Units.
Various topics in the art of southern Europe, 1400-1800. Lectures, discussions, reports, and gallery visits in the CMA. Offered as ARTH 362 and ARTH 462. Counts for CAS Global & Cultural Diversity Requirement.

ARTH 465. Issues in Early Modern Northern European Art. 3 Units.
Various topics in the art of northern Europe, 1400-1800. Lectures, discussions, reports, and gallery visits in the CMA. Offered as ARTH 365 and ARTH 465. Counts for CAS Global & Cultural Diversity Requirement.

ARTH 467. 17th and 18th Century Art in France. 3 Units.
A Survey of the arts of painting, sculpture and architecture in France from 1600-1780, a period in which France became the leading political and cultural power in Europe. We will focus on the relationship between the arts and changing social, cultural, religious and political circumstances at a time that saw the rise of the absolute state before the French Revolution, the increased use of art for political propaganda, and the burgeoning of a consumer culture in the middle class. Offered as ARTH 367 and ARTH 467. Counts for CAS Global & Cultural Diversity Requirement.

ARTH 468. Doors Wide Shut: The Private Art Collection from Raphael to Rauschenberg. 3 Units.
A child's room is often stocked with marvels: bird nests, shells, shiny stones, books, and drawings. The great art collections of the Renaissance began in much the same way as these playful assemblages. From cabinets of curiosities containing treasures from foreign lands, to paintings of nude women by Titian and Raphael, these early collections marked the beginning of the modern art museum. What do the hoarding tendencies of the Jesuit Athanasius Kircher (1601-1680), founder of the ‘Kircherianum’—a museum filled with taxidermy animals and mechanical inventions—have in common with Ronald Lauder's recent and widely publicized purchase of a Gustav Klimt painting for $135 million? Famous American art collectors of the 19th & 20th centuries like Henry Clay Frick, Isabella Stewart Gardner, and Peggy Guggenheim opened these formerly private realms of display to the public, revealing the complex motives and politics inherent to the practice of art collection. This course will focus first on the conceptual issues that informed early modern collecting in the western world, and subsequently the way that these ideas and modalities later inflected and shaped the history of modern collecting—particularly in the private sector in Europe and America. Offered as: ARTH 368 and ARTH 468. Counts for CAS Global & Cultural Diversity Requirement.

ARTH 474. Impressionism to Symbolism. 3 Units.
Major developments in European painting and sculpture during the latter half of the nineteenth century. Post-impressionism synthetism, symbolism, and the arts and crafts movement considered in their socio-cultural contexts. Works of Degas, Manet, Monet, Klimt, Bocklin, Gauguin, etc. Offered as ARTH 374 and ARTH 474.

ARTH 479. Issues in 19th Century Art. 3 Units.
Various topics in 19th century art, with class lectures, discussions and reports. Consult department for current topic. Offered as ARTH 379 and ARTH 479.
ARTH 482. Art, Eco-criticism, and the Environment. 3 Units.
As issues of sustainability and environmental impact have become increasingly dominant concerns in contemporary society, eco-criticism has emerged as a vital methodological thread across the humanities. Motivated by ethical as well as scholarly concerns, eco-criticism not only enacts a fundamental examination of nature as an ideological construct, but also seeks to investigate the complex interrelationship between humanity and the environment. Concurrently, there has been a marked interest in studying the role of “green issues” in contemporary art, particularly in tracing the development of earth art or eco-art from the early 1970s to the present. The goal of this seminar is to forge a link between these two emergent strands by tracing the complex relationship between art and the environment from the nineteenth-century to the present, seeking to thereby assess the capaciousness of eco-criticism as a methodological approach to art history. Offered as ARTH 382, ARTH 482 and ESTD 382. Counts for CAS Global & Cultural Diversity Requirement.

ARTH 484. American Art and Architecture in the Age of Washington and Jefferson. 3 Units.
In the 18th century, Americans created not only a political revolution but an artistic and creative one as well. In the 17th century, most Americans were subsistence farmers and most of their products, manufactures, and buildings were relatively crude. In the 18th century, Americans not only established a new and lasting form of government, but for the first time produced paintings, buildings, furniture and silver that rivaled the finest productions of Europe. Notably, many of the leaders of the American Revolution, such as Paul Revere, George Washington, and Thomas Jefferson, also made significant contributions to the arts. Offered as ARTH 384 and ARTH 484.

ARTH 486. Issues in American Art. 3 Units.
Various topics in American art. Each offering will focus on a specific topic within American art. Lectures, discussions, and report. The course will entail regular oral classroom reports and short writing assignments as well as a final paper. Producing an intellectually significant final paper is the major goal of the class. Graduate students are expected to produce a final paper of greater length than Undergraduates and that shows evidence of original scholarship. Offered as ARTH 386 and ARTH 486.

ARTH 487. The Tools of the Artist: An Adventure in Hands-On Learning. 3 Units.
This class embraces John Dewey’s mantra of “Learning through doing.” Students will produce work in different media, and then apply what they have learned to closely analyze a “masterpiece” object in the Cleveland Museum of Art from the standpoint of materials and technique. Media explored will include pottery, blown-glass, papermaking, drawing with a variety of tools, computer games, 3-D computer printing, and painting in watercolor, oil, and Japanese ink. Unlike most art classes, the goal is not necessarily to create an outstanding work of art, but to gain understanding of the challenges of working with different media. While serious effort is expected, grading will take into account the different skill-sets of Art Students and students with an interest in mastering scholarly writing and art history. If you can make a mark on paper you have the artistic skill necessary to take this class. Meetings will draw on Cleveland’s rich art-related resources— including not only Thinkbox and the art facilities of Case Western Reserve but the Cleveland Museum of Art, the Cleveland Institute of Art, The Glass Bubble Project, The Morgan Art of Papermaking Conservatory, and the Zygote Press. Students will produce an object or objects in a media that interests them and will share what they learned with their classmates. They will write a few short papers and a final paper on an object in the Cleveland Museum of Art. Offered as ARTH 387 and ARTH 487.

ARTH 489. M.A. Qualifying Paper. 3 Units.
Individual research and intensive study of a specific topic in art history that culminates in a written M.A. Qualifying Paper. Prereq: To be taken only after completion of 18 credit hours of graduate Art History coursework.

ARTH 490A. Visual Arts and Museums I. 3 Units.
This course examines the idea of the art museum in both its historical and contemporary manifestations, focusing on the context of Western Europe and the United States. As a result of this course, students should be familiar with the following topics: the historic development of the museum, from its origins in collecting practices to its modern incarnation as an institution; the development and care of a collection, including acquisition, cataloguing, and conservation; the display and housing of a collection, including internal and external museum architecture; the study and interpretation of the collection/exhibition, considering diverse publics; the governance of the institution, including project management, finance, and administration. Through the study of these topics, the student should be familiar with the following concepts: the museum as a place for learning, research and scholarship and the museum as steward of cultural property and the attendant issues of ethics and the law. ARTH 490A concentrates on museum collections and related aspects of care, research, interpretation and scholarship. Students who successfully complete ARTH 490A and ARTH 490B may be considered for admission into ARTH 491A, a supervised internship in an art museum or gallery situation.

ARTH 490B. Visual Arts and Museums II. 3 Units.
This course examines the idea of the art museum in both its historical and contemporary manifestations, focusing on the context of Western Europe and the United States. As a result of this course, students should be familiar with the following topics: the historic development of the museum, from its origins in collecting practices to its modern incarnation as an institution; the development and care of a collection, including acquisition, cataloguing, and conservation; the display and housing of a collection, including internal and external museum architecture; the study and interpretation of the collection/exhibition, considering diverse publics; the governance of the institution, including project management, finance, and administration. Through the study of these topics, the student should be familiar with the following concepts: the museum as a place for learning, research and scholarship and the museum as steward of cultural property and the attendant issues of ethics and the law. ARTH 490B concentrates on the museum as an institution, including physical aspects, management and governance, and as a site of learning. The inter-connections between these broad fields and individual departments will be demonstrated and reinforced throughout the semester. Students who successfully complete ARTH 490A and ARTH 490B may be considered for admission into ARTH 491A, a supervised internship in an art museum or gallery situation.

ARTH 491A. Visual Arts and Museums: Internship. 1 Unit.
First semester of required museum internship. Prereq: 490A and 490B.
ARTH 491B. Visual Arts and Museums: Internship. 3 Units.
Second semester of Internship sequence. This internship focuses on the implementation of a comprehensive project that would serve a function similar to the requirement of a qualifying paper for the completion of a master's degree in art history. It is recommended that students undertake this internship in the same division in which their first internship was situated although students may find opportunities to parlay the skills acquired in the first internship to successful advanced work in another division. The key distinction here is that the work in ARTH 491B should build upon the expertise developed in ARTH 491A and represent a significant advance in responsibilities and skills. By week 10 of ARTH 491A, students should begin to identify a potential project for ARTH 491B. By the first week of the semester in which ARTH 491B is to be completed, the student must file an internship agreement form with the department that includes a brief description of the project to be completed, including a summary of the project and major milestones/ time line. In addition to working under the direct supervision of a museum mentor, the student must obtain a faculty mentor for the project and this information should be included in the internship agreement form. Students must file a mid-term and final report describing their duties and responsibilities and a self-assessment of their performance and a final portfolio with a final version of their project as well as examples of drafts and feedback received in the course of completing the project. Students must also keep a journal that tracks their milestones in completing their projects. The faculty supervisor will solicit a letter of assessment from the internship supervisor immediately upon the close of the internship and in sufficient time for final grades. Prereq: ARTH 490A, ARTH 490B and ARTH 491A.

ARTH 492. Issues in 20th/21st Century Art. 3 Units.
Various topics in 20th/21st century art, with class lectures, discussions, and reports. Offered as ARTH 392 and ARTH 492.

ARTH 493. Contemporary Art: Critical Directions. 3 Units.
An examination of the directions taken by avant-garde American art and criticism in the aftermath of Abstract Expressionism. Includes the rise and fall of modernism in the 1960s and '70s, as well as an investigation of Post-modern trends and theories. Offered as ARTH 393 and ARTH 493.

ARTH 494A. Directed Readings in Asian Art. 1 - 3 Units.
Directed reading.

ARTH 494B. Ancient Art. 1 - 3 Units.

ARTH 494C. Medieval Art. 1 - 3 Units.

ARTH 494D. Renaissance and Baroque Art. 1 - 3 Units.

ARTH 494E. American Art. 1 - 3 Units.

ARTH 494F. Modern Art. 1 - 3 Units.

ARTH 495. Methodologies of Art History. 3 Units.
The study of art history as a discipline in its practical and theoretical aspects. Consideration given to research methods, style and historical context, and a critical examination of selected major art historical texts with a view to understanding traditional as well as recent approaches. Special attention is given to art historical writing, employing selected original works in the Cleveland Museum of Art. Required of first-year graduate students in the Ph.D. and Master's programs.

ARTH 496. Materials, Methods, and Physical Examination of Works of Art. 3 Units.
This foundational course will introduce students to the examination methods, terminology and goals of art conservation as it supports art historical research and practice. Students will learn about the various materials that make up different kinds of works of art, how these materials have been used, and what can be learned by the physical examination of works of art. Emphasis will be placed on understanding the uses of and results obtained with imaging techniques (such as X-radiography, infrared reflectography) and on what can be learned through the trained use of the human eye alone. While art from the western tradition, particularly from the 14th through the 21st centuries will be emphasized in class examples, comparisons will be made to objects from other global cultures. The growing field of technical art history, where the results of physical examination are used to illuminate art historical issues such as how workshops functioned, will be considered as well. Each student will research one work of art in the Cleveland Museum of Art or other local collections to understand the physical history and current condition of that object. The goal will be for students to gain an informed understanding of how to evaluate the condition of a work of art, of what options are available for conservation treatment, and of what art-historical information can be obtained through physical examination.

ARTH 497. Contemporary Art in East Asia. 3 Units.
This course will explore modern and contemporary art and visual culture in East Asia produced since the mid-twentieth century with a focus on major artistic movements and artists active in China, Japan, and Korea. Encountering complicated geopolitical and socioeconomic conditions in the post-war era, a series of experimental and radical artistic, cultural, and political movements have emerged in East Asia. The course will map the critical topographies of Asian art from 1945 to the 1980s through the exploration of the following: post-war art and experimental art in Japan and Korea, Chinese art during the Cultural Revolution, material culture in Japanese Mono-ha and Korean Dansaekhwa, and art of resistance in China and Korea in the 1980s. The course will also investigate contemporary Asian art and visual culture focusing on its global turn from the late 1980s. Fueled by international geopolitical change, economic boom, and the impact of globalization, art in Asia or by Asian artists has gained a high level of international visibility and taken a central position in contemporary art exhibitions and art criticism. This visual, social, and theoretical development in the recent art in Asia will be examined through key issues and themes: art's revisiting of tradition and history, its exploration of body and identity, the impact of consumerism and popular culture, and its engagement with public space and the urban environment. Offered as ARTH 397 and ARTH 497. Counts for CAS Global & Cultural Diversity Requirement.

ARTH 512. Seminar in Ancient Art. 3 Units.

ARTH 518. Seminar in Asian Art. 3 Units.

ARTH 530. Byzantine Visual Culture. 3 Units.
This seminar will focus on various aspects of Byzantine visual culture, possibly including monumental and small-scale architecture, architectural decoration (such as mosaics and wall paintings), as well as fixed and portable objects of various materials. Examples of class subjects include "The Byzantine Cult of the Virgin Mary: Image, Ritual, Text," and "The Agency of Monastic Visual Culture in Byzantium."
ARTH 545. Seminar in Medieval Art. 3 Units.
ARTH 551. Seminar in Early Modern Southern European Art. 3 Units.
ARTH 552. Seminar in Early Modern Northern European Art. 3 Units.
ARTH 565. Seminar in American Art. 3 Units.
ARTH 570. Seminar: 19th Century Art. 3 Units.
ARTH 571. Seminar in Contemporary Art. 3 Units.
This graduate seminar explores various topics in contemporary art.

ARTH 601. Research in Art History. 1 - 18 Units.
(Credit as arranged.)

ARTH 610A. Advanced Visual Arts and Museums: Internship I. 3 Units.
First semester of the internship sequence. The intern will work under the supervision of a museum professional to plan and execute a specific project. The student must also obtain a faculty mentor for the project. An internship agreement form must be filed with the department by the end of the first week of classes that includes a brief description of the project. If it is a project to be completed in one semester, a time line should be included as well. The intern must file a mid-term and final report describing their duties and responsibilities and a self-assessment of their performance. A portfolio kept in the department will include the final version of their project as it stands at the end of the semester, as well as examples of drafts and any evaluation received in the course of completing the project. The intern must also keep a journal that tracks their milestones in the execution of their project. The faculty supervisor will solicit a letter of assessment from the museum supervisor immediately upon the close of the internship and in sufficient time to assign a final grade.

ARTH 610B. Advanced Visual Arts and Museums Internship II. 3 Units.
Second semester of the internship sequence. The intern will either continue with the execution of the project begun in the first semester (ARTH 610A) or, when appropriate, undertake a new project. The intern will work under the supervision of a museum professional, and must obtain a faculty mentor for the project. An internship agreement form must be filed with the department by the end of the first week of classes that includes a brief description of the project. A time line should be included as well. The intern must file a mid-term and final report describing their duties and responsibilities and a self-assessment of their performance. A portfolio kept in the department will include the final version of their project as it stands at the end of the semester, as well as examples of drafts and any evaluation received in the course of completing the project. The intern must also keep a journal that tracks their milestones in the execution of their project. The faculty supervisor will solicit a letter of assessment from the museum supervisor immediately upon the close of the internship and in sufficient time to assign a final grade. Prereq: ARTH 610A.

ARTH 701. Dissertation Ph.D.. 1 - 9 Units.
(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

ARTS Courses

ARTS 101. Design and Color I. 3 Units.
Organizational and structural projects as a basis for the development of style. Studies in line, texture, shape, space, value, color, and two dimensional composition through studio problems, art studio media and techniques.
ARTS 300. Art For Different Futures. 3 Units.
The movements for social justice (Black Lives Matter, Me Too) are rapidly and dynamically altering long-held conceptions about the role of art in society. The culture industries (along with many other sectors) have been forced to re-examine the viability and utility of their current models, and the assumptions these models are predicated upon. Art institutions are in the process of reconciling their complicated and often contradictory relationship with white, sexist, ableist, and classist ideology, in which they have tacitly perpetuated dominant structures and perspectives while rhetorically advocating for reform and radical change. In this course, we will explore this contemporary cultural moment and unravel the seismic changes that have brought uncertainty to the art world. We will speculate potential futures free of racism, sexism, homophobia, ableism, and classism, and the role that art could play within those possible futures. And we will explore alternative models of artmaking with the potential to instigate those futures through a focus on social engagement, community, and radical inclusion. Offered as ARTS 300 and ARTS 400.

ARTS 302. Architecture and City Design I. 3 Units.
The social, spatial, and aesthetic elements in architecture; the components of the building: the window, door, roof, enclosing walls, and character of interior and exterior space. Projects related to small, intimate scale and residential structures. Lectures, field trips, studio experiences. Recommended ARTS 101 or ARTS 106 courses prior to enrollment. Offered as ARTS 302 and ARTS 402.

ARTS 303. Architecture and City Design II. 3 Units.
The social, spatial, and aesthetic elements of the urban setting of architecture, the organizational components of the city, the path, the node, the edge, and the grid. Projects related to large-scale and public buildings and their relationship to the encompassing visual world. Lectures, field trips, studio experiences. Recommended ARTS 101 or ARTS 106 courses prior to enrollment. Offered as ARTS 303 and ARTS 403.

ARTS 304. Architecture and City Design III. 3 Units.
A study of historic precedents and the social implications of modern and contemporary architecture including analysis and form interpretation as it relates to building and materials technologies. Practical application and synthesis of architectural knowledge through site visits and research of local and regional architecture. Discussions of historic and contemporary architects, engineers and significant architecture and engineering firms. Prereq: ARTS 302 and ARTS 303.

ARTS 306. Architecture for our Time. 3 Units.
Architecture has a major impact on the earth's environment and on those who inhabit the earth. Decisions made during the architectural design process have a profound impact on the environmental performance of buildings and human beings ability to navigate the built environment. In this architectural design studio, students will look at architecture through a holistic lens to understand the connections among various elements and systems, and design projects will challenge students to incorporate these lessons into innovative, well-designed, sustainable, resilient, human-centered works of architecture. This vertical summer studio is open to students at all levels of architectural experience and can be taken up to two times for credit.

ARTS 310. Enameling and Jewelry II. 3 Units.

ARTS 312. Weaving, Fibers, and Textiles II. 3 Units.
Continuation of ARTS 212. Exploration of a selected area of textiles in surface design or constructed textiles. Development of a personal aesthetic through design and execution of a series of projects. Prereq: ARTS 212.

ARTS 314. Ceramics II. 3 Units.

ARTS 316. Painting II. 3 Units.
The creative, conceptual, visual and technical aspects of painting. Styles ranging from expressionism, cubism, surrealism and abstraction. Work in acrylic and mixed media leading to the development of personal painting style. Prereq: ARTS 216.

ARTS 320. Photography Studio II. 3 Units.
Continuation of ARTS 220. Advanced theory and black and white techniques. Development of personal aesthetic encouraged. Field work. 35mm camera required. Prereq: ARTS 220.

ARTS 322. Digital Photography I. 3 Units.

ARTS 323. Creative Digital Photography II. 3 Units.
Creative Digital Photography II; Advanced theory and techniques of the digital photography workflow and its application to creative photography. Field and computer lab work. Advanced amateur digital camera and access to Photoshop CS6 required. Prereq: ARTS 322.

ARTS 325. Creative Photography. 3 Units.
Creative photography through photographing and responding to photographs. The question of self-expression and photographic medium explored in the pursuit of understanding images. Prereq: ARTS 220 and ARTS 320 or ARTS 322.

ARTS 350. Introduction To Multimedia Art. 3 Units.
This studio course explores the theories and practices of screen-based new media art. Students will manipulate video, audio, images and code to create new multimedia works. The class will use free, open source tools as well as Adobe Creative Cloud apps. This class will examine the emerging culture of contemporary new media art and its historical antecedents. There are no prerequisites. Students will need to provide their own laptops and purchase access to Creative Cloud apps through UTech. Offered as ARTS 350 and ARTS 450.

ARTS 365B. Design and Color. 3 Units.
Advanced design projects determined in consultation with instructor. Prereq: ARTS 101 and ARTS 201.

ARTS 365C. Enameling and Jewelry. 3 Units.
Advanced enameling and jewelry projects determined in consultation with instructor. Prereq: ARTS 210 and ARTS 310.

ARTS 365D. B&W Photography Studio. 3 Units.
Advanced black and white projects determined in consultation with instructor. Prereq: ARTS 220 and ARTS 320.

ARTS 365G. Ceramics. 3 Units.
Advanced ceramics projects determined in consultation with instructor. Prereq: ARTS 214 and ARTS 314.
ARTS 366A. Student Teaching in Art: Pre-K - 6th Grade. 4 Units.

ARTS 366B. Student Teaching in Art: 7th - 12th Grade. 4 Units.

ARTS 385. Clinical/Field Based Experience I. 1 Unit.
Art education students observe and assist art teachers in classes in a variety of public and private educational environments such as local schools, Cleveland Museum of Art. Students study, identify, and analyze differences in art curriculum taught at the various art programs that they observe. Written reports using departmental observation guidelines are required. Prereq: ARTS 295.

ARTS 386. Clinical/Field Based Experience II. 1 Unit.
Art education students become sensitized to serving needs of “special” populations. Observation of educational strategies for teaching learning disabled and/or physically disabled students. Written reports using departmental observation guidelines are required. Prereq: ARTS 295.

ARTS 387. Clinical/Field Based Experience III. 1 Unit.
Art education students observe and assist in art programs for artistically gifted students working in specialized art areas (drawing, painting, sculpture, printmaking, art history). Written reports using departmental observation guidelines are required. Prereq: ARTS 295.

ARTS 393. Art Content, Pedagogy, Methodology, and Assessment. 3 Units.
Growth and development of image making from Pre-K through young adult. Principles and practices of art instruction in grades Pre-K through 12th grade. Issues in art education. Curriculum construction, implementation and assessment of art lessons that address content areas of art production, art history, art appreciation, and art criticism. Clinical field experiences required. Offered as ARTS 393 and ARTS 493. Prereq: ARTS 295.

ARTS 399. Independent Study in Art Studio. 1 - 3 Units.
Independent Study in Art Studio; by permit of Director only.

ARTS 400. Art For Different Futures. 3 Units.
The movements for social justice (Black Lives Matter, Me Too) are rapidly and dynamically altering long-held conceptions about the role of art in society. The culture industries (along with many other sectors) have been forced to re-examine the viability and utility of their current models, and the assumptions these models are predicated upon. Art institutions are in the process of reconciling their complicated and often contradictory relationship with white, sexist, ableist, and classist ideology, in which they have tacitly perpetuated dominant structures and perspectives while rhetorically advocating for reform and radical change. In this course, we will explore this contemporary cultural moment and unravel the seismic changes that have brought uncertainty to the art world. We will speculate potential futures free of racism, sexism, homophobia, ableism, and classism, and the role that art could play within those possible futures. And we will explore alternative models of artmaking with the potential to instigate those futures through a focus on social engagement, community, and radical inclusion. Offered as ARTS 300 and ARTS 400.

ARTS 402. Architecture and City Design I. 3 Units.
The social, spatial, and aesthetic elements in architecture; the components of the building: the window, door, roof, enclosing walls, and character of interior and exterior space. Projects related to small, intimate scale and residential structures. Lectures, field trips, studio experiences. Recommended ARTS 101 or ARTS 106 courses prior to enrollment. Offered as ARTS 302 and ARTS 402.

ARTS 403. Architecture and City Design II. 3 Units.
The social, spatial, and aesthetic elements of the urban setting of architecture, the organizational components of the city, the path, the node, the edge, and the grid. Projects related to large-scale and public buildings and their relationship to the encompassing visual world. Lectures, field trips, studio experiences. Recommended ARTS 101 or ARTS 106 courses prior to enrollment. Offered as ARTS 303 and ARTS 403.

ARTS 450. Introduction To Multimedia Art. 3 Units.
This studio course explores the theories and practices of screen-based new media art. Students will manipulate video, audio, images and code to create new multimedia works. The class will use free, open source tools as well as Adobe Creative Cloud apps. This class will examine the emerging culture of contemporary new media art and its historical antecedents. There are no prerequisites. Students will need to provide their own laptops and purchase access to Creative Cloud apps through UTech. Offered as ARTS 350 and ARTS 450.

ARTS 465. Seminar for Art Teachers. 4 Units.
For art education majors and teacher licensure candidates. Principles and practice in school art instruction grades Pre-K through 12th grade. Organization and management of the art program that incorporates writing sequential art curriculum that integrates art production, art history, appreciation, and criticism. Planning, development, and evaluation of teaching materials, lessons, and units. The seminar includes discussion of professional issues, ethics, art advocacy, and classroom management. Counts as SAGES Senior Capstone. Prereq: ARTS 295 or ARTS 302, and ARTS 393 or ARTS 493. Coreq: ARTS 366A and ARTS 366B or ARTS 466A and ARTS 466B.

ARTS 466A. Student Teaching in Art: Pre-K - 6th Grade. 4 Units.
Teaching art for early childhood, elementary, and middle school students in a school setting. Includes art curriculum development, implementation, and assessment. Professional standards and practices. Offered as ARTS 366A and ARTS 466A. Prereq: ARTS 385, ARTS 386, ARTS 387, ARTS 400, ARTS 493, and ARTS 602. Coreq: ARTS 465 and ARTS 466B.

ARTS 466B. Student Teaching in Art: 7th - 12th Grade. 4 Units.
Teaching adolescents and young adults art in a school setting. Includes art curriculum development, implementation, assessment and classroom management. Professional standards and practices. Offered as ARTS 366B and ARTS 466B. Prereq: ARTS 385, ARTS 386, ARTS 387, ARTS 400, ARTS 493, and ARTS 602. Coreq: ARTS 465 and ARTS 466A.

ARTS 493. Art Content, Pedagogy, Methodology, and Assessment. 3 Units.
Growth and development of image making from Pre-K through young adult. Principles and practices of art instruction in grades Pre-K through 12th grade. Issues in art education. Curriculum construction, implementation and assessment of art lessons that address content areas of art production, art history, art appreciation, and art criticism. Clinical field experiences required. Offered as ARTS 393 and ARTS 493. Prereq: ARTS 295.

ARTS 497. Summer Workshop in Art Education. 3 Units.
A current art education issue is covered in depth.
ARTS 602. Study in Art Education. 3 Units.
General history and theories of art education. Development of personal philosophy as basis for teaching art. Topics in professional standards, creativity, aesthetic theory, and art criticism. Students produce an art education research paper. Clinical/Field experiences are required.

ARTS 605. Final Creative Thesis. 1 - 3 Units.
Students receive individual guidance for an approved self-designed creative project from program faculty members. A public exhibition or presentation is required. By permit only.

Asian Studies Program
215 Mather Memorial
asia.case.edu/ (http://asia.case.edu/)
Phone: 216.368.5362
Lihong Shi, Program Advisor
lihong.shi@case.edu

Asian studies have become an increasingly important area of study in North American colleges and universities. This is due in part to a growing acknowledgment that Asian cultures are of significance both regionally and globally. The Asian Studies Program offers students the opportunity to explore these cultures from a multidisciplinary perspective so that they are able to understand the social, cultural, political, and other forces that shape and have shaped Asian nations.

The Asian Studies Program draws on faculty and courses from such departments as anthropology, art history and art, economics, modern languages and literatures, history, philosophy, political science, and religious studies. A current list of approved courses is available from the program advisor. Departmental seminars and senior capstone courses in the Asian Studies Program may count toward the completion of the SAGES General Education Requirements.

The undergraduate program in Asian Studies offers a major and a minor. Students are encouraged to take courses in different disciplines in order to obtain broad exposure to the languages, literature, art, culture, religious traditions, and political, economic, and social institutions of Asian countries. The Asian Studies Program also offers an honors program to qualified majors.

In addition to course offerings, the Asian Studies Program sponsors extracurricular activities that enhance the formal study of Asia and give students additional opportunities to explore and understand Asia’s importance in the global community. The program sponsors lectures and films and administers a website devoted to Asia. It also encourages students to participate in study abroad programs in Asian countries and to utilize Asian resources at the Cleveland Museum of Art and other local institutions.

Department Faculty
Ananya Dasgupta, PhD
(University of Pennsylvania)
Associate Professor, Department of History
William E. Deal, PhD
(Harvard University)
Severance Professor in the History of Religion, Department of Religious Studies; Department of Cognitive Science

Melvyn C. Goldstein, PhD
(University of Washington)
Distinguished University Professor and John Reynolds Harkness Professor, Department of Anthropology; Co-Director, Center for Research on Tibet

Kelly M. McMann, PhD
(University of Michigan)
Professor, Department of Political Science; Director, International Studies Program

Eunyoung Park, PhD
(University of Kansas)
Assistant Professor, Department of Art History and Art

Lihong Shi, PhD
(Tulane University)
Associate Professor, Department of Anthropology; Advisor, Asian Studies Program

Yasuhiro Shirai, PhD
(University of California, Los Angeles)
Professor, Department of Cognitive Science

Jonathan Tan, PhD
(The Catholic University of America)
Archbishop Paul J. Hallinan Professor in Catholic Studies, Associate Professor, Department of Religious Studies

Peter Yang, PhD
(University of Utah)
Associate Professor, Department of Modern Languages and Literatures

Undergraduate Program
Asian Studies Major

The Asian Studies major, which leads to a Bachelor of Arts degree, consists of 31 credit hours, including:

- At least 16 credit hours (two years) of Chinese or Japanese language
- 15 credit hours of Asia-related courses, selected in consultation with the program advisor

The 15 hours in Asia-related courses must be at the 200 or 300 level and come from at least three different departments.

Honors Program

Asian Studies Honors is a semester-long program for Asian studies majors, normally taken during the senior year, which involves researching and writing an honors thesis. Honors program requirements include the completion of 12 semester hours of approved Asia-related courses, at least two semesters of study of an Asian language, and maintenance of a GPA of at least 3.0 overall and 3.2 in Asian studies courses.

A participating student enrolls in ASIA 398 Honors Thesis and writes a thesis under the direction of an Asian Studies faculty member. The student also receives guidance from a second reader, who must be a member of the Asian Studies Program. A third reader, who need not be a member of the Asian Studies Program, is optional. Each student must maintain regular contact with the supervising faculty member in the various stages of researching and writing the thesis. Detailed guidelines and deadlines for the course are available from the program advisor.

Introduction to Modern East Asia. 3 Units.

HSTY 132 is an introduction to the histories of modern China, Japan, Korea, and Vietnam from the "dawn of the global world" in the 17th century to present. Taken together these regions make up the geographic and cultural unit commonly referred to as "East Asia." Over the course of the term, we will investigate the usefulness of this concept of "East Asia" by examining its origins as well as the sometimes convergent, sometimes divergent relations between this region and the rest of the world. We will also challenge the stereotype of a monolithic and static East Asia and see to develop a critical understanding of the internal and external forces integrating and dividing this region. We will examine how international diplomatic, commercial, military, religious, and cultural relationships shaped the individual countries as well as their relationships with each other and the world. The course sweeps over large regions of time and space. It aims to put the contemporary discussion of globalization into historical perspective by examining the long-lasting interactions of East Asian countries with each other and the rest of the world. These connections were economic, political, cultural, and psychological. Topics include: global silver and trade flows, warfare and military technology, imperial domination and revolutionary resistance, and the role of historical memory, as in Nanking or Hiroshima. Sources include historical documents, pictures, films, and memoirs. As we move through the course material our goal is not to gain total knowledge of modern East Asia, nor of China, Japan, Korea nor Vietnam. Rather, by the end of the term you should be able to identify some of the main organizing themes in modern East Asian history and develop a greater understanding of the construction and nature of historical knowledge itself. Offered as HSTY 132 and ASIA 132. Counts for CAS Global & Cultural Diversity Requirement.

ASIA 240. Modern Chinese Literature in Translation. 3 Units.

This course examines Modern Chinese Literature from the beginning of the 20th century to contemporary period in the contexts of Chinese historical and cultural transformations. It examines representative works of the major literary genres, including fiction, poetry, drama, and prose writing. We will be making the following inquiries: What is modern Chinese literature? What does it tell us about the cultural, social, psychological, and historical changes that occurred in modern China? Who are the main literary and cultural figures, and what did they contribute to the construction of the Chinese nation? How did Western thoughts impact on the ways in which Chinese reflected on their own cultural identities and social and gender relationships? This course is taught in English. Offered as CHIN 240, ASIA 240 and WLIT 240. Counts for CAS Global & Cultural Diversity Requirement.

ASIA 250. Classical Chinese Literature in Translation. 3 Units.

This course is a survey of the classical Chinese literature from the pre-Qin Period to the fall of Qing Dynasty in 1911. Students will be introduced to a variety of forms and genres, including classical poetry, lyric, aria, elegy, rhapsody, folk song, narrative verse, parallel prose, classical-language short story, vernacular short story, novel, drama, etc. This course is taught in English. Offered as CHIN 250, ASIA 250 and WLIT 250. Counts for CAS Global & Cultural Diversity Requirement.

ASIA 288. Imperial China: The Great Qing. 3 Units.

This course is an introduction to the history of Imperial China, from the fall of the Ming Dynasty in 1644 to the creation of the Chinese republic in 1912. We will explore the major historical transformations (political, economic, social, and cultural) of the last imperial dynasty, the Qing (1644-1911), and develop an understanding of the major social, political, economic, and intellectual cultural forces shaping the formation of modern China. Contrary to commonly-held ideas in both West and in China that traditional Chinese society was timeless or stagnant, historians now see dramatic and significant changes during this period—to the economy, to gender relations, to religion, and to many other aspects of life. This course surveys the social, political, economic, and cultural history of this era, with emphasis on recent research. The main goals of the course will be to acquaint students with the key changes and to show the interplay between economic, social, and cultural changes on the one hand and political developments on the other. By the end of the semester you should have a good sense of how Chinese society was transformed over the course of the 17th through early 20th centuries. The topics we will discuss include urbanization and commerce; gender, family and kinship; education and the examination system; opium and free trade; and ethnicity and nationalism. Offered as ASIA 288 and HSTY 288. Counts for CAS Global & Cultural Diversity Requirement.

Asian Studies Minor

The minor in Asian Studies consists of 18 credit hours of Asia-related courses, selected in consultation with the program advisor. Only one year (8 credits) of language study (Japanese or Chinese) counts toward the minor.

The 18 hours in Asia-related courses must be at the 200 or 300 level and come from at least three different departments.

Courses

ASIA 132. Introduction to Modern East Asia. 3 Units.

HSTY 132 is an introduction to the histories of modern China, Japan, Korea, and Vietnam from the "dawn of the global world" in the 17th century to present. Taken together these regions make up the geographic and cultural unit commonly referred to as "East Asia." Over the course of the term, we will investigate the usefulness of this concept of "East Asia" by examining its origins as well as the sometimes convergent, sometimes divergent relations between this region and the rest of the world. We will also challenge the stereotype of a monolithic and static East Asia and see to develop a critical understanding of the internal and external forces integrating and dividing this region. We will examine how international diplomatic, commercial, military, religious, and cultural relationships shaped the individual countries as well as their relationships with each other and the world. The course sweeps over large regions of time and space. It aims to put the contemporary discussion of globalization into historical perspective by examining the long-lasting interactions of East Asian countries with each other and the rest of the world. These connections were economic, political, cultural, and psychological. Topics include: global silver and trade flows, warfare and military technology, imperial domination and revolutionary resistance, and the role of historical memory, as in Nanking or Hiroshima. Sources include historical documents, pictures, films, and memoirs. As we move through the course material our goal is not to gain total knowledge of modern East Asia, nor of China, Japan, Korea nor Vietnam. Rather, by the end of the term you should be able to identify some of the main organizing themes in modern East Asian history and develop a greater understanding of the construction and nature of historical knowledge itself. Offered as HSTY 132 and ASIA 132. Counts for CAS Global & Cultural Diversity Requirement.
ASIA 289. Reform, Revolution, Republics: China 1895 to Present. 3 Units.
Completes a two-term sequence of the Chinese history survey, although
HSTY 288 is not a prerequisite for this course. Beginning with the
First Sino-Japanese War (1895), we review the historical development
of intellectual discourse, public reaction, and political protest in
later Imperial China through the creation of the People’s Republic in
1949 forward to contemporary times. In contrast to the conventional
description of China from a Western point of view, this course tries to
explain the emergence of modern China in the context of its intellectual,
political, and socio-economic transformation as experienced by Chinese
in the late 19th and into the 20th century. By discussing the influence of
the West, domestic rebellions, and political radicalism, we examine how
the Chinese state and society interacted in search for modernization and
reforms, how these reforms were continued during the Republican period,
and to what extent historical patterns can be identified in China’s present-
day development. Offered as ASIA 289 and HSTY 289. Counts for CAS
Global & Cultural Diversity Requirement.

ASIA 320. Chinese Popular Culture. 3 Units.
In this course we are going to study Chinese (including Mainland China,
Hong Kong, Taiwan, and Chinese Diaspora) popular culture since the
1980s. By examining different forms of popular culture, including popular
literature, film, music, TV programs, posters, the Internet, etc., we will
be looking into their political, ideological, sociological, cultural,
and psychological mechanisms. The film viewing will take place outside the
class. Offered as: CHIN 320, ASIA 320 and WLIT 320. Counts for CAS
Global & Cultural Diversity Requirement.

ASIA 330. Chinese Cinema. 3 Units.
This course is an exploration to the history of and critical issues in
Chinese cinema: we will discuss early film making in Shanghai, leftist
melodrama, Socialist films, the Chinese New Wave, underground films,
the film making in the era of globalization, and etc. Themes and genres
that will be investigated include melodrama, the "Fifth Generation",
underground film making, filmic representations of women, minority films,
and historical epics. Films from mainland China, Hong Kong, Taiwan, and
diasporic communities will be discussed to illuminate what it means to
be "Chinese." All of the films in this course come with English subtitles;
the film viewing will take place outside the class. Offered as CHIN 330

ASIA 398. Honors Thesis. 1 - 4 Units.
Intensive study of a topic or problem under the direction of a faculty
member, resulting in the preparation of an honors thesis.

ASIA 399. Independent Study. 1 - 3 Units.
Tutorial in Asian Studies.

Department of Astronomy

567 Sears Library Building
astronomy.case.edu/ (http://astronomy.case.edu/)
Phone: 216.368.3278
Stacy S. McGaugh, Department Chair
dep@astroweb.case.edu

The Department of Astronomy offers two undergraduate degrees, a
Bachelor of Science and a Bachelor of Arts. The BS provides a rigorous
sequence of subject-specific courses, while the BA degree provides
somewhat more flexibility in the choice of courses. The department also
offers a minor in astronomy.

The curriculum emphasizes a broad and substantial education in
astronomy, physics, and mathematics. A faculty actively engaged
in research provides first-rate instruction and opportunities for
undergraduate involvement in research.

A bachelor’s degree in astronomy can prepare students for graduate
study in astronomy (about 50% of our graduates take this path), but those
who seek employment in other fields can fill the same jobs as physics
and computer science majors.

The department offers a graduate program leading to the degree
of Doctor of Philosophy in astronomy. Current research provides
opportunities in observational and theoretical studies of galaxy formation
and evolution, galaxy cluster evolution, and cosmology.

Facilities
The Department of Astronomy operates the Kitt Peak Station of the
Warner and Swasey Observatory near Tucson, Ariz., home of the Burrell
Schmidt telescope. This telescope is used for surveys and ultra-deep
imaging with a large format CCD.

On the Case Western Reserve campus, a 9.5-inch refractor permanently
mounted on the roof of the A. W. Smith Building is available for use
by students. The department also houses a research and instruction
computer laboratory and has access to the university’s high-performance
computing cluster.

Department Faculty
Stacy S. McGaugh, PhD
(University of Michigan)
Professor and Chair; Director, Warner and Swasey Observatory
Galaxy formation and evolution; low surface brightness galaxies;
cosmology; dark matter and gravity

William F. Janess, PhD
(Indiana University)
Instructor
Searches for dwarf galaxies; development of software tools

J. Christopher Mihos, PhD
(University of Michigan)
Worcester R. and Cornelia B. Warner Professor of Astronomy
Galaxy evolution; interacting and merging galaxies; galaxy clusters;
computational and observational astronomy

Adjunct Faculty
Jeffery R. Kriessler, PhD
(Michigan State University)
Adjunct Assistant Professor
Substructure in galaxy clusters

Secondary Faculty
John Ruhl, PhD
(Princeton University)
Connecticut Professor, Department of Physics
Experimental astrophysics and cosmology

Glenn D. Starkman, PhD
(Stanford University)
Distinguished University Professor, Department of Physics
Theoretical cosmology; particle physics; astrophysics
### Bachelor of Science in Astronomy

The Bachelor of Science in astronomy requires 122 credit hours, including 20 hours in astronomy, 40 hours in physics, 14 hours in math, 3 hours in computer programming and 15 hours in technical electives.

Graduate Program

The PhD degree in astronomy is granted to those students who have shown extensive knowledge of advanced astronomy and the ability to do original research. The student is required to pass a general qualifying examination in astronomy, usually taken at the end of the second year. The student must then prepare a dissertation based on the results of independent research. A PhD candidate must also satisfy the general requirements of the School of Graduate Studies.

Full-time graduate students who maintain satisfactory academic performance while pursuing the PhD degree in astronomy normally receive a stipend for teaching and/or research, which includes full tuition and a monthly amount sufficient to cover living expenses.

Courses

**ASTR 101. Introduction to the Sun and Its Planets. 3 Units.**
This introductory astronomy course describes our solar system of planets and how astronomers develop our physical understanding about the universe. Topics include the properties of the Sun and planets; the formation of the solar system and how the planets have evolved over time; asteroids, comets, and dwarf planets; and a comparison of our solar system with new planetary systems being found around other stars. This course has no pre-requisites.

**ASTR 103. Introduction to the Stars, Galaxies, and the Universe. 3 Units.**
This introductory astronomy course describes the universe we live in and how astronomers develop our physical understanding about it. Topics covered include: the properties of stars; the formation, evolution, and death of stars; white dwarfs, pulsars, and black holes; spiral and elliptical galaxies; the Big Bang and the expansion of the Universe. This course has no pre-requisites.

**ASTR 105. Introduction to Einstein’s Universe. 3 Units.**
This course is a descriptive introduction for the non-science major to Einstein’s Special and General Theories of Relativity and how these theories have fundamentally altered our understanding of the universe. Topics discussed will include: time dilation, length contraction, the twin paradox, the warping of space-time, white dwarf stars, neutron stars, black holes, the structure and evolution of the universe. No mathematical background beyond simple algebra is needed. This course has no pre-requisites.

**ASTR 107. Introduction to Life in the Universe. 3 Units.**
This course is intended to introduce the non-scientist to the field of astrobiology - the interdisciplinary study of, and the search for, extraterrestrial life and the conditions for extraterrestrial life in the Universe. This course has no pre-requisites.

**ASTR 151. Doing Astronomy. 1 Unit.**
This course is intended to introduce students to how astronomy is done. The course will focus on the astronomical research process, the scientific community, and on career paths in astronomy. Course activities will include readings and class discussions focusing on various topics in modern astronomy, including ongoing research activity in the department. This course is largely intended for first- and second-year students considering majoring or minoring in astronomy, or pursuing a career in astronomy. Prereq: First- or second-year academic standing.

**ASTR 221. Stars and Planets. 3 Units.**

**ASTR 222. Galaxies and Cosmology. 3 Units.**

**ASTR 306. Astronomical Techniques. 3 Units.**
This course covers the techniques astronomers use to conduct research, including observations using ground- and space-based telescopes, computer simulations and other numerical methods, and statistical data mining of large on-line astronomical datasets. Offered as ASTR 306 and ASTR 406. Counts as SAGES Departmental Seminar. Prereq: ASTR 222.

**ASTR 309. Astrophysics Seminar I. 1 Unit.**
Selected topics in astronomy not covered ordinarily in courses. Presentation of talks by the students. Prereq: ASTR 222 or Requisites Not Met permission.

**ASTR 310. Astrophysics Seminar II. 1 Unit.**
Selected topics in astronomy not covered ordinarily in courses. Presentation of talks by students. Prereq: ASTR 222 or Requisites Not Met permission.

**ASTR 311. Stellar Physics. 3 Units.**
Radiative transfer, atomic and molecular opacities, and the observable properties of stars. Stellar interiors, nuclear processes, and energy generation. The evolution of stars of varying mass and production of the elements within supernovae explosions. Offered as ASTR 311 and ASTR 411. Prereq: ASTR 222.

**ASTR 323. The Local Universe. 3 Units.**

**ASTR 328. Cosmology and the Structure of the Universe. 3 Units.**

**ASTR 333. Dark Matter. 3 Units.**
This course will systematically explore the evidence for dark matter in the universe. Necessary physical theory and astronomical concepts will be developed as appropriate. Topics to be covered include gravitational dynamics, gravitational lensing, and hydrostatic equilibrium as probes of the gravitational potentials of extragalactic systems. Examples include the rotation curves of spiral galaxies, the Oort discrepancy in the local Galactic disk, the dynamics of pressure supported dwarf and giant elliptical galaxies, and the Local Group timing problem. In clusters of galaxies, the mass discrepancy is illustrated separately by measured velocity dispersions, the hydrostatic equilibrium of the hot intracluster medium, and both strong and weak gravitational lensing. On cosmic scales, the course will address evidence from the gravitating and baryonic mass content of the universe, the growth of large scale structure from the initially smooth cosmic microwave background, and the existence of large voids and large scale bulk flows. The course will describe the various dark matter halo models commonly employed and introduce the techniques of mass modeling. We will examine hypotheses for the nature of dark matter, both baryonic and non-baryonic, and discuss strategies for experimental detection of plausible dark matter candidates. Theories that seek to explain the observed mass discrepancies by means of modifying the Law of Gravity rather than invoking dark matter will be explored. Offered as ASTR 333 and ASTR 433. Prereq: PHYS 310 or Requisites Not Met permission.
ASTR 351. Astronomy Capstone Project. 1 - 3 Units.
A two semester course (1 hour in the Fall Semester and either 2 or 3 hours in the Spring Semester) for students desiring a Capstone Experience in astronomy. Students pursue a project based on experimental, theoretical or teaching research under the supervision of an astronomy faculty member. A departmental Capstone Project Committee must approve all project proposals (by the end of the Fall Semester) and this same committee will receive regular oral and written progress reports. Final results are presented at the end of the semester as a paper in a style suitable for publication in a professional journal as well as an oral report in a public symposium. Counts as SAGES Senior Capstone. Prereq: ASTR 222.

ASTR 369. Undergraduate Research. 1 - 3 Units.
Supervised research on topics of interest. Can be used as a thesis course if desired. Students may register more than once for a maximum of 9 credits overall (1-3 credits each semester).

ASTR 406. Astronomical Techniques. 3 Units.
This course covers the techniques astronomers use to conduct research, including observations using ground- and space-based telescopes, computer simulations and other numerical methods, and statistical data mining of large on-line astronomical datasets. Offered as ASTR 306 and ASTR 406. Counts as SAGES Departmental Seminar.

ASTR 411. Stellar Physics. 3 Units.
Radiative transfer, atomic and molecular opacities, and the observable properties of stars. Stellar interiors, nuclear processes, and energy generation. The evolution of stars of varying mass and production of the elements within supernovae explosions. Offered as ASTR 311 and ASTR 411.

ASTR 423. The Local Universe. 3 Units.

ASTR 428. Cosmology and the Structure of the Universe. 3 Units.

ASTR 433. Dark Matter. 3 Units.
This course will systematically explore the evidence for dark matter in the universe. Necessary physical theory and astronomical concepts will be developed as appropriate. Topics to be covered include gravitational dynamics, gravitational lensing, and hydrostatic equilibrium as probes of the gravitational potentials of extragalactic systems. Examples include the rotation curves of spiral galaxies, the Oort discrepancy in the local Galactic disk, the dynamics of pressure supported dwarf and giant elliptical galaxies, and the Local Group timing problem. In clusters of galaxies, the mass discrepancy is illustrated separately by measured velocity dispersions, the hydrostatic equilibrium of the hot intracluster medium, and both strong and weak gravitational lensing. On cosmic scales, the course will address evidence from the gravitating and baryonic mass content of the universe, the growth of large scale structure from the initially smooth cosmic microwave background, and the existence of large voids and large scale bulk flows. The course will describe the various dark matter halo models commonly employed and introduce the techniques of mass modeling. We will examine hypotheses for the nature of dark matter, both baryonic and non-baryonic, and discuss strategies for experimental detection of plausible dark matter candidates. Theories that seek to explain the observed mass discrepancies by means of modifying the Law of Gravity rather than invoking dark matter will be explored. Offered as ASTR 333 and ASTR 433.

ASTR 497. Special Topics in Astronomy. 1 - 3 Units.

Biochemistry

The College of Arts and Sciences awards the Bachelor of Arts and Bachelor of Science degrees in biochemistry. The required courses for the majors and minor are offered by the Department of Biochemistry (p. 816) in the School of Medicine.

Major

The two undergraduate major programs in Biochemistry, BA and BS, are based on the Arts and Sciences General Education Requirements but differ in amount and intensity of the mathematics and physical sciences required. Either degree is excellent for students planning to undertake graduate work in biochemistry or in related areas of the biomedical sciences. Both the BA and the BS programs permit students to follow many options after graduation. Graduates are well prepared for further studies in the biological sciences, for degrees in the health sciences (MD, DO, DDS, PharmD), for employment in the chemical, pharmaceutical, and biotechnology industries, or as research assistants in research laboratories. The BA makes a considerable amount of elective time available, which allows students to concentrate on biochemistry more intensively than the curriculum requires, or pursue other subjects in science or liberal arts. The BS degree has additional course requirements in the quantitative and physical sciences; it is intended for students with interests in these areas.

In both programs, undergraduate research is required. As many as nine hours of Research in Biochemistry (BIOC 391 Research Project) may be

Approved Technical Elective 3
Research Project (BIOC 391) 3
Electives or GER Courses 6
Year Total: 16 16

Senior

Biochemistry SAGES Seminar (BIOC 373) Fall 3
Research Project (BIOC 391) Spring 3
Electives Fall 6
Proteins and Enzymes (BIOC 312) (or Approved Technical Electives) Spring 3
Senior Capstone Experience (BIOC 393) Fall 3
Structural Biology (BIOC 334) (or Approved Biochem or Technical Elective) Spring 3
Electives Fall 6-9
Year Total: 15 12-15

Total Units in Sequence: 120-123

Note: At least 3 credits of undergraduate research, BIOC 391 Research Project, is recommended for the Capstone. An additional 3 credits of BIOC 391 is highly recommended. Students should consult their academic advisers about the elective parts of the curriculum. A course in statistics or quantitative biology is suggested but not required.

| Senior Capstone Experience (BIOC 393) | 3 |
| Electives | 9 |
| Year Total: | 15 15 |

**Total Units in Sequence:** 123

Note: At least 3 credits of undergraduate research, BIOC 391 Research Project, is recommended for the Capstone. An additional 3 credits of BIOC 391 is highly recommended. Students should consult their academic advisers about the elective parts of the curriculum.

- a Selected students may be invited to take CHEM 323 Organic Chemistry I or CHEM 324 Organic Chemistry II
- b Selected students may be invited to take PHYS 123 Physics and Frontiers I - Mechanics and PHYS 124 Physics and Frontiers II - Electricity and Magnetism in place of PHYS 121 General Physics I - Mechanics and PHYS 122 General Physics II - Electricity and Magnetism.

**Honors Program**

Biochemistry majors who have excellent academic records may be awarded Biochemistry Undergraduate Honors. To graduate with departmental honors in biochemistry, a student must satisfy the following requirements:

1. A grade point average of at least 3.600
2. A minimum of 6 credit hours of undergraduate research (BIOC 391) in one laboratory
3. A BIOC 393 capstone report approved by the Undergraduate Education Committee of the department on the basis of the quality of the research, the written report, and an oral presentation. An acceptable report:
   - a. Should follow a standard journal format
   - b. Should demonstrate the student’s understanding of the research area, experimental techniques, goals and implications of the project
   - c. Should show that the student has advanced his/her knowledge of the applicable techniques and the underlying scientific concepts.
4. Using all or part of the capstone research, the student must be a co-author on a manuscript either submitted, in press, or published in a peer reviewed journal.

**Minor**

**Required Courses:**

<td>Proteins and Enzymes</td>
<td>3</td>
</tr>
<tr>
<td>Approved technical elective in biochemistry</td>
<td>3</td>
<td></td>
</tr>
</tbody>
</table>

**Total Units:** 14

Students may obtain credit for a minor in biochemistry by completing one year of first year chemistry (including laboratory), one year of organic
chemistry (including laboratory), two semesters of approved biology courses, and three semesters of didactic courses in biochemistry.

Department of Biology

203 DeGrace Hall
www.case.edu/artsci/biol (http://www.case.edu/artsci/biol/)
Phone: 216.368.3557; Fax: 216.368.4672
Emmitt R. Jolly, Department Chair
emmitt.jolly@case.edu

The mission of the Department of Biology at Case Western Reserve University is to promote research programs of national and international prominence and to provide strong undergraduate and graduate educational programs that emphasize integrative approaches to biological problems. In doing so, our programs support preparation and professional development for careers related to the biological and health sciences.

The department offers courses leading to the degrees of Bachelor of Science, Bachelor of Science in Systems Biology, Bachelor of Science in Neuroscience, Bachelor of Arts, Master of Science, and Doctor of Philosophy. Cooperative programs between the Department of Biology and the Case Western Reserve University School of Medicine, the Cleveland Museum of Natural History, the Cleveland Botanical Garden, the Cleveland Metroparks Zoo, the Holden Arboretum, the Cleveland Institute of Art, and other departments in Case Western Reserve University significantly extend the range of resources available to biology students. The department also operates an extensive field research station at Squire Valleevue Farm, located about 10 miles east of the University. Undergraduate students are encouraged to conduct individually supervised research projects with biology faculty and with faculty in cooperating departments. A supervised research project is required of all students in the BS Biology program.

The undergraduate programs in biology provide excellent preparation for graduate or professional schools, including medical, dental, and veterinary schools and the many specialized graduate programs in the biological sciences. A biology degree also prepares students for careers in industry and government. For students interested in biotechnology—a field with growing career opportunities—the department offers elective sequences within the BA and BS degrees.

In addition to formal courses for credit, the department offers weekly seminars during the academic year, presenting recent advances in biology. These seminars are held every Thursday at 4:00 p.m. and are open to the university community.

Department Faculty

Emmitt R. Jolly, PhD
(University of California, San Francisco)
Associate Professor and Chair
Molecular biology and genetics; developmental biology; parasitology; schistosomiasis

Karen C. Abbott, PhD
(University of Chicago)
Professor
Ecology; theoretical biology

Radhika Atit, PhD
(University of Cincinnati)
Professor
Developmental biology and genetics; origin and patterning of skin

Sarah C. Bagby, PhD
(Massachusetts Institute of Technology)
Assistant Professor
Microbial and viral evolution and community dynamics; geobiology; microbial physiology; bioinformatics and ecoinformatics

Michael F. Benard, PhD
(University of California, Davis)
Associate Professor
Ecology; evolutionary biology

Rebecca Benard, PhD
(University of California, Davis)
Senior Instructor
Plant population ecology; physiology

Susan M. Burden-Gulley, PhD
(Case Western Reserve University)
Senior Instructor
Neuroscience; axonal growth; neural development; brain cancer

Jean H. Burns, PhD
(Florida State University)
Associate Professor
Plant ecology; community assembly; invasibility; the role of phylogeny in assembly; the role of demographic processes in biological invasions

Arnold I. Caplan, PhD
(Johns Hopkins University)
Professor; Director, Skeletal Research Center
Developmental biology and biochemistry; molecular and cellular aspects of muscle, cartilage, and bone development

Leena Chakravarty, PhD
(Ohio State University)
Instructor
Microbial molecular genetics

Hillel J. Chiel, PhD
(Massachusetts Institute of Technology)
Professor
Neurobiology and animal behavior; cellular dynamics of neuronal computation

Nicole Crown, PhD
(Indiana University)
Assistant Professor
Molecular genetics of meiosis in Drosophila melanogaster

Christopher A. Cullis, PhD
(University of East Anglia, United Kingdom)
Francis Hobart Herrick Professor of Biology
Plant molecular biology and genetics; modifications of the information content of plant cells
Sarah E. Diamond, PhD  
(University of North Carolina, Chapel Hill)  
*Associate Professor*  
Evolutionary ecology; global change biology; invertebrate immunology; multivariate statistics

Richard F. Drushel, PhD  
(Case Western Reserve University)  
*Senior Instructor; Executive Officer*  
Vertebrate anatomy and physiology; kinematic modeling and neural control; autonomous robotics

Yolanda M. Fortenberry, PhD  
(Louisiana State University School of Medicine)  
*Associate Professor*  
Regulation of blood coagulation; development of RNA aptamers as anticoagulants and for treatment of sickle cell disease

Jessica L. Fox, PhD  
(University of Washington)  
*Associate Professor*  
Neurobiology of behavior

Stephen E. Haynesworth, PhD  
(Case Western Reserve University)  
*Associate Professor*  
Developmental and aging biology

Valerie Haywood, PhD  
(University of California, Davis)  
*Senior Instructor*  
Plant developmental biology; molecular biology

Barbara A. Kuemerle, PhD  
(Case Western Reserve University)  
*Senior Instructor*  
Molecular biology and genetics; developmental neuroscience

Ryan A. Martin, PhD  
(University of North Carolina, Chapel Hill)  
*Associate Professor*  
Evolutionary ecology; behavioral ecology; ecology’s role in evolutionary diversification; causes and consequences of phenotypic plasticity

Claudia M. Mizutani, PhD  
(Federal University of Rio de Janeiro, Brazil)  
*Associate Professor*  
Developmental biology and genetics; embryonic body-axis formation

Ronald G. Oldfield, PhD  
(University of Michigan)  
*Senior Instructor*  
Evolutionary ecology of cichlid fishes; ichthyology

Charles E. Rozek, PhD  
(Wayne State University)  
*Associate Professor; Vice Provost for Graduate Education and Faculty and Academic Affairs; Dean of Graduate Studies*  
Molecular genetics; developmental biology

Robin Snyder, PhD  
(University of California, Santa Barbara)  
*Professor*  
Theoretical ecology

Joy K. Ward, PhD  
(Duke University)  
*Professor; Dean, College of Arts and Sciences*  
Plant biology; climate change

Robert E. Ward, PhD  
(Duke University)  
*Associate Professor*  
Developmental biology; cell biology; model system genetics

Gabriella Wolff, PhD  
(University of Arizona)  
*Assistant Professor*  
Neuroethology; evolutionary and comparative neurobiology; olfaction; learning and memory

Mark A. Willis, PhD  
(University of California, Riverside)  
*Professor*  
Neurobiology and behavior; sensorimotor control of insect flight; animal behavior

---

**Research Faculty**

Rodrigo Somoza Palacio, PhD  
(Universidad Federico Santa Maria, Chile)  
*Research Associate Professor*  
Cartilage tissue engineering; somatic stem cell biology; reprogramming technology (IPS); cell therapy and tissue regeneration; cancer metastasis

Jean F. Welter, MD, PhD  
(Leopold Franzens Universität, Austria; Case Western Reserve University)  
*Research Associate Professor*  
Tissue engineering and cell-based therapies; bioreactor design; mechanobiology; bone transplantation; imaging; fluorescence spectroscopy; drug delivery

---

**Secondary Faculty**

Martín L. Basch, PhD  
(California Institute of Technology)  
*Assistant Professor, Department of Otolaryngology, University Hospitals of Cleveland*  
Neurobiology; hearing and deafness; mechanotransduction; synapse development

Darin Croft, PhD  
(University of Chicago)  
*Associate Professor, Department of Anatomy, School of Medicine*  
Vertebrate paleontology and fieldwork; mammals, especially those of South America; paleoecology and ancient ecosystems

Brian M. McDermott, PhD  
(Columbia University)  
*Associate Professor, Department of Otolaryngology, University Hospitals of Cleveland*  
Neurobiology; hearing and deafness; zebrafish; mechanotransduction; synapse development
Adjunct Faculty

James Bader, MS
(Case Western Reserve University)
Adjunct Lecturer; Executive Director, Gelfand STEM Center
STEM education; aquatic biology

David J. Burke, PhD
(Rutgers University)
Adjunct Assistant Professor; Scientist, Holden Arboretum
Rhizosphere ecology; plant-microbe interactions; molecular microbial ecology; plant ecology

Caitlin Colleary, PhD
(Virginia Tech)
Adjunct Assistant Professor; Assistant Curator of Vertebrate Paleontology, Cleveland Museum of Natural History
Taphonomy; fossilization; molecular preservation

Pam Dennis, PhD, DVM
(Ohio State University; College of Veterinary Medicine, North Carolina State University)
Adjunct Assistant Professor; Clinical Assistant Professor, Cleveland Metroparks Zoo
Veterinary wildlife epidemiology in zoo and free-ranging animal populations

Nancy Dilulio, PhD
(Pennsylvania State University College of Medicine)
Adjunct Instructor; Senior Associate Dean, Undergraduate Studies
Cell biology; biochemistry

Michael P. Donovan, PhD
(Pennsylvania State University)
Adjunct Assistant Professor; Senior Collections Manager of Paleobotany and Paleocology, Cleveland Museum of Natural History
Paleobotany; evolution and ecology of plant-insect interactions

Noah T. Dunham, PhD
(Ohio State University)
Adjunct Assistant Professor; Research Curator, Cleveland Metroparks Zoo
Primate behavior; nutritional ecology; locomotor kinematics

Elliot M. Gardner, PhD, JD
(Northwestern University and Chicago Botanic Garden; Benjamin N. Cardozo School of Law)
Adjunct Assistant Professor
Plant systematics; phylogenetics; ethnobotany; pollination biology and chemical ecology; flora of Southeast Asia

Nicole L. Gunter, PhD
(University of Queensland, Australia)
Adjunct Assistant Professor; Collections Manager, Department of Invertebrate Zoology, Cleveland Museum of Natural History
Phylogenetics and systematics of dung beetles

Andrew W. Jones, PhD
(University of Minnesota)
Adjunct Assistant Professor; William A. and Nancy R. Klamm Chair and Curator of Ornithology, Cleveland Museum of Natural History
Evolution and migration of birds

Diana C. Koester, PhD
(Georgia Institute of Technology)
Adjunct Assistant Professor; Research Curator, Cleveland Metroparks Zoo
Wildlife endocrinology; reproductive physiology; animal welfare

Christopher Kuhar, PhD
(Georgia Institute of Technology)
Adjunct Assistant Professor; Executive Director, Cleveland Metroparks Zoo
Conservation and education program evaluation; experimental psychology; animal behavior

Kristen E. Lukas, PhD
(Georgia Institute of Technology)
Adjunct Assistant Professor; Curator, Conservation and Science, Cleveland Metroparks Zoo
Applied animal behavior; behavior and health; visitor attitudes and behavior

Juliana S. Medeiros, PhD
(University of New Mexico)
Adjunct Assistant Professor; Scientist, Holden Arboretum
Plant physiological ecology; evolutionary ecology; acclimation and adaptation to the abiotic environment; carbon and water relations

Katherine L. Stuble, PhD
(University of Tennessee)
Adjunct Assistant Professor; Scientist, Holden Arboretum
Plant community ecology; plant insect interactions

Gavin J. Svenson, PhD
(Brigham Young University)
Adjunct Assistant Professor; Curator/Head, Department of Invertebrate Zoology, Cleveland Museum of Natural History
Phylogenetics and systematics

Na Wei, PhD
(University of Michigan)
Adjunct Assistant Professor; Scientist, Holden Arboretum
Evolutionary ecology; plant microbiome; population genomics; population ecology
The department offers programs leading to the BA and BS degrees. Thirty hours of biology are required for the Biology BA, 39 hours for the Biology BS, and 30 hours for the Systems Biology BS. The Neuroscience BS requires at least 30 hours of biology and neuroscience courses. All degree programs have additional requirements for chemistry, mathematics, and physics. See below for details of degree-specific requirements.

Ordinarily, all students begin their biology programs in their first year. All students must complete the SAGES seminar and General Education Requirements (GER) of the College of Arts and Sciences. While some BIOL courses serve as SAGES Departmental Seminars or SAGES Capstones, none of these are required courses for biology degree candidates, with the specific exceptions of BIOL 388S Undergraduate Research - SAGES Capstone for the Biology BS degree, and either BIOL 388S Undergraduate Research - SAGES Capstone or NEUR 388S Undergraduate Research SAGES Capstone for the Neuroscience BS degree. A Biology BA student, for example, is free to take a non-BIOL SAGES Departmental Seminar or SAGES Capstone course, assuming that prerequisites are met (or waived by the instructor).

Bachelor of Arts in Biology

The Biology BA degree program provides a general background in biology and has the most flexible scheduling of the three biology degrees offered. It is especially recommended for students who are pre-professional, have multiple majors, intend to do a junior year abroad or an internship program, or have significant extracurricular commitments (e.g., varsity athletics, student government, Greek life, or other campus involvement). Since the Biology BA degree does not formally require undergraduate research, students interested in graduate research careers should plan to take at least one semester of undergraduate research as an elective (BIOL 388 Undergraduate Research or BIOL 388S Undergraduate Research - SAGES Capstone) sometime during the senior year.

### Total Units in Sequence: 121-125

### Teacher Licensure

Students may become eligible for teacher licensure in the field of Life Sciences (Adolescents and Young Adults) by completing content area requirements as well as 36 semester hours in education courses (including student teaching) offered through CWRU. For more details, please contact James Bader (james.bader@case.edu), executive director of the Gelfand STEM Center.

Bachelor of Science in Biology
The Biology BS degree program is intended to prepare students for work as traditional bench or field research scientists. In addition to a general background in biology (the same as provided by the Biology BA program), the Biology BS program requires two semesters of undergraduate research, plus additional courses in quantitative methods (computer programming, statistics, data analysis) and physical chemistry. The research may be done at the university or at any of its affiliated institutions, but the biology department does not formally place students into laboratories. Because of the extra coursework and research requirements, the Biology BS program may present scheduling challenges to students who wish to pursue multiple majors, a junior year abroad or internship, or significant extracurricular activities. Early, careful planning in consultation with the major advisor is essential to stay on schedule.

Total Units in Sequence: 121-126

Bachelor of Science in Systems Biology

Systems biology is a rapidly emerging area of research activity at the interface of mathematics, computer science, and the biological sciences. Many modern areas of biology research (e.g., biochemical, neural, behavioral, and ecosystem networks) require the mastery of advanced quantitative and computational skills. The Systems Biology BS degree program is intended to provide the quantitative and multidisciplinary understanding that is necessary for work in these areas. This skill set is different from that produced by traditional undergraduate programs in biology. Consequently, the Systems Biology BS program includes a specialized four-course core curriculum (different from the three-course core used in the Biology BA and BS programs), as well as foundation courses from computer science and advanced mathematics. Undergraduate research is strongly recommended (as BIOL 388S Undergraduate Research - SAGES Capstone and BIOL 390 Advanced Undergraduate Research) but is not formally required.

Systems Biology core courses

| BIOL 214 | Genes, Evolution and Ecology | 3 |
| BIOL 215 | Cells and Proteins | 3 |
| BIOL 216 | Development and Physiology | 3 |
| BIOL 300 | Dynamics of Biological Systems: A Quantitative Introduction to Biology | 3 |
| BIOL 306 | Mathematical Analysis of Biological Models | 3 |

Approved subspecialty sequence (choose one of the following four sequences) 6-8

Neuroscience (any two courses)

| BIOL 322 | Sensory Biology |
| BIOL 373 | Introduction to Neurobiology |
| BIOL 374 | Neurobiology of Behavior |
| BIOL 378 | Computational Neuroscience |
| or MATH 378 | Computational Neuroscience |
| NEUR 402 | Principles of Neural Science |

Bioinformatics and genetics (any two courses)

| BIOL 301 | Biotechnology Laboratory: Genes and Genetic Engineering |
| BIOL 311A & BIOL 311B or SYBB 311A & SYBB 311B | Survey of Bioinformatics: Technologies in Bioinformatics and Survey of Bioinformatics: Data Integration in Bioinformatics and Survey of Bioinformatics: Translational Bioinformatics |
| BIOL 311C & SYBB 311C | Survey of Bioinformatics: Technologies in Bioinformatics and Survey of Bioinformatics: Data Integration in Bioinformatics and Survey of Bioinformatics: Translational Bioinformatics |
| BIOL 326 | Genetics |
| BIOL 327 | Functional Genomics |
| BIOL 328 | Plant Genomics and Proteomics |
| BIOL 397 | Molecular Phylogenetics |
| CSDS 458 | Introduction to Bioinformatics (formerly EECS 458) |
| CSDS 459 | Bioinformatics for Systems Biology (formerly EECS 459) |

Ecology and evolutionary biology (any two courses)

<p>| BIOL 305 | Herpetology |
| BIOL 307 | Evolutionary Biology of the Invertebrates |
| BIOL 318 | Introductory Entomology |
| BIOL 336 | Aquatic Biology |
| BIOL 338 | Ichthyology |
| BIOL 345 | Mammal Diversity and Evolution |
| BIOL 351 | Principles of Ecology |</p>

**Total Units in Sequence:** 124-125

---

**Bachelor of Science in Neuroscience**

Neuroscience is the study of the structure and function of the nervous system at the molecular, cellular, and systems levels, and of how the nervous system controls cognition, emotions, and behavior. The BS in Neuroscience provides both breadth and depth of understanding of these topics, and equips students to pursue multiple career paths. The field of neuroscience is both interdisciplinary and multidisciplinary, using concepts and methods from biology, biophysics, chemistry, cognitive science, computer science, engineering, physiology, and psychology. The BS in Neuroscience allows students who are interested in nervous system structure and function to explore this area from multiple perspectives. Two semesters of independent research are required (including the SAGES Capstone, BIOL 388S Undergraduate Research - SAGES Capstone or NEUR 388S Undergraduate Research SAGES Capstone).

**Biology core courses**

- BIOL 214 Genes, Evolution and Ecology 3
- BIOL 214L Genes, Evolution and Ecology Lab 1
- BIOL 215 Cells and Proteins 3
- BIOL 215L Cells and Proteins Laboratory 1
- BIOL 216 Development and Physiology 3
- BIOL 216L Development and Physiology Lab 1

**Neuroscience core courses**

- NEUR 166 Explorations in Neuroscience 1
- NEUR 201 Fundamentals of Neuroscience I 3
- NEUR 202 Fundamentals of Neuroscience II 3

**Mathematics and Statistics core courses**

Concentrations in Areas of the Biological Sciences

Students are encouraged to utilize their elective courses in the biology major to take advantage of concentrations in various specialized areas. These concentrations have been developed between the biology department, the basic science departments of the School of Medicine, and other departments. Currently, concentrations have been developed in the following areas: biotechnology and genetic engineering; computational biology; developmental biology; genetics; cell and molecular biology; neurobiology and animal behavior; population biology, ecology and environmental science. Note: these concentrations are informal; they are not declared, and will not appear on the student’s diploma or transcript.

Advising

Biology faculty advisors are assigned to students at the time of major or minor declaration. All biology majors are required to meet with their departmental advisors at least once each semester to discuss their academic program, receive clearance for electronic course registration, and obtain approval for any drops, adds, or withdrawals. Please contact Katie Bingman (kathryn.bingman@case.edu), undergraduate coordinator for the Department of Biology, for information about major or minor declaration.

Departmental Honors

To receive a bachelor’s degree “with Honors in Biology” (formally noted on the transcript), the student must meet the following criteria:

1. Maintain a 3.4 overall grade point average, with a 3.6 in BIOL courses
2. Carry out two semesters of independent research (taken as BIOL courses) at Case Western Reserve University
3. Write a senior honors thesis with the approval of the faculty supervisor
4. Submit the thesis for review by an ad hoc honors committee
5. Successfully defend the thesis at an oral examination

Additional information and application forms are available from the biology department office.

Minor

The biology minor requires 16 credits of biology courses. Students must take any two of the three biology core lectures with their associated laboratories, plus electives.

Any two of the following biology core classes (and associated labs) 8

Total Units 16
Master of Science
The Department of Biology offers both thesis and non-thesis Master of Science degree programs. Both programs require a minimum of 30 semester hours of courses at the 300 level or higher. A minimum of 18 semester hours of formal course work is required for the thesis degree, and a minimum of 27 semester hours of formal course work for the non-thesis degree. The remaining credits may be research credits (BIOL 601 Research and BIOL 651 Thesis M.S.). The Entrepreneurial Biotechnology (EB) is a two-year Plan A professional Master of Science degree in Biology. The EB program includes four required courses, an internship, and electives to make up the 30 semester hours. The thesis is based on a real entrepreneurial project with an existing company or your own startup (the internship).

Plan A (Thesis)
The Plan A Master of Science degree in biology is a thesis graduate degree program. The purpose of the program is to provide advanced exposure to biology for interested professionals, to provide additional training for those wishing to resume or change careers, or to provide additional preparation in biology for students interested in pursuing professional studies in the health sciences. Students are required to write and defend a Master of Science thesis.

Program of Study
All candidates must complete a total of 30 credit hours in course work at the 300 level or higher within 5 years of matriculation into the graduate program. At least 18 of these credit hours must be at the 400 level or above. Further, at least 15 credit hours must be in courses offered by the biology department. The remaining course work may include courses offered by any department within the University, subject to an advisor's approval and School of Graduate Studies regulations. Candidates are limited to 3 credit hours of BIOL 601 Research, but may take up to 9 credit hours of BIOL 651 Thesis M.S. According to rules of the School of Graduate Studies, once a candidate registers for BIOL 651, the registration must continue for a minimum of 1 credit per semester until completion of the degree program. Students who are uncertain about completing requirements for a Plan A Master of Science degree should consult the regulations for the Plan B Master of Science degree. These two master's degrees have different regulations concerning use of BIOL 601. A candidate may wish to use BIOL 599 Advanced Independent Study for Graduate Students; the letter grade assigned will reflect the evaluation by the entire Advisory Committee.

Plan A (Thesis) Entrepreneurial Biotechnology
The Entrepreneurial Biotechnology (EB) students study state-of-the-art biotechnology, practical business, and technology innovation while working on a real-world entrepreneurial project with an existing company or their own startup. The EB helps to connect students with mentors, advisors, partners, funding sources and job opportunities. EB prepares students to work in diverse research or technology-centered environments. The Entrepreneurial Biotechnology Program (EB) requires students to write a thesis in order to graduate with a Master of Science in Biology, Entrepreneurship Track. The thesis must be based on a project of significant time investment on the part of the student and must be grounded in the real world (i.e., not simply an academic exercise). Thus, each student is required to work as an intern, employee, or entrepreneur, typically with a start-up, existing company, early-stage investment firm, or affiliate of a research organization. The duration must be at least one year, with one semester reserved for full-time work outside of the classroom (usually the fourth and final semester). Under this requirement, international students will be permitted no more than one semester of full-time curricular practical training (CPT).

Plan B (Non-thesis)
The Plan B Master of Science degree in biology is a non-thesis graduate degree program. The purpose of the program is to provide advanced exposure to biology for interested professionals, to provide additional training for those wishing to resume or change careers, or to provide additional preparation in biology for students interested in pursuing professional studies in the health sciences. Students are not required to write a Master of Science thesis, but the program does require passing a comprehensive oral examination.

Program of Study
All candidates must complete a total of 30 credit hours in course work at the 300 level or higher. At least 18 of these credit hours must be at the 400 level or above. Further, at least 15 credit hours must be in courses offered by the Biology Department. At least one course must be taken in each of the following areas of biology: cell and molecular biology (including chemical biology), organismal biology, and population biology. The remaining course work may include courses offered by any department within the University, subject to the advisor's approval and School of Graduate Studies regulations. Candidates are limited to a total of 6 credit hours of independent study (up to 3 credits of BIOL 599 Advanced Independent Study for Graduate Students and up to 3 credits of BIOL 601 Research). BIOL 599 requires completion of a Course Proposal Form (available in the Biology Departmental Office) and approval by the advisor. In the case of enrollment in BIOL 599, the letter grade assigned will reflect the evaluation by a two-person committee recruited by the student and advisor.

Doctor of Philosophy
The degree of Doctor of Philosophy is awarded in recognition of in-depth knowledge in a major field and comprehensive understanding of related subjects together with a demonstration of ability to perform independent investigation and to communicate the results of such investigation in an acceptable dissertation.

Students entering with a bachelor's degree will satisfactorily complete a minimum of 36 credit hours (which may include independent study/research taken as BIOL 601 Research), tutorials, and seminars. For students entering with an approved master's degree, completion of at least 18 semester hours of course work is required. A minimum of 18 semester hours of dissertation research (BIOL 701 Dissertation Ph.D.) is required for all doctoral students.

Teaching experience is an integral part of graduate training. Students are involved in supervised laboratory teaching in selected undergraduate courses taking into account both the specialized areas of interest of the student and his or her broader professional development. The normal teaching requirement consists of four semesters.
Courses

BIOL 112. Biology's Survival Guide to College: How stress impacts a student's ability to thrive. 3 Units.
Stress can test the limit of an individual's ability to maintain balance, thrive and survive. This non-majors biology course explores how cells, organs and organ systems work together to maintain homeostasis. Equipped with knowledge of how the body functions, students will explore how common stressors experienced by college students (sleep deprivation, lack of relaxation, poor diet, and others) can test the limits of maintaining homeostasis. Understanding the body's stress response and how stress impacts well-being will enable students to make informed decisions about how to promote balance in their own life.

BIOL 114. Principles of Biology. 3 Units.
A one-semester course in biology designed for the non-major. A primary objective of this course is to demonstrate how biological principles impact an individual's daily life. BIOL 114 introduces students to the molecules of life, cell structure and function, respiration and photosynthesis, molecular genetics, heredity and human genetics, evolution, diversity of life, and ecology. Minimal background is required; however, some exposure to biology and chemistry at the high school level is helpful. This course is not open to students with credit for BIOL 214 or BIOL 250. This course does not count toward any Biology degree.

BIOL 116. Introduction to Human Anatomy and Physiology I. 3 Units.
This is the first course in a two-semester sequence that covers human anatomy and physiology for the non-major. BIOL 116 covers homeostasis, cell structure and function, membrane transport, tissue types and the integumentary, skeletal, muscular and nervous systems. This course is not open to students with credit for BIOL 216, BIOL 340, or BIOL 346. This course does not count toward any Biology degree. Prereq or Coreq: (Undergraduate Student and BIOL 114) or Requisites Not Met Permission.

BIOL 117. Introduction to Human Anatomy and Physiology II. 3 Units.
This is the second course in a two-semester sequence that covers human anatomy and physiology for the non-major. BIOL 117 covers the endocrine, circulatory, respiratory, digestive, lymphatic, urinary systems including acid-base regulation, and reproductive systems. This course is not open to students with credit for BIOL 216, BIOL 340, or BIOL 346. This course does not count toward any Biology degree. Prereq: (Undergraduate Student and BIOL 114) or Requisites Not Met Permission.

BIOL 205. Climate Change Science and Society. 3 Units.
This course provides a synoptic, multi-disciplinary understanding of the past, present, and future of anthropogenic climate change by integrating three distinct fields: the earth and environmental sciences, biology and ecology, and history. What is changing in the global climate? Why? How do we know? What should we expect in the future? What can be done? No single discipline can answer these questions fully, and by organizing the course around these big questions, we will demonstrate how different disciplines each contribute essential answers. Course covers diverse sources of evidence for climate change in the past and present, the core mechanisms of climate change at different timescales and their consequences, the impact of climate change on human history and history of the discovery of climate change, climate models and ecological forecasts, the modern politics and diplomacy of climate, climate communication, and multiple paths forward for the earth's physical, ecological, and social systems. Offered as BIOL 205, EEPS 205, and HSTY 205.

BIOL 214. Genes, Evolution and Ecology. 3 Units.
First in a series of three courses required of the Biology major. Topics include: biological molecules (focus on DNA and RNA); mitotic and meiotic cell cycles, gene expression, genetics, population genetics, evolution, biological diversity and ecology. Prereq or Coreq: (Undergraduate Student and CHEM 105 or CHEM 111) or Requisites Not Met permission.

BIOL 214L. Genes, Evolution and Ecology Lab. 1 Unit.
First in a series of three laboratory courses required of the Biology major. Topics include: biological molecules (with a focus on DNA and RNA); basics of cell structure (with a focus on malaria research); molecular genetics, biotechnology; population genetics and evolution, ecology. Assignments will be in the form of a scientific journal submission. Prereq or Coreq: (Undergraduate Student and BIOL 214) or Requisites Not Met permission.

BIOL 215. Cells and Proteins. 3 Units.
Second in a series of three courses required of the Biology major. Topics include: biological molecules (focus on proteins, carbohydrates, and lipids); cell structure (focus on membranes, energy conversion organelles and cytoskeleton); protein structure-function; enzyme kinetics, cellular energetics, and cell communication and motility strategies. Requirements to enroll: 1) Undergraduate degree seeking student; AND 2) Previous enrollment in BIOL 214 and (CHEM 105 or CHEM 111); AND Previous or concurrent enrollment in CHEM 106 or ENGR 145; OR Requisites Not Met permission.

BIOL 215L. Cells and Proteins Laboratory. 1 Unit.
Second in a series of three laboratory courses required of the Biology major. Topics to include: protein structure-function, enzymes kinetics; cell structure; cellular energetics, respiration and photosynthesis. In addition, membrane structure and transport will be covered. Laboratory and discussion sessions offered in alternate weeks. Prereq: (Undergraduate Student and BIOL 214L and Prereq or Coreq: BIOL 215) or Requisites Not Met permission.

BIOL 216. Development and Physiology. 3 Units.
This is the final class in the series of three courses required of the Biology major. As with the two previous courses, BIOL 214 and 215, this course is designed to provide an overview of fundamental biological processes. It will examine the complexity of interactions controlling reproduction, development and physiological function in animals. The Developmental Biology section will review topics such as gametogenesis, fertilization, cleavage, gastrulation, the genetic control of development, stem cells and cloning. Main topics included in the Physiology portion consist of: homeostasis, the function of neurons and nervous systems; the major organ systems and processes involved in circulation, excretion, osmoregulation, gas exchange, feeding, digestion, temperature regulation, endocrine function and the immunologic response. There are two instructional modes for this course: lecture mode and hybrid mode. In the lecture mode students attend class for their instruction. In the hybrid mode students watch online lectures from the course instructor and attend one discussion section with the course instructor each week. The online content prepares students for the discussion. Which mode is offered varies depending on the term. Students are made aware of what mode is offered at the time of registration. The total student effort and course content is identical for both instructional modes. Either instructional mode fulfills the BIOL 216 requirement for the BA and BS in Biology. Prereq: (Undergraduate Student and BIOL 214) or Requisites Not Met permission.
BIOL 216L. Development and Physiology Lab. 1 Unit.
Third in a series of three laboratory courses required of the Biology major. Students will conduct laboratory experiments designed to provide hands-on, empirical laboratory experience in order to better understand the complex interactions governing the basic physiology and development of organisms. Laboratories and discussion sessions offered in alternate weeks. Prereq: (Undergraduate Student and BIOL 214L and Prereq or Coreq: BIOL 216) or Requisites Not Met permission.

BIOL 222L. Introductory Research Lab in Biology. 2 Units.
This is a Course-based Undergraduate Research Experience (CURE) in which students will learn modern laboratory skills, conduct authentic research, and effectively communicate research findings orally and in writing. Students will develop ownership of their projects, gain confidence in their ability to conduct research, and will grow to see themselves as true members of the broader scientific community. Prereq or Coreq: BIOL 214 or BIOL 215.

BIOL 223. Vertebrate Biology. 3 Units.
A survey of vertebrates from jawless fishes to mammals. Functional morphology, physiology, behavior and ecology as they relate to the groups' relationships with their environment. Evolution of organ systems. Two lectures and one laboratory per week. The laboratory will involve a study of the detailed anatomy of the shark and cat used as representative vertebrates. Students are expected to spend at least three hours of unscheduled laboratory each week. This course fulfills a laboratory requirement for the biology major. Prereq: Undergraduate Student or Requisites Not Met permission.

BIOL 225. Evolution. 3 Units.
Multidisciplinary study of the course and processes of organic evolution provides a broad understanding of the evolution of structural and functional diversity, the relationships among organisms and their environments, and the phylogenetic relationships among major groups of organisms. Topics include the genetic basis of micro- and macro-evolutionary change, the concept of adaptation, natural selection, population dynamics, theories of species formation, principles of phylogenetic inference, biogeography, evolutionary rates, evolutionary convergence, homology, Darwinian medicine, and conceptual and philosophic issues in evolutionary theory. Offered as ANTH 225, BIOL 225, EEPS 225, HSTY 225, and PHIL 225.

BIOL 240. Personalized Medicine. 3 Units.
The emphasis of clinical practice is slowly shifting from one-disease and one-treatment-fits-all to more personalized care based on molecular markers of disease risk, disease subtype, drug effectiveness, and adverse drug reactions. This course, designed for non-biology majors, will introduce how the developments in gene sequencing, genetic markers, and stem cells can be applied for predictive testing and personalized therapies. Core concepts to be covered include the principles of genetics including the inheritance of traits determined by single genes and by multiple genes, the assignment of risk to particular genetic constitutions, and the nature and use of stem cells. The emergence of private companies as resources for the performance of the tests, and how the general public will be able to interpret their own data (with or without the access to genetic counselors), will also be covered. The course will include hands-on laboratory experiences of DNA manipulation and detection using the polymerase chain reaction and gel electrophoresis. The ethical, legal, and social issues associated with personal genetic testing will also be covered. This course does not count towards any Biology degree, nor towards the Biology minor. Prereq: Undergraduate Student or Requisites Not Met permission.

BIOL 300. Dynamics of Biological Systems: A Quantitative Introduction to Biology. 3 Units.
This course will introduce students to dynamic biological phenomena, from the molecular to the population level, and models of these dynamical phenomena. It will describe a biological system, discuss how to model its dynamics, and experimentally evaluate the resulting models. Topics will include molecular dynamics of biological molecules, kinetics of cell metabolism and the cell cycle, biophysics of excitability, scaling laws for biological systems, biomechanics, and population dynamics. Mathematical tools for the analysis of dynamic biological processes will also be presented. Students will manipulate and analyze simulations of biological processes, and learn to formulate and analyze their own models. This course satisfies a laboratory requirement for the biology major. Offered as BIOL 300 and EBME 300.

BIOL 301. Biotechnology Laboratory: Genes and Genetic Engineering. 3 Units.
Laboratory training in recombinant DNA techniques. Basic microbiology, growth, and manipulation of bacteriophage, bacteria and yeast. Students isolate and characterize DNA, construct recombinant DNA molecules, and reintroduce them into eukaryotic cells (yeast, plant, animal) to assess their viability and function. Two laboratories per week. This course satisfies a laboratory requirement of the B.A. in Biology. This course satisfies an additional laboratory requirement of the B.S. in Biology. Offered as BIOL 301 and BIOL 401. Prereq: Undergraduate Student and BIOL 215 or Requisites Not Met permission.

BIOL 302. Human Learning and the Brain. 3 Units.
This course focuses on the question, “How does my brain learn and how can its learning best be facilitated?” Each student is required to develop a comprehensive theory about personal learning. These theories will take the form of a major paper which will be expanded and modified throughout the semester. Readings and class discussions will focus on the following topics: learning and education systems, major structures of the brain and their role in learning, neuronal wiring of the brain and how learning changes it, the emotional brain and its essential role in learning, language and the brain, the role of images in learning, memory and learning (and related pathologies, such as PTSD). Students are expected to incorporate information on these topics into their personal theory of learning. In so doing, students are expected to articulate meaningful questions, skillfully employ research and apply their own knowledge to address such questions, produce clear, precise academic prose to explicate their ideas, and provide relevant and constructive criticism during class discussions. Offered as BIOL 302 and COGS 322. Counts as SAGES Departmental Seminar. Prereq: Undergraduate Student or Requisites Not Met Permission.
BIOL 303. From Blackbox to Toolbox: How Molecular Biology Moves Forward. 3 Units.
The pioneers of modern biology knew very little about the internal workings of the cell, and they had access to only a very limited set of very low-resolution tools. Yet clean experimental design and careful analysis let them ask and answer fundamental biological questions and enabled the development of better tools to use in the next time around. In just seven decades, biologists have built a toolbox that offers astonishing precision and power, but the logic of biological experimentation hasn’t changed. In this course, we will study that underlying logic, and what it lets us do. We will read key papers spanning the development of modern biology, from the most basic working-out of the Central Dogma to recent advances. We will pay particular attention to how well the authors used the tools available, and how successfully they accounted for their shortcomings—if indeed they did. The emphasis of the course will be on classroom discussion. In lieu of exams, students will (1) write brief responses to weekly in-class prompts for understanding, (2) write in-depth proposals for a molecular biology research project, and (3) present their proposals orally to the class. These assignments are designed to check that students are keeping up with weekly discussions and synthesizing what they have learned into a deeper understanding of how we develop questions and construct arguments in biological research. This course is offered as a SAGES departmental seminar and fulfills the Cell and Molecular breadth requirement of the B.A. and B.S. in Biology. Counts as SAGES Departmental Seminar. Prereq: Undergraduate Student and BIOL 215 or Requisites Not Met permission.

BIOL 304. Fitting Models to Data: Maximum Likelihood Methods and Model Selection. 3 Units.
This course will introduce students to maximum likelihood methods for fitting models to data and to ways of deciding which model is best supported by the data (model selection). Along the way, students will learn some basic tenets of probability and develop competency in R, a commonly used statistical package. Examples will be drawn from ecology, epidemiology, and potentially other areas of biology. The second half of the course is devoted to in-class projects, and students are encouraged to bring their own data. Offered as BIOL 304 and BIOL 404. Prereq: (Undergraduate Student and MATH 121 and MATH 122) or (Undergraduate Student and MATH 125 and MATH 126) or Requisites Not Met permission.

BIOL 305. Herpetology. 3 Units.
Amphibians and reptiles exhibit tremendous diversity in development, physiology, anatomy, behavior and ecology. As a result, amphibians and reptiles have served as model organisms for research in many different fields of biology. This course will cover many aspects of amphibian and reptile biology, including anatomy, evolution, geographical distribution, physiological adaptations to their environment, reproductive strategies, moisture, temperature, and food-relationships, sensory mechanisms, predator-prey relationships, communication (vocal, chemical, behavioral), population biology, and the effects of venomous snake bite. The graduate version of the course requires a research project and term paper. This course satisfies the Organismal breadth requirement of the B.A. and B.S. in Biology. Offered as BIOL 305 and BIOL 405. Prereq: Undergraduate Student and BIOL 214 or Requisites Not Met permission.

BIOL 305L. Herpetology Lab. 2 Units.
This course will combine field and laboratory sessions to investigate the diversity and biology of reptiles and amphibians. Topics covered will include identification and classification, field research techniques, experimental design and statistical analysis, safety handling of live individuals and working with museum specimens. Laboratory sessions will include trips to the Squire Valleyeue Farm, and may also include trips at the Cleveland Museum of Natural History and the Cleveland Metroparks Zoo. This course satisfies a laboratory requirement of the B.A. in Biology. This course satisfies an additional laboratory requirement of the B.S. in Biology. Prereq or Coreq: BIOL 305.

BIOL 306. Mathematical Analysis of Biological Models. 3 Units.
This course focuses on the mathematical methods used to analyze biological models, with examples drawn largely from ecology but also from epidemiology, developmental biology, and other areas. Mathematical topics include equilibrium and stability in discrete and continuous time, some aspects of transient dynamics, and reaction-diffusion equations (steady state, diffusive instabilities, and traveling waves). Biological topics include several “classic” models, such as the Lotka-Volterra model, the Ricker model, and Michaelis-Menten/type II/saturating responses. The emphasis is on approximations that lead to analytic solutions, not numerical analysis. An important aspect of this course is translating between verbal and mathematical descriptions: the goal is not just to solve mathematical problems but to extract biological meaning from the answers we find. Offered as BIOL 306 and MATH 376. Prereq: Undergraduate Student and (BIOL 300 or MATH 224 or MATH 228) or Requisites Not Met permission.

BIOL 307. Evolutionary Biology of the Invertebrates. 3 Units.
Important events in the evolution of invertebrate life, as well as structure, function, and phylogeny of major invertebrate groups.

BIOL 309. Biology Field Studies. 3 Units.
Intensive investigation of living organisms in a natural environment. Location of the field site may vary with each course offering, and may be either domestic or international. Topics covered include logistics, biodiversity, and current ecological, environmental, and social issues surrounding the specific ecosystem being studied. Time at the field site will be spent listening to resident lecturers, receiving guided tours, observing and identifying wild organisms in their natural habitat, and conducting a research project. The undergraduate version requires students to plan and conduct a group research project and present results independently. The graduate version requires students to plan, conduct, and present an independent research project. Instructor consent required to register. This course will fulfill a laboratory requirement of the B.A. in Biology. This course will fulfill an additional laboratory requirement of the B.S. in Biology. Course may be repeated for credit up to two times if traveling to a new destination. Offered as BIOL 309 and BIOL 409. Prereq: BIOL 216.

BIOL 310. Field Studies in Evolutionary Ecology. 3 Units.
The field of Evolutionary Ecology examines how the interactions between organisms and their environments evolve. In this field-based course, students will conduct a variety of experimental and observational field studies aimed at addressing key concepts in Evolutionary Ecology. Students will gain experience in study design and data collection in natural populations, data analysis, and the writing and presentation of scientific results. This course satisfies a laboratory requirement of a B.A. in Biology. This course satisfies an additional laboratory requirement of a B.S. in Biology. Prereq: BIOL 214.
BIOL 311A. Survey of Bioinformatics: Technologies in Bioinformatics. 1 Unit.
SYBB 311A/411A is a 5-week course that introduces students to the high-throughput technologies used to collect data for bioinformatics research in the fields of genomics, proteomics, and metabolomics. In particular, we will focus on mass spectrometer-based proteomics, DNA and RNA sequencing, genotyping, protein microarrays, and mass spectrometry-based metabolomics. This is a lecture-based course that relies heavily on out-of-class readings. Graduate students will be expected to write a report and give an oral presentation at the end of the course. SYBB 311A/411A is part of the SYBB survey series which is composed of the following course sequence: (1) Technologies in Bioinformatics, (2) Data Integration in Bioinformatics, (3) Translational Bioinformatics, and (4) Programming for Bioinformatics. Each standalone section of this course series introduces students to an aspect of a bioinformatics project - from data collection (SYBB 311A/411A), to data integration (SYBB 311B/411B), to research applications (SYBB 311C/411C), with a fourth module (SYBB 311D/411D) introducing basic programming skills. Graduate students have the option of enrolling in all four courses or choosing the individual modules most relevant to their background and goals with the exception of SYBB 411D, which must be taken with SYBB 411A. Offered as SYBB 311A, BIOL 311A and SYBB 411A. Prereq: BIOL 214 and BIOL 215. Coreq: BIOL 311B and BIOL 311C.

BIOL 311B. Survey of Bioinformatics: Data Integration in Bioinformatics. 1 Unit.
SYBB 311B/411B is a five-week course that surveys the conceptual models and tools used to analyze and interpret data collected by high-throughput technologies, providing an entry point for students new to the field of bioinformatics. The knowledge structures that we will cover include: biomedical ontologies, signaling pathways, and interaction networks. We will also cover tools for genome exploration and analysis. The SYBB survey series is composed of the following course sequence: (1) Technologies in Bioinformatics, (2) Data Integration in Bioinformatics, (3) Translational Bioinformatics, and (4) Programming for Bioinformatics. Each standalone section of this course series introduces students to an aspect of a bioinformatics project - from data collection (SYBB 311A/411A), to data integration (SYBB 311B/411B), to research applications (SYBB 311C/411C), with a fourth module (SYBB 311D/411D) introducing basic programming skills. Graduate students have the option of enrolling in all four courses or choosing the individual modules most relevant to their background and goals with the exception of SYBB 411D, which must be taken with SYBB 411A. Offered as SYBB 311B, BIOL 311B, and SYBB 411B. Prereq: BIOL 214 and BIOL 215. Coreq: BIOL 311A and BIOL 311C.

BIOL 311C. Survey of Bioinformatics: Translational Bioinformatics. 1 Unit.
SYBB 311C/411C is a longitudinal course that introduces students to the latest applications of bioinformatics, with a focus on translational research. Topics include: `omic drug discovery, pharmacogenomics, microbiome analysis, and genomic medicine. The focus of this course is on illustrating how bioinformatic technologies can be paired with data integration tools for various applications in medicine. The course is organized as a weekly journal club, with instructors leading the discussion of recent literature in the field of bioinformatics. Students will be expected to complete readings beforehand; students will also work in teams to write weekly reports reviewing journal articles in the field. The SYBB survey series is composed of the following course sequence: (1) Technologies in Bioinformatics, (2) Data Integration in Bioinformatics, (3) Translational Bioinformatics, and (4) Programming for Bioinformatics. Each standalone section of this course series introduces students to an aspect of a bioinformatics project - from data collection (SYBB 311A/411A), to data integration (SYBB 311B/411B), to research applications (SYBB 311C/411C), with a fourth module (SYBB 311D/411D) introducing basic programming. Graduate students have the option of enrolling in all four courses or choosing the individual modules most relevant to their background and goals with the exception of SYBB 411D, which must be taken with SYBB 411A. Offered as SYBB 311C, BIOL 311C and SYBB 411C. Prereq: BIOL 214 and BIOL 215. Coreq: BIOL 311A and BIOL 311B.

BIOL 312. Introductory Plant Biology. 3 Units.
This course will provide an overview of plant biology. Topics covered will include: (1) Plant structure, function and development from the cellular level to the whole plant (2) plant diversity, evolution of the bacteria, fungi, algae, bryophytes and vascular plants; (3) adaptations to their environment, plant-animal interactions, and human uses of plants. Prereq: (Undergraduate student and BIOL 215) or Requisite Not Met permission.

BIOL 314. Taming the Tree of Life: Phylogenetic Comparative Methods-from Concept to Practical Application. 3 Units.
"Nothing in biology makes sense except in the light of evolution" – Dobzhansky Biologists have long been fascinated by the diversity of life. Why are there so many species? Why are some of them similar and others divergent? How has evolution shaped ecological interactions, such as disease-host dynamics? The "tree of life" describes phylogenetic hypotheses for evolutionary history among species, and modern phylogenetic comparative methods allow us to incorporate the tree of life into statistical analyses. This course will introduce phylogenetic comparative methods, why they are needed to answer many biological questions, how they are conducted, and how they can be used to evaluate hypotheses. These methods can be used for any group of organisms, from humans and their diseases, to plants, animals, or fungi. These methods also can be used to address a broad suite of questions in biology, including biomedical, ecological, evolutionary, developmental, and neuromechanical questions. For example, issues of public health can be more deeply addressed using these tools. Students may bring their own data sets, or may use existing data sets, and will develop an independent research project using these tools. Undergraduates will present a poster at a public poster fair, as part of the requirements for the SAGES capstone. No prior experience with the R statistics language is necessary for this course. BIOL314 fulfills the requirements for an undergraduate capstone in biology. Offered as BIOL 314 and BIOL 414. Counts as SAGES Senior Capstone. Prereq: (Undergraduate student with at least Junior standing and BIOL 214) or Requisite Not Met permission.
BIOL 315. Quantitative Biology Laboratory. 3 Units.
This course will apply a range of quantitative techniques to explore structure-function relations in biological systems. Using a case study approach, students will explore causes of impairments of normal function, will assemble diverse sets of information into a database format for the analysis of causes of impairment, will analyze the data with appropriate statistical and other quantitative tools, and be able to communicate their results to both technical and non-technical audiences. The course has one lecture and one lab per week. Students will be required to maintain a journal of course activities and demonstrate mastery of quantitative tools and statistical techniques. Graduate students will have a final project that applies these techniques to a problem of their choice. Offered as BIOL 315 and BIOL 415. Prereq: (Undergraduate Student and BIOL 214) or Requisites Not Met permission.

BIOL 316. Fundamental Immunology. 4 Units.
Introductory immunology providing an overview of the immune system, including activation, effector mechanisms, and regulation. Topics include antigen-antibody reactions, immunologically important cell surface receptors, cell-cell interactions, cell-mediated immunity, innate versus adaptive immunity, cytokines, and basic molecular biology and signal transduction in B and T lymphocytes, and immunopathology. Three weekly lectures emphasize experimental findings leading to the concepts of modern immunology. An additional recitation hour is required to integrate the core material with experimental data and known immune mediated diseases. Five mandatory 90 minute group problem sets per semester will be administered outside of lecture and recitation meeting times. Graduate students will be graded separately from undergraduates, and 22 percent of the grade will be based on a critical analysis of a recently published, landmark scientific article. Offered as BIOL 316, BIOL 416, CLBY 416, PATH 316 and PATH 416. Prereq: BIOL 215 and 215L.

BIOL 318. Introductory Entomology. 4 Units.
The goal of this course is to discover that, for the most part, insects are not aliens from another planet. Class meetings will alternate; with some structured as lectures, while others are laboratory exercises. Sometimes we will meet at the Cleveland Museum of Natural History, or in the field to collect and observe insects. The 50 minute discussion meeting once a week will serve to address questions from both lectures and lab exercises. The students will be required to make a small but comprehensive insect collection. Early in the semester we will focus on collecting the insects, and later, when insects are gone for the winter, we will work to identify the specimens collected earlier. Students will be graded based on exams, class participation and their insect collections. This course satisfies either the Organismal breadth requirement of the B.A. and B.S. in Biology, or the laboratory requirement of the B.A. in Biology, or an additional laboratory requirement of the B.S. in Biology. Offered as BIOL 318 and BIOL 418. Prereq: (Undergraduate Student and BIOL 214 and BIOL 215 and BIOL 216) or Requisites Not Met permission.

BIOL 319. Applied Probability and Stochastic Processes for Biology. 3 Units.
Applications of probability and stochastic processes to biological systems. Mathematical topics will include: introduction to discrete and continuous probability spaces (including numerical generation of pseudo random samples from specified probability distributions), Markov processes in discrete and continuous time with discrete and continuous sample spaces, point processes including homogeneous and inhomogeneous Poisson processes and Markov chains on graphs, and diffusion processes including Brownian motion and the Ornstein-Uhlenbeck process. Biological topics will be determined by the interests of the students and the instructor. Likely topics include: stochastic ion channels, molecular motors and stochastic ratchets, actin and tubulin polymerization, random walk models for neural spike trains, bacterial chemotaxis, signaling and genetic regulatory networks, and stochastic predator-prey dynamics. The emphasis will be on practical simulation and analysis of stochastic phenomena in biological systems. Numerical methods will be developed using a combination of MATLAB, the R statistical package, MCell, and/or URDME, at the discretion of the instructor. Student projects will comprise a major part of the course. Offered as BIOL 319, ECSE 319, MATH 319, SYBB 319, BIOL 419, EBME 419, MATH 419, PHOL 419, and SYBB 419. Prereq: MATH 224 or MATH 223 and BIOL 300 or BIOL 306 and MATH 201 or MATH 307 or consent of instructor.

BIOL 321. Design and Analysis of Biological Experiments. 3 Units.
In this laboratory course, students will learn how to use a computer programming language (MATLAB) to design, execute, and analyze biological experiments. The course will begin with basic programming and continue to data output and acquisition, image analysis, and statistics. Students who are interested in carrying out research projects in any lab setting are encouraged to take this course and use the skills acquired to better organize and analyze their experiments. No prior programming knowledge is assumed. This course satisfies a laboratory requirement of the B.A. in biology. This course satisfies a laboratory or quantitative laboratory requirement of the B.S. in biology. Students will complete a final project on a topic of their choice; graduate students will be required to give an oral presentation of this project. Offered as BIOL 321 and BIOL 421. Counts for CAS Quantitative Reasoning Requirement. Prereq: Undergraduate Student and BIOL 216 or Requisites Not Met permission.

BIOL 322. Sensory Biology. 3 Units.
The task of a sensory system is to collect, process, store, and transmit information about the environment. How do sensory systems convert information from the environment into neural information in an animal's brain? This course will explore the ecology, physiology, and behavior of the senses across the animal kingdom. We will cover introductory neurobiology and principles of sensory system organization before delving more deeply into vision, olfaction, audition, mechanosensation, and multi-modal sensory integration. For each sensory modality, we will consider how the sensory system operates and how its operation affects the animal's behavior and ecology. We will also explore the evolution of sensory systems and their specialization for specific behavioral tasks. Students will finish the course with a research project on a topic of their choice; graduate students will present this project to the class. Offered as BIOL 322 and BIOL 422. Prereq: (Undergraduate Student and BIOL 216) or Requisites Not Met permission.
BIOL 324. Introduction to Stem Cell Biology. 3 Units.
This discussion-based course will introduce students to the exciting field of stem cell research. Students will first analyze basic concepts of stem cell biology, including stem cell niche, cell quiescence, asymmetric cell division, cell proliferation and differentiation, and signaling pathways involved in these processes. This first part of the course will focus on invertebrate genetic models for the study of stem cells. In the second part of the course, students will search for primary research papers on vertebrate and human stem cells, and application of stem cell research in regenerative medicine and cancer. Finally, students will have the opportunity to discuss about ethical controversies in the field. Students will rotate in weekly presentations, and will write two papers during the semester. Students will improve skills on searching and reading primary research papers, gain presentation skills, and further their knowledge in related subjects in the fields of cell biology, genetics and developmental biology. This course may be used as a cell/molecular subject area elective for the B.A. and B.S. Biology degrees. Offered as BIOL 324 and BIOL 424. Prereq: Undergraduate Student and (BIOL 325 or BIOL 326 or BIOL 362) or Requisites Not Met permission.

BIOL 325. Cell Biology. 3 Units.
This course will emphasize an understanding of the structure and function of eukaryotic cells from a molecular viewpoint. We will explore cell activities by answering the questions: What are the critical components of specific cellular processes and how are they regulated? An important part of this course will be appreciation of the experimental evidence that supports our current understanding of cell function. To achieve this aim, we will highlight a variety of experimental techniques currently used in research, and students will read papers from the primary literature to supplement the text. Topics will include cell structure, protein structure and function, internal organization of the eukaryotic cell, membrane structure and function, protein sorting, organelle biogenesis, and cytoskeleton structure and function. The course will also cover the life cycles of cells, their interactions with each other and their environment, intracellular signaling and cell death mechanisms. After establishing a detailed understanding of cell biology, we will explore how normal cellular processes go awry, leading to diseases such as cancer. This course fulfills the Cell and Molecular breadth requirement of the B.A. and B.S. in Biology. Prereq: (Undergraduate Student and BIOL 215) or Requisites Not Met permission.

BIOL 326. Genetics. 3 Units.
Transmission genetics, nature of mutation, microbial genetics, somatic cell genetics, recombinant DNA techniques and their application to genetics, human genome mapping, plant breeding, transgenic plants and animals, uniparental inheritance, evolution, and quantitative genetics. Offered as BIOL 326 and BIOL 426. Prereq: (Undergraduate student and BIOL 214) or Requisites Not Met permission.

BIOL 327. Functional Genomics. 3 Units.
In this course, students will learn how to access and use genomics data to address questions in cell biology, development and evolution. The genome of Drosophila melanogaster will serve as a basis for exploring genome structure and learning how to use a variety of available software to identify similar genes in different species, predict protein sequence and functional domains, design primers for PCR, analyze cis-regulatory sequences, access microarray and RNAseq databases, among others. Classes will be in the format of short lectures, short oral presentations made by students and hands-on experimentation using computers. Discussions will be centered in primary research papers that used these tools to address specific biological questions. A final project will consist of a research project formulated by a group of 2-3 students to test a hypothesis formulated by the students using the bioinformatics tools learned in the course. Graduate students will be required to make additional presentations of research papers. They also will have additional questions in exams and a distinct page requirement on written assignments. This course satisfies a laboratory requirement of the B.A. in Biology. This course satisfies a laboratory or quantitative laboratory requirement of the B.S. in Biology. Offered as BIOL 327 and BIOL 427. Prereq: Undergraduate Student and (BIOL 214L and BIOL 326) or Requisites Not Met permission.

BIOL 328. Plant Genomics and Proteomics. 3 Units.
The development of molecular tools has impacted agriculture as much as human health. The application of new techniques to improve food crops, including the development of genetically modified crops, has also become controversial. This course covers the nature of the plant genome and the role of sequenced-based methods in the identification of the genes. The application of the whole suite of modern molecular tools to understand plant growth and development, with specific examples related agronomically important responses to biotic and abiotic stresses, is included. The impact of the enormous amounts of data generated by these methods and their storage and analysis (bioinformatics) is also considered. Finally, the impact on both the developed and developing world of the generation and release of genetically modified food crops will be covered. Recommended preparation: BIOL 326. Offered as BIOL 328 and BIOL 428. Prereq: Undergraduate Student or Requisites Not Met permission.

BIOL 329. Genome Dynamics. 3 Units.
We will examine how the physical architecture of the genome facilitates a dynamic genome ecosystem. Topics will be selected from current research in the field, including: how the three dimensional architecture of chromosomes within the nucleus impacts information storage and retrieval, how biochemical phase separation impacts nucleic acid storage (including RNA), how structural features of chromosomes are critical for function, genome engineering approaches, and the clinical implications of mutations in the 3D nuclear architecture. Course materials will come from the primary research literature, supplemented with appropriate background material. This course fulfills the cell and molecular biology breadth requirement of the BA and BS in Biology. Counts as a SAGES Departmental Seminar. Offered as BIOL 329 and BIOL 429. Counts as SAGES Departmental Seminar. Prereq: Undergraduate Student and BIOL 326 or Requisites Not Met permission.
BIOL 333. The Human Microbiome. 3 Units.
This departmental seminar is designed to reveal how the abundant community of human-associated microorganisms influence human development, physiology, immunity and nutrition. Using a survey of current literature, this discussion-based course will emphasize an understanding of the complexity and dynamics of human/microbiome interactions and the influence of environment, genetics and individual life histories on the microbiome and human health. Grades will be based on participation, written assignments, exams, an oral presentation and a final paper. This class is offered as a SAGES Departmental Seminar and fulfills an Organismal breadth requirement of the BA and BS in Biology. Counts as SAGES Departmental Seminar. Prereq: (Undergraduate Student and BIOL 214 and BIOL 216) or Requisites Not Met permission.

BIOL 336. Aquatic Biology. 3 Units.
Physical, chemical, and biological dynamics of lake ecosystems. Factors governing the distribution, abundance, and diversity of freshwater organisms. This course satisfies the Population Biology/Ecology breadth requirement of the B.A. and B.S. in Biology. Offered as BIOL 336 and BIOL 436. Prereq: Undergraduate Student and BIOL 214 or Requisites Not Met permission.

BIOL 338. Ichthyology. 4 Units.
Biology of fishes. Students will develop fundamental understanding of the evolutionary history and systematics of fishes to provide a context within which they can address aspects of biology including anatomy, physiology (e.g., in species that change sex; osmoregulation in freshwater vs. saltwater), and behavior (e.g., visual, auditory, chemical, electric communication; social structures), ecology, and evolution (e.g., speciation). We will explore the biodiversity of fishes around the world, with emphasis on Ohio species, by examining preserved specimens, observing captive living specimens, and observing, capturing, and identifying wild fishes in their natural habitats. Practical applications will be emphasized, such as aquaculture, fisheries management, and biomedical research. Course will conclude with an analysis of the current global fisheries crisis that has resulted from human activities. There will be many field trips and networking with the Cleveland Metroparks Zoo, the Cleveland Museum of Natural History, and local, state, and federal government agencies. Some classes meet at the Cleveland Museum of Natural History. This course satisfies a laboratory requirement of the B.A. and B.S. in biology. The graduate version of the course requires a research project and term paper. Offered as BIOL 338 and BIOL 438. Prereq: (Undergraduate Student and BIOL 216) or Requisites Not Met permission.

BIOL 339. Aquatic Biology Laboratory. 2 Units.
The physical, chemical, and biological limnology of freshwater ecosystems will be investigated. Emphasis will be on identification of the organisms inhabiting these systems and their ecological interactions with each other. This course will combine both field and laboratory analysis to characterize and compare the major components of these ponds. Students will have the opportunity to design and conduct individual projects. This course satisfies a laboratory requirement of the B.A. in Biology. This course satisfies an additional laboratory requirement of the B.S. in Biology. Prereq or Coreq: Undergraduate Student and BIOL 336 or Requisites Not Met permission.

BIOL 340. Human Physiology. 3 Units.
This course will provide functional correlates to the students’ previous knowledge of human anatomy. Building upon the basic principles covered in BIOL 216 and BIOL 346, the physiology of organs and organ systems of humans, including the musculoskeletal, nervous, cardiovascular, lymphatic, immune, respiratory, digestive, excretory, reproductive, and endocrine systems, will be studied at an advanced level. The contribution of each system to homeostasis will be emphasized. Prereq: (Undergraduate Student and BIOL 346 and BIOL 215 and BIOL 216) or Requisites Not Met permission.

BIOL 341. Basic Biology of Blood and Blood Diseases. 3 Units.
This course incorporates biology, physiology, biochemistry, and pathology to understand how one of the most important tissues in the human body functions: blood. The course will investigate the normal flow of traffic in the body, as well as some of the biological diseases that hinder this flow. It will focus on understanding the basic and fundamental principles as it relates to biological and disease processes of blood. The course will apply scientific reasoning and critical thinking in investigating these processes. Additionally, it will explore the basic understanding of how scientific research in the area of hematology and oncology is conducted and how we apply laboratory discoveries towards treating blood-related disorders. Our focus will center upon examining the molecular mechanisms associated with bone marrow and several blood disorders. Specifically, we will study cancer (leukemia and lymphoma), anemia (sickle cell disease), blood coagulation (hemophilia and thrombosis), and atherosclerosis. Upon completion of this course, students will have gained the knowledge to apply basic biological concepts to larger, complex pathological diseases. This course fulfills the Cell & Molecular Breadth Requirement of the BA and BS in Biology. Prereq: Undergraduate Student and BIOL 214 or Requisites Not Met permission.

BIOL 342. Parasitology. 3 Units.
This course will introduce students to classical and current parasitology. Students will discuss basic principles of parasitology, parasite life cycles, host-parasite interaction, therapeutic and control programs, epidemiology, and ecological and societal considerations. The course will explore diverse classes of parasitic organisms with emphasis on protozoan and helminthic diseases and the parasites’ molecular biology. Group discussion and selected reading will facilitate further integrative learning and appreciation for parasite biology. This course counts as an elective in the cell/molecular biology subject area for the Biology B.A. and B.S. degrees. Offered as BIOL 342 and BIOL 442. Prereq: (Undergraduate Student and BIOL 214, BIOL 215, BIOL 216 and BIOL 326) or Requisites Not Met permission.

BIOL 343. Microbiology. 3 Units.
The physiology, genetics, biochemistry, and diversity of microorganisms. The subject will be approached both as a basic biological science that studies the molecular and biochemical processes of cells and viruses, and as an applied science that examines the involvement of microorganisms in human disease as well as in workings of ecosystems, plant symbioses, and industrial processes. The course is divided into four major areas: bacteria, viruses, medical microbiology, and environmental and applied microbiology. Offered as BIOL 343 and BIOL 443. Prereq: (Undergraduate Student and BIOL 215) or Requisites Not Met permission.
BIOL 344. Laboratory for Microbiology. 3 Units.
Practical microbiology, with an emphasis on bacteria as encountered in a variety of situations. Sterile techniques, principles of identification, staining and microscopy, growth and nutritional characteristics, genetics, enumeration methods, epidemiology, immunological techniques (including ELISA and T cell identification), antibiotics and antibiotic resistance, chemical diagnostic tests, sampling the human environment, and commercial applications. One three hour lab plus one lecture per week. Prereq or Coreq: (Undergraduate Student and BIOL 343) or Requisites Not Met permission.

BIOL 345. Mammal Diversity and Evolution. 4 Units.
This course focuses on the anatomical and taxonomic diversity of mammals in an evolutionary context. The emphasis is on living (extant) mammals, but extinct mammals are also discussed. By the end of the course, students will be able to: (1) describe the key anatomical and physiological features of mammals; (2) name all orders and most families of living mammals; (3) identify a mammal skull to order and family; (4) understand how to create and interpret a phylogenetic tree; (5) appreciate major historical patterns in mammal diversity and biogeography as revealed by the fossil record; (6) read and critique a scientific article dealing with mammal evolution. One weekend field trip to Cleveland Metroparks Zoo; additional individual and group visits to the Cleveland Museum of Natural History. This course satisfies a laboratory requirement for the biology major. Recommended preparation: BIOL 223 Vertebrate Biology, BIOL 225 Evolution, or BIOL 346 Human Anatomy. Offered as ANAT 445 and BIOL 345. Prereq: BIOL 214.

BIOL 346. Human Anatomy. 3 Units.
Gross anatomy of the human body. Two lectures and one laboratory demonstration per week. Prereq: (Undergraduate Student and BIOL 216) or Requisites Not Met permission.

BIOL 351. Principles of Ecology. 3 Units.
This lecture course explores spatial and temporal relationships involving organisms and the environment at individual, population, and community levels. An underlying theme of the course will be neo-Darwinian evolution through natural selection with an emphasis on organismal adaptations to abiotic and biotic environments. Studies and models will illustrate ecological principles, and there will be some emphasis on the applicability of these principles to ecosystem conservation. This course satisfies the Population Biology/Ecology breadth requirement of the B.A. and B.S. in Biology. Students taking the graduate level course will prepare a grant proposal in which hypotheses will be based on some aspect of ecological theory. Offered as BIOL 351 and BIOL 451. Prereq: Undergraduate Student and BIOL 214 or Requisites Not Met permission.

BIOL 351L. Principles of Ecology Laboratory. 2 Units.
Students in this laboratory course will conduct a variety of ecological investigations that are designed to examine relationships involving organisms and the environment at individual, population, and community levels. Descriptive and hypothesis-driven investigations will take place at Case Western Reserve University's Squire Valleyveue Farm, in both field and greenhouse settings. The course is designed to explore as well as test a variety of ecological paradigms. Students taking the graduate level course will prepare a grant proposal in which hypotheses will be based on a select number of lab investigations. This course satisfies a laboratory requirement for biology majors. Offered as BIOL 351L and BIOL 451L. Prereq or Coreq: Undergraduate Student and BIOL 351 or Requisites Not Met permission.

BIOL 352. Ecology and Evolution of Infectious Diseases. 3 Units.
This course explores the effects of infectious diseases on populations of hosts, including humans and other animals. We will use computer models to study how infectious diseases enter and spread through populations, and how factors like physiological and behavioral differences among host individuals, host and pathogen evolution, and the environment affect this spread. Our emphasis will be on understanding and applying quantitative models for studying disease spread and informing policy in public health and conservation. To that end, computer labs are the central component of the course. This course satisfies a laboratory requirement of the B.A. in biology. This course satisfies a laboratory or quantitative laboratory requirement of the B.S. in biology. Offered as BIOL 352 and BIOL 452. Prereq: (Undergraduate Student and BIOL 214 and (MATH 121 or MATH 125) and (MATH 122 or MATH 126)) or Requisites Not Met permission.

BIOL 353. Ecophysiology of Global Change. 3 Units.
Global change is an emerging threat to human health and economic stability. Rapid changes in climate, land use, and prevalence of non-native species generate novel conditions outside the range of typical conditions under which organisms evolved. Already we are witnessing the global redistribution of plants and animals, changes in the timing of critical life cycle events, and in some cases local extinction of populations. This course explores the impacts of global change on biological systems at levels from individuals to ecosystems; among animals, plants and microbes; across ecological to evolutionary timescales; and from local to global spatial scales. Throughout, physiology is emphasized as a core driver of biological responses to global change. Traditional lectures will be accompanied by discussions of primary literature articles. The laboratory component will involve the development of an independent project at the University Farm, and dissemination of results through traditional (e.g. written paper) and new (e.g. podcast) media. This class will fulfill a laboratory requirement of the B.A. in Biology. This class will fulfill an additional laboratory requirement of the B.S. in Biology. Offered as BIOL 353 and BIOL 453. Prereq: (Undergraduate Student and BIOL 214. Prereq or Coreq: BIOL 216) or Requisites Not Met permission.
BIOL 357. Backyard Behavior Capstone. 3 Units.
Interesting animal behavior is all around us. We need not go into a laboratory to observe it, but laboratory tools can help to understand the behaviors that we encounter every day. We interact with animals in our homes, in forests and wilderness areas and even in our own backyards. As pet dogs or cats interact with wild squirrels and birds, they provide insights regarding predation, neuromechanics, and mating behaviors, just to list a few concepts. This course takes advantage of the rich behavior that exists around us to provide a capstone experience for students who have an interest in animal behavior. The course will be open to 10 senior Biology majors who have emphasized the animal behavior and neurobiology courses offered by the Biology department. Each student will have taken at least one advanced course in Animal Behavior, Neurobiology, or Neuroethology. Entry into the course will be by permit, and permits will be issued only after an interview in which each student demonstrates to the instructor a deep interest in animal behavior and underlying neural control systems. Through classroom discussion, viewing of behaviorally-based video shows, and field trips, each student will choose one behavior to investigate in detail over the course of the semester. In order to move beyond casual observation to in-depth analysis, video cameras will be available to the students, as well as computer based motion analysis systems. The class will meet as a group twice weekly. During this formal classroom period, students will discuss behaviors in general and, as the course progresses, the specific topics that each student is investigating. They will present journal articles that are relevant to their topics, a prospectus on their intended study, and ultimately describe their projects outside of class time and will present a poster at a public poster fair. Counts as SAGES Senior Capstone. Prereq: BIOL 305 or BIOL 318 or BIOL 358 or BIOL 373 or BIOL 374.

BIOL 358. Animal Behavior. 4 Units.
Ultimately the success or failure (i.e., life or death) of any individual animal is determined by its behavior. The ability to locate and capture food, avoid being food, acquiring and defending territory, and successfully passing your genes to the next generation, are all dependent on complex interactions between an animal’s design, environment and behavior. This course will be an integrative approach emphasizing experimental studies of animal behavior. You will be introduced to state-of-the-art approaches to the study of animal behavior, including neural and hormonal mechanisms, genetic and developmental mechanisms and ecological and evolutionary approaches. We will learn to critique examples of current scientific papers, and learn how to conduct observations and experiments with real animals. We will feature guest observations by the Curator of Research from the Cleveland MetroParks Zoo and visits to working animal behavior research labs here at CWRU. Group discussions and writing will be emphasized. This course satisfies a laboratory requirement for biology majors. Offered as BIOL 358 and BIOL 458. Prereq: (Undergraduate Student and BIOL 214, BIOL 215 and BIOL 216) or Requisites Not Met Permission.

BIOL 362. Principles of Developmental Biology. 3 Units.
The descriptive and experimental aspects of animal development. Gametogenesis, fertilization, cleavage, morphogenesis, induction, differentiation, organogenesis, growth, and regeneration. Students taking the graduate-level course will prepare an NIH-format research proposal as the required term paper. Offered as BIOL 362, BIOL 462 and ANAT 462. Prereq: Undergraduate Student and (BIOL 216 or (EBME 201 and EBME 202)) or Requisites Not Met Permission.

BIOL 364. Research Methods in Evolutionary Biology. 3 Units.
The process of evolution explains not only how the present diversity of life on earth has formed, but also provides insights into current pressing issues today, including the spread of antibiotic resistance, the causes of geographic variation in genetic diseases, and explanations for modern patterns of extinction risk. Students in Research Methods in Evolutionary Biology will be introduced to several of the major research approaches of evolutionary biology, including methods of measuring natural selection on the phenotypic and genotypic levels, quantifying the rate of evolution, reconstructing evolutionary relationships, and assessing the factors that affect rates of speciation and extinction. The course will consist of a combination of interactive lectures, in-class problem solving and data analysis, and the discussion of peer-reviewed scientific papers. Grades are based on participation in class, discussions and written summaries of published papers, in-class presentations, and two writing assignments. Offered as BIOL 364 and BIOL 464. Counts as SAGES Departmental Seminar. Prereq: (Undergraduate Student and BIOL 214) or Requisites Not Met Permission.

BIOL 365. Evo-Devo:Evolution of Body Plans and Pathologies. 3 Units.
This discussion-based course offers a detailed introduction to Evolutionary Developmental Biology. The field seeks to explain evolutionary events through the mechanisms of Developmental Biology and Medical Genetics. The course is structured into different modules. First we will look at the developmental genetic mechanisms that can cause variation and medical pathologies. Then we focus on how alterations of these mechanisms can generate novel structural changes. We will then examine a few areas of active debate, where Evo-Devo is attempting to solve major problems in evolutionary biology and congenital birth defects. We will conclude with two writing assignments. Students will be required to present, read, and discuss primary literature in each module. This course is offered as a SAGES Departmental Seminar and fulfills a Cell and Molecular breadth requirement of the BA and BS in Biology. Offered as BIOL 365 and BIOL 465. Counts as SAGES Departmental Seminar. Prereq: Undergraduate Student and (BIOL 225 or BIOL 326 or BIOL 362) or Requisites Not Met permission.

BIOL 366. Genes, Embryos and Fossils. 3 Units.
This multidisciplinary seminar course is designed to help students understand fundamental concepts of development and evolution of biological systems. Because scientists communicate their ideas through journal articles, seminars, and in grant proposals, the course will focus upon reading and synthesizing primary literature. In this discussion-based course, students will also learn to effectively present and write on three topics that are at the exciting intersection of genetics, developmental biology, and evolution. Finally, students will be provided with the technical and intellectual skills which are needed to write and present a research proposal and a literature review. Counts as SAGES Departmental Seminar. Prereq: BIOL 225, BIOL 236, BIOL 251, BIOL 362 or BIOL 365.

BIOL 368. Topics in Evolutionary Biology. 3 Units.
The focus for this course on a special topic of interest in evolutionary biology will vary from one offering to the next. Examples of possible topics include theories of speciation, the evolution of language, the evolution of sex, evolution and biodiversity, molecular evolution. ANAT/ ANTH/EEPS/PHIL/PHOL 467/BIOL 468 will require a longer, more sophisticated term paper, and additional class presentation. Offered as ANTH 367, BIOL 368, EEPS 367, PHIL 367, ANAT 467, ANTH 467, BIOL 468, EEPS 467, PHIL 467 and PHOL 467. Prereq: BIOL 225 or equivalent.
BIOL 373. Introduction to Neurobiology. 3 Units.
How nervous systems control behavior. Biophysical, biochemical and molecular biological properties of nerve cells, their organization into circuitry, and their function within networks. Emphasis on quantitative methods for modeling neurons and networks, and on critical analysis of the contemporary technical literature in the neurosciences. Term paper required for graduate students. This course satisfies a lab requirement for the B.A. in Biology, and a Quantitative Laboratory requirements for the B.S. in Biology. Offered as BIOL 373, BIOL 473, and NEUR 473.

BIOL 374. Computational Neuroscience. 3 Units.
Computer simulations and mathematical analysis of neurons and neural circuits, and the computational properties of nervous systems. Students are taught a range of models for neurons and neural circuits, and are asked to implement and explore the computational and dynamic properties of these models. The course introduces students to dynamical systems theory for the analysis of neurons and neural learning, models of brain systems, and their relationship to artificial and neural networks. Term project required. Students enrolled in MATH 478 will make arrangements with the instructor to attend additional lectures and complete additional assignments addressing mathematical topics related to the course. Recommended preparation: MATH 223 and MATH 224 or BIOL 300 and BIOL 306. Offered as BIOL 378, COGS 378, MATH 378, BIOL 478, CSDS 478, EMBE 478, ECSE 478, MATH 478 and NEUR 478.

BIOL 378. Biobotics Team Research. 3 Units.
This course, students will examine how neurobiologists interested in animal behavior study the linkage between neural circuitry and complex behavior. Various vertebrate and invertebrate systems will be considered. Several exercises will be used in this endeavor. Although some lectures will provide background and context on specific neural systems, the emphasis of the course will be on classroom discussion of specific journal articles. In addition, students will each complete a project in which they will observe some animal behavior and generate both behavioral and neurobiological hypotheses related to it. In lieu of examinations, students will complete three written assignments, including a theoretical grant proposal, a one-page Specific Aims paper related to the project, and a final project paper. These assignments are designed to give each student experience in writing biologically-relevant documents. Classroom discussions will help students understand the content and format of each type document. They will also present their projects orally to the entire class. Offered as BIOL 374, BIOL 474 and NEUR 474. Counts as SAGES Departmental Seminar.

BIOL 377. Biorobotics Team Research. 3 Units.
Many exciting research opportunities cross disciplinary lines. To participate in such projects, researchers must operate in multidisciplinary teams. The Biobotics Team Research course offers a unique capstone opportunity for undergraduate students to utilize skills they developed during their undergraduate experience while acquiring new teaming skills. A group of eight students form a research team under the direction of two faculty leaders. Team members are chosen from appropriate majors through interviews with the faculty. They will research a biological mechanism or principle and develop a robotic device that captures the actions of that mechanism. Although each student will cooperate on the team, they each have a specific role, and must develop a final paper that describes the research generated on their aspect of the project. Students meet for one class period per week and two 2-hour lab periods. Initially students brainstorm ideas and identify the project to be pursued. They then acquire biological data and generate robotic designs. Both are further developed during team meetings and reports. Final oral reports and a demonstration of the robotic device occur in week 15. Offered as BIOL 377, EMAE 377, BIOL 467, and EMAE 477. Counts as SAGES Senior Capstone.

BIOL 379. Transformative Animal Models in Modern Biology. 3 Units.
Animal models are extremely important in the study of biology and in modern medicine. They allow us to determine fundamental biological mechanisms and cellular and molecular causes of disease. There is logic to how each animal model has found its place in the menagerie of accepted animal models. Certain animal models allow us to test particular hypotheses that may not be possible to address in other animals. Moreover, some animal models are more relevant than others to studying a particular human disease. This seminar-based course will focus on animal models that either are effective at modeling human disease, approach relevant neurobiological questions, or play a role in translational medicine. The course will focus on mammalian and non-mammalian animal models that are important to biomedical research, including the primate, mouse, zebrafish, and roundworm. Comparisons between popular animal models will be made. This course satisfies the Organismal breadth requirement of the B.A. and B.S. in Biology. Offered as BIOL 379 and BIOL 479. Counts as SAGES Departmental Seminar. Prereq: Undergraduate student and (BIOL 326 or BIOL 373) or Requisites Not Met permission.

BIOL 385. Seminar on Biological Processes in Learning and Cognition. 3 Units.
Students will read and discuss research papers on a range of topics relevant to the biological processes that lead to cognition and learning in humans. Sample topics are: cellular and molecular mechanisms of memory; visual sensory detection of images, movement, and color; role of slow neurotransmitters in synaptic plasticity; cortical distribution of cognitive functions such as working memory, decision making, and image analysis; functions of emotion-structures and their role in cognition; brain structures and mechanisms involved in language creation; others. Some papers will be assigned and others will be selected by students. Discussions will focus on the methods used, the experimental results, and the interpretations of significance. Students will work in groups on a semester project to be presented near the end of the semester. Counts as SAGES Senior Capstone. Prereq: Undergraduate Student and BIOL 302 or Requisites Not Met permission.

BIOL 388. Undergraduate Research. 1 - 3 Units.
Guided laboratory research under the sponsorship of a biology faculty member. May be carried out within the biology department or in associated departments. Appropriate forms must be secured in the biology department office. A written report must be approved by the biology sponsor and submitted to the chairman of the biology department before credit is granted. Only 3 credit-hours may count towards the biology majors or minor. Offered as BIOL 388 and SYBB 388.
BIOL 388S. Undergraduate Research - SAGES Capstone. 3 Units.
Guided laboratory research under the sponsorship of a biology faculty member. May be carried out within the biology department or in associated departments. May be taken only one semester during the student’s academic career. Appropriate forms must be secured in the biology department office. A written report must be approved by the biology sponsor and submitted to the chairman of the biology department before credit is granted. A public presentation is required. Offered as BIOL 388S and SYBB 388S. Counts as SAGES Senior Capstone.

BIOL 389. Selected Topics. 1 - 3 Units.
Individual library research projects completed under the guidance of a biology sponsor. May be carried out within the biology department or in associated departments. Appropriate forms must be secured in the biology department office. A written report must be approved by the biology sponsor and submitted to the chairman of the biology department before credit is granted. Only 3 credit-hours may count towards the biology majors or minor.

BIOL 389S. Selected Topics in Biology--SAGES Capstone. 3 Units.
Individual library research projects under the guidance of a biology sponsor. A major paper must be submitted and approved before credit is awarded. A public presentation is required. Counts as SAGES Senior Capstone.

BIOL 390. Advanced Undergraduate Research. 1 - 3 Units.
Offered on a credit only basis. Students may carry out research in biology or related departments, but a biology sponsor is required. Does not count toward the 30 hours required for a major in biology, but may be counted toward the total number of hours required for graduation. A written report must be submitted to the chairman’s office and approved before credit is granted. Prereq: BIOL 388 or BIOL 388S

BIOL 396. Undergraduate Research in Evolutionary Biology. 3 Units.
Students propose and conduct guided research on an aspect of evolutionary biology. The research will be sponsored and supervised by a member of the CASE faculty or other qualified professional. A written report must be submitted to the Evolutionary Biology Steering Committee before credit is granted. Offered as ANTH 396, BIOL 396, EEPS 396, and PHIL 396.

BIOL 397. Molecular Phylogenetics. 4 Units.
This course is designed to teach the theory and practice of molecular based phylogenetics with attention to evolutionary analysis through lecture, readings, discussion, and a quantitative laboratory section. A comprehensive overview of the history of systematics and morphology based phylogenetics will help familiarize students with the theory, methods, and character analysis frameworks used in current genetic based approaches. A laboratory section of the course will provide working knowledge in designing and carrying out an original phylogenetics project beginning with data procurement to writing a research manuscript. Through readings and discussions of research articles as well as presented content, the relevant course material will be utilized in practice by students analyzing their project data sets. The semester-long research project will take students through the process of building a data set, aligning sequences, reconstructing phylogenies, conducting evolutionary analyses, and interpreting and writing results as a scientific manuscript. In addition, students will orally present their research proposal as well as the final research project. Undergraduate students will work in teams of two on the research project component of the course and independently throughout the other course components (discussions). Graduate students will work independently and have an extra assignment. This course satisfies a laboratory requirement of the B.A. in Biology. This course satisfies a laboratory or quantitative laboratory requirement of the B.S. in Biology. Offered as: BIOL 397 and BIOL 497. Prereq: Undergraduate Student and BIOL 214 and (BIOL 225 or BIOL 364) or Requisites Not Met permission.

BIOL 398. Modern Human Biological Variation. 3 Units.
The objectives of this course are to provide students with an introduction to human biological variation and to understand the variation within an evolutionary framework through lecture, readings, discussion, and labs. We will examine the patterns of morphological and genetic variation in modern human populations and discuss the evolutionary explanations for the observed patterns. In order to do this, we will first build a solid foundation in the scientific method, population genetics, and evolutionary theory before exploring the adaptive significance of the observed variation. A major component of the class will be the discussion of the social and health implications of these patterns of biological variation, particularly in the construction and application of the concept of race and its use in medicine. There are three units to the course. Unit 1 focuses on the fundamentals to understanding biological variation, we will cover basic population genetics, evolution, and the human fossil record. Unit 2 concentrates on surveying modern human biological variation, examining both morphological and genetic traits, and why these variations exist. Unit 3 examines how race is constructed using population-based biological differences, its validity, and the implications for health and medicine. This course fulfills the Population and Ecology breadth requirement of the B.A. and B.S. in Biology. Offered as BIOL 398 and BIOL 498. Prereq: Undergraduate Student and BIOL 214 or Requisites Not Met permission.

BIOL 401. Biotechnology Laboratory: Genes and Genetic Engineering. 3 Units.
Laboratory training in recombinant DNA techniques. Basic microbiology, growth, and manipulation of bacteriophage, bacteria and yeast. Students isolate and characterize DNA, construct recombinant DNA molecules, and reintroduce them into eukaryotic cells (yeast, plant, animal) to assess their viability and function. Two laboratories per week. This course satisfies a laboratory requirement of the B.A. in Biology. This course satisfies an additional laboratory requirement of the B.S. in Biology. Offered as BIOL 301 and BIOL 401.
**BIOL 402. Principles of Neural Science. 3 Units.**
Lecture/discussion course covering concepts in cell and molecular neuroscience, principles of systems neuroscience as demonstrated in the somatosensory system, and fundamentals of the development of the nervous system. This course will prepare students for upper level Neuroscience courses and is also suitable for students in other programs who desire an understanding of neurosciences. Recommended preparation: CBIO 453. Offered as BIOL 402 and NEUR 402.

**BIOL 404. Fitting Models to Data: Maximum Likelihood Methods and Model Selection. 3 Units.**
This course will introduce students to maximum likelihood methods for fitting models to data and to ways of deciding which model is best supported by the data (model selection). Along the way, students will learn some basic tenets of probability and develop competency in R, a commonly used statistical package. Examples will be drawn from ecology, epidemiology, and potentially other areas of biology. The second half of the course is devoted to in-class projects, and students are encouraged to bring their own data. Offered as BIOL 304 and BIOL 404. Prereq: MATH 121 and MATH 122 OR MATH 125 and MATH 126 or consent of instructor.

**BIOL 405. Herpetology. 3 Units.**
Amphibians and reptiles exhibit tremendous diversity in development, physiology, anatomy, behavior and ecology. As a result, amphibians and reptiles have served as model organisms for research in many different fields of biology. This course will cover many aspects of amphibian and reptile biology, including anatomy, evolution, geographical distribution, physiological adaptations to their environment, reproductive strategies, moisture-, temperature-, and food-relations, sensory mechanisms, predator-prey relationships, communication (vocal, chemical, behavioral), population biology, and the effects of venomous snake bite. The graduate version of the course requires a research project and term paper. This course satisfies the Organismal breadth requirement of the B.A. and B.S. in Biology. Offered as BIOL 305 and BIOL 405.

**BIOL 409. Biology Field Studies. 3 Units.**
Intensive investigation of living organisms in a natural environment. Location of the field site may vary with each course offering, and may be either domestic or international. Topics covered include logistics, biodiversity, and current ecological, environmental, and social issues surrounding the specific ecosystem being studied. Time at the field site will be spent listening to resident lecturers, receiving guided tours, observing and identifying wild organisms in their natural habitat, and conducting a research project. The undergraduate version requires students to plan and conduct a group research project and present results independently. The graduate version requires students to plan, conduct, and present an independent research project. Instructor consent required to register. This course will fulfill a laboratory requirement of the B.A. in Biology. This course will fulfill an additional laboratory requirement of the B.S. in Biology. Course may be repeated for credit up to two times if traveling to a new destination. Offered as BIOL 309 and BIOL 409. Prereq: Graduate Standing.

**BIOL 416. Fundamental Immunology. 4 Units.**
Introductory immunology providing an overview of the immune system, including activation, effector mechanisms, and regulation. Topics include antigen-antibody reactions, immunologically important cell surface receptors, cell-cell interactions, cell-mediated immunity, innate versus adaptive immunity, cytokines, and basic molecular biology and signal transduction in B and T lymphocytes, and immunopathology. Three weekly lectures emphasize experimental findings leading to the concepts of modern immunology. An additional recitation hour is required to integrate the core material with experimental data and known immune mediated diseases. Five mandatory 90 minute group problem sets per semester will be administered outside of lecture and recitation meeting times. Graduate students will be graded separately from undergraduates, and 22 percent of the grade will be based on a critical analysis of a recently published, landmark scientific article. Offered as BIOL 316, BIOL 416, CLBY 416, PATH 316 and PATH 416. Prereq: Graduate standing.
BIOL 418. Introductory Entomology. 4 Units.
The goal of this course is to discover that, for the most part, insects are not aliens from another planet. Class meetings will alternate; with some structured as lectures, while others are laboratory exercises. Sometimes we will meet at the Cleveland Museum of Natural History, or in the field to collect and observe insects. The 50 minute discussion meeting once a week will serve to address questions from both lectures and lab exercises. The students will be required to make a small but comprehensive insect collection. Early in the semester we will focus on collecting the insects, and later, when insects are gone for the winter, we will work to identify the specimens collected earlier. Students will be graded based on exams, class participation and their insect collections. This course satisfies either the Organismal breadth requirement of the B.A. and B.S. in Biology, or the laboratory requirement of the B.A. in Biology, or an additional laboratory requirement of the B.S. in Biology. Offered as BIOL 318 and BIOL 418. Prereq: BIOL 214, and BIOL 215, and BIOL 216.

BIOL 419. Applied Probability and Stochastic Processes for Biology. 3 Units.
Applications of probability and stochastic processes to biological systems. Mathematical topics will include: introduction to discrete and continuous probability spaces (including numerical generation of pseudo random samples from specified probability distributions), Markov processes in discrete and continuous time with discrete and continuous sample spaces, point processes including homogeneous and inhomogeneous Poisson processes and Markov chains on graphs, and diffusion processes including Brownian motion and the Ornstein-Uhlenbeck process. Biological topics will be determined by the interests of the students and the instructor. Likely topics include: stochastic ion channels, molecular motors and stochastic ratchets, actin and tubulin polymerization, random walk models for neural spike trains, bacterial chemotaxis, signaling and genetic regulatory networks, and stochastic predator-prey dynamics. The emphasis will be on practical simulation and analysis of stochastic phenomena in biological systems. Numerical methods will be developed using a combination of MATLAB, the R statistical package, MCell, and/or URDME, at the discretion of the instructor. Student projects will comprise a major part of the course. Offered as BIOL 319, ECSE 319, MATH 319, SYBB 319, BIOL 419, EBME 419, MATH 419, PHOL 419, and SYBB 419.

BIOL 421. Design and Analysis of Biological Experiments. 3 Units.
In this laboratory course, students will learn how to use a computer programming language (MATLAB) to design, execute, and analyze biological experiments. The course will begin with basic programming and continue to data output and acquisition, image analysis, and statistics. Students who are interested in carrying out research projects in any lab setting are encouraged to take this course and use the skills acquired to better organize and analyze their experiments. No prior programming knowledge is assumed. This course satisfies a laboratory requirement of the B.A. in biology. This course satisfies a laboratory or quantitative laboratory requirement of the B.S. in biology. Students will complete a final project on a topic of their choice; graduate students will be required to give an oral presentation of this project. Offered as BIOL 321 and BIOL 421. Counts for CAS Quantitative Reasoning Requirement. Prereq: Graduate standing.

BIOL 422. Sensory Biology. 3 Units.
The task of a sensory system is to collect, process, store, and transmit information about the environment. How do sensory systems convert information from the environment into neural information in an animal’s brain? This course will explore the ecology, physiology, and behavior of the senses across the animal kingdom. We will cover introductory neurobiology and principles of sensory system organization before delving more deeply into vision, olfaction, audition, mechanosensation, and multi-modal sensory integration. For each sensory modality, we will consider how the sensory system operates and how its operation affects the animal’s behavior and ecology. We will also explore the evolution of sensory systems and their specialization for specific behavioral tasks. Students will finish the course with a research project on a topic of their choice; graduate students will present this project to the class. Offered as BIOL 322 and BIOL 422. Prereq: Graduate standing.

BIOL 424. Introduction to Stem Cell Biology. 3 Units.
This discussion-based course will introduce students to the exciting field of stem cell research. Students will first analyze basic concepts of stem cell biology, including stem cell niche, cell quiescence, asymmetric cell division, cell proliferation and differentiation, and signaling pathways involved in these processes. This first part of the course will focus on invertebrate genetic models for the study of stem cells. In the second part of the course, students will search for primary research papers on vertebrate and human stem cells, and application of stem cell research in regenerative medicine and cancer. Finally, students will have the opportunity to discuss about ethical controversies in the field. Students will rotate in weekly presentations, and will write two papers during the semester. Students will improve skills on searching and reading primary research papers, gain presentation skills, and further their knowledge in related subjects in the fields of cell biology, genetics and developmental biology. This course may be used as a cell/molecular subject area elective for the B.A. and B.S. Biology degrees. Offered as BIOL 324 and BIOL 424. Prereq: Graduate standing.

BIOL 426. Genetics. 3 Units.
Transmission genetics, nature of mutation, microbial genetics, somatic cell genetics, recombinant DNA techniques and their application to genetics, human genome mapping, plant breeding, transgenic plants and animals, uniparental inheritance, evolution, and quantitative genetics. Offered as BIOL 326 and BIOL 426.

BIOL 427. Functional Genomics. 3 Units.
In this course, students will learn how to access and use genomics data to address questions in cell biology, development and evolution. The genome of Drosophila melanogaster will serve as a basis for exploring genome structure and learning how to use a variety of available software to identify similar genes in different species, predict protein sequence and functional domains, design primers for PCR, analyze cis-regulatory sequences, access microarray and RNAseq databases, among others. Classes will be in the format of short lectures, short oral presentations made by students and hands-on experimentation using computers. Discussions will be centered in primary research papers that used these tools to address specific biological questions. A final project will consist of a research project formulated by a group of 2-3 students to test a hypothesis formulated by the students using the bioinformatics tools learned in the course. Graduate students will be required to make additional presentations of research papers. They also will have additional questions in exams and a distinct page requirement on written assignments. This course satisfies a laboratory requirement of the B.A. in Biology. This course satisfies a laboratory or quantitative laboratory requirement of the B.S. in Biology. Offered as BIOL 327 and BIOL 427. Prereq: Graduate standing.
BIOL 428. Plant Genomics and Proteomics. 3 Units.
The development of molecular tools has impacted agriculture as much as human health. The application of new techniques to improve food crops, including the development of genetically modified crops, has also become controversial. This course covers the nature of the plant genome and the role of sequenced-based methods in the identification of the genes. The application of the whole suite of modern molecular tools to understand plant growth and development, with specific examples related agronomically important responses to biotic and abiotic stresses, is included. The impact of the enormous amounts of data generated by these methods and their storage and analysis (bioinformatics) is also considered. Finally, the impact on both the developed and developing world of the generation and release of genetically modified food crops will be covered. Recommended preparation: BIOL 326. Offered as BIOL 328 and BIOL 428.

BIOL 429. Genome Dynamics. 3 Units.
We will examine how the physical architecture of the genome facilitates a dynamic genome ecosystem. Topics will be selected from current research in the field, including: how the three dimensional architecture of chromosomes within the nucleus impacts information storage and retrieval, how biochemical phase separation impacts nucleic acid storage (including RNA), how structural features of chromosomes are critical for function, genome engineering approaches, and the clinical implications of mutations in the 3D nuclear architecture. Course materials will come from the primary research literature, supplemented with appropriate background material. This course fulfills the cell and molecular biology breadth requirement of the BA and BS in Biology. Counts as a SAGES Departmental Seminar. Offered as BIOL 329 and BIOL 429. Counts as SAGES Departmental Seminar.

BIOL 431. Statistical Methods I. 3 Units.
Application of statistical techniques with particular emphasis on problems in the biomedical sciences. Basic probability theory, random variables, and distribution functions. Point and interval estimation, regression, and correlation. Problems whose solution involves using packaged statistical programs. First part of year-long sequence. Offered as ANAT 431, BIOL 431, CRSP 431, PQHS 431 and MPHP 431.

BIOL 432. Statistical Methods II. 3 Units.
Methods of analysis of variance, regression and analysis of quantitative data. Emphasis on computer solution of problems drawn from the biomedical sciences. Design of experiments, power of tests, and adequacy of models. Offered as BIOL 432, PQHS 432, CRSP 432 and MPHP 432. Prereq: PQHS/EPBI 431 or equivalent.

BIOL 436. Aquatic Biology. 3 Units.
Physical, chemical, and biological dynamics of lake ecosystems. Factors governing the distribution, abundance, and diversity of freshwater organisms. This course satisfies the Population Biology/Ecology breadth requirement of the B.A. and B.S. in Biology. Offered as BIOL 336 and BIOL 436.

BIOL 438. Ichthyology. 4 Units.
Biology of fishes. Students will develop fundamental understanding of the evolutionary history and systematics of fishes to provide a context within which they can address aspects of biology including anatomy, physiology (e.g., in species that change sex; osmoregulation in freshwater vs. saltwater), and behavior (e.g., visual, auditory, chemical, electric communication; social structures), ecology, and evolution (e.g., speciation). We will explore the biodiversity of fishes around the world, with emphasis on Ohio species, by examining preserved specimens, observing captive living specimens, and observing, capturing, and identifying wild fishes in their natural habitats. Practical applications will be emphasized, such as aquaculture, fisheries management, and biomedical research. Course will conclude with an analysis of the current global fisheries crisis that has resulted from human activities. There will be many field trips and networking with the Cleveland Metroparks Zoo, the Cleveland Museum of Natural History, and local, state, and federal government agencies. Some classes meet at the Cleveland Museum of Natural History. This course satisfies a laboratory requirement of the B.A. and B.S. in biology. The graduate version of the course requires a research project and term paper. Offered as BIOL 338 and BIOL 438. Prereq: Graduate Standing.

BIOL 442. Parasitology. 3 Units.
This course will introduce students to classical and current parasitology. Students will discuss basic principles of parasitology, parasite life cycles, host-parasite interaction, therapeutic and control programs, epidemiology, and ecological and societal considerations. The course will explore diverse classes of parasitic organisms with emphasis on protozoan and helminthic diseases and the parasites' molecular biology. Group discussion and selected reading will facilitate further integrative learning and appreciation for parasite biology. This course counts as an elective in the cell/molecular biology subject area for the Biology B.A. and B.S. degrees. Offered as BIOL 342 and BIOL 442. Prereq: Graduate standing and consent of instructor.

BIOL 443. Microbiology. 3 Units.
The physiology, genetics, biochemistry, and diversity of microorganisms. The subject will be approached both as a basic biological science that studies the molecular and biochemical processes of cells and viruses, and as an applied science that examines the involvement of microorganisms in human disease as well as in workings of ecosystems, plant symbioses, and industrial processes. The course is divided into four major areas: bacteria, viruses, medical microbiology, and environmental and applied microbiology. Offered as BIOL 343 and BIOL 443.

BIOL 451. Principles of Ecology. 3 Units.
This lecture course explores spatial and temporal relationships involving organisms and the environment at individual, population, and community levels. An underlying theme of the course will be neo-Darwinian evolution through natural selection with an emphasis on organismal adaptations to abiotic and biotic environments. Studies and models will illustrate ecological principles, and there will be some emphasis on the applicability of these principles to ecosystem conservation. This course satisfies the Population Biology/Ecology breadth requirement of the B.A. and B.S. in Biology. Students taking the graduate level course will prepare a grant proposal in which hypotheses will be based on some aspect of ecological theory. Offered as BIOL 351 and BIOL 451.
BIOL 451L. Principles of Ecology Laboratory. 2 Units.
Students in this laboratory course will conduct a variety of ecological investigations that are designed to examine relationships involving organisms and the environment at individual, population, and community levels. Descriptive and hypothesis-driven investigations will take place at Case Western Reserve University's Squire Valleeve Farm, in both field and greenhouse settings. The course is designed to explore as well as test a variety of ecological paradigms. Students taking the graduate level course will prepare a grant proposal in which hypotheses will be based on a select number of lab investigations. This course satisfies a laboratory requirement for biology majors. Offered as BIOL 351L and BIOL 451L.

BIOL 452. Ecology and Evolution of Infectious Diseases. 3 Units.
This course explores the effects of infectious diseases on populations of hosts, including humans and other animals. We will use computer models to study how infectious diseases enter and spread through populations, and how factors like physiological and behavioral differences among host individuals, host and pathogen evolution, and the environment affect this spread. Our emphasis will be on understanding and applying quantitative models for studying disease spread and informing policy in public health and conservation. To that end, computer labs are the central component of the course. This course satisfies a laboratory requirement of the B.A. in biology. This course satisfies a laboratory or quantitative laboratory requirement of the B.S. in biology. Offered as BIOL 352 and BIOL 452. Prereq: Graduate standing.

BIOL 453. Ecophysiology of Global Change. 3 Units.
Global change is an emerging threat to human health and economic stability. Rapid changes in climate, land use, and prevalence of non-native species generate novel conditions outside the range of typical conditions under which organisms evolved. Already we are witnessing the global redistribution of plants and animals, changes in the timing of critical life cycle events, and in some cases local extinction of populations. This course explores the impacts of global change on biological systems at levels from individuals to ecosystems; among animals, plants and microbes; across ecological to evolutionary timescales; and from local to global spatial scales. Throughout, physiology is emphasized as a core driver of biological responses to global change. Traditional lectures will be accompanied by discussions of primary literature articles. The laboratory component will involve the development of an independent project at the University Farm, and dissemination of results through traditional (e.g. written paper) and new (e.g. podcast) media. This class will fulfill a laboratory requirement of the B.A. in Biology. This class will fulfill an additional laboratory requirement of the B.S. in Biology. Offered as BIOL 353 and BIOL 453. Prereq: Graduate Standing.

BIOL 457. Conversations on Protein Structure and Function. 2 Units.
The goal of this course is to supplement the short and basic presentation of Proteins in C3MB by lectures and discussions for students with backgrounds in physical-chemical sciences or students who have a good basic background in protein science. The course presents an overview of Protein structure/function. Following an introduction to the principles of protein structure, the physical basis of protein folding and stability, and a brief overview of structural and bioinformatics approaches to protein analysis is presented. Typically two lecture/discussion style presentations are followed by a student lead journal club on recent high profile papers. The way the Journal club is done is that one student presents a paper (background and figures in powerpoint slides) while presentation of the main figures is shared between the class. Papers and Figures will be assigned by instructor. Typically two papers will be presented per session. Offered as PHOL 456 and BIOL 457.

BIOL 458. Animal Behavior. 4 Units.
Ultimately the success or failure (i.e., life or death) of any individual animal is determined by its behavior. The ability to locate and capture food, avoid being food, acquiring and defending territory, and successfully passing your genes to the next generation, are all dependent on complex interactions between an animal's design, environment and behavior. This course will be an integrative approach emphasizing experimental studies of animal behavior. You will be introduced to state-of-the-art approaches to the study of animal behavior, including neural and hormonal mechanisms, genetic and developmental mechanisms and ecological and evolutionary approaches. We will learn to critique examples of current scientific papers, and learn how to conduct observations and experiments with real animals. We will feature guest appearances by the Curator of Research from the Cleveland MetroParks Zoo and visits to working animal behavior research labs here at CWRU. Group discussions and writing will be emphasized. This course satisfies a laboratory requirement for biology majors. Offered as BIOL 358 and BIOL 458.

BIOL 462. Principles of Developmental Biology. 3 Units.
The descriptive and experimental aspects of animal development. Gametogenesis, fertilization, cleavage, morphogenesis, induction, differentiation, organogenesis, growth, and regeneration. Students taking the graduate-level course will prepare an NIH-format research proposal as the required term paper. Offered as BIOL 362, BIOL 462 and ANAT 462.

BIOL 464. Research Methods in Evolutionary Biology. 3 Units.
The process of evolution explains not only how the present diversity of life on earth has formed, but also provides insights into current pressing issues today, including the spread of antibiotic resistance, the causes of geographic variation in genetic diseases, and explanations for modern patterns of extinction risk. Students in Research Methods in Evolutionary Biology will be introduced to several of the major research approaches of evolutionary biology, including methods of measuring natural selection on the phenotypic and genotypic levels, quantifying the rate of evolution, reconstructing evolutionary relationships, and assessing the factors that affect rates of speciation and extinction. The course will consist of a combination of interactive lectures, in-class problem solving and data analysis, and the discussion of peer-reviewed scientific papers. Grades are based on participation in class, discussions and written summaries of published papers, in-class presentations, and two writing assignments. Offered as BIOL 364 and BIOL 464. Counts as SAGES Departmental Seminar. Prereq: BIOL 214, BIOL 216, BIOL 251.

BIOL 465. Evo-Devo:Evolution of Body Plans and Pathologies. 3 Units.
This discussion-based course offers a detailed introduction to Evolutionary Developmental Biology. The field seeks to explain evolutionary events through the mechanisms of Developmental Biology and Medical Genetics. The course is structured into different modules. First we will look at the developmental genetic mechanisms that can cause variation and medical pathologies. Then we focus on how alterations of these mechanisms can generate novel structural changes. We will then examine a few areas of active debate, where Evo-Devo is attempting to solve major problems in evolutionary biology and congenital birth defects. We will conclude with two writing assignments. Students will be required to present, read, and discuss primary literature in each module. This course is offered as a SAGES Departmental Seminar and fulfills a Cell and Molecular breadth requirement of the BA and BS in Biology. Offered as BIOL 365 and BIOL 465. Counts as SAGES Departmental Seminar.
BIOL 467. Biorobotics Team Research. 3 Units.
Many exciting research opportunities cross disciplinary lines. To participate in such projects, researchers must operate in multi-disciplinary teams. The Biorobotics Team Research course offers a unique capstone opportunity for undergraduate students to utilize skills they developed during their undergraduate experience while acquiring new teaming skills. A group of eight students form a research team under the direction of two faculty leaders. Team members are chosen from appropriate majors through interviews with the faculty. They will research a biological mechanism or principle and develop a robotic device that captures the actions of that mechanism. Although each student will cooperate on the team, each has a specific role, and must develop a final paper that describes the research generated on their aspect of the project. Students meet for one class period per week and two 2-hour lab periods. Initially students brainstorm ideas and identify the project to be pursued. They then acquire biological data and generate robotic designs. Both are further developed during team meetings and reports. Final oral reports and a demonstration of the robotic device occur in week 15. Offered as BIOL 377, EMAE 377, BIOL 467, and EMAE 477. Counts as SAGES Senior Capstone.

BIOL 468. Topics in Evolutionary Biology. 3 Units.
The focus for this course on a special topic of interest in evolutionary biology will vary from one offering to the next. Examples of possible topics include theories of speciation, the evolution of language, the evolution of sex, evolution and biodiversity, molecular evolution. ANAT/ANTH/EEPS/PHIL/PHOL 467/BIOL 468 will require a longer, more sophisticated term paper, and additional class presentation. Offered as ANTH 367, BIOL 368, EEPS 367, PHIL 367, ANAT 467, ANTH 467, BIOL 468, EEPS 467, PHIL 467 and PHOL 467.

BIOL 471. Foundations of Advanced Ecology. 3 Units.
Advanced ecology, including discussion of the classic literature, in-depth study of key terms and concepts, applications of these foundational ideas to the modern literature, and current and future directions in the field. Intended for graduate students who have already taken undergraduate biology (BIOL 351/451 or equivalent). Prereq: Graduate standing.

BIOL 472. Foundations of Advanced Evolution. 3 Units.
Advanced evolutionary biology, including discussion of the classic literature, in-depth study of key terms and concepts, applications of these foundational ideas to the modern literature, and current and future directions in the field. Intended for graduate students who have already taken undergraduate evolution. Prereq: Graduate standing.

BIOL 473. Introduction to Neurobiology. 3 Units.
How nervous systems control behavior. Biophysical, biochemical and molecular biological properties of nerve cells, their organization into circuitry, and their function within networks. Emphasis on quantitative methods for modeling neurons and networks, and on critical analysis of the contemporary technical literature in the neurosciences. Term paper required for graduate students. This course satisfies a lab requirement for the B.A. in Biology, and a Quantitative Laboratory requirements for the B.S. in Biology. Offered as BIOL 373, BIOL 473, and NEUR 473.

BIOL 474. Neurobiology of Behavior. 3 Units.
In this course, students will examine how neurobiologists interested in animal behavior study the linkage between neural circuitry and complex behavior. Various vertebrate and invertebrate systems will be considered. Several exercises will be used in this endeavor. Although some lectures will provide background and context on specific neural systems, the emphasis of the course will be on classroom discussion of specific journal articles. In addition, students will each complete a project in which they will observe some animal behavior and generate both behavioral and neurobiological hypotheses related to it. In lieu of examinations, students will complete three written assignments, including a theoretical grant proposal, a one-page Specific Aims paper related to the project, and a final project paper. These assignments are designed to give each student experience in writing biologically-relevant documents. Classroom discussions will help students understand the content and format of each type document. They will also present their projects orally to the entire class. Offered as BIOL 374, BIOL 474 and NEUR 474. Counts as SAGES Departmental Seminar.

BIOL 478. Computational Neuroscience. 3 Units.
Computer simulations and mathematical analysis of neurons and neural circuits, and the computational properties of nervous systems. Students are taught a range of models for neurons and neural circuits, and are asked to implement and explore the computational and dynamic properties of these models. The course introduces students to dynamical systems theory for the analysis of neurons and neural learning, models of brain systems, and their relationship to artificial and neural networks. Term project required. Students enrolled in MATH 478 will make arrangements with the instructor to attend additional lectures and complete additional assignments addressing mathematical topics related to the course. Recommended preparation: MATH 223 and MATH 224 or BIOL 300 and BIOL 306. Offered as BIOL 378, COGS 378, MATH 378, BIOL 478, CSDS 478, EBME 478, ECSE 478, MATH 478 and NEUR 478.

BIOL 479. Transformative Animal Models in Modern Biology. 3 Units.
Animal models are extremely important in the study of biology and in modern medicine. They allow us to determine fundamental biological mechanisms and cellular and molecular causes of disease. There is logic to how each animal model has found its place in the menagerie of accepted animal models. Certain animal models allow us to test particular hypotheses that may not be possible to address in other animals. Moreover, some animal models are more relevant than others to studying a particular human disease. This seminar-based course will focus on animal models that either are effective at modeling human disease, approach relevant neurobiological questions, or play a role in translational medicine. The course will focus on mammalian and non-mammalian animal models that are important to biomedical research, including the primate, mouse, zebrafish, and roundworm. Comparisons between popular animal models will be made. This course satisfies the Organismal breadth requirement of the B.A. and B.S. in Biology. Offered as BIOL 379 and BIOL 479. Counts as SAGES Departmental Seminar. Prereq: Graduate Standing.
BIOL 480. Physiology of Organ Systems. 4 Units.
Our intent is to expand the course from the current 3 hours per week (1.5 hour on Monday and Wednesday) to 4 hours per week (1.5 hours on Monday and Wednesday plus 1 hour on Friday). Muscle structure and function, Myasthenia gravis and Sarcopenia; Central Nervous System, (Synaptic Transmission, Sensory System, Autonomic Nervous System, CNS circuits, Motor System, Neurodegenerative Diseases, Paraplegia and Nerve Compression); Cardiovascular Physiology (Regulation of Pressure and flow; Circulation, Cardiac Cycle, Electrophysiology, Cardiac Function, Control of Cardiovascular function, Hypertension); Hemorrgagy, Cardiac Hypertrophy and Fibrillation; Respiration Physiology (Gas Transport and Exchange, Control of Breathing, Acid/base regulation, Cor Pulmonaris and Cystic Fibrosis, Sleeping apnea and Emphysema); Renal Physiology (Glomerular Filtration, Tubular Function/transport, Glomerulonephritis, Tubulopathies); Gastro-Intestinal Physiology (Gastric motility, gastric function, pancreas and bile function, digestion and absorption, Liver Physiology; Pancreatitis, Liver Disease and cirrhosis); Endocrine Physiology (Thyroid, Adrenal glands, endocrine pancreas, Parathyroid, calcium sensing receptor, Cushing and diabetes, Reproductive hormones, eclampsia); Integrative Physiology (Response to exercise, fasting and feeding, aging). For all the classes, the students will receive a series of learning objectives by the instructor to help the students address and focus their attention to the key aspects of the organ physiology (and physioapthology). The evaluation of the students will continue to be based upon the students’ participation in class (60% of the grade) complemented by a mid-term and a final exam (each one accounting for 20% of the final grade). Offered as BIOL 480 and PHOL 480.

BIOL 491. Contemporary Biology and Biotechnology for Innovation I. 3 Units.
The first half of a two-semester sequence providing an understanding of biology as a basis for successfully launching new high-tech ventures. The course will examine physical limitations to present technologies and the use of biology to identify potential opportunities for new venture creation. The course will provide experience in using biology in both identification of incremental improvements and as the basis for alternative technologies. Case studies will be used to illustrate recent commercially successful (and unsuccessful) biotechnology-based venture creation and will illustrate characteristics for success.

BIOL 492. Contemporary Biology and Biotechnology for Innovation II. 3 Units.
Continuation of BIOL 491 with an emphasis on current and prospective opportunities for Biotechnology Entrepreneurship. Longer term opportunities for Biotechnology Entrepreneurship in emerging areas including (but not limited to) applications of DNA sequence information in medicine and agriculture; energy and the environment; biologically-inspired robots. Recommended preparation: BIOL 491 or consent of department.

BIOL 495. Introduction to Graduate School in the Biological Sciences. 1 Unit.
This course will help incoming Biology MS and Ph.D. students navigate their way through graduate school and participate in the scientific process. Students in the Biology graduate program will be strongly encouraged to take this course in their first year. This will be a skill-based course that will become part of their academic toolbox. In addition, there will be sessions to offer general tips for life in graduate school. Prerequisite: Graduate Standing.

BIOL 497. Molecular Phylogenetics. 4 Units.
This course is designed to teach the theory and practice of molecular based phylogenetics with attention to evolutionary analysis through lecture, readings, discussion, and a quantitative laboratory section. A comprehensive overview of the history of systematics and morphology based phylogenetics will help familiarize students with the theory, methods, and character analysis frameworks used in current genetic based approaches. A laboratory section of the course will provide working knowledge in designing and carrying out an original phylogenetics project beginning with data procurement to writing a research manuscript. Through readings and discussions of research articles as well as presented content, the relevant course material will be utilized in practice by students analyzing their project data sets. The semester-long research project will take students through the process of building a data set, aligning sequences, reconstructing phylogenies, conducting evolutionary analyses, and interpreting and writing results as a scientific manuscript. In addition, students will orally present their research proposal as well as the final research project. Undergraduate students will work in teams of two on the research project component of the course and independently throughout the other course components (discussions). Graduate students will work independently and have an extra assignment. This course satisfies a laboratory requirement of the B.A. in Biology. This course satisfies a laboratory or quantitative laboratory requirement of the B.S. in Biology. Offered as: BIOL 397 and BIOL 497. Prerequisite: Graduate Standing.

BIOL 498. Modern Human Biological Variation. 3 Units.
The objectives of this course are to provide students with an introduction to human biological variation and to understand the variation within an evolutionary framework through lecture, readings, discussion, and labs. We will examine the patterns of morphological and genetic variation in modern human populations and discuss the evolutionary explanations for the observed patterns. In order to do this, we will first build a solid foundation in the scientific method, population genetics, and evolutionary theory before exploring the adaptive significance of the observed variation. A major component of the class will be the discussion of the social and health implications of these patterns of biological variation, particularly in the construction and application of the concept of race and its use in medicine. There are three units to the course. Unit 1 focuses on the fundamentals to understanding biological variation, we will cover basic population genetics, evolution, and the human fossil record. Unit 2 concentrates on surveying modern human biological variation, examining both morphological and genetic traits, and why these variations exist. Unit 3 examines how race is constructed using population-based biological differences, its validity, and the implications for health and medicine. This course fulfills the Population and Ecology breadth requirement of the B.A. and B.S. in Biology. Offered as BIOL 398 and BIOL 498. Prerequisite: Graduate Standing.

BIOL 549. Mathematical Life Sciences Seminar. 1 - 3 Units.
Continuing seminar on areas of current interest in the applications of mathematics to the life sciences. Allows graduate and advanced undergraduate students to become involved in research. Topics will reflect interests and expertise of the faculty and may include topics in mathematical biology, computational neuroscience, mathematical modeling of biological systems, models of infectious diseases, computational cell biology, mathematical ecology and mathematical biomedicine broadly construed. May be taken more than once for credit.
BIOL 599. Advanced Independent Study for Graduate Students. 1 - 3 Units.
Independent study of advanced topics in biology under the supervision of a biology faculty member. Registration requires submission of a proposal for a project or study and approval of the department.

BIOL 601. Research. 1 - 9 Units.

BIOL 651. Thesis M.S.. 1 - 9 Units.
(Credit as arranged.)

BIOL 701. Dissertation Ph.D.. 1 - 9 Units.
(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

Department of Chemistry

212 Clapp Hall

Phone: 216.368.3622; Fax: 216.368.3006
Gregory P. Tochtrop, Department Chair
gregory.tochtrop@case.edu

The Department of Chemistry is the largest department representing the chemical sciences at Case Western Reserve University. It consists of 19 faculty members, 15 associated faculty, about 5 postdoctoral associates, approximately 60 graduate students, and over 100 undergraduate students majoring in chemistry. The department offers undergraduate and graduate degree programs leading to the Bachelor of Arts, Bachelor of Science, Master of Science, and Doctor of Philosophy.

The general focus of chemistry is on (1) understanding the basic properties of matter, (2) employing this knowledge in the design, synthesis, and characterization of materials with novel and useful properties, and (3) using chemical perspectives and tools to better understand biological systems. The various degree programs strive to develop all aspects of the student's chemical knowledge through a broad range of lecture and laboratory courses.

Chemical research is an integral part of the department's activities: over $3 million of federal, state, and private research support flows into the department each year. State-of-the-art research facilities are available to both graduate and undergraduate students. Undergraduates are encouraged to participate in research projects with individual faculty members in order to expand their hands-on training, problem-solving skills, and understanding of the scientific method as applied in chemical research. These research projects typically involve interchange and collaboration across all levels of experience and may also involve scientists from other departments and institutions.

Chemistry is often referred to as "the central science" because of its key role in interdisciplinary studies. Correspondingly, a degree in chemistry affords a broad range of employment opportunities. Chemists can direct their talents to specialized problems of applied research, or they can choose to delve into fundamental investigations. A degree in chemistry can cover the spectrum of chemical specialties, from biochemistry to interstellar chemistry. The degree also provides valuable preparation for other professions, such as medicine, dentistry, and law.

The American Chemical Society (http://www.acs.org), with more than 160,000 members, is the major professional society in the United States for practicing chemists. Both undergraduate and graduate students may join the society.

Facilities

The department's facilities for experimental and theoretical research are modern and extensive. They include diverse major instruments for use by faculty and students, as well as specialized equipment serving individual research groups. Shared instrumentation includes 400- and 500-MHz NMR spectrometers and ultrafast laser systems in both the Center for Chemical Dynamics and the newly established Ultrafast Laser Facility.

Other departmental instrumentation includes equipment for laser Raman spectroscopy, GC-MS and LC-MS/MS mass spectrometers, calorimeters, stopped-flow kinetics instrumentation, a circular dichroism spectrometer, an analytical ultracentrifuge, and equipment for electrochemical measurements. Access to very high-field NMR instrumentation is available on campus at the Cleveland Center for Membrane Structural Biology (CCMSB), which is equipped with numerous 500- to 900-MHz NMR spectrometers for solution and solid-state measurements. The chemistry department's computers are part of the campus-wide fiber optic communications network operated by Information Technology Services, and the entire University Circle area offers wireless access. In addition to the full complement of software, Internet, and library database services offered by the university, connections to off-site databases, such as SciFinder and Ohio Supercomputer Center, are available to departmental users.

The department uses some of the foremost equipment available in high-resolution nuclear magnetic resonance spectroscopy and in tunable laser spectroscopy. Work on various aspects of chemistry as studied by these techniques is recognized throughout the world.

Primary Faculty

Gregory P. Tochtrop, PhD
(Washington University Medical School)
Professor and Chair
Biochemistry, biophysical chemistry, chemical biology, medicinal chemistry, organic chemistry, bioorganic chemistry, synthesis

Clemens Burda, PhD
(University of Basel, Switzerland)
Chemical Professor
Photochemistry, materials, physical chemistry, nanochemistry, bio- and energy applications, biophysical and biomedical science and engineering, spectroscopy

Carlos E. Crespo-Hernández, PhD
(University of Puerto Rico)
Professor; Associate Dean for Research
Analytical chemistry, biophysical chemistry, energy, photochemistry, physical chemistry, chemical dynamics and kinetics, computational chemistry, environmental chemistry, time-resolved spectroscopy

Thomas G. Gray, PhD
(Harvard University)
Professor
Inorganic, Organometallic, Materials, and Computational Chemistry

Irene Lee, PhD
(Pennsylvania State University)
Professor
Biochemistry, medicinal chemistry, bioorganic chemistry
Fu-Sen Liang, PhD  
(The Scripps Research Institute)  
Associate Professor  
Bioorganic chemistry

Drew A. Meyer, PhD  
(Stanford University)  
John Teagle Professorial Fellow in Chemistry; Senior Instructor  
Physical chemistry, inorganic chemistry, X-ray spectroscopy, chemical education

Shane M. Parker, PhD  
(Northwestern University)  
Frank Hovorka Assistant Professor of Chemistry  
Computational and theoretical chemistry

John D. Protasiewicz, PhD  
(Cornell University)  
Hurlbut Professor of Chemistry  
Inorganic chemistry, materials and energy, organometallic chemistry, photochemistry, catalysis, computational chemistry, crystallography, electrochemistry, green chemistry, main group chemistry, molecular electronics, nanotechnology, OLEDs, optoelectronics, physical organic chemistry, polymers, solar energy, solid-state chemistry, spectroscopy, supramolecular chemistry, synthesis

Robert G. Salomon, PhD  
(University of Wisconsin, Madison)  
Charles Frederic Mabery Professor of Research in Chemistry  
Biochemistry, chemical biology, medicinal chemistry, organic chemistry, bioorganic chemistry, cellular biology, molecular biology, natural products, pharmacology, synthesis

Anna C. Samia, PhD  
(Georgia Institute of Technology)  
Associate Professor  
Analytical chemistry, inorganic chemistry, materials and energy, bioinorganic chemistry, functional nanomaterials, nanotheranostics

Geneviève Sauvé, PhD  
(California Institute of Technology)  
Professor  
Materials and energy, organic chemistry, physical chemistry, functional polymers, nanoscale morphology, organic electronics, solar energy conversion, structure-property relationships

Daniel A. Scherson, PhD  
(University of California, Davis)  
Frank Hovorka Professor of Chemistry  
Analytical chemistry, materials, physical chemistry, photochemistry, electrochemistry

Rekha R. Srinivasan, PhD  
(Case Western Reserve University)  
Senior Instructor  
Analytical chemistry, biophysical chemistry, organic chemistry, chemical education

Blanton S. Tolbert, PhD  
(University of Rochester)  
Rudolph and Susan Rense Professor of Chemistry  
Biochemistry, biophysical chemistry, structural biology

Michael G. Zagorski, PhD  
(Case Western Reserve University)  
Professor  
Biochemistry, biophysical chemistry, chemical biology, organic chemistry, beer brewing, bioorganic chemistry, drug delivery, NMR, structural biology

Lecturers

Krista Cunningham, PhD  
(The Ohio State University)  
Full-time Lecturer  
Organic chemistry, chemical education

Benjamin Sturtz, PhD  
(Case Western Reserve University)  
Full-time Lecturer  
Inorganic Chemistry

Research Faculty

Mikhail D. Linetsky, PhD  
(Academy of Science of Ukraine)  
Research Professor  
Biochemistry, chemical biology, protein chemistry, post-translational protein modification, proteomics

Secondary Faculty

Paul Carey, PhD  
(University of Sussex, UK)  
Professor, Department of Biochemistry  
Biochemistry, biophysical chemistry, microscopy/imaging, spectroscopy

Chris Dealwis, PhD  
Associate Professor, Department of Pharmacology  
Biochemistry, biophysics, enzyme catalysis, pharmacology, proteins

Thomas Gerken, PhD  
(Case Western Reserve University)  
Professor, Division of Pediatric Pulmonology  
Biochemistry, biophysical chemistry, chemical biology, glycosylation, protein chemistry, protein structure

Burcu Gurkan, PhD  
(University of Notre Dame)  
Assistant Professor, Chemical Engineering  
Chemical Engineering

Thomas Kelley, PhD  
(University of Notre Dame)  
Associate Professor, Division of Pediatric Pulmonology  
Biochemistry, medicinal chemistry, cellular biology, pharmacology

Lydia Kisley, PhD  
(Rice University)  
Assistant Professor, Department of Physics  
Experimental biophysics, soft condensed matter physics, microscopy, interfacial/surface science, nanoscience, physical chemistry/chemical physics, signal processing, image analysis
Witold K. Surewicz, PhD
(University of Lodz, Poland)
Professor, Department of Physiology and Biophysics
Biochemistry, biophysical chemistry, neurochemistry, spectroscopy

Yanming Wang, PhD
(Federal Institute of Technology, Zürich, Switzerland)
Associate Professor, Department of Radiology
Organic synthesis, molecular probes for in vivo imaging

Gary E. Wnek, PhD
(University of Massachusetts, Amherst)
The Joseph F. Toot, Jr., Professor of Engineering Professor, Macromolecular Science & Engineering
Polymeric biomaterials for drug delivery and regenerative medicine; nano- and micro-fiber fabrication; bio-mimicking approaches for polymer flammability mitigation; polymer packaging systems design; polyelectrolyte gels and elastomers; physiologically-mimicking macromolecular constructs with attention to primitive motile and irritable systems

Lei Zhu, PhD
(University of Akron)
Associate Professor, Department of Macromolecular Science & Engineering
Polymer structure and morphology, polymers for energy storage, nanocomposites, polymers for drug delivery

Emeritus Faculty
Alfred B. Anderson, PhD
(Johns Hopkins University)
Emeritus Professor
Materials, physical chemistry, electrocatalysis, interfacial phenomena, catalysis, theoretical chemistry

Mary D. Barkley, PhD
(University of California, San Diego)
Emeritus Professor and M. Roger Clapp University Professor of Arts and Sciences
Analytical chemistry, biochemistry, biophysical chemistry, medicinal chemistry, photochemistry, physical chemistry, theoretical chemistry

Malcolm E. Kenney, PhD
(Cornell University)
Emeritus Professor and Hurlbut Professor of Chemistry
Biochemistry, inorganic chemistry, materials and energy, organometallic chemistry, bioinorganic chemistry, computational chemistry, drug delivery, dyes and pigments, medicinal chemistry, nanotechnology, organosilicon chemistry, photochemistry, photodynamic therapy, polymers

Barry Miller, PhD
(Massachusetts Institute of Technology)
Frank Hovorka Professor Emeritus of Chemistry
Physical chemistry, electrochemistry

Anthony J. Pearson, PhD
(University of Aston, Birmingham, England)
Rudolph and Susan Rense Professor Emeritus of Chemistry
Organic chemistry, organometallic chemistry, catalysis, natural products, synthesis

Terry Swift, PhD
Professor Emeritus of Chemistry
Analytical chemistry

Fred L. Urbach, PhD
(Michigan State University)
Professor Emeritus of Chemistry
Analytical chemistry, biochemistry, inorganic chemistry, bioinorganic chemistry, catalysis

Majors
The Department of Chemistry offers three curricula for undergraduate majors, leading to a Bachelor of Science (BS) degree in chemistry, Bachelor of Arts (BA) degree in chemistry, or Bachelor of Arts (BA) degree in chemical biology.

Bachelor of Science in Chemistry
The BS program in chemistry is designed for students who seek professional careers in the chemical sciences and is certified by the American Chemical Society. The BS curriculum provides a rigorous background in chemistry, yet offers considerable flexibility in the senior year in the choice of electives, allowing BS majors to pursue areas of chemistry of particular interest to them in greater depth. At least three units of research (CHEM 397 / CHEM 398) are required, and up to nine units of research may be credited toward the degree.

Total Units Required for Graduation: 120

**Total Units:** 25

The chemistry elective may be any chemistry department course at the 300 level or above which is not part of the "core set," or selected courses with a strong chemistry content at the 300 level or above from other science departments. Only three units of CHEM 397 may be applied to a chemistry elective.

The technical electives may be chosen more widely from any of the physical sciences, math, or engineering courses. An additional six units of CHEM 397 may be taken as technical electives. Further additional units of CHEM 397 may be taken as free electives. Students may wish to group their electives into "tracks" of specialization in order to tailor their degree to a particular area of chemistry.

BS majors who plan to go on to graduate study may elect to take advanced courses in:

#### Inorganic Chemistry

Students can also elect to take other graduate offerings. Interdisciplinary strengths can be achieved by selecting technical electives in biochemistry, biomedical engineering, chemical engineering, macromolecular science, and materials science as well as in biology; earth, environmental, and planetary sciences; mathematics, applied mathematics, and statistics; and physics.

### Bachelor of Arts in Chemistry

The BA program in chemistry is intended for pre-professional students who plan careers in medicine, dentistry, veterinary medicine, pharmacy, or in other fields for which a baccalaureate degree in chemistry provides
appropriate training. BA majors may supplement their required courses with additional chemistry courses or may utilize the curriculum’s flexibility to develop an interdisciplinary program of their choice. Many chemistry BA majors participate in undergraduate research within the Department of Chemistry (CHEM 397 / CHEM 398) or in other science departments, including those in the medical school.

**Total Units Required for Graduation: 120**

### Bachelor of Arts in Chemical Biology

The BA program in chemical biology is intended for pre-professional students who plan careers in medicine, dentistry, veterinary medicine, pharmacy, or for individuals seeking careers that utilize chemistry to solve problems affecting living systems. A key component of the major is the flexibility imparted by fewer required courses and the integration of six credit hours of technical electives. Many chemical biology BA majors participate in undergraduate research within the Department of Chemistry (CHEM 397 / CHEM 398) or in other science departments, including those in the medical school.

**Total Units Required for Graduation: 120**

**Total Units** 18

Other sequences may be followed after consultation with the Department of Chemistry.

**Graduate Programs**

**Master of Science Programs**

The MS degree in chemistry may be obtained by completing (1) a program that includes the preparation of a master’s thesis, or (2) a program involving only course work. Both programs require a minimum of 30 units, of which up to six units may be for the master’s thesis. Course work for the master’s degree may be taken on a part-time basis, but thesis research can be undertaken only by full-time graduate students. Thus, only the master’s degree without thesis can be earned entirely on a part-time basis.

The Science and Technology Entrepreneurship Program (STEP) is a three- or four-semester professional MS degree offered in chemistry as well as in biotechnology and physics. Students enter the Chemistry Entrepreneurship program with a bachelor’s, master’s, or doctoral degree in a chemistry-related field. The program consists of advanced courses in chemistry, business, and technology innovation and an entrepreneurial project with technical content in an existing company or new venture.

**Doctor of Philosophy Program**

The PhD degree in chemistry is granted to those students who have shown an extensive knowledge of advanced chemistry and the ability to do original research. The program usually requires four years of full-time study after the bachelor’s degree. Besides advanced courses, the program consists of cumulative and oral examinations, seminars and colloquia, and an original research project. At least twelve months must
be spent in residence on campus while fulfilling the PhD thesis research requirement.

Full-time graduate students who maintain satisfactory academic performance while pursuing the PhD degree in chemistry normally receive a stipend for teaching and/or research, which includes full tuition and a monthly amount sufficient to cover living expenses.

Research
The Department of Chemistry is noted for research programs in (1) chemical biology and (2) energy and materials. Projects range from synthetic studies of important bioactive substances, including antibiotics and DNA-binding substances, to detailed examination of the surface properties of materials used in batteries and electrolytic cells. Studies are being performed with molecules as simple as oxygen and as complicated as those which describe the active centers of enzymes or the protein core of insoluble aggregates that deposit in neurodegenerative disease. Efforts are being made to understand the basic chemical properties leading to reactive mediators generated from physiological lipids.

Other research is aimed at developing new drugs for photodynamic therapy and at understanding the mechanism of action of drugs for antiretroviral therapy. The influence of metal ions in modifying reactivity is a common interest of several members of the faculty, as is the development of organometallic compounds for materials and catalysis. Chemical surfaces are being studied, as are various applications of nanoparticles, from cells to the environment. Studies designed to characterize electrode-electrolyte interfaces, the electrochemical properties of new semiconductors, and single-cell microelectrodes are also ongoing. These efforts are complemented by theoretical studies on the interfacial structure and bonding of composite materials.

Case Western Reserve University ranks among the leading universities internationally in its strengths in electrochemistry and has brought these strengths together in the Yeager Center for Electrochemical Studies (YCES) (http://chemistry.case.edu/department/research/yces/). The interdisciplinary nature of electrochemistry involves the interaction of electrochemists in the chemistry and chemical engineering departments with metallurgists, surface physicists, inorganic and organic chemists, polymer membrane chemists, and electrical engineers. Such interactions, lacking on most campuses, are promoted at Case Western Reserve University through YCES. Graduate students in the chemistry department have the opportunity to specialize in electrochemistry in one of the most extensive course and research programs in the United States.

Colloquia and Seminars
The department sponsors a rich program of colloquia and seminars on recent advances in chemical research. Most notable among these is the Frontiers in Chemistry Lecture Series, in which scientists of international distinction lecture on major discoveries and developments in chemistry. In addition, a weekly colloquium series provides lectures by invited speakers in a variety of fields of chemical investigation. Both of these programs are addressed to an audience of faculty, graduate students, and other chemical scientists in the university and the Cleveland area, and are a vital means to broaden current knowledge. Numerous other seminars and meetings are held on a more specialized and informal level. Most individual research groups conduct weekly discussions to evaluate their progress.

Courses
CHEM 105. Principles of Chemistry I. 3 Units.
Atomic structure; thermochemistry; periodicity, bonding and molecular structure; intermolecular forces; properties of solids; liquids, gases and solutions. Recommended preparation: One year of high school chemistry.

CHEM 106. Principles of Chemistry II. 3 Units.
Thermodynamics, chemical equilibrium; acid/base chemistry; oxidation and reduction; kinetics; spectroscopy; introduction to nuclear, organic, inorganic, and polymer chemistry. Prereq: CHEM 105 or CHEM 111.

CHEM 111. Principles of Chemistry for Engineers. 4 Units.
A first course in university chemistry emphasizing chemistry of materials for engineering students. Atomic theory and quantitative relationships; gas laws and kinetic theory; solutions, acid-base properties and pH; thermodynamics and equilibrium; kinetics, catalysis, and mechanisms; molecular structure and bonding. Recommended preparation: One year of high school chemistry.

CHEM 113. Principles of Chemistry Laboratory. 2 Units.
A one semester laboratory based on quantitative chemical measurements. Experiments include analysis, synthesis and characterization, thermochemistry and chemical kinetics. Computer analysis of data is a key part of all experiments. Prereq or Coreq: CHEM 105 or CHEM 106 or CHEM 111 or ENGR 145.

CHEM 119. Concepts for a Molecular View of Biology I. 3 Units.
The first semester of a two-course sequence in elementary inorganic, organic, and biochemistry, intended for nursing students or non-majors. Topics include: atomic theory, the periodic table, chemical bonds, molecular geometry, ideal gas laws, equilibrium and reaction rates, acids and bases, nuclear chemistry, and nomenclature and reactions of organic compounds (including alkyl, aryl, alcohol, carbonyl, and amino compounds). Problems involving numeric computation are emphasized. This course is not open to students with credit for CHEM 105 or CHEM 111.

CHEM 121. Concepts for a Molecular View of Biology II. 3 Units.
The second course of a two-semester sequence in elementary inorganic, organic, and biochemistry, intended for nursing students or non-majors. Topics include: carbohydrates, lipids, proteins, enzymes and enzymes, metabolic pathways and bioenergetics, DNA and RNA, methods of molecular biology, and nutrition. Applications to human physiology and medicine emphasized. This course is not open to students with credit for CHEM 223 or CHEM 323. Prereq: CHEM 119.

CHEM 223. Introductory Organic Chemistry I. 3 Units.
Introductory course for science majors and engineering students. Develops themes of structure and bonding along with elementary reaction mechanisms. Includes treatment of hydrocarbons, alkyl halides, alcohols, and ethers as well as an introduction to spectroscopy. Prereq: CHEM 106 or ENGR 145.

CHEM 224. Introductory Organic Chemistry II. 3 Units.
Continues and extends themes of structure and bonding from CHEM 223 and continues spectroscopy and more complex reaction mechanisms. Includes treatment of aromatic rings, carbonyl compounds, amines, and selected special topics. Prereq: CHEM 223 or CHEM 323.

CHEM 233. Introductory Organic Chemistry Laboratory I. 2 Units.
An introductory organic laboratory course emphasizing microscale operations. Synthesis and purification of organic compounds, isolation of natural products, and systematic identification of organic compounds by physical and chemical methods. Prereq: (CHEM 106 or ENGR 145) and CHEM 113. Prereq or Coreq: CHEM 223 or CHEM 323.
CHEM 234. Introductory Organic Chemistry Laboratory II. 2 Units.
A continuation of CHEM 233, involving multi-step organic synthesis, peptide synthesis, product purification and analysis using sophisticated analytical techniques such as chromatography and magnetic resonance spectroscopy. Prereq: CHEM 233. Prereq or Coreq: CHEM 224

CHEM 290. Chemical Laboratory Methods for Engineers. 3 Units.
Techniques of chemical synthesis, analysis, and characterization. Uses students' backgrounds in general and organic chemistry, but requires no background in chemical laboratory operations. Prereq or Coreq: CHEM 223 or CHEM 323.

CHEM 301. Introductory Physical Chemistry I. 3 Units.
First of a two-semester sequence covering principles and applications of physical chemistry, intended for chemistry and engineering majors and other students having primary interests in biochemical, biological or life-science areas. States and properties of matter, Thermodynamics and its application to chemical and biochemical systems. Chemical equilibrium, Electrochemistry. Recommended preparation: One year of undergraduate physics and calculus, preferably including partial derivatives. Prereq: CHEM 106 or ENGR 145.

CHEM 302. Introductory Physical Chemistry II. 3 Units.
Continuation of CHEM 301. Chemical kinetics and catalysis, Introductory quantum chemistry, Spectroscopy, Statistical thermodynamics. Prereq: CHEM 301 or CHEM 335.

CHEM 304. Quantitative Analysis Laboratory. 2 Units.
A one-semester laboratory course providing practical experience in the analytical process. Focus is on statistical error analysis of measurements, method validation and instrument calibration, and reporting. Basic laboratory skills are developed and evaluated based on accuracy and precision of measurements. Experiments using titration, spectroscopy, electrochemistry, liquid and gas chromatography, and mass spectrometry are conducted. Prereq: (CHEM 106 or ENGR 145) and CHEM 113. Coreq: CHEM 310.

CHEM 305. Introductory Physical Chemistry Laboratory. 3 Units.
A one-semester laboratory course focusing on the principles and quantitative characterization of chemical and biochemical systems. Experiments include chemical equilibrium kinetics, electrochemistry, spectroscopy and the use of computers for the statistical analysis of experimental data. Seminar discussions and disciplinary writing of results. Counts as SAGES Departmental Seminar. Prereq: CHEM 301 and CHEM 304 or CHEM 335. Or Prereq or Coreq: CHEM 302 or CHEM 336.

CHEM 306. Biochemistry Laboratory. 3 Units.
A one semester laboratory and lecture course developed to introduce students to a variety of chemical biology laboratory themes including buffering, identification of amino acids, immunoassay, ligand binding, cellular fractionation, enzyme isolation and purification, proteomics, and enzyme kinetics. Techniques include titration, various forms of chromatography, colorimetric assays, electrophoresis, high performance liquid chromatography and liquid chromatography coupled with tandem mass spectrometry. Recommended preparation: CHEM 328/CHEM 428. Counts as SAGES Departmental Seminar. Prereq: CHEM 233.

CHEM 310. Foundations of Analytical Chemistry. 3 Units.
A one-semester lecture covering classical and modern aspects of the analytical process; analysis requirements, method selection including capabilities and limitations, sampling and sample processing, measurement data statistics for evaluation of precision and accuracy, method validation, and reporting. Fundamental concepts in equilibrium thermodynamics are covered in the context of chemical analysis. Methods based on titration, spectroscopy, electrophoresis, chromatography, and mass spectrometry are emphasized. Prereq: CHEM 106 and CHEM 113. Coreq: CHEM 304.

CHEM 311. Inorganic Chemistry I. 3 Units.
Fundamentals of inorganic chemistry. Topics include molecular structure, molecular shape and symmetry, structure of solids, d-metal complexes, oxidation and reduction, and acids and bases. Prereq or Coreq: CHEM 224 or CHEM 324.

CHEM 314. Innovation and French Science: Past, Present, and Future. 3 Units.
The French scientific enterprise over the past 250 years has been buffeted by politics, war, civil unrest, and economic and societal changes. This study abroad course examines the evolution of science in France in light of these influences, how women have played an outsized role relative to the U.S., and the centrality of the French to humanity’s scientific endeavor over the centuries. Students will visit many important scientific venues, both historical and modern, around Paris and elsewhere in the country. Readings from a variety of sources -- scientific, literary, historical -- and informal meetings with French scientists, engineers, and students will provide a comprehensive portrait of French science and scientific history from a variety of perspectives. The course will be conducted in English, although there is ample opportunity to interact in French if the student desires. The course meets the CAS Global & Cultural Diversity Requirement and may meet breadth requirements in certain programs. Not available for credit to students who have completed FRCH 328/428, PHYS 333, WGST 333, or WLIT 353/453. Offered as CHEM 314, HSTY 314, PHYS 314, and WGST 314. Counts for CAS Global & Cultural Diversity Requirement.

CHEM 316. Frontiers of Inorganic Chemistry. 3 Units.
This course deals with five topics in inorganic chemistry of current interest. The topics are: ways in which inorganic chemistry can increase the quality of the environment, methods by which inorganic chemistry can lead to sustainable processes in a developed industrial society, advances in bioinorganic and medicinal inorganic chemistry of clinical importance, modern inorganic materials with unusual and valuable property sets, and representative industrial inorganic research and production processes. It is to be team taught. Offered as CHEM 316 and CHEM 416.

CHEM 322. Laboratory Methods in Organic Chemistry. 3 Units.
Experimental approach to the synthesis, purification and characterization of organic compounds. Nuclear magnetic resonance (NMR) and infrared (IR) spectroscopies; chromatographic techniques. Prereq: CHEM 304 and CHEM 223 or CHEM 323. Prereq or Coreq: CHEM 224 or CHEM 324.

CHEM 323. Organic Chemistry I. 3 Units.
Relationships between molecular structure and chemical reactivity and development of sophisticated problem-solving skills in the context of organic reaction mechanisms and multi-step synthesis. Homolytic and heterolytic substitution, elimination, oxidation and reduction reactions; topics in stereochemistry and spectroscopy. Recommended for chemistry, biochemistry, and related majors. Prereq: CHEM 106 or ENGR 145.
CHEM 324. Organic Chemistry II. 3 Units.
Continuation of CHEM 323. Introduces the chemistry of carbonyl, aromatic and amino functional groups, and develops the concepts of conjugation and resonance, molecular orbital theory and pericyclic reactions. Prereq: CHEM 223 or CHEM 323.

CHEM 325. Physical Methods for Determining Organic Structure. 3 Units.
Structure determination of organic compounds using mass spectrometry and modern instrumental techniques such as infrared, ultraviolet, visible, and nuclear magnetic resonance spectroscopy. Recommended preparation: Two semesters of undergraduate organic chemistry. Offered as CHEM 325 and CHEM 425.

CHEM 328. Introductory Biochemistry I. 3 Units.

CHEM 329. Biochemistry II: Living Systems. 3 Units.

CHEM 331. Laboratory Methods in Inorganic Chemistry. 3 Units.
Synthesis, separation techniques, physical properties, and analysis. Advanced techniques of chemical synthesis, leading the student to the preparation of interesting inorganic and organometallic compounds. Offered as: CHEM 331 and CHEM 431. Prereq: CHEM 322.

CHEM 332. Laboratory Methods in Physical Chemistry. 3 Units.

CHEM 333. Medicinal Chemistry and Drug Development. 3 Units.
This course provides an overview on how principles in chemistry and biology are integrated to facilitate drug development. Primary emphasis will be placed on the development of organic molecules as drugs and metabolic enzymes as drug targets. Subjects pertinent to the introduction of medicinal chemistry, evaluation of drug efficacies in vitro and in vivo, and drug metabolism will be covered. Offered as CHEM 333 and CHEM 433. Prereq: CHEM 223 or CHEM 323 and BIOL 215. Coreq: CHEM 224 or CHEM 324.

CHEM 335. Physical Chemistry I. 3 Units.
First of a two-semester sequence of physical chemistry for chemistry majors and others with career goals in the physical sciences or engineering. Thermodynamics and its application to chemical systems: First Law, Heat, Work, internal energy, State functions, Thermochemistry, Entropy, 2nd and 3rd law of thermodynamics, Chemical equilibrium, Real Gases, Phase diagrams, ideal and real solutions, Electrolyte solutions, and Electrochemical cells, batteries and fuel cells. Introduction to chemical kinetics. This class is taught using the flipped classroom strategy, where students are expected to learn the basic concepts before class by reading relevant notes and textbook sections, as well as watching videos and answering pre-class questions. In class, students work on exercises and solving problems. Students have ample opportunities to clarify concepts, ask questions, and learn from both peers (in group settings) and the teacher. Recommended preparation: One year each of undergraduate physics and calculus, including partial derivatives. Prereq: CHEM 106 or ENGR 145.

CHEM 336. Physical Chemistry II. 3 Units.

CHEM 340. Solar Energy Conversion. 3 Units.
This is a multidisciplinary course from a chemist’s point of view. This course teaches the background necessary to read and understand the scientific literature on solar energy conversion, and includes some basic device physics, materials chemistry and chemistry. Topics provide an overview of the field and includes: Global energy perspective, principles of photovoltaics, crystalline solar cells, thin-film solar cells, dye-sensitized solar cells, organic solar cells (with emphasis on polymer-based solar cells), photocatalyst cells and artificial photosynthesis for fuel production, and semiconductor nanostructures and quantum dots for solar energy conversion. The course includes three laboratories and a demo using state-of-the-art equipment, as well as presentations of recent research articles by the graduate students. It is recommended that students have experience with thermodynamics. The following CWRU courses would meet this expectation: CHEM 301, CHEM 335, ENGR 225 or PHYS 313. Offered as CHEM 340 and CHEM 440. Prereq: CHEM 106 or ENGR 145.

CHEM 341. Functional Nanomaterials. 3 Units.
This course is designed to introduce important concepts on the fundamental physical and chemical properties of technologically important nanometer scale materials. The course will cover an overview of the scientific principles pertaining to new properties at the nanoscale; synthesis and characterization tools; and existing and emerging applications of nanomaterials. It will center on current research developments on major classes of functional nanomaterials, including plasmonic nanoparticles, quantum dots, nanomagnets, carbon nanotubes, nanocatalysts and hybrid inorganic/organic nanostructures. In addition an emphasis will be placed on understanding the broader societal, economical and environmental impact of the scientific and technological advances brought forward by nanotechnology. Offered as CHEM 341 and CHEM 441.

CHEM 342. Computational Chemistry. 3 Units.
An introduction to computational methods in electronic structure. Molecular mechanics, semiempirical molecular orbital calculations, ab initio, post Hartree-Fock, density-functional theories, and hybrid approaches will be addressed. Continuum solvation calculations will be considered, time permitting. Offered as CHEM 342 and CHEM 442. Prereq: CHEM 223 or CHEM 323.
CHEM 344. The Chemistry and Physics of Energy Storage. 3 Units.
This course will cover both scientific and economic aspects of the operation of energy storage devices currently being considered for both small and large scale applications ranging from portable electronics to the electrical grid. These devices include pumped hydro, flywheel, compressed air, batteries, supercapacitors, thermal conversion, regenerative fuel cells and redox flow cells. Not to be included in this course are energy conversion devices such as photovoltaics and windmills. This course would be of interest to both undergraduate and graduate students with interest in the general area of energy management and will cover the physics and chemistry principles associated with the various modes of storage. Students either individually or in small groups will be expected to prepare a written document at the end of the course that describes and summarizes each mode of storage, including a discussion of all aspects of the technology such as costs of installation and operation, environmental impact, and economic projections. As part of this exercise students will become familiar with the extraordinary resources offered by our library. Offered as CHEM 344 and CHEM 444. Prereq: CHEM 106.

CHEM 348. Chemistry Fermentation Brewing: To Discern the Molecular Basis of Fermentation and Beer Brewing. 3 Units.
This course includes in-depth discussions of the chemistry and procedures underlying either an aspect of the brewing process or a style of beer in order to discern the molecular basis of fermentation and beer brewing. The biochemistry of yeast fermentation and hops, as well as mashing, lautering, boiling, conditioning, filtering, and packaging will be discussed. There is no lab component (such as brewing beer), although field trips to pubs including the Jolly Scholar pub (located on campus) will be part of the course, as well as invited speakers who have set up local microbreweries. Each student will be expected to have basic background knowledge of chemistry, such as material taught in standard first year General Chemistry courses. Offered as CHEM 348 and CHEM 448. Prereq: CHEM 106 or ENGR 145.

CHEM 350. Modern Molecular Spectroscopy: Study of the Interactions Between Light and Matter. 3 Units.
This course is aimed to provide a modern treatment of molecular spectroscopy for physical chemists and for other related areas of interest. At the same time, it will attempt to serve the more generally interested science and engineering student to learn about the many interactions that light undergoes with matter. Offered as CHEM 350 and CHEM 450. Prereq: CHEM 302 or CHEM 310 or CHEM 336.

CHEM 395. Chemistry Colloquium Series. 1 Unit.
Course content provided by Thursday chemistry department colloquia (or Frontiers in Chemistry lectures). Discussion sessions review previous lectures and lay foundation for forthcoming lectures.

CHEM 397. Undergraduate Research. 1 - 6 Units.
Independent research project within a research group in the chemistry department or, by petition, within a research group in another Case department. Arrangements should be made with the faculty member selected. Open to all chemistry majors and other qualified students; required for Honors in Chemistry. A written report is required each semester.

CHEM 398. Undergraduate Research/Senior Capstone Project. 3 - 6 Units.
Independent research project within a research group in the chemistry department or, by petition, within a research group in another Case department. Arrangements should be made by consultation with the faculty member selected and the Senior Capstone Committee of the chemistry department. Open to all chemistry majors and other qualified students. Satisfies the research requirement for Honors in Chemistry. A written report and public oral presentations are required. Counts as SAGES Senior Capstone.

CHEM 406. Chemical Kinetics. 3 Units.
Theory and characterization of chemical rate processes. Recommended preparation: Two semesters of undergraduate physical chemistry.

CHEM 407. Chemical Thermodynamics. 3 Units.
Thermodynamics and statistical thermodynamics and their application to chemical problems. Recommended preparation: Two semesters of undergraduate physical chemistry.

CHEM 412. Advanced Inorganic Chemistry I. 3 Units.
Chemistry of inorganic systems. Spectroscopy, magnetism, and stereochemistry of transition metal compounds. Recommended preparation: One semester of undergraduate inorganic chemistry and two semesters of undergraduate physical chemistry.

CHEM 414. Organometallic Reactions and Structures. 3 Units.
Bonding, structure, and mechanistic aspects of organometallic chemistry and the relevance of organometallic species to chemical catalysis. Recommended preparation: One semester of undergraduate inorganic chemistry.

CHEM 416. Frontiers of Inorganic Chemistry. 3 Units.
This course deals with five topics in inorganic chemistry of current interest. The topics are: ways in which inorganic chemistry can increase the quality of the environment, methods by which inorganic chemistry can lead to sustainable processes in a developed industrial society, advances in bioinorganic and medicinal inorganic chemistry of clinical importance, modern inorganic materials with unusual and valuable property sets, and representative industrial inorganic research and production processes. It is to be team taught. Offered as CHEM 316 and CHEM 416.

CHEM 421. Advanced Organic Chemistry I. 3 Units.

CHEM 422. Advanced Organic Chemistry II. 3 Units.

CHEM 425. Physical Methods for Determining Organic Structure. 3 Units.
Structure determination of organic compounds using mass spectrometry and modern instrumental techniques such as infrared, ultraviolet, visible, and nuclear magnetic resonance spectroscopy. Recommended preparation: Two semesters of undergraduate organic chemistry. Offered as CHEM 325 and CHEM 425.
CHEM 428. Introductory Biochemistry I. 3 Units.

CHEM 429. Biochemistry II: Living Systems. 3 Units.

CHEM 431. Laboratory Methods in Inorganic Chemistry. 3 Units.
Synthesis, separation techniques, physical properties, and analysis. Advanced techniques of chemical synthesis, leading the student to the preparation of interesting inorganic and organometallic compounds. Offered as: CHEM 331 and CHEM 431. Prereq: CHEM 322

CHEM 433. Medicinal Chemistry and Drug Development. 3 Units.
This course provides an overview on how principles in chemistry and biology are integrated to facilitate drug development. Primary emphasis will be placed on the development of organic molecules as drugs and metabolic enzymes as drug targets. Subjects pertinent to the introduction of medicinal chemistry, evaluation of drug efficacies in vitro and in vivo, and drug metabolism will be covered. Offered as CHEM 333 and CHEM 433.

CHEM 435. Synthetic Methods in Organic Chemistry. 3 Units.

CHEM 436. Complex Molecular Synthesis. 3 Units.
An advanced organic chemistry course providing students with an in-depth examination of the art of total synthesis drawing from both classical and recent examples. Recommended preparation: Two semesters of undergraduate organic chemistry.

CHEM 438. Bioorganic and Environmental Photochemistry. 3 Units.
This discusses the fundamental principles of molecular and supramolecular photochemistry. In particular, the fundamental paradigms of light absorption by molecules and the photochemical and photophysical mechanisms by which molecules dispose of the excess energy after light absorption will be described. The goal is to develop paradigms for understanding experimental and theoretical aspects of molecular photophysics relevant to bioorganic, supramolecular, and environmental photochemistry, as well as to other light-induced processes such as photosynthesis, photocatalysis, and photovoltaics. The paradigms for determining photochemical mechanisms, the theory of the fundamental photochemical primary processes, and examples of important photochemical primary processes will be reviewed. Selected experimental techniques and theoretical methods used to probe the dynamics of electronic excited states in molecules and their photoreactivity will be presented. Advanced photochemical applications for understanding the electronic relaxation pathways and photochemistry of selected families of bioorganic molecules and environmental pollutants in natural waters will be discussed. Recommended Preparation: Chemical Kinetics (CHEM 406 or equivalent) and Elementary Differential Equations (MATH 224 or equivalent). Prereq: CHEM 336 and MATH 124.

CHEM 440. Solar Energy Conversion. 3 Units.
This is a multidisciplinary course from a chemist's point of view. This course teaches the background necessary to read and understand the scientific literature on solar energy conversion, and includes some basic device physics, materials chemistry and chemistry. Topics provide an overview of the field and includes: Global energy perspective, principles of photovoltaics, crystalline solar cells, thin-film solar cells, dye-sensitized solar cells, organic solar cells (with emphasis on polymer-based solar cells), photoelectrochemical cells and artificial photosynthesis for fuel production, and semiconductor nanostructures and quantum dots for solar energy conversion. The course includes three laboratories and a demo using state-of-the-art equipment, as well as presentations of recent research articles by the graduate students. It is recommended that students have experience with thermodynamics. The following CWRU courses would meet this expectation: CHEM 301, CHEM 335, ENGR 225 or PHYS 313. Offered as CHEM 340 and CHEM 440.

CHEM 441. Functional Nanomaterials. 3 Units.
This course is designed to introduce important concepts on the fundamental physical and chemical properties of technologically important nanometer scale materials. The course will cover an overview of the scientific principles pertaining to new properties at the nanoscale; synthesis and characterization tools; and existing and emerging applications of nanomaterials. It will center on current research developments on major classes of functional nanomaterials, including plasmonic nanoparticles, quantum dots, nanomagnets, carbon nanotubes, nanocatalysts and hybrid inorganic/organic nanostructures. In addition an emphasis will be placed on understanding the broader societal, economical and environmental impact of the scientific and technological advances brought forward by nanotechnology. Offered as CHEM 341 and CHEM 441.

CHEM 442. Computational Chemistry. 3 Units.
An introduction to computational methods in electronic structure. Molecular mechanics, semiempirical molecular orbital calculations, ab initio, post Hartree-Fock, density-functional theories, and hybrid approaches will be addressed. Continuum solvation calculations will be considered, time permitting. Offered as CHEM 342 and CHEM 442. Prereq: CHEM 223 or CHEM 323.
CHEM 444. The Chemistry and Physics of Energy Storage. 3 Units.
This course will cover both scientific and economic aspects of the operation of energy storage devices currently being considered for both small and large scale applications ranging from portable electronics to the electrical grid. These devices include pumped hydro, flywheel, compressed air, batteries, supercapacitors, thermal conversion, regenerative fuel cells and redox flow cells. Not to be included in this course are energy conversion devices such as photovoltaics and windmills. This course would be of interest to both undergraduate and graduate students with interest in the general area of energy management and will cover the physics and chemistry principles associated with the various modes of storage. Students either individually or in small groups will be expected to prepare a written document at the end of the course that describes and summarizes each mode of storage, including a discussion of all aspects of the technology such as costs of installation and operation, environmental impact, and economic projections. As part of this exercise students will become familiar with the extraordinary resources offered by our library. Offered as CHEM 344 and CHEM 444. Prereq: CHEM 106.

CHEM 445. Electrochemistry I. 3 Units.
Electrochemical properties and processes of electrode/electrolyte interfaces. Fundamental background for work in corrosion, electrodeposition, industrial electrolysis, electro-organic synthesis, batteries, fuel cells, and photoelectrochemical energy conversion. Recommended preparation: One semester of undergraduate physical chemistry.

CHEM 446. Quantum Mechanics I. 3 Units.
Introduction of quantization, measurement and the Schrodinger equation; angular momentum and states of molecules. Perturbation theory, spectroscopy and chemical bonding. Variational theory and calculations of molecular properties. Recommended preparation: Two semesters of undergraduate physical chemistry. Offered as CHEM 335 and CHEM 446.

CHEM 448. Chemistry Fermentation Brewing: To Discern the Molecular Basis of Fermentation and Beer Brewing. 3 Units.
This course includes in-depth discussions of the chemistry and procedures underlying either an aspect of the brewing process or a style of beer in order to discern the molecular basis of fermentation and beer brewing. The biochemistry of yeast fermentation and hops, as well as mashing, lautering, boiling, conditioning, filtering, and packaging will be discussed. There is no lab component (such as brewing beer), although field trips to pubs including the Jolly-Scholar pub (located on campus) will be part of the course, as well as invited speakers who have set up local microbreweries. Each student will be expected to have basic background knowledge of chemistry, such as material taught in standard first year General Chemistry courses. Offered as CHEM 348 and CHEM 448. Prereq: CHEM 106 or ENGR 145.

CHEM 450. Modern Molecular Spectroscopy: Study of the Interactions Between Light and Matter. 3 Units.
This course is aimed to provide a modern treatment of molecular spectroscopy for physical chemists and for other related areas of interest. At the same time, it will attempt to serve the more generally interested science and engineering student to learn about the many interactions that light undergoes with matter. Offered as CHEM 350 and CHEM 450. Prereq: CHEM 446.

CHEM 455. Protein Biophysics. 3 Units.
This course focuses on in-depth understanding of the molecular biophysics of proteins. Structural, thermodynamic and kinetic aspects of protein function and structure-function relationships will be considered at the advanced conceptual level. The application of these theoretical frameworks will be illustrated with examples from the literature and integration of biophysical knowledge with description at the cellular and systems level. The format consists of lectures, problem sets, and student presentations. A special emphasis will be placed on discussion of original publications. Offered as BIOL 475, CHEM 475, PHOL 475, PHRM 475, and NEUR 475.

CHEM 506. Special Topics in Physical Chemistry. 1 - 6 Units.
(Credit as arranged.) Lectures on advanced topics in physical chemistry presented by staff or visiting lecturers. Course title, content, and credit change from year to year.

CHEM 507. Special Readings in Chemistry. 1 - 6 Units.
Detailed study of a special topic in chemistry under the guidance of a faculty member.

CHEM 508. Special Readings in Chemistry. 1 - 6 Units.
Detailed study of a special topic in chemistry under the guidance of a faculty member.

CHEM 601. Research. 1 - 18 Units.
(Credit as arranged.) Special research in an area of chemistry under the guidance of a faculty member.

CHEM 605. Chemistry Colloquium Series. 0 Unit.
Course content provided by Thursday chemistry department colloquia (or Frontiers in Chemistry lectures). Discussion sessions review previous lectures and lay foundation for forthcoming lectures.

CHEM 651. Thesis M.S.. 1 - 18 Units.
(Credit as arranged.)

CHEM 701. Dissertation Ph.D.. 1 - 9 Units.
(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

Childhood Studies Program

615 Crawford Hall
schubert.case.edu/education/childhood-studies-minor/ (http://schubert.case.edu/education/childhood-studies-minor/)
Phone: 216.368.0540
Anastasia Dimitropoulos, Director, Schubert Center for Child Studies
axd116@case.edu

The Childhood Studies Program is an educational opportunity for undergraduate students interested in a wide array of issues concerning children and the experience of childhood. This interdisciplinary minor focuses on the life stages of infancy through adolescence and enables students to pursue interests in parenting, child development, gender, the life course, and the place of children in society and culture.

For students interested in exploring historical and contemporary U.S. policy and how it impacts children, young people, and families, the program offers a unique curriculum through the Child Policy Pathway. This specialization begins with CHST 301 Public Policy in Child Development, a foundational course that introduces students to central public policy issues, basic principles of policy research, policy analysis, research-informed policy development, and advocacy. The Pathway also offers an experiential learning course on policy-making that includes a trip to Washington, D.C., and an externship at a local organization—a
hands-on opportunity to work directly with professionals who design and implement policies that impact the lives of children and their families.

Policy areas of focus include:

- Child poverty and family economic asset-building
- Educational disparities and student supports
- Physical, mental, and social determinants of health
- Child welfare and well-being
- Legal systems and juvenile justice

While the Childhood Studies Program and minor are situated in the College of Arts and Sciences, children and childhood are a focus of research and teaching in units throughout the university, including the School of Medicine; the Jack, Joseph and Morton Mandel School of Applied Social Sciences; the School of Law; the School of Dental Medicine; and the Frances Payne Bolton School of Nursing.

The Childhood Studies Program is associated with the Schubert Center for Child Studies, which bridges research, practice, policy, and education for the well-being of children and adolescents. The Center sponsors research, lectures, and programs on children and childhood and provides opportunities for student involvement in research, education, and policy.

Program Advisors

Gabriella Celeste, JD
Adjunct Assistant Professor, Department of Anthropology; Policy Director, Schubert Center for Child Studies; Co-Director and Minor Advisor, Childhood Studies Program

Anastasia Dimitropoulos, PhD
Associate Professor, Department of Psychological Sciences; Director, Schubert Center for Child Studies; Co-Director and Minor Advisor, Childhood Studies Program

Jill E. Korbin, PhD
Lucy Adams Leffingwell Professor, Department of Anthropology; Senior Advisor, Schubert Center for Child Studies; Co-Director and Minor Advisor, Childhood Studies Program

Sonia Minnes, PhD
Professor, Jack, Joseph and Morton Mandel School of Applied Social Sciences; Research Director, Schubert Center for Child Studies

Elizabeth Short, PhD
Professor, Department of Psychological Sciences; Co-Director and Minor Advisor, Childhood Studies Program

Undergraduate Program

Minor

The undergraduate minor in Childhood Studies is built on a foundation in the social sciences. It is also suited, however, to students interested in exploring childhood from the perspectives of the natural sciences, the humanities, or the arts. The minor requires a minimum of 15 hours of course work; the courses must be taken in at least two different departments.

The courses listed below are accepted toward the minor. Other courses may be accepted with approval from the program advisors.

Independent studies or one-time course offerings approved by the program advisors are also accepted toward the minor.

* No more than four hours of practicum experience can count toward the minor.

**NOTE:** Students may count up to six of the hours they complete for the Childhood Studies minor toward a major in another field. If they are pursuing more than one major, they may count up to six hours toward each one.
Courses

CHST 301. Public Policy in Child Development. 3 Units.
This course introduces students to issues in public policy that impact children and families. Local, state, and federal child policy will be considered, and topics will include, for example, policies related to child poverty, education, child welfare, juvenile justice, and children's physical and mental health. Students will learn how policy is developed, how research informs policy and vice versa, and a framework for analyzing social policy. Recommended preparation: One social sciences course or consent. Offered as ANTH 305, ANTH 405, CHST 301, CHST 401, and POSC 382A.

CHST 302. Experiential Learning in Child Policy. 3 Units.
Focus on state and federal legislative policy impacting children, youth, and families. Course includes an experiential learning component at the state or federal level and a travel experience to either Columbus, OH or Washington, DC to learn firsthand how policy is formed. Students may take this course twice for credit. Offered as ANTH 307 and CHST 302.

CHST 398. Child Policy Externship. 3 Units.
Externships offered through CHST 398/ANTH 308 give students an opportunity to work directly with professionals who design and implement policies that impact the lives of children and their families. Agencies involved are active in areas such as public health, including behavioral health, education, juvenile justice, childcare and/or child welfare. Students apply for the externships, and selected students are placed in local public or nonprofit agencies with a policy focus. Each student develops an individualized learning plan in consultation with the Childhood Studies Program faculty and the supervisor in the agency. CHST 398/ANTH 308 is a 3 credit-hour course and may be taken twice for a total of 6 credit hours. Offered as CHST 398 and ANTH 308. Prereq: CHST 301.

CHST 398C. Child Policy Externship and Capstone. 3 Units.
Externships offered through CHST/ANTH/PSCL 398C give students an opportunity to work directly with professionals who design and implement policies that impact the lives of children and their families. Agencies involved are active in areas such as public health, including behavioral health, education, juvenile justice, childcare and/or child welfare. Students apply for the externships, and selected students are placed in local public or nonprofit agencies with a policy focus. Each student develops an individualized learning plan in consultation with the Childhood Studies Program faculty and the supervisor in the agency. Offered as CHST 398C, ANTH 398C, and PSCL 398C. Counts as SAGES Senior Capstone. Prereq: CHST 301.

CHST 399. Independent Study. 1 - 6 Units.
Students propose topics for independent reading and research.

CHST 401. Public Policy in Child Development. 3 Units.
This course introduces students to issues in public policy that impact children and families. Local, state, and federal child policy will be considered, and topics will include, for example, policies related to child poverty, education, child welfare, juvenile justice, and children's physical and mental health. Students will learn how policy is developed, how research informs policy and vice versa, and a framework for analyzing social policy. Recommended preparation: One social sciences course or consent. Offered as ANTH 305, ANTH 405, CHST 301, CHST 401, and POSC 382A.

Department of Classics

Mather House
http://classics.case.edu
Phone: 216.368.2348; Fax: 216.368.4681
The core of the Classics major is the study of the languages and literatures of ancient Greece and Rome and the societies that spoke Greek and Latin until the end of the ancient world (usually taken as the 5th century of the Common Era). The major uniquely offers exposure to a range of approaches: literary, philological, historical, archaeological, art historical, philosophical, and anthropological. In addition, we now offer several courses on the Ancient Near East and Egypt for a wider perspective on the ancient world.

**Major Concentrations**

There are two separate concentrations in the Classics major. **Philology** (Concentration A) is devoted to ancient languages and their associated literatures in the original languages (Greek, Latin, or Greek and Latin). **Classical Civilization** (Concentration B) focuses on ancient history, literature in translation, and archaeology. Please note that for Concentration B, students must complete study of either Greek or Latin to at least the intermediate level.

Each track requires 10 courses (30 hours), and at least two of these courses must be at the 300 level. For students who elect to complete their junior and senior year SAGES requirements in Classics, two additional courses (6 hours) are required, CLSC 320 Alexander the Great: Materials and Methods and CLSC 381 Classics Senior Capstone. (CLSC 320 may count as one of the Classics 300-level courses, provided the student takes his or her junior SAGES requirements outside of classics.)

In the **Philology Concentration** (A), students can earn one of three degrees: BA in Classics: Greek; BA in Classics: Latin; or BA in Classics: Greek and Latin. Students in Concentration A are required to take CLSC 231 Athens to Alexandria: The World of Ancient Greece and CLSC 232 Gods and Gladiators: The World of Ancient Rome, then any combination of eight GREK or LATN courses, at least two of which (6 hours) must be at the 300-level. To receive the BA in Classics: Greek and Latin, students must complete at least one year of their second language.

In the **Classical Civilization Concentration** (B), students are required to take CLSC 231 Athens to Alexandria: The World of Ancient Greece and CLSC 232 Gods and Gladiators: The World of Ancient Rome; at least one 200-level or higher GREK or LATN course (for most students, this will mean taking GREK or LATN 101, 102, and 201); and any combination of GREK, LATN, or CLSC courses to bring their course total to 10 (30 hours), at least two of which must be at the 300 level.

**Study in Related Fields**

Each student completing the Classics major is strongly advised to choose a related minor, selected in consultation with and approved by the departmental advisor, in such closely related fields as Ancient Near East and Egypt, anthropology, art history, philosophy, comparative literature, history, theater, or English.

**Departmental Honors**

Departmental honors are given to students who earn the grade of A for their senior dissertation in CLSC 382 Senior Honors Thesis and maintain a GPA in the major of 3.5.

**The Minor**

Our minors in Classics, Greek, and Latin are designed to acquaint the student with aspects of the ancient civilizations of Greece and Rome or the Greek and Latin languages by means of 5 courses (15 credit hours).

There are three separate concentrations for the classics minor. The minor in **Classical Civilization** (Concentration A) focuses on ancient history, literature (in translation or in the original languages), and archaeology. The minor in **Greek** (Concentration B) is devoted to the ancient Greek
language and its associated literature in the original language, as well as Greek civilization and history. The minor in Latin (Concentration C) is devoted to the Latin language and its associated literature in the original language, as well as Roman civilization and history.

Minor Concentrations
In the Classical Civilization Concentration (A), students are required to take CLSC 231 Athens to Alexandria: The World of Ancient Greece and CLSC 232 Gods and Gladiators: The World of Ancient Rome, then any combination of three other CLSC, GREK, or LATN courses, at least one of which (3 hours) must be at the 300 level.

In the Greek Concentration (B), students are required to take CLSC 231 Athens to Alexandria: The World of Ancient Greece and four other GREK courses, at least one of which must be at the 300 level.

In the Latin Concentration (C), students are required to take CLSC 232 Gods and Gladiators: The World of Ancient Rome and four other LATN courses, at least one of which must be at the 300 level.

Students can also design their own minor with a course of study in the Ancient Near East and Egypt that requires 5 courses, at least one of which must be at the 300 level.

Graduate Programs
The MA programs in Classical Studies and in Classical and Medieval Studies teach students to critically analyze texts and material culture by using various theoretical approaches. They also stress ethical use of sources and material artifacts, which requires providing proper citations and obtaining permission to publish.

The programs offer a broad selection of courses categorized by era (Archaic, Classical, Hellenistic, Republican, Imperial, and Medieval) and genre (epic, tragedy, comedy, history, satire, elegiac) as well as material culture courses in art history, archaeology, and epigraphy.

Curriculum Requirements
Students are to maintain a GPA of 3.0 or higher throughout the programs. Full-time students should complete their degrees within two years, part-time students within five years.

Elective Courses
6 credit hours (2 courses) of Classics courses at the 400-level
15 credit hours (5 courses) of any combination of Greek or Latin at the 400-level

Thesis
Students are required to write a substantial (at least 12,000-13,000 words or approximately 50 pages), carefully argued, original piece of scholarship that is critically documented with both primary and secondary sources on a topic in Classics, under the direction of a faculty advisor. They are also required to give an oral presentation and defense. As the culminating learning experience, the thesis gives students an opportunity to demonstrate expertise in their chosen area of research.

Elective Courses
15 credit hours (five courses) of any combination of Greek and Latin courses, one of which must be LATN 409 Medieval Latin
6 credit hours (2 courses) on any subject in Medieval Studies at the 400-level and above

Thesis
Students must write a substantial (at least 12,000-13,000 words or approximately 50 pages), carefully argued, original piece of scholarship that is carefully documented with primary and secondary sources on a topic in Medieval Studies, under the direction of a faculty advisor. They are also required to give an oral presentation and defense.

How to Apply
Interested individuals can apply to the programs through the School of Graduate Studies (https://case.edu/gradstudies/) and are admitted under Plan A (Master’s Thesis).

Application Requirements
- Transcripts
- GPA: 3.5 or higher recommended
- 2 years of college-level Greek or Latin
- GRE scores
- Two letters of recommendation
- Statement of purpose

Application Deadlines
For fall semester enrollment: May 1
For spring semester enrollment: November 1 (for applicants seeking both admission and financial aid)

Graduate Certificate Program/Post-Baccalaureate
The purpose of a graduate certificate program in Classics, known in our wider discipline as a post-baccalaureate certificate—or “post-bac” for short—is to prepare students who started “late” with Greek and Latin (i.e., after high school) for graduate work in classics and related fields such as philosophy, art history, and medieval studies. As a rule, such students need to solidify their language skills and gain experience in reading large quantities of Greek and/or Latin at an advanced speed. Students planning graduate study will have a way to prepare themselves without impossible pressures and time constraints. It takes many years of patient study to master Greek and Latin; one must devote hours to the project every single day. Few people are able to progress satisfactorily in ancient languages on their own, without instruction and without peers.
Our one-year program provides a bridge to full-fledged graduate study, although some individuals may choose to pursue our certificate simply as a means of enriching their lives.

We give post-bac students training in Greek and Latin, and the guidance they need to gain admittance into MA and PhD programs in classics and other humanities disciplines. Here at CWRU, our post-bac students regularly interact not only with our advanced undergraduate Classics majors but also with graduate students in history, English, and art history, among other fields. This blending furnishes them with useful perspectives on the realities of doctoral studies in the humanities.

**AKKD Courses**

**AKKD 101. Beginning Akkadian I. 3 Units.**
This course is the first of a sequence of two courses intended to cover the fundamentals of Akkadian grammar and a large number of the most common cuneiform signs encountered. A sample of texts (tablets) from the most important genres of cuneiform literature will be read. Counts for CAS Global & Cultural Diversity Requirement.

**AKKD 102. Beginning Akkadian II. 3 Units.**
This course, the second in a two-semester sequence, completes the introduction to the grammar of Akkadian and the most common cuneiform signs. Via grammar and exercises, we will continue to familiarize ourselves with some of the more important genres of Akkadian writing as well as the history and culture of Mesopotamian civilization. Counts for CAS Global & Cultural Diversity Requirement. Prereq: AKKD 101.

**AKKD 205. Readings from the Epic of Gilgamesh. 3 Units.**
In this course, we will read the entire Standard Babylonian recension of the Epic of Gilgamesh, considered the first great work of literature, from the original Akkadian text. While the primary goal of the course will be to become proficient readers of Akkadian, we will take some excursus on topics such as Babylonian religion, whether Gilgamesh was a historical figure or not, how the text was put together, and its possible influence on later heroic traditions such as the Greco-Roman. Offered as AKKD 205, AKKD 405, WLIT 205 and WLIT 405. Counts for CAS Global & Cultural Diversity Requirement. Prereq: AKKD 101 and AKKD 102.

**AKKD 395. Advanced Topics in Akkadian Literature. 3 Units.**
Directed readings in selected Akkadian texts in the cuneiform script either of the Old Babylonian or the Neo-Assyrian periods to serve the individual interests and needs of students (texts may be drawn from a variety of text genres: mythological, historical, scientific, medical, correspondence, religious, etc.). Offered as AKKD 395, AKKD 495, WLIT 395 and WLIT 495. Counts for CAS Global & Cultural Diversity Requirement. Prereq: AKKD 101 and AKKD 102.

**ANE Courses**

**ANE 107. Introduction to the Ancient Near East and Egypt. 3 Units.**
This is an introduction to the history and culture of the Ancient Near East and Egypt, a land spanning from modern Iraq to Egypt that was home to the earliest known societies in written history. In this course we will learn about the relatively recent discoveries of these ancient civilizations, the first deciphering of their scripts, about the political, social, and cultural history of the peoples who gave rise to the Babylonian, Assyrian, and Egyptian empires (besides other Levantine and Anatolian powers and smaller nations such as Israel). Various aspects of the literary/scientific production of these societies will also be discussed, while reflecting upon their cultural legacy. Offered as ANEE 107 and HSTY 107. Counts for CAS Global & Cultural Diversity Requirement.

**ANE 194. Catapults and Cavalry: Warfare in the Ancient Mediterranean. 3 Units.**
This course examines the development of warfare in the ancient Mediterranean, including the debated origins of war in prehistory, the rise of the great armies of Assyria and Egypt, the heyday of hoplite infantry in Greece, Alexander the Great’s vast conquests, and the domination of the Mediterranean by the legions of the Roman Empire. Using written, visual, and archaeological evidence from the ancient Near East, Egypt, Greece, and Rome, we will focus on three main topics: 1) warfare and ancient Mediterranean geopolitics; 2) warfare and innovation, including developments in strategy, tactics, and technology; and 3) the perception and experience of ancient Mediterranean warfare, including social, literary, and artistic responses to violent, interstate conflict. Class sessions will consist primarily of lecture with regular discussion of assigned readings. For the final project, students may either write a traditional research paper or complete a creative project such as building a working scale model of a catapult, reconstructing a historic battle in a video game platform, or creating an educational website or short documentary. All readings are in English. Offered as ANEE 194, CLSC 194, and HSTY 194. Counts for CAS Global & Cultural Diversity Requirement.

**ANE 210. Ancient Near Eastern and Egyptian Literature. 3 Units.**
This course offers a broad survey of Ancient Near Eastern and Egyptian literature. We will explore the rich heritage of narrative and mythological compositions through which the Mesopotamians and Egyptians tried to explain the natural phenomena, the religious beliefs and the history of the world around them. Examples of this include myths of creation, stories about gods, the great Flood, the Epic of Gilgamesh, the story of Sinuhe and many others. Other genre of literature will be explored such as the most ancient Legal Codes in history, Pyramid Texts, Wisdom Literature and Proverbs, Love Poetry and Humoristic compositions. Finally, some time will be devoted to the relation of these literatures with the texts that were composed in the Levant, where the alphabet was envisioned, and with the Bible, which grew within this Near Eastern context. All the texts will be read in English translation. Offered as ANEE 210 and CLSC 210.
ANEE 229. Introduction to Egyptology. 3 Units.
Have you marveled at how the pyramids were built? Ever wanted to read the Book of the Dead? Or were you always fascinated by mummies, expansive temples and Egyptian gods and goddesses? This course will cover all these topics, and many more, through an exploration of the writings, art, and architecture of the ancient Egyptians. In addition to examining the archaeological remains of Egyptian civilization, the course will incorporate an introduction to translation of hieroglyphs—the written form of the ancient Egyptian language.

ANEE 315. Art and Architecture of Ancient Egypt and Mesopotamia. 3 Units.
The golden mask of Tutankhamun, the imposing Ishtar Gate, delicately carved ivories, and expertly chiseled stone sculpture; the art and architecture of Ancient Egypt and Mesopotamia are some of the most captivating examples of visual culture from the ancient world. This course will emphasize the examination of art and architecture of Egypt and Mesopotamia in context, focusing on material from prehistory through the 6th century BC. We will explore the deep connection between art, religion, and the worldview of Ancient Egypt and Mesopotamia, in addition to the meaning and audience for art, the principles which guided art production, trends in media and themes over time, and the relationship of writing and art. We will also consider the interaction between Egyptian and Mesopotamian art, museums and the modern artistic and political landscapes. Offered as ATEE 315, ATEE 415, ARTH 315 and ARTH 415.

ANEE 320. Gods and Demons in the Ancient Near East and Egypt. 3 Units.
The roots of many modern religious, literary, social, and political notions reach deep into the fertile soil of Ancient Near Eastern and Egyptian cultures, which developed as early as the fourth millennium BCE and flourished until the Hellenistic period. In this course we will examine various components of the religious, divinatory and magical systems of these cultures, and reflect upon their relationship with the stories that are found in the Hebrew Bible. We will learn (through a critical analysis of a selection of ancient texts) about ancient Mesopotamian and Egyptian deities, demons, myths, and magical rituals. We will also explore notions of creation, cosmic order, the human condition, death, afterlife, divine favor, and a wide variety of beliefs that, while often contradictory to modern ways of thinking, combined into unified religious systems. Offered as ATEE 320, RLGN 320 and RLGN 420.

ANEE 337. Ancient Medicine. 3 Units.
This course offers a general survey of the history of medicine from its origins in pre-historical times to Galen (2nd c. CE) with a view to gaining a better understanding of the path that eventually lead to modern medical practice. The various medical systems considered, including the ancient Babylonian, Egyptian, Jewish, Chinese, Ayurvedic, Greek and Roman traditions, will be examined through the study of primary and secondary sources, while key conceptual developments and practices are identified within their cultural and social context. Special issues, such as epidemics, women's medicine, and surgery, are also explored and discussed. Offered as ATEE 337, CLSC 337, CLSC 437, HSTY 337, and HSTY 437. Counts for CAS Global & Cultural Diversity Requirement.

ANEE 415. Art and Architecture of Ancient Egypt and Mesopotamia. 3 Units.
The golden mask of Tutankhamun, the imposing Ishtar Gate, delicately carved ivories, and expertly chiseled stone sculpture; the art and architecture of Ancient Egypt and Mesopotamia are some of the most captivating examples of visual culture from the ancient world. This course will emphasize the examination of art and architecture of Egypt and Mesopotamia in context, focusing on material from prehistory through the 6th century BC. We will explore the deep connection between art, religion, and the worldview of Ancient Egypt and Mesopotamia, in addition to the meaning and audience for art, the principles which guided art production, trends in media and themes over time, and the relationship of writing and art. We will also consider the interaction between Egyptian and Mesopotamian art, museums and the modern artistic and political landscapes. Offered as ATEE 315, ATEE 415, ARTH 315 and ARTH 415.

ANEE 444. Archaeology of the Ancient Mediterranean. 3 Units.
This course examines the ancient Mediterranean through the material cultures of Egypt, Greece and Rome. Each of these great civilizations will be individually explored, but also examined within a broader historical context. Particular focus will be placed on the social, political and economic ideas that were exchanged across the Mediterranean Sea and the influence this interconnectivity had on eastern Mediterranean societies. Offered as ATEE 344, ATEE 444, ANTH 344, ANTH 444, ARTH 344, ARTH 444, CLSC 344 and CLSC 444.

CLSC Courses

CLSC 102. Introduction to Byzantine History, 500-1500. 3 Units.
Development of the Byzantine empire from the emperor Constantine's conversion to Christianity and founding of the eastern capital at Constantinople to the fall of Constantinople to Turkish forces in 1453. Offered as CLSC 102 and HSTY 102. Counts for CAS Global & Cultural Diversity Requirement.

CLSC 193. The Ancient World. 3 Units.
Ancient Western history from the origins of civilization in Mesopotamia to the dissolution of the Roman Empire in the West. Offered as CLSC 193 and HSTY 193. Counts for CAS Global & Cultural Diversity Requirement.

CLSC 194. Catapults and Cavalry: Warfare in the Ancient Mediterranean. 3 Units.
This course examines the development of warfare in the ancient Mediterranean, including the debated origins of war in prehistory, the rise of the great armies of Assyria and Egypt, the heyday of hoplite infantry in Greece, Alexander the Great's vast conquests, and the domination of the Mediterranean by the legions of the Roman Empire. Using written, visual, and archaeological evidence from the ancient Near East, Egypt, Greece, and Rome, we will focus on three main topics: 1) warfare and ancient Mediterranean geopolitics; 2) warfare and innovation, including developments in strategy, tactics, and technology; and 3) the perception and experience of ancient Mediterranean warfare, including social, literary, and artistic responses to violent, interstate conflict. Class sessions will consist primarily of lecture with regular discussion of assigned readings. For the final project, students may either write a traditional research paper or complete a creative project such as building a working scale model of a catapult, reconstructing a historic battle in a video game platform, or creating an educational website or short documentary. All readings are in English. Offered as ATEE 194, CLSC 194, and HSTY 194. Counts for CAS Global & Cultural Diversity Requirement.
CLSC 199. Athens: In Search of Socrates. 3 Units.
Students selected for their strong background or interest in Greek Civilization spend Spring Break in Athens, Greece (thanks to a collaboration between CWRU's Department of Classics and the Athens Centre). They follow an intensive seven-day itinerary of travel, visiting major monuments and museums including the Acropolis, Delphi, Epidaurus, and Aegina. Two class sessions of instruction in modern Greek help them to interact with people they meet; but the overwhelming emphasis lies on Classical Athens, the historical-cultural setting for the emergence of Western moral philosophy. The focus of this mini-course is on the figure of Socrates and the agenda of moral philosophy that the Athenian sage established. Readings from Plato, Aristophanes, and Aristotle. Via the Socratic method, students will also study Aristotle's Ethics and test the applicability of that foundational text to their own lives. Counts for CAS Global & Cultural Diversity Requirement.

CLSC 202. Classical Mythology. 3 Units.

CLSC 203. Gods and Heroes in Greek Literature. 3 Units.
This course examines major works of Greek literature and sets them in their historical and cultural context. Constant themes are war, wandering, tyranny, freedom, community, family, and the role of men and women within the household and the ancient city-state. Parallels with modern life and politics will be explored. Lectures and discussions. Offered as CLSC 203 and WLIT 203. Counts for CAS Global & Cultural Diversity Requirement.

CLSC 204. Heroes and Hustlers in Roman Literature. 3 Units.
This course constitutes the second half of a sequence on Classical literature. Its main themes are heroism vs. self-promotion, love vs. lust, and the struggle between democracy and tyranny. These topics are traced in a variety of literary genres from the period of the Roman republic well into the empire. Parallels with modern life and politics will be drawn. Offered as CLSC 204 and WLIT 204. Counts for CAS Global & Cultural Diversity Requirement.

CLSC 206. Ancient and Medieval Spain: Prehistory to 1492. 3 Units.
This course focuses on the history of the Iberian peninsula from before the Roman conquest from the Iberians, Greek, and Carthaginian settlements, through Roman, Visigothic, and Muslim rule to the conquest of Ferdinand and Isabella of the last non-Christian territory on the peninsula in 1492. The issues of conquest, frontier, cultural diversity, and change, tolerance, and intolerance will be examined. Offered as CLSC 206 and HSTY 206. Counts for CAS Global & Cultural Diversity Requirement.

CLSC 224. Sword and Sandal: The Classics in Film. 3 Units.
Gladiator. Alexander. The 300. Contemporary society's continuing fascination with putting the ancient world on the big screen is undeniable; and yet the causes underlying this phenomenon are not quite so readily apparent. In this course we will watch and discuss a number of movies about the ancient world, running the gamut from Hollywood classics such as Ben-Hur and Spartacus to more recent treatments (the aforementioned 300 and Gladiator, for starters), and from the mainstream and conventional (Clash of the Titans, Disney's Hercules) to the far-out and avant-garde (Fellini's Satyricon, anyone?). As we do so we'll learn quite a bit about the art and economics of film, on one hand, and the ancient world, on the other. And yet what we'll keep coming back to are the big questions: what does our fascination with the ancient Mediterranean tell us about ourselves as a society? Why do such movies get made, and what kinds of agendas do they serve? To what extent can we recapture the past accurately? And if we can't, are we doomed to just endlessly projecting our own concerns and desires onto a screen, and dressing them in togas? No knowledge of ancient languages is required for this course. Offered as CLSC 224 and WLIT 224.

CLSC 226. Greek and Roman Sculpture. 3 Units.
This survey course explores the history of sculpture in ancient Greece and Rome, from the Mycenaean period through the reign of Constantine (A.D. 306-337). Students learn how to analyze works of sculpture in terms of form, function, and iconography. Particular emphasis is placed on situating sculptures within the changing historical, cultural, political, and religious contexts of the classical world, including the Greek city-state, the Hellenistic kingdoms that followed Alexander the Great, the Roman Republic, and the Roman Empire. Students will study a variety of sculptures—such as statues, reliefs, and carved gems—from across the Greek and Roman worlds. As we study sculptures from the classical world, we will consider questions of design, patronage, artistic agency, viewer reception, and cultural identity. We will also consider the cultural interaction between ancient Greece and Rome and what impact this had on the production and appearance of sculpture. Offered as ARTH 226 and CLSC 226. Counts for CAS Global & Cultural Diversity Requirement.

CLSC 231. Athens to Alexandria: The World of Ancient Greece. 3 Units.
This course constitutes the first half of a year-long sequence on classical civilization. It examines the enduring significance of the Greeks studied through their history, literature, art, and philosophy. Lectures and discussion. (For the second course in the sequence, see CLSC 232 and HSTY 232.) Offered as CLSC 231 and HSTY 231. Counts for CAS Global & Cultural Diversity Requirement.

CLSC 232. Gods and Gladiators: The World of Ancient Rome. 3 Units.
The enduring significance of the Romans studied through their history, literature, art, and philosophy. Lectures and discussion. Offered as CLSC 232 and HSTY 232. Counts for CAS Global & Cultural Diversity Requirement.

CLSC 295. Medical Terminology. 3 Units.
A self-paced, computer-assisted course on the classical foundations (etymology) of modern English as well as the basic principles on which roots, prefixes, and suffixes combine to give precise meanings to composite words, which is then applied toward learning medical, biomedical and scientific terminology.

CLSC 301. Ancient Philosophy. 3 Units.
Western philosophy from the early Greeks to the Skeptics. Emphasis on the pre-Socratics, Plato and Aristotle. Recommended preparation: PHIL 101 and consent of department. Offered as CLSC 301 and PHIL 301.
CLSC 302. Ancient Greece: Archaic, Classical, and Hellenistic Periods. 3 Units.
The rise of Hellenic thought and institutions from the eighth to the third centuries B.C., the rise of the polis, the evolution of democracy at Athens, the crises of the Persian and Peloponnesian Wars, fifth-century historiography, the growth of individualism, and the revival of monarchy in the Hellenistic period. Offered as CLSC 302 and HSTY 302. Counts for CAS Global & Cultural Diversity Requirement.

CLSC 304. Ancient Rome: Republic and Empire. 3 Units.
Growth and development of the Roman state from the unification of Italy in the early third century B.C. to the establishment of the oriental despotism under Diocletian and Constantine. The growth of empire in the Punic Wars, the uncertain steps toward an eastern hegemony, the crisis in the Republic from the Gracchi to Caesar, the new regime of Augustus, the transformation of the leadership class in the early Empire, and the increasing dominance of the military over the civil structure. Offered as CLSC 304 and HSTY 304. Counts for CAS Global & Cultural Diversity Requirement.

CLSC 312. Women in the Ancient World. 3 Units.
The course offers a chronological survey of women’s lives in Greece, Hellenistic Egypt, and Rome. It focuses on primary sources as well as scholarly interpretations of the ancient record with a view to defining the construction of gender and sexuality according to the Greco-Roman model. Additionally, the course aims to demonstrate how various methodological approaches have yielded significant insights into our own perception of sex and gender. Specific topics include matriarchy and patriarchy; the antagonism between male and female in myth; the legal, social, economic, and political status of women; the ancient family; women’s role in religion and cult; ancient theories of medicine regarding women; pederasty and homosexuality. Offered as CLSC 312 and WGST 312. Counts for CAS Global & Cultural Diversity Requirement.

CLSC 318. Archaeological & Epigraphical Field School. 3 Units.
This interdisciplinary course takes place in situ in the Mediterranean and will be attached to an active archaeological project. Students will learn the methodological principles of archaeological and epigraphical fieldwork by participating in activities such as surveying, excavation, museum work, geophysical survey, artifact analysis, and other scientific techniques. In addition to work in the field and museum, students will receive an introduction to the history Greco-Roman culture through visits to major archaeological sites in the region. Examples of active archaeological projects may vary, depending on the year. Offered as CLSC 318 and CLSC 418.

CLSC 319. Greek Tragedy: Plays and Performance in Ancient Athens. 3 Units.
This course provides students the opportunity to read a significant number of ancient Greek tragedies in modern English translations. We read, study, and discuss selected works by Aeschylus, Sophocles, and Euripides, as well as selected criticism, ancient and modern, of these plays. All semester we read the plays as literature composed for performance. We study literary elements within the plays and theatrical possibilities inherent in the texts. As we read the plays, we pay close attention to the historical context and look for what each play can tell us about myth, religion, ethics, and society in ancient Athens. Finally, we give attention to the way these tragic dramas and the theater in which they were performed have continued to inspire literature and theater for thousands of years. Lectures provide historical background on the playwrights, the plays, the mythic and historical background, and possible interpretation of the texts as literature and as performance pieces. Students discuss the plays that they read in class. The course has three examinations and a final project that includes writing an essay and staging a monologue or scene from one of the tragedies. Offered as CLSC 319, CLSC 419, THTR 319, THTR 419, WLIT 319, and WLIT 419. Counts for CAS Global & Cultural Diversity Requirement.

CLSC 320. Alexander the Great: Materials and Methods. 3 Units.
This course is the Classics Departmental Seminar in the SAGES sequence (normally taken in the Spring semester of a major’s Junior year), though it can also be taken for regular credit in Classics or History by both undergraduate and graduate students. The seminar offers students a firm grounding in the discipline of Classics with an emphasis on the diverse materials (particularly primary source material), methods and approaches that can be brought to bear on the study of Greco-Roman antiquity. Students will read and discuss the ancient sources and contemporary scholarship on the enigmatic Alexander the Great drawn from various fields of classics, including history, archaeology, art history, philosophy, gender studies, epigraphy, numismatics, and the reception of Alexander. Based upon this, they will then write a research paper that employs conventions found in the field of Classics. Much of this training, however, will also be transferable to other fields and periods. Because the scope of the seminar moves (along with Alexander himself) beyond Europe and examines the historical foundations of the antagonism between East and West, this course qualifies as a Global and Cultural Diversity course. Offered as CLSC 320, CLSC 420, HSTY 320 and HSTY 420. Counts as SAGES Departmental Seminar. Counts for CAS Global & Cultural Diversity Requirement.
CLSC 322. Theater in Ancient Rome. 3 Units.
This course is designed as a continuation of and companion to CLSC/THTR/WLIT 319/419 Greek Tragedy: Plays and Performance in Ancient Athens, although it may be taken without having taken, or before having taken, that course. Students in Theater in Ancient Rome will read a significant number of ancient Roman plays in modern English translation and study non-literary theatrical entertainment of the Roman Republic and Empire, that may include mime and pantomime, gladiatorial shows, political speeches, courtroom drama, and various other spectacles. The dramatic texts that we shall study include the fragments of early Latin drama, selected comedies by Plautus and Terence, and the tragedies of Seneca. We shall also consider Greek and Roman literature that comments on Roman theatrical practices. These works will be read for their literary merits and theatrical possibilities, while at the same time examining them for what they can tell us about Roman civilization. Similarly, when studying the non-literary theatrical works we shall examine historical and theatrical context including archaeological evidence from theaters and amphitheaters and material remains (masks, depictions of actors and gladiators on vases, terra cotta lamps, mosaics, etc.). Finally, while the majority of the course focuses on drama originally written in Latin and theatrical entertainments performed in ancient Rome, the course may include a brief survey of selected post-classical works indebted to the tradition of Roman drama and theater. Authors that may be studied include Hrotsvitha, Marlowe, Shakespeare, Racine, Molière, and the legacy of Roman drama and theater in contemporary stage and cinema such as Sondheim’s A Funny Thing Happened on the Way to the Forum. Thus a secondary concern will be to consider how and in what ways the legacy of Roman drama and theater has continued to shape the dramatic arts since antiquity. Offered as CLSC 322, CLSC 422, THTR 322, THTR 422, WLIT 322, and WLIT 422. Counts for CAS Global & Cultural Diversity Requirement.

CLSC 325. Art at the Crossroads of Religion: Polytheistic, Christian, and Islamic Art in Antiquity. 3 Units.
People often single out the reign of Constantine (A.D. 306-337) as the point in history when Rome transformed from a polytheistic empire to a Christian empire. This course questions the strict divide between the categories of "pagan" and "Christian" in Rome in the imperial period and beyond. Through a close examination of the artistic and architectural record, students will come to understand that this dichotomy is a modern invention; for people living in the Roman Empire, religious identities were extraordinarily fluid. Indeed, traditional polytheistic religion and Christianity remained closely intertwined for centuries after Constantine "Christianized" the Empire. Moreover, religious pluralism had been a fundamental part of Roman culture since the founding of ancient Rome. We will survey a range of material culture, including public statuary, sarcophagi, silver hordes, and temples and churches. We will also examine sites such as the border city of Dura-Europos in Syria to explore how religious identities in the Roman Empire (including Judaism, early Christianity, and so-called mystery cults) intertwined even when Rome was still supposedly a "pagan" Empire. The course pays particular attention to the art and architecture produced under Constantine, whom people today often remember as Rome’s first Christian emperor but who represents, in fact, a complex amalgam of polytheistic and monotheistic practices and identities. We will also explore how Christian art slowly but ultimately became the predominant visual culture in the Roman Empire. Finally, we will examine how Early Islamic art and architecture exploited the Greco-Roman visual tradition to the ends of this new religion. Offered as ARTH 325, ARTH 425 and CLSC 325. Counts for CAS Global & Cultural Diversity Requirement.

CLSC 326. Rome on Site: The Archaeology of the Eternal City. 3 Units.
This course offers the opportunity to examine firsthand Roman remains spanning 500 years of the city's history. For three weeks we will explore all sections of Rome and discover how different spheres of Roman life, such as religion, politics, leisure, and death, combined to shape one of the most renowned cityscapes of the ancient Mediterranean world. The course constitutes a mix of museum and site visits to expose us to the artifacts that help us interpret the Roman world, including art and other types of material culture, and the monumental architecture dominating much of Rome to this day. We will also explore important sites outside of the city, including Rome's remarkably well-preserved port at Ostia, the Emperor Hadrian's magnificent villa at Tivoli, and an optional visit to Pompeii and Herculaneum during an extended weekend. Some of the questions we will be asking when visiting the sites include: How did the expansion of the Roman Empire influence the stylistic repertoires of the capital's artists and architects? How did the changing political environment shape the topography of the city from Republic to Empire? How can we read political messages and propaganda in the ancient structures? How did (and does) Rome live among, use, and reuse ancient remains? Students will be expected to be active participants in the daily tours. All students will be presenting on various structures as we come to them (topics to be assigned in advance of the trip). Graduate students are responsible for leading a day tour (with my assistance) - to create the itinerary and develop the thematic framework. Grades will be based on participation on site, presentations, and a paper. Offered as CLSC 326 and CLSC 426. Counts for CAS Global & Cultural Diversity Requirement.

CLSC 329. Marvels of Rome: Monuments and Their Decoration in the Roman Empire. 3 Units.
This course examines some of the most famous monuments of the Roman Empire, including Nero’s Golden House, the Colosseum, the Pantheon, Hadrian’s Villa at Tivoli, and the lavish villa of Piazza Armerina in Sicily. We will study each monument in depth, delving into the architecture, paintings, sculptures, mosaics, and social functions of each monument. Students will learn how to analyze artistic and archaeological evidence, ancient textual evidence (poems, prose, and inscriptions), and secondary scholarship to reconstruct the visual appearances and historical and cultural contexts of the monuments in questions. Throughout the course, students will gain a new appreciation and deeper understanding of some of the most iconic buildings of the classical tradition. Offered as ARTH 329, ARTH 429, and CLSC 329. Counts for CAS Global & Cultural Diversity Requirement.

CLSC 333. Greek and Roman Painting. 3 Units.
Greek vase painting, Etruscan tomb painting and Roman wall painting. The development of monumental painting in antiquity. Offered as ARTH 333, CLSC 333, and ARTH 433.
CLSC 336. Representations of War in Ancient Rome. 3 Units.
Few societies in history have been as militaristic as ancient Rome—
or as proud of their warrior culture. This course examines the many
ways that Romans constructed and contested their conceptions of war
from the founding of the Roman Republic in 509 B.C.E. to the reign of
Constantine (306-337 C.E.). Why did Romans choose to represent war in
certain ways, and how did these artistic representations shape Romans’
military values? What can the visual record tell us about how different
groups (soldiers, women, slaves) experienced war in the Roman world?
We will explore major public monuments in the city of Rome (including
triumphal arches and the Colosseum) and private objects (such as
silver drinking vessels) to observe how Roman militarism pervaded
different walks of life. We will also examine monuments on the edges
of Rome’s empire, such as the towering trophies in modern France
and Romania, to explore how works of art and architecture mediated
the relationship between Romans and the peoples they conquered.
Students will be encouraged to think about how art and architecture
contributed to the construction of militarism as a chief Roman value,
but also about how visual representations provided an important means
to debate the value of Rome’s military efforts, to subvert Rome’s rigidly
hierarchical social order, and to grapple with what it meant to “be Roman”
as wars transformed Rome from a small city in Italy to a massive, pan-
Mediterranean empire. After exploring Romans’ conceptions of war
and victory, students also may ask whether the common comparison
between the Roman Empire and modern America is appropriate. Offered
as ARTH 336, ARTH 436, CLSC 336 and CLSC 436. Counts for CAS Global
& Cultural Diversity Requirement.

CLSC 337. Ancient Medicine. 3 Units.
This course offers a general survey of the history of medicine from
its origins in pre-historical times to Galen (2nd c. CE) with a view to
gaining a better understanding of the path that eventually lead to modern
medical practice. The various medical systems considered, including
the ancient Babylonian, Egyptian, Jewish, Chinese, Ayurvedic, Greek and
Roman traditions, will be examined through the study of primary and
secondary sources, while key conceptual developments and practices
are identified within their cultural and social context. Special issues, such as
epidemics, women’s medicine, and surgery, are also explored and
discussed. Offered as ANEE 337, CLSC 337, CLSC 437, HSTY 337, and

CLSC 344. Archaeology of the Ancient Mediterranean. 3 Units.
This course examines the ancient Mediterranean through the material
cultures of Egypt, Greece and Rome. Each of these great civilizations
will be individually explored, but also examined within a broader historical
context. Particular focus will be placed on the social, political and
economic ideas that were exchanged across the Mediterranean Sea
and the influence this interconnectivity had on eastern Mediterranean
societies. Offered as ANEE 344, ANEE 444, ANTH 344, ANTH 444,
ARTH 344, ARTH 444, CLSC 344 and CLSC 444.

CLSC 381. Classics Senior Capstone. 3 Units.
The capstone is the final requirement of the SAGES program and
is normally taken in the fall semester of senior year. It involves an
independent study paper resulting from exploration of a topic chosen
in consultation with the student’s capstone advisor, who will regularly
review progress on the project. In the capstone students employ,
integrate, and demonstrate analytical, rhetorical, and practical skills
developed and honed through the SAGES curriculum as well as their
major or minor studies. The Capstone Project has both a written
and an oral component: oral presentation and argumentation will be
stressed. The product of the capstone may take different forms: there
will always be a written component, but other forms of expression are
also encouraged, such as a webpage or poster for a poster session. As
for the kind of project that might be done: students interested in literature
might work on an annotated translation of a classical text; archaeology
students might produce a virtual exhibit centered on a specific site or
problem. Counts as SAGES Senior Capstone. Prereq: CLSC 231 and
CLSC 232, plus courses prescribed for each track of the major.

CLSC 382. Senior Honors Thesis. 3 Units.
A course of independent study and research culminating in the
preparation of a thesis on a topic approved by the supervising faculty
member. Enrollment in this course must be approved by the Chair of the
Department. Prereq: CLSC 381.

CLSC 395. Directed Readings. 1 - 3 Units.
Readings in English on a topic of interest to the student and acceptable
to the instructor. Designed and completed under the supervision of the
instructor with whom the student wishes to work.

CLSC 418. Archaeological & Epigraphical Field School. 3 Units.
This interdisciplinary course takes place in situ in the Mediterranean
and will be attached to an active archaeological project. Students will
learn the methodological principles of archaeological and epigraphical
fieldwork by participating in activities such as surveying, excavation,
museum work, geophysical survey, artifact analysis, and other scientific
techniques. In addition to work in the field and museum, students will
receive an introduction to the history Greco-Roman culture through
visits to major archaeological sites in the region. Examples of active
archaeological projects may vary, depending on the year. Offered as
CLSC 318 and CLSC 418.

CLSC 419. Greek Tragedy: Plays and Performance in Ancient Athens. 3
Units.
This course provides students the opportunity to read a significant
number of ancient Greek tragedies in modern English translations.
We read, study, and discuss selected works by Aeschylus, Sophocles,
and Euripides, as well as selected criticism, ancient and modern, of
these plays. All semester we read the plays as literature composed for
performance. We study literary elements within the plays and theatrical
possibilities inherent in the texts. As we read the plays, we pay close
attention to the historical context and look for what each play can tell
us about myth, religion, ethics, and society in ancient Athens. Finally,
we give attention to the way these tragic dramas and the theater in
which they were performed have continued to inspire literature and
theater for thousands of years. Lectures provide historical background
on the playwrights, the plays, the mythic and historical background, and
possible interpretation of the texts as literature and as performance
pieces. Students discuss the plays that they read in class. The course
has three examinations and a final project that includes writing an essay
and staging a monologue or scene from one of the tragedies. Offered
as CLSC 319, CLSC 419, THTR 319, THTR 419, WLIT 319, and WLIT 419.
Counts for CAS Global & Cultural Diversity Requirement.
CLSC 420. Alexander the Great: Materials and Methods. 3 Units.
This course is the Classics Departmental Seminar in the SAGES sequence (normally taken in the Spring semester of a major’s Junior year), though it can also be taken for regular credit in Classics or History by both undergraduate and graduate students. The seminar offers students a firm grounding in the discipline of Classics with an emphasis on the diverse materials (particularly primary source material), methods and approaches that can be brought to bear on the study of Greco-Roman antiquity. Students will read and discuss the ancient sources and contemporary scholarship on the enigmatic Alexander the Great drawn from various fields of classics, including history, archaeology, art history, philosophy, gender studies, epigraphy, numismatics, and the reception of Alexander. Based upon this, they will then write a research paper that employs conventions found in the field of Classics. Much of this training, however, will also be transferable to other fields and periods. Because the scope of the seminar moves (along with Alexander himself) beyond Europe and examines the historical foundations of the antagonism between East and West, this course qualifies as a Global and Cultural Diversity course. Offered as CLSC 320, CLSC 420, HSTY 320 and HSTY 420. Counts as SAGES Departmental Seminar. Counts for CAS Global & Cultural Diversity Requirement.

CLSC 422. Theater in Ancient Rome. 3 Units.
This course is designed as a continuation of and companion to CLSC/THTR/WLIT 319/419 Greek Tragedy: Plays and Performance in Ancient Athens, although it may be taken without having taken, or before having taken, that course. Students in Theater in Ancient Rome will read a significant number of ancient Roman plays in modern English translation and study non-literary theatrical entertainment of the Roman Republic and Empire, that may include mime and pantomime, gladiatorial shows, political speeches, courtroom drama, and various other spectacles. The dramatic texts that we shall study include the fragments of early Latin drama, selected comedies by Plautus and Terence, and the tragedies of Seneca. We shall also consider Greek and Roman literature that comments on Roman theatrical practices. These works will be read for their literary merits and theatrical possibilities, while at the same time examining them for what they can tell us about Roman civilization. Similarly, when studying the non-literary theatrical works we shall examine historical and theatrical context including archaeological evidence from theaters and amphitheaters and material remains (face masks, depictions of actors and gladiators on vases, terra cotta lamps, mosaics, etc.). Finally, while the majority of the course focuses on drama originally written in Latin and theatrical entertainments performed in ancient Rome, the course may include a brief survey of selected post-classical works indebted to the tradition of Roman drama and theater. Authors that may be studied include Hrotsvitha, Marlowe, Shakespeare, Racine, Molière, and the legacy of Roman drama and theater in contemporary stage and cinema such as Sondheim’s A Funny Thing Happened on the Way to the Forum. Thus a secondary concern will be to consider how and in what ways the legacy of Roman drama and theater has continued to shape the dramatic arts since antiquity. Offered as CLSC 322, CLSC 422, THTR 322, THTR 422, WLIT 322, and WLIT 422. Counts for CAS Global & Cultural Diversity Requirement.

CLSC 426. Rome on Site: The Archaeology of the Eternal City. 3 Units.
This course offers the opportunity to examine firsthand Roman remains spanning 500 years of the city’s history. For three weeks we will explore all sections of Rome and discover how different spheres of Roman life, such as religion, politics, leisure, and death, combined to shape one of the most renowned cityscapes of the ancient Mediterranean world. The course constitutes a mix of museum and site visits to expose us to the artifacts that help us interpret the Roman world, including art and other types of material culture, and the monumental architecture dominating much of Rome to this day. We will also explore important sites outside of the city, including Rome’s remarkably well-preserved port at Ostia, the Emperor Hadrian’s magnificent villa at Tivoli, and an optional visit to Pompeii and Herculaneum during an extended weekend. Some of the questions we will be asking when visiting the sites include: How did the expansion of the Roman Empire influence the stylistic repertoires of the capital’s artists and architects? How did the changing political environment shape the topography of the city from Republic to Empire? How can we read political messages and propaganda in the ancient structures? How did (and does) Rome live among, use, and reuse ancient remains? Students will be expected to be active participants in the daily tours. All students will be presenting on various structures as we come to them (topics to be assigned in advance of the trip). Graduate students are responsible for leading a day tour (with my assistance) - to create the itinerary and develop the thematic framework. Grades will be based on participation on site, presentations, and a paper. Offered as CLSC 326 and CLSC 426. Counts for CAS Global & Cultural Diversity Requirement.

CLSC 436. Representations of War in Ancient Rome. 3 Units.
Few societies in history have been as militaristic as ancient Rome--or as proud of their warrior culture. This course examines the many ways that Romans constructed and contested their conceptions of war from the founding of the Roman Republic in 509 B.C.E. to the reign of Constantine (306-337 C.E.). Why did Romans choose to represent war in certain ways, and how did these artistic representations shape Romans’ military values? What can the visual record tell us about how different groups (soldiers, women, slaves) experienced war in the Roman world? We will explore major public monuments in the city of Rome (including triumphal arches and the Colosseum) and private objects (such as silver drinking vessels) to observe how Roman militarism pervaded different walks of life. We will also examine monuments on the edges of Rome’s empire, such as the towering trophies in modern France and Romania, to explore how works of art and architecture mediated the relationship between Romans and the peoples they conquered. Students will be encouraged to think about how art and architecture contributed to the construction of militarism as a chief Roman value, but also about how visual representations provided an important means to debate the value of Rome’s military efforts, to subvert Rome’s rigidly hierarchical social order, and to grapple with what it meant to “be Roman” as wars transformed Rome from a small city in Italy to a massive, pan-Mediterranean empire. After exploring Romans’ conceptions of war and victory, students also may ask whether the common comparison between the Roman Empire and modern America is appropriate. Offered as ARTH 336, ARTH 436, CLSC 336 and CLSC 436. Counts for CAS Global & Cultural Diversity Requirement.
CLSC 437. Ancient Medicine. 3 Units.
This course offers a general survey of the history of medicine from its origins in pre-historical times to Galen (2nd c. CE) with a view to gaining a better understanding of the path that eventually lead to modern medical practice. The various medical systems considered, including the ancient Babylonian, Egyptian, Jewish, Chinese, Ayurvedic, Greek and Roman traditions, will be examined through the study of primary and secondary sources, while key conceptual developments and practices are identified within their cultural and social context. Special issues, such as epidemics, women's medicine, and surgery, are also explored and discussed. Offered as ANEE 337, CLSC 337, CLSC 437, HSTY 337, and HSTY 437. Counts for CAS Global & Cultural Diversity Requirement.

CLSC 444. Archaeology of the Ancient Mediterranean. 3 Units.
This course examines the ancient Mediterranean through the material cultures of Egypt, Greece and Rome. Each of these great civilizations will be individually explored, but also examined within a broader historical context. Particular focus will be placed on the social, political and economic ideas that were exchanged across the Mediterranean Sea and the influence this interconnectivity had on eastern Mediterranean societies. Offered as ANEE 344, ANEE 444, ANTH 344, ANTH 444, ARTH 344, ARTH 444, CLSC 344 and CLSC 444.

CLSC 481. Special Studies. 1 - 6 Units.
Subject matter varies according to need.

CLSC 492. Graduate Certificate Thesis. 3 Units.
This course will be focused on the independent writing of a substantial term paper under the supervision of an advisor. It is required for the completion of the Graduate Certificate.

CLSC 493. Graduate Certificate Presentation. 1 Unit.
This course will involve the presentation of the term paper completed and refined during CLSC 492. Prereq: CLSC 492.

CLSC 651. Thesis M.A. 1 - 6 Units.
Limited to M.A. candidates actively engaged in the research and writing of their theses. Credit as arranged.

GREK Courses

GREK 101. Elementary Greek I. 3 Units.
Beginning course in Greek language, covering grammar (forms and syntax) and the reading of elementary selections from ancient sources. Makes a start toward reading Greek authors.

GREK 102. Elementary Greek II. 3 Units.
Beginning course in Greek language, covering grammar (forms and syntax) and the reading of elementary selections from ancient sources. Makes a start toward reading Greek authors. Prereq: GREK 101 or equivalent.

GREK 201. Greek Prose Authors. 3 Units.
Readings from authors such as Plato, Lysias, Xenophon, and Herodotus. Offered as GREK 201, GREK 401, WLIT 201 and WLIT 401.

GREK 202. Introduction to Greek Poetry. 3 Units.
Primarily readings from Homer, Hesiod, and Theocritus. Selections from Greek lyric may be introduced at the instructor’s discretion. Offered as GREK 202, GREK 402, WLIT 202, and WLIT 402. Prereq: GREK 102 or equivalent.

GREK 305. Readings in Ancient Philosophy: Plato. 3 Units.
Reading and interpretation of selected dialogues by Plato or other philosophical works. Offered as GREK 305 and GREK 405. Prereq: GREK 202 or equivalent.

GREK 306. Tragedy. 3 Units.
Reading and interpretation of selected plays of Aeschylus, Euripides, and Sophocles. Offered as GREK 309, GREK 406, WLIT 306, and WLIT 406. Prereq: 200-level GREK or equivalent.

GREK 307. History. 3 Units.
Extensive reading in Thucydides’ History of the Peloponnesian War, especially Books VI and VII, the expedition against Syracuse. Offered as GREK 307, GREK 407, WLIT 307 and WLIT 407. Prereq: GREK 202 or equivalent.

GREK 308. Comedy. 3 Units.
Origin, ambiance, and development of Greek Old Comedy and persisting characteristics of the genre. Translation of selected plays from Greek into English. Offered as GREK 309, GREK 408, WLIT 318, and WLIT 418. Prereq: 200-level GREK or equivalent.

GREK 311. Homer. 3 Units.
Reading and translation of extensive selections from the Odyssey. Introduction to epic meter, to Homeric Greek, and to the poet’s style. Consideration of evidences of oral composition and discussion of the heroic tradition. Offered as GREK 311, GREK 411, WLIT 311 and WLIT 411. Prereq: 200-level GREK or equivalent.

GREK 370. Greek Prose Composition. 3 Units.
This course introduces students to the principles and practice of composing continuous passages of Greek prose. It is designed to review and to strengthen students’ command of Attic forms while becoming more aware of the ways Greek syntax was employed to express thought. Via practice at writing Greek prose, the ultimate goal is for the students to become more proficient and sensitive readers of ancient Greek. Offered as GREK 370, GREK 470, WLIT 370 and WLIT 470. Prereq: 200-level GREK or equivalent.

GREK 380. Advanced Topics in Greek Literature. 3 Units.
Study and discussion of important authors, works, and topics not covered regularly. Content will reflect particular interests of students and faculty and timeliness of the topics. Offered as GREK 380 and GREK 480. Prereq: 200-level GREK or equivalent.

GREK 395. Directed Readings. 1 - 3 Units.
Readings in Greek of authors selected to serve the individual interests and needs of undergraduate students. Each program planned and completed under the supervision of the instructor with whom the student wishes to work. Offered as GREK 395 and GREK 495.

GREK 401. Greek Prose Authors. 3 Units.
Readings from authors such as Plato, Lysias, Xenophon, and Herodotus. Offered as GREK 201, GREK 401, WLIT 201 and WLIT 401.

GREK 402. Introduction to Greek Poetry. 3 Units.
Primarily readings from Homer, Hesiod, and Theocritus. Selections from Greek lyric may be introduced at the instructor’s discretion. Offered as GREK 202, GREK 402, WLIT 202, and WLIT 402.

GREK 405. Readings in Ancient Philosophy: Plato. 3 Units.
Reading and interpretation of selected dialogues by Plato or other philosophical works. Offered as GREK 305 and GREK 405.

GREK 406. Tragedy. 3 Units.
Reading and interpretation of selected plays of Aeschylus, Euripides, and Sophocles. Offered as GREK 306, GREK 406, WLIT 306, and WLIT 406.

GREK 407. History. 3 Units.
Extensive reading in Thucydides’ History of the Peloponnesian War, especially Books VI and VII, the expedition against Syracuse. Offered as GREK 307, GREK 407, WLIT 307 and WLIT 407.
Grek 408. Comedy. 3 Units.
Origin, ambiance, and development of Greek Old Comedy and persisting characteristics of the genre. Translation of selected plays from Greek into English. Offered as GREK 308, GREK 408, WLIT 318, and WLIT 418.

GREK 411. Homer. 3 Units.
Reading and translation of extensive selections from the Odyssey. Introduction to epic meter, to Homeric Greek, and to the poet’s style. Consideration of evidences of oral composition and discussion of the heroic tradition. Offered as GREK 311, GREK 411, WLIT 311 and WLIT 411.

GREK 470. Greek Prose Composition. 3 Units.
This course introduces students to the principles and practice of composing continuous passages of Greek prose. It is designed to review and to strengthen students’ command of Attic forms while becoming more aware of the ways Greek syntax was employed to express thought. Via practice at writing Greek prose, the ultimate goal is for the students to become more proficient and sensitive readers of ancient Greek. Offered as GREK 370, GREK 470, WLIT 370 and WLIT 470.

GREK 480. Advanced Topics in Greek Literature. 3 Units.
Study and discussion of important authors, works, and topics not covered regularly. Content will reflect particular interests of students and faculty and timeliness of the topics. Offered as GREK 380 and GREK 480.

GREK 495. Directed Readings. 1 - 3 Units.
Readings in Greek of authors selected to serve the individual interests and needs of undergraduate students. Each program planned and completed under the supervision of the instructor with whom the student wishes to work. Offered as GREK 395 and GREK 495.

LATN Courses

LATN 101. Elementary Latin I. 3 Units.
An introduction to the elements of Latin: pronunciation, forms, syntax, vocabulary, and reading.

LATN 102. Elementary Latin II. 3 Units.
An introduction to the elements of Latin: pronunciation, forms, syntax, vocabulary, and reading. Prereq: LATN 101 or equivalent.

LATN 201. Latin Prose Authors. 3 Units.
Reading and discussion of such prose authors as Cicero, Caesar, Livy or Pliny. Offered as LATN 201, LATN 401, WLIT 241 and WLIT 441. Prereq: LATN 102 or equivalent.

LATN 202. Vergil. 3 Units.
Primarily readings from The Aeneid; selections from Vergil’s other work may be introduced at instructor’s discretion. Recommended preparation: LATN 201 or equivalent. Offered as LATN 202, LATN 402, WLIT 232 and WLIT 432.

LATN 305. Literature of the Republic. 3 Units.
A reading course in prose and poetry of the Roman Republic. Extensive selections from Cicero and Catullus, and one comedy of Terence. Offered as LATN 305, LATN 405, WLIT 334, and WLIT 434. Prereq: 200-level LATN or equivalent.

LATN 307. Livy. 3 Units.
Readings in Books I and XXI, with other selections from this major Augustan historian. Offered as LATN 307, LATN 407, WLIT 347, and WLIT 447. Prereq: 200-level LATN or equivalent.

LATN 308. Horace: Odes and Epodes. 3 Units.
Readings and discussion of extensive selections from the poetry of Horace; consideration of Horace as exemplifying the spirit of the Augustan Age. Offered as LATN 308, LATN 408, WLIT 348, and WLIT 448. Prereq: 200-level LATN or equivalent.

LATN 309. Medieval Latin. 3 Units.
Reading and interpretation of Latin texts from the Middle Ages. Material selected according to the needs and interests of students. Offered as LATN 309, LATN 409, WLIT 349, and WLIT 449. Prereq: 200-level LATN or equivalent.

LATN 351. Latin Didactic Literature. 3 Units.
Readings from didactic poetry such as Lucretius and Vergil’s Georgics. Parodies like Ovid’s Ars Amatoria or prose treatises may also be introduced. Offered as LATN 351, LATN 451, WLIT 351, and WLIT 451. Prereq: 200-level LATN or equivalent.

LATN 352. History. 3 Units.
Works of the Roman historian Cornelius Tacitus; his Annals I-VI dealing with his portrait of Emperor Tiberius and the Empire after the death of Augustus. Offered as LATN 352, LATN 452, WLIT 352, and WLIT 452. Prereq: 200-level LATN or equivalent.

LATN 354. Drama. 3 Units.
Reading of at least one play each by Plautus and Terence. Attention to the history of Latin and Greek New Comedy, and the contrasting styles of the two authors. Offered as LATN 354, LATN 454, WLIT 354, and WLIT 454. Prereq: 200-level LATN or equivalent.

LATN 355. The Roman Novel. 3 Units.
Readings from the two surviving Roman novels, Petronius’ Satyricon and Apuleius’ Metamorphoses or Golden Ass. There will also be discussion of the major themes and approaches to the Roman novel. Recommended preparation: LATN 200-level course or equivalent. Offered as LATN 355 and LATN 455.

LATN 356. Elegiac Poetry. 3 Units.
In this course we shall translate and interpret selected elegies by Catullus, Tibullus, Propertius, and Ovid. We will also devote considerable class time to the reading and in-depth analysis of the major secondary literature, starting with the introductory pieces in the newest companions published by Brill and Cambridge, and moving on to fundamental articles and perhaps even a full scholarly monograph. Offered as LATN 356, LATN 456, WLIT 336, and WLIT 436. Prereq: 200-level LATN or equivalent.

LATN 380. Advanced Topics in Latin Literature. 3 Units.
Study and discussion of important authors, works, and topics not covered regularly. Content will reflect particular interests of students and faculty and timeliness of topics. Offered as LATN 380 and LATN 480. Prereq: 200-level LATN or equivalent.

LATN 395. Directed Readings. 1 - 3 Units.
Directed readings in Latin of authors selected to serve the individual interests and needs of undergraduate students. Each program planned and completed under the supervision of the instructor with whom the student wishes to work. Offered as LATN 395 and LATN 495.

LATN 401. Latin Prose Authors. 3 Units.
Reading and discussion of such prose authors as Cicero, Caesar, Livy or Pliny. Offered as LATN 401, WLIT 241 and WLIT 441. Prereq: LATN 402 or equivalent.

LATN 402. Vergil. 3 Units.
Primarily readings from The Aeneid; selections from Vergil’s other work may be introduced at instructor’s discretion. Recommended preparation: LATN 201 or equivalent. Offered as LATN 202, LATN 402, WLIT 232 and WLIT 432.

LATN 405. Literature of the Republic. 3 Units.
A reading course in prose and poetry of the Roman Republic. Extensive selections from Cicero and Catullus, and one comedy of Terence. Offered as LATN 305, LATN 405, WLIT 334, and WLIT 434.
LATN 407. Livy. 3 Units.
Readings in Books I and XXI, with other selections from this major
Augustan historian. Offered as LATN 307, LATN 407, WLIT 347, and
WLIT 447.

LATN 408. Horace: Odes and Epodes. 3 Units.
Readings and discussion of extensive selections from the poetry
of Horace; consideration of Horace as exemplifying the spirit of the
Augustan Age. Offered as LATN 308, LATN 408, WLIT 348, and WLIT 448.

LATN 409. Medieval Latin. 3 Units.
Reading and interpretation of Latin texts from the Middle Ages. Material
selected according to the needs and interests of students. Offered as
LATN 309, LATN 409, WLIT 349, and WLIT 449.

LATN 451. Latin Didactic Literature. 3 Units.
Readings from didactic poetry such as Lucretius and Vergil’s Georgics.
Parodies like Ovid’s Ars Amatoria or prose treatises may also be
introduced. Offered as LATN 351, LATN 451, WLIT 351, and WLIT 451.

LATN 452. History. 3 Units.
Works of the Roman historian Cornelius Tacitus; his Annals I-VI dealing
with his portrait of Emperor Tiberius and the Empire after the death of
Augustus. Offered as LATN 352, LATN 452, WLIT 352, and WLIT 452.

LATN 454. Drama. 3 Units.
Reading of at least one play each by Plautus and Terence. Attention to
the history of Latin and Greek New Comedy, and the contrasting styles
of the two authors. Offered as LATN 354, LATN 454, WLIT 354, and
WLIT 454.

LATN 455. The Roman Novel. 3 Units.
Readings from the two surviving Roman novels, Petronius’ Satyricon and
Apuleius’ Metamorphoses or Golden Ass. There will also be discussion of
the major themes and approaches to the Roman novel. Recommended
preparation: LATN 200 level course or equivalent. Offered as LATN 355
and LATN 455.

LATN 456. Elegiac Poetry. 3 Units.
In this course we shall translate and interpret selected elegies by
Catullus, Tibullus, Propertius, and Ovid. We will also devote considerable
class time to the reading and in-depth analysis of the major secondary
literature, starting with the introductory pieces in the newest companions
published by Brill and Cambridge, and moving on to fundamental articles
and perhaps even a full scholarly monograph. Offered as LATN 356,
LATN 456, WLIT 356, and WLIT 436.

LATN 480. Advanced Topics in Latin Literature. 3 Units.
Study and discussion of important authors, works, and topics not covered
regularly. Content will reflect particular interests of students and faculty
and timeliness of topics. Offered as LATN 380 and LATN 480.

LATN 495. Directed Readings. 1 - 3 Units.
Directed readings in Latin of authors selected to serve the individual
interests and needs of undergraduate students. Each program planned
and completed under the supervision of the instructor with whom the
student wishes to work. Offered as LATN 395 and LATN 495.

Department of Cognitive Science
617C Crawford Hall
www.case.edu/artsci/cogs (http://www.case.edu/artsci/cogs/)
Phone: 216.368.4753
Todd Oakley, Department Chair
todd.oakley@case.edu

Cognitive science is the scientific study of the mind in a transdisciplinary
framework. The Department of Cognitive Science at Case Western
Reserve University is specifically dedicated to the study of human
higher cognition, including language, gesture, advanced social cognition,
mathematical invention, scientific discovery, art, religion, morality, music,
literature, advanced tool use and advanced technology, theater and
dance, fashions of dress, sign systems, creativity, and culture. The
department draws on methods of research in the biological sciences, the
social sciences, and the humanities. Its educational mission is to provide
students with the best possible opportunity to integrate a wide variety of
approaches and apply them to the study of human higher cognition.

The department provides basic training in core disciplines, as well as
in a range of philosophical, evolutionary, linguistic, and computational
issues bearing on cognitive science. It seeks to place cognitive science in
a wider, more ecologically valid context than traditional programs in this
field have typically allowed, so as to broaden our theories of those high-
end cognitive capacities that mark human beings as distinctive.

The department offers an undergraduate major and minor in cognitive
science and a master’s degree in cognitive linguistics. By developing
wide-ranging expertise in at least two or three relevant disciplines, our
students can prepare for a variety of career options. Training in several
disciplines will also provide increased choices for postgraduate study.

Department Faculty
Todd Oakley, PhD
(University of Maryland)
Professor and Chair
Cognitive linguistics; discourse analysis; attention

William E. Deal, PhD
(Harvard University)
Severance Professor in the History of Religion
Cognitive science of religion and ethics; Buddhist theory of mind

Fey Parrill, PhD
(University of Chicago)
Professor
Language and co-speech gesture

Yasuhiro Shirai, PhD
(University of California, Los Angeles)
Professor
First- and second-language acquisition

Vera Tobin, PhD
(University of Maryland)
Associate Professor
Cognitive linguistics, pragmatics, literature; evolution and development

Mark Turner, PhD
(University of California, Berkeley)
Institute Professor
Higher-order cognition and creativity; conceptual integration

Secondary Faculty
Daniela Calvetti, PhD
(University of North Carolina, Chapel Hill)
James Wood Williamson Professor, Department of Mathematics, Applied
Mathematics, and Statistics
In addition to meeting general education requirements, cognitive science majors must complete a minimum of 30 semester hours in cognitive science and approved related course work: 15 hours in the foundation component and 15 hours of elective course work. The foundation courses provide all students with a common basis for further study. They consist of:

### Adjunct Faculty

- **Per Aage Brandt**, Doctorat d'Etat  
  (Sorbonne I, Paris)  
  *Adjunct Professor, Emeritus*

- **Yohannes Haile-Selassie**, PhD  
  (University of California, Berkeley)  
  *Adjunct Professor, Curator and Head of Physical Anthropology, Cleveland Museum of Natural History*

- **Bruce M. Latimer**, PhD  
  (Kent State University)  
  *Adjunct Professor, Cleveland Museum of Natural History*

### Lecturer

- **J. Elliott Casal**, PhD  
  (The Pennsylvania State University)  
  *Postdoctoral Researcher*

### Undergraduate Programs

#### Major

In addition to meeting general education requirements, cognitive science majors must complete a minimum of 30 semester hours in cognitive science and approved related course work: 15 hours in the foundation component and 15 hours of elective course work. The foundation courses provide all students with a common basis for further study. They consist of:

<td>9</td>
<td></td>
</tr>
</tbody>
</table>

Total Units: 15

The minor provides a good basic grounding in cognitive science, and allows students to narrow their exposure to those aspects of the field most relevant to their other academic interests. Individual programs can be developed in consultation with the chair of the department.

### Graduate Program

#### MA in Cognitive Linguistics

“Cognitive linguistics goes beyond the visible structure of language and investigates the considerably more complex backstage operations of cognition that create grammar, conceptualization, discourse, and thought itself. The theoretical insights of cognitive linguistics are based on extensive empirical observation in multiple contexts, and on experimental work in psychology and neuroscience. Results of cognitive linguistics, especially from metaphor theory and conceptual integration theory, have been applied to wide ranges of nonlinguistic phenomena.”

Candidates may apply for admission to the degree program in cognitive linguistics with the purpose of pursuing the MA, or for non-degree status with the purpose of taking courses for credit that can be transferred to other institutions. The MA follows Plan A as described in the School of Graduate Studies (p. 1333) section of this bulletin. Accordingly, it requires 30 credit hours and a written MA thesis.
Courses

COGS 101. Introduction to Cognitive Science. 3 Units.
This course introduces students to the field of cognitive science. Cognitive scientists are interested in the nature of the human mind--basically, we ask how humans think. This is a huge question, and has been addressed in one way or another by pretty much every academic field. Cognitive science tries to unite work from many different fields, including computer science, neuroscience, psychology, linguistics, philosophy, music, art, and literary theory. In this course, you'll get a basic introduction to some of the topics that are central to human cognition, such as intelligence, categorization, language, and creativity. We'll ask what can be gained by taking an integrated, cognitive scientific approach to these topics.

COGS 102. Introduction to Cognitive Neuroscience. 3 Units.
A survey of the fundamental methods, findings, and theories that attempt to understand the human mind from a neuroscientific standpoint. The course provides the student with background knowledge of brain processes underlying such psychological phenomena as consciousness, sensation, perception, thought, language, and voluntary action. Since many fields of neuroscience have contributed to cognitive neuroscience, the approach of this course is cross-disciplinary. It introduces theories and data from clinical and experimental neuropsychology, brain imaging, neuroelectric and neuromagnetic brain activity, the neuroscience of language, and behavioral neuroscience, among other fields.

COGS 201. Human Cognition in Evolution and Development. 3 Units.
COGS 201 covers mind unfolding in time, including the fundamental methods, findings, and theories of human mental phylo- and ontogenesis. It provides the student with background knowledge about the unfolding of cognitive structures and functions over time, in both the deep temporal perspective of evolution (measured across many lifetimes) and the shorter one of development (measured within single lifetimes). The approach of the course is cross-disciplinary, including approaches that come from anthropology, archaeology, philosophy, computing science, comparative psychology, primatology, and comparative linguistics, among others.

COGS 202. Cognition and Culture. 3 Units.
This course studies the human mind in its natural environment: culture. It covers the fundamental methods, findings, and theories that attempt to understand the growth and evolution of cognition from either a social science or humanistic standpoint. It provides the student with background knowledge of theories of human cultural evolution and change, of the relationship between the cognizing individual and larger social-cognitive structures, and of such phenomena as distributed networks, cooperative mental work, and the phenomenology of human experience. Many disciplines have contributed to this knowledge; hence the approach of this course is cross-disciplinary, including ideas from cultural anthropology, literary studies, art and art history, musicology, philosophy, and the history of technology, among others.

COGS 205. Cognition and Design. 3 Units.
Urbanism is design; architecture is design; of course, the aesthetic shaping of artifacts (such as computers, cars, and coffee machines) is design. Configuring surfaces, volumes, and portions of space in special ways, creating and changing formats for things and places that allow cultural practices to unfold while delimiting them, are essential 'designing' endeavors of human civilization and are, necessarily, activities based on the cognitive capacities and constraints of our species. We 'cognize' the human world in terms and frames of 'designed' surroundings. Design is a basic expressive activity, by which we interact with our artificial and natural surroundings and create 'interfaces' between mind and reality, thus upholding and interpretable world. Landscapes and cityscapes, work spaces of all sorts, buildings and parks, exteriors and interiors of homes, factories, institutions, and temples; furniture, artifacts such as machines, tools, weapons, symbolic objects, even the configuration ('building') of our own bodies, are design. An inquiry into cultural cognition, aiming to understand how humans as socio-cultural beings think and feel, therefore needs to explore this dimension of spatial expressivity and to acknowledge it as a constitutive fact of human meaning production; it needs to study the aesthetic and pragmatic, political and historical, philosophical and religious, and simply everyday practical, semiotic aspects of this basic form of human creativity. This course will focus on spatial expressivity--design--in several primary keys and scales, including design for learning; design for verbal and technical communication, interaction, and commerce; design for expressions of authority and deliberation; and design for emotional display.

COGS 206. Theory of Cognitive Linguistics I. 3 Units.
This is the first course in a two-course sequence presenting theory and practice of cognitive linguistics. Offered as COGS 206 and COGS 406.

COGS 215. Words and Mind. 3 Units.
There is something fascinating and special about words. They are the aspect of language that everyone knows about and pays attention to—and every academic discipline with an interest in language has something to say about them! The sheer number of words known by every speaker of any human language is quite vast (and the exact number is a mystery). In this class we will learn about words in all their aspects, and see what the wide weirdness of words can help us understand about the human mind. Subjects covered include the question of what makes a word (is "ouch" a word? "ain't")?); word origins; taboo words; words and memory; word boundaries; and word games, puns, and puzzles.

COGS 272. Morality and Mind. 3 Units.
Recent research in cognitive science challenges ethical perspectives founded on the assumption that rationality is key to moral knowledge or that morality is the product of divine revelation. Bedrock moral concepts like free will, rights, and moral agency also have been questioned. In light of such critiques, how can we best understand moral philosophy and religious ethics? Is ethics primarily informed by nature or by culture? Or is ethics informed by both? This course examines 1) ways in which cognitive science—and related fields such as evolutionary biology—impact traditional moral perspectives, and 2) how the study of moral philosophy and comparative ethics forces reconsideration of broad cognitive science theories about the nature of ethics. The course examines the concept of free will as a case study in applying these interpretive viewpoints. Interdisciplinary readings include literature from moral philosophy, religious ethics, cognitive science, and evolutionary biology. Offered as COGS 272 and RLGN 272.

COGS 301. Special Topics in Cognitive Science. 3 Units.
Special Topics in Cognitive Science. Topics vary. Permission of department is required. Offered as COGS 301 and COGS 401.
COGS 305. Social Cognition and the Brain. 3 Units.
Human beings develop intricate means of presenting themselves to others; of representing others as friends, enemies, or strangers; of making quick assessments of any situation based on the attribution of intentions; of sizing up the Other via symbols and other shibboleths; and of the disposition and ability to empathize and sympathize with the emotional states of others for specific purposes. In recent years, the role of culture and cultural diversity has come to play a significant role in thinking about social cognition and the evolution of sociality. It is likewise an unfortunate fact that many human beings lack many of the means, abilities, and dispositions to connect with one another easily and without extensive and explicit tutelage. Such clinical populations (e.g., autistics, schizophrenics, etc.) are of considerable interest because of their promise as a contrastive model of typicality. This course will focus on these aspects of sociality both at the level of the interpersonal and personal (cognitive and phenomenological) and the sub-personal (neuroscientific). By term’s end, students in this class will develop a deep understanding of several dimensions of social cognition research and its implications for the next generation of cognitive neuroscience. Each student will articulate a research problem and develop a method for investigating it through independent and collaborative means of practicing their research, critical thinking, writing and communication skills. Offered as COGS 305 and COGS 405.

COGS 307. Cog Linguistics Theory II. 3 Units.
This is the second course in a two-course sequence presenting theory and practice of cognitive linguistics. Offered as COGS 307 and COGS 407. Counts as SAGES Departmental Seminar.

COGS 308. Advanced Research Workshop I. 3 Units.
This course is an advanced research workshop for undergraduates and MA students. The workshop involves development of research topics (theoretical or empirical), and working on them with the input of other workshop members to produce final papers. Offered as COGS 308 and COGS 408.

COGS 309. Advanced Research Workshop II. 3 Units.
This course is an advanced research workshop for undergraduates and MA students. The workshop involves development of research topics (theoretical or empirical), and working on them with the input of other workshop members to produce final papers. MA students in cognitive linguistics will typically take this course as the second part of a two-part sequence. Offered as COGS 309 and COGS 409.

COGS 310. Cognitive Science of Religion. 3 Units.
This course introduces theories and methods in the cognitive science of religion. Particular emphasis is placed on applying cognitive scientific concepts and theories to such religious issues as belief in deities, religious ritual, and morality. We examine such topics as the relationship of religious studies to evolution and cognition, cognitive theories or religious ritual, anthropomorphism and religious representation, religion as an evolutionary adaptation, and cognitive semantics and religious language. Course work includes student-led discussions, a research-intensive journal-length essay on a topic chosen in consultation with the Instructor, and presentation of research findings to the class. Course readings are taken from the humanities, the social sciences, and natural sciences. Offered as COGS 310, COGS 410, RLGN 310 and RLGN 410.

COGS 311. Mind and Media. 3 Units.
An introduction to the study of mind and media, including the study of multimodal communication. This course investigates patterns of human cognition that are ancient to human beings and upon which media have converged for powerful, immersive effect. The cognitive processes studied include perception, sensation, imagination, joint attention, narrative conception, simulation, dreaming, identity construction, imaginative play, and implicit learning. Students engage in hands-on media analysis to study how basic human mental operations are used in media to achieve a variety of effects. Students will be given access to a private website of instructions, readings, and materials for the course, and will be introduced to a range of vast, rich, searchable databases of media. Students will have ample opportunity to do research inside such databases. Offered as COGS 311 and COGS 411. Counts as SAGES Departmental Seminar.

COGS 312. Second Language Acquisition I. 3 Units.
This course is an introduction to the growing field of second language acquisition (SLA). SLA seeks to understand the linguistic, psychological and social processes that underlie the learning and use of second language(s). The goal of research is to identify the principles and processes that govern second language learning and use. SLA is approached from three perspectives in the course: 1) as linguistic knowledge; 2) as a cognitive skill; and 3) as a socially and personality-mediated process. Important factors in second language learning will be identified and discussed. These include: age-related differences, the influence of the first language, the role played by innate (universal) principles, the role of memory processes, attitudes, motivation, personality and cognitive styles, and formal versus naturalistic learning contexts. The objective of this course is to survey the principal research in second language acquisition. Students will become familiar with the major research issues through their reading of both primary and secondary sources, as well as through lectures and class discussions. Offered as COGS 312, COGS 412, LING 301 and LING 401.

COGS 314. Second Language Acquisition II: Second Language Acquisition Research and Second Language Teaching. 3 Units.
This course will examine various issues in second language acquisition research that are particularly relevant to foreign language teaching and learning. Topics covered will include: the role of input (listening/reading) vs. output (speaking/writing); implicit vs. explicit learning; negative vs. positive evidence (including the role of error correction); affective factors (motivation, anxiety); individual differences; teachability hypothesis and syllabus construction, program design/evaluation, language testing, among others. The purpose of this course is to survey the principal research in the acquisition of second language that is relevant to second language teaching in a classroom setting, and to obtain the state-of-the-art knowledge of the SLA research literature that is relevant to L2 teaching. The focus is not necessarily on the practical application of the SLA research, although we will not exclude discussion of classroom application. Rather, we critically examine and evaluate SLA research and come up with our own syntheses with respect to various issues. To achieve this goal, we should ask following questions in reading and discussing the relevant literature: 1) What are the main claims that the author(s) make(s)? 2) Are the author’s claims sound? If not why? 3) What further research is needed to answer remaining questions? Students will become familiar with the major research issues through their reading of both primary and secondary sources, as well as through lectures and class discussions. The students are required to complete a term project that addresses the issues treated in the course. Offered as LING 302, LING 402, COGS 314 and COGS 414. Prereq: COGS 301 or requisites not met permission.
COGS 316. Decision-Making. 3 Units.
This course is a topical introduction to decision-making, a major area of cognitive social science, with connections to economics, law, political science, business, policy, and related fields. Topics include game theory and rational calculation, equilibria, kinds of choice, heuristics, the role of affect in decision, framing, bounded rationality, mechanisms of choice such as heuristics, the role of social cognition in choice, concepts of self and other, and computer modeling of choice. The course also includes an introduction to the design of empirical behavioral research. Offered as COGS 316 and COGS 416. Counts as SAGES Departmental Seminar.

COGS 317. Cognitive Diversity. 3 Units.
This course surveys research from cognitive science (psychology, linguistics, neuroscience, etc.) on the ways that different people think differently. We will consider dimensions such as sex, gender, sexual orientation, race/ethnicity, bodily differences, cultural differences, and effects of speaking different languages. Students will choose the last two topics at the end of the semester (Different religions? Different ages? Whatever interests the class!). Offered as COGS 317 and COGS 417. Counts for CAS Global & Cultural Diversity Requirement.

COGS 319. Elements of Surprise. 3 Units.
This course will connect research into the cognitive experiences of surprise and suspense with the ways people can create those experiences for each other—cooperatively and uncooperatively—in everyday interaction and in cultural products like jokes, architecture, music, written narratives, films, and games. Topics include predictions and expectations involved in perceiving and navigating the physical world, cognitive biases, timing in conversation, language processing, attention, perspective-taking, counterfactual thinking, the psychological structure of explanations, and the psychology of "fair play." Offered as COGS 319 and COGS 419.

COGS 322. Human Learning and the Brain. 3 Units.
This course focuses on the question, "How does my brain learn and how can its learning best be facilitated?" Each student is required to develop a comprehensive theory about personal learning. These theories will take the form of a major paper which will be expanded and modified throughout the semester. Readings and class discussions will focus on the following topics: learning and education systems, major structures of the brain and their role in learning, neuronal wiring of the brain and how learning changes it, the emotional brain and its essential role in learning, language and the brain, the role of images in learning, memory and learning (and related pathologies, such as PTSD). Students are expected to incorporate information on these topics into their personal theory of learning. In so doing, students are expected to articulate meaningful questions, skillfully employ research and apply their own knowledge to address such questions, produce clear, precise academic prose to explicate their ideas, and provide relevant and constructive criticism during class discussions. Offered as BIOL 302 and COGS 322. Counts as SAGES Departmental Seminar.

COGS 325. Cognitive Approaches to Literature. 3 Units.
This course approaches literature as a window into language, in which cognition is characterized by the same imaging and imaginary properties as artistic literature. It is an attempt to identify and analyze procedures as aesthetically interesting and generally relevant forms of human thinking, feeling, imagining, fantasizing, and conceptualizing. The course introduces current theories of literature in relation to language and mind, and it presents and discusses practical applications in critical reading and text analysis, using examples from modern literature in the main genres. A student may earn credit for either COGS 325 or COGS 425 but not both. Recommended preparation: COGS 101, COGS 202. Offered as COGS 325 and COGS 425.

COGS 327. Gesture in Cognition and Communication. 3 Units.
Most people never notice that when they are talking, they’re also gesturing. Why do we produce these gestures? What can studying them tell us about the human mind? This course surveys scientific research on gesture, exploring topics such as the role of gesture in communication, cross-cultural differences in gesture, and the relationship between gesture and signed languages. The course will focus on gestures produced with speech, but will cover symbolic and ritualized gesture in the visual arts and in dance. Offered as COGS 327, COGS 427 and MLIT 327. Counts as SAGES Departmental Seminar.

COGS 330. Cognition and Computation. 3 Units.
An introduction to (1) theories of the relationship between cognition and computation; (2) computational models of human cognition (e.g. models of decision-making or concept creation); and (3) computational tools for the study of human cognition. All three dimensions involve data science: theories are tested against archives of brain imaging data; models are derived from and tested against datasets of e.g., financial decisions (markets), legal rulings and findings (juries, judges, courts), legislative actions, and healthcare decisions; computational tools aggregate data and operate upon it analytically, for search, recognition, tagging, machine learning, statistical description, and hypothesis testing. Offered as COGS 330, COGS 430, DSCI 330 and DSCI 430.

COGS 331. Introduction to Applied Linguistics. 3 Units.
This course provides students with answers to the question, "Linguistics? What can you do with that?" We will survey the ways that linguistics has been used (i.e. applied) to solve 'real world' problems. Some of these, like computational linguistics and the teaching of language, are intimately involved in language, even though they do not necessarily concern themselves with linguistic theory. Others, such as language and the law, use linguistics as a tool to do their work. We will be concerned with understanding the various ways that linguistic inquiries have been used or neglected, and also with the implications of applied fields for linguistic theories. Offered as LING 309, LING 409, COGS 331 and COGS 431. Counts for CAS Global & Cultural Diversity Requirement.

COGS 335. Japanese Linguistics. 3 Units.
The purpose of this course is to survey the principal research in Japanese linguistics for students who have basic knowledge of Japanese and are interested in more in-depth treatment of linguistic phenomena (phonetics, phonology, morphology, syntax, semantics, etc.). Lectures and discussions will cover many different aspects of the Japanese language. There is a great deal of analytic studies of the Japanese language done both inside and outside Japan, which will be surveyed in this course. Students will become familiar with the major issues through lectures and class discussions, as well as through their reading of both primary and secondary sources. Both formal and functional approaches to the analysis of Japanese will be examined, and the acquisition of these structures will also be discussed. The course will also be useful for the improvement of students’ Japanese language proficiency. Recommended preparation: JAPN 101 and JAPN 102, or equivalent competence in Japanese. Offered as COGS 335, COGS 435, JAPN 435, LING 335 and LING 435. Counts for CAS Global & Cultural Diversity Requirement.
COGS 348. Buddhism and Cognitive Science. 3 Units.
In 1987, the Dalai Lama initiated a yearly event--Mind and Life Dialogues--to address "critical issues of modern life at the intersection of scientific and contemplative understanding". Dialogue topics included issues related to Buddhist thought and practice, and cognitive science. Others with an interest in the intersection of Buddhism and cognitive science, such as Robert Wright in Why Buddhism is True: The Science and Philosophy of Meditation and Enlightenment (2017), argue that non-supernatural aspects of Buddhism, such as the benefits of mindfulness meditation and the nature of the (non-)self, are affirmed by cognitive science and evolutionary psychology. The notion that at least some aspects of Buddhism are "true" in relation to contemporary cognitive scientific views of mind and brain has attracted considerable attention from both Buddhist practitioners and cognitive scientists. This seminar explores Buddhist and cognitive science perspectives on issues such as embodied cognition, consciousness, mind, self and personal identity, theory of mind, morality, representation, and language. We start with a general overview of Buddhist philosophy, and then turn to specific readings on Buddhist concepts in relation to similar concepts found in the cognitive science literature. For instance, we will explore the Buddhist concept of no permanent self or soul (an-tman). This idea resonates with Daniel Dennett's notion of the "narrow self" and the cognitive neuroscience view that there is no neurological center of self or experience. Although the specific concepts covered will vary in each iteration of this course, readings will always be drawn from both Buddhist primary and secondary readings, and from the cognitive science literature. Offered as COGS 348, COGS 448, RLGN 348 and RLGN 448. Counts for CAS Global & Cultural Diversity Requirement. Prereq: Completion of one COGS or RLGN course or Requisites Not Met permission.

COGS 352. Language, Cognition, and Religion. 3 Units.
This course utilizes theoretical approaches found in cognitive semantics--a branch of cognitive linguistics--to study the conceptual structures and meanings of religious language. Cognitive semantics, guided by the notion that conceptual structures are embodied, examines the relationship between conceptual systems and the construction of meaning. We consider such ideas as conceptual metaphor theory, conceptual blending, image schemas, cross-domain mappings, metonymy, mental spaces, and idealized cognitive models. We apply these ideas to selected Christian, Buddhist, and Chinese religious texts in order to understand ways in which religious language categorizes and conceptualizes the world. We examine both the universality of cognitive linguistic processes and the culturally specific metaphors, conceptual blends, image schemas, and other cognitive operations that particular texts and traditions utilize. Offered as RLGN 352, RLGN 452, COGS 352 and COGS 452. Counts for CAS Global & Cultural Diversity Requirement.

COGS 378. Computational Neuroscience. 3 Units.
Computer simulations and mathematical analysis of neurons and neural circuits, and the computational properties of nervous systems. Students are taught a range of models for neurons and neural circuits, and are asked to implement and explore the computational and dynamic properties of these models. The course introduces students to dynamical systems theory for the analysis of neurons and neural learning, models of brain systems, and their relationship to artificial and neural networks. Term project required. Students enrolled in MATH 478 will make arrangements with the instructor to attend additional lectures and complete additional assignments addressing mathematical topics related to the course. Recommended preparation: MATH 223 and MATH 224 or BIOL 300 and BIOL 306. Offered as BIOL 378, COGS 378, MATH 378, BIOL 478, CSDS 478, EBME 478, ECSE 478, MATH 478 and NEUR 478.

COGS 381. Philosophy and Cognitive Neuroscience. 3 Units.
This course will focus on the various methodologies used in the cognitive neuroscience, and explore their strengths and weaknesses from scientific and philosophical standpoints. We will begin by examining baseline measures (including IQ tests, tasks of cognitive flexibility, verbal and visual memory, causal/sequential thinking and narrative tasks) and their experimental design. Lesion methods will follow, with an eye toward understanding the strength of inferences that can be drawn from such data. The course will also focus on imaging techniques (CAT, PET, SPECT, fMRI, TMS, etc.) as well as measures of electrical activity such as EEG and single-cell recordings. Students will become familiar with many fundamental assumptions necessary for the implementation of each method, and philosophical questions associated with these endeavors and their potential impact on our knowledge and society. Recommend preparation: PHIL 101 or COGS 201. Offered as COGS 381 and PHIL 381.

COGS 390. Introduction to General Semiotics. 3 Units.
Semiotics, the study of meaning and signs conveying meaning, is a central part of cognitive semiotics, or 'high level' cognitive semantics. This discipline is typically taught in departments of linguistics, cognitive science, philosophy, or cultural studies. The domain of semiotics is in fact widely intersecting with other disciplines (general linguistics, philosophy, neuroscience, anthropology, music, literature, architecture, and the arts). Sign theory, text theory, studies of narrative structure, enunciation, natural logic, rhetoric and poetics, speech act forms, are important components in this field.

COGS 391. Introduction to Text Semiotics. 3 Units.
Introduction to Text Semiotics addresses both students of Literature and students in Cognitive Science. Most of the authors included in the reading list extend their linguistic approach towards fields that intersect literature, psychology, philosophy, aesthetics, and anthropology. The scholarly traditions of text analysis and structural theory of meaning, including authors from classical formalism, structuralism, structural semiotics, and new criticism will be connected to cognitive theories of meaning construction in test, discourse, and cultural expressions in general. The focus of this course, taught as a seminar, is on empirical studies, specific text analyses, discourse analyses, speech act analyses, and other studies of speech, writing, and uses of language in cultural contexts. This course thus introduces to a study of literature and cultural expressions based on cognitive science and modern semiotics—the new view that has been coined Cognitive Semiotics. Offered as COGS 391 and WLIT 391.

COGS 397. SAGES Capstone in Cognitive Science. 3 Units.
Supervised original research on a topic in cognitive science, culminating in a public presentation. The research may be in the form of an independent research project, a literature review, or some other form approved by the department. Counts as SAGES Senior Capstone.

This course is for students with special interests and commitments that are not fully addressed in regular courses, and who wish to work independently.

COGS 401. Special Topics in Cognitive Science. 3 Units.
Special Topics in Cognitive Science. Topics vary. Permission of department is required. Offered as COGS 301 and COGS 401.
COGS 405. Social Cognition and the Brain. 3 Units.
Human beings develop intricate means of presenting themselves to others; of representing others as friends, enemies, or strangers; of making quick assessments of any situation based on the attribution of intentions; of sizing up the Other via symbols and other shibboleths; and of the disposition and ability to empathize and sympathize with the emotional states of others for specific purposes. In recent years, the role of culture and cultural diversity has come to play a significant role in thinking about social cognition and the evolution of sociality. It is likewise an unfortunate fact that many human beings lack many of the means, abilities, and dispositions to connect with one another easily and without extensive and explicit tutelage. Such clinical populations (e.g., autistics, schizophrenics, etc.) are of considerable interest because of their promise as a contrastive model of typicality. This course will focus on these aspects of sociality both at the level of the interpersonal and personal (cognitive and phenomenological) and the sub-personal (neuronscientific). By term's end, students in this class will develop a deep understanding of several dimensions of social cognition research and its implications for the next generation of cognitive neuroscience. Each student will articulate a research problem and develop a method for investigating it through independent and collaborative means of practicing their research, critical thinking, writing and communication skills. Offered as COGS 305 and COGS 405.

COGS 406. Theory of Cognitive Linguistics I. 3 Units.
This is the first course in a two-course sequence presenting theory and practice of cognitive linguistics. Offered as COGS 206 and COGS 406.

COGS 407. Cog Linguistics Theory II. 3 Units.
This is the second course in a two-course sequence presenting theory and practice of cognitive linguistics. Offered as COGS 307 and COGS 407. Counts as SAGES Departmental Seminar. Prereq: COGS 406 or consent of instructor.

COGS 408. Advanced Research Workshop I. 3 Units.
This course is an advanced research workshop for undergraduates and MA students. The workshop involves development of research topics (theoretical or empirical), and working on them with the input of other workshop members to produce final papers. Offered as COGS 308 and COGS 408.

COGS 409. Advanced Research Workshop II. 3 Units.
This course is an advanced research workshop for undergraduates and MA students. The workshop involves development of research topics (theoretical or empirical), and working on them with the input of other workshop members to produce final papers. MA students in cognitive linguistics will typically take this course as the second part of a two-part sequence. Offered as COGS 309 and COGS 409.

COGS 410. Cognitive Science of Religion. 3 Units.
This course introduces theories and methods in the cognitive science of religion. Particular emphasis is placed on applying cognitive scientific concepts and theories to such religious issues as belief in deities, religious ritual, and morality. We examine such topics as the relationship of religious studies to evolution and cognition, cognitive theories or religious ritual, anthropomorphism and religious representation, religion as an evolutionary adaptation, and cognitive semantics and religious language. Course work includes student-led discussions, a research-intensive journal-length essay on a topic chosen in consultation with the Instructor, and presentation of research findings to the class. Course readings are taken from the humanities, the social sciences, and natural sciences. Offered as COGS 310, COGS 410, RLGN 310 and RLGN 410.

COGS 411. Mind and Media. 3 Units.
An introduction to the study of mind and media, including the study of multimodal communication. This course investigates patterns of human cognition that are ancient to human beings and upon which media have converged for powerful, immersive effect. The cognitive processes studied include perception, sensation, imagination, joint attention, narrative conception, simulation, dreaming, identity construction, imaginative play, and implicit learning. Students engage in hands-on media analysis to study how basic human mental operations are used in media to achieve a variety of effects. Students will be given access to a private website, readings, and materials for the course, and will be introduced to a range of vast, rich, searchable databases of media. Students will have ample opportunity to do research inside such databases. Offered as COGS 311 and COGS 411. Counts as SAGES Departmental Seminar.

COGS 412. Second Language Acquisition I. 3 Units.
This course is an introduction to the growing field of second language acquisition (SLA). SLA seeks to understand the linguistic, psychological and social processes that underlie the learning and use of second language(s). The goal of research is to identify the principles and processes that govern second language learning and use. SLA is approached from three perspectives in the course: 1) as linguistic knowledge; 2) as a cognitive skill; and 3) as a socially and personality-mediated process. Important factors in second language learning will be identified and discussed. These include: age-related differences, the influence of the first language, the role played by innate (universal) principles, the role of memory processes, attitudes, motivation, personality and cognitive styles, and formal versus naturalistic learning contexts. The objective of this course is to survey the principal research in second language acquisition. Students will become familiar with the major research issues through their reading of both primary and secondary sources, as well as through lectures and class discussions. Offered as COGS 312, COGS 412, LING 301 and LING 401.

COGS 414. Second Language Acquisition II: Second Language Acquisition Research and Second Language Teaching. 3 Units.
This course will examine various issues in second language acquisition research that are particularly relevant to foreign language teaching and learning. Topics covered will include: the role of input (listening/reading) vs. output (speaking/writing); implicit vs. explicit learning; negative vs. positive evidence (including the role of error correction); affective factors (motivation, anxiety); individual differences; teachability hypothesis and syllabus construction, program design/evaluation, language testing, among others. The purpose of this course is to survey the principal research in the acquisition of second language that is relevant to second language teaching in a classroom setting, and to obtain the state-of-the-art knowledge of the SLA research literature that is relevant to L2 teaching. The focus is not necessarily on the practical application of the SLA research, although we will not exclude discussion of classroom application. Rather, we critically examine and evaluate SLA research and come up with our own syntheses with respect to various issues. To achieve this goal, we should ask following questions in reading and discussing the relevant literature: 1) What are the main claims that the author(s) make(s)? 2) Are the author's claims sound? If not why? 3) What further research is needed to answer remaining questions? Students will become familiar with the major research issues through their reading of both primary and secondary sources, as well as through lectures and class discussions. The students are required to complete a term project that addresses the issues treated in the course. Offered as LING 302, LING 402, COGS 314 and COGS 414. Prereq: COGS 401 or requisites not met permission.
COGS 416. Decision-Making. 3 Units.
This course is a topical introduction to decision-making, a major area of cognitive social science, with connections to economics, law, political science, business, policy, and related fields. Topics include game theory and rational calculation, equilibria, kinds of choice, heuristics, the role of affect in decision, framing, bounded rationality, mechanisms of choice such as heuristics, the role of social cognition in choice, concepts of self and other, and computer modeling of choice. The course also includes an introduction to the design of empirical behavioral research. Offered as COGS 316 and COGS 416. Counts as SAGES Departmental Seminar.

COGS 417. Cognitive Diversity. 3 Units.
This course surveys research from cognitive science (psychology, linguistics, neuroscience, etc.) on the ways that different people think differently. We will consider dimensions such as sex, gender, sexual orientation, race/ethnicity, bodily differences, cultural differences, and effects of speaking different languages. Students will choose the last two topics at the end of the semester (Different religions? Different ages? Whatever interests the class!). Offered as COGS 317 and COGS 417. Counts for CAS Global & Cultural Diversity Requirement.

COGS 419. Elements of Surprise. 3 Units.
This course will connect research into the cognitive experiences of surprise and suspense with the ways people can create those experiences for each other—cooperatively and uncooperatively—in everyday interaction and in cultural products like jokes, architecture, music, written narratives, films, and games. Topics include predictions and expectations involved in perceiving and navigating the physical world, cognitive biases, timing in conversation, language processing, attention, perspective-taking, counterfactual thinking, the psychological structure of explanations, and the psychology of "fair play." Offered as COGS 319 and COGS 419.

COGS 425. Cognitive Approaches to Literature. 3 Units.
This course approaches literature as a window into language, in which cognition is characterized by the same imaging and imaginary properties as artistic literature. It is an attempt to identify and analyze procedures as aesthetically interesting and generally relevant forms of human thinking, feeling, imagining, fantasizing, and conceptualizing. The course introduces current theories of literature in relation to language and mind, and it presents and discusses practical applications in critical reading and text analysis, using examples from modern literature in the main genres. A student may earn credit for either COGS 325 or COGS 425 but not both. Recommended preparation: COGS 101, COGS 202. Offered as COGS 325 and COGS 425.

COGS 427. Gesture in Cognition and Communication. 3 Units.
Most people never notice that when they are talking, they’re also gesturing. Why do we produce these gestures? What can studying them tell us about the human mind? This course surveys scientific research on gesture, exploring topics such as the role of gesture in communication, cross-cultural differences in gesture, and the relationship between gesture and signed languages. The course will focus on gestures produced with speech, but will cover symbolic and ritualized gesture in the visual arts and in dance. Offered as COGS 327, COGS 427 and MLIT 327. Counts as SAGES Departmental Seminar.

COGS 430. Cognition and Computation. 3 Units.
An introduction to (1) theories of the relationship between cognition and computation; (2) computational models of human cognition (e.g. models of decision-making or concept creation); and (3) computational tools for the study of human cognition. All three dimensions involve data science: theories are tested against archives of brain imaging data; models are derived from and tested against datasets of e.g., financial decisions (markets), legal rulings and findings (juries, judges, courts), legislative actions, and healthcare decisions; computational tools aggregate data and operate upon it analytically, for search, recognition, tagging, machine learning, statistical description, and hypothesis testing. Offered as COGS 330, COGS 430, DSCI 330 and DSCI 430.

COGS 431. Introduction to Applied Linguistics. 3 Units.
This course provides students with answers to the question, "Linguistics? What can you do with that?" We will survey the ways that linguistics has been used (i.e. applied) to solve 'real world' problems. Some of these, like computational linguistics and the teaching of language, are intimately involved in language, even though they do not necessarily concern themselves with linguistic theory. Others, such as language and the law, use linguistics as a tool to do their work. We will be concerned with understanding the various ways that linguistic inquiries have been used or neglected, and also with the implications of applied fields for linguistic theories. Offered as LING 309, LING 409, COGS 331 and COGS 431. Counts for CAS Global & Cultural Diversity Requirement.

COGS 435. Japanese Linguistics. 3 Units.
The purpose of this course is to survey the principal research in Japanese linguistics for students who have basic knowledge of Japanese and are interested in more in-depth treatment of linguistic phenomena (phonetics, phonology, morphology, syntax, semantics, etc.). Lectures and discussions will cover many different aspects of the Japanese language. There is a great deal of analytic studies of the Japanese language done both inside and outside Japan, which will be surveyed in this course. Students will become familiar with the major issues through lectures and class discussions, as well as through their reading of both primary and secondary sources. Both formal and functional approaches to the analysis of Japanese will be examined, and the acquisition of these structures will also be discussed. The course will also be useful for the improvement of students’ Japanese language proficiency. Recommended preparation: JAPN 101 and JAPN 102, or equivalent competence in Japanese. Offered as COGS 335, COGS 435, JAPN 435, LING 335 and LING 435. Counts for CAS Global & Cultural Diversity Requirement.
COGS 448. Buddhism and Cognitive Science. 3 Units.
In 1987, the Dalai Lama initiated a yearly event–Mind and Life Dialogues–to address “critical issues of modern life at the intersection of scientific and contemplative understanding”. Dialogue topics included issues related to Buddhist thought and practice, and cognitive science. Others with an interest in the intersection of Buddhism and cognitive science, such as Robert Wright in Why Buddhism is True: The Science and Philosophy of Meditation and Enlightenment (2017), argue that non-supernatural aspects of Buddhism, such as the benefits of mindfulness meditation and the nature of the (non-)self, are affirmed by cognitive science and evolutionary psychology. The notion that at least some aspects of Buddhism are “true” in relation to contemporary cognitive scientific views of mind and brain has attracted considerable attention from both Buddhist practitioners and cognitive scientists. This seminar explores Buddhist and cognitive science perspectives on issues such as embodied cognition, consciousness, mind, self and personal identity, theory of mind, morality, representation, and language. We start with a general overview of Buddhist philosophy, and then turn to specific readings on Buddhist concepts in relation to similar concepts found in the cognitive science literature. For instance, we will explore the Buddhist concept of no permanent self or soul (an-tman). This idea resonates with Daniel Dennett’s notion of the “narrative self” and the cognitive neuroscience view that there is no neurological center of self or experience. Although the specific concepts covered will vary in each iteration of this course, readings will always be drawn from both Buddhist primary and secondary readings, and from the cognitive science literature. Offered as COGS 348, COGS 448, RLGN 348 and RLGN 448. Counts for CAS Global & Cultural Diversity Requirement. Prereq: Completion of one COGS or RLGN course or Requisites Not Met permission.

COGS 452. Language, Cognition, and Religion. 3 Units.
This course utilizes theoretical approaches found in cognitive semantics—a branch of cognitive linguistics—to study the conceptual structures and meanings of religious language. Cognitive semantics, guided by the notion that conceptual structures are embodied, examines the relationship between conceptual systems and the construction of meaning. We consider such ideas as conceptual metaphor theory, conceptual blending, Image schemas, cross-domain mappings, metonymy, mental spaces, and idealized cognitive models. We apply these ideas to selected Christian, Buddhist, and Chinese religious texts in order to understand ways in which religious language categorizes and conceptualizes the world. We examine both the universality of cognitive linguistic processes and the culturally specific metaphors, conceptual blends, image schemas, and other cognitive operations that particular texts and traditions utilize. Offered as RLGN 352, RLGN 452, COGS 352 and COGS 452. Counts for CAS Global & Cultural Diversity Requirement.

COGS 499. Independent Studies. 1 - 3 Units.
This course is a face-to-face seminar between students and instructor, aiming at letting and helping the students independently develop original research on well-defined topics in the field of cognitive linguistics. Themes can vary within the wide area of cognition and culture.

COGS 651. Thesis M.A.. 1 - 6 Units.
Conduct independent research and writing in Cognitive Linguistics under the guidance of a faculty adviser from Cognitive Science. The precise requirements of the course are to be determined by the faculty advisor. Prereq: COGS 406 and COGS 407 and COGS 408. Coreq: COGS 409.

Department of Dance

Mather Dance Center
http://dance.case.edu/
Phone: 216.368.1491; Fax: 216.368.6936
Karen Potter, Department Chair
karen.potter@case.edu

The Department of Dance offers education and participation in many aspects of dance, with course offerings in modern dance and ballet technique, choreography, kinesiology, history, production and more. Students have the opportunity to perform on stage as well as to serve on the technical crews in dance concerts. The high ratio of faculty to students ensures that students will be able to work closely with highly skilled professionals. The department treats all performances as educational experiences and welcomes the participation of all students, particularly in Mather Dance Collective (MaDaCol), regardless of their academic majors and career goals.

Graduates of the dance program are currently employed as modern dance company members (regionally and nationally), company directors/choreographers, and dance production managers, and as teachers, program directors, and administrators in colleges and universities. Others have transitioned into such disciplines as physical therapy and massage therapies.

Department Faculty

Karen Potter, MFA
(Case Western Reserve University)
Professor and Chair
Contemporary dance technique; choreography; pedagogy

Gary Galbraith, MFA
(Case Western Reserve University)
Professor; Artistic Director, Mather Dance Ensemble
Contemporary dance technique; choreography; dance wellness; production and technology

Undergraduate Programs

Major
Degree requirements for the major in dance, Bachelor of Arts degree, are as follows:

Technique Core (all but 103 and 160 are repeatable for credit as advised and/or desired) 21

Modern Techniques: By advisement and placement, select from among the 3-credit and floating credit classes below (15 credits):

<table>

Graduate Programs

Master of Arts

Although the graduate dance program is geared toward the Master of Fine Arts degree (see below), all graduate students begin in the MA program. Advancement to the MFA program occurs upon faculty recommendation to the Dean of Graduate Studies in the third semester. The course work for the MA may be similar to that for the Master of Fine Arts, enhanced by related studies in theater and other departments. The candidate’s program of study will be designed by the primary dance faculty. The School of Graduate Studies and the Department of Dance, in accordance with the Ohio Department of Education, requires a minimum grade point average of 3.0.

MA candidates must complete a minimum of 30 hours, following a program similar to that suggested below. The principal faculty advisor may suggest modifications.

Technique Classes: 12

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
</tr>
</thead>
<tbody>
<tr>
<td>DANC 417 &amp; DANC 418</td>

</tr>
</tbody>
</table>
Requirements for the MFA degree include:

1. A minimum of 60 semester hours of graduate work beyond the bachelor’s degree
2. A cumulative grade point average of 3.0 for all course work on the graduate level
3. Completion of the course requirements for the MFA Thesis Portfolio
4. Successful completion of the third year in performance in the Mather Dance Center mainstage season

Specific requirements for the MFA degree are as follows:

**Courses**

**DANC 103. First-Year Contemporary Dance Technique I. 3 Units.**

Introduction to contemporary dance technique, through active participation, to serve individual development of basic movement principles, locomotor and axial skills and dance vocabulary, all in relation to time, space and dynamics and with a broad spectrum of applications, including dance, music, sports and theater. Explorations and investigations, both practical and cognitive, are designed to lay an introductory foundation for participating in and appreciating and understanding creative expressions.

**DANC 104. First-Year Contemporary Dance Techniques II. 3 Units.**

Continuation of DANC 103. Prereq: DANC 103.

**DANC 121. Dance in Culture - Ethnic Forms. 3 Units.**

A lecture class designed to introduce dance as an art form and the many roles it plays in a variety of cultures. Focus will be on ethnic forms and primal cultures. Counts for CAS Global & Cultural Diversity Requirement.

**DANC 122. Dance in Culture - Theatrical Forms. 3 Units.**

Introduction to an historical and cultural overview of many different theatrical forms of dance from various cultures specifically selected to encompass geographic diversity and represent different periods in history. Basic craft elements of the structures of theatrical dance will be introduced to provide a foundation for viewing dance and developing a personal aesthetic. Counts for CAS Global & Cultural Diversity Requirement.

**DANC 160. Introduction to Ballet Technique I. 3 Units.**

This introductory-level course offers the beginning ballet student the basic tenets and principles of ballet technique. Classwork will involve strong emphasis on proper alignment of the body, dynamic timings, and a command of ballet terminology.

**DANC 161. Introduction to Ballet Technique II. 3 Units.**

Continuation of DANC 160. Prereq: DANC 160 or consent of department.
DANC 203. Second-Year Contemporary Dance Technique I. 3 Units.
Building upon the movement foundations explored in first-year contemporary dance courses, this course introduces the formalities of dance technique as a contemporary American art form with continued and progressive refinement and development of basic movement principles, locomotor and axial skills and dance vocabulary, all in relation to time, space and dynamics and with a broad spectrum of applications, including dance, music, sports and theater. Prereq: DANC 103 and DANC 104.

DANC 204. Second-Year Contemporary Dance Technique II. 3 Units.
Continuation of DANC 203. Prereq: DANC 203.

DANC 237. Religion and Dance in South Asia. 3 Units.
This is an experimental interdisciplinary course in religion, dance, and South Asian studies. We will explore the performance of religion in bharata natyam, one storytelling dance form from South Asia. This dance style draws upon Hindu devotional (bhakti) allegories of sacred and profane love in its choreography. Lover and beloved, as the ideal relationship between God and the human, becomes the model for the performed relationship between heroes and heroines (nayaka-nayaki) danced on stages and, more recently, Bollywood screens. To this end we will examine primary and secondary sources on bharata natyam and aesthetic theory/classical dramatics. We will also observe dance performances in the greater Cleveland area. Offered as RLGN 237 and DANC 237.

DANC 260. Second-Year Ballet Technique I. 3 Units.
In-depth exploration of principles and foundations of ballet technique as preparation for the specialized training needs of dancers. Prereq: DANC 161.

DANC 261. Second-Year Ballet Technique II. 3 Units.
Continuation of DANC 260. Prereq: DANC 260 or consent of department.

DANC 303. Thrid-Year Contemporary Dance Technique I. 3 Units.
For the dance major and upper level non-major. Formalities of dance technique as a contemporary American art form serve as the basis of the aesthetic and technical challenges explored in the course. Prereq: DANC 204.

DANC 304. Third-Year Contemporary Dance Technique II. 3 Units.
Continuation of DANC 303. Recommended preparation: DANC 303 or consent of department.

DANC 314. The Craft of Choreography. 3 Units.
An in-depth investigation of choreographic craft elements is presented through lecture, practical involvement and specified studies. Emphasized are tools to discover primary movement vocabulary, development of vocabulary through permutative investigations and the co-ordination of movement vocabulary into phrases, structural units, and larger sections. Offered as DANC 314 and DANC 414. Prereq: DANC 303 and DANC 304.

DANC 315. Choreography and Music. 3 Units.
Combining craft resources with emphasis on use of music. Music selections, historically categorized, are chosen for the purpose of analyzing metric and structural characteristics in accord with which choreography will be created. Offered as DANC 315 and DANC 415. Prereq: DANC 314 or requisite not met permission.

DANC 317. Advanced Contemporary Dance Technique I. 1 - 3 Units.
Emphasis on performing skills enlarged to include rehearsal and performance of full repertory works. Adaptability, versatility, and fidelity to choreographic intention stressed. Offered as DANC 317 and DANC 417. Prereq: DANC 304
DANC 396. SAGES Senior Capstone in Dance. 3 Units.
This capstone course, the final requirement of the SAGES program, is limited to students majoring in Dance. As it is not required of the major, enrollment will be based on the recommendation of the student's major advisor. Projects may focus on creative or scholarly research, both of which require a written component that culminates in a formal presentation. Creative projects are only available to students who have successfully completed DANC 314, DANC 315, and DANC 324, who have also consistently excelled in their upper-level contemporary technique classes, and who have been recommended by the faculty of the Department of Dance to undertake a creative project versus a scholarly project. Except in approved situations, all capstone projects are supervised by a faculty person in the Department of Dance. Counts as SAGES Senior Capstone. Prereq: DANC 203, DANC 204, DANC 303, DANC 304, DANC 314 and DANC 355.

DANC 397. Honors Studies I. 3 Units.
Individual projects in dance.

DANC 398. Honors Studies II. 3 Units.
Individual projects in dance.

DANC 399. Independent Study in Dance. 1 - 3 Units.
Independent research and project work in areas of dance and pedagogy.

DANC 403. Fourth-Year Contemporary Dance Technique I. 1 - 3 Units.
A logical progression of contemporary technique, this class is designed for the upper level dance major and graduate student in dance to further develop technical acumen with emphasis on aesthetic and physical challenges. Prereq: DANC 303.

DANC 404. Fourth-Year Contemporary Dance Technique II. 1 - 3 Units.
Continuation of DANC 403. Prereq: DANC 403.

DANC 414. The Craft of Choreography. 3 Units.
An in-depth investigation of choreographic craft elements is presented through lecture, practical involvement and specified studies. Emphasized are tools to discover primary movement vocabulary, development of vocabulary through permutative investigations and the co-ordering of movement vocabulary into phrases, structural units, and larger sections. Offered as DANC 314 and DANC 414.

DANC 415. Choreography and Music. 3 Units.
Combining craft resources with emphasis on use of music. Music selections, historically categorized, are chosen for the purpose of analyzing metric and structural characteristics in accord with which choreography will be created. Offered as DANC 315 and DANC 415. Prereq: DANC 414.

DANC 416. Choreography and Theatrical Elements. 3 Units.
Use of properties, costumes, and scenic elements in both "first- and second-function" (Northrop) or "literal" and "abstract" applications challenge the functional and aesthetic appropriateness of conjoined choices. Dance structures fully developed under supervision. Successful results may be programmed for performance and tested for applicability to the Production sequence. Prereq: DANC 414.

DANC 417. Advanced Contemporary Dance Technique I. 1 - 3 Units.
Emphasis on performing skills enlarged to include rehearsal and performance of full repertory works. Adaptability, versatility, and fidelity to choreographic intention stressed. Offered as DANC 317 and DANC 417. Prereq: DANC 404.

DANC 418. Advanced Contemporary Dance Technique II. 1 - 3 Units.
Continuation of DANC 317/417. Offered as DANC 318 and DANC 418. Prereq: DANC 417.

DANC 424. Dance Production Resources. 3 Units.
An examination of dance production resources such as costumes construction, lighting design, and management. Exercises include design, construction, and implementation to emphasize practical applications. Offered as DANC 324 and DANC 424.

DANC 426. Advanced Topics in Choreography. 3 Units.
Introduction and investigation of advanced topics in choreography including but not limited to dance and technology, directing ensemble dance, and dance and the narrative. This course work is explored in the format of in-studio practicum and lecture, discussion, and peer and instructor review of student generated work. Structured studies will be developed under instructor supervision; students will be required to dedicate time and energy in the studio outside of class meetings to develop choreography studies for in-class presentation and review. Prereq: DANC 414 and DANC 415 and DANC 416.

DANC 445. Kinesiology for Dance. 3 Units.
Seminar and laboratory for assessment of kinesiological and biomechanical principles as related to dance. Assessment of current research will be implemented to affect cross-training protocols.

DANC 446. Topics in Dance Medicine, Science, and Wellness. 1 - 3 Units.
Review and application of continually emerging information from the fields of Dance Medicine and Science that impacts general dancer health and the care and prevention and treatment of dance specific injuries. Participation in the Dancer Wellness Program is encouraged to facilitate continued application of principles developed in DANC 345. Offered as DANC 346 and DANC 446.

DANC 447. Dancer Wellness Research. 1 - 6 Units.
This course is designed to promote research interests for those students who have had an introduction to the field of Dancer Wellness through their other coursework and/or participation in the Dancer Wellness Program annual screening and summary profiles. Prereq: DANC 446.

DANC 455. History of Modern Dance. 3 Units.
Origin and development of modern dance in its historical context.

DANC 460. Ballet Technique for Contemporary Dance Students I. 1 - 3 Units.
Ballet Technique for Dancers will focus on developing the ballet skills required of the contemporary dancer. The technical level of the class will range from intermediate to advanced where applicable in barre work as well as center. Offered as DANC 360 and DANC 460.

DANC 461. Ballet Technique for Contemporary Dance Students II. 1 - 3 Units.
Ballet Technique for Dancers will focus on developing the ballet skills required of the contemporary dancer. The technical level of the class will range from intermediate to advanced where applicable in barre work as well as center. Offered as DANC 361 and DANC 461. Prereq: DANC 460.

DANC 485. Rehearsal, Performance and Production. 1 - 6 Units.
(See DANC 385.)

DANC 505. Music Resources for Contemporary Dance. 1 - 3 Units.
Resources in the various periods and styles of music for the dancer/choreographer. Study of the choreographic use of music.

DANC 509. Introduction to Performance Theory. 1 - 3 Units.
This independent study oriented course is designed to acquaint the dance student with the major theoretical writings and practices of performance theory. Areas of exploration may include anthropological, mythological, psychological, and cultural sources of art, performance, and the creative impulse.
DANC 535. Contemporary Dance Pedagogy. 3 Units.
The study and investigation of the approaches and methods of teaching
contemporary dance. Detailed study is made of kinesthetic, oral, and
creative factors in teaching dance. Opportunity to assist and teach under
supervision. Offered as DANC 335 and DANC 535.

DANC 601. Special Projects. 1 - 3 Units.
(Credit as arranged.)

DANC 610. Professional Internship. 1 - 4 Units.
Involvement in intensive internships with professional dance companies,
private studios, festivals, workshops or clinics to bridge the academic and
professional lives. Internships may be scheduled for varying lengths of
time.

DANC 640. M.F.A. Thesis Production I. 3 Units.
Preproduction conception in area of specialization researched and
documented under appointed adviseemnt, in accord with production
syllabus, and subcommittee approval.

DANC 641. M.F.A. Thesis Production II. 3 Units.
Production implementation, post production evaluation/defense, and
advisory assessment.

DANC 644. M.A. Project. 1 - 12 Units.
Research and development of a Master of Arts project in Dance.

Department of Earth, Environmental, and Planetary Sciences

Phone: 216.368.3690; Fax: 216.368.3691
Steven A. Hauck, II, Department Chair
steven.hauck@case.edu

The earth, environmental, and planetary sciences encompass a wide
range of inquiries into the physical, chemical, and biological processes
that shape the earth and the planets. Application of these inquiries to
understanding a planet’s evolution through time is a unique attribute of
general geological investigations. Knowledge of the past and present reveals the
constraints of our environment and serves as a guide for the future.

In recent years, significant advances have been made in the
understanding of Earth’s interior, the nature of surface and near-surface
processes, the history of the Earth’s climate, the ecology of living and
ancient organisms, and the comparative geology of other planets.
Geological knowledge is fundamental to resource conservation, land use
planning and other environmental concerns.

Department faculty have active research programs to investigate planet
formation and evolution, and Earth and environmental history. The
department offers degree programs leading to the Bachelor of Arts (BA)
and Bachelor of Science (BS) in geological sciences, BA in environmental
gogy, BA in environmental studies, Master of Science (MS), and Doctor
of Philosophy (PhD). The Environmental Studies Program (p. 360) is
described elsewhere in this bulletin.

Department Faculty

(Washington University in St. Louis)
Professor and Chair
Geodynamics

Ralph P. Harvey, PhD
(University of Pittsburgh)
Professor
Planetary geology

Peter L. McCall, PhD, JD
(Yale University)
Professor; Director, Environmental Studies Program
Benthic ecology; paleoecology

Beverly Z. Saylor, PhD
(Massachusetts Institute of Technology)
Professor
Sedimentary geology

James A. Van Orman, PhD
(Massachusetts Institute of Technology)
Professor
Geochemistry

Peter J. Whiting, PhD
(University of California, Berkeley)
Professor; Associate Dean, College of Arts and Sciences
Geomorphology; surface water hydrology; environmental geology

Adjunct Faculty

Mulugeta Alene Araya, PhD
(University of Turin/University of Genoa)
Adjunct Associate Professor
Structural geology

Jeffrey Balcerski, PhD
(Case Western Reserve University)
Adjunct Assistant Professor

Andrew Dombard, PhD
(Washington University in St. Louis)
Adjunct Associate Professor; University of Illinois-Chicago
Planetary geophysics

Joseph Hannibal, PhD
(Kent State University)
Adjunct Associate Professor; Cleveland Museum of Natural History
Invertebrate paleontology

Nathan Jacobson, PhD
(University of California)
Adjunct Associate Professor

Zhicheng Jing, PhD
(Yale University)
Adjunct Associate Professor

Elham Mohsenian, PhD
(University of Leoben)
Adjunct Assistant Professor

Anne Willem Omta, PhD
(Vrije Universiteit)
Adjunct Assistant Professor
Undergraduate Programs

Majors

Students in Earth, Environmental, and Planetary Sciences obtain a solid background in basic science and mathematics as well as intensive training in the major. In addition, because of the wide variety of ways in which geologic knowledge can be applied, all students are encouraged to take electives in subjects appropriate to their personal objectives, which may range from the engineering applications of geology to the socioeconomic and legal systems bearing on environmental issues. The undergraduate programs stress practical experience and fieldwork as well as classroom study. The environmental geology major combines courses in geological sciences with courses in basic and applied sciences to provide students with an understanding of environmental problems, with employable skills, and with a background for graduate study or professional school.

All students participate in a three-semester Senior Project sequence in which they propose a research project, conduct the research, write a thesis, and present it to the department.

### Total Units
67

In the above majors, the student and his or her advisor will design the remainder of the curriculum based on individual interests, in accordance with departmental and college requirements. Through the Integrated Graduate Studies Program (p. 1298), students may earn a bachelor’s and a master’s degree in five years. Special programs, such as interdisciplinary majors, also may be arranged.

### Minor

Students may complete a minor in geological sciences by taking at least 15 hours of course work.

### Graduate Programs

The Department of Earth, Environmental, and Planetary Sciences offers the following degree programs:

- Geological Sciences MS
- Geological Sciences PhD

Both programs are flexible so as to meet the needs of the individual student. General areas of study include benthic ecology, biostratigraphy and paleontology, environmental and urban geology, geomorphology, limnology, paleoclimatology, petrology, sedimentary geochemistry, sedimentation and stratigraphy, stable isotope studies, meteoritics, planetary materials, geodynamics of planetary interiors, and planetary geology.

More specific information is available from the departmental office, the departmental webpage (https://eeps.case.edu/), and the Office of Admission of the School of Graduate Studies (https://case.edu/gradstudies/prospective-students/admissions-information/).
Geological Sciences MS

Background Required of Entering Students
The coursework background of all incoming graduate students is evaluated at the time of admission. If deficiencies are deemed to exist in some areas, admission may be contingent upon completion of background courses. After arrival, the coursework background of each incoming graduate student will be reviewed by the student’s advisor to determine whether background deficiencies exist for their planned program of study. A student whose background is deemed deficient will, in consultation with their faculty advisor, determine which courses shall be taken to alleviate the deficiencies. Background deficiencies will normally be made up in the first year of graduate study. Some remedial coursework may not count toward graduate credit.

Advisor
Each incoming graduate student will be assigned an advisor from the faculty of the department. The assignment will be based on the background and interests of the student. The advisor may be changed with the approval of the student’s Graduate Committee. The student should meet with their advisor before registration for the first semester of study in order to outline an initial program of studies for the Geological Sciences MS degree. Additional meetings with the advisor should take place before the student registers for subsequent semesters, and from time to time, to review and update this program and discuss the student's progress.

The Graduate School requires that each student file an official Program of Study with the Office of Graduate Studies before they can receive a degree. Normally, this document is submitted during the second semester, subject to later revisions as conditions necessitate.

Graduate Committee Progress Reports
In addition to the regular, continuous contact the student has with their advisor, the student will receive an annual review of their progress from their Graduate Committee. These progress reports will be based on coursework performance and Graduate Committee discussions with the faculty advisor.

MS Requirements
Students must satisfy the university requirements stipulated in the General Bulletin as well as the departmental requirements described below. A minimum of 30 hours of credit beyond the bachelor's degree is required for the MS, and the student must spend at least one year in full-time residence at CWRU. Full-time graduate study consists of 12 semester hours, or 9-10 semester hours where the student has contractual assistantship obligations to the department.

Every graduate student must register once for EEPS 490, a three-credit course. As part of EEPS 490, the student will develop skills in preparing a research project and writing a research grant proposal. Registration for this course is typically in the spring of the first year of the program.

All graduate students are expected to regularly attend Earth, Environmental, and Planetary Sciences Seminars.

The university requires that students maintain a cumulative grade-point average of at least 2.75 for all courses; the department requires a 3.0 cumulative average for Earth, Environmental, and Planetary Sciences courses. Courses below the 300 level may not be counted for degree credit. With the approval of the Graduate Committee, a maximum of 6 hours of graduate-level credit may be transferred from another university. Transfer credit will not be given for courses used for degree credit by the student elsewhere. A student will be terminated for any of the following reasons:

- A grade of F in any Earth, Environmental, and Planetary Sciences course
- More than one grade of C or lower in Earth, Environmental, and Planetary Sciences courses
- More than one grade of F in a non-Earth, Environmental, and Planetary Sciences course
- A grade of I that is not converted within one calendar year

Any 300-level Earth, Environmental, and Planetary Sciences course in which a grade of C or below is obtained will not be counted toward the degree requirements. No course in which a grade of D or below is earned will be counted toward the degree requirements.

Students can complete degree requirements for a Geological Sciences MS under one of two tracks: thesis-focused or project-focused.

Thesis-focused MS
During the second semester, the student will present their thesis prospectus. This will usually be done at a seminar open to the department and will typically follow the work in EEPS 490. The seminar consists of a discussion of the project and the general field in which it lies in order to determine the preparedness and capabilities of the student and the practicability of the project.

A thesis describing original and independent research by the student is required for the MS degree under the thesis-focused track. In preparing the thesis, the student will have the guidance of one or more advisors, and the thesis should be submitted with their approval. Approval of the format of the thesis must be obtained from the Graduate Office at least one month before graduation (see “Instruction for the Preparation of Theses and Dissertations,” available on request in the Office of Graduate Studies). The thesis must be orally defended before the project committee in an examination which is open to the public. The defense must be taken at least one week before the granting of the degree. In practice, a longer period of time should be allowed so that the student can incorporate any corrections suggested at the defense.

Project-focused MS
This requires a comprehensive oral examination involving knowledge of the principles of a student's area of study. This examination is usually given in the final semester. The examination will be given by a committee consisting of the student’s advisor and at least two other faculty members selected by the advisor. The examination is open to other faculty members who may ask questions but have no vote in the grading. One question will be given to the student by the examining committee, not more than seven days nor less than two days prior to the examination. This question will be conceptual in nature and will test the student's ability to reason and find a method of solution for a particular problem. The examination will begin with a discussion of this question. A unanimous vote of the committee is required to pass the examination. If two-thirds of the members vote to recommend passing, the committee may then consider passing the student contingent upon the fulfillment of other conditions. A unanimous vote is required for the stipulation of specific conditions.

If the examination is not passed, the student may retake it after a successful petition to the Graduate Committee, but re-examination must be before the end of the first month of the next semester. No examinations will be given later than the last day of classes. A student
who fails re-examination or is denied re-examination is terminated from the Geological Sciences MS program.

Geological Sciences PhD

The mission of the graduate program in Earth, Environmental, and Planetary Sciences at Case Western Reserve University is to train the coming generations of professional earth, environmental, and planetary scientists. Professional scientists in these disciplines work in a wide range of environments, including, but not limited to, colleges and universities; commercial and nonprofit research laboratories; mining, energy, and environmental consulting industries; local, state, and federal regulatory agencies; federal research laboratories; and museums.

Research opportunities in the graduate program are available in field and observational, experimental, and theoretically based disciplines. These include benthic ecology, surface processes, soil erosion, sediment transport, stratigraphy, geologic sequestration of carbon, geochemistry, meteorites, planetary materials, planetary geology and geophysics, and high-pressure mineral physics and chemistry. Faculty and students conduct field research on five continents, perform experiments at world-class facilities such as the Advanced Photon Source at Argonne National Laboratory, the Cleveland Museum of Natural History, and the NASA Glenn Research Center, and participate in a NASA spacecraft mission.

For students who wish to be admitted to the PhD program, a bachelor's degree in the earth, environmental, or planetary sciences or a related technical field is expected.

The program of research within the Department of Earth, Environmental, and Planetary Sciences addresses state and regional needs by providing students with training in technical research and technical communication skills, promoting an engaged scientific community and fostering a scientifically informed public through outreach and educational activities. Technical skills in the earth, environmental, and planetary sciences are crucial for fostering a workforce capable of addressing needs in natural resource utilization, management, and regulation.

Background Required of Entering Students

The coursework background of all incoming graduate students is evaluated at the time of admission. If deficiencies are deemed to exist in some areas, admission may be contingent upon completion of background courses. After arrival, the coursework background of each incoming graduate student will be reviewed by the student’s advisor to determine whether background deficiencies exist for their planned program of study. A student whose background is deemed deficient will, in consultation with their faculty advisor, determine which courses shall be taken to alleviate the deficiencies. Background deficiencies will normally be made up in the first year of graduate study. Some remedial coursework may not count toward graduate credit.

Advisor

Each incoming graduate student will be assigned an advisor from the faculty of the department. The assignment will be based on the background and interests of the student. The advisor may be changed with the approval of the Graduate Committee. The student should meet with their advisor before registration for the first semester of study in order to outline an initial program of study for the PhD degree. Additional meetings with the advisor should take place before the student registers for subsequent semesters, and from time to time, to review and update this program and discuss the student’s progress.

On passing the PhD candidacy examination, the student selects a faculty member who agrees to be their dissertation advisor. Upon notification of the Graduate Committee, the dissertation advisor assumes the advisory responsibilities formerly held by the faculty advisor and, in addition, supervises the student’s dissertation research. The dissertation advisor, in consultation with the Graduate Committee, selects two additional faculty to form the student’s Advisory Committee.

The Graduate School requires that each student file an official Program of Study with the Office of Graduate Studies before they can receive a degree. Normally this document is submitted during the second semester, subject to later revisions as conditions necessitate.

Graduate Committee Progress Reports

In addition to the regular, continuous contact the student has with the dissertation advisor, the student must call a meeting of the Advisory Committee once each semester to report and discuss their progress on the dissertation. No later than two weeks following this meeting, the Advisory Committee must submit a written report on the student’s progress to the Graduate Committee. The Graduate Committee in turn will send a report to the student, evaluating their progress, before the beginning of the next semester. A student who has not yet been admitted to candidacy will be sent a progress report from the Graduate Committee after each fall semester on the basis of their coursework performance and the Graduate Committee’s discussion with the faculty advisor.

PhD Requirements

The student must satisfy the university requirements stipulated in the General Bulletin as well as the departmental requirements described below. The formal fulfillment of residency requires continuous registration in at least six consecutive academic terms (fall, spring and/or summer). Full-time graduate study consists of 12 semester hours, or 9-10 semester hours if the student has contractual assistantship obligations to the department. It is a university requirement that the PhD be completed within five consecutive calendar years, including leaves of absence, from the initial registration in EEPS 701 Dissertation Ph.D.

A student without a master’s degree will devote at least 36 hours during the first two years to a program approved by the advisor and submitted to the Graduate Committee. For a student already holding a master’s degree, at least 18 hours will be devoted to a one-year program approved by the Graduate Committee. The objective of the program is to broaden the student’s knowledge at an advanced level in a manner consistent with their interests.

Every graduate student must register once for EEPS 490, a three-credit course. As part of EEPS 490 the student will develop skills in preparing a research project and writing a research grant proposal. Registration for this course is typically in the spring of the first year of the program.

All graduate students are expected to regularly attend Earth, Environmental, and Planetary Sciences Seminars.

The university requires a minimum grade-point average of 2.50 after 12 semester hours, 2.75 after 21 semester hours, and 3.00 for graduation; the department requires a 3.0 average for Earth, Environmental, and Planetary Sciences courses. Courses below the 300 level may not be counted for degree credit. With the approval of the Graduate Committee, a maximum of 6 hours of graduate-level credit may be transferred from another university. Transfer credit will not be given for courses used for degree credit by the student elsewhere. A student will be terminated for any of the following reasons:
Part 1: The Written Proposition

Two weeks before the oral presentation of the proposition, the student will submit to each member of the Earth, Environmental, and Planetary Sciences faculty, to each member of the Examining Committee, and to the department office (for file) a paper of about 8-10 pages, introducing and discussing the proposition. The format of the written presentation should be similar to that of an article submitted for publication in Geology or Science. The paper must be graded by each faculty examiner prior to the oral examination.

Part 2: The Comprehensive Examination

The oral examination usually will be no longer than 3 hours in length. It is initiated by a 20-minute formal presentation of the proposition by the candidate. Then the candidate is expected to answer questions about the proposition and its relation to the general field(s) in which it lies. Initially, the questions are centered on the proposition. The candidate may expect to be asked questions of an increasingly general nature as questioning proceeds.

Grading

Grades are assigned to the written proposition and the oral proposition by averaging the numerical grades assigned by each member of the Examining Committee. A grade of 85 is a passing grade for each of these two parts of the examination.

The student will have passed the comprehensive examination part if no grades of F are received, and if the average grade for all four sections is 85 or higher.

All three parts of the examination must be passed. If a student does not pass one or more parts of the examination, the Examining Committee will recommend whether the student should retake those parts of the examination which were failed, or should proceed to the MS degree. A student is not required to retake any of the three parts of the examination which they have passed. In the case of the comprehensive examination, no section which has been passed needs to be retaken. Portions of the examination that are retaken will generally be retaken within a month and in no case later than the end of the semester following the initial examination.

Acceptance as a PhD Candidate

Upon passing the candidacy examination, the department will formally accept the student as a PhD candidate. The student must subsequently register for a minimum of 1 hour of Dissertation Ph.D. (EEPS 701) in each succeeding semester. Prior to admission to candidacy, a student may register for 1 but not more than 3 hours of EEPS 701, and must maintain continuous registration in EEPS 701. See the General Bulletin for further details about dissertation registration.

Dissertation Prospectus

The prospectus is a written two-page document, with references, describing the student’s proposed dissertation research. It is submitted to the Advisory Committee early in the semester following admission to candidacy. The prospectus is also presented orally as a seminar open to the entire department. Announcement of the seminar and distribution of the written prospectus to all department faculty and graduate students are to take place two weeks ahead of time. The prospectus is not an examination of the student, but rather an examination of the suitability and feasibility of the dissertation project. After the seminar, the Advisory Committee will discuss with the student the suitability of the project and the adequacy of the student’s preparation for it.

Dissertation

A dissertation describing original and independent research by the candidate is required for the PhD degree. Not less than one academic year or its equivalent will be devoted to the dissertation research. In preparing the dissertation, the student will have the guidance of one or
Department of Earth, Environmental, and Planetary Sciences

more advisors, and it will not usually be submitted without their approval. Approval of the format of the dissertation must be obtained from the Office of Graduate Studies at least one month before graduation.

Defense of Dissertation
The dissertation must be successfully defended in an oral examination before a faculty committee. The dissertation defense is open to the public. The examination committee is appointed by the Dean of Graduate Studies on recommendation by the department chair no later than three weeks before the date of the examination. The examining committee consists of not fewer than four university faculty, with at least one member from outside the department. The student must provide each member of the committee a copy of his/her completed dissertation at least 10 days prior to the examination. The defense must be taken at least one week before the granting of the degree. In practice, a longer period of time should be allowed so that the student can incorporate required revisions as a result of the defense. Major changes can be required. Check the General Bulletin for further university-wide regulations about the dissertation defense.

Time Requirements
Students who obtain financial assistance from the department must make satisfactory progress toward fulfilling the degree requirements in order to qualify for continued support. Normally, support will not be provided for more than eight semesters of graduate work.

Exceptions
Requests for exceptions must be submitted by petition to the Graduate Committee.

Courses
EEPS 101. The Earth and Planets. 3 Units.  
An examination of the geological processes that have shaped the planets and moons of the inner solar system, focusing on those with relevance to our own planet Earth. Following an introduction to the fundamentals of planetary geology, lectures and exercises will explore how the inner planets (the asteroids, Mercury, Venus, Earth, the Moon, and Mars) exhibit the effects of planetary differentiation, impact cratering, volcanic activity, tectonics, climate, and interactions with life.

EEPS 110. Physical Geology. 3 Units.  
Introduction to geologic processes and materials that shape the world we live in. Hydrologic cycle and evolution of landscapes. Earthquakes, volcanoes, plate tectonics, and geologic resources. Students desiring laboratory experience should enroll in EEPS 119 concurrently.

EEPS 115. Introduction to Oceanography. 3 Units.  
The sciences of oceanography. Physical, chemical, biologic, and geologic features and processes of the oceans. Differences and similarities between the oceans and large lakes including the Great Lakes. Required: Sunday field trip.

EEPS 117. Weather and Climate. 3 Units.  
Introduction to the study of weather and climate. Covers the basics of meteorology, climate zones, the hydrologic cycle, and weather prediction. Lectures address timely topics including greenhouse warming, past global climates, and recent advances in meteorology.

EEPS 119. Geology Laboratory. 1 Unit.  
Principles and techniques common to the geological sciences including rock and mineral identification, map interpretation, land form analysis, application of geological information to engineering works, and more. One three-hour laboratory or field trip weekly. Recommended preparation: EEPS 110.

EEPS 201. Formation and Evolution of a Habitable Planet. 3 Units.  
This course will provide an introduction to the formation and evolution of Earth with an emphasis on how our habitable planet has originated, developed, and sustained conditions suitable for life from a planetary science perspective. Topics include the Big Bang and formation of elements, formation of minerals and organic molecules, formation of the Solar System and planets, formation and differentiation of Earth’s interior, plate tectonics and internal circulation, interactions between interior, atmosphere, and oceans, climate regulation, co-evolution of life and planet, and habitability of other planets in the Solar System and in the universe.

EEPS 202. Global Environmental Problems. 3 Units.  
Global Environmental Problems is a course designed to provide students with an understanding of, and an appreciation for, human-influenced environmental changes that are global in scope. Accordingly, much of the material will focus on the nature and structure of natural global systems, how and where in those systems human influences occur, and will delve deeply into a few particular problems and solutions of current interest, such as population growth, climate change, ozone depletion, and fisheries, from a variety of viewpoints. Offered as ESTD 202 and EEPS 202.

EEPS 205. Climate Change Science and Society. 3 Units.  
This course provides a synoptic, multi-disciplinary understanding of the past, present, and future of anthropogenic climate change by integrating three distinct fields: the earth and environmental sciences, biology and ecology, and history. What is changing in the global climate? Why? How do we know? What should we expect in the future? What can be done? No single discipline can answer these questions fully, and by organizing the course around these big questions, we will demonstrate how different disciplines each contribute essential answers. Course covers diverse sources of evidence for climate change in the past and present, the core mechanisms of climate change at different timescales and their consequences, the impact of climate change on human history and history of the discovery of climate change, climate models and ecological forecasts, the modern politics and diplomacy of climate, climate communication, and multiple paths forward for the earth’s physical, ecological, and social systems. Offered as BIOL 205, EEPS 205, and HSTY 205.

EEPS 210. Earth History: Time, Tectonics, Climate, and Life. 3 Units.  
The discovery and measurement of deep time, tectonic cycles, and geochronological cycles. The origin of life, major fossil groups and their consequences, the impact of climate change on human history and history of the discovery of climate change, climate models and ecological forecasts, the modern politics and diplomacy of climate, climate communication, and multiple paths forward for the earth’s physical, ecological, and social systems. Offered as BIOL 205, EEPS 205, and HSTY 205.

EEPS 215. Climate Crises in Earth History. 3 Units.  
The past century has seen three great revolutions in our understanding of how the earth works: a revolution our understanding of geologic time, construction of the tectonic cycle that creates continents and oceans, and most recently, the ability to trace using isotopes global geochemical cycles. One of these, the carbon cycle, is intimately tied to climate change. We now know there have been a handful of climate crises in earth history—at least five—during which the planet experienced large scale changes in a short time, and we live now in the midst of another. We will examine the large-scale workings of the earth system, how the carbon cycle interacts with climate on time scales from millions of years to millennia to decades, and get an accessible overview of what we know about ongoing climate change and its current and future impacts. No prior knowledge of geology is assumed, and the course is suitable for non-majors, though we will encounter a few equations, some graphs, and some very simple computer models.
EEPS 220. Environmental Geology. 3 Units.

EEPS 225. Evolution. 3 Units.
Multidisciplinary study of the course and processes of organic evolution provides a broad understanding of the evolution of structural and functional diversity, the relationships among organisms and their environments, and the phylogenetic relationships among major groups of organisms. Topics include the genetic basis of micro- and macro-evolutionary change, the concept of adaptation, natural selection, population dynamics, theories of species formation, principles of phylogenetic inference, biogeography, evolutionary rates, evolutionary convergence, homology, Darwinian medicine, and conceptual and philosophic issues in evolutionary theory. Offered as ANTH 225, BIOL 225, EEPS 225, HSTY 225, and PHIL 225.

EEPS 260. Introduction to Climate Change: Physics, Forecasts, and Strategies. 3 Units.
This is a one-semester introduction to the physical processes that determine Earth's past, present, and future climate. The course focuses on quantitatively understanding the human impact on climate, including the historical development of steadily more sophisticated physical models, and ever more complete data. Particular emphasis will be placed on understanding climate change projections, as well as the ethical, political, economic, and communications challenges associated with various strategies going forward. The course is appropriate for all majors. Offered as EEPS 260 and PHYS 260.

EEPS 301. Stratigraphy and Sedimentation. 3 Units.
Formation, distribution, and composition of sediments and sedimentary rocks. Modern depositional environments and their ancient analogues; principles of stratigraphic and biostratigraphic correlation. Two lectures and one laboratory per week. Offered as EEPS 301 and EEPS 401.

EEPS 303. Environmental Law. 3 Units.
Introduction to treatment of environmental issues in legal proceedings. Sources of environmental law, legal procedure, common law remedies (tort law and human health, nuisance, contract law), statutes and regulations, endangered species, public lands, toxics regulation, nuclear power, coal. The course employs the case method of reading and recitation of appellate judicial opinions. We read both classic cases in environmental law as well as current controversies. Offered as ESTD 303 and EEPS 303.

EEPS 305. Geomorphology and Remote Sensing. 3 Units.
Recognition and interpretation of land forms and their significance in revealing present and past geologic processes. Introduction to acquisition and analysis of data through aerial photography and satellite imagery. Two lectures and one laboratory weekly. Recommended preparation: EEPS 110 and EEPS 119. Offered as EEPS 305 and EEPS 405.

EEPS 307. Evolutionary Biology and Paleobiology of Invertebrates. 3 Units.
Important events in the evolution of invertebrate life; structure, function, and phylogeny of major invertebrate groups.

EEPS 315. Structural Geology and Geodynamics. 3 Units.
Theoretical analysis of deformation in earth materials, with illustrations of deformatinal styles in various tectonic settings and the dynamics of the Earth's interior. Recommended preparation: EEPS 110. Offered as EEPS 315 and EEPS 415.

EEPS 317. Introduction to Field Methods. 3 Units.
Practice in field procedures, recognition and testing of hypotheses in the field, field mapping and analysis of sedimentary, igneous, and metamorphic rocks in deformed and tectonically active settings. Weekly meeting plus spring break field trip. Students required to pay partial cost of meals, lodging, and travel. Offered as EEPS 317 and EEPS 417. Prereq: EEPS 119.

EEPS 321. Hydrogeology. 3 Units.
Basic and applied concepts pertaining to the occurrence and movement of groundwater. Definitions, basic equations, applications to a variety of geologic settings, wells. Requires one Saturday field trip to make field measurements, collect and analyze data, and prepare a report. Offered as EEPS 321 and EEPS 421.

EEPS 330. Geophysical Field Methods and Laboratory. 4 Units.
Use of seismic refraction and reflection, gravity, electrical, magnetic, and electromagnetic methods to infer the earth's structure and composition. Application of inverse theory to estimate model parameters. Requires students to make field measurements, analyze data, and prepare a report. Includes several required Saturday field trips. Offered as EEPS 330 and EEPS 430.

EEPS 336. Aquatic Chemistry. 4 Units.
Chemical equilibria occurring in natural waters. Quantitative methods of describing acid-base, metal ion/ligand, precipitation/dissolution, and oxidation/reduction reactions. Geochemical cycling of trace metals and nutrients. Offered as EEPS 336 and EEPS 436.

EEPS 340. Earth and Planetary Interiors. 3 Units.
Quantitative introduction to the composition, structure, dynamics, and evolution of Earth and other planets using principles of geophysics and geochemistry. Planetary formation and differentiation, composition and structure of Earth and planets, heat generation and heat flow, mantle convection and plate tectonics, planetary magnetism and core dynamics, chemical evolution of Earth and planets, extrasolar planets and super Earths. This course will be offered to both undergraduate students and graduates. In addition to the requirements for undergraduate students, graduate students will be asked to work on a small course project relevant to the subject of the course and submit a term paper based on this project by the end of semester. Offered as EEPS 340 and EEPS 440. Prereq: MATH 122 or MATH 126.

EEPS 341. Mineralogy. 4 Units.
Crystallography, hand specimen mineralogy and petrology, principles of crystal structure and crystal chemistry, elementarygeochemistry and phase diagrams, and an introduction to the petrographic microscope. Three lectures and one three-hour laboratory weekly. Prereq: EEPS 119.

EEPS 344. Igneous and Metamorphic Petrology. 4 Units.
Composition, classification, and genesis of igneous and metamorphic rocks, emphasizing physical and chemical principles governing their origin. Laboratory study of rocks in thin section. Two lectures and two three-hour laboratories weekly. Prereq: EEPS 341.

EEPS 345. Planetary Materials. 1 - 3 Units.
An introduction to the materials that make up the solid matter of the solar system. Student presentations will review our current understanding of accessible primitive materials such as meteorites, cosmic dust, lunar and ancient terrestrial rocks, and their relationship to modern natural materials and solar system processes. Offered as EEPS 345 and EEPS 445.

EEPS 349. Geological Problems. 1 - 3 Units.
Special work arranged according to the qualifications of the student.
EEPS 350. Geochemistry. 3 Units.
Introduction to geochemistry. Properties of the elements, elemental and isotopic fractionation, element transport, geochemical systems, geochronology, mineral reactions, the solid Earth, Earth in the solar system. A quantitative approach to modeling geochemical processes will be emphasized throughout. Offered as EEPS 350 and EEPS 450.

EEPS 352. Biogeochemistry. 3 Units.
This course is intended for upper-level undergraduate and graduate students and will focus on global environmental changes and the intersections between biology, geology, chemistry and environmental sciences. Throughout the semester students will explore the cycling of biologically important elements (carbon, nitrogen, phosphorus) in order to understand their role in shaping ecosystem processes and in the development of life on Earth. In the first half of the class, students will explore the biological/chemical processes that shape the past, present and future Earth System. In the second half of the course, students will investigate inter-related nature of these processes/reactions in regulating global biogeochemical cycles. Topics to be covered in this class include the origin of the Earth, elements and life, the Gaia Hypothesis; Geochemical tools to study Earth processes; biological and chemical processes occurring on Earth’s surface; Global Climate/Environmental Change. Recommended Preparation: (CHEM 105 or CHEM 111) and CHEM 106 or ENGR 145. Offered as EEPS 352 and EEPS 452.

EEPS 360. Summer Field Camp. 6 Units.
Six-week course in geologic field methods and mapping. Not offered at CWRU; must be taken at another college or university. Credits will be transferred.

EEPS 367. Topics in Evolutionary Biology. 3 Units.
The focus for this course on a special topic of interest in evolutionary biology will vary from one offering to the next. Examples of possible topics include theories of speciation, the evolution of language, the evolution of sex, evolution and biodiversity, molecular evolution. ANAT/ANTH/EEPS/PHIL/PHOL 467/BIOL 468 will require a longer, more sophisticated term paper, and additional class presentation. Offered as ANTH 367, BIOL 368, EEPS 367, PHIL 367, ANTH 467, BIOL 468, BIOL 467, EEPS 467, PHIL 467 and PHOL 467. Prereq: EEPS 225 or equivalent.

EEPS 390. Introduction to Geological Research. 3 Units.
Examination of factors in the selection, design, and conduct of research projects and in the analysis and interpretation of research results. Consideration of ethical issues in scientific research. Development of a written research proposal and oral presentation of proposed research. Consultations with department faculty in development of research proposal. Research initiation. Offered as EEPS 390 and EEPS 490. Counts as SAGES Departmental Seminar.

EEPS 391. Senior Project. 2 Units.
Research project required of all department majors, based on formal project proposals presented to department faculty. Proposals may be submitted prior to the semester in which EEPS 391 is taken. Grading based on project progress presentation that will include a statement of the problem, a literature review, a description of their field/lab work and presentation of their data collected to date. This course is the first of a 2 semester Senior Capstone (EEPS 391, 392) sequence. Recommended preparation: EEPS 390. Counts as SAGES Senior Capstone.

EEPS 392. Professional Presentation. 2 Units.
Preparation and presentation of final written and oral reports on individual Senior Projects. Class meetings focus on group discussion of problem areas in analysis and interpretation of project results, and in styles of writing poster and oral presentation as demonstrated by practice examples. This course is the second in a two-course (EEPS 391, 392) Senior Capstone sequence. Counts as SAGES Senior Capstone. Prereq: EEPS 390 and EEPS 391. Or Coreq: EEPS 390.

EEPS 396. Undergraduate Research in Evolutionary Biology. 3 Units.
Students propose and conduct guided research on an aspect of evolutionary biology. The research will be sponsored and supervised by a member of the CASE faculty or other qualified professional. A written report must be submitted to the Evolutionary Biology Steering Committee before credit is granted. Offered as ANTH 396, BIOL 396, EEPS 396, and PHIL 396.

EEPS 401. Stratigraphy and Sedimentation. 3 Units.
Formation, distribution, and composition of sediments and sedimentary rocks. Modern depositional environments and their ancient analogues; principles of stratigraphic and biostratigraphic correlation. Two lectures and one laboratory per week. Offered as EEPS 301 and EEPS 401.

EEPS 405. Geomorphology and Remote Sensing. 3 Units.
Recognition and interpretation of land forms and their significance in revealing present and past geologic processes. Introduction to acquisition and analysis of data through aerial photography and satellite imagery. Two lectures and one laboratory weekly. Recommended preparation: EEPS 110 and EEPS 119. Offered as EEPS 305 and EEPS 405.

EEPS 415. Structural Geology and Geodynamics. 3 Units.
Theoretical analysis of deformation in earth materials, with illustrations of deformaional styles in various tectonic settings and the dynamics of the Earth's interior. Recommended preparation: EEPS 110. Offered as EEPS 315 and EEPS 415.

EEPS 417. Introduction to Field Methods. 3 Units.
Practice in field procedures, recognition and testing of hypotheses in the field, field mapping and analysis of sedimentary, igneous, and metamorphic rocks in deformed and tectonically active settings. Weekly meeting plus spring break field trip. Students required to pay partial cost of meals, lodging, and travel. Offered as EEPS 317 and EEPS 417.

EEPS 421. Hydrogeology. 3 Units.
Basic and applied concepts pertaining to the occurrence and movement of groundwater. Definitions, basic equations, applications to a variety of geologic settings, wells. Requires one Saturday field trip to make field measurements, collect and analyze data, and prepare a report. Offered as EEPS 321 and EEPS 421.

EEPS 430. Geophysical Field Methods and Laboratory. 4 Units.
Use of seismic refraction and reflection, gravity, electrical, magnetic, and electromagnetic methods to infer the earth's structure and composition. Application of inverse theory to estimate model parameters. Requires students to make field measurements, analyze data, and prepare a report. Includes several required Saturday field trips. Offered as EEPS 330 and EEPS 430.

EEPS 436. Aquatic Chemistry. 4 Units.
Chemical equilibria occurring in natural waters. Quantitative methods of describing acid-base, metal ion/ligand, precipitation/dissolution, and oxidation/reduction reactions. Geochemical cycling of trace metals and nutrients. Offered as EEPS 336 and EEPS 436.
EEPS 437. Chemistry of Natural Waters. 3 Units.
Advanced topics in aquatic chemistry. Thermodynamics models for ion/ligand speciation in natural waters; origin and composition of seawater, chemical and mineralogical sequence during evaporation, chemical weathering, groundwater and river water chemistry, chemical cycling and a global mass balances; perturbations on natural systems by man. Predictive capabilities of box models.

EEPS 440. Earth and Planetary Interiors. 3 Units.
Quantitative introduction to the composition, structure, dynamics, and evolution of Earth and other planets using principles of geophysics and geochemistry. Planetary formation and differentiation, composition and structure of Earth and planets, heat generation and heat flow, mantle convection and plate tectonics, planetary magnetism and core dynamics, chemical evolution of Earth and planets, extrasolar planets and super Earths. This course will be offered to both undergraduate students and graduates. In addition to the requirements for undergraduate students, graduate students will be asked to work on a small course project relevant to the subject of the course and submit a term paper based on this project by the end of semester. Offered as EEPS 340 and EEPS 440. Prereq: MATH 122 or MATH 126.

EEPS 445. Planetary Materials. 1 - 3 Units.
An introduction to the materials that make up the solid matter of the solar system. Student presentations will review our current understanding of accessible primitive materials such as meteorites, cosmic dust, lunar and ancient terrestrial rocks, and their relationship to modern natural materials and solar system processes. Offered as EEPS 345 and EEPS 445.

EEPS 450. Geochemistry. 3 Units.
Introduction to geochemistry. Properties of the elements, elemental and isotopic fractionation, element transport, geochemical systems, geochronology, mineral reactions, the solid Earth, Earth in the solar system. A quantitative approach to modeling geochemical processes will be emphasized throughout. Offered as EEPS 350 and EEPS 450.

EEPS 452. Biogeochemistry. 3 Units.
This course is intended for upper-level undergraduate and graduate students and will focus on global environmental changes and the intersections between biology, geology, chemistry and environmental sciences. Throughout the semester students will explore the cycling of biologically important elements (carbon, nitrogen, phosphorus) in order to understand their role in shaping ecosystem processes and in the development of life on Earth. In the first half of the class, students will explore the biological/chemical processes that shape the past, present and future Earth System. In the second half of the course, students will investigate inter-related nature of these processes/reactions in regulating global biogeochemical cycles. Topics to be covered in this class include the origin of the Earth, elements and life; the Gaia Hypothesis; Geochemical tools to study Earth processes; biological and chemical processes occurring on Earth's surface; Global Climate/Environmental Change. Recommended Preparation: (CHEM 105 or CHEM 111) and (CHEM 106 or ENGR 145). Offered as EEPS 352 and EEPS 452.

EEPS 467. Topics in Evolutionary Biology. 3 Units.
The focus for this course on a special topic of interest in evolutionary biology will vary from one offering to the next. Examples of possible topics include theories of speciation, the evolution of language, the evolution of sex, evolution and biodiversity, molecular evolution. ANAT/ANTH/EEPS/PHIL/PHOL 467/Biol 468 will require a longer, more sophisticated term paper, and additional class presentation. Offered as ANTH 367, BIOL 368, EEPS 367, PHIL 367, ANAT 467, ANTH 467, BIOL 468, EEPS 467, PHIL 467 and PHOL 467.

EEPS 490. Introduction to Geological Research. 3 Units.
Examination of factors in the selection, design, and conduct of research projects and in the analysis and interpretation of research results. Consideration of ethical issues in scientific research. Development of a written research proposal and oral presentation of proposed research. Consultations with department faculty in development of research proposal. Research initiation. Offered as EEPS 390 and EEPS 490. Counts as SAGES Departmental Seminar.

EEPS 506. Seminar in Geophysics. 1 - 3 Units.
Selected topics in geophysics: advanced research issues, classical papers, current state of the field, advanced techniques. Course content will vary depending on interests of students and faculty.

EEPS 509. Seminar: Graduate Research. 1 Unit.

EEPS 511. Special Readings in Geology. 1 - 6 Units.
Detailed study of a selected topic in geology under the guidance of a faculty member.

EEPS 512. Special Readings in Geology. 1 - 6 Units.
Detailed study of a selected topic in geology under the guidance of a faculty member.

EEPS 601. Special Problems and Research. 1 - 18 Units.
(Credit as arranged.)

EEPS 651. Thesis M.S.. 1 - 18 Units.
(Credit as arranged.)

EEPS 701. Dissertation Ph.D.. 1 - 9 Units.
(Credit as arranged.) Prereq: Predoctoral research consent or advanced to Ph.D. candidacy milestone.

Department of Economics

The College of Arts and Sciences awards the Bachelor of Arts degree in economics. The required courses for the major and minor are offered by the Department of Economics in the Weatherhead School of Management (p. 1112).

Bachelor of Arts (BA) in Economics

The BA in Economics is a 120-credit-hour, structured program in which students learn to analyze problems of resource allocation and decision making and to understand the influence of these factors on economies and societies.

Our highly regarded major attracts some of the best students on campus. Students have the opportunity to assist Weatherhead faculty in their research activities and to participate in independent research projects.

Bachelor of Arts (BA) in Economics concentration in Quantitative Methods

This major option (120-hours) emphasizes mathematical and empirical methods in economics, including development of strong quantitative and programming skills. The Quantitative Methods concentration is especially recommended for students who are highly interested in research and advanced study in Economics.
General Degree Requirements

Students are required to complete the Arts and Sciences General Education Requirements (p. ...).

Students who desire a Secondary Major in Economics should consult with a Weatherhead academic advisor.

Major Requirements: Economics

MATH 121  Calculus for Science and Engineering I  4
or MATH 125  Math and Calculus Applications for Life, Managerial, and Social Sci I
ECON 102  Principles of Microeconomics  3
ECON 103  Principles of Macroeconomics  3
ECON 307  Intermediate Macro Theory  3
ECON 308  Intermediate Micro Theory  3
or ECON 309  Intermediate Micro Theory: Calculus-Based
OPRE 207  Statistics for Business and Management Science I  3
or STAT 243  Statistical Theory with Application I
or STAT 312  Basic Statistics for Engineering and Science
or STAT 312R  Basic Statistics for Engineering and Science Using R Programming
ECON 326  Econometrics (Ideally, Econometrics should be taken by the junior year to enrich understanding of upper-level elective courses and to enable engagement in more sophisticated economic analysis.)  4
Elective courses (a minimum of five additional economics courses at the 200 or 300 level). ECON 398 Honors Research II does not count toward fulfilling this requirement.  15

Total Units  38

Major Requirements: Economics concentration in Quantitative Methods

The Quantitative Methods concentration includes the requirements above, AND the following additional or alternative requirements:

MATH 122  Calculus for Science and Engineering II  4
or MATH 126  Math and Calculus Applications for Life, Managerial, and Social Sci II
ECON 309  Intermediate Micro Theory: Calculus-Based  3
Quantitative Methods - Any three of the following:
ECON 216  Data Visualization in R  3
ECON 327  Advanced Econometrics  3
ECON 329  Game Theory: The Economics of Thinking Strategically  3
ECON 364  Economic Analysis of Business Strategies  3
ECON 380  Computational Economics  3
Electives 9 units - At least 3 must be in economics at 200-level or 300-level, and at least 3 must be from non-economics electives menu below:

**NOTE: ECON 395 and ECON 398 do not count towards electives (See information below on SAGES Senior Capstone).**

SAGES Senior Capstone: Economics

The basic Economics major does not require a capstone as part of the major. However, students need to complete a capstone as part of the SAGES requirement. The Economics Department offers the following courses for a capstone.

ECON 398  Honors Research II  3
ECON 395  Senior Capstone in Economics  3
ECON 399  Individual Readings and Research (upon approval of Senior Capstone Coordinator)  3-6

For more information, contact Teresa Kabat (teresa.kabat@case.edu), department administrator, at 216.368.4110.
The Department of English offers courses of study leading to the Bachelor of Arts, Master of Arts, and Doctor of Philosophy degrees. Included among the department's offerings are literary and cultural studies, linguistics, film, journalism and new media, creative writing, rhetoric, and professional writing.

Combining the intellectual resources of a major research university with a scale and set of values more typical of a liberal arts college, the department emphasizes class discussion, individual conferences or tutorials, and other opportunities for students and faculty to work closely together. Likewise, the curriculum is deliberately flexible to respond to student needs and interests and to encourage close cooperation with the faculty in planning a course of study.

A major in English prepares students for various sorts of careers. Three paths are common:

- English leads readily to careers that put a premium on writing skills and on the ability to analyze complex human situations. In addition to the fields that have often been of first interest to English majors (writing and publishing, journalism, advertising, the film industry, public relations, and teaching), significant opportunities exist in the corporate world, in government, and in nonprofit organizations such as those devoted to social service, the environment, or the arts.
- The BA in English is usually essential to anyone expecting to do graduate work in English or to pursue a career as a teacher or a scholar in the field.
- The BA in English traditionally has been an important stepping stone to success in professional school, and many of our English majors choose this path. A significant number go on to law school, many to medical or business school, and some to nursing, journalism, social work, or library school, as well as directly into the business world.

Facilities

The main office is located in Guilford House, where regular public talks, department events, and classes are held. In Bellflower Hall, Writers House augments the English Department's mission through public lectures, workshops, community projects, and the Writing Resource Center. In addition to manuscript and rare-book holdings in the Special Collections Division, Kelvin Smith Library has strengths in Renaissance literature; 18th-, 19th-, and 20th-century English literature; and American literature. The library also houses an outstanding collection of several thousand films and other audiovisual materials, supported in part by English department endowment funds. In Strosacker Auditorium, the Film Society maintains facilities capable of projecting 35 mm and 16 mm films. In the library's Freedman Center for Digital Scholarship, students have access to video cameras, state-of-the-art digital editing software, and stations where they can view audiovisual materials from the library collection.

For further details about our programs, see our website at https://english.case.edu/

Chair

Georgia J. Cowart, PhD
(Rutgers University)
Professor and Interim Chair
17th and 18th centuries; music, the arts, and politics

Department Faculty

Michael Clune, PhD
(Johns Hopkins University)
Samuel B. and Virginia C. Knight Professor of Humanities; Director of Graduate Studies
American literature; literature and philosophy; poetry

Gusztav Demeter, PhD
(Oklahoma State University)
Instructor; Coordinator of ESL Writing
Teaching English as a second language; applied linguistics; cognitive linguistics; discourse analysis

Kimberly Emmons, PhD
(University of Washington)
Oviatt Professor of English; Associate Professor; Director of Composition
Rhetoric; composition; gender and language; medical humanities

Christopher Flint, PhD
(University of Pennsylvania)
Professor
18th-century English literature; print culture

Mary Grimm, MA
(Cleveland State University)
Associate Professor; Director, Writers House
Creative writing (fiction); contemporary literature; graphic novels

Megan Swihart Jewell, PhD
(Duquesne University)
Senior Instructor
American literature; writing studies; poetics

Kurt Koenigsberger, PhD
(Vanderbilt University)
Associate Professor
19th- and 20th-century British literature; postcolonial literature

William H. Marling, PhD
(University of California, Santa Barbara)
Professor
American and world literature; modernism; popular culture; the detective novel; translation studies; anarchist theory

Erika Mae Olbricht, PhD
(University of New Hampshire)
Senior Instructor; SAGES Instructional Coordinator
16th- and 17th-century British literature and theatre; landscape studies

John M. Orlock, MFA
(Pennsylvania State University)
Professor
British and American drama; narrative theory; playwriting; screenwriting
Department of English

Martha Wilson Schaffer, JD, PhD
(Bowling Green State University)
Senior Instructor; Associate Director of Composition
Rhetoric; composition; writing assessment

James Sheeler, MA
(University of Colorado)
Shirley Wormser Professor of Journalism and Media Writing; Director of Undergraduate Studies; Associate Chair
Journalism

Robert Spadoni, PhD
(University of Chicago)
Associate Professor
Film studies

Thrity Umrigar, PhD
(Kent State University)
Distinguished University Professor
Creative writing (fiction and memoir); journalism; African American literature

Maggie Vinter, PhD
(Johns Hopkins University)
Associate Professor
16th- and 17th-century British literature; drama

Lecturer
Gabrielle Parkin, PhD
(University of Delaware)
Interim Director of the Writing Resource Center
Late medieval English literature; material culture studies

Undergraduate Programs

Major
The major in English includes two tracks. The primary track consists of at least 30 semester hours in English above the 100 level (including 15 hours at the 300 level or above). The required courses are:

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENGL 300</td>
<td>English Literature to 1800</td>
<td>3</td>
</tr>
<tr>
<td>ENGL 302</td>
<td>English Literature since 1800</td>
<td>3</td>
</tr>
<tr>
<td>ENGL 308</td>
<td>American Literature</td>
<td>3</td>
</tr>
<tr>
<td>ENGL 380</td>
<td>Departmental Seminar</td>
<td>3</td>
</tr>
<tr>
<td>Choose one of the following:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>ENGL 310</td>
<td>History of the English Language</td>
<td>3</td>
</tr>
<tr>
<td>ENGL 312</td>
<td>Chaucer</td>
<td></td>
</tr>
<tr>
<td>ENGL 320</td>
<td>Renaissance Literature</td>
<td></td>
</tr>
<tr>
<td>ENGL 323</td>
<td>Milton</td>
<td></td>
</tr>
<tr>
<td>ENGL 324</td>
<td>Shakespeare: Histories and Tragedies</td>
<td></td>
</tr>
<tr>
<td>ENGL 325</td>
<td>Shakespeare: Comedies and Romances</td>

</tr>
<tr>
<td>ENGL 327</td>
<td>Eighteenth-Century Literature</td>
<td></td>
</tr>
</tbody>
</table>

ENGL 328   Studies in the Eighteenth Century
ENGL 329   English Literature, 1780-1837
Fifteen additional hours of English courses, at least 3 of which must be at the 300 level

In addition, students submit an English major portfolio as described on our website.

Because of the flexibility of departmental requirements and the variety of career paths to which the major may lead, all students should confer frequently and closely with advisors. No courses outside the department are required for the major (although a language course or equivalent proficiency is necessary for the honors track—see below), but the department recommends courses in comparative literature, history, philosophy, history and criticism of the fine arts, theater, and literature in other languages. Students planning to go to graduate school are reminded of the importance of foreign language study.

Departmental Honors
To qualify for honors, English majors must maintain a minimum GPA of 3.75 in English courses taken for honors and follow a track consisting of at least 36 hours above the 100 level, including: (a) the general requirements for the major (see above); (b) ENGL 387 Literary and Critical Theory; (c) at least 18 hours of approved electives in literary and cultural studies; and (d) one of the following:

- a course in a foreign language taught in the elected language at or above the 200 level,
- a course either in linguistics or in the history of the English language (the latter, however, cannot count for the general pre-1800 requirement and for honors track language substitution), or
- demonstrated fluency in a foreign language.

To be eligible for departmental honors, students must also complete their capstone requirement in a designated capstone course in English.

The department also offers other specialized options which follow.

Major with a Concentration in Film
The film concentration requires that 9 of the 30 credits for the English major be approved film courses.

These 9 credits must include:

<table>
<thead>
<tr>
<th>Course</th>
<th>Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENGL 367</td>
<td>Introduction to Film (no prerequisites)</td>
<td>3</td>
</tr>
<tr>
<td>ENGL 368</td>
<td>Topics in Film (no prerequisites; the course may be repeated for credit and may count for up to 6 credits of the concentration)</td>
<td>3-6</td>
</tr>
<tr>
<td>ENGL 368C</td>
<td>Topics in Film Capstone</td>
<td>3</td>
</tr>
<tr>
<td>ENGL 316</td>
<td>Screenwriting</td>
<td>3</td>
</tr>
<tr>
<td>ENGL 309</td>
<td>Immersion Journalism/Multimedia Storytelling</td>
<td>3</td>
</tr>
</tbody>
</table>

Or an approved elective course* (up to 3 credits of the concentration) 3
Teacher Licensure in Integrated Language Arts

The English department offers a special option for undergraduate students who wish to pursue an English major and a career in teaching. The Adolescent to Young Adult (AYA) Teacher Education Program in Integrated Language Arts prepares CWRU students to receive an Ohio Teaching License for grades 7-12. Students declare a second major in education—which involves 36 hours in education and practicum requirements—and complete a planned sequence of English content course work within the context of an English major. The program is designed to offer several unique features not found in other programs and to place students in mentored teaching situations throughout their teacher preparation career. This small, rigorous program is designed to capitalize on the strengths of CWRU’s English department, its Teacher Licensure Program, and the relationships the university has built with area schools.

The subject area requirements for teacher licensure (33 credit hours) are as follows:

**ENGL 204** Introduction to Journalism 3
**ENGL 300** English Literature to 1800 3
**ENGL 302** English Literature since 1800 3
**ENGL 308** American Literature 3
**ENGL 310** History of the English Language 3
**ENGL 324** Shakespeare: Histories and Tragedies 3
or **ENGL 325** Shakespeare: Comedies and Romances
**ENGL 368** Topics in Film 3
**ENGL 380** Departmental Seminar 3
One of the following: 3
**ENGL 301** Linguistic Analysis
or **ENGL 379** Topics in Language Studies
or **COSI 313** Language Development
Two of the following: 6
**ENGL 270** Introduction to Gender Studies
**ENGL 363H** African-American Literature
**ENGL 365E** The Immigrant Experience
**ENGL 365N** Topics in African-American Literature
**ENGL 365Q** Post-Colonial Literature

Recommended electives:
**ENGL 203** Introduction to Creative Writing
**ENGL 213** Introduction to Fiction Writing
**ENGL 214** Introduction to Poetry Writing
**ENGL 303** Intermediate Writing Workshop: Fiction
**ENGL 304** Intermediate Writing Workshop: Poetry
**ENGL 392** Classroom Teaching

Integrated Graduate Studies

The Department of English participates in the Integrated Graduate Studies Program (p. 1298), which makes it possible to complete both a BA and an MA in English in about five years of full-time study. The department particularly recommends the program to qualified students who are interested in seeking admission to highly competitive professional schools or PhD programs. Interested students should note the general requirements and the admission procedures elsewhere in this bulletin.

Minor in English

The minor in English consists of at least 15 hours above the 100 level. Students who wish to minor in English arrange their sequence of courses in consultation with the department advisor. They should also keep in mind that the flexibility of the department's requirements often makes it possible to take English as a second major.

Minor in Film Studies

Like the minor in English, the minor in Film Studies requires 15 hours:

**ENGL 367** Introduction to Film (no prerequisites) 3

The remaining 12 credits can consist of a combination of the following:

**ENGL 368** Topics in Film (no prerequisites; the course may be repeated for credit and may count for up to 12 credits of the minor) 3-12
**ENGL 368C** Topics in Film Capstone (up to 3 credits) 3
**ENGL 316** Screenwriting (up to 3 credits) 3
**ENGL 309** Immersion Journalism/Multimedia Storytelling 3
An approved elective course** (up to 6 credits) 0-6

** Courses that have counted as electives toward the film minor include: Latin American Cinema, Black Religion & Film, The Hollywood Musical, Topics in German Cinema, Film Music, Jewish Image in Popular Culture, French Cinema, James Bond & Popular Culture, Classics in Film, Bollywood & Social Justice, Video Production, and Folklore & Myth in Japanese Film.

Minor in Creative Writing

The minor in creative writing requires 15 credit hours. Students will take courses in two genres—poetry and fiction—and will be required to have an intro/intermediate sequence in one of those genres (e.g., ENGL 213 Introduction to Fiction Writing and ENGL 303 Intermediate Writing Workshop: Fiction).

Requirements:

15 credit hours, which includes the following:

- 9 credit hours in creative writing courses (at least 6 hours in one genre)
- 6 credit hours in literature classes. Students should take two 300-level classes; at least one of these classes should match their dominant genre. These courses may be in other disciplines if cross-listed with English (e.g., World Literature). Up to six credits may count toward either the English major or another minor (but not both).
In addition, students submit a creative writing portfolio.

Graduate Programs

The Department of English offers programs in American and English literature and language leading to the following degrees:

- Master of Arts in English
- Doctor of Philosophy in English

At either the MA or PhD level, students may elect a concentration in Writing History and Theory or a practicum in Creative Writing.

Admissions

Candidates for graduate work in English should present an undergraduate major in English or a minimum of 18 semester hours of English (or its equivalent) beyond the freshman level. In some cases, students will be required to make up deficiencies without graduate credit. The department requires all candidates for admission to submit their scores on the aptitude sections of the Graduate Record Examination. Candidates are also required to submit a writing sample, consisting of at least 15 pages of academic writing.

A maximum of six semester hours of transfer credit will be accepted from another institution and applied toward the MA, provided they were earned in graduate-level courses, with the approval of the department and the dean of graduate studies. (PhD transfer credit is normally not granted.) Such courses must have been taken within five years of matriculation at Case Western Reserve University and passed with grades of B or better.

Graduate Assistantships

New and continuing graduate students are normally supported with graduate assistanceships providing tuition remission and a living stipend. Assistantships are awarded by the Dean on the recommendation of the department. All graduate assistants are required to take university- and department-level teacher training courses in their first semester of work at the university.

Teaching is viewed as an essential part of the education of graduate students aspiring to academic posts, and is required of all students working under assistantships. The department provides opportunities for graduate assistants to gain teaching experience in a variety of courses and in the Writing Resource Center.

English MA

Students initially admitted to the English MA degree complete 30 hours of coursework and a written examination. Students take three courses in the first semester and two per semester for the balance of the degree. All MA students take ENGL 400 Rhetoric and Teaching of Writing; and ENGL 487 Literary and Critical Theory (or an equivalent course in theory). Beginning in Fall 2018, students will complete three semesters of a one-credit-hour seminar tied to the Department Colloquium. Students must also take at least one and no more than four from each of the following areas:

1. British Literature to 1800
2. British Literature since 1800
3. American Literature
4. Other departmental offerings at the 400- or 500-levels, including linguistics, rhetoric, critical theory, film, and creative writing. (Note that some of these courses are by permission of the instructor.)

Master's Non-Thesis Option

In normal circumstances, students take the MA Comprehensive Examination over the course of their second year of study. Part I is a 90-minute oral examination covering a set reading list; Part II involves the revision of a course paper and the submission of a portfolio.

MA Reading List (https://english.case.edu/ma-reading-list/)

Master's Thesis Option

In exceptional cases, students may be able to write a Master's thesis. Students pursuing the Thesis Option complete 24 hours of coursework and write a thesis over the course of the second year that reflects 6 credits of writing and research. While there is no comprehensive examination for students pursuing the Thesis Option, students must nevertheless earn a unanimous “pass” on the thesis and the thesis defense from a supervisory committee.

English PhD

Students admitted to the PhD after completing an MA must complete 24 hours of coursework. All PhD students must complete ENGL 506 Professional Writing: Theory and Practice; and ENGL 487 Literary and Critical Theory (or another theory course). Those who have not completed the equivalent of ENGL 400 Rhetoric and Teaching of Writing in the course of MA work must complete that essential training as soon as possible. There are no distribution requirements for doctoral coursework.

PhD students complete a minimum of 18 credits of dissertation research in addition to a Qualifying Examination. Doctoral students admitted with prior MA degrees typically take the Qualifying Examination in the spring semester of their second year. Working with an advisory committee, students prepare a list of approximately 75 works in two or three areas of concentration. They also prepare four research questions in these areas, from which the committee will select two for submission after a 72-hour period. (Examination answers to all four questions may be drafted in advance of the 72-hour period between receipt of the assignment of questions and the submission of the completed exam.) The written exam is followed by an oral examination. Both portions of the Qualifying Examination must be passed in order for students to Advance to Candidacy.

All doctoral students must demonstrate proficiency in at least one foreign language, normally by completing an upper-division (200-level) undergraduate course in the language at CWRU with a grade of “B” or better. Non-native speakers of English are exempt from this requirement; students who have completed a minor or major in a foreign language in the course of undergraduate study, or who have completed a comparable foreign language requirement as part of prior graduate study, may petition to have the prior work satisfy the language requirement.

No later than the semester following successful completion of Qualifying Exams, a dissertation prospectus must be accepted by the dissertation committee. The student should complete and defend the dissertation within six semesters following the acceptance of the prospectus.

Writing History and Theory (WHiT) Project Emphasis

English Graduate students at the PhD level can elect to focus their research in Writing History and Theory (WHiT) as part of their degree program. Students pursuing a WHiT doctoral research emphasis work closely with faculty to ensure that their work fulfills the aims of the WHiT Rationale. WHiT students select courses, define exam areas and build reading lists, and design dissertation projects that represent scholarly
interventions in the history, theory, and practice of writing in all of its aspects.

**WHiT Rationale:** The Writing History and Theory (WHiT) doctoral emphasis addresses writing in all of its aspects, including its material bases—its diverse technologies, sites, and economies; its conventions, forms, and pedagogies; and its practices and uses, both contemporary and historical. Students who pursue this emphasis investigate a variety of writing practices, historicizing them in sophisticated ways and relating them to dominant strands in literary, cultural, and rhetorical theory. WHiT projects emphasize the relationships among texts and the larger social, economic, and political contexts in which they are produced and circulated, exploring, for instance, the legal infrastructure of creative production; the origins, uses, and revisions of generic forms; the remediation of texts; and the material practices of invention, dissemination, and display.

The WHiT research emphasis prepares doctoral students for an academic job market that calls on them to teach in a number of areas (composition, literature, linguistics, technical writing) and demonstrate familiarity with digital forms of scholarship. It also anticipates alternative academic and non-academic markets in which graduates will profit from a broad and deep understanding of the history and theory of writing practices.

**Creative Writing Coursework Practicum**
The creative writing coursework practicum addresses not only the production of creative writing but also its contemporary theory, history, and pedagogy. English PhD students who pursue this practicum will be able to focus on their own creative work in the context of two or more advanced workshop courses, explore the connections between that work and contemporary scholarship, and prepare to teach creative writing at the college and university levels. Their selected courses will ideally be a mixture of practicum and focused literary scholarship that provide a wide range of marketable skills, preparing them for an academic job market that calls on them to teach in more than one area.

**Courses**

**ENGL 145. Utopia, Dystopia, and Scientific Modernity Sixteenth-Century to the Present. 3 Units.**
A utopia is a dream of a better world; a dystopia is a nightmare of a worse one. Both are fantasies. Yet both respond to the very real technological, political and cultural conditions in which they are written. This multidisciplinary course uses utopian and dystopian literature from the sixteenth century to the present to investigate the rise of scientific modernity and the responses it provoked. Starting with Thomas More's Utopia, and ending with Octavia Butler's The Parable of the Sower and a contemporary film, students will read important utopian and dystopian works of fiction and connect them to themes that run through the history of science: the relationship between knowledge and power; the impact of new technologies; voyages of exploration and exploitation; industrialization and forms of production; ideas of gender, race, and class; nuclear power; genetics; and climate change. We encourage students to ask what led to these specific critiques or ideas, and why? What limits or determines the boundaries of the possible or the desirable to each author? And how might these still be relevant today? Offered as ENGL 145 and HSTY 145. Counts for CAS Global & Cultural Diversity Requirement.

**ENGL 146. Tools, Not Rules: English Grammar for Writers. 3 Units.**
